NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document.

General disclaimer

(*a*) The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

(*b*) Where the designation "country or area" appears in the headings of tables, it covers countries, territories, cities or areas.

NOTE

Les cotes des documents de l'Organisation des Nations Unies se composent de lettres majuscules et de chiffres. La simple mention d'une cote dans un texte signifie qu'il s'agit d'un document de l'Organisation.

Déni de responsabilité

a) Les appellations utilisées dans cette publication ont été fournies par les autorités compétentes. Ces appellations et la présentation des données qui figurent dans cette publication n'impliquent de la part du Secrétariat de l'Organisation des Nations Unies aucune prise de position quant au statut juridique des pays, territoires, villes ou zones, ou de leurs autorités, ni quant au tracé de leurs frontières ou limites.

b) L'appellation "pays ou zone" figurant dans les titres des rubriques des tableaux désigne des pays, des territoires, des villes ou des zones.

EXPLANATION OF SYMBOLS

Category not applicable	..
Data not available	...
Magnitude zero	—
Magnitude not zero, but less than half of unit employed	0 0.0
Marked break in series is indicated by a vertical bar	I
Provisional	*
United Nations estimate	x
Data tabulated by year of registration rather than occurrence:	
non-computerized tables	†
computerized tables	foot-notes
Based on less than specified minimum	
Relatively reliable data	roman type
Data of lesser reliability:	◇
non-computerized tables	italics
computerized tables	**

It should be noted that some changes have been made in the symbols used to indicate level of reliability and data tabulated by year of registration rather than occurrence. These changes have been introduced to facilitate the use of computer print-outs as manuscript for the *Demographic Yearbook*. For example, in those tables prepared from computer print-outs it is no longer possible to use italics for data of incomplete or of unknown reliability. Instead, two asterisks (**) will be used after the name of the country or area or after the year, as appropriate. Nor will it be possible to use the dagger to indicate data tabulated by year of registration rather than occurrence. Instead, a foot-note will be used.

Other limitations refer to the use of headnotes and country names. Information previously shown in headnotes will appear at the end of the table. Some country names, because of their length, have been abbreviated even further than the commonly-employed abbreviations referred to on page 14.

EXPLICATION DES SIGNES

Sans objet	..
Données non disponibles	...
Néant	—
Chiffre inférieur à la moitié de l'unité employée	0 0.0
Un trait vertical dans la colonne indique une discontinuité notable dans la série	|
Données provisoires	*
Estimations des Nations Unies	x
Données exploitées selon l'année de l'enregistrement et non l'année de l'événement :	
Tableaux établis sans l'aide de l'ordinateur	†
Tableaux établis à l'aide de l'ordinateur	Notes
Rapport fondé sur un nombre inférieur à celui spécifié	◇
Données relativement sûres	Caractère romains
Données dont l'exactitude est moindre :	
Tableaux établis sans l'aide de l'ordinateur	Italiques
Tableaux établis à l'aide de l'ordinateur	**

On notera que certains changements ont été apportés dans les signes utilisés pour indiquer le degré d'exactitude et le fait que les données sont exploitées selon l'année de l'enregistrement et non l'année de l'événement. Ces changements ont été introduits pour qu'il soit plus facile d'utiliser les imprimés d'ordinateur comme manuscrits pour l'*Annuaire démographique*. Par exemple, dans les tableaux établis d'après les imprimés d'ordinateur il n'est plus possible d'utiliser des italiques pour les données qui sont incomplètes ou celles dont le degré d'exactitude n'est pas connu. Au lieu de cela, on fera suivre de deux astérisques les noms des pays ou zones ou les années, selon le cas, pour lesquels les données sont douteuses. Il ne sera pas possible non plus d'utiliser la croix pour indiquer que les données sont exploitées selon l'année de l'enregistrement et non l'année de l'événement; on a remplacé ce signe par une note.

On se heurte également à des restrictions en ce qui concerne l'utilisation de notes en tête des tableaux et les noms de pays. Les indications qui figuraient auparavant dans les notes placées en tête des tableaux figureront désormais à la fin. Certains noms de pays, particulièrement longs, ont été abrégés encore plus que dans les abbréviations couramment utilisées qui figurent à la page 56.

INTRODUCTION

The *Demographic Yearbook 1974* is the twenty-sixth in the series of compendia of demographic statistics issued by the United Nations since 1948. In accordance with a cyclical rotation plan of publication, a different field of demographic statistics receives intensive treatment each year. The special topic of the present issue is mortality statistics, which were last featured in the 1967 issue of the *Demographic Yearbook*. The special topic of each of the twenty-five issues is set forth on page iv.

Official demographic statistics from almost 250 geographical entities of the world are included through the co-operation of national statistical services. In addition, United Nations estimates of total population are used for all countries or areas where official estimates are lacking, and this has made it possible to include in table 1 of this issue, 1974 estimates of the order of magnitude of area, population, population growth rates, crude birth rates and crude death rates for the world, macro regions and regions. Table 2, newly introduced in this issue of the *Yearbook*, shows population and its percentage distribution by age and sex for the world, macro regions and regions. This marks the first time that a sex or age distribution has been shown in the *Demographic Yearbook* for world population and its major geographic components. As for table 1, the data are derived from official estimates and estimates prepared by the United Nations where official estimates were not available. Table 3 of this issue shows a population estimate and growth rate for the latest possible year (1974) and table 5 presents complete and consistent series of population estimates for most countries, through the use of United Nations estimates to replace inconsistent official data and to fill gaps in official time series.

This 1974 issue of the *Yearbook* contains the basic tables shown every year on population vital statistics, international migration and expectation of life. In addition, because mortality is the featured topic, it includes a series of detailed tables on foetal and perinatal mortality, infant mortality and general mortality as well as additional life tables showing mortality rates and survivors specific for age and sex. Mortality statistics were last featured in the 1966 and 1967 *Demographic Yearbooks*. At that time, because of the volume of mortality data available, it was necessary to divide the tables and publish them in two separate issues. Subsequently, however, a great deal of the data published in the *Yearbook* has been computerized and for this issue, tables on mortality have been produced from computer print-outs. As a result of the reduced time and cost required for preparation, it has been possible to revert to the original system of publishing all of the available mortality data in a single issue.

With the exception of 1973, previous issues have included a section on a topic considered to be of particular interest to the users of the *Demographic Yearbook*. In this issue, the topic is *Dates of National Population and Housing Censuses Carried Out During the Decade 1965-1974*. This is followed by the usual section entitled "Technical notes on the statistical tables". A cumulative index provides information as to the subject matter and time coverage of each of the twenty-six issues.

The estimates of the order of magnitude of population for the world, major areas and regions, shown in tables 1 and 2, the United Nations estimates of population shown in tables 3 and 5 for countries where an acceptable official mid-year population estimate was lacking and certain estimated birth and death rates and expectation of life values shown in tables 4, 9, 24, and 33 were prepared by the Population Division, Department of Economic and Social Affairs of the United Nations Secretariat.

*
* *

The *Demographic Yearbook* is one of a co-ordinated and interrelated set of publications issued by the United Nations and the specialized agencies and designed to supply basic statistical data for demographers, economists, public-health workers and sociologists. Under the co-ordinated plan, the *Demographic Yearbook* tables. Both the *Demographic Yearbook* and the World Health assembled for it are reprinted in the publications of the World Health Organization—in particular in the *World Health Statistics Annual*—to make them more readily accessible to the medical and public-health professions. In addition, the World Heath Organization publishes annually compilations of deaths by cause, age and sex, detailed statistics on selected causes of death, information on cases of deaths from notifiable diseases and other data of medical interest, which supplement the *Demographic Yearbook* tables. Both the *Demographic Yearbook* and the World Health Organization publications should be used when detailed figures on the full range of internationally assembled statistics on these subjects are required.

INTRODUCTION

L'*Annuaire démographique* (1974) est le vingt-sixième d'une série de recueils de statistiques démographiques que l'Organisation des Nations Unies fait paraître depuis 1948. Conformément à un plan de rotation cyclique des publications, il y a chaque année un domaine différent des statistiques démographiques qui est traité en profondeur. Le sujet qui est traité plus spécialement dans la présente édition de l'*Annuaire démographique* est celui des statistiques de la mortalité, sujet qui a été traité en profondeur pour la dernière fois dans l'édition de 1967 de l'*Annuaire démographique*. Le sujet spécial de chacune des éditions est indiqué à la page iv.

Grâce à la coopération des services nationaux de statistique, il a été possible de faire figurer dans le présent annuaire des statistiques démographiques officielles provenant de près de 250 entités géographiques du monde. En outre, on a utilisé des estimations de la population totale, établies par l'Organisation des Nations Unies, pour tous les pays ou zones pour lesquels les estimations officielles faisaient défaut; on a ainsi pu faire figurer au tableau 1 de la présente édition des estimations pour 1974 indiquant la superficie et l'ordre de grandeur de la population, des taux d'accroissement démographique et des taux bruts de mortalité et de natalité pour l'ensemble du monde, les grandes zones et les régions géographiques. Le tableau 2, qui est publié pour la première fois dans la présente édition de l'*Annuaire*, fournit pour l'ensemble du monde, les grandes zones et les régions, l'effectif de la population et sa répartition en pourcentage selon l'âge et le sexe. C'est la première fois que l'*Annuaire démographique* présente une série de données selon le sexe ou l'âge pour la population du monde et des principales régions géographiques qui en font partie. Comme pour le tableau 1, on a utilisé les estimations officielles et les estimations établies par l'Organisation des Nations Unies là où les estimations officielles faisaient défaut. Le tableau 3 présente des estimations et des taux d'accroissement de la population pour la dernière année disponible (1974) et il a été possible de présenter au tableau 5 des séries complètes et homogènes d'estimations de la population pour la plupart des pays en utilisant les estimations des Nations Unies pour remplacer les données officielles qui présentaient des anomalies et pour combler les lacunes des séries chronologiques officielles.

La présente édition de l'*Annuaire* contient les tableaux de base qui sont présentés chaque année sur les statistiques de l'état civil, la migration internationale et l'espérance de vie. En outre, la mortalité étant cette année le sujet spécial traité, on a inclus dans la présente édition une série de tableaux détaillés sur la mortalité fœtale et périnatale, la mortalité infantile et la mortalité générale ainsi que des tables de mortalité supplémentaires montrant les quotients de mortalité et les survivants à un âge donné pour chaque sexe. Les statistiques de la mortalité ont été présentées pour la dernière fois comme sujet spécial dans les éditions de 1966 et de 1967 de l'*Annuaire démographique*. Etant donné l'ampleur des données disponibles sur la mortalité à ce moment-là, on avait été obligé de répartir les tableaux et de les publier en deux fois, dans des éditions distinctes. Par la suite, cependant, un grand nombre des données publiées dans l'*Annuaire* ont été mises sur ordinateur et, pour la présente édition, les tableaux relatifs à la mortalité ont été établis à partir d'imprimés d'ordinateur. Le travail de préparation étant de ce fait plus rapide et moins coûteux, il a été possible de publier toutes les données disponibles sur la mortalité dans le même volume, comme on le faisait autrefois.

Sauf en 1973, les éditions antérieures comprenaient chacune un chapitre sur un sujet dont on jugeait qu'il présentait un intérêt particulier pour les utilisateurs de l'*Annuaire démographique*. Le sujet traité ainsi dans la présente édition est celui des *Dates des recensements nationaux de la population et de l'habitation effectués au cours de la décennie 1965-1974*. Vient ensuite le chapitre intitulé "Notes techniques sur les tableaux statistiques". Un index cumulatif fournit des renseignements sur les matières traitées dans chacune des vingt-six éditions et sur la période sur laquelle portent les données.

La Division de la population du Département des affaires économiques et sociales du Secrétariat de l'Organisation des Nations Unies a établi des estimations de l'ordre de grandeur de la population du monde et des grandes zones et régions géographiques (tableaux 1 et 2) des estimations relatives à la population des pays pour lesquels une estimation officielle acceptable de la population au milieu de l'année faisait défaut (tableaux 3 et 5) ainsi que certains taux estimatifs de natalité et de mortalité et certaines valeurs d'espérance de vie (tableaux 4, 9, 24 et 33).

*
* *

L'*Annuaire démographique* s'intègre dans un ensemble de publications complémentaires que font paraître l'Organisation des Nations Unies et les institutions spécialisées et qui ont pour objet de fournir des statistiques de base aux démographes, aux économistes, aux spécialistes de la santé publique et aux sociologues. Conformément au plan de coordination, l'*Annuaire démographique* constitue la source internationale des statistiques démographiques. Certaines des données qui y sont ras-

semblées sont reproduites dans les publications de l'Organisation mondiale de la santé — notamment dans l'*Annuaire des statistiques sanitaires mondiales* — afin qu'elles soient plus accessibles au corps médical et aux agents de la santé publique. En outre, l'Organisation mondiale de la santé publie chaque année des statistiques des décès selon la cause, l'âge et le sexe, des séries détaillées sur les décès imputables à certaines causes, des données sur les cas de maladies à déclaration obligatoire et sur les décès dus à ces maladies, ainsi que d'autres statistiques d'intérêt médical qui viennent compléter les tableaux de l'*Annuaire démographique*. L'*Annuaire démographique* et les publications de l'Organisation mondiale de la santé doivent être consultés concurremment si l'on veut connaître, dans tout leur détail, les statistiques rassemblées dans ces domaines sur le plan international.

DATES OF NATIONAL POPULATION AND HOUSING CENSUSES CARRIED OUT DURING THE DECADE 1965-1974

In accordance with resolution 1054 B (XXXIX) of the United Nations Economic and Social Council, the 1970 World Population and Housing Census Programme covered the 10-year period from 1965 through 1974. The list below shows for each country or area whether or not a population and/or housing census was carried out during the 1970 census decade and the date of each census taken.

The list reflects information available to the Statistical Office of the United Nations as of 30 April 1975. It refers to complete (100 per cent) enumerations of the population and/or living quarters, even though some topics may have been investigated on a sample basis.

If a census was taken during the period 1965-1974, a "Yes" appears in the *Status* column and the date of the census is given in the *Census date* column. An asterisk (*) following the word "Yes" indicates provision by the United Nations of a resident technical expert or of financial assistance for the census. The letters in parentheses following each date indicate enumeration of both population and housing (P/H), population only (P) or housing only (H).

For countries or areas that did not carry out a population or housing census during the 1965-1974 decade, a "No" appears in the *Status* column. If, in any country or area with a "No" in the *Status* column, a population census was held in the first four months of 1975 or definite plans have been announced for holding a population census before the end of 1976, the accomplished or anticipated date of enumeration is shown in parentheses in the *Census date* column. Otherwise, a dash (—) appears instead. For all countries or areas with a "No" in the *Status* column, the date, if any, of the last national population census or sample survey is shown in a foot-note.

Foot-notes:

[1] A population census of the Chagos Archipelago was conducted 30 June 1962; a census of Aldabra, Farquhar and Des Roches was conducted 4 May 1960.
[2] A sample survey of population was conducted in 1970-1971.
[3] A sample survey of population was conducted in 1959-1960 and "recensements instantanés" in 1965 and 1968.
[4] A census of population was conducted December 1963-August 1964.
[5] A sample survey of population was conducted 25 May-30 September 1961.
[6] A formal census is not taken because the population consists entirely of official mission personnel and the exact number of persons is known at all times.
[7] A census of population was conducted in 1960-1961.
[8] Housing questions asked on the permanency of buildings and the source of water supply.
[9] A sample survey of population was conducted November 1957-1958.
[10] Housing information collected in urban areas only.
[11] Enumeration to be conducted in three stages of varying durations.
[12] A sample survey of population was conducted 15 June 1960-May 1961.
[13] A sample survey of population was conducted December 1964-December 1965.
[14] A sample survey of population was conducted October 1959-March 1960.
[15] A sample survey of population was conducted May-November 1970.
[16] A sample survey of population was conducted 1970–1971.
[17] African population only. The census of the remainder of the population was conducted 20 March 1969.
[18] A sample survey of population was conducted in 1960–1965.
[19] A sample survey of population was conducted 30 September 1960-22 April 1961.
[20] A sample seurvey of population was conducted 23 May 1955-February 1958.
[21] A census of population and housing was conducted in urban areas and a sample survey of population and housing was conducted in rural areas September-October 1971.
[22] Limited housing data collected.
[23] A census of population was conducted 5 September 1950.
[24] A formal census is not taken because the population consists entirely of scientists and technicians of the British Antartic Survey and the exact number of persons is known at all times.
[25] A census of population was conducted 16 October 1963.
[26] Unofficial reports have been received of a population census held in June 1964 but no further information is available.
[27] A census of population was conducted 11 December 1960.
[28] A census of population was conducted 18 November 1961.
[29] A census of population was conducted 17 April 1962.
[30] A census of population was conducted 1 May 1944.
[31] A partial census, covering the city and plain of Vientianne, the cities of Luang-Prabang, Houeisai, Sayaboury, Savannakhet and Paksé was conducted 1 February-31 March 1973.
[32] A sample survey of population was conducted 15 November 1970.
[33] A census of population has been conducted in June of each year since 1955.
[34] A census of population was conducted in November 1954.
[35] The census of the Island of Jersey was conducted 4 April 1971; the census of the Island of Guernsey and the adjacent Islands was conducted 25 April 1971.
[36] A census of population was conducted 30 April 1948.
[37] A census of population was conducted 28 September 1947.
[38] A census of population was conducted 1 November 1960.
[39] A sample survey of population was conducted 7 July 1971.

DATES DES RECENSEMENTS NATIONAUX DE LA POPULATION ET DE L'HABITATION EFFECTUÉS AU COURS DE LA DÉCENNIE 1965–1974

Conformément à la résolution 1054 B (XXXIX) du Conseil économique et social de l'Organisation des Nations Unies, le programme de recensement mondial de la population et de l'habitation de 1970 porte sur la période de 10 ans comprise entre 1965 et 1974 inclusivement. La liste ci-dessous indique pour chaque pays ou zone si un recensement de la population et/ou de l'habitation a été effectué au cours de la décennie couverte par le programme de recensements de 1970 et la date de chaque recensement effectué.

Cette liste a été établie sur la base des renseignements dont disposait le Bureau de statistique de l'Organisation des Nations Unies au 30 avril 1975. Les recensements dont il s'agit sont des dénombrements complets (100 p. cent) de la population et/ou des habitations, encore que certains sujets aient pu être étudiés à l'aide d'enquêtes par sondage.

Si un recensement a été effectué au cours de la période comprise entre 1965 et 1974, le fait est indiqué par la mention « oui » dans la colonne intitulée *Recensement* avec en regard la date du recensement dans la colonne intitulée *Date*. Un astérisque (*) suivant le mot « oui » sert à indiquer que l'Organisation des Nations Unies a fourni les services d'un expert technique résident ou une assistance financière aux fins du recensement. Les lettres figurant entre parenthèses après chaque date indiquent s'il s'agit d'un recensement de la population et de l'habitation à la fois (P/H), de la population seulement (P) ou de l'habitation seulement (H).

En regard des pays ou zones qui n'ont pas effectué de recensement de la population ou de l'habitation au cours de la décennie 1965-1974, on a fait figurer la mention « non » dans la colonne intitulée *Recensement*. Dans le cas de ceux de ces pays ou zones où un recensement de la population a été effectué au cours du premier semestre de 1975 ou qui ont annoncé qu'ils avaient pris des dispositions précises pour effectuer un recensement de la population avant la fin de 1976, on a indiqué entre parenthèses dans la colonne intitulée *Date*, la date à laquelle le recensement a été ou doit être effectué. Dans les autres cas, un tiret (—) figure dans la colonne. Pour tous les pays ou zones où il n'a pas été effectué de recensement pendant la décennie considérée, on a indiqué dans une note la date du dernier recensement national de la population ou de la dernière enquête par sondage.

[16] Un recensement de la population a été effectué entre décembre 1963 et août 1964.
[17] Il n'est pas effectué de recensement à proprement parler parce que la population ne comprend que le personnel des missions et que l'on en connaît à tout moment l'effectif exact.
[18] Un recensement de la population a été effectué dans l'archipel des Chagos le 30 juin 1962; et à Aldabra, Farqhar, et Des Roches, le 4 mai 1960.
[19] Un recensement de population a été effectué en 1960–1961.
[20] Une enquête démographique par sondage a été effectuée entre le 23 mai 1955 et le mois de février 1958.
[21] Un recensement de la population et de l'habitation a été effectué dans les zones urbaines et une enquête par sondage sur la population et l'habitation a été effectuée dans les zones rurales en septembre–octobre 1971.
[22] Des données partielles sur l'habitation ont été recueillies.
[23] Un recensement de la population a été effectué le 5 septembre 1950.
[24] Il n'est pas effectué de recensement à proprement parler parce que la population est composée exclusivement de chercheurs et de techniciens attachés au *British Antarctic Survey* et que l'on en connaît à tout moment l'effectif exact.
[25] Un recensement de la population a été effectué le 16 octobre 1963.
[26] Selon des sources officieuses, un recensement de la population aurait été effectué en juin 1964, mais on ne dispose d'aucune autre information à ce sujet.
[27] Un recensement de la population a été effectué le 11 décembre 1960.
[28] Un recensement de la population a été effectué le 1er mai 1944.
[29] Un recensement de la population a été effectué le 18 novembre 1961.
[30] Un recensement partiel portant sur la ville et la plaine de Vientiane, les villes de Luang-Prabang, Houeisai Sayaboury, Savannakhet et Paksé a été effectué entre le 1er février et le 31 mars 1973.
[31] Une enquête démographique par sondage a été effectuée le 15 novembre 1970.
[32] Un recensement de la population a été effectué en juin de chaque année depuis 1955.
[33] Un recensement de la population a été effectué le 17 avril 1962.
[34] Un recensement de la population a été effectué en novembre 1954.
[35] Le recensement de la population de l'île de Jersey a été effectué le 4 avril 1971; le recensement pour l'île de Guernesey et pour l'île avoisinante a été effectué le 25 avril 1971.
[36] Un recensement de la population a été effectué le 28 septembre 1947.
[37] Un recensement de la population a été effectué le 30 avril 1948.
[38] Un recensement de la population a été effectué le 1er novembre 1960.
[39] Une enquête démographique par sondage a été effectuée le 7 juillet 1971.

TECHNICAL NOTES ON THE STATISTICAL TABLES

INTRODUCTION

SOURCE OF DATA

The statistics presented in the *Demographic Yearbook*[1] are official data unless otherwise indicated. They have been assembled by the Statistical Office of the United Nations from official publications and from data transmitted in monthly and annual questionnaires and in correspondence by the national statistical services or other appropriate government offices of over 240 countries or areas.

To establish comparability in so far as computation procedures are concerned, all rates and ratios (except life-table functions and a few exceptions noted in the rate tables) have been computed in the Statistical Office of the United Nations according to the methods described for each table. The populations used for the computation of rates are those published in this or previous issues of the *Yearbook*.

In cases where differences are observed between data in this volume and those published in previous *Demographic Yearbooks* or related publications, statistics in this issue may be assumed to reflect revisions received in the Statistical Office by 31 March 1975.

ARRANGEMENT AND NUMBERING OF TABLES

The tables in this *Demographic Yearbook* are arranged in two groups. Group I includes tables published annually, while Group II contains the tables on the Special Topic —in this case, mortality statistics. Tables are numbered in sequence throughout the book.

FEATURED SUBJECT

The subject to which particular attention is paid in this issue is "Mortality Statistics". Twenty-one tables are devoted to this subject, including 10 which are recurring tables shown each year in less detail than is possible when they are part of the feature subject.

SCOPE OF DATA

Geographic coverage

In accordance with the original plans, the geographic coverage of the tables has been made as extensive as possible. Each table includes data for as many countries or areas as provide them and, as far as possible, data refer to the whole country or area or the total population within the country or area. Where national coverage for the entire population has not been achieved, data are presented for specified major segments of the population for which data may be available. These data are included not as representative statistics but as an index to the availability of statistics. It should be emphasized that publication of all available data does not indicate that a value judgment has been made as to their accuracy except as it is reflected in the quality codes, described on pp. 17, 18 and 19.

Table 3 is the most comprehensive, showing population and surface area for every country or area having at least 50 inhabitants. Time series of total population and vital statistics are next most comprehensive. Frequency distributions in which a population characteristic is the variable are of more limited coverage, and the geographic scope decreases even further when more than one variable is introduced or where the table consists of rates or ratios.

Territorial composition

In so far as possible, both time series and frequency distributions are for the territory within the 1974 boundaries of the country or area specified. Whenever the territory to which data relate is other than present, foot-notes have been used to describe the ways in which the territorial composition of the reporting surface area differs from the surface area within 1974 boundaries.

In cases where, because of frequent or recent boundary changes or other reasons, the present territorial composition might require clarification, the salient points have been set forth in table 3. The particulars are also given in other tables where such changes have bearing on the data presented.

Data relating to People's Republic of China generally include those for Taiwan Province in the field of statistics relating to population, surface area, natural resources, natural conditions such as climate, etc. In other fields of statistics, they do not include Taiwan Province unless otherwise stated. Therefore in this publication, the data published under the heading "China" include those for Taiwan Province.

Definition of population

In assembling national demographic statistics for publication, the basic aim has been to obtain data for the present-in-area or *de facto* population rather than for the habitually resident or *de jure* inhabitants. Thus, unless otherwise noted, it must be assumed that population and vital statistics cover both nationals and aliens, native and foreign-born, aborigines, jungle tribes, nomadic peoples, displaced persons, internees, refugees and any other group present within the borders of a country or area at a specified time. Hence, population estimates which have been adjusted to include national armed forces and diplomats stationed outside the country or area, and to exclude alien armed forces, foreign diplomats and enemy prisoners of war stationed in the area are explained in the tables both where the population figures are shown and, if

[1] For sales numbers of previous issues, see "Special topics of the *Demographic Yearbook* series: 1948-1974", p. iv of this publication.

neccesary, where these figures are used in the computation of vital-statistics rate.

NOMENCLATURE

Names of countries or areas

Because of space limitations, the country or area names listed in the tables are generally the commonly employed abbreviations in use in the United Nations as of 31 December 1974[2], the full official titles being used only when a short form is not available. However, for purposes of clarity, the following full official titles are used in table 3: United Kingdom of Great Britain and Northern Ireland, United States of America, Union of Soviet Socialist Republics, Byelorrusian Soviet Socialist Republic and Ukrainian Soviet Socialist Republic.

Arrangement of country or area names

Except for the short tables 15 and 16 where country or area names are listed in English alphabetic order throughout the world, country or area names in the stub of the tables are grouped by continents, the sequence of which is determined by English alphabetic order, i.e. Africa; America, North; America, South; Asia; Europe; Oceania; and USSR. Within each continent, countries or areas are listed in English alphabetic order.

The designations employed and the presentation of the material in this publication were adopted solely for the purpose of providing a convenient geographic basis for the accompanying statistical series. The same qualification applies to all notes and explanations concerning the geographic units for which data are presented.

EVALUATION OF QUALITY OF DATA

The attempt to differentiate demographic statistics according to their degree of accuracy, begun in the 1959 issue, has been continued in this *Demographic Yearbook*. Where possible, distinction is achieved through the use of two different type fonts—roman type for relatively "reliable" data and italics for those of lesser reliability. However, in special topic tables 15 through 35, two asterisks (**) are used after the name of the country or area or after the year to indicate data that are incomplete or of unknown reliability. (See explanatory note under *Explanation of Symbols* p. ix. For a description of the methods used to evaluate the data, see the discussion under "Population" and "Vital Statistics," which follows.

[2] For a listing of the majority of these areas, see *Names of Countries and Adjectives of Nationality* (United Nations document ST/CS/SER.F/285 and Corr.7).

SURFACE AREA

CONCEPT OF SURFACE AREA

Statistics of territorial expanse or geographic area are found in tables 1 and 3. Table 3 shows the most recent surface area estimate for every geographic unit of the world; table 1 shows aggregate surface area for the world, 8 macro regions and 22 component regions. Unless otherwise specified, all of these figures are assumed to represent total surface area, that is, they comprise the land area and inland waters (assumed to consist of major rivers and lakes) and exclude only polar regions and some uninhabited islands.

Surface area is given in square kilometres, the conversion from square miles (if required) having been accomplished by equating 1 square mile to 2.589988 square kilometres. Use of a different factor would give slightly different results. Rounding also may affect the last digit of the value.

Apparent inconsistency with previously published figures may be due to the introduction of improved surface area estimates, to increases in actual land surface by reclamation, or to a change in the unit of measurement used. In most cases it was possible to ascertain the reason for a revision but, failing this, the latest figures have nevertheless been accepted as correct and substituted for values previously on file. Some slight changes in surface area figures from those previously published are also due to the use of the factor given above (2.589988), which was adopted by the Statistical Office in 1965, replacing the factor of 2.589998 previously used.

SOURCES OF VARIATION

Lack of international comparability among surface area statistics arises primarily from differences in definition. For example, surface area defined as "land and water" cannot be considered comparable to "land area" figures unless the amount of inland water is known to be negligible. Also the term "water area" may vary in meaning from one country or area to another; in one, it may comprise only major rivers and lakes ("inland water" according to the standard), while in others, it may include, in addition, coastal bays, inlets and gulf. Variations of this type especially among countries or areas with coastlines can impair international comparability.

Another problem concerns the source of the surface area data. Some surface area figures are based on surveys, carried out by modern scientific methods; others are simply conjectures based on diverse types of information. Some values are of recent origin, reflecting current knowledge and significant territorial changes up to the present time; others are not current and may thereby fail to take cognizance of recent boundary rectifications. Since neither the exact method of determining the surface area nor the precise definition of its composition and time reference is known for all countries or areas, the values in table 3 should not be considered strictly comparable from country or area to country or area.

POPULATION

This twenty-sixth issue of the *Demographic Yearbook* features mortality statistics; hence, population statistics are the subject of only seven of the 35 tables, namely, tables 1, 2, 3, 5, 6, 7 and 8. These seven tables show (1) the size of national and city populations; (2) trends in population-size of countries, continents, regions and the world; (3) age-sex composition of national populations; (4) urban rural components of national populations. These are the population data considered necessary on a continuing basis for most purposes. Limited as the coverage is, these population statistics exemplify clearly the types of variation common to population data as a whole.

SOURCES OF VARIATION

Certain types of variation will be readily seen in the data: *viz.*, definitions and concepts of characteristics differ from country or area to country or area and national classification schemes do not always conform to the standard adopted for the *Yearbook* tables. These types of variation are noted on the tables whenever possible; they are also discussed in connexion with specific tables[3].

There are other more fundamental sources of variation, however, which are common to all population data but which are not always readily apparent. They include different concepts of what constitutes "total" population; under- or over-numeration and omission at the census; unreliability of age reporting; and variations in the reliability of estimates. These, together with some of the means used to evaluate their magnitude, are discussed below.

Definition of total population

Variation in the composition of the population described as the "total" for different countries or areas is one of the most important factors to be considered in evaluating comparability. Although there are numerous variations, the total population of a country or area is conveniently characterized as being defined in terms of either a *de facto* or *de jure* concept.

De facto *and* de jure

A strict *de facto* or present-in-area concept implies that all persons physically present in the country or area—residents and non-residents alike—have been counted in the local area where they were found at the time of the census. The *de jure* count, in contrast, comprises all persons who normally reside in the area, irrespective of where they might happen to have been at the time of the census. Simple as these concepts appear, strict conformity to either of them is rarely found. Moreover, even when these terms are used with precision to describe the method of obtaining subnational totals in a census of population, they are often misleading when applied to the national figures in an international context. Also, the terms encountered may correctly describe the place of enumeration (i.e., place of occurrence *versus* place of residence) but be incorrect when used to describe the tabulated data.

The wide variation which exists in the actual composition of national census totals defined as *de facto* and *de jure* can be seen from table A, page 16, of the *Demographic Yearbook, 1960,* which shows how certain subgroups of the population were treated in the censuses taken between 1945 and 1954 in 52 sovereign countries. The subgroups within the country or area, whose inclusion or exclusion from the enumeration are considered in the table, are: nomadic tribes, aborigines, alien armed forces,merchant seamen in port or ashore, alien displaced persons, enemy prisoners of war, foreign diplomatic personnel, other civilian aliens permanently resident and other civilian aliens temporarily present. The subgroups of persons who may be outside the country or area at the time of the census are: national armed forces, merchant seamen at sea, diplomatic personnel and other civilian nationals temporarily absent.

The lack of uniformity in the treatment of these subgroups in respect of population designated as *de facto* and *de jure,* makes it evident that the terms, though traditionally accepted, fail to convey a clear understanding of the composition of the "total" population. The United Nations *Principles and Recommendations for the 1970 Population Censuses*[4] state that it is not sufficient to describe the total population as *de facto* or *de jure* because the meanings of the two terms are not sufficiently precise. No recommendation is made as to what specific subgroups of persons should be included or excluded in the population total, since this depends on national circumstances and needs. However, it is recommended that the description of the total indicate clearly the disposition of substantially the same subgroups as are listed in the preceding paragraph. This information, when available at the United Nations, is taken into account in the presentation of data in the *Demographic Yearbook* and, if it indicates a divergence from the strict *de facto* or *de jure* concept, the data are foot-noted to this effect. All other data are identified as *de facto* or *de jure,* either on the basis of information on the disposition of the subgroups or a statement from the country or area that the figures are *de facto* or *de jure*.[5]

Reliability of census data

Evaluation of census "total"

Irrespective of whether the census is *de facto* or *de jure* in concept, the obtaining of a complete yet unduplicated total count of the population of an area presents numerous difficulties. These difficulties are, of course, more pronounced in areas where the inhabitants are unfamiliar with census-taking, but it should be emphasized that they are present in every enumeration[6].

Since even the most carrefully planned and executed census is subject to error, measuring the extent of net under-enumeration (or rarely, net over-enumeration) of a

[3] For further discussion, see *Handbook of Population Census Methods,* vol. I, *General Aspects of a Population Census;* vol. II, *Economic Characteristics of the Population*; vol. III, *Demographic and Social Characteristics of the Population* (United Nations publication, Sales No. 58.XVII.6 (vols. I, II, III)).

[4] *Principles and Recommendations for the 1970 Population Censuses* (United Nations publication, Sales No. 67.XVII.3), paras. 283-286.

[5] For a more detailed discussion of *de jure* and *de facto* concepts and the implications of these concepts in connexion with enumeration, see *Handbook of Population Census Methods*, vol. I, pp. 91-92, and vol. III. pp. 55-59.

[6] For further discussion, see *Demographic Yearbook, 1962* (United Nations publication, Sales No. 63.XII.1), chapter I. Also *Handbook of Population Census Methods,* vol. I, pp. 104-111.

census furnishes valuable information to users. As described in Chapter I of the *Demographic Yearbook 1962*, a number of methods have been used for this purpose: post-enumeration field checks, matching individual census schedules with other records, analytical procedures, and so on. Such evaluation studies can sometimes be used to generate adjustments to correct deficient census results. Even where this is not possible, evaluation studies can provide users with a rough indication of census quality and can often pinpoint specific sources of error so that in subsequent censuses, they can be reduced. To assist in the interpretation of data in the various tables of the *Yearbook*, care has been taken to describe the census results, in so far as this is possible, as relating to population actually enumerated or as having been adjusted by a correction factor[7].

Evaluation of age distribution

Age—the characteristic most universally investigated both in population and vital statistics—is the estimated or calculated interval of time between the date of birth and the date of the census, expressed in completed solar years[8]. Age is commonly determined on the basis of two types of questions, used singly or in combination. The first type asks for information about date of birth; the alternative method requires that the age be given in completed units of time, that is, age at last birthday—in years for adults and in months, weeks, day or hours of life for infants. These two methods do not necessarily result in date of equal accuracy. There is evidence that the date-of-birth type of inquiry yields more precise data than the direct question on "age", but it is obviously of limited applicability in areas where a large proportion of the population does not know the year and date of birth. On the other hand, the direct question on age may also be answered incorrectly, either through ignorance or deliberate misstatement.

Another source of variation may be found in the method of classifying the age data after they have been collected. The recommended method is to convert the date-of-birth information to "age at last birthday" by subtracting the exact date of birth from the date of the census. This age, which will be in the largest units of completed time, (i.e., years, months, or days of age), would then be tabulated by single years if desired or classified into selected age groups. This method of "completed years" is not always used, however. Some countries or areas classify by the year of birth which is equivalent to determining age by finding the difference between the *year* of birth and the *year* of the census. In such a classification, a child born in the calendar year immediately prior to the census year would be counted as one year of age even though he might not have completed one month of life. This type of classification can usually be identified by the fact that the frequencies in the under-one-year category appear smaller than they should be in relation to the succeeding categories. It should be noted, however, that for a year during which a large number of births took place, the effect may not be so clear.

Another source of non-comparability may result from differences in the method of reckoning age, e.g., the Western *versus* the Eastern or, as it is usually known, the English *versus* the Chinese system. By the latter, a child is regarded as one year old at birth and his age advances one year at each Chinese New Year. The effect of this system is most obvious at the beginning of the age span where the frequencies in the under-one-year category are markedly understated. The effect on higher age groups is not so apparent. Distributions constructed on this basis are often adjusted before publication, but the possibility of such aberrations should not be excluded when census data by age are compared.

Misstatements of age may be due to a variety of causes, among which may be cited ignorance of correct age; carelessness in reporting and recording; a general tendency to state age in figures ending in certain digits (such as zero, two, five and eight); a tendency to exaggerate length of life at advanced ages; a possibly subconscious aversion to certain numbers such as 13; and wilful misrepresentations arising from motives of an economic, social, political or purely personal character. The above-cited reasons for misstatements are common to most investigations of age and to most countries or areas, and they may impair comparability to a marked degree.

As a result of the above-mentioned difficulties the age-sex distribution of population in many countries or areas shows irregularities which may be summarized as follows: (1) deficiency in number of infants and young children, (2) heaping at ages ending in 0 and 5, (3) a preference for even ages over odd ages, (4) unexpectedly large differences between the frequency of males and females at certain ages, and (5) unaccountably large differences between the frequencies in adjacent age groups. Comparison of identical age-sex cohorts from successive censuses, as well as study of the age-sex composition of each census, may reveal these and other inconsistencies, some of which are characteristic of even the most modern censuses.

Index of concentration: To measure the accuracy of age statistics on the evidence of irregularities in 5-year groups, an index was devised for presentation in the *Demographic Yearbook, 1949-1950*[9]. Although this index was sensitive to various sources of inaccuracy in the data, it could also be affected considerably by real fluctuations of past demographic development. It could not, therefore, be applied indiscriminately to all types of statistics, unless certain adjustments were made and caution used in the interpretation of results.

The publication of population statistics by single years of age in the 1955 issue of the *Demographic Yearbook* made it possible to apply a simple, yet highly sensitive, index known as Whipple's Index, or the Index of Concentration[10], the interpretation of which is relatively free from consideration of factors not connected with the ac-

[7] National estimates of underenumeration are given in the foot-notes to table 3, p. 114.

[8] *Principles and Recommendations for the 1970 Population Censuses*, para 176.

[9] In this index, differences were scored from expected values of ratios between numbers of either sex in the same age group, and numbers of the same sex in adjoining age groups. In compounding the score, allowance had to be made for certain factors such as the effects of past fluctuations in birth rates, of heavy war casualties, and of the smallness of the population itself. A detailed description of the index, with results of its application to the data presented in the 1949-1950 and 1951 issues of the *Demographic Yearbook*, is furnished in *Population Bulletin, No. 2* (United Nations publication, Sales No. 52.XIII.4), pp.59-79. The scores obtained from statistics presented in the *Demographic Yearbook, 1952* are presented in that issue, and the index has also been briefly explained in that issue, as well as those of 1953 and 1954.

[10] United States, Bureau of the Census, *Thirteenth Census. . .* vol. I (Washington D.C., U.S. Government Printing Office), pp. 291-292.

curacy of age returns. More refined methods for the measurement of age accuracy by single years have been devised, but this particular index was selected for presentation in the *Demographic Yearbook* on the basis of its simplicity and the wide use it has already found in other sources.

Whipple's Index "is obtained by summing the age returns between 23 and 62 years inclusive and finding what percentage is borne by the sum of the returns of years ending with 5 and 0 to one-fifth of the total sum. The results would vary between a minimum of 100, representing no concentration at all, and a maximum of 500, if no returns were recorded with any digits other than the two mentioned."[11]

The index is applicable to all age distributions for which single years are given at least to the age of 62, with the following exceptions: (1) where the data presented are the result of graduation, no irregularity is scored by Whipple's Index, even though the graduated data may still be affected by inaccuracies of a different type; (2) where statistics on age have been derived by reference to the year of birth, and tendencies to round off the birth year would result in overly frequent age returns with odd figures of age, the frequency of age returns with terminal digits 5 and 0 is not an adequate measure of their accuracy.

Whipple's Index was applied to a number of the single-year-of-age distributions of population from censuses taken between 1945 and 1954; the ratings achieved by 91 such distributions can be found on pages 18-19 of the *Demographic Yearbook, 1960,* as well as in the 1955 and 1956 issues.

The index was also computed ofr the single-year-of-age statistics available as of 31 December 1963 from censuses held between 1955 and 1962. The results of this tentative rating of 62 distributions for both sexes combined were published in the *Demographic Yearbook, 1963,* page 20.

Using the statistics for both sexes combined, the index has also been computed for all the single-year age statistics available as of 31 December 1973 from censuses held between 1962 and 1973, with the exception of those excluded on the criteria set forth above. The results of this tentative rating of 113 distributions were published in the 1973 *Demographic Yearbook,* page 9.

Reliability of population estimates

The reliability of a population estimate depends on the nature and quality of the statistics employed in its construction and on the method by which these statistics are combined. An estimate is considered *reliable* if the probability of a relatively large error is slight, or if errors in a given probability range are relatively small. A measure of reliability defined in such terms can actually be calculated, provided there is a quantitative appraisal of possible errors in each of the component factors of the estimate. For population statistics, such quantitative appraisals have been obtained systematically in relatively few countries or areas. Accordingly only rough assessments of reliability can be made in most cases, based on a consideration of the methods by which the current population estimates are obtained.

Evaluation of current estimates of total population

As a rough indication of the presumable degree of reliability in current estimates of total population, a code describing the manner of their construction was introduced experimentally in table 1 of the *Demographic Yearbook, 1949-1950.* With increased experience and knowledge, it became evident that the slight modifications introduced each year subsequent to 1952 were not adequate. By 1958, a more far-reaching modification seemed both feasible and necessary for two reasons: (1) it had become practicable to separate more clearly the logical elements which affected the reliability of each estimate, and (2) it was considered desirable to give more weight to the effect of the time which had elapsed between the date of the last basic population measurement (e.g., the last census) and the date of the current estimate.

In constructing the new code, five elements have been recognized as affecting the reliability of a current population estimate: (1) the nature of the base measurement of the population, (2) the probable error in that base measurement, (3) the time elapsed since the last measurement, (4) the method of time adjustment by which the base figure was brought up to date, and (5) the quality of the time adjustment. However, since very few comparable indications of the probable error in the base measurements have been secured so far, only elements (1), (3), (4) and (5) can be systematically considered. Hence, the revised code is composed of four parts, namely, the nature of the base data, their recency, the nature of the time adjustment, and its quality. The symbols of the code are listed below:

Quality code for current estimates of total population[12]

Part I. Nature of base data (capital letter)
- **A** Complete census of individuals.
- **B** Sample survey.
- **C** Partial census or partial registration of individuals.
- **D** Conjecture.
- ... Nature of base data not determined.

Part II. Recency of base data (subscript numeral following capital letter)
Numeral indicates time elapsed (in years) since establishment of base figure.

Part III. Method of time adjustment (lowercase letter)
- **a** Ajustment by continuous population register.
- **b** Adjustment based on calculated balance of births, deaths and migration.
- **c** Adjustment by assumed rate of population increase.
- **d** No adjustment; base figure held constant at least two consecutive years.
- **x** Adjustment derived from regional population estimates.
- ... Method of time adjustment not determined.

Part IV. Quality of adjustment for types *a* and *b* (numeral following letter *a* or *b*)
- **1** Population balance adequately accounted for.
- **2** Adequacy of accounting for population balance not determined but assumed to be adequate.
- **3** Population balance not adequately accounted for.

Quality of adjustment for type *c* (numeral following letter *c*)
- **1** Two or more censuses taken at decennial intervals or less.
- **2** Two or more censuses taken, but latest interval exceeds a decennium
- **3** One or no census taken.

[11] J.T. Marten, *Census of India, 1921,* vol. I, part I (Calcutta 1924), pp. 126-127.

[12] For detailed explanation of the content of each category of the code, see *Demographic Yearbook, 1964,* pp. 12-14.

Italic type: The "Code for current estimates of total population" given above describes in abbreviated form the method used in constructing the estimates of total population for a current year which, in this *Demographic Yearbook,* relates to 1974. The quality of these estimates can be ascertained roughly by the application of certain criteria based on their origin.

To begin with, reliable estimates can be defined as those having their origin in a census of population (coded **A**); those based on a sample survey represesenting the majority of the population (coded **B**); and, provided the total population is under 1 000 persons, those obtained by annual administrative counting of population (coded **C**).

A second criteria of reliability is the "method of time adjustment". Time adjustment by the population-register method (coded **a**), or by the balancing equation method (coded **b**), is considered acceptable, provided the components of the adjusting factors are adequately accounted for. "Adequate" accounting is defined for this purpose as combinations of (**a**) and (**b**) with 1 and 2. "Less good" time adjustment includes updating by assumed rates of population growth (coded **c**); no updating (coded **d**), and method unknown (coded. . .).

Application of the above criteria results in "reliable" and "less reliable" estimates and in the tables, the latter are distinguished from the former by being set in italics, rather than in roman type.

Evaluation of time series of population estimates

The code described above was designed primarily to evaluate the reliability of a particular estimate of total population for a current date. However, since there is usually a certain consistency in the manner in which countries or areas prepare their population estimates from year to year, the code has some relevance also to the estimates for other recent years. Therefore, it was decided to assume that the quality of the entire time series was the same as that of the latest official estimate[13].

Hence, the time trend of estimates is set in italics if the code for the estimate in the latest year column is "less reliable". No attempt has been made to split the series even though it is evident that the data now considered reliable are of varying degrees of reliability, and that, in earlier years, many must have been considerably less reliable than the current classification implies. Thus it will be evident that this method overstates the probable reliability of the time series in many cases. It may also understate the reliability of estimates for years immediately preceding or following a census enumeration.

Evaluation of estimated age distributions

Estimates of the age/sex distribution of population may be constructed by two major methods: (1) by applying the specific components of population change to each age/sex group of the population as enumerated at the census and (2) by distributing the total estimated for a post-censal year proportionately according to the age/sex structure at the time of the census. Estimates constructed by the latter method are not published in the *Demographic Yearbook.*

Among those published estimated age/sex distributions are categorized as "reliable" or "less reliable" according to the method of construction established for "total" population. Hence, the quality designation of the total figure, as determined by the code, is considered to apply also to the whole distribution by age and sex, and the data are set in italics or roman type, as appropriate, on this basis alone.

Although the accuracy of the age statements at the time of the census has been studied and the results of a number of censuses have been rated (see p. 9 of DYB 1973), no attempt has been made to project this evaluation to the post-censal estimates by age and sex.

[13] United Nations estimates are preferably constructed according to the same method as was used for the latest official figure. However, lack of the proper time-adjustment components often dictates the use of a less desirable method in which case the quality code for the time series is determined by the latest official estimate, irrespective of its time reference.

VITAL STATISTICS

The United Nations *Principles and Recommendations for a Vital Statistics System*[14] define the field of vital statistics as statistics of live birth, death, foetal death, marriage, divorce, annulment, judicial separation, adoption, legitimation and recognition. However, for purposes of the *Demographic Yearbook,* vital statistics are limited to the statistics of live birth, death, foetal death, marriage and divorce.

The factors which affect international comparability of vital statistics are much the same as those which must be considered in evaluating the variations in population statistics. Differences in geographic and ethnic coverage of the data; variation in the reliability of the statistics, as measured by completeness of registration and of reporting in household surveys; non-sampling and sampling errors and other sources of bias; diverse tabulation procedures; differences in statistical definitions of vital events—all these may influence comparability.

Standards for the improvement of vital statistics in respect of these and other factors have been set forth in *Principles and Recommendations for a Vital Statistics System*[14]. As a guide to their implementation the present edition of the *Handbook of Vital Statistics Methods*[15], which was prepared in connexion with the 1953 *Principles*[16], can be consulted. The Handbook discusses in

[14] *Principles and Recommendations for a Vital Statistics System* (United Nations publication, Sales No. E.73.XVII.9) para 38.

[15] *Handbook of Vital Statistics Methods* (United Nations publication, Sales No. 55.XVII.1). A forthcoming revision of the *Handbook* will discuss the new principles and recommendations in greater detail.

[16] *Principles for a Vital Statistics System: Recommendations for the Improvement and Standardization of Vital Statistics* (United Nations publication, Sales No. 53.XVII.8).

detail the sources of error in vital statistics which are outlined below, and reference should be made to it for further information. Reference should also be made to *Methodology of Demographic Sample Surveys*[17] for a discussion of the effects of sampling and response errors in the interview-type inquiry.

SOURCES OF VARIATION

Fragmentary coverage—geographic and ethnic

Despite the fact that the obtaining of statistics of live birth, death, foetal death, marriage and divorce has been given priority in the United Nations recommendations, the availability of such statistics varies widely[18]. This is due in part to lack of uniformity and universality in national legislation. In some countries or areas, registration is compulsory only for births and deaths. In others, there is no national provision for compulsory registration, but only municipal or state ordinances which do not cover the entire geographic area. Still other countries or areas have developed a registration area which comprises only a part of the country or area, the remainder being excluded for reasons of inaccessibility or because of economic and cultural considerations that make registration a practical impossibility.

Examinations of the tables will show that the availability of vital statistics from civil registers is particularly spotty in Africa. They are only slightly more available for much of Asia and parts of Latin America. In these continents, coverage is uneven and the statistics generally incomplete and unreliable. This fragmentary coverage is a serious limitation to international comparability. It should be noted, however, that estimated rates obtained by the sample survey method or from analysis of census returns are becoming increasingly available. Although such estimates cannot be considered an adequate substitute for reliable registration statistics, they do provide valuable interim information and they are included in the tables.

Reliability of vital statistics

In addition to the variations which arise because of lack of national provision for civil registration, there are also differences in the effectiveness with which national laws operate in the various countries or areas. The manner in which the law is implemented and the degree to which the public complies with the legislation determine the reliability of the vital statistics obtained from the civil registers.

Evaluation of vital statistics for a current year

Deficiencies in vital statistics are often fairly obvious. An examination of the computed or implied rates will almost always indicate the cases for which a presumption of incompleteness is probably justified. However, this technique applies only where the data are markedly deficient, where they are tabulated by date of occurrence and where the population base is correctly estimated. Tabulation by date of registration will often produce rates which appear correct simply because the numerator is artifically inflated by the inclusion of delayed registrations and, conversely, rates may be of credible magnitude because the population at risk has been underestimated.[19] Moreover, it should be remembered that knowledge of what is credible in regard to levels of fertility, mortality, and nuptiality is extremely scanty for many parts of the world, and borderline cases, which are the most difficult to appraise, are frequent.

Since an evaluation of quality, based solely on examination of the tabulated series, can be very misleading, the United Nations makes a special effort to obtain national estimates of the completeness and accuracy of vital statistics from civil registers, using the *Demographic Yearbook* annual "Questionnaire on Vital Statistics" for this purpose.

On the basis of information accumulated from the questionnaires, from direct correspondence and from relevant official publications, it has been possible to classify current national vital statistics from civil registers into three broad quality categories, as follows:

Quality code for current vital statistics

- **C** Data stated to be virtually complete, i.e., representing at least 90 per cent coverage of the events occurring each year.
- **U** Data stated to be unreliable, that is, less than 90 per cent coverage.
- **...** Data concerning which no specific information is available.

It should be noted that, in establishing the above categories, the varied character of the information available did not permit the application of uniform objective criteria. Furthermore, in many cases, the basis for a country's or area's own evaluation of the data was not available. Nevertheless, it was felt that national statistical offices are in the best position to judge the quality of their data and in these cases their evaluations have been accepted at face value. It was considered that even the very broad categories that could be established on the basis of the information at hand would provide useful indicators of the reliability of the vital statistics presented in this *Yearbook*.

The results of this classification (**C**, **U** or . . .) appear in the first column of the trend tables which show total frequencies and rates for live births, foetal deaths, infant deaths, marriages and divorces. Here also, in the form of foot-notes, will be found the exact values—when they exist—upon which the **U** code was based.

Despite the fact that the code is presented only in connexion with the trend tables, it is of course applicable to recent vital statistics for the country or area in question wherever they appear in the *Yearbook*. Thus, in using data from any vital-statistics table, reference should be made to the quality code on the time-trend tables before any comparisons or analyses are attempted. In the case of the life-table function in tables 33, 34 and 35 however adjustments have usually been made for deficiencies in the basic data.

Strictly speaking, the reliability code relates specifically to vital-statistics frequencies obtained from civil registers

[17] *Methodology of Demographic Sample Surveys*. (United Nations publication, Sales No. E.71.XVII.11), chap. VII and pp. 94-142.

[18] For an analysis of the regional availability of birth and death statistics, see *Population Bulletin of the United Nations, No. 6* (United Nations publication, Sales No. 62.XIII.2) and *Population Bulletin of the United Nations, No. 7* (United Nations publication, Sales No. 64.XIII.2).

[19] For discussion of this point, see page 19.

and only indirectly to rates which are computed by relating these frequencies to a population base. However, since the two components of the rate—the numerator and the denominator—are not unrelated, particularly where vital statistics have been utilized in the construction of the population estimates, rates based on unreliable vital statistics are coded "U" even though their magnitude may appear credible. A fuller evaluation of current rates may be made by considering also the evaluation of the quality of the population estimates.

Italic type: Data coded U and those for which reliability is unknown (. . .) are typeset in italics to distinguish them quickly from more reliable figures. However, in special topic tables 15 through 35, two asterisks (**) are used after the name of the country or area or the year to indicate data that are incomplete or of unknown reliability.

Estimated rates are set in roman type. These rates are usually *ad hoc* estimates which have been derived either from the results of a sample survey or by demographic analysis. They have been included in the tables because they are assumed to represent a better estimate of the true level of the rate in question than can be provided by the existent civil registration system. By implication, therefore, they are also assumed to be "reliable" by comparison with patently unreliable registered rates.

Evaluation of vital-statistics time series

Evaluation of the quality of a time series of vital statistics is more difficult than evaluation of data for a single year. Since a time series of vital statistics is usually generated only by a system of continuous civil registration, it was decided to assume that the quality of the entire series was that implied by the code for the latest-year's data obtained from civil registers. Hence, if the code for the latest registered data was unreliable (U) or unknown (. . .) the frequencies and rates for the whole registered time series were set in italics. Conversely, if the latest registered data were alleged to be complete (C) the series of registered data was set in roman type. It may be noted that in special topic tables 15 through 35, two asterisks (**) are used after the name of the country or area or after the year to indicate data that are incomplete or of unknown reliability.

Estimated rates which may be interspersed in the series continue to be set in roman type.

It is recognized that this method is not entirely valid, because it is known that, in earlier years, many of the series were considerably less reliable than the current code implies. But, since it was felt that an obvious means was desirable for identifying data whose reliability was questionable and, since the effect is to overstate rather than understate reliability, the current code—despite its deficiencies—has been used as a basis of classification and identification.

Tabulation procedures

Place-of-occurrence statistics

The recommendations for a vital statistics system[20] state that tabulation of data for a national territory should relate in general only to data on events occurring within the national boundaries. Accordingly the vital statistics shown in this *Yearbook* relate to the *de facto* or present-in-area population. Thus, unless otherwise noted, vital statistics cover all events which occurred within the present boundaries of the geographic areas shown and among all segments of population therein. Foot-notes are used to show deviations from this present-in-area concept.

The need for distinguishing between statistics for areas or populations where registration is moderately complete and those in which it is incomplete, has been recognized in the *Recommendations*.[21] In line with these principles, statistics for some countries or areas regularly exclude data for a segment of the population in which registration, though compulsory, is not even moderately complete, and for which, therefore, vital statistics are very unreliable. Countries or areas which follow this procedure include Surinam where date for the tribal population are excluded and Peru and Venezuela whose Indian jungle population is excluded. Australia, which used to exclude data for aborigines, includes them beginning 1967. These cases, as well as others where the geographic area or population covered by the statistics is less than the entire country or area, are noted in the tables.

By date of occurrence versus date of registration

In so far as possible, the vital statistics presented in the *Demographic Yearbook* refer to events which occurred during the specified year, rather than to those which were registered during that period. This is in accord with the United Nations *Recommendations*[22].

Symbol: Reference to the tables will reveal, however, that despite this international principle, a considerable number of countries or areas tabulate their vital statistics not by date of occurrence but by date of registration; moreover, very few of these analysed the results with a view to proving their adequacy as measures of natality or mortality. Because such statistics can be very misleading, the countries or areas known to tabulate vital statistics by date of registration are identified in the tables by a dagger symbol (†) or in the case of the special topic tables by foot-notes. The absence of the dagger or foot-note, therefore, implies date-of-occurrence tabulation, but, since complete information is not available, this assumption may overstate the "occurrence group" to some extent.

Because this factor is so inextricably related to delay in registration, it must always be considered in conjunction with the quality code with which it appears on the trend tables. Obviously if registration of births is complete and timely (code C) the ill effects of tabulating by date of registration are, for all practical purposes, nullified. Similarly, the qualification is less significant in connexion with death statistics because, in most countries or areas, the sanitary code requires that a death must be registered before a burial permit can by issued and this regulation tends to make registration prompt. The symbol is even less meaningful in relation to marriage and divorce statistics because, in most countries or areas, these events are registered immediately or within a reasonably short period after their occurrence in order to ensure their legality. It is least meaningful for foetal-death statistics because of the

[20] *Principles and Recommendations for a Vital Statistics System*, para. 249.

[21] *Ibid.*, para 233.

[22] *Ibid.*, paras. 238, 239 and 254.

need for a burial permit and because registration of foetal deaths is usually made at once, or not at all.

Effect on comparability: As noted above, if registration is prompt, the difference between statistics tabulated by the date of occurrence and those tabulated by date of registration might be negligible. In such cases, the only factor affecting comparability is the lengh of the statutory time period allowed for current registration.

On the other hand, if registration is not prompt, and delayed registration exists to any substantial degree, vital statistics by date of registration will not produce internationnally comparable data. Under the best circumstances, statistics of registrations will include primarily events which occurred in the immediately preceding year; in countries or areas with less well-developed systems, they will include some which occurred many years in the past. Examination of available evidence reveals that delays of up to 20-25 years are not uncommon for birth registration, though the majority are recorded between 2 and 4 years after birth. As registration completeness and promptness improve, date-of-registration tabulations will approximate more closely the true frequencies for the year in question but, until this time is reached, the statistics by date of registration will not be internationnally comparable either among themselves or with statistics by date of occurrence.

It should also be mentioned that lack of international comparability is not the only limitation introduced by date-of-registration tabulation. Even within the same country or area, comparability over time may be lost by the practice of counting registrations rather than occurrences. If the number of events registered from year to year fluctuates to any extent, due to *ad hoc* incentives to stimulate registration, or to the sudden need for proof of (unregistered) birth or death to meet certain requirements, vital statistics tabulated by date of registration cannot provide a measure of the level of natality or mortality; nor can they provide an indication of the trend. All they can give is an indication of the fluctuations in the need for a birth, death or marriage certificate and the work load of the registrars. If, on the other hand, registration completeness remains unchanged from year to year, an apparent rise in the birth and death rates based on the date-of-registration figures may be mistaken for evidence of changes in the incidence of births and deaths. In both cases, statistics of birth and death registrations are of very limited use for either national or international studies.

Statistical definition of events

Another source of variation—though a much less important one—lies in the statistical definition of each vital event. It is important, for example, to establish a uniform and definite criterion which can be used to differentiate statistically between foetal deaths and live births. In some countries or areas, a child must survive for at least 24 hours before it can be inscribed in the live-birth register. Infants who die before the expiration of the 24-hour period are classified as "stillbirths" and, failing special tabulation procedures, they would not be counted as either a live birth or as a death. Similarly, in several other countries or areas, those infants who are born alive but who die before registration of their birth, are considered as "stillbirths"; these likewise might be excluded from both the live-birth and the death statistics, if special statistical provisions were not made.

Unless special tabulation procedures are adopted in such cases, the live-birth and death statistics will both be deficient by the number of these infants, while the incidence of late foetal deaths will be increased by the same amount. As a result, late foetal deaths ratios would be exaggerated and general birth and death rates understated to some degree. The infant mortality rate would also be understated because, although both components (infant deaths and live births) are deficient by the same absolute amount, the deficiency is proportionately greater in relation to the infant deaths and the rate tends to be lower than it should be[23] Luckily, most countries or areas make provision for correcting this deficiency (at least in the total frequencies) at the tabulation stage; where correction has not been made, foot-notes to the tables indicate the omission.

Lack of comparability due to different statistical definitions is found also in statistics of marriage and divorce. Even though marriage and divorce are legal events and thus presumably less subject to variation in definition, conceptual differences between countries or areas do affect the statistics. Further details will be given in the description of each table.

LIVE-BIRTH STATISTICS

Because this issue of the *Yearbook* is devoted chiefly to mortality statistics, the subject coverage for birth statistics has been restricted to basic data for which continuity is required each year, namely, to time trends of numbers and rates, births by age of mother and sex of child, and urban/rural differentials in these events. These data will be found in tables 9 and 10 respectively.

For purposes of these tables, live birth has been defined in accordance with the international definition set forth in the *Principles and Recommendations for a Vital Statistics System.*[24] The variations in the data are discussed briefly in connexion with tables 9 and 10. For limitations of live birth statistics in general, see the 1969 issue of the *Demographic Yearbook* where natality statistics were featured.

FOETAL-DEATH STATISTICS

Foetal-death statistics may be considered as components of the mortality picture as well as elements in fertility and pregnancy wastage. Because of the virtual impossibility of assessing the completeness of statistics of early foetal deaths, only data on late foetal deaths and legally induced abortions are shown. A time trend of numbers of legally induced abortions is shown in table 15. Data on legally induced abortions by age and number of previous live births of woman for the latest available year are shown in table 16. A time trend of numbers and ratios of late foetal deaths is given in table 17. A time trend of foetal deaths and foetal death ratios, by gestational age, is given in table 18.

The basic definition of foetal death, upon which statistics are compiled, is the international standard[25], as follows: *Foetal death is death prior to the complete expulsion or extraction from its mother of a product of con-*

[23] For more precise evaluation of these effects, see *Handbook of Vital Statistics Methods*, chap. IV.

[24] *Principles and Recommendations for a Vital Statistics System*, para 46.

[25] *Ibid.*

ception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the foetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

"*Late foetal deaths*" are those of "*twenty-eight completed weeks of gestation or over*". These are synonymous with the events reported under the pre-1950 term "still-birth".

Limitations of the Data

Comparability of foetal-death statistics is markedly affected by differences in definitions, by variations in reliability and by tabulation procedures. A fuller discussion of these problems can be found in the *Handbook of Vital Statistics Methods*,[26] and in the *Demographic Yearbook 1969*, which featured natality statistics.

Completeness of data

Foetal-death statistics more than any other are subject to severe limitations as regards completeness of registration. It would appear that even with a highly efficient registration system, a considerably greater proportion of foetal deaths than of live births or deaths escapes registration. However, it is difficult to measure or estimate just what fraction of the total number go unregistered; consequently, not as much precise information on completeness of coverage will be found on these tables as is given for live births and deaths.

Definitions

The comparability of foetal-death statistics is affected strongly by differences in definitions. Principal of these are the differences in what is to be registered as a "still-birth" or "late foetal death" when registration of all products of conception is not mandatory. The criteria of viability are usually based on the duration of pregnancy—measured in days, weeks or months—and they vary widely, ranging from 3 to 7 months' gestational age. The interval most frequently specified as the minimum is 28 weeks. Some countries have an additional requirement that the foetus be a minimum length, the minimum specified ranging from 30 to 35 centimetres. In a number of cases, the only specification is simply that the foetus must be "viable" or that it must be "recognizable as a human being."

As has already been pointed out above, some countries register a live-born infant who dies shortly after birth (and before the birth has been registered) as a "stillbirth". Such a death may occur as many as 3 days after birth; hence, stillbirth (late foetal-death) statistics may be inflated to a rather high degree. Theoretically, corrections can be made in the figures so long as these pseudo-stillbirths are tabulated, separately from the true stillbirths. This is done in some countries, but such a correction can be applied only to the gross totals. The countries where these procedures apply are pointed out in the foot-notes to table 17.

DEATH STATISTICS

This twenty-sixth issue of the *Demographic Yearbook* features mortality statistics. Five previous issues (1951, 1957, 1961, 1966 and 1967) have featured mortality statistics, each issue prior to 1966 carrying the full range of available data. Subsequently because of the extensive amount of data available, tables on mortality were divided for publication between the 1966 and 1967 issues of the *Yearbook*. In this issue, because of computerization, it has been possible again to include the full range of available data on mortality in a single issue.

Twenty-one tables in this issue (numbers 15 to 35 inclusive) are devoted to mortality statistics. In addition to carrying forward the time coverage of most tables shown in the 1966 and 1967 issues, this issue contains two new tables which show legally induced abortions and legally induced abortions by age and number of previous live-births of woman. The time coverage of each table in this and previous issues may be ascertained from the Subject-matter Index beginning on p. 1086.

For purposes of these tables, death has been defined in accordance with the *Principles and Recommendations for a Vital Statistics System*[27] as follows:

Death is the permanent disappearance of all evidence of life at any time after live birth has taken place (post-natal cessation of vital functions without capability of resuscitation).

By definition, the figures exclude foetal deaths except in a few cases noted in the tables and, in these, the presumption seemed warranted that the number included is too small to invalidate the data.

Normally all deaths of live-born issue are included but, because of the legal definition of live birth in some countries, deaths of infants who died before registration of birth or alternatively before 24 hours of age are excluded from the totals for certains countries. This exclusion is potentially an important one, inasmuch as deaths up to three days after birth (a period at which mortality tends to be high) may thus escape registration and counting. The countries affected are noted in the tables.

The data presented relate to deaths which occurred in the population present within the current boundaries of the given country. Therefore, unless otherwise specified, they may be presumed to include deaths among nomadic tribes and aborigines and those among national or alien armed forces, displaced persons, war refugees, and aliens residing in the country at the time when death occurred. They normally exclude deaths among nationals (armed forces or civilians) stationed or residing outside the country. It should not, however, be assumed that absence of qualifying notes in respect of inclusions or exclusions necessarily indicates conformity to the standard, though in most cases, the assumption is probably justified.

Because under-registration of deaths is more difficult to detect than under-registration of births, the quality-of-data code columns in the tables presenting foetal, general mortality and infant mortality contain more "unknowns" (. . .) than does that in the table of birth statistics. It is generally believed that deaths are more completely registered than births, but this may not be the case everywhere. In fact, evidence is beginning to accumulate which suggests that, in some areas and under

[26] *Handbook of Vital Statistics Methods*, Chap. IV.

[27] *Principles and Recommendations for a Vital Statistics System*, para 46.

certain conditions, births may be more fully registered than deaths.[28]

LIFE TABLES

Life tables are based on observed mortality conditions for a selected time period, but they permit a more detailed analysis of the implications and prospects inherent in those conditions than do conventional central death rates.

Though first developed for actuarial purposes, the life table has many applications in the demographic field. Among these are: (1) preparation of population projections by age and sex, (2) analysis of effects of mortality on the age and sex composition of a population, (3) comparisons of summarizing measures of mortality, such as the life-table death rate (the reciprocal of the expectation of life at birth), expectation of life at various ages, etc., (4) computation of net reproduction rates, and (5) appraisal of the accuracy of census enumerations and vital-registration data. In addition, life-table techniques have been applied to the analysis of other types of demographic data, for example, in the computation of probabilities of marriage specific for age and sex, on the basis of census data classified by marital status.

Three principal functions are given in this *Demographic Yearbook*: (1) the mean expectation of life or the average future lifetime for persons at exact ages specified ($\mathring{e}_x$); (2) the probability of dying within one year or within a specified age interval for persons of exact ages specified (q_x); (3) the survivors at the beginning of each age interval out of a generation of 100 000 (l_x).

Details of procedure in life-table construction vary somewhat, depending in large measure upon the availability and form of the basic data. The basic data ordinarily consist of deaths in a given period classified by single years of age and sex and the mean population of that age and sex during that period. The values of the life-table mortality rate (q_x), which is the basic function of the life table, are generally so derived as to correspond to the death rates of persons of that age and sex in a particular period of time.

The most usual procedure is to utilize statistics of deaths in a three-year or five-year period centred at the census date so that the census results can be taken as the mean population. Sometimes the period covered is that between two censuses, and the population figures utilized are averages of the results of the two censuses. It is common to make adjustments to correct for misstatements of age in the census and death statistics and to obtain successive values of q_x which vary smoothly from one age to the next; a correction for the effect of migration is occasionally made. In a few rare cases, approximate life tables have been computed without the use of data on deaths, by deriving q_x values from the comparison of the population in each age group as enumerated at one census with the survivors at the next census.

The number of persons surviving to successive ages of life is obtained by diminishing the initial arbitrary cohort (usually 100 000 persons) by the application of the mortality rate specific for that age. These survivors are represented by the symbol "l_x" which stands for "persons living at age x".

Computation of the number of survivors (l_x) produces also the number of persons dying in each age interval (d_x) and additional manipulation produces the number of years lived by the cohort between age x and $x + 1$ (L_x) as well as the cumulative number of years lived by the cohort from age x until all have died (T_x).

The average future lifetime of persons at each age specified ($\mathring{e}_x$) is then computed by relating the total number of years lived (T_x) to the survivors at each age (l_x).

The accuracy of life tables depends mainly upon the accuracy and completeness of the registration of deaths and of the enumeration of the population at the census. Deficiencies in death registration are likely to be greater than corresponding defects in census enumeration. Where this happens, death rates are understated and the l_x (survivors) and $\mathring{e}_x$ values are exaggerated. The mortality rates computed from population and death statistics at the very young ages are particularly likely to be understated, and such an error affects the l_x values throughout the table. As indicated earlier, infant mortality rates obtained by relating the number of infant deaths to the number of births in countries where registration is deficient may be either too low or too high, and the error in either direction may have an important effect on the l_x values for every age. The expectation of life at birth ($\mathring{e}_o$) will also be too high or too low.

The accuracy and the international comparability of life-table values are particularly suspect at the highest ages. Those values depend on imperfect data and frequently on somewhat arbitrary procedures. Certain remarkable features—for example, the fact that the expectation of life at ages over sixty is often distinctly higher in countries where mortality in general is heavy than in countries with low death rates—may, thus, merely reflect imperfections of the tables.

Differences in the methods used for constructing life tables (adjustment of data, graduation, etc.) may affect the reliability of the results and impair their international comparability. The effect of such differences is, however, probably much smaller than that of deficiencies in censuses and in death registration.

MARRIAGE STATISTICS

The trend of marriages and their distribution by age of bride and groom constitute the coverage in this issue. This is the minimun coverage required for continuity.

In accordance with the recommendation made in the *Principles and Recommendations for a Vital Statistics System*,[29] the statistics refer, unless otherwise noted, to formal unions which are established by civil, religious or other means as recognized by the laws of each country. The definition of marriage is set forth in the *Principles and Recommendations for a Vital Statistics System*[29]. The effects of variations in definition, as well as other sources of non-comparability, are discussed briefly in connexion with Tables 11 and 12; for a more detailed treatment of these factors, see p. 13 of the 1968

[28] *Population Bulletin* of the United Nations, No. 6—1962, *op. cit.*, pp. 12-13.

[29] *Principles and Recommendations, for a Vital Statistics System*, para 46.

Demographic Yearbook, where this subject was featured.

DIVORCE STATISTICS

Time series of statistics on dissolution of marriage by divorce have been set forth in Table 13. Unless otherwise specified, the definition used in compiling these statistics was that recommended in the *Principles and Recommendations for a Vital Statistics System,*[30] that is, statistics refer to final legal dissolutions of marriage which confer on the parties the right to remarry.

The effects of variations in definition, as well as other sources of non-comparability, are discussed briefly in connexion with Table 13; for a more detailed treatment of these factors, see pp. 13-14 of the 1968 *Demographic Yearbook,* where this subject was featured.

[30] *Ibid.*

INTERNATIONAL MIGRATION STATISTICS

Data on international migration were last published in the *Demographic Yearbook, 1972.* In accordance with the policy of publishing data on this subject biennially, this issue of the *Demographic Yearbook* again presents limited statistics on international migration. Table 14 shows total arrivals and departures of all types of travellers in a parallel arrangement which facilitates the calculation of net migration for each country. With a view to simplification of presentation and elimination of non-comparable data, the major categories of travellers shown in issues of the *Demographic Yearbook* prior to 1970 are not included in table 14. However, data in table 14 are assumed to be defined in accordance with the United Nations "Recommendations for the improvement of international migration statistics"[31] unless otherwise noted.

Statistics of immigrants and emigrants by country of last residence or intended residence are not included. Although they are of manifest interest, they have not been published since the 1959 issue of the *Demographic Yearbook,* principally because of the lack of internal consistency in the available data. Also, because of space limitations, it has not been possible to include in this issue tables showing the numbers of long-term immigrants and emigrants by age and sex.

The United Nations "Recommendations"[32] emphasize also the importance of data on long-term migrants by usual occupation of migrants of working age. Data on the economic characteristics of long-term migrants, 1918-1954, are available for selected countries in a source-book published in 1958[33] but it has not been possible to include such tables in the *Demographic Yearbook.*

SOURCES OF VARIATION

Sources of data

The statistics presented in table 14 have been obtained generally by means of a questionnaire sent to Governments by the Statistical Office of the United Nations. Supplementary information was extracted from official publications.

The data are drawn from one or more of a variety of national sources, among which may be mentioned; *port statistics* (based on ship or aircraft manifests or other administrative documents made out by the navigation companies); *statistics of frontier control* (provided by the police or immigration authorities supervising the crossings of international frontiers); *passport statistics* (being the number of passports issued to certain categories of prospective travellers; naturally these data are limited to departures of nationals); *statistics of local population registers* (based on entries recording declarations of change of residence, which are required by the laws of a few countries); *statistics of work-permits* for aliens, special *transport contracts* for emigrants etc.

Variations in definitions correspond, in a certain measure, to the diversity in the sources of statistics on international migration and travel. This diversity complicates the interpretation of different series available for the same country and serves as an obstacle to international comparisons.

An analysis of sources shows that, outside of Europe, migration and travel data are obtained in a large majority of the countries, from *frontier control, port statistics,* and *population registers*. In Europe, a greater diversity of methods prevails, reflecting the particular difficulty of collecting migration data in that continent as a result of the multiplicity of frontiers crossed by large numbers of travellers each year. Only a detailed study of each case may reveal the reliability of the figures, and show how comparable they may be for different countries and periods of time.

Definitions and nomenclature

In order to make it possible to collect statistics on international migration and travel, and to ensure that they possess a reasonable degree of consistency and international comparability, it is necessary to establish a statistical nomenclature which defines precisely what is to be counted, is adapted to the processes of data collection and tabulation, and also meets the needs of users of statistical information in this field.

The statistics shown in table 14 are based on a nomenclature which is substantially the same as that given in the United Nations "Recommendations"[34] except that the following clarifications have been introduced in the terminology so as to avoid some common difficulties in interpretation:

Long-term is used instead of "permanent" to designate movements of more than one year's duration.

[31] *International Migration Statistics. Organization and Operation; Recommended Standards; Sampling* (United Nations publication, Sales No. 53.XVII.10) chap. II.

[32] *Ibid.*

[33] *Economic Characteristics of International Migrants: Statistics for Selected Countries, 1918-1954* (United Nations publication, Sales No. 58.XIII.3).

[34] *International Migration Statistics,* p. 17.

Short-term is used instead of "temporary" in the case of movements of one year or less.

The 1953 "Recommendations", defined *frontier traffic* as the movements of persons residing in the frontier area, moving frequently across the border, and often authorized to use simplified travel documents (frontier cards). Only a small number of countries are able to identify such frontier traffic and show it separately from all other departures and arrivals, as suggested in the "Recommendations". In those few cases, frontier traffic is *not* included in totals.

The categories of migration on which table 14 is based are as follows:

Arrivals from another country including the following:

a. *Long-term immigrants*, i.e., non residents (nationals and aliens) intending to remain for a period exceeding one year.
b. *Short-term immigrants*, i.e., non-residents intending to exercise for a period of one year or less an occupation remunerated from within the country.
c. *Visitors*, i.e., non-residents intending to remain for a period of one year or less without exercising an occupation remunerated from within the country (including their dependants). The purpose of the visit may include holiday, education, business, etc.
d. *Transit visitors.*
e. *Cruise-ship visitors.*
f. *Residents* (nationals and aliens) returning after a short-term sojourn abroad.
g. *Special categories*, i.e., any other groups to which special interest attaches in a given country.

Departures to another country including the following:

a. *Long-term emigrants*, i.e., residents (nationals and aliens) intending to remain abroad for a period exceeding one year.
b. *Short-term immigrants departing.*
c. *Visitors* departing on completion of visit. The purpose of the visit may include holiday, education, business, etc.
d. *Transit visitors.*
e. *Cruise-ship visitors.*
f. *Residents* (nationals and aliens intending to go abroad for a short absence (one year or less).
g. *Special categories*, i.e., any other groups to which special interest attaches in a given country.

The value of the data and their international comparability are restricted by the fact that clandestine movements which are known to occur across certain frontiers escape statistical recording, except perhaps in a very limited number of cases where provisions are made for including the persons concerned in the statistics when their status is regularized.

DESCRIPTION OF TABLES

Table 1

Table 1 presents world and regional estimates of the order of magnitude of population size, rates of population increase, crude birth and death rates, geographic area and population density.

Estimates of world population by macro regions are presented for each fifth year, 1950 to 1970[35] and for 1973 and 1974. Average annual percentage rates of population growth have been computed on these estimates for both the period 1965-1974 and 1970-1974, while crude birth and death rates have been estimated for the period 1965-1974. Estimates of surface area in square kilometres and population density relate to 1974.

With the exception of surface area, all data are set in italic type to indicate their conjectural quality.

The scheme of regionalization, described on p. 26, is the one used in *World Population Prospects, 1970-2000, as Assessed in 1973*.[36] Although some continental totals are given, and all can be derived, the basic scheme refers to eight macro regions that are so drawn as to obtain greater homogeneity in sizes of population, types of demographic circumstances and accuracy of demographic statistics. Six of the eight macro regions are further subdivided into 22 regions.

These are arranged within macro regions according to rank order of population size; these together with Northern America and the USSR, which are not subdivided, make a total of 24 regions.

Some changes have been made in the manner of listing regions and countries or areas since the 1973 issue of the *Demographic Yearbook*. They are listed below.

a. In Latin America, Paraguay is now included in "Tropical South America" instead of "Temperate South America" as formerly.
b. East Asia which had previously three regions designated as "Mainland region", "Japan" and "Other East Asia" now consists of "China", "Japan" and "Other East Asia". "Other East Asia" includes Hong Kong, Democratic People's Republic of Korea, Republic of Korea, Macau and Mongolia.
c. In South Asia the three regions which were previously called "South East Asia", "Middle South Asia" and "South West Asia" are now designated respectively, without change in coverage of countries, "Eastern South Asia", "Middle South Asia" and "Western South Asia."
d. The former "Polynesia and Micronesia" region is now called "Micronesia-Polynesia".

Because countries like the Union of Soviet Socialist Republics, Turkey and the United States overlap the boundaries of traditional continents, the macro regions, with the exception of those in Africa, could not be drawn up so as to coincide exactly with continents. The distinction of East Asia and South Asia as separate macro regions was dictated largely by the size of their population. The macro regions of Northern America and Latin America were distinguished, rather than the conventional continents of

[35] The new base year for computing economic indexes is 1970, replacing 1963 wherever that year had previously been used as a base.
[36] *World Population Prospects, 1970-2000, as Assessed in 1973* (United Nations document ESA/P.WP.53).

North America and South America, because population trends in the middle American mainland and the Caribbean region more closely resemble those of South America than those of America north of Mexico. Hence, "Latin America" as defined here has somewhat wider limits than the twenty American republics of Spanish, Portuguese and French speech which constitute Latin America in a stricter sense. Data for the traditional continents of North and South America can be obtained by adding Middle America (mainland) and Caribbean region to Northern America and deducting them from Latin America.

Coverage: The 24 regions designed to meet the needs of demographic statistics are constituted of the countries or areas set forth and defined in table 3. They have been delineated in terms of present *de facto* boundaries and since all retrospective figures have been adjusted for boundary changes, they refer to constant surface areas. The composition of each region and macro region is set forth on pages 26 and 27.

Computation:

Population estimates: Estimates of the order of magnitude of population of the world, macro regions and regions are based on newly revised estimates presented in *World Population Prospects; 1970-2000, as assessed in 1973*,[36] prepared by the United Nations Secretariat. As explained in this report, the estimates for the years 1950, 1955, 1960, 1965 and 1970 take account of the latest official estimates of the various countries or areas, but the estimates for later years are projections based on the data shown for 1970. The estimates have been prepared according to three sets of assumptions resulting in high, medium and low variants. It is the medium variant which is used in table 1.

Rate of population increase: The average annual percentage rates of population increase have been calculated from data in the table, using the following formula:

Formula for computing rate of population change

$$r = \left(\sqrt[t]{\frac{P_1}{P_0}} - 1 \right) \times 100$$

where P_0 *is the population in* **1965** *or in* **1970**,
P_1 *is the population in* **1974**,
t *is* **9** (*years between* **1965** *and* **1974**)
or
4 (*years between* **1970** *and* **1974**)
r *is the annual percentage rate of change.*

Although estimates of the order of magnitude of population appear in table 1 in millions, figures in thousands were used for the computation, and rates were computed to two decimals and rounded to one for publication.

Birth and death rates: Estimates of the order of magnitude of average annual crude birth and death rates for Northern America, Europe and Australia/New Zealand are weighted averages of recorded rates. Average rates for

UNION OF SOVIET SOCIALIST REPUBLICS

Japan and the Union of Soviet Socialist Republics are obtained by summing the data for each year in the period and computing rates on the totals. Estimates for the other regions shown in the table have been derived from a study of the range of national rates in each region, utilizing for this purpose recorded rates and such estimates of natality and mortality as may have been obtained from current and lifetime fertility reported at the time of sample surveys or censuses, or those derived by the "reverse-survival" method applied to survey or census results, by analysis of consecutive census results or by other analytical means.

The technique employed involves obtaining and approximation of the average number of births and deaths in each country or area of the region by applying the latest reliable birth and death rate for each country or area to the average population for the first and last year of the period; these birth, death and population data are then summed to obtain regional totals and birth and death rates for the region are obtained by dividing the total births and deaths by the total population.

Rates for macro regions are weighted averages of regional rates, and those for the world are, in turn, weighted averages of macro region rates.

Wide discrepancies between the natural increase rate obtained as described above and the rate of increase of population, calculated as described on p. 26 were assumed to be due to migratory movements; these cases are noted in the table. One-digit or two-digit discrepancies are assumed to result from rounding.

Surface area: The regional and world geographic area totals were obtained by summing the figures for individual countries or areas shown in table 3.

Density: Density is the number of persons in the 1974 total population per square kilometre of total surface area.

Limitations: Being derived in part from data in table 3, the estimated orders of magnitude of population and surface area are subject to all the basic limitations set forth in connexion with that table. Likewise, the population-increase rates and density indexes are affected by the limitations of the original figures. However, it may be noted that, in compiling data for regional and macro region totals, errors in the components may tend to compensate each other and the resulting aggregates may be somewhat more reliable than the quality of the individual components would imply.

Because of their estimated character, many of the birth and death rates shown should also be considered only as orders of magnitude, and not as measures of the true level of natality or mortality. Moreover, rates for 1965-74 cannot be considered comparable with those derived for earlier periods, nor should the sets be considered a time series. Each group of rates is based on the data available at the time of estimation, and much new information has been taken into account in constructing the estimates for 1965-74.

In interpreting the population densities, allowance should be made for the fact that most of the regions include large segments of land that are uninhabitable or barely habitable, and density values calculated as described make no allowance for this, nor for differences in patterns of land settlement.

Table 2

Table 2, newly introduced in this issue of the *Yearbook*, presents population estimated for 1970 and its percentage

distribution by age and sex for the world, macro regions and regions. This marks the first time that a sex or age distribution has been shown in the *Demographic Yearbook* for world population and its major components.

The data are presented according to the scheme of regionalization employed in table 1. The basis for identification of the regions shown and sources of the estimates included are described in the Technical Notes to table 1. All figures are estimates of the order of magnitude and are subject to a substantial margin of error; all data in the table are therefore set in italics.

Table 3

Table 3 presents, for each country or area of the world, the latest population estimate, population growth rate and surface area. Specifically, it shows the total male and female population according to the latest census of population; mid 1970[37] and 1974 estimates of total population; a code representing the method of constructing the 1974 estimate; the average annual percentage rate of population increase (or decrease) between 1970 and 1974 and the geographic area and population density as of 1974.

Census data: In so far as possible the figures presented in the census columns of table 3 are the results of the latest nation-wide census of population[38]. If a census has never been taken, however, they are an estimate of the population, based on the results of a recent sample survey which is substantially national in character. Results of surveys covering less than 50 per cent of the total territory or population are not included.

Estimates: Except as described in the next paragraph, estimates are official figures which are consistent with the results of national censuses or sample surveys taken in the period. This means that if inexplicable discontinuities appeared to exist, the estimates have been officially revised to accord with the results of a census or survey of population, and they thus form part of a consistent time series. They refer to the mid-year, i.e., to the population at 1 July of the relevant year or to the mean of the two proximate end-year estimates. No distinction is made between these two types of mid-year estimates, on the assumption that the difference is negligible.

When an acceptable official mid-year estimate of population as defined above was not available, a United Nations mid-year estimate, identified by the superscript "x", has been used. These United Nations estimates are provited by the Population Division of the United Nations and take into account available information on the reliability of census and survey results, natural increase, the possibility of migratory movement substantial enough to affect the pre-censal and post-censal estimates, and so forth.

The policy of utilizing United Nations estimates is designed to produce comparable mid-year estimates of population for 1970 and 1974 which are not only in accord with census and survey results shown adjacent but also with estimates for prior years shown in table 5. Unrevised official estimates as well as results of censuses or surveys and estimates for dates other than the mid-year have been eliminated in favour of the United Nations consistent mid-year estimates. This also makes possible the computation of rates of population change between 1970 and 1974 for almost every country or area in the world, whereas without them rates for many countries or areas could not be calculated because of the apparent lack of comparability between the two official estimates concerned.

Code: The type-of-estimate code, the construction of which was described in detail on p. 17, is included in this table. Together with information on underenumeration, the code furnishes the basis for a fairly precise evaluation of the 1974 estimates of population—wherever they appear—and it may also be assumed to apply less precisely to the estimates for 1970. On the basis of this assumption and other available information, estimates for both years have been classified as reliable or of questionable reliability and they have been set in roman or italic type as described below.

The code has been omitted where the estimate for a country or area was a composite, resulting from summation of estimates for component parts which themselves were constructed by varying methods. Where the code is considered "not applicable" the fact is indicated by two dots (. .).

Although codes are shown for all 1974 estimates other than the composites, it should be emphasized that, as an assessment of the presumed reliability of some of the small populations, the codes are quite inadequate. This is so because some small populations are estimated by methods not easily classifiable by the present scheme, and others are disproportionately affected by the frequent arrival and departure of migrants, visitors, etc., with consequent relatively large variations between *de facto* and *de jure* population.

Type fonts: In order clearly to distinguish the quality of figures presented, two different styles of type are employed for 1970 and 1974 estimates of population and for the average annual rates of increase, *viz.:* estimates considered to be reliable and rates based on them are set in the usual roman type; estimates and rates considered to be less reliable are set in italics.

Surface area: The surface area figures, given in square kilometres, relate to the total surface area of the specified geographic units, including inland water as well as such uninhabited or uninhabitable stretches of lands as may lie within the boundaries. Wholly uninhabited areas, such as the polar regions and a few small islands, are usually excluded from the statistics.

All surface area estimates are official but those reported in square miles have been converted to square kilometres, using the factor 2.589988.

Coverage: Table 3 includes data for over 240 separate countries or areas. The stub of this table is, therefore, the most comprehensive in the *Demographic Yearbook.*

Computation:

Rate of increase is the average annual per cent rate of change in population size between 1970 and 1974 computed from data in the table, using the following formula:

[37] The new base year for computing economic indexes is 1970 replacing 1963 wherever that year had previously been used as a base.

[38] For definition of a census, see *Principles and Recommendations for the 1970 Population Censuses,* paras. 7 and 8.

$$r = \left(\sqrt[t]{\frac{P_1}{P_0}} - 1 \right) \times 100$$

where P_0 *is the population in 1970,*
P_1 *is the population in 1974,*
t *is 4 (years between 1970 and 1974)*
r *is the annual per cent rate of change.*

Although population estimates in table 3 appear only in thousands, figures in units were used for the computation whenever possible, and rates were computed to two decimals and rounded to one for publication.

Rates were not computed where the 1970 estimate in thousands appeared to be identical with the 1974 estimate, even though the figures in units probably differed slightly. In these cases, a symbol of two dots (. .) was used to signify that a rate was not applicable under the circumstances.

Density is the number of persons in the 1974 total population per square kilometre of total surface area. Where two surface area figures are given—for example, one for the surface area within administrative boundaries and another for habitable land—the habitable surface area has been taken as the base for the density computation.

Limitations: The population data given in table 3 are subject to the limitations of population statistics in general, namely, variations in definitions and tabulation methods, deficiencies in completeness of the basic count and differences in the method of constructing estimates—all of which were discussed on pp. 15-18. To assist in assessing comparability, the degree of underenumeration in the population census, or a description of the population covered by a sample survey, has been given when known.

The reliability of the estimates may be ascertained by reference to the type-of-estimate code and to the typeface in which the figures are set. Moreover, the policy of replacing out-of-line estimates and scattered census results, by an internally consistent series of mid-year estimates constructed by the United Nations should increase comparability.

Percentage rates of population growth are subject to all the qualifications of the basic population figures mentioned above. In some cases, they admittedly reflect simply the rate calculated or assumed in constructing the estimates themselves when adequate measures of natural and migratory increase were not available.[39] For small populations, an error up to ±0.5 may be introduced by chance alone. Despite their shortcomings, these rates do provide a useful index for studying population change and, used with proper precautions, they can be useful also in evaluating the accuracy of vital and migration statistics.

Comparability of surface area and density figures is limited by the factors set forth above. It should be emphasized that density values are very rough indexes, inasmuch as they do not take account of the dispersion or concentration of population within countries or areas, nor the probable proportion of habitable land. They should not be interpreted as reflecting density in the urban sense nor as indicating the supporting power of a territory's land and resources.

[39] *Demographic Yearbook, 1956*, p. 13.

Table 4

Table 4 presents, for each country or area of the world, the latest available national rates of birth, death, marriage, divorce, infant mortality, fertility and natural increase, as well as expectation of life for males and females separately. It thus serves the same quick reference purpose for vital statistics as is served by table 3 for population and surface area.

Registered rates for the latest available year are shown except that, where registered birth and death statistics are unreliable and credible estimates of the national birth and death rate are available, the latter have been included in the table, suitably identified. The effects of this policy are particularly evident in Africa and Asia, where vital statistics from civil registers are notably defective but where apparently reasonable estimates of rates have been derived from sample-survey results or from other sources.

Relatively reliable rates are shown in roman type, while those believed to be markedly less reliable are in italics. It must be emphasized, however, that special qualifications of these data have had to be omitted for lack of space; hence, reference should be made to the corresponding trend table for more precise information on coverage, basis of tabulation and general limitations.

The reference year shown in the table is that common to the birth and death rates; when the time reference for other rates differs from this, it is given in a foot-note.

Coverage: Table 4 contains rates for 208 countries or areas. Only national rates, or those for the major ethnic group, are shown; rates for cities, minor civil divisions or minor ethnic groups have not been included, inasmuch as the table's function is to provide indexes which are presumed to be representative of those for the country or area as a whole.

Rate computation:

Crude registered birth, death, marriage and divorce rates are the number of events reported from civil registers for the calendar year cited, per 1 000 persons present in the same geographic area at the mid-point of the year in question.

Crude estimated rates obtained from sample survey results are the number of events estimated to have occurred during the reference period (usually 12 months preceding the date of the sample survey) per 1 000 persons estimated to have been resident when the survey took place. Basis of other estimated rates is given in foot-notes.

Infant mortality rates are the number of deaths which occurred under one year of age during the calendar year cited, per 1 000 live births reported in the same year. No adjustment is made for the fact that some of the infants who died were born in the year preceding the reference year.

Fertility rates are the number of live births reported in the calendar or survey year, per 1 000 female population aged 10-49 years at the mid-point of the year in question.

Natural-increase rates are the difference between the crude birth and death rates.

Expectation-of-life values are the average number of years of life for males and females at birth, if they contin-

ued to be subject to the same mortality conditions as obtained in the period mentioned. Unless otherwise noted, they have been taken from the official life tables of the countries or areas concerned.

Limitations: Since most of the rates and all of the life expectancies are presented also in other tables in this or previous issues of the *Demographic Yearbook,* reference should be made to the corresponding basic compilations for details of limitations and qualifications.

In assessing comparability, special attention should be paid to the relative degrees of completeness as expressed in the quality code in each trend table and the foot-notes appended thereto, and to the source of the estimated rates. Variation in the basis of tabulation (i.e., date of occurrence *versus* date or registration) is another potential source of noncomparability which should be borne in mind in using the rates on an international basis. Finally, the noncorrespondence of the time reference might also need to be considered in comparing the various rates for one country or area with each other and with corresponding rates for other countries or areas.

Table 5

Estimates of total population for each year 1965-1974 are presented in table 5.[40] Contrary to the procedure used in this table prior to the 1970 issue, all figures are presented in millions with two decimal places rather than in thousands as formerly. This change has been made because the presentation of data in thousands indicated a degree of precision which does not exist in the data for many of the countries or areas included in the table. The data have been rounded in the Statistical Office using the digit five (5) in the thousands place as the criterion for upward adjustment.

Unless otherwise indicated, all estimates relate to the present-in-area (*de facto*) population within present geographic boundaries. Major divergencies from this principle have been explained in foot-notes. On the other hand, the disposition of certain major segments of population (such as armed forces) has been indicated, even though this disposition does not strictly constitute disagreement with the standard.

Estimates: Except as described below, estimates are official figures which are consistent with the results of national censuses or sample surveys taken in the period. This means that, if inexplicable discontinuities appeared to exist, the estimates have been officially revised to accord with the results of a census or survey of population and they thus form a consistent time series. They refer to the mid-year, i.e., to the population at 1 July of the relevant year or to the mean of the two proximate end-year estimates. No distinction is made between these two types of mid-year estimates, on the assumption that the difference is negligible.

The policy determining the data to be shown in table 5 is the same as that adopted in table 3, that is, when an acceptable official mid-year estimate of population as defined above was not available, a United Nations mid-year estimate, identified by the superscript "x", has been used instead. These United Nations estimates, which are provided by the Population Division of the United Nations, take into account available information on the reliability of census and survey results, natural increase, the possibility of migratory movement substantial enough to affect the pre-censal and post-censal estimates, and so forth. This policy is designed to produce an internally consistent time series of mid-year estimates which are in accord with reliable census and survey results. Unrevised data, as well as results of censuses, surveys and estimates related to dates other than the mid-year, have been eliminated in favour of United Nations mid-year estimates.

It should be pointed out, however, that in a number of countries or areas, the basic data necessary for the construction of population estimates (that is, census or survey results and some reliable measure of natural increase) were not available. In these cases United Nations estimates could not be made either to replace internally inconsistent and fragmentary official series, or to fill gaps in otherwise acceptable official series. The inconsistent estimates have been omitted and the gaps appear in the official series.

The quality of the time series has been evaluated by the method set forth on p. 17. Series considered to be reliable are set in the usual roman type; series considered to be of questionable reliability are set in italics.

Coverage: Data are for 199 countrys or areas having 10 000 or more inhabitants.

Limitations: Comparability of population estimates is limited by the factors set forth on pp. 15-16, namely by the variation in the meaning attached to the terms *de jure* and *de facto* in defining the total count, by the accuracy and recency of the census, if any, on which estimates are based and by the method of time adjustment. However, the policy of replacing out-of-line estimates and scattered census results by an internally consistent series of mid-year estimates constructed by the United Nations should increase comparability.

Table 6

Table 6 presents a time-trend of the number and per cent of population enumerated or estimated as urban, by sex, during the period 1966-1974. A similar trend, for the period 1965-1973 was shown in the 1973 *Demographic Yearbook,* data for 1962-1971 were shown in the 1971 *Demographic Yearbook*, data for 1950-1970 were shown in the 1970 *Demographic Yearbook,* data for 1920-1960 were shown in the 1960 *Demographic Yearbook* and a limited trend for 1900-1950 was presented in the 1952 *Demographic Yearbook.*

In general, data shown are from nation-wide censuses or sample surveys of population carried out among all segments of the population. Estimates are included when these appeared to have been constructed by a method other than proportionate distribution based on census results. The estimates are identified by an (E) following the date in the stub, sample surveys are further identified by foot-notes; other data may be assumed to be censuses. In addition to showing census results on this important characteristic, this table provides the urban/rural population base for the crude rates shown in tables 9, 11, 13 and 24.

Estimates which are believed to be of questionable reliability as determined for table 5, are set in italics rather than in roman type. Classification into reliable and less

[40] Urban and total population for 1966-1974 are shown in table 6.

reliable is based on the method of construction, as described on p. 17. *Urban* is assumed to be defined according to the national definitions set forth at the end of the table.

Coverage: A total of 143 countries or areas is included in this table.

Limitations: The basic limitations imposed by variations in the definition of the total population and in the degree of underenumeration is perhaps more important in relation to urban-rural than to any other distributions. The classification by urban and rural will, for example, be affected by variations in defining *usual residence* for purposes of sub-national tabulations, inasmuch as *urban* is usually defined in terms of towns or cities. Likewise, the geographic differentials in the degree of underenumeration in censuses will affect the comparability of these categories throughout the table.

A more important and specific limitation, however, lies in the national differences encountered in the definition of *urban*. Because the distinction between urban and rural areas is made in so many different ways, the definitions have been included at the end of the table. The definitions are necessarily brief and, where the classification as *urban* involves administrative civil divisions, they are often given in the terminology of the particular country or area. As a result of variations in terminology, it may appear that differences between countries or areas are greater than they actually are. On the other hand, similar or identical terms (e.g., town, village, district) as used in different countries or areas may have quite different meanings.

It will be seen from an examination of the definitions that they fall roughly into three major types: (1) classification of certain size localities as urban; (2) classification of administrative centres of minor civil divisions as *urban* and the remainder of the division as *rural;* and (3) classification of minor civil divisions on a chosen criterion which may include type of local government, number of inhabitants or proportion of population engaged in agriculture.

Thus, urban status may be granted to places with as few as 400 inhabitants in Albania, while in Austria the lower limit is 5 000 persons. In Bulgaria, urban means places with urban status regardless of size; in Israel, it implies predominantly non-agricultural centres; in Sweden, it is built-up areas with less then 200 metres between houses. The lack of strict comparability as evidenced by the diverse definitions will be immediately apparent.

The designation of areas as urban or rural is so closely bound up with historical, political, cultural, and administrative considerations that the process of developing uniform definitions and procedures moves very slowly. Not only do the definitions differ one from the other, but, in actual fact, they may no longer reflect the original intention of distinguishing *urban* from *rural*. The criteria once established on the basis of administrative subdivisions (as most of these are) become fixed and resistant to change. For this reason, comparisons of data over time may be invalidated by the inapplicability of the definition to current circumstances. Special care must be taken in comparing data from censuses with those from sample surveys because of the likelihood that the definitions of *urban* are not compatible.

Despite their shortcomings, however, statistics of urban and rural population are useful for comparing on a broad scale degrees of urbanization between countries or areas. No matter how they are defined, *urban* is likely to include a heavy concentration of clearly urban population, while *rural* will be heavily weighted towards village or clearly rural areas. Thus, the differences between urban and rural characteristics of the population, though not precisely measured, will tend to be reflected in the statistics.

Table 7

Table 7 shows the latest available official distribution of the total, urban and rural population by 5-year age groups and sex for the latest available year between 1965 and 1974. Included are acceptable estimates and the results of censures. The table serves to extend the historical (1940-1973) trend of population by age and sex published in previous issues of the *Demographic Yearbook*.

The reference date of the census or estimate appears in the stub of the table. The results of censuses are identified by a "C" following the date.

In general, estimates relate to the mid-point (1 July) of the specified calendar year. In the absence of a mid-year estimate, a mean of two acceptable end-year estimates has been substituted and if only one end-year estimate is availabe, it is shown. "Means" are not separately identified except where the total for all ages differs from the mid-year estimate given in table 5.

Estimates which are believed to be of questionable reliability are set in italics rather than in roman type. Classification into reliable and less reliable is based on the method of construction as described on p. 17. No attempt has been made to take account of age-reporting accuracy, the evaluation of which has been described on p. 17.

Age is defined as age at last birthday or completed years. The age classification used includes 20 categories as follows: under 1 year, 1-4, 5-9, continuing in 5-year groups to 80-84, a residual category of 85 and over, and unknown. This is in accord with the classification recommended by the United Nations.[41]

Urban is defined as indicated in the national definitions of urban population set forth at the end of table 6.

Coverage: This table includes age-sex distributions of population for 164 countries or areas; of these distributions, 71 are census results, 8 are estimates based on results of sample surveys, and 85 are other type of estimates.

Availability was not the sole criterion used in determining the scope of the table; a number of estimated age-sex distributions were deliberately excluded on the basis of their construction. To be included in this table, an estimate must have been based on the results of a sample survey or have been constructed by the component method, from the results of a population census. Distributions which result when the estimated total population is distributed by age and sex according to percentages in each age-sex group at the time of a census or sample sur-

[41] *Principles and Recommendations for the 1970 Population Censuses*, para 313 (7).

vey are not acceptable and they have not been included in this table.

Limitations: Comparability of population data classified by age and sex is limited in the first place by variations in the definition of total population (which has been discussed in detail on p. 17 and by the accuracy of the original enumeration also discussed above. Both of these factors are more important in relation to certain age groups than to others. For example, underenumeration is known to be more prevalent among infants and young children than among older persons. Similarly the exclusion from the total population of certain groups which tend to be of selected ages (such as the armed forces) can markedly affect the age structure and its comparability with that for other countries or areas. Consideration should be given to the implications of these basic limitations in using the data.

Further to these general qualifications are the special problems of comparability which arise in relation to age statistics in particular. Age distributions of population are known to suffer from certain deficiencies which have their origin in irregularities in age reporting. Although some of the irregularities tend to be obscured or eliminated when data are tabulated in 5-year age groups rather than by single years, precision still continues to be affected, though the degree of distortion is not always readily seen. For a discussion of this factor, see pp. 16-17.

Another limitation on comparability is found in the basis for the age classification employed by the various countries or areas. Whenever it was known that the distribution was based on the year of birth rather than the calculated "age at last birthday", the data are so noted in the tables. The effect is described on page 16.

In connexion with the age classification, it should be noted that zero frequency reported in the unknown-age category is not always an indication of perfect age reporting; it is more often an indication that ages have been imputed before tabulation began or that the unknowns have been distributed according to certain assumptions. The method used to eliminate frequencies in the unknown-age category is not always known and hence it is noted infrequently in the tables, but the possibility of its having occurred should not be overlooked.

As noted in connexion with table 5, intercensal estimates of total population are usually revised to accord with the results of a census of population if inexplicable discontinuities appear to exist. Post-censal age-sex distributions, however, are less likely to be revised in this way. Those which have not been revised are noted in this table; they should be used with extreme caution in analysing time trends though their utility for studying age structure for the specified year is probably unimpaired.

In addition to the foregoing, the limitations inherent in statistics of urban/rural population must be considered in using the data in this table. These limitations have been discussed fully in connexion with table 6 and are therefore not repeated here.

Table 8

The population of the capital in each country or area and of each city which had 100 000 or more inhabitants, according to the latest available data, is shown in table 8. The reference date of the census, sample survey or estimate appears in the stub of the table and the results of national censuses are further identified by a "C" following the date. Estimates based on results of sample surveys, as well as results of city censuses, are identified by foot-notes.

In a few cases, it will be observed that the dates of enumeration do not coincide exactly with those of the national survey set forth in other tables. This is explained by the fact that enumeration in sample surveys and censuses often extends over a period of time, with consecutive rather than simultaneous coverage of various parts of the country or area.

Since the way in which cities are delimited differs from country or area to country or area, efforts have been made to include in the table not only data for the so-called city proper but also those for the urban agglomeration, if such exists.

A *city proper* is a large locality with legally fixed boundaries and an administratively recognized urban status which is usually characterized by some form of local government.

The *urban agglomeration* has been defined as comprising the city proper and also the suburban fringe or thickly settled territory lying outside of, but adjacent to, the city boundaries. Whenever an urban-agglomeration figure is available, it has been used as the basis for applying the 100 000 criterion in order that every city of the selected size class, however defined, may be included.

The order of presentation of cities in this table is English alphabetical, although the names are given in the language of the country or area to which they pertain or, if required, in a transliteration of it. These principles of presentation were adopted because of the difficulty of establishing English and/or French equivalents for official names of cities. For purposes of identification, the name of the capital is printed in small capital letters.

Since information is not available on the method of constructing estimates, the reliability of the data has been assumed to be the same as that of the national population figures. This means that data from censuses and sample surveys are shown in roman type, while other estimates of city population are either roman or italic depending on the method of construction employed in making estimates of national population.

Coverage: Cities from 193 countries or areas are included in table 8; of these 111 show the capital only, while 82 show the capital and one or more cities which, according to the latest census or estimate, had 100 000 or more inhabitants.

Limitations: City populations are especially affected by the difficulties of defining the *de facto* and *de jure* concepts in relation to them. Comparability is also impaired by different methods used in constructing the estimates and by the lack of precision which may be present even in the same methods. For example, births and deaths occurring in the cities do not all originate in the population present in, or resident of, that area. Therefore, the use of natural increase to estimate the probable size of the city population is a potential source of large errors. Internal migration is a second estimating component which cannot be measured with accuracy in many areas. Because of

these factors, estimates in table 8 tend to be untrustworthy in general and especially limited for purposes of international comparison.

Comparability is even more limited by variations in the national concepts. In France, for example, the data shown in table 8 are those *communes* which constitute the centre of urban agglomerations. In other cases, (e.g., Belgium, Italy, Japan, Spain) the figures relate to entire administrative divisions variously known as *shi, communes, municipios* which are composed of a populated centre and adjoining territory, some of which may contain other quite separate urban localities or be distinctively rural in character. For this group of countries or areas the type of civil division is noted in table 8 and, where practicable, the figures have been centred in the two columns as an indication that they refer to units which may extend beyond an integrated urban locality but which are not necessarily urban agglomerations.

Finally, it must be mentioned that data in table 8 may have been obtained from city censuses (as in Jordan and Ethiopia), from national population censuses, from regular estimating procedures, or from *ad hoc* surveys. Their reference dates tend to be diverse in any case, and inasmuch as city populations follow all types of growth patterns, comparison between data for different years should be carried out with caution.

Table 9

This table presents new and revised data on the trend of live births and birth rates by urban/rural residence for each year 1970-1974.

Frequencies shown are obtained almost entirely from civil registers of live birth, and rates based on these data have been computed in the Statistical Office of the United Nations. In addition, in a number of cases where civil registration data are known to be non-existent or unreliable, it has been possible to include estimated data which are thought to reflect more accurately the true level of natality. These data for isolated years have been obtained from results of sample surveys, from analysis of consecutive population census results, and by the "reverse-survival" method. Also included are certain estimated rates for 1965-70 prepared by the Population Division of the United Nations, which are based on assumed levels of fertility expressed in terms of gross reproduction rates and patterns of age-specific fertility rates. To distinguish them from civil registration data, estimated numbers and rates are identified and their nature explained in foot-notes. Corresponding registered data, when available, are given at the end of the table.

Urban is assumed to have been defined to accord with the national definitions of "urban" used in the censuses of population. These national definitions are set forth at the end of table 6.

In accordance with usual practice, the code which indicates the quality of civil registration data appears in the first column of table 9 in the form **C, U** or . . ., and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 19.

It should be noted that the quality code is not applicable to estimated numbers and rates so that when these are combined in the series with data from civil registers, the code shown applies only to the latter. Where a series consists only of estimated rates, the code column will show two dots (. .).

Coverage: Birth statistics for 96 countries or areas are included in table 9. Of these 38 show the urban/rural distribution. Major countries or areas are shown if a frequency or a rate for at least one year was available. Ethnic or geographic segments of the population are included in the absence of national figures; these data are not nationally significant but they serve to make the table an index to the availability of natality statistics throughout the world.

Rate computation:

Crude registered birth rates are the number of live births reported for a calendar year per 1 000 persons in the same geographic area at the mid-point of the year.

Urban and rural birth rates are the number of live births reported as urban and rural per 1 000 urban or rural population at the mid-point of the year.

Estimated rates obtained from sample survey results are the number of births estimated to have occurred during the reference period (usually 12 months preceding the date of the sample survey) per 1 000 persons estimated to have been resident when the survey took place.

Rates for years where frequencies are available have been computed in the Statistical Office of the United Nations on the mid-year estimates of population which are set forth in tables 5 and 6. Every effort was made to achieve strict correspondence between the numerator of the rate (live births) and the denominator (population), and notes are used to describe instances where correspondence could not be obtained.

Limitations: Births statistics are subject to the qualifications set forth above for vital statistics in general, and for birth statistics in particular.

The limitations on birth statistics imposed by the quality code, and the classification of series as reliable or unreliable, are particularly pertinent. In using data from this table, care must be taken to consider also the effects of tabulation by date of registration rather than by date of occurrence. Countries or areas which are known to have adopted the registration basis of tabulation are identified with a dagger (†), which has been placed in the same column as the quality code for convenience in evaluating the combined effect.

It should be emphasized that whenever the lag between occurrence and registration is prolonged, i.e., where a large proportion of live-birth registrations are delayed—as in some parts of Latin America, Asia and Africa—live-birth statistics by date of registration may give a very distorted or even wholly erroneous picture of natality trends. They may often produce birth rates of credible magnitude even though births which are known to have occurred admittedly fail to get registered. In such cases, incompleteness of current registration is masked by the inclusion of events which occurred in previous years, and the resulting data may be very misleading, especially in so far as fertility characteristics are concerned.

The countries or areas in which live-birth statistics exclude infants born alive who died before registration of their birth, or alternatively, those who die before having survived 24 hours, are noted in the table. The effect on birth statistics is one of understatement, the general magnitude of which has been discussed in the *Handbook of Vital Statistics Methods*.[42]

In addition to the above, the birth statistics by urban/rural residence are subject to all the limitations imposed by the lack of international comparability among national concepts of urbanity and rurality as described in the text of table 6 of this issue. Perhaps the most important is the difficulty of achieving strict comparability between the numerator and the denominator of the rates. It may not be evident, for example, that the definitions of "urban" and "rural" used in connexion with the birth statistics in the numerator are different from those used in the population statistics which form the denominator. Such an inconsistency would invalidate the rates. Unfortunately, it is not possible to document the presumed agreement of these components.

Computed rates are affected also by the quality and limitations of the population estimates used in their computation. This factor is of special importance in connexion with this table because of the policy, adopted in the *Demographic Yearbook, 1965,* of computing rates on estimates of population constructed by the United Nations.

On the other hand, rates estimated from the results of sample surveys are subject to possibilities of considerable error as a result of omissions in reporting of births, or as a result of erroneous reporting of events which ocurred outside the period of reference. However, rates estimated from sample surveys do have an outstanding advantage and that is the availability of a built-in and strictly corresponding population base. The accuracy of the birth rates estimated by the "reverse-survival" method is affected by several factors, the most important of which are the accuracy of the count of children in the age groups used and errors in the survival coefficients.

Despite their limitations, crude birth rates do provide a measure of gross additions to the population and hence, in combination with crude death rates, some estimate of population growth rates. They can also give a general idea of trends over time within one area and information which allows the rough classification of countries or areas according to levels of natality. But because of the variation among countries or areas in the age and sex composition of the population, crude rates do not precisely reflect differences in fertility and they cannot, therefore, be used alone to evaluate current trends and future prospects.

Table 10

Live births by age of mother and sex of child, cross-classified by urban/rural residence, for the latest available year, are given in table 10. In some instances, the latest year available by urban/rural residence is not the same as that for total or total and sex of child; in such cases, the two distributions are shown. The data shown are mainly taken from civil registers of live births. Similar data for the latest available year were shown in the 1970, 1971, 1972 and 1973 issues of the *Demographic Yearbook*. Data for live births by age of mother and sex of child have been shown in each issue of the *Yearbook* since 1965; data for live births by age of mother and urban/rural residence were shown in the 1965, 1969 and 1973 issues. Prior to 1965, livebirths by age of mother, but without the sex of child or the urban/rural variable, were shown in almost all issues of the *Demographic Yearbook*.

Age in this table refers to the mother and it is defined as age at last birthday or completed years, in accordance with the United Nations recommendations.[43]

The age classification is the 10-group one which begins with an under-15 year category, continues through quinquennial groups to age 49, and terminates with a residual category of 50 years and over and an unknown category, as recommended by the United Nations.[44]

Urban is assumed to have been defined to accord with the national definitions of urban and, conversely, of rural used in the censuses of population. These national definitions are set forth at the end of table 6.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis of the quality specification may be found on p. 20.

Coverage: The latest available distribution of births by age of mother is included in the table for each of the 131 countries or areas reporting 50 or more births.[45] The cross-classification by sex of child and urban/rural residence is shown for 17 countries or areas, while cross-classification by sex alone is available for 76 countries or areas and cross-classification by urban/rural residence alone for 13 countries or areas. Data for ethnic or geographic segments of the population are included in the absence of national figures. Thus, the table serves as an index to those countries or areas which tabulated live births by age of mother, sex of child and urban/rural residence and the timeliness of these statistics.

Limitations: Statistics of births by age of mother are subject to the same limitations as have been set forth in connexion with table 9.

Because these are statistics classified according to age, they are subject to the limitations with respect to accuracy of reported ages similar to those already discussed in connexion with population by age and sex. The absence of frequencies in the unknown age group does not necessarily indicate completely accurate reporting and tabulation of the age item. It is often an indication that the unknowns have been eliminated by imputing ages before tabulation, or by proportionate distribution after tabulation. On the other hand, large frequencies in the unknown-age category may indicate that a large proportion of the births are illegitimate, the records for which tend to be incomplete in so far as characteristics of the parents are concerned.

Another age-reporting factor which must be kept in mind in using these data is the variation which may result from calculating age of mother at birth of child (or at time of registration) from year of birth rather than from

[42] Chap. IV.

[43] *Principles and Recommendations for a Vital Statistics System*, para. 124.

[44] *Ibid.*, para 268, Tabulation LB-5.

[45] Countries excluded on this basis are Christmas Island, Cocos (Keeling) Islands, Norfolk Island and Pitcairn Island.

day, month and year of birth. Information on this factor is given in foot-notes when known.

Lack of strict comparability, both among data for different countries or areas shown in this table, and between those shown here and in table 9, also results from other causes, among which may be mentioned the fact that data by age may refer to deliveries or confinements rather than to live births; moreover, in some cases the confinements referred to are those resulting in live birth only and in others to those resulting in live-born and still-born offspring. Some countries or areas restrict tabulations by age of mother to legitimate births only, while live births in table 9 relate to a total of legitimate and illegitimate. In most cases, this limitation qualifies the data very little, but where illegitimate births are relatively numerous, age-of-mother data limited to legitimate births cannot be considered representative. Similarly, for a few countries or areas, the distribution of live births by age of mother is confined to infants born alive who did *not* die before registration of birth, whereas the totals in table 9 have been adjusted to include those who died before registration.

As is the case with total births, comparability is affected by differences in the basis of tabulation, i.e., date of occurrence of date of registration. The dagger (†) in the stub indicates the countries or areas which tabulate by date of registration, the implications of which have been set forth on p. 20. However, when birth statistics refer to registrations rather than occurrences, the age of the mother will almost always refer to the date of registration rather than to the date of birth of the child. Hence, in those countries or areas where registration of births is delayed, often for years, it is evident that the distribution by mother's age will be of limited use as an index of present natality patterns.

In addition to the above, the birth statistics by urban/rural residence are subject to all the limitations imposed by the lack of international comparability among national concepts of urbanity and rurality as described in the text of table 6 in this issue.

Table 11

This table presents new and revised data on the trend of marriages and crude marriage rates by urban/rural residence for each year 1970-1974.

Unless otherwise specified, the statistics refer to marriages *performed,* that is, *the legal relationship of husband and wife as constituted by an act, ceremony or process. The legality of the union may be established by civil, religious or other means recognized by the laws of each country*[46] [or area]. These are statistics of marriages, not of marrying.

Urban is assumed to have been defined to accord with national definitions of "urban" used in censuses of population. These national definitions are set forth at the end of table 6.

In accordance with the usual practice, the quality code (**C, U** and **. . .**) is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on p. 19.

Coverage: Marriages and crude marriage rates are shown for 134 countries or areas; of these, 21 show the urban/rural distribution. Data for ethnic or geographic segments of the population are included in the absence of national figures. Such data are of minor significance, but they do serve to designate the countries or areas for which some marriage statistics are obtainable.

Rate computation: Crude marriage rates are the number of marriages reported per 1 000 persons present in the same country or area at the mid-point of the year in question.

Urban and rural marriage rates are the number of marriages reported per 1 000 persons in the urban or rural population at the mid-point of the year. Rates for years where frequencies are available have been computed in the Statistical Office of the United Nations on the mid-year estimates of population which have been set forth in tables 5 and 6. Every effort was made to achieve strict correspondence between the numerator of the rate (marriages) and the denominator (population), and notes are used to describe instances where correspondence could not be obtained.

Limitations: Data in this trend table are subject to almost all the limitations of vital statistics set forth on p. 18, as well as those pointed out in connexion with marriage statistics specifically. They suffer from national variations in statistical definitions; they are deficient as indicators of *de facto* family formation to the extent that consensual unions exist; even as measures of formal marriage incidence, they are unreliable to the extent that they are incomplete. However, it must be emphasized that since marriage is a legal rather than a biological event, the problem of comparability in the sense of complete and incomplete data takes on a somewhat different aspect. This should be borne in mind in using the quality-of-data code **C** and **U**, which appears in the first column of the table.

High incidence of consensual unions will be especially noticeable in the rates, because the range of formal marriage rates is relatively narrow and marked divergence is almost always due to a preponderance of *de facto* rather than *de jure* unions. Lack of comparability from this factor is especially evident in abnormally low marriage rates for parts of Latin America and Africa.

As will be seen from the foot-notes, strict correspondence between the numerator of the rate and the denominator is not always obtained; for example, marriages among civilian and military segments of the population may be related to civilian population. The effect of this may be to increase the rates or, if the population is larger than that from which the marriages are drawn, to decrease them but, in most cases, it is probably negligible. The potential size of the effect may be judged from the rate series for Gilbraltar.

The symbol (†) is used here to indicate that data have been tabulated by date of registration, rather than by date of occurrence or performance, in this case. As was pointed out on p. 20, this qualification is not particularly important in connexion with marriages because, in most cases, registration is a prerequisite for, or equivalent to, performance. However, since there are some countries or

[46] *Principles and Recommendations for a Vital Statistics System,* para. 46 (4).

areas in which a potential time interval may exist between performance of a marriage and its registration,[47] the implications of the symbol should be considered in relation to the data it qualifies.

In addition to the above, marriage statistics by urban/rural residence are subject to all the limitations imposed by the lack of international comparability among the national concepts of urban and rural as described at the end of table 6 in this issue. Perhaps most important is the difficulty of achieving strict comparability between the numerator and the denominator of the rates. It may not be evident, for example, that the definitions of "urban" and "rural" used in connexion with marriage statistics in the numerator are different from those used in the population statistics which form the denominator. Such an inconsistency would tend to invalidate the rates. Unfortunately it is not possible to document the agreement presumed between these concepts.

Computed rates are affected also by the quality and limitations of the population estimates used in their computation. This factor is of special importance in connexion with this table because of the policy, adopted in the *Demographic Yearbook, 1965*, of computing rates on estimates of population constructed by the United Nations.

Finally, it should be emphasized that crude marriage rates—like crude birth and death rates—are not probability indexes, because they take no cognizance of the age-sex-marital-status structure of the populations to which they relate. Nevertheless, they do measure levels and changes in marriage frequency. For more details on the uses of crude marriage rates, see chapter I of the *Demographic Yearbook, 1958*.

Table 12

Marriages classified by age of bride and, separately, by age of bridegroom are set forth in table 12 for the latest year available. "Latest available data" on this subject have been shown in each issue beginning with the *Demographic Yearbook, 1958*. In addition, a time trend for the period 1936-1949 was shown in the 1949/50 issue, a time trend for the period 1948-1957 was shown in the 1958 issue, and a time trend for the period 1958-1967 was shown in the 1968 issue.

Unless otherwise specified, the statistics refer to marriages *performed*, that is, *the legal relationship of husband and wife as constituted by an act, ceremony or process. The legality of the union may be established by civil, religious or other means recognized by the laws of each country*[48] [or area]. They are statistics of marriages, not of persons marrying.

Age of bridegroom and bride is defined as completed years at last birthday, in accordance with the United Nations recommendations,[49] that is, it is computed by subtracting day, month and year of birth from day, month and year of marriage.

The age classification is that recommended by the United Nations,[50] curtailed at the upper limit to end at 60 years and over rather than 75 and over because of space limitations; categories included are 12 in number, namely, under 15 years, 5-year age groups to 59, 60 and over, and unknown, and the same classification is used for both brides and bridegrooms.

A continuing feature in this table is the inclusion of minimum age for marriage of brides and corresponding ages of bridegrooms. This is the "marriageable age", i.e., that which must be attained before persons are allowed to contract a marriage which is valid before the law. Attainment of the legal age does not, however, always automatically confer the right to marry without consent. In most countries or areas, persons between the legal age and a more advanced age (usually 21 years) can be married only with the consent of their guardians. In some countries or areas, provision is made under certain circumstances for the minimum age requirement to be waived by a competent authority; in other countries or areas there is no provision for dispensation or waiver.

Date believed to be unreliable (incomplete) as determined by the quality code (see p. 19) are set in italics rather than in roman type. If incompleteness is assumed to be evenly distributed throughout the age span, then such data may still be of value as indicators of the age pattern of marriages, even though the absolute levels may be deficient.

Coverage: Table 12 includes marriages by age of bride and bridegroom for 83 countries or areas in which the distribution totalled at least 1 000 marriages.

Limitations: All the limitations of vital statistics and of marriage statistics in particular, influence comparability of data in table 12. Deviation from the standard in respect of the type of data included is one important factor in comparability. Some of the non-standard types encountered are "marriage licences issued", marriages recorded only in church registers", "marriages resumed after a separation" and so forth.

Limitations are also imposed by the age variable. Age-reporting errors in censuses of population have been described on p. 16. It is probable that biases are less pronounced in marriage statistics, because information is obtained from the persons concerned and since marriage is a legal act the participants are likely to give correct information. However, in some countries or areas, there appears to be an abnormal concentration of marriages at the minimum marriageable age and at the age at which valid marriage may be contracted without parental consent, indicating perhaps an overstatement in some cases to comply with the law. Factors which may influence age reporting particularly at older ages include an inclination to understate the bride's age in order that it may be equal to or less than that of the bridegroom.

Inter-area comparability of the frequencies at the lower ages, i.e., up to 24 years, may also be limited by the variation in the minimum legal age for marriage. Information is not available for all countries or areas but it would appear that the marked international variability in rates at these ages is due not so much to differences in patterns of nuptiality but to national variations in the legal requirements for entering into a valid civil marriage contract. The inclusion in the table of the minimum marriageable ages

[47] See *Handbook of Vital Statistics Methods*, table 10, pp. 84-86.
[48] *Principles and Recommendations for a Vital Statistics System*, para 46 (4).
[49] *Principles and Recommendations for a Vital Statistics System*, para. 124.
[50] *Ibid.*, para 268, Tabulation MA-3.

for a number of countries or areas should be useful in investigating this point.

Limitations implied by the code of completeness attached to table 11—but applicable as well to this table—warrant some consideration although, as explained above, the meaning of the codes in connexion with marriage registration is not always clear. The limitations imposed by date-of-registration tabulation procedures can be largely ignored in evaluating data in this table.

Table 13

Table 13 is the regular trend table of divorces and crude divorce rates, which in this issue shows data for each year, 1970-1974.

Unless otherwise described, divorces refer to *final legal dissolutions of marriage which confer on the parties the right to remarry*. Data refer to divorces within the present geographic boundaries and among the present-in-area population. They are not "persons divorced" but "decrees granted".

In accordance with the usual practice, the quality code (**C, U** and **. . .**) is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on p. 19.

Coverage: Annual figures are shown for 98 countries or areas. Major countries or areas are included if a frequency for one year was available. Data for subnational population segments are also included if national figures are lacking. This policy serves to provide information not only on divorce incidence but on the practices of countries or areas in respect of compiling divorce statistics. Countries or areas where there is no legal provision for divorce are noted in the table.

Rate computation: Rates are the absolute number of divorces granted each year per 1 000 persons present in the population at the mid-point of the year in question. The population bases are those presented in table 5. Every effort was made to achieve strict correspondence between the numerator of the rate (divorces) and the denominator (population), and notes are used to describe instances where correspondence could not be obtained.

Limitations: Comparability of the basic data is limited by several of the factors described in connexion with vital statistics in general and divorce statistics in particular.

Since divorce statistics originate in court records and procedures, the marked year-to-year fluctuations are likely to reflect court delays and clearances rather than trends in divorce incidence. Moreover, they tend to reflect also the ability of persons to acquire a divorce, including the laxness or stringency of the grounds on which divorce can be granted and the ability to meet financial and other costs of the court procedures. Connected with this aspect is the influence of certain religious faiths on the incidence of divorce. If divorces are few in number, "divorce statistics" may include also annulments and even separations. Inclusions of annulments in the numerator of the crude divorce rate has a negligible effect on its size, but inclusion of separations may have a measurable effect on the level of the rate. For all these reasons, divorce rates are not strictly comparable as measures of family dissolution by legal means.

The effect of completeness on divorce statistics depends to a large extent on the type of the statistics; for a detailed discussion of this aspect, see the *Demographic Yearbook, 1968*, p. 13.

Crude rates of divorce—like corresponding crude birth, death and marriage rates—are not probability indexes. They are rather indicators of the gross additions to the marriageable population and deletion from the married segment; in that capacity, they are extremely useful even though not strictly comparable from country or area to country or area. But because of basic differences in the marital status and age composition of populations, they do not measure the risk of divorce among married persons or couples. They give only a general idea of the trends over time and the gross differences between countries or areas in levels of divorce in the total population, limited always by the international variations in the meaning of the term "divorce".

Table 14

Table 14 presents statistics of total *arrivals of travellers from another country* and total *departures of travellers to another country* for the period 1967-1973. Corresponding data for the period 1965-1971 were shown in the *Demographic Yearbook, 1972*. Those for 1963-1969 were shown in the *Demographic Yearbook, 1970;* for 1966-1967 in the *Demographic Yearbook 1968;* for 1960-1965 in the *Demographic Yearbook, 1966;* for 1956-1961 in the *Demographic Yearbook, 1962*, for 1953-1958 in the *Demographic Yearbook, 1959;* and for 1945-1956 in earlier issues. Together these provide a summary of international arrivals and departures for a period of more than 20 years. Data are from diverse sources, including port statistics, statistics of frontier control, statistics of population registers and statistics of work permits. These and other sources have been described on p. 24.

Arrivals are defined as to comprise *(1) long-term immigrants, (2) short-term immigrants, (3) visitors, (4) transit visitors, (5) cruise-ship visitors, (6) residents returning after a short-term sojourn abroad and (7) other categories recognized in the country or area concerned.*

Departures are defined as to comprise *(1) long-term emigrants, (2) short-term immigrants departing, (3) visitors departing on completion of visit, (4) transit visitors, (5) cruise-ship visitors, (6) residents intending to go abroad for a short absence and (7) other categories recognized in the country or area concerned.*

The present table like the one shown in the *Demographic Yearbook, 1972*, presents total arrivals and departures in one table in a parallel arrangement which facilitates computation of net migration, and the major categories or types of arrivals and departures included in the totals are not shown separately. It was felt that these categories were of small interest to users, particularly as the definitions on which they are based vary widely from country to country, and that the simplification which results from their elimination would enhance the usefulness of the table.

[51] *Principles and Recommendations for a Vital Statistics System*, para 46.

In the absence of contrary indication, data include national as well as alien travellers arriving or departing and relate to both continental and intercontinental movements, in accordance with the United Nations "Recommendations for the improvement of international migration statistics."[52]

Coverage: Statistics on arrivals are presented for 93 countries and statistics on departures for 80 countries in table 14.

Limitations: Observations on the limitations of international migration statistics have been presented on p. 24 and need not be repeated in detail here. Comparability is affected primarily by differences in the definitions of the categories used in various countries. The inclusion or exclusion of data on frontier border crossings may also greatly affect the comparability of the statistics if it is of a substantial amount.

The accuracy of the data is limited by the difficulties of collection at the occasion of frontier control, the clandestine movements of persons across international borders, and the fact that long-term immigrants and emigrants, in particular, are categorized according to their announced intentions, which may not necessarily be carried out.

Tables 15 and 16

Tables 15 and 16 present data on legally induced abortions. Table 15 shows the trend in reported totals for the years 1965-1974; table 16 provides data on legally induced abortions by age and number of previous live births of woman, for the latest available year. The data are also classified according to the grounds on which legally induced abortion is permitted. Legally induced abortions by age and number of previous live births of woman were presented in the 1971, 1972 and 1973 issues of the *Demographic Yearbook*, the trend for recent years is presented in table 15.

Abortion appears in the International Classification of Diseases in two places: (a) as a disease or cause of death of a woman[53] and (b) with reference to the foetus[54]. It is defined, with reference to the woman, as *any interruption of pregnancy before 28 weeks of gestation with a foetus.*[55] There are two major categories of abortion: *spontaneous* and *induced. Induced abortions* are those initiated by deliberate action undertaken with the intention of terminating pregnancy; all other abortions are considered as *spontaneous.*[56] The induction of abortion is subject to governmental regulation in most, if not all, countries or areas. This regulation varies from complete prohibition in some countries or areas to abortion on request, with services provided by governmental health authorities, in others. Between these extremes, the legislatures of some countries or areas have attempted to define the conditions under which pregnancy may lawfully be terminated, and have established procedures for authorizing abortion in individual cases.[57]

[52] *International Migration Statistics.*

[53] *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death, 1965 Revision,* vol. I, Geneva, World Health Organization 1967, p. 243.

[54] *Ibid., p. 298.*

[55] *Ibid.*, p. 243.

[56] *World Health Organization Technical Report Series,* Geneva, 1970, No. 461, p. 8.

[57] *Ibid.*, p. 32.

The focus of the present table is on abortion as a social, rather than physiological, event. Differences among countries or areas in definition and in record-keeping would seem to preclude the collection on any internationally comparable basis of data on abortion defined solely in physiological terms. By restricting coverage to events that have been *induced,* the table avoids any distortion arising either from differences in definition, or from differences in accuracy and comprehensiveness of the records kept concerning spontaneous foetal loss. By further restricting coverage to events performed under *legal* auspices, the table at least reduces (if it does not eliminate altogether) the likelihood of distortion arising from any reluctance to report the occurrence of such a procedure.

Coverage: Data for 23 countries or areas are included in table 15. Data for 16 countries or areas are included in table 16. Of the data shown in table 16, 4 countries or areas show the age of woman but not the previous number of live births.

Limitations: With regard to the collection of information on abortions, a variety of sources are used but hospital records are the most common source of information.[58] This obviously implies that most cases which have no contact with hospitals are missed. Data from other sources are probably also incomplete. The data in the present tables are limited to legally induced abortions which, by their nature, might be assumed to be more complete than data on total abortions.

Table 17

Table 17 presents new and revised data on the trend of late foetal deaths and corresponding ratios for each year, 1965-1973. These data serve to up-date the table in the *Demographic Yearbook, 1973,* where data were shown for the period 1967-1972. The urban/rural distribution of these data are also presented, when possible. The data shown are obtained from civil registers of foetal death.

Late foetal deaths are those of 28 or more completed weeks of gestational age. Foetal deaths of unknown gestational age are included with those of 28 or more weeks. When it was known that data in table 17 did not conform to this definition, foot-notes were appended. Full and precise information on current national definitions is not available for all areas and all years, but reference should be made to the *Handbook of Vital Statistics Methods*[59] for additional details and to table 37 of the *Demographic Yearbook, 1969* for frequencies at various gestational ages.

In accordance with the usual practice, the code which indicates the quality of civil-registration data is presented in the first column of the table in the form **C, U** and **. . .**, and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on page 19.

Coverage: Data for 127 countries or areas are included in table 17. The urban/rural variable is shown for 27 countries or areas. Major countries or areas are shown even though figures for the most recent years are lacking

[58] *World Health Organization, World Health Statistics Report,* vol. 22, No. 1 (Geneva, 1969), pp. 38-42.

[59] Pp. 55-57.

and data for segments of the population are presented when statistics are not available for the country or area as a whole. These subnational data are included not as representative statistics but as an index to the areas for which late foetal-death statistics are routinely collected.

Ratio computation: Annual late foetal-death ratios are the number of late foetal deaths reported in the year per 1 000 live births in the same year. The live-birth base was adopted because it is assumed to be more stable in time and more comparable from country or area to country or area than the combination of live births and foetal deaths. The marked irregularities known to exist in the registration of foetal deaths are discussed on p. 21.

Unless otherwise indicated, all ratios were computed in the Statistical Office of the United Nations of live births shown in table 9, and in previous issues of the *Demographic Yearbook*.

Limitations: Foetal deaths and ratios are subject to the specific qualifications set forth on p. 21 as well as to most of those relating to vital statistics in general. The limitations imposed by the quality code and the classification of series as reliable or unreliable, have been described on p. 19.

One additional factor in connexion with late foetal deaths is the error which may be introduced by incorrect designation of gestational age. The determination of gestational age is difficult at best and since the distinction between "late" and "intermediate" foetal deaths is made on gestational age alone, variation in the skill with which this is done may contribute to lack of comparability.

Foetal deaths are known to be incompletely registered in most countries or areas of the world, so data for most countries or areas are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. However, it must be pointed out that when foetal deaths and live births are both underregistered, the resulting ratios may be of quite reasonable magnitude. As a matter of fact for the countries or areas where livebirth registration is poorest, the foetal-death ratios may be the largest, effectively masking the incompleteness of the base data. For this reason, possible variations in birth-registration completeness—as well as the reported completeness of late foetal deaths—must always be borne in mind in evaluating foetal-death ratios.

In addition to the indirect effect of live-birth underregistration, foetal-death ratios may be seriously affected by date-of-registration tabulation of live births. When the annual number of live births registered and reported fluctuates over a wide range due to changes in legislation or to special needs for proof of birth on the part of large segments of the population, then the foetal-death ratios will fluctuate also, but inversely. Because of these effects, data for countries or areas known to tabulate live births by date of registration should be used with caution unless it is also known that statistics by date of registration approximate those by date of occurrence.

Finally, it may be noted that the counting of live-born infants as "stillbirths", because they died before registration, has the effect of inflating the foetal-death ratios unduly by decreasing the birth denominator and increasing the foetal-death numerator. This factor should not be over-looked in using data from this table. The potential size of the problem has been set forth in the *Handbook of Vital Statistics Methods*.[60]

In addition to the above, the foetal-death statistics by urban/rural residence are subject to all the limitations imposed by the lack of international comparability among national concepts of urban and rural as described in the text of table 6 in this issue.

Table 18

Foetal deaths and ratios according to gestational age are set forth in table 18 for the period 1965-1973. This table was last published in the *1968 Demographic Yearbook*.

Gestational age (of child or dead foetus) is defined in accordance with the international recommendations[61] as *the interval, in completed weeks, between the first day of the last menstrual period of the mother and the day, month and year of delivery, irrespective of whether the product of conception was live-born or without evidence of life.*

In accordance with the recommendations of the United Nations[62] the following classification of gestational age in weeks is used throughout the table: "under 20 weeks", "20-27 weeks", "28-31 weeks", "32-35 weeks", "36 weeks", "37-39 weeks", "40 weeks and over" and an unknown category. Where age has been reported in months—either calendar or lunar—it has been converted to gestational weeks according to the following scale:

Under 20 weeks = 1-4 months
20-23 weeks = 5 months
24-27 weeks = 6 months
28-31 weeks = 7 months
32-35 weeks = 8 months
36-39 weeks = 9 months
40 weeks and over = 10 months
Unknown

The three major categories of foetal death are: *early foetal death* at less than 20 completed weeks of gestation; *intermediate foetal death* at 20 but less than 28 weeks; and *late foetal death* at 28 weeks or more[63]. Three dots (. . .)[63] in lower age groups indicate that intermediate and/or late foetal deaths are all that are available.

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: Data for 45 countries or areas are included in this table.

Rate computation: Ratios are the number of foetal deaths which occurred in each gestational age group during the year per 1 000 total live births which occurred during the same year. The live-birth base was adopted because it is assumed to be more stable in time and more comparable from country to country than the combination of live births and foetal deaths. The marked irregularities known to exist in the registration of the latter are discussed on

[60] P. 58.
[61] *Principles and Recommendations for a Vital Statistics System*, para. 138.
[62] *Ibid.*
[63] *Ibid.* para. 46 (3).

p. 21. Although methods of imputing values for unstated age are available, none has been used in table 18 and the foetal deaths of unknown age are included in the ratio for all ages.

Unless otherwise indicated, all ratios were computed in the Statistical Office of the United Nations on live births shown in table 9 and in previous issues of the *Demographic Yearbook*.

Limitations: Foetal-death statistics are probably the least accurate of all vital statistics; their general deficiencies have been reviewed on p. 22, and the special limitations of late foetal deaths and ratios are set forth in connexion with table 17.

The principal factor limiting comparability of data from this table is the variation observed in the content of the data. For a few countries, the data are purported to comprise all foetal deaths, that is, early, intermediate and late. For many others, however, they are late foetal deaths only, i.e., those of 28 or more weeks of gestation; for others, they are intermediate plus late foetal deaths, i.e., those of 20 or more weeks' gestation; for still others, they are foetal deaths of at least 3 months' gestation.

In addition, there is the variation that exists among countries in the proportion of the foetal deaths for which gestational age is unknown. As noted above, except, for the total, ratios are computed only on foetal deaths of known gestational ages, hence, ratios by age for countries where the number with unknown age is relatively large, will not be comparable with those for a country where the unknowns are negligible.

In view of the differences in content and the basic deficiencies in registration completeness, it must be emphasized that no real basis exists for comparing ratios by age from country to country. At this stage of development, the principal justification for including statistics by gestational age is that they can assist in defining more clearly the content of other foetal-death tables, they can show the lack of reporting at young gestational ages and they can give, for some countries, and indication of the relative distribution of foetal deaths according to gestational age.

Table 19

This table, which is appearing for the third time in the *Demographic Yearbook*, presents the trend of perinatal deaths and ratios for the period 1965-1973 . The first time the table was published in the 1961 *Demographic Yearbook*, it covered the period 1952-1960;[64] in the 1966 *Demographic Yearbook* it covered the period 1956-1965.

Perinatal mortality ratios are designed to measure the risk of dying during the period near parturition, that is, immediately before, during and after birth. This use is predicated on the premise that the factors influencing neonatal mortality are more closely related to those influencing prenatal or foetal mortality than they are to those effective in postneonatal infant mortality. A composite measure is also justified on the well-founded assumption that some deaths during the first few days of life are inadvertently (or in some cases deliberately) registered and counted as a late foetal death rather than as a live birth and a neonatal death, and that a combination of the frequencies in these two categories would, therefore, be free of the limitations of under- or over-statement assumed to be inherent in the two categories used separately.

Perinatal, for purposes of this table, is defined as the *period of prenatal existence after viability is reached, the duration of labour, and the early part of extra-uterine life.*[65] For computation purposes, the lower limit of viability is taken as 28 completed weeks of gestation; thus late foetal deaths, as set forth in table 17, comprise one component of "perinatal" deaths. The other component i.e., "early part of extra-uterine life" is taken to be mortality during the first six days of life (also known as early neonatal, or semanatal, mortality) shown in table 21.

In accordance with usual practice, a quality code **C**, **U** and. . . is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: Data for 99 countries or areas are included in this table; this coverage is essentially the lowest common denominator from tables 17 and 21.

Ratio computation: Ratios are the number of perinatal deaths reported each year per 1 000 live births for the same year. These ratios, therefore, will be the sum of the late foetal-death ratios shown in each of table 17 and 18 and the under-7-day mortality rates shown in table 22.

Limitations: Except for the deficiencies due to imperfect registration of deaths of live-born infants who die during the first few days of life which, by definition, are eliminated, all the limitations of foetal death statistics, infant death statistics and live birth statistics, as described above must still be borne in mind in evaluating international comparability of perinatal statistics.[66]

The varying degrees of completeness with which foetal deaths are registered in different countries are perhaps the most important limitation on international comparability. Coupled with this are the differences in the national statistics of late foetal death as regards the minimum gestational age. The late foetal death component may refer to those over 28 weeks of age, over 20 weeks of age, or even to all foetal deaths irrespective of age. When this lower limit is known, it is noted in the table, but it must be emphasized that the dimensions of the late foetal death definition are not clear in all cases and, as can be seen from table 18, distributions by gestational age, which could be used to verify the limits, are not available for all countries.

Another source of variation related to the above is the difference observed in the upper limit of the second component. In principle, deaths during the first week of life are supposed to be included, but in many cases, the classification of infant deaths by detailed age does not provide

[64] A brief analysis of trends in perinatal mortality was presented in the *1957 Demographic Yearbook*, p. 8; data for 1950-1955, analysed by cause, are available in World Health Organization *Epidemiological and Vital Statistics Report*, Vol. 10, No. 11-12, 1957.

[65] This is the definition agreed upon by the Study Group on Perinatal Mortality set up by the World Health Organization Regional Office for Europe, at its first meeting in Brussels, 17-23 September 1953 (Document MH/EUR/74-54, Geneva, 1954, 84 pp., mimeo).

[66] A more detailed treatment may be found in *Foetal, Infant and Early Childhood Mortality*, 2 vols. (United Nations publication, Sales No. 1954.IV.8).

semanatal mortality but rather mortality under 10 or 14 days of age.

The completeness with which live births are registered is also indirectly effective as a limitation on the comparability of perinatal mortality ratios in that unreliable birth figures used as the denominator of the perinatal ratios will artificially inflate them. Likewise, live births tabulated by date of registration rather than by date of occurrence can have an exaggerating effect on the ratios. Moreover, the exclusion from live birth statistics of those live-born infants who die shortly after birth and are, therefore, registered as stillbirths, can have the effect of artificially increasing the perinatal ratios since the denominator will not correspond to the numerator.

Table 20

This table presents new and revised data on the trend of infant deaths (deaths under one year of age) and of infant mortality rates by urban/rural residence for each year, 1965-1974. With the corresponding tables shown in previous issues, it provides infant death statistics from 1932 to 1974 for a number of countries or areas.

Frequencies shown have been obtained in most part from civil registers of death, and rates based on these data have been computed in the Statistical Office of the United Nations by the method described below. In addition, in a number of cases where civil registration data are known to be non-existent or unreliable, it has been possible to include numbers and rates estimated from survey results which are thought to reflect the true level of infant mortality. To distinguish them from civil-registration data, they are identified and their nature explained in foot-notes. The registered data for the same years are also given in foot-notes, if possible.

Urban is assumed to have been defined to accord with the national definitions of "urban" used in the censuses of population. These national definitions are set forth at the end of table 6.

In accordance with the usual practice, the code which indicates the quality of civil-registration data is presented in the first column of the table in the form **C**, **U**, and . . ., and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on page 19.

It should be noted that the quality code is not applicable to estimated numbers and rates so that when these are combined in the series with data from civil registers, the code shown applies only to the latter. Where a series consists only of estimated rates, the code column will show two dots (. .).

Coverage: Date are available in this table for 158 countries or areas, of which 47 are differentiated as to urban and rural residence. Ethnic or geographic segments of the population are included in the absence of national figures; these data are not nationally significant but they serve to make the table an index to the availability of infant mortality statistics throughout the world.

Rate computation:

Crude registered infant-mortality rates are the number of deaths under one year of age during the year per 1 000 live births which occurred during the same time period.

Urban and rural rates are the number of deaths under one year of age reported as urban and rural per 1 000 urban or rural live births in the same year.

Estimated rates, obtained from sample survey results, are the number of infant deaths estimated to have occurred during the reference period (usually 12 months preceding the date of the survey) per 1 000 live births estimated to have occurred in the same period.

Where frequencies are available, rates have been computed in the Statistical Office of the United Nations, using the live births shown in table 9.

Since the rates have been computed in accordance with the conventional method, no adjustment was made to take account of the fact that a proportion of the infant deaths which occur during a given year are deaths of infants who were born during the preceding year and hence are not taken from the universe of births used to compute the rates. However, unless the number of live births or infant deaths is changing rapidly, the error involved is not important.[67]

Limitations: Infant death statistics are subject to all the limitations of vital statistics in general and of death and live-birth statistics in particular.

Perhaps the most important and widespread limitation on comparability results from compiling statistics of infant deaths and live births by date of registration rather than date of occurrence of the events. Where these procedures obtain, a large increase, for whatever reason, in the number of live births registered in any one year may introduce sizable errors into the registered infant mortality rates, especially since deaths tend to be more promptly reported than births.

If the delay in registration remains nearly constant, and is approximately the same for births and deaths, the rates are not affected to any appreciable degree. But if—as is the case in many countries or areas—a large proportion of the births are not registered until many years after occurrence, then infant mortality rates obtained by relating infant deaths for any one year to births which occurred over a period of years, have little validity. Because of the importance of this factor, especially as it relates to the live births which constitute the denominator of the infant mortality rates, the statistics known to be by year of registration are identified in foot-notes.

Even on a date-of-occurrence basis, underregistration of births and infant deaths also affects the infant mortality rates unless the proportion registered is the same for both components. The code **C** or **U**, discussed in detail on p. 19 will serve as a guide in this connexion. This code refers to the completeness with which deaths under one year are registered and reported. As noted above, differences in levels of completeness between the two components of the infant mortality rate, i.e., the infant deaths and the live births, will bias the rates upward or downward, the direction of bias depending on which component is more fully

[67] For a more detailed discussion of this problem, see W. P. D. Logan, "The measurement of infant mortality", *Population Bulletin of the United Nations, No. 2* (United Nations publication, Sales No. 53.XII.8), pp. 30-67.

registered. This factor is not reflected by the asterisks (**) which distinguish reliable from unreliable data.

Another factor which has a bearing on the completeness of live-birth and infant-death registration is that concerned with the statistical definition of the events to be reported. The exclusion from both the live-birth and the death register of live-born infants who die before 24 hours of age or before registration of birth, may distort the statistics to some extent, tending to give the rates a downward bias. Failure to register as a live birth each infant death which occurs during the first few weeks of life may also be a factor in the lack of comparability among infant-mortality rates, but the effect, if any, would be toward an upward bias.

The method of reckoning infant age at death may also introduce noncomparability. If year alone, rather than completed minutes, hours, days and months elapsed since birth is used to compute infant mortality, many deaths in the first eleven months of life would be classified as having completed one year of age and thus be excluded from the data. Care should be taken to consider this possibility in comparing and rank ordering infant mortality rates. For further discussion, see text of table 22.

In addition to the above, these data are also subject to all the limitations imposed by the lack of international comparability among the national concepts of urbanity and rurality as described in the text of table 6 in this issue. However, since the rates are based on live births and since all vital statistics are assumed to utilize the same definitions, it is assumed that adequate comparability has been achieved between the numerator and denominator of the registered infant mortality rates in respect of urban or rural residence.

On the other hand, estimated rates based on the results of sample surveys are subject to considerable error as a result of omissions in reporting infant deaths or as a result of erroneous reporting of those which occurred outside the period of reference. However, rates estimated from sample sureys do have an outstanding advantage and that is the availability of a "built-in" and strictly corresponding base.

Table 21

Deaths of male and female infants by detailed age and urban/rural residence for each year 1965-1973 are shown in table 21.

Infant death frequencies classified into 4 consolidated age groups have been shown annually, either as part of the general table of deaths by age or (since the 1970 issue) in a separate table. In this issue, which features mortality statistics, the numbers of infant deaths are shown for the secord time since the 1967 issue in single days, weeks and months of age.

Age in this table, as in all others, is defined as hours, days and months of life completed, that is, the difference between the hour, day, calendar month and year of birth and the hour, day, calendar month and year of death.

As noted above, the age classification used is a marked expansion over that shown annually in the frequency tables; it has 21 single-age categories plus an unknown, namely, single days for the first week; single weeks for the first lunar month and single calendar months for the remainder of the year. This classification is in accord with international recommendations for infant death statistics by age.[68]

Male and female deaths are shown separately but data for both sexes combined and those of unstated sex are not shown for lack of space. The latter are given in foot-notes.

Urban is assumed to have been defined to accord with the national definitions of "urban" used in the censuses of population. These national definitions are set forth at the end of table 6.

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for the quality specification may be found on p. 20.

Coverage: Data are shown for 122 countries or areas. Every country or area with data for any year is included irrespective of the number of deaths involved.

Limitations: Infant deaths by age and sex are subject to the limitations of vital statistics in general, of death statistics in particular and of age-reporting errors in addition.

Comparability is also affected by the quality of the data as expressed in the code of completeness attached to the trend table of infant deaths.

The inclusion from some series of deaths of infants who die before their births were registered and who were thereby counted only as stillbirths or as "infants presented without life" may contribute to the lack of comparability among deaths under one year, under 28 days, under 1 week and under 1 day. When this registration factor is known to exist, the qualification is set forth in a foot-note to the table.

Variation in the method of reckoning age at the time of death introduces limitations on comparability. Although it is to some degree a limiting factor throughout the age span, it is an especially important consideration with respect to deaths at ages under one day and under one week (semanatal deaths) and under 28 days (neonatal deaths). As noted above, the recommended method of reckoning infant age at death is to calculate duration of life in minutes, hours and days, as appropriate. This gives age in completed units of time. In some countries, however, infant age is calculated to the nearest day only, that is, age at death for an infant is the difference between the day, month and year of birth and the day, month and year of death. The result of this procedure is to classify as deaths at age one day many deaths of infants dying before they have completed 24 hours of life. The under-one-day class is thus understated while the frequency in the one-day-age group is inflated.

A special limitation on comparability of neonatal (under 28 days) mortality is the variation in the classification of infant age used. It is evident from the foot-notes in the tables that many countries continue to report infant age in calendar, rather than lunar month (4-week or 28-day) periods.

[68] *Manual of the International Statistical Classification of Diseases, Injuries and Causes of Deaths, 1965 Revision,* volume 1, p. 471 and *Principles and Recommendations for a Vital Statistics System,* para.269, Tabulation ID-3.

Table 22

Annual rates of infant mortality by age and urban/rural residence for each sex separately and both sexes combined are presented in table 22 for the period 1965-1973. This table up-dates the corresponding table shown in the 1967 issue, and carries forward the series shown successively in the 1951, 1957, 1961, 1966 and 1967 issues.

Age, in this table as in all others, is defined as hours, days and months of life completed, based on the difference between the hour, day, month and year of birth and the hour, day, month and year of death.

The age classification used in this table is a consolidation of that employed in the corresponding frequency table 21; it consists of 5 grouped categories of infant age, namely, under 1 day, 1-6 days, 7-27 days, 28 days-5 months, and 6-11 months. Unknown age is included only in the rate for age under 1 year.

This classification distinguishes the lunar month of 28 days in accordance with international recommendations for infant mortality statistics.[69]

Deaths of unstated sex are included in the rate for both sexes and hence these rates, shown in the first column of the table, should agree with the conventional infant mortality rates shown in table 20. Discrepancies of any magnitude are explained in foot-notes.

Coverage: Rates are available for 124 countries or areas while the corresponding distribution for urban and rural population separately is available for only 10. The criterion for rate computation was a total frequency of infant deaths for both sexes combined of 50 or more. National and sub-national figures which met this criterion are included.

Rate computation: Rates are the number of infant deaths of the specified age and sex which occurred in the year, per 1 000 live births of the same sex during the same period. Thus the base of each age-sex rate is the same as that of the rate for all ages of the same sex, and no adjustment was made to take account of the fact that some of the deaths were those of infants born not in the current year but in the preceding one. Live births used in the denominator of the rates are those presented in table 9 and in previous issues of the *Demographic Yearbook*.

Limitations: Infant mortality rates by age are subject to all the limitations set forth in connexion with table 21. They are also affected by the limitations of live birth statistics described in connexion with table 9, perhaps the most important being that which results from tabulation of live births by date of registration rather than date of occurrence. The implications of this procedure have been set forth in connexion with table 20 above, to which reference should be made.

Underregistration of births and deaths, as indicated in the quality codes appended to tables 9 and 20, also introduces non-comparability, the direction of the bias depending on which component is more completely registered.

Variations in the statistical definition of a live birth and a stillbirth have been discussed on p. 21. It may be noted that data for Guadeloupe and Martinique could be used to evaluate the effect of this factor.

[69] *Ibid.*

The method of reckoning infant age at death to the nearest day, disregarding hours, versus the method of reckoning time elapsed between date of birth and date of death in minutes, hours, and days as appropriate, introduces a source of non-comparability. This factor is particularly troublesome in determining the number of deaths under 1 day and those classified in the next age interval; care should be taken to consider this in analysing rates—especially in these age groups.

Failure to tabulate infant deaths under 4 weeks of age in terms of completed days introduces another source of variation between countries. Deaths described as occurring "under one month" usually connote deaths within any one calendar month; rates based on these frequencies are not strictly comparable with those referring to deaths within 4 weeks or 27 completed days. Many other differences in age classification will be evident from the table, including 5, 10 or 14 days rather than 7 days for the upper limit of the semanatal mortality period, and 6 rather than 5 completed months for the division between intermediate and late infant mortality. The effect of these differences is difficult to determine but they should be borne in mind in using the rates.

Table 23

Table 23 shows infant deaths (under one year of age) by calendar month of deaths for the nine years, 1965-1973. This is the second time that these monthly frequencies have been published in the *Demographic Yearbook*. The 1967 issue provided similar information for the period 1962-1966.

Data in this table are "final" figures compiled by calendar month of death rather than provisional monthly frequencies which are usually compiled from a count of deaths entered in the register during the month in question, irrespective of the date when the death occurred.

These data from civil registers of death and those believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: Data by month for 119 countries are included in this table. Of these, 77 countries show final figures while for 42 they are provisional and presumably based on registrations.

Limitations: Infant death statistics are subject to all the limitations of vital statistics described beginning p. 18 and of death statistics in particular.

For a number of reasons, deaths under one year are more likely to be underregistered than deaths at older ages. The two asterisks used to indicate date of questionable reliability should be of assistance in evaluating this factor.

Another limiting factor which has a bearing on the completeness of infant death registration is the variation in the statistical definition of the events to be reported. The exclusion from the death register of live born infants who die before 24 hours of age or, alternately, before registration of birth, may distort the statistics to some extent.

Since these data are a one-year segment of the distribution of deaths by age, they may suffer also from errors in

age reporting, especially the deflationary effect brought about through calculating infant age by subtracting year of death from year of birth, rather than computing completed months of life. For investigating the possibility of this error, reference should be made to table 21, where detailed age is given.

Attention is also directed to the variation among countries in the basis of tabulation, i.e., by date of occurrence or by date of registration. A foot-note identifies a country which routinely tabulates according to date of registration of death. The implications of this practice are described on p. 20 but it should be noted that it is a much more important consideration in respect of monthly data because of the variation in the length of the statutory time period allowed for registering a death. An additional consideration in connexion with monthly frequencies is the fact, as noted under "Coverage" above, that some of the data shown in this table are provisional, and thus have probably been compiled on the basis of date of registration rather than date of death. International comparability is not possible between series of these two types.

Finally it may be emphasized that these frequencies are by month of death and have not, therefore, been adjusted for variation in the number of days in the different calendar months, an adjustment which must be made before seasonal patterns and variation in infant mortality can be determined. A second adjustment, required especially when the number of births (the denominator of the rates) is changing rapidly, is one which requires the allocation of the infant deaths to the month of birth, since the conventional method of computation will not give accurate rates.

Table 24

This table presents new and revised data on the trend of deaths and crude death rates by urban/rural residence for each year 1965-1974. With the corresponding tables shown in previous issues, it provides death statistics from 1932 to 1974 for a number of countries or areas, and rates back to 1920.

Frequencies shown have been obtained in most part from civil registers of death, and rates based on these data have been computed in the Statistical Office of the United Nations by the method described below. In addition, in a number of cases where civil registration data are known to be non-existent or unreliable, it has been possible to include estimated data which are thought to reflect the true levels of mortality. These data for isolated years have been obtained from sample surveys, from analysis of consecutive census results and from informed guesses. Also included in the table are estimated rates for 1965-1970 prepared by the Population Division of the United Nations. These rates are based on the estimated number of deaths obtained by adding to the 1965 population total the estimated number of births obtained as described in connexion with table 24 and subtracting the 1970 sex-age projected total population adjusted for net migration. To distinguish them form civil registration data, estimated rates are identified and their nature explained in footnotes. Corresponding registered data, when available, are given at the end of the table.

Urban is assumed to have been defined to accord with national definitions of urban used in the censuses of population. These national definitions are set forth at the end of table 6.

In accordance with the usual practice, the code which indicates the quality of civil-registration data is presented in the first column of the table in the form **C**, **U** and . . . and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 19.

It should be noted that the quality code is not applicable to estimated numbers and rates, so that, when these are combined in the series with data from civil registers, the code shown applies only to the latter. Where a series consists only of estimated rates, the code column will show two dots (. .).

Coverage: Deaths statistics are shown for 223 countries or areas; of these, 56 show the urban/rural distribution. Data for segments of population, e.g., non-indigenous population and population living in a major city, are included when statistics for the country or area as a whole are not available. Such data are of only minor significance, but they do serve to indicate the areas for which death statistics are obtainable.

Rate computation: Crude registered death rates are the number of deaths reported for a calendar year per 1 000 persons present in the same geographic area at the mid-point of the year.

Urban and rural death rates are the number of deaths reported as urban and rural per 1 000 urban or rural population at the mid-point of the year.

Estimated rates obtained from sample survey results are the number of deaths estimated to have occurred during the reference period (usually 12 months preceding the date of the survey) per 1 000 persons estimated to have been resident when the survey took place.

Rates for years where frequencies are available have been computed in the Statistical Office of the United Nations on the mid-year estimates of population which are set forth in tables 5 and 6. Every effort was made to achieve strict correspondence between the numerator of the rate (deaths) and the denominator (population), and notes are used to describe instances where correspondence could not be obtained.

Limitations: Death statistics from registers are subject to all the limitations of vital statistics, described on p. 18 and of death statistics described on p. 22.

The limitations imposed by the quality code, and the classification of data as reliable or unreliable, are particularly pertinent. Although the factor is of greatest importance in connexion with live births, attention is directed to the variation among countries or areas in the basis of tabulation, i.e., by date of occurrence or date of registration. A foot-note identifies countries or areas which tabulate according to the registration date. The implications of this practice are described on p. 20.

The possibility of error being introduced by exclusion of deaths of infants who died before registration of birth should not be overlooked.

In addition to the above, death statistics by urban/rural residence are subject to all the limitations imposed by the lack of international comparability among the national concepts of urbanity and rurality as described in the text

for table 6 in this issue. Perhaps most important is the difficulty of achieving strict comparability between the numerator and the denominator of the rates. It may not be evident, for example, that the definitions of "urban" and "rural" used in connexion with death statistics in the numerator are different from those used in the population statistics which form the denominator. Such an inconsistency would tend to invalidate the rates. Unfortunately it is not possible to document the agreement presumed between these concepts. Computed rates are affected also by the quality and limitations of the population estimates used in their computation.

On the other hand, estimated rates based on the results of sample surveys are subject to considerable error as a result of omissions in reporting deaths or as a result of erroneous reporting of those which occurred outside the period of reference. However, rates estimated from sample surveys do have an outstanding advantage and that is the availability of a "built-in" and strictly corresponding population base.

Despite their limitations, deaths and crude death rates provide a measure of gross deletions from the population and hence, in combination with crude birth rates, some estimate of population growth rates. They can also give a general idea of trend over time within one area and information which allows the rough classification of countries or areas according to levels of mortality. It must be emphasized, however, that because they take no cognizance of differences in the age-sex composition of populations and since mortality is highest at the older any younger ages, crude death rates are not strictly comparable from area to area or for the same area over time and care should be exercised in using them for this purpose.

Table 25

Distributions of deaths, by age, sex, and urban/rural residence are set forth in table 25 for the period 1965-1973. In this issue, reference should be made to table 21 for the breakdown by days of age at death of infants under 1 year of age, which have been included in this table in recent issues of the *Demographic Yearbook*. Tables 21 and 25, combined with the corresponding age/sex data for earlier years shown in the 1951, 1957, 1961, 1965 and subsequent issues of the *Demographic Yearbook*, provide a 38-year trend of mortality by age and sex for a number of countries or areas. Data for the latest available year cross-classified by urban/rural residence have been shown in each issue since the *Demographic Yearbook, 1967*.

Age, unless otherwise noted, is assumed to be expressed in completed years of life.

The classification of age employed is in accordance with international recommendations,[70] namely: under one year of age, 1 to 4-years, 5-year groups from 5-9 years to 80-84 years, a residual group of 85 and over, and unknown.

Urban is assumed to have been defined to accord with the national definitions of urban used in the censuses of population. These national definitions are set forth at the end of table 6.

[70] *Principles and Recommendations for a Vital Statistics System*, para. 268, tabulation DE-4 and *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death, 1965 Revision*, vol. I, p. 471.

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area after the year, as appropriate.

A description of the basis for this quality specification may be found on p. 20.

Coverage: Deaths by age and sex are shown for 142 countries or areas while the corresponding distributions for urban and rural population separately is available for only 34.

Every country or area with data for any year is included irrespective of the number of deaths involved, as well as data for subnational segments (geographic or ethnic). Thus, the table may serve to indicate most of the countries or areas which currently tabulate deaths by age, sex and urban/rural residence and those which follow the United Nations recommended age classification.

Limitations: Deaths by age, sex and urban/rural residence are subject to the limitations for vital statistics in general and death statistics in particular. They are also subject to the limitations implied by the code of completeness, which was described in connexion with vital statistics in general (p. 18) and which appears in table 24. Comparability may also be affected to some degree by differences in the basis of tabulation, i.e., by date of occurrence or by date of registration. A foot-note identifies countries or areas which tabulate according to the registration date.

The exclusion of deaths of infants who died before their births were registered, and were thereby counted only as stillbirths or as "infants presented without life", may contribute to the lack of comparability among total deaths and deaths under one year. When this registration factor is known to exist, the qualification is set forth in a foot-note to the table.

Because the data in this table are classified according to age, they are subject to the inaccuracies of age reporting described in connexion with population. The factors influencing inaccurate reporting may be somewhat dissimilar in vital statistics (because of the differences in the method of taking a census and registering a death) but, in general, the same errors can be observed. As in census tabulation, the absence of frequencies in the unknown age group does not necessarily indicate complete age reporting; it may also be an indication that the unknowns have been eliminated either by imputing an age before tabulation or by proportionate distribution after tabulation.

Variation in the method of reckoning age at the time of death introduces limitations on comparability. Although it is to some degree a limiting factor throughout the age span, it is an especially important consideration with respect to deaths under one year (infant deaths); for a complete discussion of the method of reckoning infant age at death, see the text of tables 21 and 22.

Differences in methods of calculating or reporting age at death persist throughout the age span, with some countries or areas following the recommended procedure of expressing age in completed years of age, that is, in calculating age by subtracting day, month and year of birth from day, month and year of death, while others use only the year of birth and year of death. This has the effect of overstating each age group at the expense of the one

immediately preceding it but, except for the initial and terminal groups, the effect is probably cancelled out.

In addition to the above, death statistics by urban/rural residence are also subject to all the limitations imposed by the lack of international comparability among national concepts of urbanity and rurality as described in the text for table 6 in this issue.

Table 26

Death rates specific for age, sex and urban/rural residence are presented in table 26, for the period 1965-1973. A similar table for the latest available year was last published in the 1972 *Demographic Yearbook* while a trend of age-sex specific death rates was presented in the 1966 issue. These, together with series shown in previous issues, provide a 39-year trend of mortality rates by age and sex for a number of countries. In some cases, the latest year available by urban/rural residence is not as current as that for age and sex alone, in which case the two distributions are shown.

Age is defined as it is in table 25, that is, in terms of completed years.

The age classification is the same as that used in previous issues namely, an initial age class of under 1 year followed by 1-4 and 5-year age groups to 80-84; a residual terminal group of 85 years and over completes the classification. Deviations from these categories are shown in the table by consolidation bars.

Urban in this table is assumed to have been defined to accord with the national definitions of "urban" used in the censuses of population. These national definitions are set forth at the end of table 6. Definitions which differ from those are given in foot-notes.

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: Rates for 106 countries or areas which have distributions totalling 50 or more deaths are included in this table. Of these, 106 are age-sex specific rates while a smaller number (18) are specific also for urban/rural residence. The lesser coverage is due to the fact that (1) the urban/rural cross-classification of deaths is available for fewer countries and (2) the corresponding population base is more difficult to locate.

Rate computation: Rates are the number of deaths that occurred within a given age-sex—urban-rural group during the course of a year, per 1 000 persons falling within that same group at the middle of the year or at some other date within the year. The populations used as a base for the computation are the results of an enumeration or survey, or a mid-year estimate based on an enumeration adjusted in time by the use of vital and migration statistics. Distributions estimated by the pro-rating method of applying to the total the percentages of population in each age group at the time of the census were not used for computation of rates.

Deaths at unknown age and the population of unknown age were disregarded except as they formed part of the death rate for all ages combined.

It should be noted that the rates for infants under 1 year of age in this table differ from the infant mortality rates shown elsewhere, because the latter are computed in relation to live births rather than per 1 000 population.

Also, in a number of cases the rates shown here for all ages combined differ from those shown elsewhere, because in this table they are computed on the population for which an appropriate age-sex distribution was available, while the total rates shown elsewhere may utilize a different total population. The population by age and sex might refer to a census date within the year rather than to the mid-point, or it might be more or less inclusive as regards ethnic groups, armed forces and so forth. In a few instances, the difference is attributable to the fact that the rates in this table were computed on the mean population (obtained by averaging age data for two successive Decembers) whereas the corresponding rates in table 24 were computed on an estimate for 1 July. Differences of these types are insignificant but, for convenience, they are noted in the table.

Limitations: This rate table is based on the absolute frequencies from table 25 and is therefore subject to all the limitations mentioned in connexion with that table.

The problem of obtaining precise correspondence between deaths (numerator) and population (denominator) as regards the inclusion or exclusion of armed forces, refugees, displaced persons, and other special groups, is particularly difficult where age-specific death rates are concerned. In cases where it was not possible to achieve strict correspondence, the differences in coverage are noted. Male rates in the age range 20 to 40 years may be especially affected by this non-correspondence and care should be exercised in using these rates for comparative purposes.

It should be added that even when deaths and population do correspond conceptually, comparability of the rates may be affected by abnormal conditions such as absence from the country of large numbers of young men in the military forces. Death rates may appear high in the younger ages, simply because a large section of the able-bodied members of the age-group, whose death rates under normal conditions might be less than the average for persons of their age, is not included.

Tables 27 and 28

Tables 27 and 28 are devoted to deaths and death rates by cause. Table 27 presents a trend of deaths and death rates by cause for each year 1965-1973, together with an indication of the extent to which deaths in each cause group were medically certified. Using these data in combination with those from table 20 of the 1966 *Demographic Yearbook*, table 17 of the 1961 *Demographic Yearbook*, table 14 of the 1957 *Demographic Yearbook* and from the 1951 and 1952 *Demographic Yearbooks*, a series beginning 1947 may be constructed, provided adjustments are made for changes in the classification scheme used.[71] If differences are observed in data for the same year published in different issues, those in the latest issue may be assumed to be correct.

[71] For comparability of statistics of cause of death according to the fifth and sixth revisions of the International List, see "Comparability of Statistics of Causes of Death According to the Fifth and Sixth Revisions of the International List" (World Health Organization, *Bulletin*, Supplement 4), Geneva, 1952.

Death and death rates by cause, specific for sex, are shown in table 28 for the latest available year. A similar table appeared in the 1967 *Demographic Yearbook*.

Causes of death are "*All those diseases, morbid conditions or injuries which either resulted in or contributed to deaths, and the circumstances of the accident or violence which produced any such injuries.*[72]

The underlying cause of death, rather than the direct or intermediate antecedent cause, is the one recommended as the main cause for tabulation of mortality statistics. It is defined as (a) *the disease or injury which initiated the train of events leading directly to death, or* b) *the circumstances of the accident or violence which produced the fatal injury.*[73]

Each table is divided into two parts, A and B. Part A shows deaths and death rates classified according to the "Abbreviated list of 50 causes for tabulation of mortality", recommended by the International Conference for the Seventh Revision of the International Lists of Diseases and Causes of Death.[74] The 1955 (seventh) revision[75] is known or assumed to have been used by all of the countries or areas for which data are included in part A. Part B is devoted to data classified according to the "List of 50 causes for tabulation of mortality", recommended by the Eighth Revision Conference 1965 and adopted by the Nineteenth World Health Assembly.[76] The two-part presentation is required because the 1965 Revision does not provide a classification which conforms directly to the one immediately preceding it, namely the 1955 Revision, and although the new Revision was recommended to come into effect as from 1 January 1968 a number of countries have not yet introduced it into the coding, classifying and tabulating of cause of death.

It will be noted that the full title of each of the 50 Cause Groups, and the Detailed List Numbers included, appears in English and French only at the beginning of part A and part B of each table. On every other page, the stub of the table is represented by the *List Numbers B1-B46 and BE47-BE50*. This abbreviation of the normal stub entries was adopted because of space limitations.

Medically certified deaths are those which are reported to have been recorded or certified by a medical attendant. Causes for which type of certification is unknown are assumed not to have been certified by a medical man but by a lay person; hence, they are excluded.

Percentages of deaths medically certified are shown in all cases where these ratios are less than 100 per cent: Where all causes are reported to have been medically certified, a special foot-note is used.

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: A total of 201 countries or areas appears in table 27 (126 in part A and 75 in part B) and a total of 124 appears in table 28 (21 in part A and 103 in part B). The criteria used to determine whether or not data for an area should be included were two: first, availability of statistics classified by, or convertible to, the 1955 or 1965 Lists mentioned above; and second that within this distribution, the total number of deaths classified as due to ill-defined causes (*B45*) does not exceed 25 per cent of deaths from all causes. The second criterion is based on the premise that if 25 per cent of the deaths have been coded as due to ill-defined causes, frequencies in the other 49 cause groups in the Classification must be understated to a marked degree. The limit has been placed deliberately high; it might better be at 10 per cent to exclude all poor data. Moreover, it must be admitted that this criterion fails to consider the equally indicative percentages in *B46*—a residual category which often accounts for an inordinately large proportion of the whole.

Rate computation: For cause groups *B1-B38*, and *B45-BE50*, rates are the number of deaths in each cause group reported for the year, per 100 000 persons in the mid-year estimate of the population for the same year. For the other cause groups, populations which more nearly approximate the population at risk of death are used, as specified in the following paragraphs.

In part A, rates for *B39* (Hyperplasia of the prostate) are based on male population 50 years and over, rates for *B40* (Deliveries and complications of pregnancy, childbirth and the puerperium) are based on female population of all ages, rates for *B41* (Congenital malformations) are based on total population and rates for *B42* (Birth injuries, postnatal asphyxia and atelactasis), *B43* (Infections of the newborn) and *B44* (Other diseases peculiar to infancy, and immaturity unqualified) are computed per 100 000 total live births in the year.

Similarly, in part B, rates for *B39* (Hyperplasia of the prostate) are based on male population 50 years and over, rates for *B40* (Abortion) and *B41* (Other complications of pregnancy, childbirth and the puerperium. Delivery without mention of complication) are based on female population of all ages, rates for *B42* (Congenital anomalies) are based on total population and rates for *B43* (Birth injury, difficult labour and other ranoxic and hypoxic conditions) and *B44* (Other causes of perinatal mortality) are computed per 100 000 total live births in the year.

The population used in the computation of rates in this table may generally be found in table 5, total live births may be found in table 9.

Limitations: Cause-of-death statistics are subject to the defects already described as limiting the international comparability of vital statistics in general and death statistics in particular. These include differences in completeness of the statistics, differences in the basis of tabulation, and exclusion from the cause distribution of those infants born alive who died within 24 hours of birth or before registration, and who, therefore, were registered as "stillbirths". In several countries, tabulation procedures have been devised to separate these pseudo-stillbirths from true

[72] *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death, 1965 Revision,* volume I, p. 469.
[73] *Ibid.*
[74] Held in Paris under WHO auspices from 21 to 28 February 1955.
[75] *Manual of the International Statistical Classification of Diseases, Injuries and Causes of Death,* based on the Recommendations of the Seventh Revision Conference, 1955, and adopted by the Ninth World Health Assembly under the WHO Nomenclature Regulations, volume I (Geneva, 1957), 393 pp.
[76] *Manual of the International Statistical Classification of Diseases, Injuries and Causes of Death,* based on the Recommendations of the Eighth Revision Conference, 1965, and adopted by the Nineteenth World Health Assembly, WHO (Geneva, 1967).

stillbirths and to incorporate them into the total deaths, but even in these cases there is no way of knowing the cause of the death. Such distributions are foot-noted.

More important than these, however, are differences among countries in the quality, availability, and efficiency of medical services, certification procedures, and coding practices. In most countries, when a death is registered and reported for statistical purposes, the cause of death is required to be stated. This statement of cause may have several sources: (1) If the death has been followed by an autopsy, presumably the "true" cause will have been discovered; (2) If an autopsy is not performed but the decedent was treated prior to his death by a medical attendant, the reported cause of death will reflect the opinion of that physician based on observation of the patient while he was alive; (3) If, on the other hand, the decedent has died without medical attendance, his body may be examined (not autopsied) by a physician who, aided by the questioning of persons who saw the patient before death, may come to a decision as to the probable cause of death; (4) Still another possibility is that a physician or other medically-trained person may question witnesses without seeing the decedent and arrive at a diagnosis; (5) Finally, there is the case where witnesses give the cause of death without benefit of medical advice or questioning. These five possible sources of information on cause of death constitute in general five degrees of accuracy which may be judged from the proportions of deaths from each cause medically certified. These proportions are set forth in table 20 of the *Demographic Yearbook, 1966*.

Serious difficulties of comparability may stem also from differences in the form of death certificate being used, an increasing tendency to enter more than one cause of death on the certificate, and diversity in the principles by which the primary or underlying cause is selected for statistical use when more than one is entered.[77]

Differences in terminology used to identify the same disease also result in lack of comparability in statistics. These differences may arise in the same language in various parts of one country, but they are particularly troublesome between different languages. They arise even in connexion with the medically certified deaths, but they are infinitely more varied and obscure in cause of death reported by lay persons. This problem of terminology and its solution are receiving attention by the World Health Organization.

Coding problems, and problems in interpretation of rules, arise constantly in using the various revisions of the *International Statistical Classification of Diseases, Injuries and Causes of Death*. Lack of uniformity between countries in these interpretations and in adapting rules to national needs result in lack of comparability which can be observed in the statistics. They are particularly evident in causes which are coded differently according to the age of the decedent, such as pneumonia, diarrhoeal diseases, and others. Changing interpretations and new rules can also introduce disparities into the time series for one country. Hence, large increases or decreases in deaths reported from specified diseases should be examined carefully for possible explanations in terms of coding practice, before they are accepted as changes in mortality.

Except for the hidden differences produced by the factors described above, the various categories of the Lists should be nominally comparable. However, attention must be called to an anomaly which exists in some distributions—particularly in countries of Asia and the Caribbean—in connexion with deaths due to accidents and violence. In these distributions, only a portion of the deaths have been classified according to the External Cause (E) classification as *BE47-BE50* while a second group has been classified solely according to the Nature of Injury (N) classification. These deaths cannot, therefore, be included in the separate *BE* categories and the latter are correspondingly under-stated. These aberrations are noted in the table.

In addition to the qualifications explained in foot-notes, particular care must be taken in using distributions with relatively large numbers of deaths attributed to ill-defined causes (*B45*). The all-other-causes group (*B46*) must also be scrutinized. Large frequencies in the two categories, *B45* and *B46*, may indicate that causes of death among whole segments of the population have been undiagnosed, and the distribution of known causes in such cases is likely to be quite unrepresentative of the situation as a whole. An examination of the distribution from this point of view, together with the general quality code found in table 24 and the visual classification of statistics into reliable and less reliable as indicated by the type face used, should provide a basis for a rough evaluation of the quality of cause-of-death statistics. For a more detailed discussion of the development of statistics of causes of death and the problems involved, see chapter II of the *Demographic Yearbook, 1951*.

Table 29

Deaths by cause and age for males and females separately during the latest available year are presented in table 29 for the first time since the 1967 issue.

The reference year for data shown tend to be 1972 or 1973. In the *1967 Demographic Yearbook*, the data referred most often to *1965* or *1966*. These, together with data around *1959* shown in the *1961 Demographic Yearbook*, with data around 1955 shown in the *1957 Demographic Yearbook* and those for a year around 1950, presented in the 1951 issue provide the basis for studying change over time, keeping in mind the possible lack of continuity among the *1938*, *1948*, *1955* and *1965* Revisions of the International Statistical Classification.

Causes of death are *"All those diseases, morbid conditions or injuries which either resulted in or contributed to death, and the circumstances of the accident or violence which produced any such injuries"*.[78]

The underlying cause of death, rather than the direct or intermediate antecedent cause, is the one recommended as the main cause for tabulation of mortality statistics. It is defined as (a) *the disease or injury which initiated the train of events leading directly to death, or* (b) *the circumstances of the accident or violence which produced the fatal injury*.[79]

[77] Comparability of Statistics of Causes of Death According to the Fifth and Sixth Revisions of the International List (World Health Organization, *Bulletin*, Supplement 4, Geneva, 1952).

[78] *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death, 1965 Revision*, volume I, p. 469.

[79] *Ibid.*

The classification of cause of death is the same as that used in tables 27 and 28, namely, the Abbreviated List of 50 Causes for Tabulation of Mortality.[80] However, in this table, the stub consists of the *Abbreviated List Numbers B1 to BE50;* for the full titles and the detailed list numbers included, see table 27, p. 706 for the English and for the French.

Age is age at last birthday, or completed years, as defined for other tables showing this characteristic.

Sex: Data by cause and age are shown for males and females separately, but not for both sexes because of space limitations.

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: Table 29 contains one cause-age-sex distribution for each of 72 countries. This is somewhat fewer than the potential capacity of the table. The first criterion employed for inclusion was that total deaths for both sexes combined totalled at least 1 000. The second criterion for inclusion was that deaths be coded by cause according to the 1955 or 1965 Revision of the International List and tabulated by the Abbreviated List of 50 Causes for Tabulation of Mortality or by a tabulation list directly convertible to it, e.g., the Intermediate List. A third criterion was that the frequency in category *B45 (Senility, without mention of psychosis, ill-defined and unknown causes)* accounted for less than 25% of the total deaths for at least one of the sexes.

Limitations: These data are subject to all the qualifications of death statistics in general and, in addition, those produced by errors in age reporting and in certifying and classifying cause of death. Since these have all been set forth in connexion with other tables, they will not be repeated here. Reference should be made to the text of table 25 for age-reporting problems and to that of tables 27 and 28 for difficulties of cause-of-death reporting and classifying. The general accuracy of these cause-of-death statistics may be judged from the proportions of deaths from each cause reported to have been medically certified set forth in table 27.

Every effort has been made to query doubtful cause/age frequencies, as for example, deaths from suicide *(BE49)* or homicide *(BE50)* at infant and childhood ages; where these cases remain in the statistics they are noted as probably due to imperfect coding. On the other hand, deaths reported as due to complications of pregnancy *(B40)* which would normally be expected only among females in the reproductive ages, appear unnoted at older ages because coding practices in some countries allow this cause to be acceptable beyond the childbearing period.

International comparisons of cause-of-death statistics are fraught with very real dangers of misinterpretation, not only because of the variation between countries in the proportion of deaths medically certified for cause, but also because of the lack of uniformity in the method of selecting the principal cause when more than one is given on the certificate. Final statistical classification of the reported cause poses another potential source of variation. These, together with more general factors, have been discussed in connexion with tables 27 and 28; they were discussed in more detail in chapter II of the *1951 Demographic Yearbook* and in the *Handbook of Vital Statistics Methods*, to which reference may be made.

[80] Manual . . ., *op. cit.*, p. 361.

Table 30

Deaths by marital status, age and sex of the decedent are shown in table 30 for the latest available year.

This is the fourth time these statistics have been included in the *Demographic Yearbook*. They were first shown in the *1958 Demographic Yearbook* as elements for the study of dissolution of marriage; they are included in this issue as they were in the 1961 and 1967 issues as statistics useful for the analysis of mortality patterns.

Marital status is defined as *the personal status of each individual in relation to the marriage laws and customs of the country.*[81] The international recommendations recommend at least the following categories: (a) single, i.e., never-married, (b) married, (c) widowed and not remarried, (d) divorced and not remarried and (e) married but legally separated.[82]

Marital status in this table, is classified into a maximum of seven and a minimum of four categories, depending on availability of data. The minimum, which is standard for the table, comprises single, married, widowed and divorced; these are augmented—if the data permit—by two sub-classes of married, namely, consensually married and separated, and by unknown if required. When the four standard categories appear unqualified, they are assumed to be constituted as follows: (1) single, i.e., never married (including annulled); (2) married, including persons in stable *de facto* (customary or consensual) unions and persons legally or *de facto* estranged, i.e., separated, from their spouses; (3) widowed, not re-married; (4) divorced, not re-married. Changes in the stub, foot-notes or brackets have been used to explain deviations from the above.

Age, defined here as elsewhere in the *Demographic Yearbook* as completed years, is classified into 11 categories, beginning with under 15, 15-19, 20-24 and thence proceeding in 10-year age groups to 75-84, 85 and over, and unknown. When statistics did not conform exactly to these classes, bars or foot-notes are used to indicate the limits.

It will be noted that data for the under-15 category are sometimes shown as not available (. . .). This indicates that the tabulation of deaths by marital status is not made for persons under 15 years of age on the assumption that all are single. The absurdity of this assumption for some countries may be seen by reference to the minimum marriageable age given in table 12 and also to the distribution of population by marital status, last shown in the *1973 Demographic Yearbook.*

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

[81] *Principles and Recommendations for the 1970 Population Censuses,* para 238.

[82] *Ibid.*

Coverage: Data for 84 countries or areas are shown in table 30 by marital status, age and sex.

Limitations: These death statistics are subject to all the limitations of vital statistics and deaths described beginning p. 22, including unreliability, variation in coverage and so forth. Only the total deaths and those under 15 years are affected by the definitions which result in the exclusion of infants born alive who die before registration of birth, but frequencies at all ages are subject to the age-reporting errors described on p. 16 and mentioned in connexion with table 25.

Comparability is affected by the accuracy of the response to the question on marital status of the decedent. In connexion with population enumeration, it is believed that many divorced persons report themselves as single, married or widowed, while married males separated from their spouse, may report themselves as single. There are no data which would allow an evaluation of this factor in respect of death reporting, but it seems reasonable to assume that incorrect response would be less likely to occur on death reports. This is so because information on death is usually supplied by a relative of the decedent who would presumably have the correct information and, moreover, the factors inducing an incorrect report are not so operative after the death of the person concerned.

Variation in the composition of the marital status categories may also be a factor in comparability. The disposition of decedents whose marital union was a consensual one, is a case in point. Because it is believed that the marital status of most of these would be reported as "married", the United Nations has recommended that when deaths in this class are not tabulated separately, they be included with married. The degree to which this recommendation is followed is not known. Similarly with the category "separated": decedents who were separated from their spouse at the time of death are to be considered as "married" for purposes of this table, but the category is known to be included with divorced in some cases. Unknown marital status poses problems also. In some countries, no deaths are recorded as being of unknown marital status—because a status has been assigned to the decedent before tabulation. In other countries, this category shows considerable frequencies. These possible differences in the composition of marital status categories should be borne in mind in comparing frequencies.

One further limitation must not be overlooked in using the data from this table. It concerns the homogeneity, in so far as marital history is concerned, of the persons represented by the frequencies in the various marital status categories. In this respect, only the single may be said to represent a homogeneous group. Decedents reported as married may have been previously divorced or widowed; those classified as divorced were previously married and some may also have been previously widowed; widowed persons were previously married, widowed or divorced. Because of this overlapping of categories, none, with the exception of single, is actually complete as regards marital history. All exclude persons who have changed status. This factor must be taken into consideration in evaluating mortality differentials.

Table 31

Death rates specific for marital status, age, and sex for the latest available year are set forth in table 31. The year to which the rates refer is determined by availability of a corresponding distribution of population by marital status, age and sex, and the absolute numbers of deaths classified by these characteristics. Since the necessary base population is generally available only from a census of population, the years shown in table 31 are not as recent as those for which frequencies are available in table 30.

Age and marital status are defined and classified as they are in table 30 except that categories for unknown age and unknown marital status are omitted in the rate table (see Rate computation below). As in table 30, data for the under-15-years category are sometimes shown as not available because the tabulation of deaths by marital status is limited to decedents of 15 or more years of age.

Data believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: Rates for 48 countries or areas are shown in table 31 by marital status, age and sex. The number of countries or areas able to be included is sharply limited by lack of an appropriate population base for computation of rates specific for the characteristics involved.

Rate computation: Rates are the number of deaths in each age/sex/marital status group per 1 000 population in the same group. Deaths at unknown age or of unknown marital status are not distributed nor are rates computed for them.

Limitations: Because these rates specific for marital status, age and sex are based on frequencies similar to those set forth in table 30, they are subject to the same limitations of comparability as are described in connexion with table 30. They are also, of course, subject to the analogous problems of the reporting and classification of marital status and age encountered in connexion with census taking as described below.

Comparability of population statistics, by marital status and age are subject to special limitations originating in the enumeration itself. There is evidence, for example, that the respondent in the enumeration who is "divorced" may report himself or herself as single, married or widowed. This possibility is confirmed by the fact that the number of divorced persons returned at the census is usually too small in relation to the number of divorces granted and the frequency of re-marriage. Similarly, married males who are separated from their spouses may report themselves as single, while their wives may report themselves correctly as married. Another type of response error is the possibility that a woman with an illegitimate child will be reported in the census as married, while the father of the child is reported correctly.

In respect of classification, the same types of variation may exist whereby apparent uniformity of the major categories conceals important differences.

Perhaps the most important element in these considerations is the disposition of the consensual or *de facto* unions, especially in those countries where such unions are relatively numerous. Disregarding errors of response, which cannot in any case be estimated, achieving comparability becomes a function of either tabulating the

group separately—in which case it may be identified—or of including it with another category. Evidence seems to indicate that partners of consensual unions are more likely to report themselves as married than as single. Because of this tendency and because they are, from the demographic point of view "married", the United Nations has recommended that, when not tabulated separately, persons reporting these statuses be classified as "married".[83]

Similarly, the sub-category of population reported as "separated" may be of uncertain composition. It may contain persons whose marriage has been suspended by legal process, or it may include as well, married persons who are simply living apart and who may or may not intend to remain apart. Since laws and practices with regard to legal separation differ within and among countries, genuine comparability for this group is probably out of the question. Because of this, separated persons are generally included in the category "married", although they are sometimes tabulated separately or combined with "divorced".

There is evidence that the errors in civil registration and enumeration may not be exactly the same and that errors of response may be more numerous in connexion with the census. This may be due, in part, to the fact that the respondent in a census enumeration is not necessarily the person who is cognizant of the true facts concerning the age or marital status of another member of the household on whom he is supplying information to the enumerator. Age, for example, may more often be reported at the census in digits ending in zero or five. Divorced and separated persons may erroneously be reported as single at the census, while those in consensual unions, if not reported separately, will more likely be enumerated as married than in the true marital status which would likely be reported at death registration. For the same reason, marital status is more likely to be recorded as unknown at the census, than it is at death registration.

However, the actual extent of these theoretical inconsistencies may be judged from an investigation of the comparability of reports on marital status between the census of population and the civil register of death completed *inter alia* by authorities in the United States.[84] According to this retrospective study, the married group has the highest level of correspondence, 97 per cent; and the single, widowed, and divorced groups ranged downward at 88, 82 and 69 per cent, respectively. A British study,[85] very similar in approach to the United States investigation, showed that 97 per cent of the male decedents 35 to 64 years old were reported in the same marital status category in the two sources; for the married group, the figure is 98 per cent; for the single, 88 per cent; and for the widowed and divorced together, 94 per cent.

In addition to differences in response which are due primarily to differences in the identity of the informant, census statistics may be classified by marital status in a different way. It is obvious, for example, that independent categories for consensual unions and separated appear much more often in population census data then they do in distributions of deaths by marital status.

Finally, cognizance must be taken of the fact that with the exception of the group reported as "single", the various categories cannot be viewed as comprising a homogenous group of people in so far as marital history is concerned. Decedents reported as married at the time of death may have been previously widowed or divorced; widowed persons may have previously been divorced and *vice versa*. Differentials observed in the rates must be studied with this factor in mind.

Table 32

Table 32 shows total deaths by calendar month of death, for the nine years 1965-1973. These monthly frequencies have been published twice before in the *Demographic Yearbook*, namely in the 1951 issue, where data for 1946-1950 were presented, and in the 1967 issue, where data for 1962-1966 were presented.

Data in this table are "final" figures compiled by calendar month of death, rather than provisional monthly frequencies which are usually compiled from a count of deaths entered in the register during the month in question, irrespective of the date when the death occurred.

These data are from civil registers of death and those believed to be unreliable (incomplete) or of unknown reliability are identified by two asterisks (**) placed after the name of the country or area or after the year, as appropriate. A description of the basis for this quality specification may be found on p. 20.

Coverage: Data by month for 138 countries or areas are included in this table. Of these, 83 countries or areas show final figures while for 55 they are provisional and presumably based on registration.

Limitations: Death statistics are subject to all the limitations of vital statistics as described beginning p. 18 and of death statistics in particular.

The limitations imposed by the quality code and the classification of data as reliable or unreliable, are particularly pertinent.

Another limiting factor which has a bearing on the completeness of death registration is the variation in the statistical definition of the event to be reported. Exclusion from the death register of live-born infants who die before 24 hours of age or before registration of birth may distort the statistics to some extent.

Attention is also directed to the variation among countries in the basis of tabulation, i.e., by date of occurrence or by date of registration. A foot-note identifies countries or areas which tabulate according to the date of registration of death. The implications of this practice are described on p. 20 but it should be noted that it is a much more important consideration with respect to monthly data because of the variation in the length of the statutory period allowed for registering a death. An additional consideration in connexion with monthly frequencies is the fact, as noted under "Coverage" above, that some of the data shown in this table are provisional, and thus have probably been compiled on the basis of date of registration rather than date of death. International comparability is not possible between series of these two types.

[83] *Principles and Recommendations for National Population Censuses, op. cit.*, para 410.

[84] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census.* U.S. Department of Health, Education, and Welfare, Public Health Service, National Office of Vital Statistic; *Vital Statistics—Special Reports*, Vol. 53, No. 1, June 1961, p. 24.

[85] General Register Office, *1951 Census of England and Wales, General Report*, H.M. Stationery Office, London, 1958.

Finally it may be pointed out that these frequencies are by month of death and have not therefore been adjusted for variation in the number of days in the different calendar months, an adjustment which must be made before seasonal patterns and variation in mortality can be determined.

Table 33

Expectation of life ($\mathring{e}_x$) values by age and sex for the two latest available years are set forth in table 33. Together with those shown in previous issues of the *Demographic Yearbook*, they give a time series covering 74 years for some countries or areas.

Values from the two latest official life tables—complete or abridged—are included, and in general they cover the period 1900-1973. Values from tables relating to the period 1950-1965 are available in the 1966 *Demographic Yearbook*. Values from life tables relating to the period 1940-1960 may be found in table 24 of the 1961 *Demographic Yearbook*, while those for 1900-1940 may be found in the 1957 and 1953 *Demographic Yearbooks*. The latest value of expectation-of-life is also published annually in the *Demographic Yearbook*.

The data come mainly from the official life tables of the countries or areas concerned. Where official data are lacking, however, available estimates of life expectancy at birth, recently prepared by the Population Division of the United Nations, are included. These United Nations estimates have been prepared by use of the techniques described in the United Nations manual on *Methods of Estimating Basic Demographic Measures from Incomplete Data*[86] and the application of assumed rates of gain in life expectancy based on model life tables[87] and other information. United Nations estimates are identified in the table by foot-notes.

Expectation of life is defined as the average number of years of life which would remain for males and females reaching the ages specified if they continued to be subjected to the same mortality conditions as obtained in the period mentioned.

Male and female expectations are shown separately for selected ages beginning at birth (age 0) and proceeding with ages 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 and 85 years.

Data are shown to the number of digits provided in the original computation, a policy which produces a mixture of one and two decimal values.

Since the values shown in this table come either from official life tables or from estimates prepared at the United Nations, they are all considered to be reliable. With regard to the values taken from official life tables, it is assumed that, if necessary, the basic data (population and deaths classified by age and sex) have been adjusted for deficiencies before their use in constructing the life table.

Coverage: Official values are available in table 33 for 159 countries or areas and United Nations estimates for an additional 38 countries or areas. Lack of reliable base data restricts the number of countries or areas for which official life tables can be constructed but, even so, the coverage has increased notably in the last few years.

Limitations: Expectation-of-life values are subject to all the limitations of population and mortality statistics.

Perhaps the most important specific qualifications which can be set forth in connexion with expectation of life values is that they must be interpreted strictly in terms of the underlying assumption that surviving cohorts are subjected to the age-specific mortality rates of the period to which the life table refers. Thus, in interpreting $\mathring{e}_{50}$ in the 1970-1972 life table for England and Wales it may be said that, if males reaching age 50 were to experience for the rest of their lives the same age-specific mortality rates that obtained during the period 1970-1972, they would, on the average, live 23.0 years past the age of 50 or to 73.0 years of age. Experience during the past decades have indicated, however, that an assumption of unchanging mortality in fact understates the expectation of life, since mortality rates are decreasing almost universally.

Table 34

Life-table mortality rates by age and sex are shown in table 34. These data come from the official life tables of the countries or areas concerned; none has been derived in the Statistical Office of the United Nations.

Values from the two latest official life tables—complete or abridged—are included and, in general, they cover the period 1900-1973. Values from tables relating to the period 1950-1965 are available in the 1966 *Demographic Yearbook*. Values from tables relating to the period 1940-1960 may be found in table 25 of the 1961 *Demographic Yearbook* while those for 1900-40 may be found in the 1957 and 1953 *Demographic Yearbooks*.

The *age-specific mortality rate* is the basic function of the life table; it is commonly described by the symbol q_x, in which the subscript "x" refers to the age. The values shown in table 34 are expressed as 1 000 q_x and represent the number dying at age x per 1 000 persons reaching age x, or the probability per 1 000 of dying within one year (or within the specified age interval) after reaching age x.

In table 34, male and female mortality rates are shown separately for selected ages beginning at birth (age 0) and proceeding with ages, 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 and 85 years.

The life-table mortality rate differs from the central death rate in that it refers to persons reaching the given age during the course of a year, rather than to persons of that age in the middle of the year. Thus, it is similar in concept to the infant-mortality rates.

The complete life table gives rates for each single year of age; an abridged life table gives rates for aggregated ages, usually 5-year age groups. Some of the data in table 34 are of the latter type and are so indicated by foot-notes. In these cases, the mortality rate is the probability of dying, not within one year after reaching the age indicated, but within the number of years specified by the age group.

Since this function comes from an official life table and since it is assumed that, if necessary, the basic data (popu-

[86] *Manuals on Methods of Estimating Population, Manual IV* (United Nations publication, Sales No. 67.XIII.2).

[87] *Manuals on Methods of Estimating Population, Manual III, Methods for Population Projections by Age and Sex* (United Nations publication, Sales No. 56.XIII.3); *Regional Model Life Tables and Stable Population*, by A.J. Coale and Paul Demeny (Princeton, Princeton University Press, 1966).

lation and deaths classified by age and sex) have been adjusted for deficiencies before their use in constructing the life table, no attempt has been made in the Statistical Office to evaluate the quality of the values.

Coverage: Mortality rates are shown for 100 countries or areas. Lack of reliable base data restricts the number of areas for which life tables can be constructed but, even so, the coverage has increased notably in the last few years.

Limitations: Life-table mortality rates are subject to all the limitations of life tables, set forth on p. 23, as well as to the limitations of population and mortality statistics in general.

The method of computing the rates has been described in general terms on p. 23. Special problems arise in deriving q_x values for the very young ages and for the end of life. For the young ages, q_x values are frequently obtained by using the statistics of births occurring in the proximate years and estimating from them the number of persons at risk of dying in the period to which the life table relates. At the older ages, data are frequently so scanty or unreliable that they have to be subjected to considerable manipulation if a reasonable series of q_x values is to be derived from them. In many cases, the life-table q_x values at the older ages do not depend in any way on the registered deaths at those ages, but have been estimated on the basis of q_x figures for younger ages.

Although the aberrations due to age reporting are usually "smoothed out" to obtain a succession of reasonable values from age to age, comparability may be impaired by differences in methods of adjustment.

Table 35

Life-table survival values for males and females at various ages are presented in table 35. These data come from the official life tables of the countries concerned; none has been derived in the statistical Office of the United Nations.

Values from the two latest official life tables—complete or abridged—are included and, in general, they cover the period 1900-1973. Values from tables relating to the period 1956-1965 are available in the 1966 *Demographic Yearbook*. Values from tables relating to the period 1940-1960 may be found in table 26 of the 1961 *Demographic Yearbook*, while those for 1900-1940 may be found in the 1957 and 1953 *Demographic Yearbooks*.

Life-table survival values, commonly known as l_x values, are derived from the q_x of the life table; they represent the number of males or females surviving to each successive age or central age out of a cohort born alive and subjected thereafter to the mortality rates of the given life table. In other words, these values are the proportion of persons born alive who are expected to survive to any given age x. The radix of the life tables (the initial cohort) is usually 100 000, although in some cases shown in table 35, it is 10 000 or 1 000.

Survivors are shown for males and females separately and for ages beginning with zero and proceeding with 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 and 85 years.

Since this function comes from an official life table and since it is assumed that if necessary, the basic data (population and deaths classified by age and sex) have been adjusted for deficiencies before their use in constructing the life table, no attempt has been made to evaluate the quality of the values, and hence none are set in italics.

Coverage: Table 35 includes survival values for 100 countries or areas. As noted in connexion with tables 33 and 34, the number of countries for which values are available has increased despite the lack of reliable base data.

Limitations: Like other values from the life table, the number of survivors are subject to the general limitations of the basic population and death statistics and, in addition, to variations in the methods used to construct the life table. These have been described on p. 23.

The uncertainty of mortality rates at the very young and older ages introduces a special problem, as noted in connexion with table 34. Because of this, values for older ages especially are little more than estimates.

NOTES TECHNIQUES SUR LES TABLEAUX STATISTIQUES

INTRODUCTION

ORIGINE DES DONNÉES

Sauf indication contraire, les statistiques présentées dans l'*Annuaire démographique*[1] sont des données officielles. Elles ont été rassemblées par le Bureau de statistique de l'Organisation des Nations Unies à partir de publications officielles et de renseignements que communiquent mensuellement ou annuellement, en réponse à des questionnaires ou dans leur correspondance, les services officiels de statistiques ou autres services gouvernementaux compétents de plus de 240 pays ou zones.

Afin d'assurer la comparabilité du point de vue des méthodes de calcul, tous les taux et rapports autres que les valeurs des fonctions des tables de mortalité (à l'exception de quelques cas signalés dans les tableaux) ont été calculés au Bureau de statistique de l'Organisation des Nations Unies selon les méthodes exposées pour chaque tableau. Les chiffres de population utilisés pour le calcul des taux sont ceux qui figurent dans la présente édition de l'*Annuaire* ou qui ont paru dans une édition antérieure.

Chaque fois que l'on constatera des différences entre les données du présent volume et celles des éditions antérieures de l'*Annuaire démographique,* ou de certaines publications apparentées, on pourra en conclure que les statistiques publiées cette année sont des chiffres révisés communiqués au Bureau de statistique avant le 31 mars 1975.

ORDONNANCE ET NUMÉROTATION DES TABLEAUX

Les tableaux qui figurent dans la présente édition de l'*Annuaire démographique* sont présentés en deux groupes. Le groupe I comprend les tableaux publiés chaque année et le groupe II contient les tableaux portant sur le sujet spécial — en l'occurrence, les statistiques de la mortalité. Les tableaux sont numérotés selon l'ordre où ils apparaissent dans le volume.

SUJET SPÉCIAL

Le sujet qui est traité plus spécialement dans la présente édition est celui des «Statistiques de la mortalité», auquel sont consacrés 21 tableaux, dont 10 font normalement partie de l'*Annuaire* et y figurent chaque année, mais sous une forme moins détaillée que lorsqu'ils rentrent dans le cadre du sujet spécial.

CHAMP DES STATISTIQUES

Portée géographique

Conformément aux plans adoptés à l'origine, on a cherché à rendre la portée géographique des tableaux aussi large que possible. Chaque tableau présente des données sur tous les pays ou zones qui en ont communiqué et, dans la mesure du possible, les données se rapportant à l'ensemble du pays ou zone ou à la population totale du pays ou zone. Lorsque les données ne portaient pas sur l'ensemble de la population, on les a présentées selon les grands secteurs de la population auxquels elles se rapportent. Ces données ont été reproduites non parce qu'elles sont représentatives, mais pour indiquer de quelles statistiques on disposait. Il convient de noter que la publication de toutes les données disponibles n'implique aucun jugement de valeur sur leur exactitude, sauf dans la mesure où elle se traduit dans les codes de qualité dont il est question aux pages 60 à 62.

Le tableau 3 est le plus complet; il donne l'effectif de la population et la superficie de chaque pays comptant au moins 50 habitants. Après celles du tableau 3, les données les plus complètes sont les séries chronologiques et les statistiques de l'état civil. Les tableaux où la variable est une caractéristique de la population sont de portée plus limitée, la portée géographique diminuant encore lorsque l'on introduit plusieurs variables ou que le tableau comporte des taux ou des rapports.

Composition territoriale

Autant que possible, les séries chronologiques aussi bien que les distributions de fréquence se rapportent au territoire actuel (1974) des pays ou zones indiqués. Lorsque le territoire auquel les chiffres se rapportent diffère du territoire de 1974 on a signalé en note la nature de la différence.

Lorsqu'il était nécessaire de préciser la composition actuelle du territoire, à cause de changements fréquents ou récents de frontière, ou pour d'autres raisons, on a indiqué les points saillants au tableau 3. Des précisions ont également été apportées dans d'autres tableaux lorsque les changements influaient sur les données présentées.

Les données relatives à la République populaire de Chine comprennent en général les données relatives à la province de Taïwan lorsqu'il s'agit de statistiques concernant la population, la superficie, les ressources naturelles, les conditions naturelles, tel que le climat, etc. Dans d'autres domaines statistiques, elles ne comprennent pas les données relatives à la province de Taiwan, sauf indication contraire. Ainsi, dans la présente édition les données publiées sous la rubrique «Chine» comprennent les données relatives à la province de Taiwan.

Définition de la population

Lorsqu'on a rassemblé les statistiques démographiques nationales en vue de leur publication, on s'est efforcé

[1] Pour les numéros de vente des éditions antérieures, voir "Sujets spéciaux" des diverses éditions de l'*Annuaire démographique,* 1948-1974, p. iv du présent volume.

essentiellement d'obtenir des données sur la population présente ou population de fait, plutôt que sur la population de résidence habituelle ou population de droit. Donc, sauf indication contraire, il faut supposer que les statistiques de la population et celles de l'état civil concernent à la fois les nationaux et les étrangers nés dans le territoire ou à l'étranger, les aborigènes, les tribus de la jungle, les nomades, les personnes déplacées, les détenus, les réfugiés, ainsi que toutes autres catégories de personnes se trouvant dans le pays ou zone à une date donnée. Par conséquent, lorsque les estimations de population ont été ajustées de manière à englober les militaires nationaux et le personnel diplomatique en poste hors du pays ou zone et à exclure les militaires étrangers, le personnel diplomatique étranger et les prisonniers de guerre ennemis se trouvant sur le territoire, on l'a indiqué dans les tableaux contenant les chiffres de population et, au besoin, dans ceux où sont présentés des taux calculés à partir de ces chiffres.

NOMENCLATURE

Noms de pays ou zones

Pour gagner de la place, on a jugé commode de désigner les pays dans les tableaux par les désignations abrégées couramment utilisées par les Nations Unies au 31 décembre 1974, les désignations officielles complètes n'étant utilisées que lorsqu'il n'existait pas de forme abrégée[2]. Toutefois, pour plus de clarté, on a fait figurer dans le tableau 3 les désignations officielles complètes pour les pays suivants : Royaume-Uni de Grande-Bretagne et d'Irlande du Nord, États-Unis d'Amérique, Union des Républiques socialistes soviétiques, République socialiste soviétique de Biélorussie et République socialiste soviétique d'Ukraine.

[2] Pour une liste de la plupart de ces régions, voir *Names of countries and adjectives of nationality* (document des Nations Unies ST/CS/SER.F/285 et Corr.7).

Ordonnance des noms de pays ou zones

Excepté pour les courts tableaux 15 et 16, dans lesquels les noms des pays ou zones ont été classés mondialement dans l'ordre alphabétique anglais, dans les colonnes des tableaux qui leur sont réservées, les noms des pays ou zones sont répartis par continents, ces derniers étant eux-mêmes classés dans l'ordre alphabétique anglais (Afrique, Amérique du Nord, Amérique du Sud, Asie, Europe et Océanie, plus l'URSS). Pour chaque continent, les noms des pays ou zones apparaissent dans l'ordre alphabétique anglais.

Les appellations employées dans la présente édition et la présentation des données qui y figurent n'ont d'autre objet que de donner un cadre géographique commode aux séries statistiques. La même observation vaut pour toutes les notes et précisions fournies sur les unités géographiques pour lesquelles des données sont présentées.

ÉVALUATION DE LA QUALITÉ DES DONNÉES

Comme on avait commencé à le faire dans l'édition de 1959 de l'*Annuaire démographique*, on a cherché, dans la présente édition, à différencier les données selon leur degré d'exactitude en utilisant autant que possible pour l'impression deux caractères distincts : le romain pour les données reconnues relativement exactes et l'italique pour les données dont l'exactitude est moindre. Toutefois, dans les tableaux portant sur le sujet spécial (tableaux 15 à 35) on a fait suivre de deux astérisques (**) le nom des pays ou zones ou les années pour lesquels les données sont incomplètes ou le degré d'exactitude des données n'est pas connu (voir l'explication des signes à la p. x). On trouvera plus loin, sous les rubriques «Population» et «Statistiques de l'état civil», des indications sur les méthodes utilisées pour évaluer les données.

SUPERFICIE

DÉFINITION DE LA SUPERFICIE

Dans les tableaux 1 et 3 du présent volume, on trouvera des statistiques sur l'étendue ou la superficie des territoires considérés. Le tableau 3 donne le chiffre estimatif le plus récent de la superficie de chacune des unités géographiques du monde. Le tableau 1 indique la superficie totale de l'ensemble du monde, de huit grandes régions et de 22 régions qui en font partie. Sauf indication contraire, tous ces chiffres sont censés représenter des superficies totales, c'est-à-dire qu'ils englobent les terres émergées et les eaux intérieures, qui sont censées comprendre les principaux lacs et cours d'eau, à la seule exception des régions polaires et de certaines îles inhabitées.

Les superficies sont exprimées en kilomètres carrés; le cas échéant, on a converti en kilomètres carrés les chiffres qui avaient été communiqués en miles carrés, sur la base de 2,589988 kilomètres carrés pour un mile carré. L'utilisation d'un autre coefficient conduirait évidemment à des résultats un peu différents. En outre, les chiffres ont été arrondis à l'unité la plus proche.

Le fait que certains chiffres sont différents de ceux que l'on a publiés précédemment s'explique par la révision des estimations antérieures de la superficie, par des augmentations effectives de la superficie terrestre — dues par exemple à des travaux d'assèchement — ou par l'utilisation de nouvelles unités de mesure. Dans la plupart des cas, il a été possible de déterminer la raison de ces révisions; toutefois, lorsqu'on n'a pas pu le faire, on a néanmoins remplacé les anciens chiffres par les nouveaux en admettant que ce sont ces derniers qui sont exacts. Quelques légers changements dans les chiffres de superficie par rapport à ceux qui ont été publiés précédemment proviennent également de l'emploi du coefficient indiqué plus haut (2,589988), que le Bureau de statistique a adopté

en 1965 en remplacement du coefficient 2,589998 utilisé jusqu'alors.

SOURCES DE VARIATIONS

Le défaut de comparabilité internationale entre les données relatives à la superficie est dû essentiellement à des différences de définition. Par exemple, on ne saurait considérer comme comparables le chiffre de la superficie totale (terres et eaux) et celui de la superficie terrestre, à moins que l'on ne sache que la superficie des eaux intérieures est négligeable. En outre, la définition du terme «eaux» peut varier d'un pays ou d'une zone à l'autre; dans un pays ou zone, ce terme peut s'entendre des principaux lacs et cours d'eau seulement (qui, conformément à la norme, constituent les «eaux intérieures») et, dans un autre, il peut englober aussi la zone maritime comprise à l'intérieur des golfes, les baies et les criques. Des variations de ce genre, surtout lorsqu'il s'agit de pays ou zones ayant des frontières maritimes étendues, peuvent nuire à la comparabilité internationale des données.

Les sources des données relatives à la superficie posent aussi des problèmes. Certaines données proviennent de levés effectués selon des méthodes scientifiques modernes; d'autres ne représentent que des conjectures reposant sur diverses catégories de renseignements. Pour certains pays ou zones, les chiffres sont très récents et tiennent compte des derniers levés et des modifications territoriales importantes qui sont intervenues jusqu'à présent; pour d'autres, les chiffres nets ne sont pas récents et les dernières rectifications de frontières risquent donc d'avoir été négligées. Comme ni la méthode de calcul de la superficie ni la composition du territoire et la date à laquelle se rapportent les données ne sont connues avec précision pour tous les pays, il n'est pas possible de procéder, d'après le tableau 3, à des comparaisons rigoureuses d'un pays ou d'une zone à l'autre.

POPULATION

Cette vingt-sixième édition de l'*Annuaire démographique* est consacrée surtout aux statistiques de la mortalité; aussi les statistiques de la population ne font-elles l'objet que de sept des trente-cinq tableaux, à savoir les tableaux 1, 2, 5, 6, 7 et 8. Ces sept tableaux indiquent : 1) la dimension de la population du pays et des grandes villes; 2) les tendances de la dimension de la population des pays, des continents, des régions et du monde; 3) la structure par âge et par sexe des populations nationales; et 4) la répartition des populations nationales selon la résidence (urbaine ou rurale). Ce sont là les données démographiques dont on a constamment besoin pour la plupart des études. Si limitée que soit leur portée, elles illustrent clairement les types de variations courantes dans les données démographiques en général.

SOURCES DE VARIATIONS

Des variations de plusieurs sortes apparaissent nettement dans les données; ainsi les définitions des caractéristiques et les notions qu'elles recouvrent varient d'un pays ou d'une zone à l'autre et les classifications appliquées dans les différents pays ne sont pas toujours identiques à la classification type adoptée pour les tableaux de l'*Annuaire*. Les variations de cet ordre sont notées dans les tableaux chaque fois que possible; elles sont également expliquées dans la description des différents tableaux[3].

Il y a également d'autres causes plus profondes de variations qui sont communes à toutes les statistiques démographiques mais qui n'apparaissent pas toujours nettement. On peut citer notamment : les différentes conceptions des éléments à inclure dans la population «totale»; le sous-dénombrement ou le surdénombrement et les omissions lors du recensement; l'inexactitude des déclarations d'âge; et les variations dans la fiabilité des estimations. Toutes ces divergences, ainsi que certaines des méthodes utilisées pour en déterminer l'ampleur, seront examinées dans les sections qui suivent.

Définition de la population totale

Pour déterminer dans quelle mesure les données sont comparables, il convient de tenir le plus grand compte des différences de composition de la «population totale» d'un pays ou d'une zone à l'autre. Les variations possibles sont nombreuses mais la population totale d'un pays ou zone est d'ordinaire définie soit comme étant la population présente ou de fait, soit comme étant la population de droit.

Population de fait et population de droit

À proprement parler, la population présente ou de fait comprend toutes les personnes — résidents et non-résidents — dénombrées dans le pays ou zone à l'endroit où elles se trouvaient au moment du recensement. Au contraire, le dénombrement de la population de droit porte sur toutes les personnes qui ont leur résidence normale dans le pays ou zone, quel que soit l'endroit où elles se trouvaient au moment du dénombrement. Aussi simples que ces critères puissent paraître, il est rare de les voir appliquer strictement. De plus, même lorsque les termes en question sont utilisés avec rigueur pour décrire la méthode par laquelle ont été obtenus des totaux partiels dans un recensement national de population, on s'expose souvent à des erreurs quand on les applique à des totaux nationaux aux fins de comparaisons internationales. En outre, le terme utilisé peut définir correctement le lieu de dénombrement (lieu de résidence ou lieu de présence) mais être impropre lorsqu'on l'applique aux données une fois mises en tableau.

Les différences importantes qui existent, d'un pays ou d'une zone à l'autre, dans la composition effective de la population totale recensée, qu'il s'agisse, par définition,

[3] Pour plus de détails, voir *Manuel des méthodes de recensement de la population* : vol. I, *Aspects généraux d'un recensement de la population;* vol. II, *Caractéristiques économiques de la population;* vol. III, *Caractéristiques démographiques et sociales de la population* (publication des Nations Unies, numéro de vente : 58.XVII.6, vol. I, II, III).

de population de fait ou de population de droit, apparaissent dans le tableau A, p. 62, de l'*Annuaire démographique* de 1960, qui indique comment le statisticien a traité certains sous-groupes de population dans les recensements effectués entre 1945 et 1954 dans 52 pays souverains. Les sous-groupes de population se trouvant dans le pays ou zone dont l'inclusion ou l'exclusion du dénombrement est étudiée dans le tableau sont les suivants : tribus nomades, aborigènes, militaires étrangers, personnel de la marine marchande dans les ports ou à terre, personnes déplacées de nationalité étrangère, prisonniers de guerre ennemis, personnel diplomatique étranger, autres civils étrangers résidant de façon permanente dans le pays ou zone et autres civils étrangers temporairement dans le pays ou zone. Les sous-groupes de personnes susceptibles de se trouver hors du pays ou zone au moment du recensement sont les suivants : militaires nationaux, personnel de la marine marchande en mer, personnel diplomatique et autres civils nationaux temporairement absents.

Le manque d'uniformité quant à la manière de situer ces sous-groupes par rapport à la population dite «de fait» et «de droit» montre clairement que ces termes, bien qu'ils soient devenus classiques, ne permettent pas de se faire une idée exacte de la composition de la population «totale». Selon les *Principes et recommandations concernant les recensements de population de 1970*[4] *établis par les Nations Unies*, il ne suffit pas d'indiquer si le chiffre de la population totale représente la population de fait ou la population de droit, car ces deux expressions n'ont pas un sens suffisamment précis. Il n'est fait aucune recommandation quant aux sous-groupes de personnes à inclure dans la population totale ou à en exclure, car cela dépend des conditions et des besoins de chaque pays ou zone. Mais il est recommandé, lorsqu'on donne des détails sur le chiffre total, de spécifier si celui-ci comprend certains groupes déterminés, virtuellement identiques à ceux qui sont énumérés au paragraphe précédent. Lorsque les services des Nations Unies disposent de cette précision, il en est tenu compte dans la présentation des données de l'*Annuaire démographique* et, s'il en ressort que la pratique s'écarte de la définition stricte de la population de fait ou de la population de droit, les données sont affectées d'une note de bas de tableau à cet effet. Dans tous les autres cas, les données sont classées comme se rapportant à la population de fait ou à la population de droit, soit parce qu'elles sont classées comme telles par le pays ou zone intéressé, soit d'après les renseignements relatifs à la manière de traiter les sous-groupes susmentionnés[5].

Exactitude des données de recensement

Évaluation du chiffre de recensement concernant la population «totale»

Qu'il s'agisse de la population de fait ou de la population de droit, il est bien difficile d'éviter à la fois les omissions et les doubles comptes dans le recensement de la population d'une unité géographique donnée. Les difficultés que l'on rencontre sont naturellement plus sensibles dans les pays ou zones où la population n'est pas habituée aux recensements, mais, à vrai dire, elles se présentent dans tous les dénombrements[6].

Même dans les recensements les mieux planifiés et les mieux exécutés, des erreurs sont inévitables, mais une évaluation de l'ampleur des erreurs par défaut — sous-dénombrement net (ou, plus rarement, par excès — sur-dénombrement net) fournit des indications précieuses aux utilisateurs. Ainsi qu'il a été indiqué au chapitre premier de l'*Annuaire démographique* de 1962, un certain nombre de méthodes ont été utilisées à cette fin : enquêtes de contrôle après le dénombrement, comparaisons de bulletins individuels de recensement avec d'autres actes, analyses, etc. Les évaluations ainsi effectuées peuvent parfois conduire à procéder à des ajustements pour compenser les lacunes des données de recensement. Elles peuvent en tout cas, à défaut de cela, donner aux utilisateurs une idée générale de la qualité du recensement et souvent mettre en lumière les sources d'erreur, permettant ainsi d'en réduire l'incidence dans les recensements ultérieurs. Afin de faciliter l'interprétation des données présentées dans les différents tableaux de l'*Annuaire*, on a pris soin d'apporter autant que faire se peut des précisions sur les données de recensement, en indiquant, par exemple, qu'elles se rapportent à la population effectivement dénombrée ou qu'elles ont été ajustées au moyen d'un coefficient de correction[7].

Évaluation de la répartition par âge

L'âge, qui est la caractéristique la plus universellement utilisée dans les statistiques de la population et dans celles de l'état civil, est l'intervalle de temps, déterminé par calcul ou par estimation, qui sépare la date de naissance de la date du recensement; il doit être exprimé en années solaires révolues[8]. L'âge est généralement déterminé au moyen de deux types de questions, posées ensemble ou séparément. Dans un cas, on demande des renseignements sur la date de naissance et, dans l'autre, l'âge exprimé en unités de temps révolu — en années au dernier anniversaire pour les adultes, et en mois, semaines, jours ou heures pour les enfants de moins d'un an. Ces deux méthodes ne donnent pas nécessairement des résultats d'une égale exactitude. Les faits tendent à prouver que la question relative à la date de naissance permet d'obtenir des données beaucoup plus précises que la question directe sur l'âge, mais il va sans dire qu'il serait vain de la poser dans les pays où bien des gens ne connaissent pas leur date de naissance. Il arrive aussi que les réponses à la question directe soient inexactes, que l'erreur ait été faite par ignorance ou de propos délibéré.

Une autre source d'inexactitude réside dans la méthode de classement des données recueillies sur l'âge. La méthode recommandée consiste à passer de la date de naissance à l'âge au dernier anniversaire, en faisant la différence entre la date exacte de la naissance et la date du recensement. Les âges exprimés dans la plus grande unité

possible de temps révolu — c'est-à-dire années, mois, semaines, jours — sont ensuite répartis par groupes d'âge déterminés ou, le cas échéant, classés par année d'âge. Toutefois, on n'a pas toujours recours à la méthode des «années révolues». Dans certains pays ou zones, la population est classée par âge sur la base de l'année de naissance, ce qui revient à définir l'âge par la différence entre l'*année* du recensement et l'*année* de la naissance. En pareil cas tout enfant né dans l'année civile qui précède immédiatement celle du recensement est censé être âgé d'un an, alors qu'en réalité il peut n'avoir pas même un mois révolu. Lorsque ce mode de classement est utilisé, il est généralement facile de s'en rendre compte, car les chiffres dans la catégorie des moins d'un an sont plus faibles qu'ils ne devraient l'être eu égard à l'effectif des groupes suivants. Il est à noter cependant que, dans le cas d'une année de forte natalité, les effets de cette méthode ne sont pas toujours aussi apparents.

Une autre cause de non-comparabilité est l'emploi de méthodes différentes pour le calcul de l'âge, par exemple la méthode occidentale et la méthode orientale, ou, comme on les désigne plus communément, la méthode anglaise et la méthode chinoise. Selon la méthode chinoise, on considère que l'enfant est âgé d'un an à sa naissance et qu'il avance d'un an à chaque nouvelle année chinoise. Les répercussions de cette méthode sont très apparentes dans les données pour le premier âge : les données concernant les enfants de moins d'un an sont nettement inférieures à la réalité. Les effets sur les chiffres relatifs aux groupes d'âge suivants sont moins visibles. Les séries ainsi établies sont souvent ajustées avant d'être publiées, mais il ne faut pas exclure la possibilité d'erreurs de ce genre lorsque l'on compare des données censitaires sur l'âge.

Les causes d'erreur dans l'enregistrement de l'âge sont diverses; on peut citer notamment l'ignorance de l'âge exact, la négligence dans les déclarations et dans la façon dont elles sont consignées, la tendance générale à déclarer des âges se terminant par certains chiffres tels que 0, 2, 5 et 8 et, pour les personnes âgées, à exagérer leur âge, l'aversion irraisonnée pour certains nombres tels que 13 et les fausses déclarations faites délibérément pour des motifs d'ordre économique, social, politique ou simplement personnel. Les causes d'erreur mentionnées ci-dessus sont communes à la plupart des enquêtes sur l'âge et à la plupart des pays ou zones, et elles peuvent nuire sensiblement à la comparabilité.

À cause des difficultés indiquées ci-dessus, les répartitions par âge et par sexe de la population d'un grand nombre de pays comportent des inexactitudes qui sont notamment les suivantes : 1) erreurs par défaut dans les groupes d'âge correspondant aux enfants de moins d'un an et aux jeunes enfants; 2) polarisation des déclarations sur les âges se terminant par les chiffres 0 ou 5; 3) prépondérance des âges pairs au détriment des âges impairs; 4) écart considérable et inattendu entre les données concernant les hommes et les données concernant les femmes pour certains âges; et 5) différence importante et difficilement explicable entre les données concernant des groupes d'âge voisins. En comparant les statistiques fournies par des recensements successifs pour des cohortes d'âge et de sexe identiques et en étudiant la répartition par âge et par sexe de la population à chaque recensement, on peut constater l'existence de ces inexactitudes et de quelques autres, un certain nombre d'entre elles se retrouvant même dans les recensements les plus modernes.

Indice de concentration : Pour déterminer, sur la base des anomalies relevées dans les groupes d'âge quinquennaux, le degré d'exactitude des statistiques par âge, on avait mis au point un indice spécial[9] pour l'*Annuaire démographique* de 1949-1950. Cet indice était sensible à l'influence des différents facteurs qui limitent l'exactitude des données et il n'échappait pas non plus à celle des véritables fluctuations démographiques. On ne pouvait donc l'appliquer indistinctement à toutes les statistiques à moins d'effectuer les ajustements nécessaires et de faire preuve de prudence dans l'interprétation des résultats.

La publication dans l'*Annuaire démographique* de 1955 de statistiques de la population par année d'âge a permis d'utiliser un indice simple, mais très sensible, connu sous le nom d'indice de Whipple ou indice de concentration[10], dont l'interprétation échappe pratiquement à l'influence des facteurs sans rapport avec l'exactitude des déclarations d'âge. Il existe des méthodes plus perfectionnées pour évaluer l'exactitude des répartitions de population par année d'âge, mais on a décidé de se servir de cet indice à cause de sa simplicité et de la large utilisation dont il a déjà fait l'objet dans d'autres publications.

L'indice de Whipple «s'obtient en additionnant les déclarations d'âge comprises entre 23 et 62 ans inclusivement et en calculant le pourcentage des âges déclarés se terminant par 0 ou 5 par rapport au cinquième du nombre total de déclarations. Les résultats varient entre un minimum de 100, s'il n'y a aucune concentration, et un maximum de 500, si aucun âge déclaré ne se termine par un chiffre autre que 0 et 5»[11].

Cet indice est applicable à toutes les répartitions par âge pour lesquelles les années d'âge sont données au moins jusqu'à 62 ans, sauf dans les cas suivants : 1) lorsque les données présentées ont déjà fait l'objet d'un ajustement, l'indice de Whipple ne révèle aucune irrégularité bien que des inexactitudes d'un type différent puissent fausser ces données; 2) lorsque les statistiques relatives à l'âge sont établies sur la base de l'année de naissance et que la tendance à arrondir l'année de naissance se traduit par une fréquence excessive des âges impairs, on ne peut utiliser la méthode reposant sur les

[9] Pour calculer cet indice, on déterminait d'abord, pour chaque sexe, la différence entre l'unité et le rapport du nombre d'individus dans chaque groupe d'âge à la moyenne des nombres correspondants dans les deux groupes d'âge adjacents. On déterminait également les variations du rapport de masculinité d'un groupe d'âge à l'autre. Pour combiner les valeurs moyennes de ces deux séries d'écarts de façon à obtenir l'indice, il fallait tenir compte de facteurs tels que l'influence de mouvements passés du taux de natalité, des pertes de guerre élevées et, le cas échéant, de l'effectif restreint de la population. On trouvera dans le *Bulletin démographique* no 2 (publication des Nations Unies, numéro de vente : 52.XIII.4), p. 64-87, un exposé détaillé sur cet indice ainsi que les résultats de son application aux données présentées dans les éditions de 1949-1950 et de 1951 de l'*Annuaire démographique*. On a fait les mêmes calculs sur les statistiques publiées dans l'*Annuaire démographique* de 1952 et les résultats obtenus sont indiqués dans cette édition de l'*Annuaire*, qui, comme celles de 1953 et de 1954, donne de brèves explications sur l'indice en question.

[10] *United States Bureau of the Census, Thirteenth Census. . .*, vol. I (Washington, D.C., U.S. Government Printing Office), p. 291-292.

[11] J.T. Marten, *Census of India*, 1921, vol. I, première partie (Calcutta, 1924), p. 126-127.

déclarations d'âge se terminant par 5 et 0 pour évaluer l'exactitude des données recueillies.

L'indice de Whipple a été appliqué à un certain nombre de répartitions de la population par année d'âge établies à partir des données fournies par les recensements effectués entre 1945 et 1954; l'édition de 1960 de l'*Annuaire démographique* (p. 65 et 66) ainsi que les éditions de 1955 et de 1956 donnent une évaluation de l'exactitude des déclarations d'âge pour 91 séries.

On a également calculé cet indice pour les statistiques par année d'âge disponibles au 31 décembre 1963 et fondées sur les recensements effectués entre 1955 et 1962. Les résultats de cet essai d'appréciation de 62 répartitions pour l'ensemble des deux sexes ont été publiés dans l'*Annuaire démographique* de 1963, p. 79.

À partir de chiffres relatifs à l'ensemble des deux sexes, on a calculé cet indice pour toutes les statistiques par année d'âge disponibles au 31 décembre 1973 sur la base des recensements effectués entre 1962 et 1973, à l'exception de celles que l'on a écartées pour les motifs indiqués plus haut. Les résultats de cette évaluation provisoire de l'exactitude des distributions correspondant à 113 séries ont été publiés dans l'*Annuaire démographique* de 1973, p. 45.

Valeur des estimations de population

La valeur des estimations de population dépend de la nature et de la qualité des statistiques employées pour les établir ainsi que de la méthode utilisée pour combiner ces statistiques. Le degré d'exactitude d'une estimation est considéré comme suffisant si la probabilité qu'elle contient une erreur relativement importante est faible ou si, dans une gamme de probabilités données, les erreurs sont relativement petites. Ainsi défini, le degré d'exactitude peut se mesurer si les erreurs possibles dans chacun des éléments de l'estimation ont été quantitativement évaluées. En ce qui concerne les statistiques de population, une évaluation quantitative de ce genre n'est faite systématiquement que dans quelques pays ou zones. On ne peut donc, dans la plupart des cas, déterminer le degré d'exactitude des estimations de population que d'une manière approximative, compte tenu des méthodes utilisées pour les établir.

Évaluation des estimations courantes de la population totale

Pour donner une idée approximative du degré d'exactitude probable des estimations courantes de la population totale, un code indiquant la manière dont elles sont établies avait été introduit, à titre d'essai, dans le tableau 1 de l'*Annuaire démographique* de 1949-1950. À la lumière des renseignements et connaissances supplémentaires que l'on a acquis, on s'est aperçu que les légères modifications apportées chaque année depuis 1952 étaient insuffisantes. En 1958, on a jugé possible et nécessaire de procéder à une révision plus radicale pour deux raisons : 1) on était alors en mesure de distinguer plus nettement les facteurs logiques dont dépend l'exactitude de chaque estimation; et 2) il semblait y avoir intérêt à tenir davantage compte de l'écart entre la date où la population a été effectivement mesurée pour la dernière fois (par exemple, la date du dernier recensement) et la date de l'estimation considérée.

Pour établir le nouveau code, on a admis que cinq facteurs influent sur la qualité d'une estimation courante de la population : 1) la nature du chiffre de population qui sert de base; 2) l'erreur probable que comporte ce chiffre de base; 3) le temps écoulé depuis qu'il a été établi; 4) la méthode d'ajustement chronologique ayant servi à mettre à jour le chiffre de base; 5) la qualité de l'ajustement chronologique. Cependant, comme on n'a recueilli jusqu'à présent que très peu d'indications comparables sur l'erreur probable que comportent les chiffres de base, on ne peut prendre systématiquement en considération que les facteurs 1, 3, 4 et 5. C'est pourquoi le code révisé se compose de quatre éléments, à savoir la nature des données de base, leur âge, la méthode d'ajustement chronologique et la qualité de cet ajustement. Voici quels sont les signes conventionnels du code:

Code de qualité des estimations courantes de la population totale[12]

Premier élément. Nature des données de base (lettres majuscules)

- **A** Recensement complet.
- **B** Enquête par sondage.
- **C** Recensement ou enregistrement partiel.
- **D** Estimations conjecturales.
- . . . Nature des données de base inconnue.

Deuxième élément. Age des données de base (indices accompagnant les majuscules)

Dans chaque cas, l'indice est le nombre d'années écoulées depuis l'établissement des données de base.

Troisième élément. Méthode d'ajustement chronologique (lettres minuscules)

- **a** Ajustement d'après un registre de population permanent.
- **b** Ajustement d'après l'équation de concordance (solde des naissances, des décès et de la migration nette).
- **c** Ajustement d'après un taux d'accroissement présumé de la population.
- **d** Pas d'ajustement : base constante pour au moins deux années consécutives.
- **x** Ajustement d'après des estimations de population régionales.
- . . . Méthode d'ajustement inconnue.

Quatrième élément. Qualité de l'ajustement pour les types a et b (chiffre accompagnant la lettre a ou b)

1. Balance démographique sûre.
2. Balance démographique de qualité inconnue mais supposée sûre.
3. Balance démographique non sûre.

Qualité de l'ajustement pour le type c (chiffre accompagnant la lettre c)

1. Au moins deux recensements, à intervalle de dix ans au moins.
2. Au moins deux recensements, l'intervalle entre les deux derniers étant de plus de dix ans.
3. Un ou aucun recensement.

Caractères italiques : Le «Code des estimations courantes de la population totale» ci-dessus permet d'indiquer, sous une forme abrégée, la méthode utilisée pour obtenir le chiffre estimatif de la population totale pour une année récente; dans le présent volume de l'*Annuaire démographique*, il s'agit de l'année 1974. On peut se faire une idée approximative de la qualité de ces estimations en appliquant certains critères fondés sur leur origine.

Tout d'abord, on peut définir comme sûres les estimations fondées sur un recensement de population (codées **A**); celles qui reposent sur une enquête par sondage représentant la majorité de la population (codées **B**); et,

[12] On trouvera des explications plus complètes du contenu de chaque catégorie du code dans l'*Annuaire démographique* de 1964, p. 52-54.

à condition que la population totale soit inférieure à 1 000, celles qui résultent d'un comptage administratif annuel de la population (codées **C**).

Un deuxième critère de fiabilité est la méthode d'ajustement chronologique. L'ajustement chronologique d'après un registre de population (codé **a**), ou d'après l'équation de concordance (codé **b**) est jugé « satisfaisant » à condition toutefois qu'il ait été dûment tenu compte des composantes du facteur d'ajustement. On considère qu'il n'en est ainsi que lorsque **a** et **b** sont combinés avec 1 et 2. L'ajustement chronologique est jugé «moins satisfaisant» dans les cas suivants : ajustement d'après un taux d'accroissement démographique présumé (codé **c**), pas d'ajustement (codé **d**) et méthode d'ajustement inconnue (codée . . .).

L'application des critères ci-dessus donne des estimations «sûres», et moins sûres, ces dernières étant données en italique dans les tableaux de façon à les distinguer des premières, qui sont données en caractères romains.

Évaluation des séries chronologiques d'estimations de la population

Le code décrit ci-dessus a été conçu principalement pour évaluer l'exactitude d'une estimation donnée de la population totale à une date récente. Cependant, comme il y a généralement une certaine continuité dans la manière dont les pays ou zones établissent leurs estimations de population d'une année à l'autre, le code peut aussi s'appliquer dans une certaine mesure aux estimations relatives à d'autres années récentes. Par conséquent, on a décidé de partir du principe que la qualité de la série chronologique tout entière était la même que celle de l'estimation officielle la plus récente[13].

[13] Les estimations des Nations Unies sont obtenues, de préférence, par la méthode qui a servi à établir le chiffre officiel le plus récent. Néanmoins, on est souvent amené, faute de connaître sous la forme voulue les composantes du facteur d'ajustement chronologique, à utiliser une méthode moins satisfaisante; en pareil cas, le code qui indique la qualité de la série chronologique est déterminé par l'estimation officielle la plus récente, à quelque période qu'elle se rapporte.

En conséquence, les tendances chronologiques des estimations sont imprimées en italique si le code pour l'estimation figurant dans la dernière colonne annuelle classe celle-ci comme «moins sûre». On n'a pas cherché à subdiviser les séries, mais il est évident que les données qui sont jugées «sûres» actuellement n'ont pas toutes le même degré de fiabilité et que, pour les premières années, nombre d'entre elles étaient certainement bien moins sûres que la classification actuelle ne semble l'indiquer. Ainsi, il apparaît clairement que cette méthode tend, dans bien des cas, à surestimer la fiabilité probable des séries chronologiques. Elle peut aussi sous-estimer la fiabilité des estimations pour les années qui précèdent ou qui suivent immédiatement un recensement.

Évaluation des répartitions estimatives par âge

La répartition estimative par âge et par sexe de la population peut être obtenue selon deux méthodes principales : 1) en appliquant les composantes spécifiques du mouvement de la population, pour chaque groupe d'âge et pour chaque sexe, à la population dénombrée lors du recensement; et 2) en répartissant proportionnellement le chiffre total estimé pour une année post-censitaire d'après la structure par âge et par sexe au moment du recensement. Les estimations obtenues par la deuxième méthode ne sont pas publiées dans l'*Annuaire démographique*.

Les répartitions estimatives selon l'âge et le sexe qui sont publiées sont classées en deux catégories : «sûres» ou «moins sûres» selon la méthode retenue pour calculer la population «totale». Ainsi, l'appréciation de la qualité du chiffre total telle qu'elle ressort des signes du code est censée s'appliquer aussi à toutes les répartitions par âge et par sexe, et c'est sur cette seule base que l'on décide si les données figureront en caractères italiques ou romains.

Bien que l'exactitude des déclarations d'âge faites au moment du recensement ait été étudiée et que les résultats d'un certain nombre de recensements aient été évalués (voir p. 45 de l'*Annuaire* 1973), on n'a pas cherché à projeter cette évaluation pour l'appliquer aux estimations post-censitaires de la répartition par âge et par sexe.

STATISTIQUES DE L'ÉTAT CIVIL

Selon les *Principes et recommandations pour un système de statistiques de l'état civil*[14] établis par les Nations Unies, les statistiques de l'état civil englobent les statistiques des naissances vivantes, des décès, des morts fœtales, des mariages, des divorces, des annulations, des séparations légales, des adoptions; de la légitimation et de la reconnaissance. Aux fins de l'*Annuaire démographique*, on entend par statistiques de l'état civil uniquement les statistiques des naissances vivantes, des décès, des morts fœtales, des mariages et des divorces.

Les facteurs qui influent sur la comparabilité internationale des statistiques de l'état civil sont à peu près les mêmes que ceux qu'il convient de prendre en considération pour interpréter les variations observées dans les statistiques de la population. La portée des données du point de vue géographique et ethnique, la qualité des statistiques, mesurées d'après le degré de complétude de l'enregistrement et des déclarations dans les requêtes sur les ménages, les erreurs, dues ou non à l'échantillonnage, et autres causes de distorsion, les méthodes d'exploitation et la définition des faits d'état civil aux fins de la statistique sont autant d'éléments qui peuvent influer sur la comparabilité.

Des normes pour l'amélioration des statistiques de l'état civil en ce qui concerne ces facteurs et d'autres facteurs ont été énoncées dans les *Principes et recommandations pour un système de statistiques de l'état civil*[14]. La présente édition du *Manuel de statistique de l'état*

[14] *Principes et recommandations pour un système de statistiques de l'état civil* (publication des Nations Unies, numéro de vente : F.73.XVII.9) par. 38.

civil[15], établi en rapport avec les *Principes* de 1953[16], peut servir de guide pour l'application de ces normes. Le *Manuel* examine en détail les sources d'erreur dans les statistiques de l'état civil traitées ci-après, et il y a lieu de s'y reporter pour obtenir de plus amples renseignements. Il faut également mentionner ici la *Methodology of Demographic Sample Survey*[17], où sont examinés les effets des erreurs d'échantillonnage et des erreurs qui se glissent dans les réponses lors d'enquêtes par interrogatoires directs.

SOURCES DE VARIATIONS

Portée géographique et ethnique restreinte

Bien que l'Organisation des Nations Unies ait recommandé d'établir par priorité des statistiques des naissances vivantes, des décès, des morts fœtales, des mariages et des divorces, ces statistiques sont loin d'être disponibles partout dans la même mesure[18]. Cela tient en partie au manque d'uniformité et d'universalité des législations nationales. Dans certains pays ou territoires, l'enregistrement n'est obligatoire que pour les naissances et les décès. Dans d'autres, il n'existe pas de disposition qui prescrive l'enregistrement obligatoire sur le plan national, mais seulement des règlements ou décrets des municipalités ou des États, qui ne s'appliquent pas à l'ensemble du pays ou de la zone. Il en est encore autrement dans d'autres pays ou zones où les autorités ont institué une zone d'enregistrement comprenant seulement une partie du territoire, le reste étant exclu en raison des difficultés d'accès ou parce qu'il est pratiquement impossible, pour des raisons d'ordre économique ou culturel, d'y procéder à un enregistrement régulier.

En examinant les tableaux, on remarquera que les statistiques fournies par l'enregistrement des faits d'état civil sont particulièrement fragmentaires en Afrique. Il n'y en a guère plus pour une bonne partie de l'Asie et pour certaines régions d'Amérique latine. Dans ces continents, les statistiques sont incomplètes, peu sûres et de portée inégale. Ce caractère fragmentaire nuit gravement à la comparabilité internationale. Il convient de noter toutefois qu'on dispose de plus en plus de taux estimatifs obtenus par la méthode des enquêtes par sondage ou par l'analyse des données de recensement. Bien que ces estimations n'équivalent pas à de bonnes statistiques d'enregistrement, elles fournissent néanmoins des renseignements provisoires appréciables; on les a donc fait figurer dans les tableaux.

Fiabilité des statistiques de l'état civil

La qualité des données varie non seulement parce que dans certains pays ou zones il n'existe pas de disposition qui prescrive l'enregistrement des faits d'état civil, mais aussi par suite de différences d'efficacité, d'un pays ou d'une zone à l'autre, dans l'application des lois. Les modalités d'application de la loi et son degré d'observation par le public déterminent la fiabilité des statistiques tirées des registres de l'état civil.

Évaluation des statistiques de l'état civil pour une année récente

Les imperfections des statistiques de l'état civil apparaissent souvent de manière assez évidente. Un examen des taux calculés ou présumés révélera presque toujours les cas où il est sans doute justifié de soupçonner un défaut de complétude. Toutefois, cette observation est valable uniquement lorsque les statistiques présentent des lacunes évidentes, qu'elles sont exploitées d'après la date de l'événement et que l'estimation du chiffre de population pris pour base est exacte. L'exploitation des données d'après la date de l'enregistrement donne souvent des taux qui paraissent exacts, tout simplement parce que le numérateur est artificiellement gonflé par suite de l'inclusion d'un grand nombre d'enregistrements tardifs[19]; inversement, il arrive que des taux paraissent vraisemblables parce que l'on a sous-évalué la population exposée au risque. Il ne faut pas oublier, en outre, que les renseignements dont on dispose sur les taux de fécondité, de mortalité et de nuptialité sont extrêmement sommaires pour un grand nombre de régions du monde, et les cas limites, qui sont les plus difficiles à reconnaître, sont fréquents.

Comme on risque d'arriver à des résultats très trompeurs si l'on évalue la qualité des données en se fondant uniquement sur les séries présentées dans les tableaux, l'Organisation des Nations Unies s'est tout spécialement efforcée d'obtenir de chaque pays ou zone des estimations de la complétude et de l'exactitude de ses statistiques d'enregistrement des faits d'état civil en utilisant à cet effet les «Questionnaires sur les statistiques de l'état civil» qui sont envoyés chaque année et qui servent à l'élaboration de l'*Annuaire démographique*.

D'après les renseignements directement fournis par les gouvernements, ou tirés des questionnaires et des publications officielles, il a été possible de classer les statistiques courantes de l'enregistrement des faits d'état civil en trois catégories selon leur qualité :

Code de qualité des statistiques de l'état civil

C Données signalées comme virtuellement complètes, c'est-à-dire qui représentent dans la proportion d'au moins 90 p. 100 les faits d'état civil survenus chaque année.

U Données signalées comme discutables, c'est-à-dire qui englobent moins de 90 p. 100 des faits considérés.

. . . Données sur lesquelles il n'a pas été possible d'obtenir de renseignements précis.

Il y a lieu de noter que lorsqu'on a établi les catégories ci-dessus il n'a pas été possible, du fait de l'hétérogénéité des renseignements disponibles, d'appliquer des critères objectifs uniformes. En outre, dans bien des cas, on ne savait pas quels éléments d'appréciation les services nationaux avaient utilisés. Néanmoins, on a estimé que les services nationaux de statistique étaient les mieux placés

[19] Pour l'étude de cette question, voir page 62.

pour évaluer la qualité de leurs propres données et, dans ces cas, leurs évaluations ont été acceptées telles quelles. On a jugé que, malgré leur étendue, les deux catégories qu'il a été possible de distinguer sur la base des renseignements disponibles seraient utiles puisqu'elles donnaient une idée de la fiabilité des statistiques de l'état civil publiées dans l'*Annuaire*.

Les résultats de ce classement (notations **C, U** ou . . .) figurent dans la première colonne des tableaux qui indiquent, pour une longue période, la fréquence totale des naissances vivantes, des décès à tous âges, des décès d'enfants de moins d'un an, des morts foetales, des mariages et des divorces. On trouvera aussi dans les notes des indications touchant les éléments précis sur lesquels se fonde le classement codé **U**, lorsqu'ils sont connus.

Bien que le code apparaisse seulement dans les tableaux qui retracent l'évolution à long terme, il est naturellement applicable à toutes les statistiques de l'état civil récentes publiées dans l'*Annuaire* pour les pays ou zones en question. Aussi, lorsqu'on veut comparer ou analyser les données des tableaux des statistiques de l'état civil quels qu'ils soient, il convient de se reporter d'abord au code de qualité des tableaux retraçant l'évolution à long terme. Toutefois, en ce qui concerne les valeurs des fonctions des tables de mortalité figurant dans les tableaux 33, 34 et 35, on a généralement procédé à des ajustements pour tenir compte de l'insuffisance des données de base.

À proprement parler, le code de qualité s'applique aux nombres absolus de faits d'état civil enregistrés et ne vaut qu'indirectement pour les taux, qui sont calculés en rapportant ces données à une base de population. Toutefois, étant donné que les deux éléments constitutifs d'un taux — le numérateur et le dénominateur — ne sont pas indépendants, surtout lorsque ce sont les statistiques de l'état civil qui ont servi à établir les estimations de population, les taux établis à partir de statistiques de l'état civil discutables sont classés dans la catégorie des données «discutables», bien qu'ils puissent paraître vraisemblables. Il est possible d'évaluer plus justement encore la qualité des taux courants en examinant aussi la qualité des estimations de population.

Les données de la catégorie **U** et celles dont le degré d'exactitude n'est pas connu (. . .) sont reproduites en italique, afin que l'on puisse les distinguer aisément des données plus sûres. Toutefois, dans les tableaux portant sur le sujet spécial (tableaux 15 à 35), on a fait suivre de deux astérisques (**) le nom des pays ou zones ou les années pour lesquels les données sont incomplètes ou le degré d'exactitude des données n'est pas connu.

Les taux estimatifs sont imprimés en caractère romain. Ces taux sont en général établis spécialement soit à partir des résultats d'un sondage, soit par l'analyse démographique. S'ils figurent dans les tableaux, c'est qu'on y voit une estimation plus proche de la valeur réelle du taux en question que ne le permettrait le système existant d'enregistrement des faits d'état civil. Il s'ensuit implicitement qu'on les suppose «sûrs» par comparaison avec les taux qui sont tirés des registres et qui sont manifestement discutables.

Évaluation des séries chronologiques de statistiques de l'état civil

Il est plus difficile d'évaluer la qualité des séries chronologiques de statistiques de l'état civil que d'évaluer les données pour une année déterminée. Étant donné qu'une série chronologique de statistiques de l'état civil ne peut généralement avoir pour source qu'un fichier permanent de la population, on a arbitrairement supposé que le degré d'exactitude de la série tout entière était celui indiqué par le code pour la dernière tranche annuelle de données tirées de registres de l'état civil. En conséquence, les chiffres absolus et les taux d'une même série chronologique enregistrée ont tous été imprimés en italique lorsque le code relatif aux données enregistrées les plus récentes était **U** (discutable) ou. . . (inconnu). Inversement, si les données enregistrées les plus récentes étaient censées être complètes (C), la série tout entière a été imprimée en romain. On notera que dans les tableaux portant sur le sujet spécial (tableaux 15 à 35), deux astérisques (**) suivent le nom des pays ou zones ou les années pour lesquels les données sont incomplètes ou le degré d'exactitude des données est inconnu.

Il arrive que des taux estimatifs soient intercalés dans la série; ils sont, comme auparavant, imprimés en romain.

Cette méthode n'est certes pas entièrement satisfaisante (les données des premières années étant souvent beaucoup plus sujettes à caution que le code ne l'indique); mais, comme on a jugé souhaitable d'identifier clairement les données discutables et que l'emploi du code actuel à cette fin ne peut conduire qu'à surestimer plutôt qu'à sous-estimer la qualité des statistiques, c'est d'après ce code, malgré ses insuffisances, que l'on a décidé de classer les données et de les identifier.

Méthodes d'exploitation des données

Statistiques relatives au lieu de l'événement

Dans les *Recommandations pour un système de statistiques de l'état civil*[20], il est dit que, d'une façon générale, l'exploitation des données qui portent sur un territoire national devra seulement concerner des faits qui se sont produits à l'intérieur des frontières nationales. En conséquence, les statistiques de l'état civil présentées dans l'*Annuaire* se rapportent à la population de fait ou population présente. Sauf indication contraire, ces statistiques portent donc sur tous les faits survenus dans l'ensemble de la population, à l'intérieur des frontières actuelles des pays et zones considérés. Des notes signalent les exceptions.

Il est reconnu dans les *Recommandations*[21] qu'il est nécessaire de distinguer entre les statistiques selon qu'elles se rapportent à des régions ou à des groupes de population pour lesquels l'enregistrement des faits d'état civil est raisonnablement complet ou nettement incomplet. Conformément à ces *Recommandations*, les statistiques de certains pays ou zones font régulièrement abstraction des groupes de population pour lesquels l'enregistrement, bien qu'obligatoire, n'est même pas raisonnablement complet et les statistiques de l'état civil, par conséquent, sont très sujettes à caution. Parmi les pays ou zones qui procèdent ainsi, on peut citer le Surinam, où les statistiques ne tiennent pas compte des données relatives à la population vivant en tribus, et le Pérou et le Venezuela, où il n'est pas tenu compte des Indiens de

[20] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 249.

[21] *Ibid.*, par. 233.

la jungle. L'Australie, qui auparavant ne tenait pas compte des données relatives aux aborigènes, en tient compte depuis 1967. Tous les cas de ce genre, où les statistiques ne portent que sur une partie du territoire national ou de la population du pays ou zone, sont indiqués en note dans les tableaux.

Exploitation des données selon la date de l'événement ou la date de l'enregistrement

Autant que possible, les statistiques de l'état civil figurant dans l'*Annuaire démographique* correspondent aux faits survenus pendant l'année indiquée et non aux faits enregistrés au cours de cette année. Cela est conforme aux *Recommandations*[22] formulées par l'Organisation des Nations Unies.

Symbole : On pourra toutefois constater dans les tableaux que, malgré cette recommandation internationale, bon nombre de pays ou zones exploitent leurs statistiques de l'état civil selon la date de l'enregistrement et non selon la date de l'événement; en outre, rares sont ceux qui ont analysé les résultats ainsi obtenus pour déterminer s'ils correspondent bien au niveau de la natalité ou de la mortalité. Comme ces statistiques risquent d'induire gravement en erreur, les pays ou zones dont on sait qu'ils établissent leurs statistiques d'après la date de l'enregistrement sont désignés dans les tableaux par une croix (†) ou, dans le cas des tableaux portant sur le sujet spécial, par des notes. L'absence de croix ou de note implique donc que les données ont été exploitées selon la date de l'événement, mais comme on n'a pas de renseignements complets, c'est sans doute surestimer l'importance du groupe où les données sont exploitées de cette façon que d'interpréter toujours ainsi l'absence de ce symbole.

Étant donné que l'influence de cette méthode d'exploitation des données est si inextricablement liée aux retards dans l'enregistrement, il faudra toujours considérer en même temps le code de qualité qui figure également dans les tableaux retraçant l'évolution à long terme. Évidemment, si l'enregistrement des naissances est complet et effectué en temps voulu (code C), les effets perturbateurs de cette méthode seront pratiquement annulés. Aussi la remarque que l'on vient de faire a-t-elle moins d'importance pour les statistiques des décès, car le code sanitaire de la plupart des pays ou zones subordonne la délivrance du permis d'inhumer à l'enregistrement du décès; cette condition tend à hâter l'enregistrement. Le symbole est encore moins significatif pour les mariages et les divorces étant donné que dans la plupart des pays ou zones ces faits sont enregistrés immédiatement ou dans un délai assez court afin d'en garantir la légalité. Enfin, il perd presque toute signification lorsqu'il s'agit de morts fœtales, d'une part parce que, là encore, un permis d'inhumer est nécessaire et d'autre part parce que les morts fœtales sont généralement déclarées immédiatement ou ne sont pas déclarées du tout.

Conséquences sur la comparabilité : Comme on l'a dit, si l'enregistrement se fait dans un délai très court, la différence entre les statistiques établies selon la date de l'événement et celles qui sont établies selon la date de l'enregistrement peut être négligeable. En pareil cas, le seul facteur qui influe sur la comparabilité est la durée des délais légaux accordés pour l'enregistrement courant des faits d'état civil.

En revanche, si l'enregistrement n'a lieu qu'avec un certain retard, et si les déclarations tardives sont nombreuses, les statistiques de l'état civil exploitées selon la date de l'enregistrement ne sont pas comparables sur le plan international. Dans les meilleures conditions, les statistiques exploitées selon la date de l'enregistrement comprendront surtout des faits survenus au cours de l'année précédente; dans les pays ou zones où le système d'enregistrement n'est pas très développé, elles comprendront des événements survenus de nombreuses années auparavant. Il ressort des documents dont on dispose que des retards de 20 à 25 ans dans l'enregistrement des naissances ne sont pas rares, bien que le plus souvent la déclaration se fasse de deux à quatre ans après l'événement. À mesure que l'enregistrement deviendra plus complet et se fera plus promptement, les données exploitées selon la date de l'enregistrement se rapprocheront davantage de la réalité pour l'année considérée; mais, en attendant, les statistiques fondées sur les données d'enregistrement ne seront comparables sur le plan international ni entre elles ni avec les statistiques établies selon la date de l'événement.

Il convient également de noter que l'exploitation des données selon la date de l'enregistrement ne compromet pas seulement la comparabilité internationale des statistiques. Même à l'intérieur d'un même pays ou zone, le procédé qui consiste à compter les enregistrements et non les événements met en cause la comparabilité des chiffres sur une longue période. Si le nombre des faits d'état civil enregistrés varie dans une mesure quelconque d'une année à l'autre (par suite de la mise en vigueur de mesures destinées spécialement à encourager l'enregistrement ou exigeant dorénavant la production d'un certificat de naissance ou de décès pour l'accomplissement de certaines formalités), les statistiques de l'état civil établies d'après la date de l'enregistrement ne permettent pas de mesurer le niveau réel de la natalité ou de la mortalité; elles ne peuvent pas davantage fournir d'indications sur la tendance. Tout ce qu'elles peuvent faire, c'est de montrer que les conditions d'exigibilité du certificat de naissance, de décès ou de mariage et la charge de travail des bureaux d'état civil n'ont pas été uniformes. D'autre part, si la complétude de l'enregistrement ne varie pas d'une année à l'autre, l'augmentation des taux de natalité et de mortalité de l'enregistrement peut faire croire à des variations de l'incidence des naissances et des décès. Dans un cas comme dans l'autre, les statistiques des naissances et des décès enregistrés ne présentent qu'une utilité très réduite pour des études nationales ou internationales.

Définition des faits d'état civil aux fins de la statistique

La définition de chaque fait d'état civil adoptée aux fins de la statistique explique aussi — mais dans une bien moindre mesure — le défaut de comparabilité que peuvent présenter les données. Il est important par exemple d'énoncer un critère uniforme et précis permettant de distinguer, du point de vue statistique, les morts fœtales des naissances vivantes. Dans certains pays ou zones, il faut que le nouveau-né ait vécu 24 heures pour pouvoir être inscrit sur le registre des naissances vivantes. Les nouveaux-nés décédés avant l'expiration des 24 heures sont

[22] *Ibid.*, par. 238, 239 et 254.

classés avec les « mort-nés » et, en l'absence de classifications spéciales, ne sont comptés ni dans les naissances vivantes ni dans les décès. De même, dans plusieurs autres pays ou zones, les enfants nés vivants mais décédés avant l'enregistrement de leur naissance sont considérés comme «mort-nés» et risquent en l'absence de dispositions statistiques spéciales à cet égard d'être exclus eux aussi des statistiques de la natalité et de la mortalité.

À moins de méthodes spéciales d'exploitation des données, les statistiques des naissances vivantes et des décès ne tiendront pas compte de ces cas, qui viendront en revanche accroître d'autant le nombre des «mortinaissances». Dans ces conditions, les rapports de mortalité fœtale tardive se trouveraient exagérés et les taux de natalité et de mortalité générales seraient dans une certaine mesure sous-évalués. Le taux de mortalité infantile serait légalement faussé, car, bien que les éléments constitutifs du taux (décès d'enfants de moins d'un an et naissances vivantes) accusent exactement la même insuffisance en valeur absolue, les lacunes sont proportionnellement plus fortes pour les décès de moins d'un an et le taux tend à être inférieur à la réalité[23]. Heureusement, la plupart des pays ou zones effectuent au stade de la mise en tableaux les ajustements nécessaires pour corriger ce défaut (du moins dans les fréquences totales); lorsqu'il n'y a pas eu de correction, les notes l'indiquent.

Le manque d'uniformité des définitions utilisées par les statisticiens a aussi des répercussions sur la comparabilité des statistiques de la nuptialité et de la divortialité. Bien que le mariage et le divorce soient des actes de caractère juridique et non des faits biologiques, ce qui limite les possibilités de variation des définitions, les différences de concepts d'un pays ou d'une zone à l'autre influent néanmoins sur les statistiques. On trouvera plus de détails à ce sujet dans la description de chaque tableau.

STATISTIQUES DES NAISSANCES VIVANTES

Comme la présente édition de l'*Annuaire démographique* porte essentiellement sur les statistiques de la mortalité, on a limité les statistiques des naissances aux données de base dont la continuité est nécessaire d'année en année, à savoir les tendances de la natalité (chiffres absolus et taux), les naissances selon l'âge de la mère et le sexe de l'enfant, et les différences selon le lieu de résidence (urbain/rural). Ces statistiques sont présentées dans les tableaux 9 et 10, respectivement.

Pour l'établissement de ces tableaux, la «naissance vivante» a été définie conformément à la recommandation internationale énoncée dans les *Principes et recommandations pour un système de statistiques de l'état civil*[24]. Les variations de la qualité des données sont examinées brièvement à propos des tableaux 9 et 10. Pour ce qui est des insuffisances des statistiques des naissances vivantes en général, voir l'*Annuaire démographique* de 1969 qui portait spécialement sur les statistiques de la natalité.

STATISTIQUES DE LA MORTALITÉ FOETALE

On peut considérer les statistiques de la mortalité fœtale à la fois comme des éléments de la mortalité et de la fécondité et comme des éléments dont il faut tenir compte pour l'étude des grossesses n'arrivant pas à terme. Étant donné qu'il est virtuellement impossible d'estimer si les statistiques relatives aux morts fœtales précoces sont complètes, on ne présente de données que sur les morts fœtales tardives et les avortements légaux. Le tableau 15 donne l'évolution chronologique du nombre des avortements légaux. On trouvera au tableau 16 des données se rapportant à la dernière année pour laquelle on dispose de statistiques et concernant les avortements légaux selon l'âge de la femme et le nombre d'enfants vivants auxquels elle a donné naissance auparavant. Le tableau 17 donne l'évolution chronologique du nombre des morts fœtales tardives et du taux de mortalité fœtale tardive. Le tableau 18 donne l'évolution chronologique du nombre des morts fœtales et du taux de mortalité fœtale, selon la durée de la gestation.

La définition de la mort fœtale qui sert de base pour l'établissement des statistiques est la définition internationale[25] énoncée ci-après :

La *mort fœtale* est le décès d'un produit de la conception lorsque ce décès est survenu avant l'expulsion ou l'extraction complète du corps de la mère, indépendamment de la durée de la gestation; le décès est indiqué par le fait qu'après cette séparation le fœtus ne respire ni ne manifeste aucun autre signe de vie, tel que battements du cœur, pulsations du cordon ombilical ou contractions effectives d'un muscle soumis à l'action de la volonté.

Les «*morts fœtales tardives*» sont celles qui sont survenues «au bout de la *vingt-huitième semaine de gestation ou au-delà*». Il n'y a aucune différence entre ces «morts fœtales tardives» et les faits dont l'ensemble était désigné, avant 1950, par le terme «mortinatalité».

Insuffisances des données

La comparabilité des statistiques des morts fœtales est fortement influencée par des différences de définition aussi bien que par des variations dans la qualité des données et dans les méthodes suivies pour leur exploitation. Ces problèmes sont examinés de façon plus approfondie dans le *Manuel de statistique de l'état civil*[26] et dans l'*Annuaire démographique* de 1969, dans lequel le sujet traité plus spécialement était celui des statistiques de la natalité.

Complétude des données

Les statistiques des morts fœtales sont encore plus fragmentaires que les données sur tout autre fait d'état civil. Il semble que même dans le cadre d'un système particulièrement efficace une proportion bien plus grande des morts fœtales que des naissances vivantes ou des décès échappe à l'enregistrement. Mais il est difficile de mesurer ou d'estimer quelle fraction du total n'est pas enregistrée; de ce fait, on ne trouvera pas dans les tableaux consacrés aux morts fœtales autant de renseignements précis sur la complétude des données que dans les tableaux consacrés aux naissances vivantes et aux décès.

Définitions

La comparabilité des statistiques des morts fœtales est fortement influencée par des différences de définitions.

[23] Pour un examen critique plus approfondi de ces effets, voir *Manuel de statistique de l'état civil*, chap. IV.

[24] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 46.

[25] *Ibid.*

[26] *Manuel de statistique de l'état civil*, chap. IV.

Ces différences concernent principalement les critères appliqués pour enregistrer comme tels les « mort-nés » ou les « morts fœtales tardives » lorsque l'enregistrement de tous les produits de conception n'est pas obligatoire. Les critères de viabilité reposent d'ordinaire sur la durée de la grossesse calculée en jours, semaines ou mois, et varient considérablement d'un pays à l'autre, allant de trois à sept mois de gestation. Le minimum le plus fréquemment retenu est 28 semaines. Dans quelques pays, il faut en outre que le fœtus ait une longueur minimum, celle-ci variant entre 30 et 35 centimètres. Dans un certain nombre de cas, la seule condition requise est que le fœtus soit « viable » et qu'il puisse être reconnu comme un « être humain ».

Ainsi qu'on l'a déjà fait observer plus haut, certains pays classent avec les mort-nés les enfants nés vivants décédés peu après leur naissance (et avant l'enregistrement de la naissance). Ces décès assimilés à des mortinaissances peuvent avoir lieu jusqu'à trois jours après la naissance; de ce fait, les statistiques de la mortinatalité ou des morts fœtales tardives peuvent être entachées d'une erreur par excès assez importante. En théorie, et à condition que les pseudo-mort-nés et les mort-nés véritables soient comptés séparément, des corrections peuvent être apportées à ces statistiques. C'est ce qui se fait dans certains pays, mais on ne peut rectifier ainsi que les totaux bruts. Les pays qui procèdent de cette façon sont signalés dans les notes au tableau 17.

STATISTIQUES DE LA MORTALITÉ

Le présent *Annuaire démographique*, le vingt-sixième de la série, est consacré spécialement aux statistiques de la mortalité. Cinq éditions antérieures (1951, 1957, 1961, 1966 et 1967) y ont déjà été consacrées, chacune, antérieurement à 1966, présentant l'ensemble des données disponibles. Par la suite, étant donné l'ampleur de données dont on disposait, il avait fallu répartir les tableaux relatifs à la mortalité entre l'édition de 1966 et celle de 1967 de l'*Annuaire*. Dans la présente édition, il a été possible, grâce à l'ordinateur, de présenter dans le même volume la totalité des données disponibles sur la mortalité.

Dans la présente édition, vingt et un tableaux (nos 15 à 35 compris) sont consacrés aux statistiques de la mortalité. Il s'agit, d'une part, de tableaux qui figuraient déjà dans les éditions de 1966 et 1967, et qui ont été mis à jour, et, d'autre part, de deux tableaux nouveaux où sont présentées des données concernant les avortements provoqués légalement et les avortements provoqués légalement classés selon l'âge de la femme et selon le nombre des naissances vivantes précédentes. La période sur laquelle porte chacun des tableaux de la présente édition et des éditions précédentes est indiquée dans l'index par sujet qui commence à la page 1097.

Pour l'établissement de ces tableaux, le décès a été défini comme suit, conformément aux *Principes et recommandations pour un système de statistiques de l'état civil*[27].

Le décès est la disparition permanente de tout signe de vie à un moment quelconque, postérieur à la naissance vivante (cessation des fonctions vitales après la naissance sans possibilité de ressuscitation).

Par définition, les chiffres ne comprennent pas les morts fœtales, sauf dans un petit nombre de cas qui ont été signalés dans les tableaux; et dans ces cas il semble raisonnable de supposer que le nombre de ces décès est trop faible pour fausser les données.

Normalement, il est tenu compte de tous les décès d'enfants nés vivants, mais, dans certains pays, par suite de la définition légale adoptée pour la naissance vivante, les décès d'enfants nés vivants qui sont morts soit avant l'enregistrement de leur naissance soit dans les 24 heures qui ont suivi la naissance n'entrent pas dans les totaux. Leur exclusion peut fausser gravement les données, car les décès qui surviennent dans un délai maximal de trois jours après la naissance (période pendant laquelle la mortalité est assez élevée) risquent d'échapper à l'enregistrement et de ne pas être comptés. Les pays dont il s'agit sont mentionnés dans les notes au bas des tableaux.

Les données publiées correspondent aux décès survenus dans la population présente à l'intérieur des frontières actuelles du pays. Elles comprennent donc, en principe, sauf indication contraire, les décès qui se sont produits parmi les tribus nomades et les aborigènes, les forces armées étrangères ou nationales, les personnes déplacées, les réfugiés de guerre et les étrangers résidant dans le pays au moment du décès. Normalement, elles n'englobent pas les décès survenus parmi les ressortissants (militaires ou civils) se trouvant hors du territoire. Cependant, l'absence de note sur l'inclusion ou l'exclusion de certains éléments n'implique pas nécessairement qu'il y a conformité avec la norme, encore que cette hypothèse soit sans doute justifiée dans la plupart des cas.

Comme les lacunes de l'enregistrement des décès sont plus difficiles à déceler que celles de l'enregistrement des naissances, les colonnes réservées au code dans les tableaux de la mortalité fœtale, de la mortalité à tous âges et de la mortalité infantile contiennent plus de signes « inconnu » (. . .) que la colonne correspondante du tableau relatif aux statistiques des naissances. Il est généralement admis que l'enregistrement des décès est plus complet que celui des naissances, mais ce n'est pas nécessairement le cas partout. En fait, des exemples toujours plus nombreux montrent que, dans plusieurs territoires et dans certaines conditions, les naissances peuvent être mieux enregistrées que les décès[28].

TABLES DE MORTALITÉ

Les tables de mortalité reposent sur les conditions de mortalité observées pendant une certaine période, mais elles permettent d'analyser les incidences et les perspectives découlant de ces conditions de manière plus détaillée que les taux classiques de mortalité.

Les tables de mortalité ont d'abord été mises au point à des fins actuarielles, mais elles ont de nombreuses applications dans le domaine démographique. Citons parmi celles-ci : 1) l'établissement de projections relatives à la

[27] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 46.

[28] *Bulletin démographique* des Nations Unies, No 6, 1962, *op. cit.*, p. 14-15.

population par âge et par sexe; 2) l'analyse des incidences de la mortalité sur la répartition par âge et par sexe d'une population donnée; 3) la comparaison des mesures sommaires de la mortalité, telles que le quotient de mortalité (inverse de l'espérance de vie à la naissance) l'espérance de vie à différents âges, etc; 4) le calcul des taux nets de reproduction; 5) l'évaluation de l'exactitude des données tirées des recensements et des registres de l'état civil. En outre, la technique des tables de mortalité a été appliquée à l'analyse d'autres genres de données démographiques, par exemple au calcul des probabilités de mariage, par âge et par sexe, sur la base des chiffres de recensement classés suivant l'état matrimonial.

Les valeurs de trois fonctions principales de la table de mortalité sont publiées dans le présent *Annuaire démographique*, à savoir : 1) l'espérance moyenne de vie ou nombre moyen d'années restant à vivre pour les personnes d'un âge donné ($\mathring{e}_x$); 2) la probabilité de décès dans le délai d'un an ou dans un intervalle d'âge déterminé pour les personnes d'un âge donné (q_x) et 3) les survivants au début de chaque intervalle d'âge sur une génération de 100 000 individus (l_x).

Les méthodes d'établissement des tables de mortalité varient quelque peu sur des points de détail selon l'importance et la nature des données de base disponibles. Les données de base sont ordinairement les suivantes : décès au cours d'une période déterminée, classés par âge et par sexe, ainsi que le chiffre de la population moyenne de chaque âge et chaque sexe pour la même période. La valeur de qx, fonction fondamentale de la table de mortalité, est généralement calculée de façon à correspondre aux taux de mortalité des personnes ayant l'âge considéré au cours d'une période déterminée.

La méthode la plus employée consiste à utiliser des statistiques de décès s'étendant sur une période de trois ou cinq ans et choisies de telle sorte que la date du recensement se situe à peu près au milieu de la période; ainsi les données de recensement peuvent être considérées comme indiquant la population moyenne. Parfois, on considère la période comprise entre deux recensements, et les chiffres de population utilisés sont la moyenne des résultats des deux recensements. Il est courant de procéder à des ajustements pour corriger les erreurs des déclarations d'âge faites lors des recensements et de l'enregistrement des décès et pour obtenir d'un âge à l'autre une série de valeurs q_x ayant une allure régulière; à l'occasion, les données sont corrigées pour tenir compte des migrations. Dans quelques rares cas, des tables de mortalité approximatives ont été calculées sans recourir aux données sur les décès; la valeur de q_x a été établie en comparant le chiffre de la population dénombrée dans chaque groupe d'âge lors d'un recensement avec le nombre de survivants au recensement suivant.

Le nombre de personnes appartenant à une même cohorte qui survivent à divers âges successifs est obtenu en appliquant à la cohorte initiale fictive (généralement 100 000 personnes) le taux de mortalité de l'âge en question. Le nombre des survivants est représenté par le symbole « l_x », qui exprime l'effectif des « personnes qui survivent à l'âge x ».

Le calcul du nombre des survivants (l_x) permet également de déterminer celui des personnes qui meurent dans chaque intervalle d'âge (d_x); des opérations supplémentaires fournissent le nombre des années vécues entre les âges x et $x + l$ (Lx) ainsi que le nombre cumulatif des années vécues par la cohorte à partir de l'âge x jusqu'au décès du dernier de ses membres (T_x).

Le potentiel moyen de vie des personnes à un âge déterminé ($\mathring{e}_x$) est alors calculé en divisant le nombre total des années vécues (T_x) par celui des survivants à l'âge correspondant (l_x).

L'exactitude des tables de mortalité dépend surtout de la précision et de la complétude de l'enregistrement des décès et des dénombrements de population effectués lors des recensements. Les lacunes de l'enregistrement des décès sont probablement plus graves que celles des recensements. Lorsqu'il en est ainsi, les taux de mortalité sont sous-estimés et les valeurs de lx (survivants) et de $\mathring{e}x$ surestimées. Les taux de mortalité calculés à partir des statistiques de la population et de la mortalité pour les premiers âges de la vie risquent tout particulièrement d'être sous-estimés, et cette erreur se répercute sur toutes les valeurs de l_x dans la table de mortalité. Comme on l'a déjà indiqué, les taux de mortalité infantile obtenus en rapportant le nombre de décès d'enfants de moins d'un an au nombre des naissances dans les pays où l'enregistrement est incomplet risquent d'être supérieurs ou inférieurs à la réalité; l'erreur, quel que soit son sens, aura des effets importants sur les valeurs de l_x à chaque âge. L'espérance de vie à la naissance ($\mathring{e}_o$) sera alors également trop élevée ou trop faible.

L'exactitude et la comparabilité internationale des valeurs des tables de mortalité sont particulièrement sujettes à caution pour les âges avancés. Ces valeurs sont tirées de données défectueuses et fréquemment établies par des méthodes assez arbitraires. Certains traits remarquables — par exemple le fait que l'espérance de vie au-delà de 60 ans est souvent beaucoup plus élevée dans les pays où la mortalité est en général forte que dans les pays à faibles taux de mortalité — résultent parfois uniquement des imperfections des tables de mortalité.

La diversité des méthodes utilisées pour établir les tables de mortalité (ajustement des données, etc.) peut compromettre l'exactitude des résultats et nuire à leur comparabilité internationale. Toutefois, elle a sans doute des répercussions beaucoup moins prononcées que les lacunes des recensements et de l'enregistrement des décès.

STATISTIQUES DE LA NUPTIALITÉ

On trouvera dans la présente édition de l'*Annuaire* des statistiques sur l'évolution de la nuptialité et sur la répartition des mariages selon l'âge de l'époux et de l'épouse. Ce sont les données minimales pour lesquelles la continuité est nécessaire d'année en année.

Conformément aux recommandations formulées dans les *Principes et recommandations pour un système de statistiques de l'état civil*[29], ces statistiques se rapportent,

[29] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 46.

sauf indication contraire, aux mariages officiels établis selon une procédure civile ou religieuse, ou selon toute autre procédure, conformément à la législation de chaque pays. La définition du mariage est énoncée dans les *Principes et recommandations pour un système de statistiques de l'état civil*[29]. Les effets des différences de définition, ainsi que les autres facteurs qui limitent la comparabilité, sont examinés brièvement à propos des tableaux 11 et 12; pour une étude plus détaillée de ces facteurs, voir la page 53 de l'*Annuaire démographique* de 1968, dont le sujet spécial était la nuptialité.

STATISTIQUES DE LA DIVORTIALITÉ

Les séries chronologiques de statistiques relatives aux dissolutions de mariages pour cause de divorce sont présentées dans le tableau 13. Sauf indication contraire, la définition du divorce utilisée pour établir ces statistiques est celle que l'Organisation des Nations Unies a recommandée dans les *Principes et recommandations pour un système de statistiques de l'état civil*[30]; en d'autre termes, ces statistiques se rapportent aux dissolutions légales et définitives des liens du mariage conférant aux parties le droit de se remarier.

Les effets des différences de définition, ainsi que les autres facteurs qui limitent la comparabilité, sont étudiés brièvement à propos du tableau 13; pour un examen plus détaillé de ces facteurs, voir les pages 53 et 54 de l'*Annuaire démographique* de 1968, dont l'un des sujets spéciaux était la divortialité.

[30] *Ibid.*

STATISTIQUES DES MIGRATIONS INTERNATIONALES

Les statistiques des migrations internationales ont été publiées pour la dernière fois dans l'*Annuaire démographique* de 1971. La pratique établie étant de publier des statistiques sur ce sujet un an sur deux, on trouvera de nouveau dans la présente édition de l'*Annuaire* des statistiques limitées sur les migrations internationales. Le tableau 14 donne, présentés en regard pour faciliter le calcul de la migration nette pour chaque pays, les totaux des entrées et ceux des sorties de tous les types de voyageurs. Afin de simplifier la présentation et d'éliminer les données qui ne sont pas comparables, on n'a pas repris dans le tableau 14 les catégories principales de voyageurs qui étaient distinguées dans les éditions de l'*Annuaire* antérieures à 1970. Cependant, les définitions des données présentées au tableau 14 sont censées, sauf indication contraire, correspondre aux normes définies dans les « Recommandations concernant l'amélioration des statistiques des migrations internationales »[31] publiées par les Nations Unies.

On n'a pas présenté de statistiques sur les immigrants et émigrants selon le pays de dernière résidence ou selon le pays de résidence projetée. Malgré leur intérêt évident, elles n'ont pas été publiées depuis l'édition de 1959 de l'*Annuaire démographique*, principalement en raison du manque de cohérence interne des données disponibles. Par ailleurs, il n'a pas été possible, faute de place, d'inclure dans la présente édition des tableaux indiquant le nombre des immigrants et des émigrants à long terme selon l'âge et le sexe.

Les « Recommandations » des Nations Unies[32] accordent aussi une importance spéciale à la publication de statistiques sur les migrants à long terme selon la profession habituelle pour les migrants en âge de travailler. Des statistiques sur les caractéristiques économiques des migrants à long terme pour 1918-1954 ont été publiées, pour certains pays, dans un recueil paru en 1958[33], mais il n'a pas été possible d'inclure des tableaux de ce genre dans l'*Annuaire démographique*.

SOURCES DE VARIATIONS

Origine des données

Les renseignements figurant dans le tableau 14 ont été obtenus généralement au moyen d'un questionnaire adressé aux gouvernements par le Bureau de statistique des Nations Unies. Des renseignements complémentaires ont été extraits de publications officielles.

Les données proviennent de sources nationales plus ou moins diverses parmi lesquelles on peut mentionner *les statistiques des ports* (fondées sur les manifestes des navires et aéronefs ou sur d'autres documents administratifs établis par les compagnies de navigation); *les statistiques du contrôle aux frontières* (fournies par les services de police ou d'immigration assurant la surveillance des entrées et sorties); *les statistiques des passeports* (étant donné qu'elles représentent le nombre des passeports délivrés à certaines catégories de futurs voyageurs, elles ne peuvent naturellement renseigner que sur les sorties de nationaux); *les registres locaux de population* (statistiques fondées sur les transcriptions de déclarations de changement de résidence qu'exige la législation de certains pays); *les statistiques établies d'après les permis de travail* requis des étrangers; *les contrats de transport* pour les émigrants, etc.

À la diversité des origines des statistiques sur les migrations et voyages internationaux correspondent, dans une certaine mesure, des variations dans les définitions. Cette diversité complique l'interprétation des différentes séries statistiques dont on peut disposer pour un même pays et fait obstacle à l'établissement des comparaisons internationales.

[31] *Statistiques des migrations internationales. Organisation et technique; Normes recommandées; Sondages* (Publication des Nations Unies, numéro de vente : 53.XVII.10), chap. II.

[32] *Ibid.*

[33] *Migrations internationales selon les caractéristiques économiques : statistiques pour certains pays, 1918-1954* (Publication des Nations Unies, numéro de vente : 58.XIII.3).

L'étude de l'origine des données montre que, hors d'Europe, les statistiques des migrations et des voyages proviennent dans la plupart des cas de sources assez sûres : *contrôle aux ports et aux frontières, registres de population*. En Europe, les statistiques ont des origines plus diverses; c'est là une manifestation des difficultés particulières que l'on rencontre pour recueillir des renseignements sur les migrations dans un continent où il existe des frontières très nombreuses traversées chaque année par un grand nombre de voyageurs. Seule une étude détaillée de chaque cas peut indiquer la valeur des chiffres et montrer jusqu'à quel point ceux qui se rapportent à différentes périodes de temps et à différents pays peuvent être comparables entre eux.

Définitions et nomenclatures

Pour pouvoir recueillir des statistiques sur les migrations et voyages internationaux qui soient à un degré raisonnable concordantes entre elles et internationalement comparables, il est indispensable d'établir des nomenclatures statistiques qui définissent avec précision ce qu'on peut énumérer, qui soient adaptées au processus de rassemblement des données et de leur exploitation, et qui répondent enfin aux besoins des utilisateurs de la documentation statistique dans le domaine considéré ici.

Les statistiques qui figurent au tableau 14 sont fondées sur une nomenclature qui est essentiellement celle que préconisaient les « Recommandations » des Nations Unies[34], on a cependant précisé la terminologie sur les points suivants de manière à éviter certaines difficultés courantes d'interprétation :

À long terme est utilisé à la place de *permanent* pour qualifier les déplacements d'une durée supérieure à un an.

À court terme est utilisé à la place de *temporaire* pour les déplacements d'une durée égale ou inférieure à un an.

Selon les « Recommandations » de 1953, le *trafic frontalier* s'entend des mouvements de personnes résidant dans les zones frontières, appelées à franchir fréquemment la frontière et souvent autorisées à se servir de documents de voyage simplifiés (carte de frontalier). Il n'y a qu'un petit nombre de pays où l'on peut identifier ce trafic de frontière et le distinguer, dans les séries statistiques, des autres entrées et sorties, comme le préconisent les « Recommandations ». Dans ces quelques cas, le trafic de frontière n'est *pas* compris dans les totaux.

[34] *Statistiques des migrations internationales*, p. 19.

Voici les catégories de migrants sur lesquelles est fondé le tableau 14 :

Entrées en provenance d'un autre pays, à savoir :

a) *Immigrants à long terme :* c'est-à-dire non-résidents (nationaux et étrangers) ayant l'intention de séjourner dans le pays pendant plus d'un an.
b) *Immigrants à court terme :* c'est-à-dire non-résidents ayant l'intention d'exercer pendant un an au maximum une profession rémunérée dans le pays même.
c) *Visiteurs :* c'est-à-dire non-résidents ayant l'intention de séjourner dans le pays pendant un an au maximum sans y exercer de profession rémunérée (et personnes à charge). Le séjour peut avoir pour but des vacances, des études, des affaires et d'autres motifs.
d) *Visiteurs en transit.*
e) *Visiteurs en croisière.*
f) *Résidents* (nationaux et étrangers) rentrant dans le pays après un court séjour à l'étranger.
g) *Catégories spéciales :* c'est-à-dire tous autres groupes présentant un intérêt particulier pour un pays.

Sorties à destination d'un autre pays, à savoir :

a) *Émigrants à long terme,* c'est-à-dire résidents (nationaux et étrangers) ayant l'intention de séjourner à l'étranger pendant plus d'un an.
b) *Immigrants à court terme quittant le pays.*
c) *Visiteurs* quittant le pays à la fin de leur visite. Le séjour peut avoir pour but des vacances, des études, des affaires et d'autres motifs.
d) *Visiteurs en transit.*
e) *Visiteurs en croisière.*
f) *Résidents* (nationaux et étrangers) ayant l'intention de se rendre à l'étranger pour une courte période (un an au maximum).
g) *Catégories spéciales :* c'est-à-dire tous autres groupes présentant un intérêt particulier pour un pays.

L'exactitude des données et leur comparabilité internationale sont limitées par le fait que certaines frontières sont traversées clandestinement et que les déplacements correspondants échappent à tout enregistrement statistique, sauf peut-être dans un très petit nombre de cas où des dispositions ont été prévues pour inclure les personnes en cause dans la statistique lorsque leur situation vient à être régularisée.

DESCRIPTION DES TABLEAUX

Tableau 1

Le tableau 1 donne, pour le monde et les diverses régions, des estimations de l'ordre de grandeur de la population, les taux d'accroissement démographique, les taux bruts de natalité et de mortalité, la superficie et la densité.

Des estimations de la population mondiale par «grandes zones» sont présentées pour les années 1950, 1955, 1960, 1965 et 1970[35] ainsi que pour 1973 et 1974. Les taux annuels moyens d'accroissement de la population ont été calculés sur la base de ces estimations pour les périodes 1965-1974 et 1970-1974, alors qu'on a estimé les taux bruts de natalité et de mortalité pour la période 1965-1974. Les estimations de la superficie exprimée en kilomètres carrés et l'ordre de grandeur de la densité de population se rapportent à 1974.

À l'exception des données concernant la superficie, toutes les données sont reproduites en italique pour en faire ressortir le caractère conjectural.

[35] La nouvelle base de comparaison des indices économiques est 1970; elle a été substituée dans chaque cas à l'ancienne base, 1963.

La classification géographique utilisée, exposée à la page 71, correspond à celle qui a été adoptée dans le rapport intitulé *Les perspectives d'avenir de la population mondiale de 1970 à l'an 2000 évaluées en 1973*[36]. Bien que l'on ait donné certains totaux pour les continents (tous les autres pouvant être calculés), on a réparti le monde en huit grandes zones qui ont été groupées de manière plus homogène du point de vue de l'importance de la population, du type de situation démographique et de l'exactitude des statistiques démographiques. Six de ces huit grandes zones ont été subdivisées en 22 régions, classées à l'intérieur de chaque grande zone selon l'ordre de grandeur de la population. Avec l'Amérique septentrionale et l'URSS, qui n'ont pas été subdivisées, on arrive à un total de 24 régions.

Depuis l'édition de 1973 de l'*Annuaire démographique*, quelques modifications ont été introduites dans la présentation des régions et des pays ou zones. Ces modifications sont indiquées ci-après.

a) En ce qui concerne l'Amérique latine, le Paraguay, qui était auparavant compris dans l'«Amérique du Sud (zone tempérée)», figure à présent sous la subdivision «Amérique du Sud tropicale».

b) En ce qui concerne l'Asie orientale, qui était auparavant subdivisée en trois régions portant les noms de « Région continentale », « Japon » et « Autres pays d'Asie orientale », on distingue à présent comme subdivisions la « Chine », le « Japon » et les « Autres pays d'Asie orientale ». Sous cette dernière subdivision figurent Hong-kong, Macao, la Mongolie, la République de Corée et la République populaire démocratique de Corée.

c) En ce qui concerne l'Asie méridionale, les trois régions qui portaient auparavant les noms de «Asie du Sud-Est», «Asie méridionale centrale» et «Asie du Sud-Ouest» sont à présent dénommées, sans changement quant à leur composition, «Asie méridionale orientale», «Asie méridionale centrale» et «Asie méridionale occidentale»

d) La région qui était auparavant désignée par le nom de «Polynésie et Micronésie» figure à présent sous le nom de «Micronésie-Polynésie»

Parce que des pays comme l'Union des Républiques socialistes soviétiques, la Turquie et les États-Unis dépassent les frontières traditionnelles des continents, il n'a pas été possible, sauf pour l'Afrique, de faire coïncider les grandes zones avec les continents. La distinction entre l'Asie orientale et l'Asie méridionale parmi les grandes zones a été dictée principalement par l'importance de leur population. On a distingué comme grandes zones l'Amérique septentrionale et l'Amérique latine, au lieu des continents classiques (Amérique du Nord et Amérique du Sud), parce que les tendances démographiques dans la partie continentale de l'Amérique centrale et dans la région des Antilles se rapprochent davantage de celles de l'Amérique du Sud que de celles de l'Amérique au nord du Mexique. L'Amérique latine ainsi définie a par conséquent des limites plus larges que celles des 20 républiques américaines de langue espagnole, portugaise et française qui constituent l'Amérique latine au sens plus strict du terme. On obtient les données pour les continents traditionnels de l'Amérique du Nord et de l'Amérique du Sud en extrayant des données relatives à l'Amérique latine les données concernant l'Amérique centrale (continentale) et les Antilles, et en les regroupant avec celles relatives à l'Amérique septentrionale.

Portée : Les 24 régions que l'on a distinguées aux fins des statistiques démographiques sont formées des pays ou zones énumérés au tableau 2. Elles ont été définies d'après les frontières de fait actuelles, et comme les chiffres donnés pour des années antérieures ont été ajustés pour tenir compte des modifications de frontières, ils se rapportent à des superficies constantes. La composition de chaque région et de chaque grande zone est indiquée à la page 71.

Calculs :

Chiffres estimatifs de la population : Il s'agit d'estimation de l'ordre de grandeur de la population mondiale. Les chiffres relatifs aux grandes zones et régions correspondent aux nouvelles estimations révisées qui figurent dans le document préparé par le Secrétariat de l'ONU et intitulé *Les perspectives d'avenir de la population mondiale de 1970 à l'an 2000 évaluées en 1973*[36]. Comme l'indique ce document, les estimations pour 1950, 1955, 1960, 1965 et 1970 tiennent compte des dernières estimations officielles communiquées par les divers pays ou zones, alors que les estimations pour les années ultérieures sont des projections fondées sur les données dont on disposait pour 1970. Les estimations ont été établies sur la base de trois séries d'hypothèses, qui ont conduit à trois variantes : forte, moyenne et faible. C'est la variante moyenne qui a été retenue pour le tableau 1.

Taux d'accroissement : Le taux annuel moyen (en pourcentage) d'accroissement de la population a été calculé à partir des données du tableau, à l'aide de la formule ci-après :

Formule pour le calcul du taux de variation de la population

$$r = \left(\sqrt[t]{\frac{P_1}{P_0}} - 1 \right) \times 100$$

où P_0 *représente la population en 1965 ou en 1970;*
P_1 *représente la population en 1974;*
t *est égal à 9 (nombre d'années écoulées entre 1965 et 1973) ou à 4 (nombre d'années écoulées entre 1970 et 1974);*
r *est le taux annuel de variation (en pourcentage).*

Les estimations de l'ordre de grandeur de la population figurant dans le tableau 1 sont exprimées en millions, mais pour les calculs on a utilisé des nombres au millier près et les taux ont été calculés à deux décimales près et arrondis à une décimale pour la publication.

Taux de natalité et de mortalité : Pour l'Amérique septentrionale, l'Europe et l'Australie/Nouvelle-Zélande, les taux représentent la moyenne pondérée des taux enregistrés. Pour le Japon et l'Union des Républiques socialistes soviétiques, on obtient la moyenne des taux en additionnant les chiffres se rapportant à chaque année de la période considérée et en calculant la moyenne à partir des totaux obtenus. Les estimations relatives aux autres régions sur lesquelles porte le tableau ont été établies à

[36] *Les perspectives d'avenir de la population mondiale de 1970 à l'an 2000 évaluées en 1973* (document ESA/PJWP.53).

la faveur d'une étude de l'ordre de grandeur des taux des pays ou zones de chaque région; on a utilisé pour cette étude les taux enregistrés de la natalité et de la mortalité et les estimations établies sur la base des données courantes concernant la fécondité et des données concernant la fécondité pendant la durée de vie recueillies à l'occasion d'enquêtes par sondage ou de recensements ou encore les estimations faites en appliquant la méthode de l'inverse du taux de survie aux résultats d'enquêtes ou de recensements, par l'analyse des résultats de recensements successifs ou par d'autres méthodes analytiques.

La méthode utilisée consiste à obtenir une estimation du nombre moyen de naissances et de décès dans chaque pays de la région en prenant les taux de mortalité et de natalité les plus récents et les plus sûrs pour chaque pays ou zone et en les appliquant à l'effectif moyen de la population pour la première et la dernière année de la période considérée; on additionne ensuite ces données relatives à la natalité, à la mortalité et à la population de façon à obtenir des totaux régionaux et on calcule les taux de natalité et de mortalité pour la région en divisant le nombre total des naissances et des décès par l'effectif total de la population.

Les taux par grandes régions sont des moyennes pondérées des taux régionaux et les taux pour l'ensemble du monde sont des moyennes pondérées des taux par grandes régions.

Les divergences importantes constatées entre le taux d'accroissement naturel obtenu selon la méthode décrite ci-dessus et le taux d'accroissement calculé selon la méthode décrite à la page 70 ont été imputées aux mouvements migratoires; ces cas sont signalés en note dans les tableaux. On pense que les divergences d'une ou de deux unités proviennent de l'arrondissement des chiffres.

Superficie : Pour obtenir les superficies régionales et la superficie mondiale, on a fait la somme des superficies des pays ou zones du tableau 3.

Densité : La densité est égale au rapport de l'effectif total de la population en 1974 à la superficie totale exprimée en kilomètres carrés.

Insuffisances des données : Les estimations concernant l'ordre de grandeur de la population et la superficie reposent essentiellement sur les données du tableau 3; elles appellent donc toutes les réserves fondamentales formulées à propos de ce tableau. Les taux d'accroissement et les indices de la densité de population se ressentent eux aussi des insuffisances inhérentes aux données de base. Toutefois, il est à noter que, lorsqu'on additionne des données par territoire pour arriver à des totaux régionaux et par grandes régions, les erreurs qu'elles comportent arrivent parfois à s'équilibrer, de sorte que les agrégats obtenus sont un peu plus exacts que chacun des éléments dont on est parti.

Vu leur caractère estimatif, un grand nombre des taux de natalité et de mortalité du tableau 1 doivent être considérés uniquement comme des ordres de grandeur pour les usages courants, mais ne sont pas censés mesurer exactement le niveau de la natalité ou de la mortalité. En outre, les taux pour 1965-1974 ne peuvent être considérés ni comme comparables à ceux qui ont été calculés pour des périodes antérieures ni comme constituant avec eux une série chronologique. On s'est fondé pour chaque série de taux sur les données disponibles au moment de l'estimation et beaucoup d'éléments nouveaux sont intervenus dans le calcul des estimations relatives à 1965-1974.

Pour interpréter les valeurs de la densité de population, il faut prendre en ligne de compte qu'il existe dans la plupart des régions de vastes étendues terrestres inhabitables ou à peine habitables et que les chiffres calculés selon la méthode indiquée ne tiennent compte ni de ce fait ni des différences de la répartition de la population à l'intérieur des régions considérées.

Tableau 2

Le tableau 2, qui est publié pour la première fois dans la présente édition de l'*Annuaire*, fournit pour l'ensemble du monde les grandes zones et les régions, des estimations de la population pour 1970 et la répartition en pourcentage de la population selon l'âge et le sexe. C'est la première fois que l'*Annuaire démographique* présente une série de données selon le sexe ou l'âge pour la population du monde et des principales régions qui en font partie.

Les données sont présentées selon la classification géographique utilisée dans le tableau 1. Le mode d'identification des régions indiquées et les sources des estimations reproduites sont décrits dans les Notes techniques relatives au tableau 1. Tous les chiffres sont des estimations de l'ordre de grandeur et comportent une importante marge d'erreur; toutes les données figurant dans le tableau sont donc reproduites en italique.

Tableau 3

Le tableau 3 présente pour chaque pays ou zone du monde les valeurs les plus récentes du chiffre estimatif de la population, du taux d'accroissement démographique et de la superficie. Plus particulièrement, il indique la population totale selon le sexe d'après les derniers recensements de population; les estimations établies au milieu de l'année 1970[37] et de l'année 1974, un code indiquant la méthode d'après laquelle l'estimation pour 1974 a été faite; le taux d'accroissement annuel moyen de la population (positif ou négatif) en pourcentage pour la période de 1970 à 1974 ainsi que des données sur la superficie et la densité de population en 1974.

Données de recensement : Autant que possible, les chiffres inscrits dans la colonne «recensements» du tableau 3 sont les résultats du recensement général de population le plus récent[38] ou, s'il n'y a jamais eu de recensement, des estimations de la population fondées sur les résultats d'enquêtes nationales par sondage récentes qui soient d'ordre plus ou moins national. Les résultats d'enquêtes ne portant que sur une fraction de moins de 50 p. 100 du territoire total ou de la population ne sont pas compris.

Estimations : Avec les réserves indiquées au paragraphe suivant, les estimations sont des chiffres officiels qui sont compatibles avec les résultats des recensements nationaux ou des enquêtes par sondage effectuées au cours de la période considérée. En d'autres termes, lors-

[37] La nouvelle base de comparaison pour le calcul des indices économiques est 1970; elle a été substituée dans chaque cas à l'ancienne base, 1963.

[38] Pour la définition du terme "recensement" voir *Principes et recommandations concernant les recensements de la population de 1970*, par. 7 et 8.

qu'on a constaté des incompatibilités inexplicables, les estimations ont été officiellement rectifiées en fonction des résultats des recensements de population ou des enquêtes démographiques et elles constituent par conséquent les éléments d'une série chronologique cohérente. Il s'agit d'estimations de la population au milieu de l'année, c'est-à-dire au 1er juillet, ou de la moyenne des deux estimations voisines de fin d'année. Aucune distinction n'a été faite entre ces deux types d'estimation, les différences en cause étant négligeables.

Lorsqu'on ne possédait pas d'estimation officielle de la population au milieu de l'année qui soit acceptable, on a reproduit une estimation des Nations Unies en la faisant précéder du signe «x». Ces estimations des Nations Unies ont été établies par la Division de la population de l'ONU compte tenu des renseignements disponibles, notamment de la qualité des données provenant de recensements ou d'enquêtes, de l'accroissement naturel, de la possibilité de mouvements migratoires assez importants pour influer sur les estimations précensitaires et post-censitaires, etc.

L'utilisation d'estimations établies par les Nations Unies a pour objet d'obtenir, pour 1970 et 1974, des estimations de la population au milieu de l'année qui se prêtent à la comparaison et qui soient compatibles non seulement avec les résultats de recensements ou d'enquêtes reproduits dans le même tableau, mais aussi avec les estimations relatives aux années précédentes qui figurent au tableau 5. On a renoncé aux estimations officielles non rectifiées ainsi qu'aux résultats de recensements ou d'enquêtes et aux estimations se rapportant à des dates autres que le milieu de l'année, pour leur substituer des estimations cohérentes des Nations Unies relatives au milieu de l'année. On a pu ainsi calculer des taux exprimant le mouvement de la population pour la période comprise entre 1970 et 1974 pour presque tous les pays ou zones du monde, alors qu'en l'absence de telles estimations, il aurait fallu renoncer à calculer des taux pour bien des pays ou zones en raison du manque de comparabilité apparente entre les deux estimations officielles considérées.

Code : C'est dans le tableau 3 que se trouve le code des types d'estimations, dont la composition est exposée en détail à la page 60. Avec les données sur l'erreur par défaut dans les dénombrements, ce code fournit une base à partir de laquelle on peut se faire une idée assez précise de la qualité des estimations de population pour 1974 où qu'elles soient présentées. On peut considérer qu'il s'applique aussi — avec moins d'exactitude — aux estimations pour 1970. Sur la base de cette hypothèse et d'autres renseignements, les estimations pour ces deux années ont été classées en «exactes» ou «douteuses» et ont été reproduites en caractères romain ou italique selon qu'il est indiqué ci-après.

On a renoncé au codage lorsque l'estimation pour un pays ou zone était une estimation combinée, obtenue en faisant la somme d'estimations elles-mêmes établies par des méthodes différentes pour diverses parties du territoire. Les estimations pour lesquelles on a pensé que le codage serait «sans objet» sont signalées par deux points (..).

Bien que toutes les estimations pour 1974 autres que les estimations combinées aient été codées, il convient de noter que le codage n'offre pas un moyen satisfaisant d'évaluer la fiabilité probable des données concernant certaines populations peu nombreuses. Il en est ainsi parce que certaines estimations de populations peu nombreuses sont établies par des méthodes qui ne se prêtent pas à ce codage et que l'effectif d'autres populations peu nombreuses subit de violentes fluctuations en raison de la fréquence des entrées et sorties de migrants, de visiteurs, etc., ce qui se traduit par des écarts relativement importants entre population de fait et population de droit.

Caractères employés : Pour établir une distinction claire entre la nature des chiffres indiqués, on a employé deux types de caractères différents pour les estimations de la population en 1970 et en 1974 et pour le taux annuel moyen d'accroissement : les estimations jugées sûres et les taux calculés sur la base de ces estimations apparaissent en caractère romain ordinaire; les estimations et les taux jugés moins sûrs sont en italique.

Superficie : Les chiffres relatifs à la superficie — exprimés en kilomètres carrés — correspondent à la superficie totale des unités géographiques considérées, compte tenu des eaux intérieures et des régions inhabitables ou inhabitées que peut comprendre le territoire en question. À quelques exceptions près, les régions entièrement inhabitées, telles que les régions polaires et certaines petites îles, ne sont pas comprises dans les statistiques.

Toutes les estimations de superficie sont des chiffres officiels. Les superficies communiquées en miles carrés ont été converties en kilomètres carrés au moyen du coefficient 2,589988.

Portée : Le tableau 3 comprend des données se rapportant à plus de 240 pays ou zones distincts. La colonne de gauche de ce tableau est donc la plus complète de l'*Annuaire démographique*.

Calculs :

Le *taux d'accroissement* est le taux annuel moyen de variation (en pourcentage) de la population entre 1970 et 1974 calculé à partir des données du tableau 1, à l'aide de la formule ci-après :

$$r = \left(\sqrt[t]{\frac{P_1}{P_0}} - 1 \right) \times 100$$

où P_0 *représente la population en 1970;*
P_1 *représente la population en 1974;*
t *est égal à 4 (nombre d'années écoulées entre 1970 et 1974);*
r *est le taux annuel de variation (en pourcentage).*

Les estimations du tableau 3 sont exprimées seulement en milliers, mais, pour le calcul, on a utilisé toutes les fois qu'on le pouvait des nombres à l'unité près, et les taux ont été calculés à deux décimales près et arrondis à une décimale pour la présentation.

On n'a pas calculé de taux lorsque les estimations de 1970 paraissaient, jusqu'au chiffre des milliers, identiques à l'estimation de 1974 bien que les nombres, exprimés à l'unité près, aient probablement différé quelque peu. En pareil cas, on a indiqué par deux points (..) qu'il n'y avait pas lieu de calculer de taux.

La *densité* est égale au rapport de l'effectif total de la population en 1974 à la superficie totale, exprimée en

kilomètres carrés. Dans les cas où deux chiffres de superficie sont donnés — l'un se rapportant par exemple à la superficie administrative et l'autre à la superficie habitable — c'est la superficie habitable que l'on a prise comme base pour le calcul de la densité.

Insuffisances des données : Les données contenues dans le tableau 3 présentent les mêmes insuffisances que les statistiques de population en général, à savoir absence d'uniformité dans les définitions et les méthodes d'exploitation, défauts de complétude du dénombrement de base et différences dans les méthodes d'établissement des estimations; toutes ces questions ont été examinées aux pages 57 à 60. Pour aider à évaluer la comparabilité, on a indiqué, lorsqu'on possédait les renseignements voulus, le degré de complétude des recensements de population ou les groupes sur lesquels ont porté les enquêtes par sondage.

Le lecteur pourra se faire une idée de la valeur des estimations en se reportant au code des types d'estimations ainsi que d'après le caractère employé pour l'impression des chiffres. En outre, la méthode consistant à remplacer les estimations divergentes et les données de recensement fragmentaires par des séries cohérentes d'estimations au milieu de l'année établies par les Nations Unies devrait permettre une meilleure comparabilité.

Les taux d'accroissement en pourcentage appellent toutes les réserves mentionnées plus haut à propos des chiffres de base sur la population. Dans certains cas, ils représentent seulement le taux qu'il a fallu calculer ou présumer pour établir les estimations elles-mêmes lorsqu'on ne disposait pas de mesures appropriées de l'accroissement naturel et de l'accroissement résultant des migrations[39]. Lorsqu'il s'agit de populations peu nombreuses, l'erreur fortuite peut atteindre à elle seule jusqu'à plus ou moins 0,5. Malgré leurs imperfections, ces taux fournissent pour chaque pays et zone des indications intéressantes pour l'étude du mouvement de la population et, utilisés avec les précautions nécessaires, ils peuvent également servir à évaluer l'exactitude des statistiques de l'état civil et des migrations.

La comparabilité des chiffres de superficie et de densité est compromise par les facteurs mentionnés précédemment. Il convient de souligner que les valeurs de la densité de population ne constituent que des indices très approximatifs, car elles ne tiennent compte ni de la dispersion ou de la concentration de la population à l'intérieur des pays ni de la proportion probable du territoire habitable. Il ne faut donc y voir d'indication ni de la densité au sens urbain du terme ni du chiffre de population que seraient capables de supporter les terres et les ressources naturelles d'un territoire.

Tableau 4

Le tableau 4 présente, pour chaque pays ou zone du monde, les derniers taux nationaux disponibles de natalité, de mortalité, de nuptialité, de divortialité, de mortalité infantile, de fécondité et d'accroissement naturel, ainsi que l'espérance de vie établie séparément pour les deux sexes. Il doit permettre de faciliter les recherches relatives aux statistiques de l'état civil et peut avoir, à cet égard, la même utilité que le tableau 3 pour la population et la superficie.

[39] Voir *Annuaire démographique* de 1956, p. 74.

On a présenté les taux fondés sur les données de l'enregistrement pour la dernière année disponible; excepté dans le cas où les statistiques établies sur la base des registres de l'état civil étaient discutables et que l'on possédait des estimations dignes de foi des taux de natalité et de mortalité du pays ou zone, on a reproduit ces taux estimatifs en signalant leur caractère. On verra que cette dernière formule a été employée surtout dans le cas des pays ou zones d'Afrique et d'Asie, où les statistiques de l'état civil, fondées sur les registres de l'état civil, sont nettement défectueuses, mais pour lesquelles il existe des estimations des taux apparemment satisfaisantes établies sur la base de résultats d'enquêtes par sondage ou de données provenant d'autres sources.

Les taux jugés relativement sûrs sont imprimés en caractère romain, tandis que ceux qu'on estime être nettement plus discutables sont en italique. Il est à noter toutefois que, faute de place, on n'a pas donné de détails sur leurs particularités; il convient donc de se reporter aux tableaux retraçant une évolution à long terme pour avoir des renseignements plus précis sur leur portée, leurs insuffisances générales et la base d'exploitation des données.

L'année de référence indiquée est la même pour les taux de natalité et de mortalité; si la période de référence diffère pour d'autres taux, on a donné en note les précisions nécessaires.

Portée : Les données du tableau 4 se rapportent à 208 pays ou zones. Ne sont reproduites que les données de portée nationale ou concernant le principal groupe ethnique; les taux relatifs aux grandes villes, aux subdivisions territoriales secondaires ou aux minorités ethniques ont été exclus, l'objet du tableau étant de fournir des indices que l'on puisse considérer comme représentatifs pour l'ensemble du pays ou zone.

Calcul des taux : Les *taux bruts enregistrés de natalité, de mortalité, de nuptialité et de divortialité* représentent le nombre d'événements inscrits sur les registres de l'état civil au cours de l'année civile indiquée pour 1 000 habitants présents dans l'unité géographique considérée au milieu de l'année.

Les *taux estimatifs bruts* obtenus à partir des résultats des enquêtes par sondage représentent le nombre d'événements qu'on estime être survenus pendant la période de référence (généralement la période de 12 mois qui a précédé l'enquête par sondage) pour 1 000 habitants qu'on estime avoir été présents lors de l'enquête. La base des autres taux estimatifs est indiquée dans les notes.

Les *taux de mortalité infantile* représentent le nombre de décès d'enfants de moins d'un an survenus pendant l'année civile en question pour 1 000 naissances vivantes signalées pendant la même année; il n'a été procédé à aucun ajustement pour tenir compte du fait que certains des enfants décédés étaient nés pendant l'année qui a précédé l'année de référence.

Les *taux de fécondité* représentent le nombre d'enfants nés vivants de femmes âgées de 10 à 49 ans au milieu de l'année considérée et signalés pendant l'année civile ou l'année de l'enquête pour 1 000 femmes du même groupe d'âge.

Le *taux d'accroissement naturel* est égal à la différence entre le taux brut de natalité et le taux brut de mortalité.

Les *valeurs de l'espérance de vie* représentent le nombre moyen d'années qu'ont à vivre, à partir du moment de leur naissance, les personnes des deux sexes, si elles continuaient à être soumises aux mêmes conditions de mortalité que celles de la période indiquée. Sauf indication contraire, ces valeurs ont été tirées des tables de mortalité officielles des pays ou zones intéressés.

Insuffisances des données : Étant donné que la plupart des taux et toutes les valeurs de l'espérance de vie du tableau 4 figurent également dans d'autres tableaux de la présente édition ou d'éditions antérieures de l'*Annuaire démographique*, il y a lieu de se reporter aux séries de base correspondantes pour trouver des renseignements détaillés sur les insuffisances des données et les réserves qu'elles appellent.

Pour apprécier la comparabilité des statistiques présentées ici, on devra tout spécialement tenir compte du degré de complétude indiqué par la notation du code de qualité dans chacun des tableaux et dans les notes qui s'y rapportent ainsi que de la source des taux estimatifs. Le manque d'uniformité en ce qui concerne la base d'exploitation des données (par exemple, date de l'événement ou date de l'enregistrement) peut également compromettre la comparabilité des données, ce dont il faudra tenir compte pour les comparaisons de pays à pays. Enfin, lorsqu'on voudra comparer divers taux d'un même pays ou zone ou les taux correspondants de différents pays ou zones, il faudra aussi se rappeler que les dates de référence ne sont pas toujours les mêmes.

Tableau 5

Ce tableau donne des estimations de la population totale pour chaque année de la période 1965-1974[40]. Cette année, contrairement à la pratique suivie jusqu'en 1970, tous les chiffres de ce tableau sont exprimés non plus en milliers, mais en millions, avec deux décimales. La raison de ce changement est que la présentation des données en milliers dénotait un degré de précision que ne possèdent pas, en fait, les données relatives à nombre des pays ou zones qui figurent dans le tableau. Le Bureau de statistique a arrondi les chiffres à la dizaine de mille la plus proche.

Sauf indication contraire, toutes les estimations se rapportent à la population présente (population de fait) sur le territoire actuel des pays ou zones considérés. Les principales exceptions à cette règle sont expliquées en note. On a aussi indiqué le traitement de certains groupes importants (tels que les militaires), même si ce traitement ne constitue pas à proprement parler une exception à la règle.

Estimations : Avec les réserves indiquées ci-après, les estimations sont des chiffres officiels qui sont compatibles avec les résultats des recensements nationaux ou des enquêtes par sondage effectués au cours de la période considérée. En d'autres termes, lorsqu'on a constaté des incompatibilités inexplicables, les estimations ont été officiellement rectifiées en fonction des résultats des recensements de population ou des enquêtes démographiques et elles forment par conséquent une série chronologique cohérente. Il s'agit d'estimations de la population au milieu de l'année, c'est-à-dire au 1er juillet, ou de la moyenne des deux estimations voisines de fin d'année. Aucune distinction n'a été faite entre ces deux types d'estimations, les différences en cause étant négligeables.

Les principes dont on s'est inspiré pour le choix des données du tableau 5 sont les mêmes que pour celles du tableau 3; c'est-à-dire que, lorsqu'on ne possédait pas d'estimation officielle de la population au milieu de l'année qui soit acceptable, on a préféré reproduire une estimation des Nations Unies en la faisant précéder du signe «x». Ces estimations des Nations Unies ont été établies par la Division de la population de l'ONU compte tenu des renseignements disponibles, notamment de la qualité des données provenant de recensements ou d'enquêtes, de l'accroissement naturel, de la possibilité de mouvements migratoires assez importants pour influer sur les estimations précensitaires et post-censitaires, etc. L'objet de cette méthode est d'obtenir des séries chronologiques cohérentes d'estimations de la population au milieu de l'année qui soient compatibles avec les résultats de recensements ou d'enquêtes. On a renoncé aux données non rectifiées ainsi qu'aux résultats de recensements, d'enquêtes et d'estimations se rapportant à des dates autres que le milieu de l'année, pour leur substituer des estimations des Nations Unies relatives au milieu de l'année.

Il convient de noter cependant que, pour certains pays ou zones, les données de base nécessaires à l'établissement d'estimations de population (c'est-à-dire les résultats de recensements ou d'enquêtes et les moyens de mesurer aussi exactement que possible l'accroissement naturel) faisaient défaut. En pareil cas, l'ONU n'a pu établir d'estimations ni pour remplacer des séries officielles fragmentaires ou divergentes, ni pour combler des lacunes dans des séries acceptables par ailleurs. On a donc omis les estimations divergentes et des lacunes apparaissent dans les séries officielles.

La qualité des séries chronologiques a été évaluée par la méthode exposée à la page 60. Les séries jugées sûres apparaissent en caractère romain ordinaire; les séries jugées de fiabilité douteuse sont en italique.

Portée : Le tableau 5 présente des données pour 199 pays ou zones du monde qui comptent 10 000 habitants ou davantage.

Insuffisances des données : La comparabilité des estimations de population est limitée par les facteurs mentionnés aux pages 57 et 58, à savoir : le manque d'uniformité dans les définitions de la population de droit et de la population de fait, l'inexactitude des résultats de recensement sur lesquels reposent certaines estimations et la date plus ou moins ancienne du recensement et la méthode d'ajustement chronologique. La méthode consistant à remplacer les estimations divergentes et les données de recensement fragmentaires par des séries cohérentes d'estimations au milieu de l'année établies par les Nations Unies devrait cependant permettre une meilleure comparabilité.

Tableau 6

Le tableau 6 décrit le mouvement général, en nombre et en pourcentage, selon le sexe, de la population dénom-

[40] Les estimations relatives à la population totale et à la population urbaine pour la période 1966-1974 figurent au tableau 6.

brée ou estimée comme urbaine, au cours de la période 1966-1974. Un tableau analogue, portant sur la période 1965-1973 figurait dans l'*Annuaire démographique* de 1973, des chiffres pour la période 1962-1971 figuraient dans l'*Annuaire démographique* de 1971, des chiffres pour la période 1950-1970 figuraient dans l'*Annuaire* de 1970, et des chiffres pour la période 1920-1960 figuraient dans l'*Annuaire* de 1960 tandis que dans l'*Annuaire* de 1952 était présenté un tableau limité de l'évolution de la population pour 1900-1950.

En général, les données présentées sont tirées de recensements de la population, ou d'enquêtes nationales par sondage portant sur tous les secteurs de la population. On a inclus les estimations qui semblaient avoir été établies par une autre méthode que la répartition proportionnelle fondée sur les résultats du recensement. Les estimations sont indiquées par la lettre (E) placée après la date dans la colonne des titres, les enquêtes par sondage sont aussi indiquées par une note; toutes les autres données peuvent être présumées provenir de recensements. On trouve, dans ce tableau, non seulement des résultats de recensements portant sur ce caractère important, mais également une répartition de la population selon la résidence (urbaine ou rurale) qui permet de calculer les taux bruts figurant dans les tableaux 9, 11, 13 et 24.

Les estimations qui paraissent de valeur discutable, selon l'évaluation effectuée à propos du tableau 5, sont reproduites non en caractère romain mais en italique. Le classement des données en données exactes et données moins exactes est fondé sur la méthode qui a servi à les établir (voir explications page 60). Le sens donné au terme «*urbain*» est censé être conforme aux définitions nationales présentées à la fin du tableau.

Portée : Le tableau présente des données pour 143 pays ou zones.

Insuffisances des données : Les limitations fondamentales imposées par les variations de la définition de la population totale et par les lacunes du recensement se font peut-être sentir davantage dans la répartition de la population en urbaine et rurale que dans sa répartition suivant toute autre caractéristique. C'est ainsi que la classification en population urbaine ou population rurale sera affectée par des différences dans la définition de la *résidence habituelle* utilisée pour l'exploitation des données à l'échelon sous-national, d'autant plus que la population *urbaine* est généralement exprimée en fonction de divisions telles que les communes ou les villes. Pareillement, le degré de sous-dénombrement aura une influence notable sur la comparabilité de ces deux catégories dans l'ensemble du tableau.

Ce qui crée une difficulté encore plus caractérisée, c'est que les pays ou zones ne sont pas d'accord sur la définition du terme *urbain*. La distinction entre les régions urbaines et les régions rurales varie tellement que les définitions utilisées ont été reproduites à la fin du tableau. Les définitions sont forcément brèves, et lorsque le classement en «*zone urbaine*» repose sur des divisions administratives on a souvent identifié celles-ci par le nom qu'elles portent dans le pays ou zone considéré. Par suite des variations dans la terminologie, les différences entre pays ou zones peuvent sembler plus grandes qu'elles ne le sont réellement. Mais il se peut aussi que des termes similaires ou identiques, tels que ville, village, district, aient des significations très différentes suivant les pays ou zones.

On constatera, en examinant les définitions adoptées par les différents pays ou zones, qu'elles peuvent être ramenées à trois types principaux : 1) classification des localités de certaines dimensions comme *urbaines;* 2) classification des centres administratifs de petites circonscriptions administratives comme *urbains*, le reste de la circonscription étant considéré comme *rural;* 3) classification des petites divisions administratives selon un critère déterminé, qui peut être soit le type d'administration locale, soit le nombre d'habitants, soit le pourcentage de la population exerçant une activité agricole.

Il arrive ainsi que soient considérées comme urbaines des localités de 400 habitants à peine en Albanie, alors qu'en Autriche les agglomérations ne sont reconnues comme telles que lorsque leur population atteint 5 000 personnes au moins. En Bulgarie, les localités urbaines sont celles qui jouissent officiellement du statut urbain, quelle que soit l'importance de leur population; en Israël, les centres urbains sont ceux de caractère essentiellement non agricole; en Suède, ce sont les zones bâties où les maisons sont espacées de moins de 200 m. Cet aperçu de quelques variations donne une idée du défaut de comparabilité existant entre les définitions de chaque pays ou zone.

La distinction entre régions urbaines et rurales est si étroitement liée à des considérations d'ordre historique, politique, culturel et administratif que l'on ne peut progresser que très lentement vers des définitions et des méthodes uniformes. Non seulement les définitions sont différentes les unes des autres, mais encore on n'y retrouve parfois même plus l'intention originale de distinguer les régions *rurales* des régions *urbaines*. Lorsque la classification est fondée, en particulier, sur le critère des circonscriptions administratives (comme la plupart le sont), elle a tendance à devenir rigide avec le temps et à décourager toute modification. Pour cette raison la comparaison des données dans le temps peut être dépourvue de signification puisque les définitions ne s'appliquent plus aux circonstances actuelles. Il faut être particulièrement prudent lorsqu'on compare les données de recensements et les données d'enquêtes par sondage car il est probable que les définitions du terme «*urbain*» ne sont pas homogènes.

Cependant, malgré leurs insuffisances, les statistiques de la population urbaine et rurale sont extrêmement utiles lorsqu'on se propose de comparer en gros le degré d'urbanisation entre pays. Quelle que soit la manière dont elles sont définies, les régions *urbaines* ont de grandes chances de comprendre une forte concentration de population urbaine tandis que les régions *rurales* sont en majeure partie composées de villages ou de zones aux caractéristiques rurales évidentes. On peut donc dire que si les contrastes entre la population rurale et la population urbaine ne sont pas mesurés de façon précise, ils se reflètent néanmoins dans les statistiques.

Tableau 7

Le tableau 7 présente les dernières données officielles disponibles concernant la répartition de la population urbaine et rurale par groupes d'âge quinquennaux et par sexe (chaque recensement entre 1965 et 1974 et dernières estimations post-censitaires. Ce tableau permet de mettre à jour les séries chronologiques (1940-1973) montrant les tendances de la population classée par âge et par sexe

et publiées dans les éditions antérieures de l'*Annuaire démographique*.

La date de référence du recensement ou de l'estimation figure dans la colonne des titres. Les données de recensements sont identifiées par la lettre «C» placée après la date.

En général, les estimations se rapportent au milieu de l'année civile considérée (1er juillet). En l'absence d'une estimation au milieu de l'année, la moyenne de deux estimations acceptables de fin d'année lui a été substituée; lorsqu'on disposait d'une seule estimation de fin d'année, on l'a fait figurer dans le tableau. Les «moyennes» ne sont pas spécialement désignées, sauf lorsque le total pour tous les âges diffère de l'estimation de mi-année figurant au tableau 5.

Les estimations dont la fiabilité paraît douteuse sont reproduites en italique et non en caractère romain. Le classement des estimations, exactes ou douteuses, est fondé sur la méthode employée pour les obtenir, ainsi qu'il est indiqué à la page 60. On n'a pas tenu compte des inexactitudes dans les déclarations d'âge, dont la méthode d'évaluation est exposée à la page 60.

L'*âge* désigne soit l'âge au dernier anniversaire, soit l'âge en années révolues. La classification par âge comprend les 20 groupes suivants : moins d'un an, 1 à 4 ans, 5 à 9 ans, et ainsi de suite, de 5 ans en 5 ans jusqu'à 80, 84 ans; 85 ans et plus; âge inconnu. Ce système est conforme au classement recommandé par l'ONU[41].

Urbain a le sens que lui donnent les définitions nationales de la population urbaine (et, *a contrario*, de la population rurale) qui figurent à la fin du tableau 6.

Portée : Le tableau 7 présente, pour 164 pays ou zones, des séries de données sur la population selon l'âge et le sexe. De ces séries de données, 71 sont des résultats de recensement, 8 sont des estimations fondées sur les résultats d'enquêtes par sondage et 85 sont des estimations post-censitaires.

La portée du tableau n'a pas été déterminée uniquement par la possibilité de réunir des données; en effet, on a délibérément exclu un certain nombre d'estimations de population selon l'âge et le sexe à cause des méthodes de calcul sur lesquelles elles reposaient. Pour pouvoir figurer dans le présent tableau, une estimation doit être fondée sur les résultats d'une enquête par sondage ou doit avoir été établie par la méthode des composantes, à partir des résultats d'un recensement de population. Les répartitions par âge et par sexe obtenues en appliquant à l'estimation de la population totale les pourcentages des divers groupes d'âge pour chaque sexe lors du dernier recensement ou de la dernière enquête par sondage ne sont pas acceptables et n'ont pas été reproduites dans ce tableau.

Insuffisances des données : La comparabilité des statistiques de la population selon l'âge et le sexe est limitée en premier lieu par le manque d'uniformité dans la définition de la population totale (voir page 57) et par les lacunes des dénombrements (voir plus haut). L'influence de ces deux facteurs varie selon les groupes d'âge. Ainsi, le dénombrement des nouveau-nés et des jeunes enfants comporte souvent plus de lacunes que celui des personnes plus âgées. De même l'exclusion du chiffre de la population totale de certains groupes de personnes appartenant souvent à des groupes d'âge déterminés, par exemple les militaires, peut influer sensiblement sur la structure par âge et sur la comparabilité des données avec celles d'autres pays ou zones. Il conviendra de tenir compte de ces facteurs fondamentaux lorsqu'on utilisera les données du tableau.

Outre ces difficultés d'ordre général, la comparabilité pose des problèmes particuliers lorsqu'il s'agit des données par âge. On sait que les répartitions de la population selon l'âge présentent certaines imperfections dues à l'inexactitude des déclarations d'âge. Certaines de ces anomalies ont tendance à s'estomper ou à disparaître lorsqu'on classe les données par groupes d'âge quinquennaux et non par années d'âge, mais une certaine imprécision demeure, même s'il n'est pas toujours facile de voir à quel point il y a distorsion. Un exposé critique sur cette question figure aux pages 59 à 60.

Le degré de comparabilité dépend également des méthodes employées dans les divers pays ou zones pour classer les données selon l'âge. Dans tous les cas où l'on sait que la répartition n'a pas été établie d'après le calcul de l'âge au dernier anniversaire, mais d'après l'année de naissance, on l'a indiqué en note. Pour le résultat de cette méthode, voir page 58.

En ce qui concerne le classement par âge, il est à noter que l'absence de chiffre sous la rubrique «âge inconnu» n'indique pas toujours que toutes les déclarations d'âge étaient précises; elle indique plus souvent qu'on a attribué des âges avant d'exploiter les données ou que les personnes d'âge inconnu ont été réparties sur la base de certaines hypothèses. On ne sait pas toujours quelle méthode a été utilisée pour éliminer les chiffres de la catégorie d'âge inconnu et les tableaux comportent donc peu de notes qui donnent des indications à ce sujet; toutefois, il ne faut pas oublier que ce procédé peut avoir été employé.

Comme on l'a indiqué à propos du tableau 5, les estimations intercensitaires de la population totale sont d'ordinaire rectifiées d'après les résultats des recensements de population si l'on constate des discontinuités inexplicables. Mais, dans les cas des données concernant la répartition intercensitaire de la population par âge et par sexe, il y a moins de chances pour qu'elles soient rectifiées de cette manière. Celles qui ne l'ont pas été font l'objet d'une note dans ce tableau; elles ne doivent alors être employées qu'avec une extrême précaution pour l'analyse des séries chronologiques, quoique leur utilité pour l'étude de la structure par âge de la population pour l'année visée reste probablement entière.

Par ailleurs, l'utilisateur des données du présent tableau devra tenir compte des insuffisances propres aux statistiques de la population urbaine et rurale. Ces insuffisances ayant déjà été exposées en détail à propos du tableau 6, ces explications n'ont pas été reprises ici.

Tableau 8

Le tableau 8 présente, pour chaque pays ou zone, des données sur la population de la capitale et de chaque ville de 100 000 habitants ou plus d'après les derniers chiffres

[41] *Principes et recommandations concernant les recensements de population de 1970*, par. 313 (7).

disponibles. La date de référence du recensement, de l'enquête par sondage ou de l'estimation apparaît dans la colonne de gauche du tableau et les résultats des recensements nationaux ont été indiqués par un «C» après la date. Les estimations fondées sur les résultats d'enquêtes par sondage ainsi que le résultat des recensements municipaux ont été identifiés dans les notes.

On constatera que parfois les dates d'un dénombrement ne coïncident pas exactement avec celles de l'enquête nationale indiquées dans d'autres tableaux. En effet, dans le cas des enquêtes par sondage et des recensements, le dénombrement s'étend souvent sur une assez longue période, les opérations étant menées consécutivement et non simultanément dans les diverses régions du pays ou de la zone.

Étant donné que les villes ne sont pas délimitées de la même manière dans tous les pays ou zones, on s'est efforcé de donner, dans ce tableau, des chiffres correspondant non seulement aux villes proprement dites, mais aussi, le cas échéant, aux agglomérations urbaines.

On entend par *villes proprement dites* les localités importantes qui ont des limites juridiquement définies et sont administrativement considérées comme villes, ce qui se caractérise généralement par l'existence d'une autorité locale.

L'*agglomération urbaine* comprend, par définition, la ville proprement dite ainsi que la proche banlieue, c'est-à-dire la zone fortement peuplée qui est extérieure, mais contiguë aux limites de la ville. Chaque fois que les chiffres obtenus se rapportaient à une agglomération urbaine, c'est à ces chiffres que l'on a appliqué le critère choisi (100 000 habitants) afin que toutes les villes de la dimension prévue — quelle qu'en soit la définition — figurent dans le tableau.

Dans le présent tableau, les villes sont rangées dans l'ordre alphabétique anglais, bien que leur nom soit donné dans la langue du pays ou de la zone auquel elles appartiennent, ou, le cas échéant, dans une translitération. Si l'on a adopté ce mode de présentation, c'est qu'il est difficile d'établir les équivalents anglais et français des noms officiels de bien des villes. Pour faciliter l'identification des capitales, leur nom a été imprimé en lettres majuscules de petit format.

Étant donné l'absence de renseignements concernant la méthode d'établissement des estimations, la fiabilité des données a été jugée équivalente à celle des chiffres de population de chacun des pays ou zones. En conséquence, les données provenant des résultats de recensements et d'enquêtes par sondage apparaissent en caractère romain tandis que les autres estimations de la population urbaine sont en caractère romain ou en italique, suivant la méthode utilisée pour l'établissement des estimations de la population nationale.

Portée : Le tableau 8 fournit les chiffres de la population des grandes villes de 193 pays ou zones; pour 111 d'entre eux on n'a donné que la population de la capitale, tandis que pour 82 on a indiqué celle de la capitale et d'une ou plusieurs villes comptant, selon le dernier recensement ou la dernière estimation disponible, 100 000 habitants ou plus.

Insuffisances des données : C'est surtout dans le cas des villes qu'on se heurte aux difficultés soulevées par la définition de la population de fait et de la population de droit. La comparabilité des données est également compromise par les différences entre les méthodes utilisées pour l'établissement des estimations et, même lorsque les méthodes sont identiques, par le manque de précision inhérent à certaines d'entre elles. Par exemple, les naissances et décès qui surviennent dans les villes ne correspondent pas tous à la population présente ou résidente. En conséquence, des erreurs considérables peuvent se produire si l'on établit pour les villes des estimations fondées sur l'accroissement naturel de la population. Les migrations intérieures constituent un second élément d'estimation que, dans bien des régions, on ne peut pas toujours mesurer avec exactitude. Pour ces diverses raisons, les estimations du tableau 8 sont dans l'ensemble peu sûres et leur valeur est particulièrement limitée du point de vue des comparaisons internationales.

La comparabilité est limitée davantage encore du fait que les critères sur lesquels reposent les définitions nationales ne sont pas partout les mêmes. En France, par exemple, les données indiquées au tableau 8 correspondent aux communes qui constituent le centre d'une agglomération urbaine. Dans d'autres cas (Belgique, Espagne, Italie, Japon), les chiffres se rapportent à des divisions administratives entières, connues, selon le pays, sous le nom de *shî,* de «communes» ou de *municipios,* et comportent une agglomération et le territoire avoisinant, lequel peut englober d'autres agglomérations urbaines tout à fait distinctes ou être de caractère essentiellement rural. Pour ce groupe de pays, le type de division administrative est indiqué au tableau 8 et, dans la mesure du possible, les chiffres ont été portés entre les deux colonnes, de manière à montrer qu'il s'agit d'unités pouvant s'étendre au-delà d'une localité urbaine intégrée, sans constituer nécessairement pour autant une agglomération urbaine.

Enfin, il convient de noter que les données du tableau 8 proviennent soit de recensements municipaux, comme en Jordanie et en Éthiopie, soit de recensements nationaux de population, soit d'estimations régulièrement établies, soit encore d'enquêtes spéciales. En tout état de cause, les dates de base ne sont pas uniformes et, comme les populations urbaines s'accroissent selon des processus différents, il faut faire preuve de prudence si l'on veut comparer valablement les données se rapportant à des années différentes.

Tableau 9

Ce tableau présente des données nouvelles et des données révisées sur l'évolution des naissances vivantes et sur les taux bruts de natalité selon la résidence (urbaine ou rurale) pour chacune des années 1970-1974.

La plupart des chiffres indiqués se rapportent aux naissances vivantes enregistrées par les services de l'état civil, et les taux fondés sur ces données ont été calculés par le Bureau de statistique de l'ONU. En outre, dans un certain nombre de cas où l'on savait qu'il n'existait pas de données d'enregistrement ou que ces données étaient discutables, il a été possible de publier des estimations dont on pense qu'elles représentent plus fidèlement le niveau de natalité. Ces estimations concernant des an-

nées particulières ont été établies à partir des résultats d'enquêtes par sondage, par l'analyse des données de recensements consécutifs et par la «méthode de l'inverse des quotients de survie». Sont inclus également certains taux estimatifs pour 1965-1970 qui ont été établis par la Division de la population de l'ONU, sur la base de niveaux hypothétiques de fécondité exprimés en termes de taux de reproduction brute et de répartition des taux de fécondité par âge. Pour distinguer ces données de celles qui proviennent des registres de l'état civil, les chiffres et les taux estimatifs ont été identifiés et l'on en a précisé la nature dans des notes de bas de page, en fournissant, chaque fois que possible, à la suite du tableau les données d'enregistrement correspondantes.

Le sens donné au terme *Urbain* est censé être conforme aux définitions nationales du terme «urbain» utilisées dans les recensements de population. Ces définitions nationales sont données à la fin du tableau 6.

Conformément à la pratique habituelle, le code (**C, U** ou . . .) qui indique la qualité des données d'enregistrement apparaît dans la première colonne du tableau 9; de plus, les données jugées discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites non en caractère romain mais en italique (voir explications à la page 62.

Il y a lieu de noter que le code de qualité ne s'applique pas aux chiffres et aux taux estimatifs; lorsqu'une série comporte à la fois des données estimatives et des données d'enregistrement, le codage ne s'applique donc qu'à ces dernières. Lorsqu'une série ne comporte que des taux estimatifs, on a mis deux points (. .) dans la colonne réservée au code.

Portée : Le tableau 9 contient des statistiques de la natalité intéressant 96 pays ou zones. Dans 38 cas, elles donnent la répartition selon la résidence (urbaine ou rurale). On a fait figurer tous les principaux pays ou zones pour lesquels on possédait un chiffre ou un taux pour une année au moins. En l'absence de chiffres nationaux, on a fait figurer des chiffres concernant des groupes ethniques ou géographiques. Ces données n'ont pas de valeur sur le plan national, mais leur présence donne au tableau la valeur d'un index des statistiques de la natalité disponibles pour le monde entier.

Calcul des taux : Les *taux bruts de natalité enregistrés* représentent le nombre de naissances vivantes enregistrées au cours d'une année civile pour 1 000 habitants présents dans l'unité géographique considérée au milieu de l'année.

Les *taux de natalité selon la résidence (urbaine ou rurale)* représentent le nombre de naissances vivantes enregistrées pour une population urbaine ou rurale de 1 000 personnes au milieu de l'année.

Les *taux estimatifs* obtenus à partir des résultats des enquêtes par sondage représentent le nombre de naissances qu'on estime être survenues pendant la période de référence (généralement la période de 12 mois qui a précédé l'enquête par sondage) pour 1 000 habitants qu'on estime avoir été présents lors de l'enquête.

Les taux pour les années pour lesquelles on possède des données ont été calculés par le Bureau de statistique des Nations Unies sur la base des estimations de la population au milieu de l'année reproduites aux tableaux 5 et 6. On s'est toujours efforcé d'établir une correspondance rigoureuse entre le numérateur (naissances vivantes) et le dénominateur (population) des taux et l'on a indiqué en note les cas où l'on n'a pas pu y parvenir.

Insuffisances des données : Les statistiques de la natalité appellent les réserves faites à propos des statistiques de l'état civil en général et des statistiques de la natalité en particulier.

Les insuffisances des statistiques de la natalité, que traduit le code, et la classification des statistiques en données sûres et données discutables sont particulièrement pertinentes. Pour interpréter les statistiques de ce tableau, il faudra également tenir compte des effets de l'exploitation des données selon la date de l'enregistrement et non la date de l'événement. Les pays ou zones dont on sait qu'ils établissent leurs statistiques d'après la date de l'enregistrement sont indiqués par une croix (†) figurant dans la même colonne que les notations codiques, ce qui permet d'évaluer immédiatement l'effet combiné des deux facteurs.

Il importe de souligner que, là où le décalage entre l'événement et son enregistrement est grand, c'est-à-dire là où une forte proportion des naissances vivantes fait l'objet de déclarations tardives, comme c'est le cas dans certaines régions d'Amérique latine, d'Asie et d'Afrique, l'exploitation des statistiques des naissances vivantes d'après la date de l'enregistrement peut donner une idée très inexacte, ou même totalement fausse, des tendances de la natalité. Souvent, ces statistiques conduisent à des taux de natalité qui paraissent tout à fait vraisemblables alors même que l'on sait que bon nombre de naissances n'ont pas été enregistrées. En pareil cas, les lacunes de l'enregistrement sont masquées par l'inclusion de naissances survenues les années précédentes et les chiffres obtenus peuvent conduire à de grosses erreurs d'interprétation, particulièrement en ce qui concerne les caractéristiques de la fécondité.

On a indiqué dans les notes les pays ou zones où les statistiques des naissances vivantes ne tiennent pas compte soit des enfants nés vivants et décédés avant l'enregistrement de leur naissance, soit de ceux qui décèdent dans les 24 heures qui ont suivi la naissance. Cette exclusion conduit à sous-estimer la natalité; l'importance générale de cette erreur est examinée dans le *Manuel de statistique de l'état civil*[42].

En dehors des insuffisances exposées ci-dessus, les statistiques de la natalité selon la résidence urbaine ou rurale appellent toutes les réserves qui découlent du manque de comparabilité internationale des définitions nationales de la population «urbaine» et de la population «rurale» — réserves qui ont été exposées à propos du tableau 6 du présent *Annuaire*. La plus grave vient peut-être de ce qu'il est difficile d'assurer une comparabilité rigoureuse du numérateur et du dénominateur des taux. Il se peut par exemple que des définitions différentes du terme «urbain» et du terme «rural» aient été utilisées pour les statistiques de la natalité (numérateur) et pour les statistiques de la population (dénominateur), ce qui aurait pour effet d'invalider les taux. Or, il n'est malheureusement pas possible de s'assurer de la concordance des définitions utilisées.

[42] Chap. IV.

L'exactitude des taux dépend également de la qualité et des insuffisances des estimations de population qui sont utilisées pour leur calcul. Ce facteur revêt une importance particulière dans le cas du tableau 9 étant donné que l'on a décidé à partir de l'édition de 1965 de l'*Annuaire* de calculer des taux d'après les estimations de population établies par les Nations Unies.

D'autre part, les taux estimatifs fondés sur les résultats d'enquêtes par sondage comportent des possibilités d'erreurs considérables dues soit à des omissions dans les déclarations, soit au fait que l'on a déclaré à tort des naissances survenues en réalité hors de la période considérée. Toutefois, les taux estimatifs fondés sur les résultats d'enquêtes par sondage présentent un avantage considérable : le chiffre de population utilisé comme base est, par définition, connu et rigoureusement correspondant. L'exactitude des taux de natalité estimés selon « la méthode de l'inverse des quotients de survie » dépend de plusieurs facteurs, dont les principaux sont l'exactitude du dénombrement des enfants des groupes d'âge utilisés et les erreurs dans les coefficients de survie.

Malgré leurs insuffisances, les taux bruts de natalité permettent néanmoins de mesurer l'augmentation brute de la population et, lorsqu'ils sont examinés conjointement avec les taux bruts de mortalité, ils donnent une certaine estimation du taux d'accroissement de la population. Ils peuvent également donner une idée générale des tendances de longue période dans un pays ou un territoire donné, ainsi que des indications permettant de classer approximativement les pays ou zones selon le niveau de la natalité. Mais, comme la structure de la population selon l'âge et le sexe varie d'un pays ou d'une zone à l'autre, les taux bruts ne traduisent pas exactement les différences de fécondité et ne permettent donc pas, à eux seuls, d'évaluer la tendance présente ni de prévoir les mouvements futurs.

Tableau 10

Les naissances vivantes selon l'âge de la mère et le sexe de l'enfant, avec classification croisée selon la résidence (urbaine ou rurale) pour la dernière année pour laquelle on possède des données, font l'objet du tableau 10. Dans certains cas, la dernière année pour laquelle on possède des données concernant la résidence (urbaine ou rurale) n'est pas la même que pour le total ou le total et le sexe de l'enfant; dans ce cas, on a indiqué les deux répartitions. Les données présentées proviennent essentiellement des registres de l'état civil. Des données analogues pour la dernière année disponible figuraient dans les éditions de 1970, 1971, 1972 et 1973 de l'*Annuaire démographique*. Des données concernant les naissances vivantes selon l'âge de la mère et selon le sexe de l'enfant ont été présentées dans toutes les éditions de l'*Annuaire démographique* depuis 1965; des données concernant les naissances vivantes selon l'âge de la mère et selon la résidence (urbaine ou rurale) figurent dans les éditions de 1965, 1969 et 1973. Avant 1965, presque toutes les éditions de l'*Annuaire démographique* contenaient des données concernant les naissances vivantes selon l'âge de la mère mais non selon le sexe de l'enfant ni la résidence (urbaine ou rurale).

L'*âge*, dans ce tableau, désigne l'âge de la mère au dernier anniversaire, ou âge en années révolues, conformément aux recommandations de l'Organisation des Nations Unies[43].

La classification par âge, également conforme aux recommandations de l'ONU[44], comporte dix catégories : moins de 15 ans, groupes quinquennaux jusqu'à 49 ans, 50 ans et plus, et âge inconnu.

Le sens donné au terme *urbain* est censé être conforme aux définitions nationales du terme «urbain» (et, *a contrario*, du terme «rural») utilisées dans les recensements de population. Ces définitions nationales sont données à la fin du tableau 6.

Les données jugées discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. (Voir explication à la page 63).

Portée : La dernière répartition disponible des naissances selon l'âge de la mère est incluse dans le tableau pour chacun des 131 pays ou zones où l'on a enregistré 50 naissances ou plus[45]. On a pu présenter la répartition selon le sexe de l'enfant et la résidence (urbaine ou rurale) pour 17 pays ou zones, selon le sexe uniquement pour 76 pays ou zones et selon la résidence (urbaine ou rurale) pour 13 pays ou zones. Lorsqu'il n'existait pas de chiffres nationaux, on a donné des chiffres portant sur des groupes ethniques ou géographiques. Ce tableau peut donc être considéré comme un index des pays ou zones qui classent les naissances vivantes d'après l'âge de la mère, le sexe de l'enfant et la résidence (urbaine ou rurale), et du degré d'actualité de ces statistiques.

Insuffisances des données : Les statistiques de la natalité selon l'âge de la mère présentent les mêmes insuffisances que celles indiquées pour le tableau 9.

Comme ces statistiques sont classées par âge, les mêmes limitations concernant l'exactitude des déclarations d'âge que celles déjà mentionnées à propos de la répartition de la population selon l'âge et le sexe s'y appliquent également. Si aucun nombre ne figure dans la colonne réservée aux âges inconnus, cela ne signifie pas nécessairement que les déclarations d'âge et l'exploitation des données par âge aient été tout à fait exactes. C'est souvent une indication que l'on a attribué un âge aux personnes d'âge inconnu avant l'exploitation des données ou qu'elles ont été réparties proportionnellement entre les différents groupes après cette opération. D'autre part, lorsque le nombre des personnes d'âge inconnu est important, cela peut signifier que le pourcentage des naissances illégitimes est élevé, étant donné qu'en pareil cas l'acte de naissance ne contient pas toutes les caractéristiques concernant les parents.

Il importe de ne pas oublier non plus, lorsqu'on utilisera ces données, que l'on calcule parfois l'âge de la mère à la naissance de l'enfant (ou à l'enregistrement de cette naissance) sur la base de l'année de naissance seulement et non d'après la date exacte (jour, mois et année) de naissance de la mère. Des renseignements à ce sujet sont fournis en note chaque fois que faire se peut.

Le défaut de comparabilité rigoureuse, à la fois entre les données du présent tableau qui se rapportent à des

[43] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 124.

[44] *Ibid.*, par. 268, tableau L B-5.

[45] Les pays qui ont été exclus en application de ce critère sont les îles Cocos (Keeling), l'île Norfolk et l'île Pitcairn.

pays ou zones différents et entre ces données et celles du tableau 9, résulte également d'autres causes, parmi lesquelles on peut citer le fait que les données selon l'âge peuvent se rapporter aux accouchements plutôt qu'aux naissances vivantes; en outre, dans certains cas, les accouchements en question correspondent seulement à ceux d'enfants nés vivants tandis que, dans d'autres, ils concernent les accouchements d'enfants nés vivants et de mort-nés. Certains pays ou zones ne classent selon l'âge de la mère que les naissances légitimes alors que les chiffres du tableau 9, relatifs aux naissances vivantes se rapportent à toutes les naissances, légitimes ou non. Dans la plupart des cas, cette restriction n'a guère d'importance, mais lorsque les naissances illégitimes sont relativement nombreuses, on ne peut considérer des données selon l'âge de la mère limitées aux seules naissances légitimes comme significatives. De même, dans d'autres pays ou zones, la répartition des naissances vivantes par âge de la mère ne porte que sur les enfants nés vivants qui ne sont pas décédés avant l'enregistrement de leur naissance, tandis que les totaux du tableau 9 ont été ajustés pour tenir compte de ceux qui sont décédés avant l'enregistrement.

De même que pour le nombre total de naissances, les différences dans la méthode d'exploitation des données — selon la date de l'événement ou celle de l'enregistrement — nuisent à leur comparabilité. Une croix (†) dans la colonne de gauche du tableau indique les pays ou zones qui établissent leurs statistiques d'après la date de l'enregistrement; les conséquences de cette méthode ont déjà été exposées à la page 64. Il convient de noter cependant que, lorsque les statistiques de la natalité sont établies selon la date de l'enregistrement et non de l'événement, l'âge de la mère représente presque toujours son âge à la date de l'enregistrement et non à la date de la naissance de l'enfant. Ainsi, dans les pays ou zones où l'enregistrement des naissances est tardif — le retard atteignant souvent plusieurs années — il est évident que la répartition selon l'âge de la mère ne présente guère d'utilité comme indice de la structure actuelle de la natalité.

Les statistiques des naissances selon la résidence (urbaine ou rurale) appellent en outre toutes les réserves qui découlent du manque de comparabilité internationale des définitions nationales de la population *urbaine* et de la population *rurale* et qui ont été exposées à propos du tableau 6 de la présente édition.

Tableau 11

Le tableau 11 présente des données nouvelles et des données révisées sur la tendance des mariages et des taux bruts de nuptialité selon la résidence (urbaine ou rurale) pour chacune des années 1970-1974.

Sauf indication contraire, les statistiques se rapportent aux mariages *célébrés*, c'est-à-dire à l'*acte, la cérémonie ou la procédure qui établit un rapport légal entre mari et femme. L'union peut être rendue légale par une procédure civile ou religieuse, ou par toute autre procédure, conformément à la législation du pays*[46] *(ou de la zone)*. Ce sont des statistiques des mariages, non des statistiques des personnes qui se marient.

[46] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 46 (4).

Le sens du terme *urbain* est censé être conforme aux définitions nationales de ce terme utilisées dans les recensements de population. Ces définitions nationales sont données à la fin du tableau 6.

Conformément à la pratique habituelle, le symbole (**C, U** ou . . .) qui figure dans la première colonne du tableau indique la qualité des données; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. (voir explications à la page 62).

Portée : Des statistiques sur les mariages et les taux bruts de nuptialité sont présentées pour 134 pays ou zones et classées selon la résidence (urbaine ou rurale) pour 21 d'entre eux. En l'absence de statistiques pour l'ensemble du pays, on a présenté des chiffres concernant des groupes ethniques ou géographiques. Ces données n'ont guère de valeur en elles-mêmes, mais elles permettent d'identifier les pays ou zones pour lesquels il existe quelques statistiques de la nuptialité.

Calcul des taux : Les *taux bruts de nuptialité* indiquent le nombre de mariages enregistrés pour 1 000 personnes présentes au milieu de l'année considérée.

Les *taux de nuptialité selon la résidence (urbaine ou rurale)* représentent le nombre de mariages enregistrés pour une population urbaine ou rurale de 1 000 personnes au milieu de l'année. Pour les années où des données étaient disponibles, les taux ont été calculés par le Bureau de statistique de l'ONU d'après les estimations de la population au milieu de l'année présentées aux tableaux 5 et 6. On s'est efforcé d'assurer une correspondance rigoureuse entre le numérateur du taux (mariages) et le dénominateur (population); on a indiqué en note les cas où elle n'a pu être assurée.

Insuffisances des données : Presque toutes les réserves faites à propos des statistiques de l'état civil à la page 61, et toutes celles qui ont été formulées au sujet des statistiques de la nuptialité en particulier, s'appliquent aux données du présent tableau. Leur qualité varie en raison des différences qui existent d'un pays ou d'une zone à l'autre dans les définitions utilisées aux fins de la statistique; dans la mesure où elles ne tiennent pas compte des unions consensuelles, elles donnent une idée trompeuse de la formation des familles biologiques; enfin, si elles sont incomplètes, elles ne donnent même pas une bonne indication du nombre des mariages reconnus par la loi. Toutefois, il importe de souligner que, le mariage étant un acte juridique et non un fait biologique, le problème de la comparabilité des données du point de vue de la complétude se présente sous un aspect un peu différent. Il convient d'en tenir compte pour interpréter les notations codées (**C** ou **U**) qui indiquent la qualité des données dans la première colonne du tableau.

Les taux sont d'excellents indices de la fréquence des unions consensuelles, car, pour les mariages reconnus par la loi, l'intervalle de variation des taux est assez étroit; les variations marquées sont donc presque toujours dues à une prépondérance des unions de fait par rapport aux unions de droit. L'influence de ce facteur sur la comparabilité des données est particulièrement évidente pour certaines parties de l'Amérique latine et de l'Afrique où les taux de nuptialité sont anormalement faibles.

Comme on le verra dans les notes, il n'a pas toujours été possible, pour le calcul des taux, d'obtenir une correspondance rigoureuse entre le numérateur et le dénominateur. Par exemple, les mariages parmi la population civile et les militaires sont parfois rapportés à la population civile. Cela peut avoir pour effet d'accroître les taux; au contraire, si la population de base englobe un plus grand nombre de personnes que celle dans laquelle les mariages ont été comptés, les taux seront plus faibles, mais, dans la plupart des cas, il est probable que la différence sera négligeable. Voir à ce sujet la série des taux pour Gibraltar.

Le signe (†) sert ici à indiquer que les statistiques ont été établies d'après la date de l'enregistrement, et non d'après celle de l'événement, c'est-à-dire, dans le cas présent, de la célébration. Comme on l'a signalé à la page 64, cette précision n'est pas très importante en ce qui concerne les mariages, étant donné que, dans la plupart des cas, l'enregistrement est la condition préalable à la célébration ou se confond avec elle. Cependant, comme il y a des pays ou zones où il peut y avoir un intervalle entre la célébration du mariage et son enregistrement[47], il faudra en tenir compte pour interpréter les données.

Ces statistiques des mariages selon la résidence (urbaine ou rurale) appellent en outre toutes les réserves qui découlent du manque de comparabilité internationale des définitions nationales de la population «urbaine» et «rurale» dont il a été question à la fin du tableau 6 de la présente édition. Le problème le plus important vient peut-être de ce qu'il est difficile d'assurer une comparabilité rigoureuse du numérateur et du dénominateur des taux. Il se peut, par exemple, que les définitions du terme «urbain» et du terme «rural» utilisées pour les statistiques de la nuptialité (numérateur) soient différentes de celles utilisées pour les statistiques de la population (dénominateur), ce qui aurait pour effet d'invalider les taux. Or, il n'est malheureusement pas possible de s'assurer de la concordance des définitions utilisées.

Les taux calculés sont également affectés par la qualité et les insuffisances des estimations de population qui servent à les établir. Ce facteur présente une importance particulière dans le cas du tableau 11 parce que depuis l'*Annuaire démographique* de 1965 on a pris pour principe de calculer les taux d'après les estimations de population établies par les Nations Unies.

Enfin, il convient de souligner que les taux bruts de nuptialité — de même que les taux bruts de natalité et de mortalité — ne sont pas des indices de probabilité, puisqu'ils ne tiennent pas compte de la répartition selon l'âge, le sexe et l'état matrimonial de la population à laquelle ils se rapportent. Néanmoins, ils mesurent les niveaux de la nuptialité et les fluctuations de la fréquence des mariages. Pour plus de détails sur l'utilisation des taux bruts de nuptialité, voir le chapitre premier de l'*Annuaire démographique* de 1958.

Tableau 12

Le tableau 12 indique le nombre de mariages classés selon l'âge de l'épouse, d'une part, et selon l'âge de l'époux, d'autre part, pour l'année la plus récente pour laquelle on possède des données. Depuis 1958, les «dernières données disponibles» sur ce sujet figurent dans chaque édition de l'*Annuaire démographique*. En outre, l'édition de 1949-1950 présentait l'évolution chronologique pour la période 1936-1949, celle de 1958 pour la période 1948-1957, et celle de 1968 pour la période 1958-1967.

Sauf indication contraire, les statistiques se rapportent aux mariages *célébrés*, c'est-à-dire à *l'acte, la cérémonie ou la procédure qui établit un rapport légal entre mari et femme. L'union peut être rendue légale par une procédure civile ou religieuse, ou par toute autre procédure, conformément à la législation du pays*[48] [*ou zone*]. Ce sont des statistiques des mariages, non des statistiques des personnes qui se marient.

L'*âge* de l'époux et de l'épouse est exprimé en années révolues au dernier anniversaire, conformément aux recommandations de l'Organisation des Nations Unies[49], c'est-à-dire que pour le calculer on soustrait la date de la naissance (jour, mois et année) de celle du mariage (jour, mois et année).

Le classement par âge est celui recommandé par l'Organisation des Nations Unies[50], la limite supérieure ayant été fixée à 60 ans et plus au lieu de 75 ans et plus, de façon à gagner un peu de place. On a utilisé 12 catégories : moins de 15 ans, groupes quinquennaux jusqu'à 59 ans, 60 ans et plus, et âge inconnu. On a adopté la même classification pour les deux sexes.

La présentation adoptée depuis quelques années pour ce tableau a été maintenue et il comporte à nouveau une colonne indiquant l'âge minimum du mariage pour le sexe féminin et pour le sexe masculin. Cet âge, appelé «âge de nubilité», est celui qu'il faut avoir atteint pour pouvoir contracter un mariage valable au regard de la loi. Toutefois, les personnes qui ont atteint cet âge légal ne se voient pas nécessairement conférer automatiquement le droit de contracter mariage sans avoir à obtenir de consentement. Dans la plupart des pays ou zones, entre l'âge légal et un âge plus avancé (généralement 21 ans), le mariage ne peut être contracté qu'avec le consentement des parents ou des tuteurs. Dans certains pays ou zones, la loi prévoit que l'autorité compétente peut, dans des cas déterminés, accorder une dispense en ce qui concerne l'âge minimum; dans d'autres, il n'existe rien de semblable.

Les données classées comme discutables (incomplètes) d'après le code qualité (voir p. 62) sont reproduites en italique. Si l'on admet que ces données sont incomplètes au même degré pour tous les âges, on peut dire qu'elles permettent de se faire une idée de la façon dont les mariages se répartissent selon l'âge, même si les nombres absolus sont inexacts.

Portée : On trouvera dans le tableau 12 des statistiques de la nuptialité selon l'âge de l'épouse et l'âge de l'époux pour 83 pays ou zones pour lesquels les statistiques portent sur 1 000 mariages au moins.

Insuffisances des données : Toutes les imperfections des statistiques de l'état civil en général et des statistiques

[47] *Manuel de statistique de l'état civil,* tableau 10, p. 100-101.

[48] *Principes et recommandations pour un système de statistiques de l'état civil,* par. 46 (4).

[49] *Principes et recommandations pour un système de statistiques de l'état civil,* par. 124.

[50] *Ibid.,* par. 268, tableau MA-3.

de la nuptialité en particulier influent sur la comparabilité des données du tableau 12. Les divergences par rapport à la norme en ce qui concerne le type de données incluses constituent un élément important dont il faut tenir compte dans les comparaisons. Ces divergences comprennent notamment les cas où les statistiques reposent sur les «autorisations de mariages délivrées», sur les «mariages inscrits sur les registres des églises seulement», ou encore ceux où elles comprennent les «unions reconstituées après une séparation», etc.

Le facteur âge compte aussi parmi les causes d'erreur. L'influence des erreurs de déclaration d'âge dans les recensements de population a été étudiée à la page 58. Il est probable que les statistiques de la nuptialité sont moins faussées par ce genre d'erreur, car les renseignements sont donnés par les intéressés eux-mêmes, et, comme le mariage est un acte juridique, il y a toutes chances pour que leurs déclarations soient exactes. Toutefois, dans certains pays ou zones, il semble y avoir une concentration anormale des mariages à l'âge minimum de nubilité ainsi qu'à l'âge auquel le mariage peut être valablement contracté sans le consentement des parents, ce qui peut indiquer que certains déclarants se vieillissent pour se conformer à la loi. Parmi les facteurs pouvant exercer une influence sur les déclarations d'âge, en particulier celles qui sont faites par des personnes plus âgées, il faut citer la tendance des femmes à se donner un âge soit égal, soit inférieur à celui de l'époux.

Pour les premiers âges, c'est-à-dire jusqu'à 24 ans, la comparabilité des données d'un pays ou d'une zone à l'autre risque également d'être limitée par les variations de l'âge minimum au mariage. On n'a pas à ce sujet de données pour tous les pays ou zones, mais il semble que, si les taux concernant les âges en question varient sensiblement d'un pays ou d'une zone à l'autre, c'est moins en raison des caractéristiques de la nuptialité qu'en raison des différences existant, sur le plan international, entre les conditions légales de validité du mariage civil. L'inclusion dans le tableau de l'âge de nubilité pour un certain nombre de pays devrait présenter un certain intérêt à ce point de vue.

Les réserves qu'implique le code de complétude figurant au tableau 11 et qui valent également pour les données du tableau 12 méritent d'être prises en considération, mais, comme on l'a indiqué plus haut, la signification des codes n'est pas toujours claire pour ce qui est de l'enregistrement des mariages. Quant aux erreurs découlant de l'exploitation des données selon la date de l'enregistrement, elles sont négligeables dans le cas de ce tableau.

Tableau 13

Le tableau 13 est le tableau habituel qui indique les tendances des divorces et des taux bruts de divortialité; il porte sur chacune des années de la période 1970-1974.

Sauf indication contraire, on entend par divorce la *dissolution définitive des liens du mariage qui confère aux parties le droit de se remarier*[51]. Les données se rapportent aux divorces prononcés à l'intérieur des frontières actuelles des pays ou zones énumérés pour la population présente. Il s'agit de jugements de divorce prononcés, non de personnes divorcées.

Conformément à la pratique habituelle, le symbole (**C, U** ou . . .) qui figure dans la première colonne du tableau indique la qualité des données; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. (Voir explications à la page 62).

Portée : Les chiffres annuels publiés ici concernent 98 pays ou zones. Tous les pays ou zones importants y sont représentés, même si l'on ne possédait pas de données récentes à leur sujet. Dans les cas où des statistiques sur l'ensemble de la population faisaient défaut, on a publié les données partielles. On a voulu ainsi non seulement fournir des renseignements sur la fréquence des divorces, mais aussi montrer quels sont les pays ou zones qui établissent des statistiques de la divortialité. Les pays ou zones où il n'existe pas de dispositions légales sur le divorce sont signalés dans des notes.

Calcul des taux : Les *taux* représentent le nombre absolu de divorces prononcés chaque année pour 1 000 personnes présentes au milieu de l'année considérée. Les chiffres de population sont ceux qui figurent dans le tableau 5. On s'est efforcé d'assurer une correspondance rigoureuse entre le numérateur du taux (divorces) et le dénominateur (population); on a indiqué en note les cas où elle n'a pu être assurée.

Insuffisances des données : La comparabilité des données de base est limitée par plusieurs des facteurs mentionnés au sujet des statistiques de l'état civil en général et des statistiques de la divortialité en particulier.

Comme les statistiques de la divortialité ont leur source dans les archives et les actes des tribunaux, il est probable que les fluctuations annuelles accusées traduiront le rythme plus ou moins rapide auquel les affaires sont jugées plutôt que l'évolution de la fréquence des divorces. En outre, elles montrent dans quelle mesure il est facile ou difficile d'obtenir un divorce, selon le caractère plus ou moins strict de la législation sur les causes de divorce et selon la capacité des intéressés à supporter les frais de procédure. À cet égard, il convient de citer aussi l'influence de certaines religions sur la fréquence des divorces. Lorsque les divorces sont peu nombreux, les statistiques de la divortialité peuvent englober les annulations ou même les séparations. L'inclusion des annulations dans le numérateur du taux brut de divortialité n'en modifie guère le niveau, mais l'inclusion des séparations peut avoir un effet appréciable sur le taux. Pour toutes ces raisons, les taux de divortialité ne sont pas rigoureusement comparables et ne permettent pas de mesurer exactement la fréquence des dissolutions légales de mariages.

L'effet de la complétude des données sur les statistiques de la divortialité dépend en grande partie du type des statistiques. On trouvera une analyse détaillée de la question à la page 13 de l'*Annuaire démographique* de 1968.

Les taux bruts de divortialité — comme les taux bruts correspondants de natalité, de mortalité et de nuptialité — ne sont pas des indices de probabilité. Ils servent plutôt à indiquer l'accroissement brut de la population nubile et la diminution de la population mariée. À ce titre, leur utilité est très grande, même s'ils ne sont pas absolument comparables d'un pays ou d'une zone à l'autre. Toutefois,

[51] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 46.

en raison des différences fondamentales qui existent entre les populations du point de vue de la répartition selon l'état matrimonial et de la structure par âge, ils ne mesurent pas le risque de divorce parmi les personnes mariées ou les couples. Ils ne donnent qu'une idée générale de l'évolution de la divortialité et des différences brutes qui existent entre les pays ou zones en ce qui concerne la fréquence des divorces par rapport à la population totale, réserve faite, bien entendu, des différences d'acception du terme «divorce» d'un pays ou d'une zone à l'autre.

Tableau 14

Le tableau 14 présente des statistiques sur le chiffre total des *entrées de voyageurs venant d'autres pays* et le chiffre total des *départs de voyageurs à destination d'autres pays* pour la période 1967-1973. Les données correspondantes pour la période 1965-1971 figurent dans l'édition de 1972 de l'*Annuaire démographique*, pour 1963-1969, dans l'édition de 1970 de l'*Annuaire*, pour 1966-1967 dans l'édition de 1968 de l'*Annuaire*, pour 1960-1965, dans l'édition de 1966 de l'*Annuaire*, pour 1956-1961, dans l'édition de 1962 de l'*Annuaire*, pour 1953-1958, dans l'édition de 1959 de l'*Annuaire* et pour 1945-1956 dans des éditions antérieures. Ces statistiques donnent une idée des entrées et des sorties internationales pendant une période de 20 ans. Les diverses sources en sont notamment les suivantes : statistiques des ports, statistiques du contrôle aux frontières, statistiques provenant des registres locaux de population ou statistiques des permis de travail. Pour plus de précisions sur ces statistiques et celles provenant d'autres sources, voir page 68.

Les *entrées* comprennent les personnes suivantes : 1) *immigrants à long terme;* 2) *immigrants à court terme;* 3) *visiteurs;* 4) *visiteurs en transit;* 5) *visiteurs en croisière;* 6) *résidents rentrant après un court séjour à l'étranger;* et 7) *autres catégories reconnues dans le pays ou la zone considérés.*

Les *sorties* comprennent les personnes suivantes : 1) *émigrants à long terme;* 2) *émigrants à court terme quittant le pays;* 3) *visiteurs quittant le pays à la fin de leur visite;* 4) *visiteurs en transit;* 5) *visiteurs en croisière;* 6) *résidents se proposant de se rendre à l'étranger pour une absence de courte durée;* et 7) *autres catégories reconnues dans le pays ou la zone considérés.*

Le présent tableau, comme le tableau correspondant de l'*Annuaire démographique* de 1972, présente le chiffre total des entrées et celui des sorties en un même tableau synoptique pour faciliter le calcul de l'émigration nette, tandis que les catégories ou types principaux d'entrées et de sorties compris dans les totaux ne sont pas présentés séparément. Ces catégories, a-t-on estimé, n'offrent que peu d'intérêt pour les utilisateurs, d'autant que les définitions sur lesquelles elles sont fondées varient largement de pays à pays; leur élimination produirait un tableau plus simple, et partant plus utile.

Sauf indication contraire, les données se rapportent aux entrées et aux sorties de voyageurs nationaux et étrangers et aux déplacements continentaux et intercontinentaux, conformément aux "*Recommandations des Nations Unies concernant l'amélioration des statistiques des migrations internationales*"[52].

[52] *Statistiques des migrations internationales.*

Portée : Le tableau 14 présente des statistiques sur les entrées pour 93 pays et des statistiques sur les sorties pour 80 pays.

Insuffisances des données : Des observations concernant les insuffisances des statistiques des migrations internationales ont été présentées à la page 68 et il n'est pas nécessaire de les reproduire ici en détail. La comparabilité de ces statistiques est essentiellement limitée par les différences de définition des diverses catégories données par les différents pays. L'inclusion ou l'exclusion des données relatives au trafic frontalier peut aussi exercer une influence sensible sur la comparabilité des statistiques si ce trafic est important.

Les difficultés que l'on rencontre pour rassembler des données à l'occasion du contrôle aux frontières, les passages de frontières clandestins et le fait que les immigrants à long terme, en particulier, sont classés selon les intentions qu'ils déclarent eux-mêmes sans nécessairement les exécuter toujours sont autant de facteurs qui limitent l'exactitude des statistiques.

Tableaux 15 et 16

Les tableaux 15 et 16 présentent des données concernant les avortements provoqués légalement. Le tableau 15 indique l'évolution générale des totaux indiqués pour la période allant de 1965 à 1974 et le tableau 16 présente des données concernant les avortements provoqués légalement, selon l'âge de la femme et selon le nombre des naissances vivantes précédentes, pour la dernière année au sujet de laquelle on possède des données. Les données sont aussi classées en fonction des raisons pour lesquelles la loi autorise l'avortement provoqué. Des données concernant les avortements provoqués légalement, selon l'âge de la femme et selon le nombre des naissances vivantes précédentes, ont été présentées dans les éditions de 1971, 1972 et 1973 de l'*Annuaire démographique*. La tendance enregistrée au cours des dernières années est indiquée au tableau 15.

Le mot avortement apparaît à deux reprises dans la Classification internationale des maladies : *a)* il est mentionné comme maladie ou cause de décès de la femme[53] et *b)* il est mentionné à propos du fœtus[54]. Il est défini, en ce qui concerne la femme, comme toute interruption d'une grossesse avant la 28ème semaine de gestation avec présence d'un fœtus[55].

L'avortement peut être *spontané* ou *provoqué*. *L'avortement provoqué* est celui qui résulte de manœuvres délibérées entreprises dans le but d'interrompre la grossesse; tous les autres avortements sont considérés comme *spontanés*[56].

L'interruption de la grossesse fait l'objet d'une réglementation législative dans la plupart des pays sinon dans tous. Cette législation va de l'interdiction totale à la liberté complète. Certains pays ou zones ont même créé des services officiels. Entre ces deux extrêmes, d'autres législateurs se sont efforcés de définir les circonstances dans

[53] *Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès, Révision 1965,* vol. 1, Genève, Organisation mondiale de la santé, 1967, p. 249.

[54] *Ibid.*, p. 313.

[55] *Ibid.*, p. 249.

[56] *Organisation mondiale de la santé, série de rapports techniques,* Genève, 1970, n° 461, p. 8.

lesquelles la grossesse peut être interrompue licitement et de fixer une procédure d'autorisation[57].

Le présent tableau cherche à présenter l'avortement comme un fait social plutôt que physiologique. Étant donné les différences qui existent entre les pays quant à la définition du mot et quant à l'enregistrement des événements, il paraît impossible, si l'on part d'une définition purement physiologique de l'avortement, de rassembler des données qui possèdent la moindre comparabilité internationale. Parce que la portée du tableau est limitée aux seuls avortements *provoqués,* on évite les déformations qui résulteraient soit de différences de définition, soit de différences dans la précision ou l'étendue des données d'enregistrement concernant les pertes fœtales spontanées. Comme, de surcroît, il n'est question que des opérations effectuées légalement, les possibilités de distorsion qu'entraînerait l'hésitation à déclarer un fait de ce genre sont réduites, sinon éliminées.

Portée : Le tableau 15 présente des données se rapportant à 23 pays ou zones. Le tableau 16 présente des données se rapportant à 16 pays ou zones; sur ce nombre, 4 pays ou zones donnent l'âge de la femme mais non pas le nombre des naissances vivantes antérieures.

Insuffisances des données : En ce qui concerne le rassemblement de renseignements sur l'avortement, un grand nombre de sources sont utilisées mais les relevés hospitaliers constituent la source la plus fréquente d'information[58]. Il s'ensuit que la plupart des cas qui ne passent pas par les hôpitaux sont ignorés. Les données provenant d'autres sources sont sans doute également incomplètes. Les données des présents tableaux se limitent aux avortements provoqués légalement dont on peut supposer que, de par leur nature même, elles sont plus complètes que les données sur le nombre total d'avortements.

Tableau 17

Le tableau 17 présente des données nouvelles et des données révisées sur la tendance des morts fœtales tardives et des rapports de mortinatalité pour les années 1965 à 1973. Ces données mettent à jour le tableau présenté dans l'édition de 1973 de l'*Annuaire démographique* où l'on avait fait figurer des données pour la période 1967-1972. La répartition de ces données selon la résidence (urbaine ou rurale) figure également dans la présente édition dans la mesure du possible. Les données présentées proviennent des registres de l'état civil.

Par *mort fœtale tardive,* on entend le décès d'un fœtus survenu après 28 semaines complètes de gestation au moins. Les morts fœtales pour lesquelles la durée de la période de gestation n'est pas connue sont comprises dans cette catégorie. Chaque fois que l'on a pu déterminer en quoi les statistiques présentées s'écartent de cette définition, on l'a indiqué en note. On ne possède pas de renseignements complets et précis sur la façon dont les mort-nés sont définis dans tous les pays ou zones ni pour toutes les années auxquelles se rapportent les statistiques, mais le lecteur pourra consulter sur ce point le *Manuel de statistique de l'état civil*[59]; il pourra consulter aussi le tableau 37 de l'édition de 1969 de l'*Annuaire démographique* qui présente des données selon la durée de gestation.

La qualité des données provenant des registres de l'état civil est dénotée par le symbole habituel (**C, U** ou . . .) qui figure dans la première colonne du tableau; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 62).

Portée : Le tableau 17 présente des données pour 127 pays ou zones. La variable de résidence (urbaine ou rurale) est indiquée pour 27 pays ou zones. On a fait figurer tous les principaux pays même lorsqu'on ne possédait pas de chiffres pour les années les plus récentes ainsi que des données se rapportant à certains groupes de population seulement lorsqu'on ne possédait pas de statistiques pour l'ensemble du pays ou de la zone. Les données concernant des groupes ne sont pas représentatives, mais elles ont été incluses pour montrer quelles sont les régions où l'on rassemble régulièrement des statistiques des morts fœtales tardives.

Calcul des rapports : Les *rapports de mortinatalité* représentent le nombre de morts fœtales tardives déclarées au cours de l'année pour 1 000 naissances vivantes survenues pendant la même année. On a pris pour base de calcul les naissances vivantes parce qu'on pense qu'elles sont plus stables et plus facilement comparables d'un pays ou d'une zone à l'autre que la combinaison des naissances vivantes et des morts fœtales. Les irrégularités marquées qui existent dans l'enregistrement des morts fœtales sont étudiées à la page 65.

Sauf indication contraire, tous les rapports ont été calculés au Bureau de statistique de l'ONU sur la base des naissances vivantes telles qu'elles figurent au tableau 9 et dans les éditions antérieures de l'*Annuaire*.

Insuffisances des données : Les données relatives aux morts fœtales et aux rapports de mortinatalité appellent toutes les réserves exposées à la page 65 et la plupart de celles qui ont trait aux statistiques de l'état civil en général. On a fourni à la page 62 des indications sur les insuffisances que traduit le code de qualité et la classification des séries en données sûres et données discutables.

Un autre facteur dont il convient de tenir compte en ce qui concerne les morts fœtales tardives est l'erreur qui peut résulter d'une désignation inexacte de la durée de la gestation. La détermination de la durée de gestation est toujours difficile et comme la distinction entre les morts foetales «tardives» et «intermédiaires» repose uniquement sur ce facteur les variations du degré d'exactitude de ce calcul peuvent contribuer au manque de comparabilité.

On sait que les morts fœtales sont incomplètement enregistrées dans la plupart des pays ou zones; aussi les données sont-elles identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. Cependant, il convient de noter que, si l'enregistrement est défectueux à la fois pour les morts fœtales et pour les naissances vivantes, les rapports de mortinatalité peuvent être tout à fait raisonnables. En fait, c'est parfois pour les pays ou zones où l'enregistrement des naissances vivantes laisse le plus à désirer que les rapports

[57] *Ibid.*, p. 33.
[58] Organisation mondiale de la santé, *Rapport de statistiques sanitaires mondiales*, vol. 22, n° 1 (Genève, 1969), p. 3.
[59] Voir p. 66 à 68.

de mortinatalité sont les plus élevés, ce qui masque l'incomplétude des données de base. Aussi, pour porter un jugement sur la qualité des rapports de mortinatalité, il ne faut jamais oublier que la complétude de l'enregistrement des naissances — comme celle de l'enregistrement des morts fœtales tardives — peut varier sensiblement.

En dehors des effets indirects des lacunes de l'enregistrement des naissances vivantes, il arrive que les rapports de mortinatalité soient sérieusement faussés lorsque l'exploitation des données relatives aux naissances se fait d'après la date de l'enregistrement. Si le nombre des naissances vivantes enregistrées vient à varier notablement d'une année à l'autre par suite de modifications de la législation ou parce que des groupes importants de la population ont besoin de posséder une attestation de naissance, les rapports de mortinatalité varient également, mais en sens contraire. Il convient donc d'utiliser avec prudence les données des pays ou zones où les statistiques sont établies d'après la date de l'enregistrement, à moins qu'on ne sache aussi que les données exploitées d'après la date de l'enregistrement diffèrent peu de celles qui sont exploitées d'après la date de l'événement.

Enfin, on notera que l'inclusion parmi les «mort-nés» des enfants nés vivants qui sont décédés avant l'enregistrement de leur naissance conduit à des rapports de mortinatalité exagérés parce que le dénominateur (nombre de naissances) se trouve alors diminué et le numérateur (morts fœtales) augmenté. Il importe de ne pas négliger ce facteur lorsqu'on utilise les données du présent tableau. Les effets éventuels en sont exposés dans le *Manuel de statistiques de l'état civil*[60].

En dehors des insuffisances exposées ci-dessus, les statistiques concernant les morts fœtales selon la résidence (urbaine ou rurale) appellent toutes les réserves qui découlent du manque de comparabilité internationale des définitions nationales de la population «urbaine» et de la population «rurale», réserves qui ont été exposées à propos du tableau 6 de la présente édition.

Tableau 18

Le tableau 18 indique le nombre de morts fœtales ainsi que les rapports de mortalité fœtale selon la durée de gestation pour la période 1965-1973. Un tableau analogue a été publié pour la dernière fois dans l'édition de 1968 de l'*Annuaire démographique*.

La *durée de la gestation (d'un enfant, d'un fœtus mort)* désigne, conformément aux recommandations de l'ONU[61], *le nombre de semaines entières qui se sont écoulées entre le premier jour de la dernière menstruation de la mère et la date exacte (jour, mois, année) de l'accouchement, que le produit de la conception soit né vivant ou soit né sans manifester aucun signe de vie.*

Conformément aux recommandations de l'ONU[62], les renseignements relatifs à la durée de la gestation ont été classés par semaine dans tout le tableau, de la manière suivante : moins de 20 semaines, 20 à 27 semaines, 28 à 31 semaines, 32 à 35 semaines, 36 semaines, 37 à 39 semaines, 40 semaines et plus, et durée «non indiquée». Lorsque la durée de gestation était exprimée en mois — mois civils ou lunaires — on a fait la conversion en semaines conformément au tableau ci-après :

1- 4 mois = moins de 20 semaines
5 mois = 20-23 semaines
6 mois = 24-27 semaines
7 mois = 28-31 semaines
8 mois = 32-35 semaines
9 mois = 36-39 semaines
10 mois = 40 semaines et plus.

Les trois principales catégories de mort fœtale sont les suivantes : les *morts fœtales précoces,* survenues après une période de gestation de moins de 20 semaines révolues; les *morts fœtales intermédiaires,* survenues après une période de gestation de 20 à 28 semaines; et les *morts fœtales tardives,* survenues après une période de gestation de 28 semaines ou plus [63]. Trois points (. . .) dans les colonnes correspondant aux durées les plus courtes indiquent qu'on ne possède de données que sur les morts fœtales tardives ou intermédiaires

Les données jugées discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Le tableau 18 présente des données pour 45 pays ou zones.

Calcul des rapports : Les rapports représentent pour chaque période de gestation le nombre de morts fœtales survenues au cours d'une année pour 1 000 naissances vivantes pendant la même année. On a pris pour base les naissances vivantes et non la somme des naissances vivantes et des morts fœtales parce que cette base est plus stable et se prête mieux à des comparaisons valables entre pays. Les irrégularités marquées qui existent dans l'enregistrement des morts fœtales sont étudiées à la page 65. Bien qu'il existe des méthodes permettant de répartir les morts fœtales pour lesquelles la durée de gestation est inconnue, on n'en a utilisé aucune dans le tableau 18, et les morts fœtales de cette catégorie ont été comprises dans le rapport concernant l'ensemble des morts fœtales.

Sauf indication contraire, tous les rapports ont été calculés par le Bureau de statistique des Nations Unies sur la base des naissances vivantes telles qu'elles figurent au tableau 9 et dans les éditions antérieures de l'*Annuaire démographique*.

Insuffisances des données : Les statistiques des morts fœtales sont probablement les moins exactes de toutes les statistiques de l'état civil; leurs insuffisances générales ont été exposées à la page 65 et les réserves qu'appellent plus particulièrement les statistiques des morts fœtales tardives et les rapports de mortinatalité correspondants ont été mentionnées à propos du tableau 17.

Le principal facteur qui limite la comparabilité des données du tableau 18 est l'hétérogénéité des faits étudiés. Pour quelques pays, il s'agit en principe de l'ensemble des morts fœtales indépendamment de la durée de la gestation (morts fœtales précoces, intermédiaires ou tardives). Pour bon nombre d'autres, en revanche, les statistiques établies sont uniquement celles des morts fœtales

[60] P. 61 à 64.
[61] *Principes et recommandations pour un système de statistiques de l'état civil,* par. 138.
[62] *Ibid.*
[63] *Ibid.*, par. 46 (3).

tardives, c'est-à-dire celles qui surviennent après 28 semaines au moins de gestation; dans d'autres cas, les données se rapportent aux morts fœtales intermédiaires et tardives, c'est-à-dire à celles qui sont survenues après 20 semaines au moins de gestation, et dans d'autres encore aux morts fœtales survenues après trois mois de gestation au moins.

En outre, il faut tenir compte des variations qui existent entre les pays dans la proportion des morts fœtales pour lesquelles la durée de gestation est inconnue. Comme on l'a noté plus haut, sauf pour l'ensemble, les rapports sont calculés seulement pour les morts fœtales pour lesquelles la durée de gestation est connue; il s'ensuit que les rapports concernant les pays où le nombre de morts fœtales pour lesquelles la durée de gestation est inconnue est relativement important ne seront pas comparables avec les rapports pour un pays où ce nombre est négligeable.

Étant donné ces différences et les lacunes fondamentales de l'enregistrement, il n'y a pas de base solide sur laquelle on puisse comparer les rapports d'un pays à l'autre selon la durée de gestation. Dans l'état actuel des choses, la principale raison pour laquelle on a présenté des statistiques des morts fœtales selon la durée de gestation est que ces statistiques peuvent aider à préciser le contenu d'autres tableaux consacrés aux morts fœtales, montrer les lacunes dans les déclarations des morts fœtales lorsque la durée de gestation est courte et donner, pour certains pays, une indication de la répartition relative des morts fœtales selon la durée de gestation.

Tableau 19

Ce tableau, qui paraît pour la troisième fois dans l'*Annuaire démographique,* retrace l'évolution de la mortalité périnatale et des rapports correspondants pour la période 1965-1973. Lorsque ce tableau a paru pour la première fois, dans l'*Annuaire démographique* de 1961, il portait sur la période 1952-1960[64]; dans l'*Annuaire* de 1966, il portait sur la période 1956-1965.

Les rapports de mortalité périnatale sont calculés pour permettre de mesurer le risque de décès aux alentours de la date de l'accouchement, c'est-à-dire immédiatement avant, pendant, ou après la naissance. Ces calculs s'inspirent de l'idée que les facteurs agissant sur la mortalité néo-natale sont plus étroitement liés à ceux qui agissent sur la mortalité prénatale ou fœtale qu'à ceux qui influent sur la mortalité infantile post-néonatale. L'adoption d'une technique de mesure composite s'appuie aussi sur l'hypothèse tout à fait fondée que certains des décès survenus dans les premiers jours qui suivent la naissance sont, par négligence (ou parfois délibérément), enregistrés et comptés comme morts fœtales tardives et non comme naissances vivantes suivies de mort néo-natale, de sorte que la combinaison des données de ces deux catégories ne serait pas entachée des erreurs par défaut ou par excès que l'on croit inhérentes à l'une et à l'autre prises séparément.

Aux fins du présent tableau, le terme « périnatal » désigne *la période comprenant l'existence prénatale après le début de la viabilité, la durée de l'accouchement et le début de la vie extra-utérine*[65]. Pour la commodité du calcul, on a fixé la limite inférieure de la viabilité à 28 semaines complètes de gestation; ainsi les morts fœtales tardives qui font l'objet du tableau 17 constituent l'un des éléments des morts « périnatales ». L'autre élément, à savoir les décès du « début de la vie extra-utérine », est la mortalité pendant les six premiers jours qui suivent la naissance, que l'on désigne aussi par l'expression « mortalité néo-natale précoce » ou mortalité des premières semaines. Des données s'y rapportant figurent au tableau 21.

Conformément à la pratique habituelle, la qualité des données est indiquée par les lettres ou signes conventionnels **C, U** ou . . . dans la première colonne; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 62).

Portée : Le tableau 19 contient des données se rapportant à 99 pays ou zones, ce nombre représentant le plus petit dénominateur commun des tableaux 17 et 21.

Calcul des rapports : Les *rapports* représentent le nombre de morts périnatales déclarées chaque année pour 1 000 naissances vivantes enregistrées pendant la même période. Ces rapports constituent donc la somme des rapports de mortalité intra-utérine figurant aux tableaux 17 et 18 et des taux de mortalité parmi les moins de 7 jours figurant au tableau 22.

Insuffisances des données : Abstraction faite des insuffisances imputables à l'enregistrement imparfait des décès survenus au cours des premiers jours qui suivent la naissance — décès qui sont par définition éliminés — , on doit tenir compte de toutes les insuffisances propres aux statistiques de la mortalité fœtale, de la mortalité infantile et des naissances vivantes exposées plus haut si l'on veut évaluer la comparabilité internationale des statistiques périnatales[66].

Le fait que la complétude de l'enregistrement des morts fœtales varie d'un pays à l'autre est peut-être le facteur qui nuit le plus à la comparabilité internationale des données. En même temps, il est à noter que la durée de gestation minimum sur laquelle repose l'établissement des statistiques nationales des morts fœtales tardives n'est pas uniforme. Ces statistiques se rapportent tantôt aux morts fœtales survenues après 28 semaines au moins de gestation, tantôt après 20 semaines, tantôt à toutes les morts fœtales, quelle que soit la durée de la gestation. Lorsque la limite inférieure est connue, on l'a indiquée en note dans le tableau; mais il convient de souligner que la portée de la définition de la mort fœtale tardive n'est pas toujours très nette (voir tableau 18) et que les répartitions selon la durée de la gestation qui permettraient d'en vérifier les limites ne sont pas disponibles pour tous les pays.

[64] On trouvera une brève analyse de l'évolution de la mortalité périnatale dans l'*Annuaire démographique* de 1957 (p. 56 et 57); les données classées par cause de décès pour la période 1950-1955 figurent dans la publication de l'Organisation mondiale de la santé intitulée : *Rapport épidémiologique et démographique,* vol. 10, Nos 11-12, 1957.

[65] Cette définition a été adoptée par le Groupe d'étude sur la mortalité périnatale constitué par le Bureau régional de l'OMS pour l'Europe lors de sa première réunion tenue à Bruxelles du 17 au 23 septembre 1953 (document MH/EUR/74.54, Genève, 1954, miméographié).

[66] On trouvera une étude plus détaillée de cette question dans *Mortalité fœtale, mortalité des enfants du premier âge et mortalité des jeunes enfants*, 2 volumes (publication des Nations Unies, numéro de vente : 1954.IV.8).

Une autre cause d'hétérogénéité dont il a déjà été question est constituée par les différences que présente la limite supérieure du second élément du rapport. En principe, cet élément doit comprendre les décès survenus au cours de la première semaine qui suit la naissance, mais dans bien des cas la répartition de la mortalité infantile selon l'âge ne fournit pas de données sur la mortalité ainsi définie, mais sur la mortalité jusqu'à 10 ou 14 jours.

Le manque de complétude de l'enregistrement des naissances vivantes nuit aussi, indirectement, à la comparabilité des rapports de mortalité périnatale, en ce sens que ces rapports comporteront une erreur par excès si les statistiques des naissances, qui en constituent le dénominateur, sont incomplètes. De même, l'exploitation des statistiques des naissances vivantes selon la date de l'enregistrement et non celle de l'événement peut gonfler artificiellement les rapports. En outre, en excluant des statistiques des naissances vivantes les données concernant les enfants décédés peu de temps après leur naissance et enregistrés de ce fait comme mort-nés, on peut aussi accroître artificiellement les rapports de mortalité périnatale, du fait que le dénominateur ne correspond pas au numérateur.

Tableau 20

Le tableau 20 présente des données nouvelles et des données révisées sur la tendance des décès d'enfants de moins d'un an et des taux de mortalité infantile selon la résidence (urbaine ou rurale) pour les années 1965 à 1974. Ce tableau et les tableaux correspondants des éditions antérieures donnent ensemble, pour un certain nombre de pays ou zones, des statistiques de la mortalité infantile pour la période 1932-1974.

Les chiffres indiqués reposent presque tous sur l'enregistrement des décès par les services de l'état civil et les taux fondés sur ces données ont été calculés par le Bureau de statistique de l'ONU selon la méthode exposée ci-après. En outre, dans un certain nombre de cas où l'on savait qu'il n'existait pas de données d'enregistrement ou que ces données n'étaient pas sûres, on a publié des chiffres et taux estimatifs, calculés à partir de résultats de sondages qui traduisent, sans doute, assez bien le niveau réel de la mortalité infantile. Pour distinguer ces données de celles qui proviennent des registres de l'état civil, on a identifié les estimations et l'on en a précisé la nature dans les notes à la fin du tableau. On a également indiqué dans les notes les données enregistrées pour les mêmes années lorsque cela était possible.

Le sens donné au terme *urbain* est censé être conforme aux définitions nationales de ce terme utilisées dans les recensements de population. Ces définitions nationales sont données à la fin du tableau 6.

La qualité des données provenant des registres de l'état civil est indiquée par le symbole habituel (**C**, **U** ou . . .) qui figure dans la première colonne du tableau; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 62).

Il y a lieu de noter que le code de qualité ne s'applique pas aux taux estimatifs; lorsqu'une série comporte à la fois des chiffres et taux estimatifs et des données d'enregistrement, le codage ne s'applique qu'à ces dernières. Lorsqu'une série ne comporte que des taux estimatifs, on a mis deux points (. .) dans la colonne réservée au code.

Portée : Le tableau 20 présente des données se rapportant à 158 pays ou zones, et classées selon la résidence (urbaine ou rurale) pour 47 d'entre eux. En l'absence de chiffres nationaux, on a fait figurer des chiffres concernant des groupes ethniques ou géographiques; bien qu'ils ne soient pas très représentatifs, on les a reproduits dans le tableau pour donner une idée des statistiques des décès d'enfants de moins d'un an disponibles dans l'ensemble du monde.

Calcul des taux : Les *taux bruts de mortalité infantile* représentent le nombre de décès d'enfants de moins d'un an pour 1 000 naissances vivantes survenues pendant la même période.

Les *taux de mortalité selon la résidence (urbaine ou rurale)* représentent le nombre de décès d'enfants de moins d'un an enregistrés selon la résidence pour 1 000 naissances vivantes classées selon la résidence et survenues pendant la même année.

Les *taux estimatifs*, obtenus à partir des résultats d'enquêtes par sondage, représentent le nombre de décès d'enfants de moins d'un an que l'on estime être survenus au cours de la période de référence (généralement les douze mois qui précèdent l'enquête) pour 1 000 naissances vivantes que l'on estime être survenues pendant la même période.

Lorsque les chiffres étaient disponibles, les taux ont été calculés par le Bureau de statistique de l'ONU sur la base des naissances vivantes indiquées au tableau 9.

Les taux étant calculés suivant la méthode classique, il n'est pas tenu compte du fait qu'une partie des décès survenus pendant une année donnée sont des décès d'enfants nés l'année précédente et ne correspondent donc pas à l'univers des naissances utilisé pour le calcul des taux. Toutefois, l'erreur n'est pas grave, à moins que le nombre des naissances vivantes ou de décès d'enfants de moins d'un an ne varie rapidement[67].

Insuffisances des données : Les statistiques de la mortalité infantile appellent toutes les réserves faites à propos des statistiques de l'état civil en général et à propos des statistiques de la mortalité et des naissances vivantes en particulier.

Des différents facteurs qui nuisent à la comparabilité des données, le plus grave et le plus généralisé est sans doute la pratique consistant à établir les statistiques des décès d'enfants de moins d'un an et des naissances vivantes selon la date de l'enregistrement et non celle de l'événement. Quand, pour une raison quelconque, le nombre des naissances vivantes enregistrées pendant une année augmente fortement, il peut en résulter des erreurs considérables dans les taux enregistrés de mortalité infantile, d'autant plus que les décès sont, en règle générale, déclarés plus rapidement que les naissances.

[67] Pour un exposé critique plus détaillé sur ce problème, voir W.P.D. Logan, «Mesure de la mortalité infantile», *Bulletin démographique des Nations Unies*, n° 2 (publication des Nations Unies, numéro de vente : F.53.XIII.8), p. 32 à 72.

Si le retard apporté à l'enregistrement reste presque constant et s'il est à peu près le même pour les naissances et pour les décès, les taux ne sont pas faussés trop sensiblement. Mais si une grande partie des naissances ne sont enregistrées qu'après plusieurs années, comme c'est le cas dans nombre de pays ou zones, les taux de mortalité infantile obtenus en rapportant le nombre des décès d'enfants de moins d'un an survenus pendant une année à celui des naissances échelonnées sur plusieurs années n'ont guère de valeur. Comme ce facteur est important, en particulier pour les naissances vivantes, qui constituent le dénominateur des taux de mortalité infantile, on a signalé en note les statistiques que l'on sait établies d'après la date de l'enregistrement.

Même lorsque les statistiques sont établies d'après la date de l'événement, les lacunes de l'enregistrement des naissances et des décès d'enfants de moins d'un an ont également pour effet de fausser les taux de mortalité infantile, à moins que la proportion des faits enregistrés ne soit la même pour le numérateur et pour le dénominateur. Les symboles **C** ou **U** du code expliqué en détail à la page 62 aideront le lecteur à se faire une idée de la qualité des données. Ce code indique dans quelle mesure l'enregistrement et la transcription des décès d'enfants de moins d'un an sont complets. Comme on l'a noté plus haut, les différences de complétude des deux éléments du taux de mortalité infantile, à savoir les décès d'enfants de moins d'un an et les naissances vivantes, introduisent des erreurs par excès ou par défaut, le sens de l'erreur dépendant de celui de ces deux éléments (numérateur ou dénominateur) pour lequel l'enregistrement est le plus complet. Ce facteur n'est pas identifié à l'aide des astérisques (**) qui distinguent ailleurs les données sujettes à caution d'avec les autres.

Un autre facteur qui influe sur la complétude de l'enregistrement des naissances vivantes et des décès d'enfants de moins d'un an est la définition adoptée, aux fins de la statistique, pour les faits à déclarer. La pratique consistant à n'inscrire ni dans le registre des naissances ni dans celui des décès les enfants nés vivants qui sont morts dans les 24 heures qui ont suivi la naissance ou avant son enregistrement peut fausser les statistiques : le taux risque alors d'être entaché d'une erreur par défaut. Si les nouveau-nés qui meurent pendant les premières semaines ne sont pas enregistrés parmi les naissances vivantes, la comparabilité des taux de mortalité infantile risque aussi d'en souffrir, mais il s'agira alors d'une erreur par excès.

Les méthodes suivies pour calculer l'âge au moment du décès peuvent également nuire à la comparabilité des données. Si on utilise l'année seulement et non pas les minutes, heures, jours et mois qui se sont écoulés depuis la naissance, pour calculer la mortalité infantile, de nombreux décès survenus dans les onze mois qui suivent la naissance sont classés comme décès d'un an et donc exclus des données. Il faut en tenir compte lorsqu'on compare et classe les taux de mortalité infantile. Pour plus amples détails, se reporter au texte du tableau 22.

Ces données appellent en outre toutes les réserves qui découlent du manque de comparabilité internationale des définitions nationales de la population «urbaine» et de la population «rurale» — réserves qui ont été exposées à propos du tableau 6 de la présente édition. Cependant, les taux étant calculés sur la base des naissances vivantes et toutes les statistiques de l'état civil reposant en principe sur les mêmes définitions, on a supposé qu'il existait une comparabilité satisfaisante entre le numérateur et le dénominateur des taux enregistrés de mortalité infantile quant à la définition du lieu de résidence (urbaine ou rurale).

Par ailleurs, les taux estimatifs fondés sur les résultats d'enquêtes par sondage comportent des possibilités d'erreurs considérables dues soit à des omissions dans les déclarations de décès d'enfants de moins d'un an, soit au fait que l'on a déclaré à tort des décès survenus en réalité hors de la période considérée. Mais ils présentent aussi un important avantage puisque le chiffre des naissances vivantes utilisé comme base est connu par définition et rigoureusement correspondant.

Tableau 21

Le tableau 21 présente pour les années 1965-1973 des données sur les décès d'enfants de moins d'un an selon le sexe, selon une classification par âge détaillée et selon la résidence (urbaine ou rurale). Les statistiques de la mortalité infantile regroupées en quatre grands groupes d'âge sont présentées chaque année soit dans le tableau général des décès selon l'âge (depuis l'édition de 1970) soit dans un tableau distinct. Dans la présente édition, spécialement consacrée aux statistiques de la mortalité, l'âge au décès des enfants de moins d'un an est donné pour la deuxième fois depuis l'édition de 1967 exactement en jours, semaines ou mois.

Comme dans les autres tableaux, l'*âge* est exprimé en heures, jours ou mois révolus et est calculé en retranchant la date de la naissance (heure, jour, mois et année) de celle du décès (heure, jour, mois et année).

Comme on l'a vu ci-dessus, la classification par âge utilisée est sensiblement plus détaillée que celle des tableaux correspondants des éditions précédentes; cette classification comporte 21 catégories exactes — l'âge étant indiqué en jours pour la première semaine de vie, en semaines pour le premier mois lunaire et en mois civils pour le reste de l'année — et une catégorie « inconnu ». Cette classification est conforme aux recommandations internationales relatives aux statistiques de la mortalité infantile, selon l'âge[68].

On a indiqué les décès pour chaque sexe séparément, mais non, faute de place, pour l'ensemble des deux sexes non plus que pour les enfants de sexe inconnu, pour lesquels les chiffres sont indiqués en note.

Le sens donné au terme «urbain» est censé être conforme aux définitions nationales de ce terme utilisées dans les recensements de population. Ces définitions nationales figurent à la fin du tableau 6.

Les données jugées discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Le tableau 21 présente des données pour 122 pays ou zones. On a fait figurer tous les pays ou zones qui ont

[68] *Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès, Révision 1965,* vol. I, p. 495, et *Principes et recommandations pour un système de statistiques de l'état civil,* par. 268, tableau ID-3.

communiqué des données pour une année quelconque, quel que soit le nombre de décès déclarés.

Insuffisances des données : Les statistiques de la mortalité infantile selon l'âge et le sexe appellent les réserves faites à propos des statistiques de l'état civil en général et des statistiques de la mortalité en particulier et peuvent en outre être faussées par des erreurs de déclaration d'âge.

La comparabilité se ressent également de la qualité des données, telle que la dénote le code de qualité qui accompagne le tableau des tendances de la mortalité infantile.

Dans quelques séries, l'exclusion des décès d'enfants qui sont survenus avant l'enregistrement de leur naissance et qui, de ce fait, ont seulement été comptés comme mort-nés ou « présentés sans vie » peut également contribuer au défaut de comparabilité des décès d'enfants de moins d'un an, des décès de moins de 28 jours, de moins d'une semaine et de moins d'un jour. Lorsqu'on savait que ce facteur était intervenu, on l'a signalé en note.

Un autre facteur nuit à la comparabilité des données : il s'agit du manque d'uniformité des méthodes suivies pour calculer l'âge au moment du décès. Ce facteur influe dans une certaine mesure sur les données relatives à la mortalité à tous les âges, mais il a des répercussions particulièrement marquées sur les statistiques des décès de moins d'un jour et de moins d'une semaine (mortalité de la première semaine) ainsi que sur celles des décès de moins de 28 jours (mortalité néo-natale). Comme on l'a dit, l'âge d'un enfant de moins d'un an à son décès est calculé, selon la méthode recommandée, en évaluant la durée de vie en minutes, heures et jours, selon le cas. L'âge est donc exprimé en unités de temps révolues. Toutefois, dans certains pays, l'âge de ces enfants n'est calculé qu'en jours, c'est-à-dire que l'âge au décès est calculé en retranchant la date de la naissance (jour, mois et année) de celle du décès (jour, mois et année). Il s'ensuit que de nombreux décès survenus dans les vingt-quatre heures qui suivent la naissance sont classés comme décès d'un jour. Dans ces conditions, les données concernant les décès de moins d'un jour sont entachées d'une erreur par défaut et celles qui se rapportent aux décès du groupe suivant d'une erreur par excès.

La comparabilité des données relatives à la mortalité néo-natale (moins de 28 jours) est influencée par un facteur spécial : l'hétérogénéité de la classification par âge utilisée pour les enfants de moins d'un an. Les notes figurant au bas des tableaux montrent que, dans de nombreux pays, on continue d'utiliser le mois civil au lieu du mois lunaire (4 semaines ou 28 jours).

Tableau 22

Le tableau 22 donne, pour la période 1965-1973, les taux annuels de mortalité infantile selon l'âge, selon la résidence (urbaine ou rurale) pour chaque sexe séparément et pour l'ensemble des deux sexes. Ce tableau met à jour le tableau correspondant de l'édition de 1967 et complète les séries déjà parues dans les éditions de 1951, 1957, 1961, 1966 et 1967 de l'*Annuaire démographique*.

Comme dans les autres tableaux, l'*âge* est exprimé en heures, jours et mois révolus et est calculé en retranchant la date de la naissance (heure, jour, mois et année) de celle du décès (heure, jour, mois et année).

La classification par âge utilisée dans ce tableau reprend, en les regroupant, les éléments de classification du tableau 21; les subdivisions de la première année de vie sont au nombre de cinq : moins d'un jour, 1-6 jours, 7-27 jours, 28 jours-5 mois et 6-11 mois. Il n'est tenu compte des décès d'enfants d'âge inconnu que pour le calcul du taux correspondant à l'ensemble des décès de moins d'un an.

Cette classification fait une distinction pour le mois lunaire de 28 jours, conformément aux recommandations internationales concernant les statistiques de la mortalité infantile[69].

Les décès d'enfants de sexe inconnu étant compris dans le numérateur des taux concernant « les deux sexes », ces taux, qui figurent dans la première colonne du tableau 22, devraient concorder avec les taux de mortalité infantile classiques du tableau 20. Les divergences sont expliquées en note, quelle qu'en soit l'importance.

Portée : Des taux sont présentés pour 124 pays ou zones, mais les données correspondantes pour la population rurale et la population urbaine séparément ne sont disponibles que pour 10 pays ou zones. On a calculé un taux dans tous les cas où le nombre total des décès pour les deux sexes était d'au moins 50. Toutes les données qui répondaient à cette condition ont été retenues, que leur portée fût nationale ou limitée à des subdivisions géographiques ou à des groupes ethniques.

Calcul des taux : Les taux représentent le nombre de décès d'enfants de moins d'un an, pour chaque âge indiqué et pour chaque sexe, survenus pendant l'année pour 1 000 naissances vivantes du même sexe au cours de la même période. Ainsi, la base du taux pour chaque catégorie d'âge et pour chaque sexe est la même que celle du taux pour tous les âges pour le même sexe; il n'y a pas eu d'ajustement pour tenir compte du fait que certains des décès sont ceux d'enfants nés non pendant l'année considérée mais pendant l'année précédente. Les naissances vivantes prises comme dénominateur des taux sont celles du tableau 9 et d'éditions antérieures de l'*Annuaire démographique*.

Insuffisances des données : Les taux de mortalité infantile présentés selon une classification par âge appellent toutes les réserves formulées à propos du tableau 21. Ils appellent également les réserves relatives aux statistiques des naissances vivantes dont il a été question à propos du tableau 9, la plus importante étant peut-être celle qui résulte de l'exploitation des naissances vivantes d'après la date de l'enregistrement et non la date de l'événement. Les conséquences de cette pratique ont été indiquées plus haut à propos du tableau 20, auquel il convient de se reporter.

Comme le montre le code de qualité qui accompagne les tableaux 9 et 20, les lacunes de l'enregistrement des naissances et des décès compromettent également la comparabilité des données, le sens de l'erreur systématique variant selon que l'enregistrement est plus complet pour l'une ou l'autre des composantes des taux.

[69] *Ibid.*

Les différences entre les définitions de la naissance vivante et de la mortinaissance, adoptées aux fins de la statistique, ont été étudiées à la page 65. Les données relatives à la Guadeloupe et à la Martinique pourraient servir à évaluer l'effet de ces différences.

La méthode employée pour calculer l'âge de l'enfant au décès, qui peut consister soit à arrondir au jour le plus proche, abstraction faite des heures, soit à calculer le temps écoulé entre la date de la naissance et celle du décès (en minutes, heures et jours, selon le cas), peut aussi compromettre la comparabilité des données. Ce facteur fausse tout particulièrement les résultats pour les décès de moins d'un jour et ceux de l'intervalle d'âge suivant; il faut en tenir compte dans l'analyse des taux surtout pour ces groupes d'âge.

Lorsque les données relatives aux décès de moins de 4 semaines ne sont pas exploitées sur la base de l'âge en jours révolus, il existe une nouvelle cause de non-comparabilité internationale. Les décès de « moins de 1 mois » sont généralement ceux qui se produisent au cours d'un mois civil; les taux calculés sur la base de ces données ne sont pas strictement comparables à ceux qui sont établis à partir des données concernant les décès survenus pendant 4 semaines ou 27 jours révolus. Le tableau 22 montre que la classification des âges présente bien d'autres différences. C'est ainsi que, pour la mortalité néo-natale précoce, la limite supérieure est parfois de 5, 10 ou 14 jours au lieu de 7 jours, et que la démarcation entre la mortalité infantile intermédiaire et la mortalité infantile tardive est quelquefois fixée à 6 mois révolus au lieu de 5. Les conséquences de ces divergences sont difficiles à évaluer, mais il faut en tenir compte dans l'utilisation des taux.

Tableau 23

Le tableau 23 présente les données relatives aux décès d'enfants de moins d'un an, selon le mois civil du décès, pour les neuf années 1965-1973. Ces chiffres mensuels paraissent pour la deuxième fois dans l'*Annuaire démographique*. L'édition de 1967 de l'*Annuaire* présentait des données similaires pour la période 1962-1966.

Pour ce tableau, on a utilisé les chiffres "définitifs" établis selon le mois civil du décès, de préférence aux chiffres mensuels provisoires que l'on calcule généralement d'après le nombre de décès enregistrés au cours du mois en question abstraction faite de la date du décès.

Ces données reposent sur l'enregistrement des décès par les services de l'état civil, et les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Le tableau 23 présente des données mensuelles pour 119 pays; pour 77 d'entre eux, il s'agit de chiffres définitifs; pour 42 autres, de chiffres provisoires, vraisemblablement tirés des registres de l'état civil.

Insuffisances des données : Les statistiques de la mortalité infantile appellent toutes les réserves faites à propos des statistiques de l'état civil (voir p. 61 et suivantes) et des statistiques de la mortalité en particulier.

Pour diverses raisons, les données relatives aux décès d'enfants de moins d'un an risquent davantage d'être incomplètes que les statistiques des décès aux âges plus avancés. Les deux astérisques qui distinguent les données sujettes à caution devraient permettre d'évaluer l'importance de ce facteur.

Un autre facteur qui influe sur la complétude de l'enregistrement des décès d'enfants de moins d'un an est la définition adoptée, aux fins de la statistique, pour les faits à déclarer. La pratique consistant à ne pas inscrire dans le registre des décès les enfants nés vivants qui sont morts dans les 24 heures qui ont suivi la naissance ou avant son enregistrement peut fausser les statistiques.

Étant donné que ces données sont des répartitions des décès selon l'âge pour une année, elles peuvent également comporter des erreurs de déclaration d'âge, notamment l'erreur par défaut à laquelle on aboutit si l'on calcule l'âge de l'enfant en retranchant la date de la naissance de celle du décès au lieu de calculer le nombre de mois révolus. Pour plus de précisions sur cette possibilité d'erreur, on pourra se reporter au tableau 21, qui donne une répartition par âge détaillée.

Il convient également de relever que tous les pays n'exploitent pas leurs données de la même façon : les uns le font selon la date de l'événement, les autres selon celle de l'enregistrement. On a indiqué en note les pays où les données sont normalement exploitées selon la date de l'enregistrement. Les conséquences de ce mode d'exploitation sont exposées à la page 64, mais il convient de noter qu'il présente une importance toute particulière en ce qui concerne les données mensuelles en raison de la diversité des délais réglementaires d'enregistrement des décès. Il convient en outre de remarquer, comme on l'a vu sous la rubrique « portée » ci-dessus, que certaines des données mensuelles présentées dans ce tableau sont des données provisoires qui ont donc probablement été exploitées d'après la date de l'enregistrement et non d'après celle du décès. Sur le plan international, il est impossible de comparer ces deux types de séries.

Enfin, il importe de souligner que les chiffres présentés ont été établis d'après le mois du décès et qu'ils n'ont donc pas été ajustés pour tenir compte du fait que les mois civils sont de longueur variable, alors qu'il faut faire cet ajustement pour pouvoir déterminer les tendances et les variations saisonnières de la mortalité infantile. Un autre ajustement consiste à rapporter les décès d'enfants de moins d'un an au mois de la naissance; il est particulièrement nécessaire lorsque le nombre des naissances (c'est-à-dire le dénominateur des taux) change rapidement, car alors la méthode classique ne permet pas de calculer les taux avec précision.

Tableau 24

Le tableau 24 présente des données nouvelles et des données révisées sur l'évolution des décès et des taux bruts de mortalité selon la résidence (urbaine ou rurale) pour chacune des années 1965-1974. Avec les tableaux correspondants des éditions antérieures, il donne, pour un certain nombre de pays ou zones, des statistiques des décès pour la période 1932-1974 et fournissent des taux de mortalité à partir de 1920.

Les chiffres indiqués reposent presque tous sur l'enregistrement des décès par les services de l'état civil et les taux fondés sur ces données ont été calculés par le Bureau de statistique de l'ONU selon la méthode exposée ci-après. En outre, dans un certain nombre de cas où l'on savait qu'il n'existait pas de données d'enregistrement ou que ces données n'étaient pas sûres, on a publié des données estimatives qui traduisent sans doute assez bien le niveau réel de la mortalité. Ces données concernant des années particulières ont été établies à partir de résultats de sondages, par l'analyse des données de recensements consécutifs et par inférence. Dans ce tableau figurent également des taux estimatifs pour 1965-1970 calculés par la Division de la population de l'ONU. Ces taux sont fondés sur le nombre estimatif des décès obtenu à partir des chiffres de la population totale en 1965, augmenté du nombre estimatif de naissances (calculé selon la méthode décrite au tableau 24) et diminué du chiffre de population totale selon le sexe et l'âge, projeté pour 1970 (après ajustement pour tenir compte de la migration nette). Pour distinguer ces estimations des données qui proviennent des registres de l'état civil, elles ont été identifiées comme telles et l'on en a précisé la nature en note. Les données enregistrées correspondantes figurent, chaque fois que possible, à la fin du tableau.

Le sens du terme *urbain* est censé être conforme aux définitions nationales de ce terme utilisées dans les recensements de population. Ces définitions nationales sont données à la fin du tableau 6.

La qualité des données provenant des registres de l'état civil est dénotée par le symbole habituel (**C, U** ou . . .) qui figure dans la première colonne du tableau; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 62).

Il y a lieu de noter que le code de qualité ne s'applique pas aux chiffres et taux estimatifs; lorsqu'une série comporte à la fois des chiffres et taux estimatifs et des données d'enregistrement, le codage ne s'applique qu'à ces dernières. Lorsqu'une série ne comporte que des taux estimatifs, on a mis deux points (. .) dans la colonne réservée au code.

Portée : Le tableau 24 présente des statistiques des décès se rapportant à 223 pays ou zones et classées selon la résidence (urbaine ou rurale) pour 56 d'entre eux. Les données se rapportant à des groupes de population, par exemple la population non indigène ou la population d'une grande ville, ont été retenues lorsqu'on ne disposait pas de statistiques pour l'ensemble du pays ou de la zone. Ces données ne sont pas très représentatives, mais elles indiquent du moins quels sont les pays ou zones où il existe des statistiques de la mortalité.

Calcul des taux : Les *taux bruts de mortalité* représentent le nombre de décès déclarés pendant l'année civile pour 1 000 personnes présentes dans la même région géographique au milieu de l'année.

Les *taux de mortalité selon la résidence (urbaine ou rurale)* représentent le nombre de décès enregistrés pour une population urbaine ou rurale de 1 000 personnes au milieu de l'année.

Les *taux estimatifs* de mortalité fondés sur les résultats d'enquêtes par sondage représentent le nombre estimatif des décès au cours de la période de référence (généralement les douze mois qui précèdent l'enquête) pour 1 000 personnes qu'on estime avoir été présentes à la date de l'enquête.

Pour les années où des données étaient disponibles, les taux ont été calculés par le Bureau de statistique de l'ONU d'après les estimations de la population au milieu de l'année données aux tableaux 5 et 6. On s'est efforcé d'assurer une correspondance rigoureuse entre le numérateur (décès) et le dénominateur (population) des taux; on a signalé par des notes le cas où cette correspondance n'a pas pu être établie.

Insuffisances des données : Les statistiques de la mortalité établies d'après les registres de l'état civil appellent toutes les réserves faites à propos des statistiques de l'état civil (voir page 61) et à propos des statistiques de la mortalité (voir page 66).

Les insuffisances que traduit le code de qualité et la classification des statistiques en données sûres et données discutables sont particulièrement pertinentes. On a distingué les pays ou zones selon que les statistiques y sont établies d'après la date de l'événement ou d'après celle de l'enregistrement, bien que ce facteur ait surtout de l'importance en ce qui concerne les naissances vivantes. Les pays ou zones où les données sont exploitées selon la date de l'enregistrement sont signalés en note. Les conséquences de ce mode d'exploitation sont exposées à la page 64.

Les possibilités d'erreurs dues à l'exclusion des décès d'enfants survenus avant l'enregistrement de la naissance ne sauraient non plus être négligées.

Ces statistiques des décès selon la résidence (urbaine ou rurale) appellent en outre toutes les réserves qui découlent du manque de comparabilité internationale des définitions nationales de la population «urbaine» et «rurale» dont il a été question à propos du tableau 6 dans la présente édition. Le problème le plus important vient peut-être de ce qu'il est difficile d'assurer une comparabilité rigoureuse du numérateur et du dénominateur des taux. Il se peut par exemple que les définitions du terme «urbain» et du terme «rural» utilisées pour les statistiques de la mortalité (numérateur) soient différentes de celles utilisées pour les statistiques de la population (dénominateur), ce qui aurait pour effet d'invalider les taux. Or, il n'est malheureusement pas possible de s'assurer de la concordance des définitions utilisées.

Les taux calculés sont également affectés par la qualité et les insuffisances des estimations de population qui servent à les établir.

Par ailleurs, les taux estimatifs fondés sur les résultats d'enquêtes par sondage comportent des possibilités d'erreurs considérables dues soit à des omissions dans les déclarations de décès, soit au fait que l'on a déclaré à tort des décès survenus en réalité hors de la période considérée. Mais ils présentent aussi un important avantage, puisque le chiffre de la population utilisé comme base est connu par définition et rigoureusement correspondant.

Quelles que soient leurs insuffisances, le nombre de décès et les taux bruts de mortalité permettent néanmoins de mesurer la diminution brute de la population et, lors-

qu'ils sont examinés conjointement avec les taux bruts de natalité, ils donnent une indication des taux d'accroissement de la population. Ils peuvent également donner une idée générale des tendances à long terme dans un pays ou zone ou un territoire donné, ainsi que des indications permettant de classer approximativement les pays ou zones selon leur niveau de mortalité. Il convient de signaler toutefois que les taux bruts ne tiennent nullement compte des différences de structure par âge et par sexe de la population; par conséquent, comme la mortalité est plus forte aux premiers âges et aux âges avancés, on ne peut dire qu'ils soient strictement comparables d'une population à l'autre ou d'une période à l'autre pour la même population; la prudence s'impose donc dans toutes les comparaisons de ce genre.

Tableau 25

Le tableau 25 indique la répartition des décès selon l'âge et le sexe et selon la résidence (urbaine ou rurale) pour la période 1965-1973. Dans les éditions récentes de l'*Annuaire démographique*, ce tableau donnait la répartition des décès d'enfants de moins d'un an selon l'âge calculé en jours. Dans la présente édition, on trouvera cette répartition au tableau 21. Les tableaux 21 et 25 combinés avec les données correspondantes selon l'âge et le sexe pour les années antérieures figurant dans les éditions de 1951, 1957, 1961, 1965 et suivantes de l'*Annuaire démographique* permettent de suivre l'évolution de la mortalité selon l'âge et le sexe dans certains pays ou zones sur une période de 38 ans. Les données pour la dernière année disponible, avec classification croisée selon la résidence (urbaine ou rurale), figurent depuis 1967 dans chaque édition de l'*Annuaire démographique*.

Sauf indication contraire, l'*âge* est, en principe, exprimé en années de vie révolues.

La classification par âge utilisée ici est conforme aux recommandations internationales[70] : moins d'un an, un à quatre ans, groupes quinquennaux de 5-9 ans à 80-84 ans, un groupe résiduel de 85 ans et plus et un groupe d'âge inconnu.

Le sens donné au terme *urbain* est censé être conforme aux définitions nationales de ce terme utilisées dans les recensements de population. Ces définitions nationales figurent à la fin du tableau 5.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Le tableau 25 présente des statistiques des décès selon l'âge et le sexe pour 142 pays ou zones, mais les données correspondantes pour la population rurale et la population urbaine séparément ne sont disponibles que pour 34 pays ou zones.

On a fait figurer tous les pays ou zones qui ont communiqué des données pour une année quelconque, quel que soit le nombre de décès déclarés et même lorsque ces données ne portent que sur des groupes (géographiques ou ethniques) de la population. Le tableau permet donc de voir quels sont les pays ou zones où les statistiques de la mortalité sont normalement exploitées selon l'âge, le sexe et la résidence (urbaine ou rurale) et si le classement par âge adopté est celui qu'a recommandé l'Organisation des Nations Unies.

Insuffisances des données : Les statistiques des décès selon l'âge, le sexe et le lieu de résidence (urbain ou rural) appellent les réserves mentionnées à propos des statistiques de l'état civil en général et des statistiques de la mortalité en particulier. Ces données appellent aussi les réserves indiquées par le code de complétude que l'on a décrit à propos des statistiques de l'état civil en général (page 62) et qui figure dans le tableau 24. La comparabilité des données peut également être compromise dans une certaine mesure selon que les données sont exploitées d'après la date de l'événement ou celle de l'enregistrement. On a signalé en note les pays ou zones où les données sont exploitées selon la date de l'enregistrement.

L'exclusion des décès d'enfants survenus avant l'enregistrement de leur naissance et qui, de ce fait, ont seulement été comptés comme mort-nés ou «présentés sans vie» peut également contribuer au défaut de comparabilité pour ce qui est du total des décès et des décès d'enfants de moins d'un an. Lorsqu'on savait que ce facteur était intervenu, on l'a signalé en note.

Comme les données du tableau 25 sont classées par âge, elles sont plus ou moins faussées par les inexactitudes des déclarations d'âge dont il a été question à propos de l'état de la population. Dans le cas des statistiques de l'état civil, les facteurs qui interviennent à cet égard sont parfois un peu différents, étant donné que le recensement et l'enregistrement des décès se font par des méthodes différentes, mais, d'une manière générale, les erreurs observées sont les mêmes. Comme dans les tableaux de population, l'absence de chiffre pour le groupe d'âge «inconnu» ne signifie pas nécessairement que les déclarations d'âge sont complètes; elle peut indiquer aussi que l'on a éliminé les personnes d'âge inconnu soit en leur attribuant un âge avant l'exploitation, soit en les répartissant proportionnellement entre tous les groupes d'âge après cette opération.

Un autre facteur nuit à la comparabilité des données : il s'agit du manque d'uniformité des méthodes suivies pour calculer l'âge au moment du décès. Ce facteur influe dans une certaine mesure sur les données relatives à la mortalité à tous les âges, mais il a des répercussions particulièrement marquées sur les statistiques des décès d'enfants de moins d'un an. Un exposé complet de la méthode utilisée pour calculer l'âge du nouveau-né à son décès a été présenté à propos des tableaux 21 et 22.

Les méthodes de calcul et d'enregistrement de l'âge au décès présentent le même manque d'uniformité s'agissant de la mortalité à tous les âges : certains pays ou zones utilisent la méthode recommandée, c'est-à-dire qu'ils expriment l'âge en années révolues en retranchant la date exacte de la naissance (jour, mois et année) de celle du décès (jour, mois et année), tandis que d'autres se bornent à prendre en considération la date de la naissance et celle du décès, ce qui a pour effet d'entacher d'une erreur par excès les données relatives à chaque groupe d'âge et d'une erreur par défaut celles qui concernent le groupe

[70] *Principes et recommandations pour un système de statistiques de l'état civil*, par. 268, tableau DE-4, et *Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès, Révision, 1965*, vol. 1, par. 495.

d'âge précédent; mais il est probable que ces erreurs se compensent sauf pour le premier et le dernier groupe d'âge.

Les statistiques de la mortalité selon la résidence (urbaine ou rurale) appellent en outre les réserves qui découlent du manque de comparabilité internationale des définitions nationales de la population «urbaine» et de la population «rurale» — réserves qui ont été exposées à propos du tableau 6 de la présente édition.

Tableau 26

Le tableau 26 présente les taux de mortalité selon l'âge et le sexe et selon la résidence (urbaine ou rurale) pour la période 1965-1973. Un tableau similaire pour la dernière année sur laquelle on soit renseigné a été publié pour la dernière fois dans l'*Annuaire démographique* de 1972; l'évolution des taux de mortalité selon l'âge et le sexe figurait dans l'édition de 1966. Ces données, raccordées aux séries parues dans les éditions antérieures, permettent de suivre l'évolution des taux de mortalité selon l'âge et le sexe sur une période de trente neuf ans dans un certain nombre de pays. Dans les cas où l'année la plus récente pour laquelle on disposait de données classées selon la résidence (urbaine ou rurale) était antérieure à l'année pour laquelle on disposait de données classées selon l'âge et le sexe seulement, les deux répartitions ont été indiquées.

Comme dans le tableau 25, l'*âge* est exprimé en années révolues.

La classification par âge utilisée est la même que celle qui servit à établir les séries publiées antérieurement; elle comprend les groupes suivants : moins d'un an, 1-4 ans, groupes quinquennaux jusqu'à 84 ans et un groupe résiduel de 85 ans et plus. Des traits horizontaux dans les colonnes du tableau montrent les cas où l'on s'est écarté de cette classification.

Dans le tableau 26, le sens donné au terme *urbain* est censé être conforme aux définitions nationales du terme « urbain » utilisées dans les recensements de population. Ces définitions nationales figurent à la fin du tableau 6 de la présente édition. Toute exception à ces définitions a été indiquée en note.

Les données jugées discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : On a présenté dans ce tableau des taux pour 106 pays dont les distributions totalisent 50 décès ou plus. Pour 106 d'entre eux, les chiffres représentent les taux de mortalité selon l'âge et le sexe tandis que, pour un plus petit nombre (18), ils représentent également les taux de mortalité selon la résidence (urbaine ou rurale). La différence de portée s'explique par le fait que 1) la répartition des décès selon la résidence n'est disponible que pour un plus petit nombre de pays et 2) le chiffre de population correspondant utilisé comme base est plus difficilement identifiable.

Calcul des taux : Les taux représentent le nombre de décès survenus au cours d'une année pour chaque sexe et pour chaque groupe d'âge (urbain ou rural) pour 1 000 personnes du même groupe au milieu de l'année ou à une autre date de l'année. Les chiffres de population sur lesquels on s'est fondé pour le calcul des taux proviennent d'un dénombrement ou d'une enquête ou sont des estimations au milieu de l'année fondées sur un dénombrement et ajustées compte tenu des statistiques de l'état civil et des migrations. Les estimations établies par la méthode des prorata en multipliant le chiffre total par les pourcentages correspondant à chaque groupe d'âge au moment du recensement n'ont pas été utilisées pour le calcul des taux.

On n'a pas tenu compte des décès d'âge inconnu ni de la population d'âge inconnu, sauf en ce qui concerne le taux de mortalité pour tous les âges combinés.

Il convient de noter que, dans ce tableau, les taux relatifs au groupe de moins d'un an sont différents des taux de mortalité infantile qui figurent dans d'autres tableaux, ces derniers ayant été établis d'après le nombre de naissances vivantes et non pour 1 000 habitants.

De même, les taux indiqués pour tous les âges combinés diffèrent dans plusieurs cas de ceux qui figurent dans d'autres tableaux parce qu'ils se rapportent à une population pour laquelle on disposait d'une répartition par âge et par sexe appropriée tandis que les taux globaux indiqués ailleurs peuvent avoir été calculés sur la base d'un chiffre de population totale différent. Ainsi, il est possible que les chiffres de population par âge et par sexe proviennent d'un recensement effectué dans l'année et non au milieu de l'année et qu'ils se différencient des autres chiffres de population en excluant ou en incluant certains groupes ethniques, les militaires, etc. Quelquefois, la différence tient à ce que les taux du tableau 26 ont été calculés sur la base de la population moyenne (obtenue en faisant la moyenne des données par âge au mois de décembre de deux années consécutives) alors que les taux correspondants du tableau 24 reposent sur une estimation au 1er juillet. Les écarts de cet ordre sont insignifiants mais on les a signalés dans le tableau à toutes fins utiles.

Insuffisances des données : Les taux du tableau 26 étant calculés sur la base des chiffres absolus du tableau 25, toutes les réserves mentionnées à propos de ce tableau leur sont applicables.

S'agissant des taux de mortalité par âge, il est particulièrement difficile d'établir une correspondance exacte entre les décès (numérateur) et la population (dénominateur) en ce qui concerne l'inclusion ou l'exclusion des militaires, des réfugiés, des personnes déplacées et autres groupes spéciaux. Dans les cas où il n'a pas été possible d'y parvenir tout à fait, des notes indiquent les différences de portée des données de base. Les taux de mortalité pour le sexe masculin dans les groupes d'âge de 20 à 40 ans peuvent être tout particulièrement faussés par ce manque de correspondance et il importe d'être prudent lorsqu'on les utilise dans des comparaisons.

Il convient d'ajouter que, même lorsque population et décès correspondent, la comparabilité des taux peut être compromise par des conditions anormales telles que l'absence du pays d'un grand nombre de jeunes gens qui sont sous les drapeaux. Il arrive ainsi que les taux de mortalité paraissent élevés parmi la population jeune simplement parce qu'on a laissé de côté un grand nombre

d'hommes valides de ces groupes d'âge pour lesquels le taux de mortalité pourrait être, dans des conditions normales, inférieur à la moyenne observée pour les personnes du même âge.

Tableaux 27 et 28

Les tableaux 27 et 28 présentent des statistiques des décès selon la cause (nombres et taux). Le tableau 27 présente des statistiques des décès selon la cause (nombres et taux) pour chaque année de la période 1965-1973, et indique dans quelle mesure les décès de chaque rubrique ont été attestés par un médecin. Avec les données du tableau 20 de l'*Annuaire démographique* de 1966, celles du tableau 17 de l'*Annuaire démographique* de 1961, celles du tableau 14 de l'*Annuaire démographique* de 1957 et celles des tableaux correspondants des *Annuaires démographiques* de 1951 et 1952, les données de ce tableau permettent d'établir une série commençant en 1947, moyennant certains ajustements pour tenir compte des modifications apportées au système de classification utilisé[71]. Si l'on constate des différences entre les données publiées pour une même année dans différentes éditions, ce sont les séries figurant dans l'édition la plus récente que l'on peut présumer être exactes.

Le tableau 28 présente des statistiques des décès selon la cause et le sexe (nombres et taux) pour la dernière année sur laquelle on soit renseigné. Un tableau similaire figurait dans l'*Annuaire démographique* de 1967.

Par causes de décès, on entend «toutes les maladies, états morbides ou traumatismes qui ont abouti ou contribué au décès et les circonstances de l'accident ou de la violence qui ont entraîné ces traumatismes»[72].

La cause initiale de décès, plutôt que la cause directe de décès, est recommandée pour l'exploitation des statistiques de la mortalité. La cause initiale de décès est définie comme : a) *la maladie ou le traumatisme qui a déclenché l'évolution morbide conduisant directement au décès* ou b) *les circonstances de l'accident ou de la violence qui ont entraîné le traumatisme mortel*[73].

Chaque tableau est divisé en deux Parties, A et B. La Partie A présente les statistiques des décès selon la cause (nombres et taux) classées selon la « Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité » recommandée par la Conférence internationale pour la septième révision des Nomenclatures internationales des maladies et causes de décès[74]. La septième révision (1955)[75] a été utilisée ou est censée avoir été utilisée par tous les pays ou zones pour lesquels des statistiques sont présentées dans la Partie A. La Partie B présente des données classées selon la « Liste de 50 rubriques pour la mise en tableaux des causes de mortalité » recommandée par la Conférence pour la huitième révision (1965) et adoptée par la dix-neuvième Assemblée mondiale de la santé[76]. Il a fallu présenter les tableaux en deux parties parce que la classification utilisée dans la révision de 1965 ne correspond pas exactement à celle de la révision précédente, c'est-à-dire à celle de 1955; bien qu'il ait été recommandé que cette nouvelle révision prenne effet à partir du 1er janvier 1968, un certain nombre de pays n'en ont pas encore tenu compte dans le codage, la classification et la mise en tableaux des causes de décès.

On notera que le titre complet de chacune des 50 catégories de causes avec les numéros de la Liste détaillée ne figurent, en anglais et en français, qu'au début de la Partie A et de la Partie B de chaque tableau. Sur toutes les autres pages, on a indiqué, dans la colonne correspondante, les numéros de la *Liste BI à B46 et BE47 à BE50*. Cette simplification des rubriques a été adoptée pour gagner de la place.

Les *décès attestés par un médecin* sont ceux pour lesquels il existe un certificat de décès établi par un médecin. Les décès pour lesquels le type de déclaration n'est pas connu sont censés n'avoir pas été attestés par un médecin, mais déclarés par une personne n'appartenant pas à la profession médicale; on n'en a donc pas tenu compte.

Les pourcentages des décès attestés par un médecin sont indiqués chaque fois qu'ils sont inférieurs à 100 p. 100. Lorsque l'on sait que tous les décès ont été attestés par un médecin, on l'a indiqué en note.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Un total de 201 pays ou zones sont représentés dans le tableau 27 (126 à la Partie A et 75 à la Partie B) et un total de 124 pays ou zones sont représentés dans le tableau 28 (21 à la Partie A et 103 à la Partie B). Pour déterminer s'il convenait ou non de retenir les données relatives à tel ou tel pays ou territoire, on s'est fondé sur les deux critères suivants : premièrement, il fallait que le classement soit conforme à la Liste de 1955 ou à celle de 1965 mentionnées plus haut ou qu'il soit possible de passer par conversion aux catégories de cette liste et, deuxièmement, qu'à l'intérieur de cette répartition le nombre total des décès dus à des causes mal définies *(B45)* ne dépasse pas 25 p. 100 du nombre total des décès pour toutes les causes. Le deuxième critère est fondé sur l'argument suivant : si 25 p. 100 des décès sont classés comme dus à des causes mal définies, les chiffres relatifs aux 49 autres causes de la Liste doivent être sensiblement inférieurs à la réalité. La limite a été fixée délibérément à un niveau élevé; il serait peut-être préférable qu'elle soit fixée à 10 p. 100 pour éliminer toutes les données défectueuses. En outre, il faut reconnaître que ce critère ne tient pas compte des pourcentages de la catégorie *B46*, qui sont non moins significatifs, cette catégorie résiduelle comprenant souvent une proportion anormalement forte du total.

[71] Pour la comparabilité des statistiques des causes de décès, selon la cinquième et la sixième révisions de la Nomenclature internationale, voir *Comparabilité des statistiques des causes de décès selon la cinquième et la sixième révisions de la Nomenclature internationale* (Organisation mondiale de la santé, Bulletin, Supplément n° 4), Genève, 1952.

[75] *Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès*, fondé sur les Recommandations de la Conférence pour la septième révision (1955) et adopté par la neuvième Assemblée mondiale de la santé en vertu du Règlement de Nomenclature de l'OMS, vol. I (Genève, 1957), 404 pages.

[76] *Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès*, fondé sur les Recommandations de la Conférence pour la huitième révision (1965) et adopté par la dix-neuvième Assemblée mondiale de la santé, OMS (Genève, 1967).

Calcul des taux : Pour les catégories de causes BI-B38 et *B45-BE50,* les taux de mortalité représentent le nombre de décès pour chaque catégorie de causes déclarés pendant l'année pour 100 000 personnes dans la population totale selon l'estimation au milieu de l'année pour l'année considérée. Pour les autres catégories de causes, le chiffre de population utilisé correspond mieux à la population effectivement exposée au risque de décès, telle qu'elle est décrite aux paragraphes qui suivent.

Dans la Partie A, les taux pour la rubrique *B39* (Hypertrophie de la prostate) sont fondés sur la population masculine de 50 ans et plus, les taux pour la rubrique *B40* (Accouchements et complications de la grossesse, de l'accouchement et des suites de couches) sont fondés sur la population du sexe féminin de tous les âges, et pour la rubrique *B41* (Malformations congénitales) sur la population totale; pour les rubriques *B42* (Lésions obstétricales et asphyxie et atélectasie postnatales), *B43* (Infections du nouveau-né) et *B44* (Autres maladies particulières à la première enfance et débilité sans précisions), les taux sont calculés pour 100 000 naissances vivantes pendant l'année.

De même, dans la Partie B, les taux pour la rubrique *B39* (Hypertrophie de la prostate) sont fondés sur la population masculine de 50 ans et plus, les taux pour la rubrique *B40* (Avortements) et *B41* (Autres complications de la grossesse, de l'accouchement et des suites de couches. Accouchement sans mention de complication) sont fondés sur la population féminine de tous les âges, les taux pour la rubrique *B42* (Anomalies congénitales) sont fondés sur la population totale et, pour les rubriques *B43* (Lésions obstétricales, accouchements dystociques et autres états anoxémiques et hypoxémiques) et *B44* (Autres causes de mortalité périnatale), ils sont calculés pour 100 000 naissances vivantes pendant l'année.

Les chiffres de population utilisés pour le calcul des taux du présent tableau sont en général ceux du tableau 5; les chiffres des naissances vivantes sont ceux du tableau 9.

Insuffisances des données : Les statistiques des causes de décès présentent les imperfections déjà mentionnées comme limitant la comparabilité internationale des statistiques de l'état civil en général et des statistiques de la mortalité en particulier. Ces imperfections tiennent notamment à ce que ces statistiques sont plus ou moins complètes, à ce que la base utilisée pour l'exploitation n'est pas toujours la même et au fait qu'on a exclu, dans la répartition des décès selon la cause, les enfants nés vivants, décédés dans les 24 heures qui ont suivi leur naissance ou avant l'enregistrement de leur naissance et, partant, enregistré ces enfants avec les mort-nés. Dans plusieurs pays, les méthodes d'exploitation permettent de différencier ces pseudo-mort-nés des mort-nés véritables et de les ajouter au nombre total des décès mais, là encore, il est impossible de connaître la cause du décès. Ces répartitions sont signalées dans des notes.

Plus importantes encore sont les différences existant entre les pays du point de vue de la qualité, du degré de développement et de l'efficacité des services médicaux ainsi que des méthodes d'établissement des certificats de décès et des procédés de codage. Dans la plupart des pays, lorsqu'un décès est enregistré aux fins de la statistique, le bulletin qui est établi doit mentionner la cause du décès. Or, la déclaration de la cause peut émaner de plusieurs sources : 1) si le décès a été suivi d'une autopsie, il est probable qu'on en aura décelé la cause « véritable »; 2) s'il n'y a pas eu d'autopsie, mais si le défunt a reçu, avant sa mort, les soins d'un médecin, la déclaration de la cause du décès reflétera l'opinion de ce médecin, laquelle sera fondée sur l'observation du malade alors qu'il vivait encore; 3) si, au contraire, le malade est mort sans avoir reçu de soins médicaux, il se peut qu'un médecin examine le corps (sans qu'il soit fait d'autopsie), auquel cas il pourra, en questionnant les personnes qui ont vu le malade avant sa mort, se former une opinion sur la cause probable du décès; 4) il se peut encore que, sans voir le corps, un médecin ou une autre personne de formation médicale interroge des témoins et arrive ainsi à un diagnostic; 5) enfin il y a le cas où de simples témoins indiquent une cause de décès sans l'avis d'un médecin. À ces cinq sources de renseignements possibles correspondent généralement cinq degrés d'exactitude des données, dont on peut juger d'après le pourcentage des décès attribuables à chaque cause qui sont attestés par un médecin. Ces pourcentages figurent au tableau 20 de l'*Annuaire démographique* de 1966.

La comparabilité est aussi parfois très difficile à assurer par suite des différences existant dans la forme des certificats de décès utilisés, de la tendance à indiquer plus d'une cause de décès sur le certificat et de la diversité des principes régissant le choix de la cause principale ou initiale à retenir dans les statistiques quand le certificat indique plus d'une cause[77].

Les différences entre les termes utilisés pour désigner la même maladie compromettent aussi la comparabilité des statistiques. On en rencontre parfois d'une région à l'autre d'un même pays où toute la population parle la même langue, mais elles sont particulièrement gênantes lorsque plusieurs langues interviennent. Ces différences soulèvent des difficultés même quand les décès sont certifiés par un médecin, mais elles sont infiniment plus grandes et plus difficiles à éclaircir lorsque la cause du décès est indiquée par de simples témoins. L'Organisation mondiale de la santé s'emploie à étudier et à résoudre ce problème de terminologie.

En outre, des problèmes de codage et d'interprétation des règles se posent constamment lorsqu'on utilise les diverses révisions du *Classement statistique international des maladies, traumatismes et causes de décès.* Les pays n'interprètent pas ces règles de manière uniforme et ne les adaptent pas de la même façon à leurs besoins; la comparabilité s'en ressent, comme le montrent les statistiques. Cela est particulièrement vrai pour les causes comme la pneumonie et les maladies diarrhéiques et autres, qui sont codifiées différemment selon l'âge du défunt. Les changements d'interprétation et l'adoption de nouvelles règles peuvent aussi introduire des divergences dans les séries chronologiques d'un même pays. En conséquence, il convient d'examiner attentivement les cas où le nombre des décès attribués à des maladies déterminées s'accroît ou diminue sensiblement pour s'assurer, avant

[77] *Comparabilité des statistiques des causes de décès selon la cinquième et la sixième révisions de la Nomenclature internationale* (Organisation mondiale de la santé, Bulletin, Supplément n° 4), Genève, 1952.

de conclure à une évolution de la mortalité, que le changement n'est pas dû à la méthode de codage.

Exception faite des divergences cachées résultant des facteurs mentionnés ci-dessus, les diverses rubriques des Listes devraient en principe être comparables. Toutefois, il convient de signaler ici une anomalie que l'on rencontre dans certaines répartitions — en particulier pour les pays d'Asie et de la région des Caraïbes — en ce qui concerne les morts accidentelles et violentes. Dans ces répartitions, une fraction seulement des décès ont été classés dans les catégories *BE47* à *BE50* du classement selon la cause (code E) tandis que d'autres sont classés uniquement d'après la nature du traumatisme (code N). Il s'ensuit que ces décès ne peuvent être répartis entre les diverses catégories *BE* qui comportent en conséquence une erreur par défaut. Ces divergences sont signalées en note dans le tableau.

Outre les réserves expliquées dans les notes, il faudra interpréter avec beaucoup de prudence les répartitions comportant un nombre relativement élevé de décès attribués à des causes mal définies ou inconnues (*B45*). Il conviendra aussi d'examiner de très près le groupe « Toutes autres maladies »*(B46)*. Si les chiffres donnés pour ces deux catégories *B45* et *B46* sont importants, c'est sans doute parce que les décès survenus dans des groupes entiers de la population n'ont fait l'objet d'aucun diagnostic; en pareil cas, il est probable que la répartition des causes connues est loin de donner une vue exacte de la situation d'ensemble. Cet examen critique des répartitions, l'utilisation du Code général de qualité présenté dans le tableau 24 et la distinction visuelle opérée au moyen du type de caractères d'imprimerie entre les données sûres et celles qui le sont moins devraient permettre de se faire une idée approximative de la valeur des statistiques des causes de décès. Pour un exposé plus détaillé des progrès réalisés dans l'établissement des statistiques des causes de décès et des problèmes qui se posent, voir le chapitre II de l'*Annuaire démographique* de 1951.

Tableau 29

Le tableau 29, qui paraît pour la première fois depuis 1967, présente des données sur les décès selon la cause et l'âge pour chacun des deux sexes séparément pour la dernière année sur laquelle on soit renseigné.

Dans l'ensemble, les données se rapportent à 1972 ou à 1973. Dans l'*Annuaire démographique* de 1967, ces chiffres se rapportaient le plus souvent à 1965 ou à 1966. Combinées avec celles de l'*Annuaire démographique* de 1961 pour l'année 1959, avec celles de l'*Annuaire* de 1957 pour l'année 1955 et avec celles de l'*Annuaire* de 1951 pour les années antérieures à 1950, ces données permettent d'établir des comparaisons dans le temps, mais il ne faut pas oublier qu'il peut exister une solution de continuité entre les Révisions de 1938, de 1948, de 1955 et de 1965 du Classement statistique international.

Par causes de décès, on entend «toutes les maladies, états morbides ou traumatismes qui ont abouti ou contribué au décès et les circonstances de l'accident ou de la violence qui ont entraîné ces traumatismes»[78].

La cause initiale de décès, plutôt que la cause directe de décès, est recommandée pour l'exploitation des statistiques de la mortalité. La cause initiale de décès est définie comme : a) *la maladie ou le traumatisme qui a déclenché l'évolution morbide conduisant directement au décès* ou b) *les circonstances de l'accident ou de la violence qui ont entraîné le traumatisme mortel*[79].

La classification des causes de décès est la même que dans les tableaux 27 et 28; elle correspond à la Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité[80]. On notera toutefois que, dans ce tableau, la colonne des causes de décès ne reprend que les *numéros des rubriques de la Liste abrégée : B1 à B50;* pour les désignations complètes et les numéros de la Nomenclature détaillée correspondant à chacune des rubriques, voir le tableau 27 page 706 pour le texte anglais et pour le texte français.

Les données représentent l'*âge,* au dernier anniversaire, ou en années révolues, selon la définition utilisée pour les autres tableaux où figure cette caractéristique.

Sexe : On a présenté des données sur les décès selon la cause et l'âge pour chacun des deux sexes séparément, mais il n'a pas été possible, faute de place, de présenter des statistiques pour « les deux sexes ».

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Le tableau 29 indique une répartition des décès selon la cause, l'âge et le sexe pour 72 pays ou zones, soit un peu moins qu'il aurait été possible d'en retenir si l'on n'y avait pas mis certaines conditions. La première était que le nombre total des décès pour les deux sexes fût d'au moins 1 000; la deuxième que les décès fussent classés par cause, selon la révision de 1955 ou de 1965 de la Nomenclature internationale et les tableaux conformes à la Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité ou à une liste qui lui corresponde directement, par exemple la Liste intermédiaire; la troisième enfin que le total des décès classés sous la rubrique *B45 (Sénilité sans mention de psychose, et causes mal définies ou inconnues)* n'atteignît pas 25 pour 100 de l'ensemble des décès pour l'un des deux sexes au moins.

Insuffisances des données : Les données du tableau 29 présentent toutes des imperfections propres aux statistiques des décès en général, auxquelles viennent s'ajouter celles qui sont dues aux erreurs dans les déclarations d'âge et dans la certification et la classification des causes de décès. Étant donné que toutes ces imperfections ont déjà été exposées à propos d'autres tableaux, on n'y reviendra pas ici. Pour les problèmes relatifs aux déclarations d'âge et les difficultés concernant les déclarations d'âge et la classification des causes de décès, on se reportera à la description du tableau 25 et des tableaux 27 et 28 respectivement. On peut se rendre compte de l'exactitude générale de ces statistiques selon les causes de décès en examinant le pourcentage des décès, médicale-

[78] *Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès, Révision 1965,* vol. 1, p. 493.

[79] *Ibid.*

[80] *Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès, op. cit.,* p. 369.

ment certifiés, qui sont attribuables à chacune des causes (voir tableau 27).

On s'est efforcé d'étudier de très près les données douteuses concernant les causes et l'âge comme par exemple les chiffres des décès résultant de suicides *(BE49)* ou d'homicides *(BE50)* survenus parmi les enfants de moins de 1 an ou les jeunes enfants; lorsqu'on a conservé ces données, on a indiqué qu'elles étaient probablement dues à un codage imparfait. Par contre, les décès déclarés comme étant attribuables à des complications de la grossesse *(B40)* — et qui normalement ne devraient se produire que parmi les femmes en âge de procréer — n'ont pas fait l'objet d'un renvoi en note lorsqu'ils sont survenus à des âges ultérieurs, car dans certains pays les méthodes de codage permettent de retenir cette cause de décès au-delà de la période de procréation.

Lorsqu'on veut faire des comparaisons des statistiques de la mortalité selon la cause entre pays, on risque de commettre de graves erreurs d'interprétation non seulement parce que le pourcentage des décès certifiés par un médecin varie considérablement d'un pays à l'autre, mais encore parce que les méthodes utilisées pour déterminer la cause principale, lorsque le certificat en mentionne plusieurs, ne sont pas uniformes. La classification statistique finale de la cause retenue peut être aussi une source de variations. Tous ces facteurs, et d'autres de caractère plus général, ont été étudiés à propos des tableaux 27 et 28; ils ont fait l'objet d'un examen plus détaillé dans le chapitre II de l'*Annuaire démographique* de 1951 et dans le *Manuel de statistique de l'état civil* auxquels le lecteur pourra se reporter.

Tableau 30

Le tableau 30 indique le nombre de décès selon l'état matrimonial, l'âge et le sexe du décédé pour la dernière année sur laquelle on soit renseigné.

C'est la quatrième fois que des statistiques de ce genre sont publiées dans l'*Annuaire démographique*. Des séries analogues ont déjà paru dans l'*Annuaire démographique* de 1958 en raison de l'intérêt qu'elles présentent pour l'étude de la dissolution du mariage; elles ont été reproduites dans la présente édition et dans les éditions de 1961 et 1967 du fait qu'elles sont importantes pour l'analyse de la mortalité.

« L'*état matrimonial* d'une personne est *sa situation vis-à-vis des lois ou coutumes de son pays concernant le mariage*[81]. À cet égard, il est recommandé d'adopter une classification comprenant au moins les catégories suivantes : *a*) célibataires ou personnes n'ayant jamais été mariées; *b*) personnes mariées; *c*) veufs non remariés; *d*) divorcés non remariés; et *e*) personnes mariées mais séparées légalement.[82]».

Dans ce tableau, le classement selon l'état matrimonial comporte sept catégories au maximum, et quatre au minimum, selon les données disponibles. Pour l'ensemble du tableau, la règle est de distinguer au moins les catégories suivantes : célibataires, mariés, veufs et divorcés; lorsque les données de base le permettent, à la catégorie des mariés s'ajoutent deux sous-groupes : unions consensuelles et séparés; le cas échéant, on a ajouté une rubrique : inconnue. Si les quatre catégories types apparaissent sans précisions particulières, on peut admettre qu'elles sont ainsi constituées : 1) célibataires : personnes qui n'ont jamais été mariées (y compris les personnes ayant bénéficié d'une annulation); 2) mariés, y compris les personnes vivant en union de fait stable (coutumière ou consensuelle) et celles qui sont en état de séparation légale ou de fait, c'est-à-dire les séparés; 3) veufs, non remariés; 4) divorcés, non remariés. On a utilisé des rubriques supplémentaires dans la colonne de gauche du tableau, des notes ou des crochets pour expliquer, le cas échéant, en quoi le classement s'écarte des définitions ci-dessus.

Comme partout ailleurs dans l'*Annuaire démographique*, la classification par âge est exprimée en années révolues. Elle comprend 11 groupes, qui sont les suivants : moins de 15 ans, 15-19 ans, 20-24 ans, groupes décennaux jusqu'à 75-84 ans, 85 ans et plus et un groupe d'âge inconnu. Lorsque les données reçues ne correspondaient pas exactement à ces groupes, on a indiqué par des traits horizontaux ou en note les cas où plusieurs groupes types ont été fondus.

On remarquera que, pour le groupe moins de 15 ans, le signe non disponible (. . .) apparaît parfois. Cela signifie que le classement des décès selon l'état matrimonial ne tient pas compte des décès de moins de 15 ans car on suppose que ces personnes sont toutes célibataires. Toutefois, on peut constater que cette hypothèse n'est pas toujours fondée en se reportant à l'âge minimum du mariage (voir tableau 12) ainsi qu'à la répartition de la population selon l'état matrimonial (voir *Annuaire démographique* de 1973).

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année selon le cas. (Voir explications à la page 63).

Portée : Le tableau 30 donne les taux de mortalité selon l'état matrimonial, l'âge et le sexe pour 84 pays ou zones.

Insuffisances des données : Les données du tableau 30 appellent toutes les réserves faites à propos des statistiques de l'état civil et des statistiques de la mortalité (voir p. 61 et suivantes), qu'il s'agisse de leur qualité, des différences de portée ou d'autres caractéristiques. L'exclusion des décès d'enfants nés vivants qui meurent avant l'enregistrement de leur naissance n'influe que sur le total des décès et sur les décès de moins de 15 ans; en revanche, les erreurs dues aux inexactitudes de déclaration d'âge (définies à la page 58 et signalées à propos du tableau 25) peuvent fausser les données dans tous les groupes d'âge.

La comparabilité dépend également de l'exactitude des réponses à la question concernant l'état matrimonial du décédé. Il y a tout lieu de penser qu'au moment du dénombrement de la population, de nombreux divorcés peuvent se déclarer soit célibataires, soit mariés, soit veufs, tandis que de nombreux hommes mariés qui sont séparés de leur épouse peuvent se déclarer célibataires. Il n'existe pas de données qui permettent de déterminer l'importance de ce facteur dans le cas des déclarations

[81] *Principes et recommandations concernant les recensements de population de 1970*, par. 217.
[82] *Ibid.*

de décès, mais il paraît raisonnable de penser qu'il est peu probable que l'on obtienne des réponses inexactes à l'occasion des décès. En effet, les renseignements sont généralement fournis par un parent qui est bien placé pour savoir exactement quel était l'état matrimonial du décédé; en outre, les motifs qui incitent à faire une déclaration incorrecte ne jouent plus le même rôle après la mort de l'intéressé.

Les différences existant dans la composition de chaque catégorie d'état matrimonial peuvent nuire à la comparabilité des données. Un des facteurs les plus importants est le classement des décédés ayant vécu en union consensuelle. On estime que dans la plupart des cas la catégorie indiquée pour ces personnes est celles des « mariés »; c'est pourquoi l'Organisation des Nations Unies a recommandé de ranger les décédés en question parmi les mariés lorsque les décès correspondants ne font pas l'objet d'un classement spécial. On ne sait pas dans quelle mesure cette recommandation est appliquée. Il en va de même pour la catégorie des « séparés » aux fins du tableau 30, les décédés qui vivaient séparés de leur conjoint au moment du décès doivent être considérés comme « mariés » mais ils sont parfois assimilés aux divorcés. Dans certains pays, on n'indique pas que l'état matrimonial du décédé est inconnu car on attribue un état matrimonial déterminé à chaque décédé avant d'exploiter les données. Dans d'autres, les chiffres des décédés dont l'état matrimonial est inconnu sont très élevés. Il faut tenir compte de ces différences éventuelles dans la composition des catégories de l'état matrimonial lorsque l'on veut comparer les statistiques.

Une autre réserve s'impose à propos des données de ce tableau. Elle a trait à l'homogénéité des différentes catégories d'état matrimonial du point de vue des antécédents matrimoniaux des individus qui les composent. À cet égard, on peut dire que seul le groupe des célibataires est homogène. En effet, les décédés classés comme mariés ont pu avoir été antérieurement divorcés ou veufs; ceux qui sont classés dans le groupe des divorcés étaient antérieurement mariés et certains d'entre eux peuvent avoir été veufs; les veufs étaient antérieurement mariés, voire déjà veufs ou divorcés. En raison de ces chevauchements, aucune des catégories, à l'exception de celle des célibataires, n'est complète du point de vue des antécédents matrimoniaux. Aucune d'entre elles ne comprend les personnes qui ont appartenu au groupe visé mais dont l'état matrimonial a changé. Il convient de tenir compte de ce facteur pour interpréter les différences entre groupes.

Tableau 31

Ce tableau présente des taux de mortalité selon l'état matrimonial, l'âge et le sexe pour la dernière année sur laquelle on soit renseigné. L'année retenue est celle pour laquelle on dispose d'une répartition correspondante de la population selon l'état matrimonial, l'âge et le sexe correspondant à la classification des chiffres absolus des décès selon ces trois caractéristiques. Étant donné que les chiffres concernant la population de base proviennent souvent d'un recensement de population, les années auxquelles se rapportent les statistiques du tableau 31 ne sont pas toujours aussi récentes que celles sur lesquelles portent les chiffres absolus du tableau 30.

L'âge et l'état matrimonial sont définis et classés comme dans le cas du tableau 30 à ceci près qu'il n'est pas tenu compte du groupe d'âge inconnu ni de la catégorie état matrimonial inconnu pour l'établissement du tableau 31 (voir plus bas, calcul des taux). Comme dans le tableau 30, on a parfois indiqué qu'il n'existait pas de données pour les décédés de moins de 15 ans, l'exploitation des statistiques de la mortalité selon l'état matrimonial étant limitée aux décédés de 15 ans et plus.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Le tableau 31 donne les taux de mortalité selon l'état matrimonial, l'âge et le sexe pour 48 pays ou zones. Le nombre des pays et zones auxquels se rapportent ces statistiques est très limité car on ne dispose que rarement du chiffre de population auquel on doit rapporter les données classées selon les caractéristiques en question pour calculer les taux du tableau.

Calcul des taux : Les taux de mortalité selon l'âge, le sexe et l'état matrimonial sont calculés sur la base de 1 000 personnes du même âge et du même sexe. Il n'est pas tenu compte de la répartition de la population des personnes d'âge et d'état matrimonial inconnus et par conséquent aucun taux n'a été calculé en ce qui les concerne.

Insuffisances des données : Étant donné que les taux de mortalité selon l'état matrimonial, l'âge et le sexe sont calculés d'après des données analogues à celles du tableau 30, ils sont sujets, quant à leur comparabilité, aux mêmes limitations que les chiffres du tableau 30. Bien entendu, comme on le verra ci-après, ils sont également sujets aux problèmes analogues que posent les recensements en ce qui concerne l'enregistrement et la classification selon l'état matrimonial et l'âge.

La comparabilité des statistiques de la population selon l'état matrimonial est sujette à des limitations qui ont leur source dans le dénombrement lui-même. On sait, par exemple, que lors du dénombrement, une personne divorcée peut se déclarer soit célibataire, soit mariée, soit veuve. Cette possibilité est confirmée par le fait que le nombre de divorcés obtenu à la suite d'un recensement est généralement trop faible par rapport au nombre des divorces accordés et à la fréquence des remariages. De même, les hommes mariés qui sont séparés de leur épouse peuvent se déclarer « célibataires », tandis que leur épouse se déclarera, à juste titre, « mariée ». Une erreur de déclaration d'un autre type est introduite dans les statistiques lorsqu'une femme qui a un enfant illégitime se déclare « mariée », alors que le père de l'enfant se sera correctement déclaré « célibataire ».

En ce qui concerne la classification, les mêmes formes de variation peuvent exister, l'uniformité apparente des principales catégories cachant parfois d'importantes différences.

L'élément qui est peut-être le plus important de tous en ce qui concerne la comparabilité des données est le classement des unions consensuelles ou unions de fait, surtout dans les pays où elles sont relativement nombreuses. Abstraction faite des erreurs de déclaration, que

l'on ne peut de toutes façons évaluer, le seul moyen de rendre les données comparables est de classer les unions consensuelles séparément — de manière qu'elles puissent être identifiées — ou de les inclure dans une autre catégorie. Il semble que les personnes vivant en union consensuelle ont tendance à se déclarer mariées plutôt que célibataires. Par suite, et comme, du point de vue démographique, elles sont, en fait, mariées, l'Organisation des Nations Unies[83] a recommandé que, lorsqu'elles ne font pas l'objet d'un classement spécial, ces personnes soient rangées dans la catégorie des « mariés ».

De même, la subdivision « séparés » est de composition incertaine; elle peut comprendre des personnes dont le mariage a été suspendu par une procédure légale; elle peut comprendre également des personnes mariées qui vivent simplement séparées de leur conjoint sans avoir nécessairement l'intention de le rester. Cependant, comme les lois et coutumes relatives à la séparation légale diffèrent d'un pays à l'autre ainsi qu'à l'intérieur d'un même pays, une véritable comparabilité pour ce groupe est probablement hors de question. Pour cette raison, les personnes séparées sont généralement rangées dans la catégorie des « mariés », mais elles sont parfois ou classées séparément ou assimilées aux « divorcés ».

Il est certain que les erreurs d'enregistrement par le service de l'état civil et les erreurs de dénombrement peuvent présenter certaines différences et que les déclarations erronées risquent d'être plus nombreuses dans le cas du recensement. S'il en est ainsi, c'est en partie parce que, lors du dénombrement, la personne interrogée n'est pas nécessairement bien placée pour connaître exactement l'âge ou l'état matrimonial de l'autre membre du ménage au sujet duquel elle est interrogée. Par exemple, l'âge déclaré à l'agent recenseur est souvent un chiffre se terminant par un zéro ou un cinq. Les divorcés et séparés risquent d'être à tort enregistrés comme célibataires au moment du dénombrement, mais les personnes en unions consensuelles qui ne sont pas classées comme telles ont plus de chance d'être déclarées comme mariées au moment du dénombrement qu'au moment de l'enregistrement de leur décès où leur véritable état matrimonial sera indiqué. Pour la même raison, l'état matrimonial risque davantage d'être déclaré comme inconnu lors d'un recensement que lors de l'enregistrement du décès.

Cependant, on peut se rendre compte de la portée réelle de ces imperfections théoriques d'après les résultats d'une enquête menée notamment pas les autorités des États-Unis[84] sur la comparabilité des déclarations de l'état matrimonial faites à l'occasion du recensement de la population et de l'enregistrement des décès. Selon cette étude rétrospective, c'est pour le groupe des mariés que la correspondance est la plus parfaite : 97 pour 100; le pourcentage va en diminuant pour les célibataires, les veufs et les divorcés; il s'établit respectivement à 88, 82 et 69 p. 100. Une étude britannique[85] effectuée selon une méthode très voisine de celle qui a été utilisée aux États-Unis montre que *97 pour cent des hommes décédés entre 35 et 64 ans, l'état matrimonial déclaré a été le même dans le cas du recensement et dans celui de l'enregistrement des décès; pour les mariés, la correspondance est de 98 pour cent; pour les célibataires de 88 pour 100; et pour les veufs et divorcés de 94 pour 100.*

En plus des différences qui tiennent essentiellement au fait que le déclarant n'est pas toujours le même, il peut exister des divergences qui sont dues au manque d'uniformité de la méthode suivie pour classer les données de recensement selon l'âge et plus spécialement l'état matrimonial. Il est par exemple évident que les données de recensement de la population distinguent plus souvent que les statistiques de la mortalité selon l'état matrimonial les personnes en union consensuelle des personnes séparées.

Enfin, lorsque l'on utilise les taux selon l'état matrimonial et l'âge pour analyser la mortalité, il faut considérer qu'à l'exception du groupe des personnes classées comme « célibataires », les autres catégories ne constituent pas nécessairement un groupe homogène du point de vue des antécédents matrimoniaux. Les décédés déclarés comme mariés au moment du décès ont pu avoir été précédemment divorcés ou veufs; de même, les veufs ont pu être antérieurement divorcés et vice versa. Il convient de tenir compte de ce facteur pour interpréter les différences entre groupes.

Tableau 32

Le tableau 32 donne le nombre total de décès, selon le mois civil du décès, pour les cinq années 1965-1973. Antérieurement à la présente édition, ces chiffres mensuels ont déjà été publiés deux fois dans l'*Annuaire démographique* de 1951, où les données portaient sur la période 1946-1950, et dans l'*Annuaire* de 1967, où les données portaient sur la période 1962-1966.

Pour ce tableau on a utilisé les chiffres « définitifs » établis selon le mois civil du décès, de préférence aux chiffres mensuels provisoires que l'on calcule généralement d'après le nombre de décès enregistrés au cours du mois en question, abstraction faite de la date du décès.

Ces données reposent sur l'enregistrement de décès par les services de l'état civil et les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont identifiées à l'aide de deux astérisques (**) placés après le nom du pays ou de la zone ou après l'année, selon le cas. (Voir explications à la page 63).

Portée : Le tableau 32 présente des données mensuelles pour 138 pays; pour 83 d'entre eux, il s'agit de chiffres définitifs; pour 55 autres, de chiffres provisoires, vraisemblablement tirés des registres de l'état civil.

Insuffisances des données : Les statistiques de la mortalité appellent toutes les réserves faites à propos des statistiques de l'état civil (voir page 61 et suivantes) et des statistiques de la mortalité en particulier.

Les insuffisances que traduit le code de qualité et la classification des statistiques en données sûres et données discutables sont particulièrement pertinentes.

Un autre facteur qui influe sur la complétude de l'enregistrement des décès est la définition adoptée, aux fins

[83] *Principes et recommandations concernant les recensements nationaux de population, op. cit.*, par. 410.

[84] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census.* U.S. Department of Health, Education and Welfare, Public Health Service, National Office of Vital Statistics; *Vital Statistics—Special Reports*, Vol. 53, no 1, juin 1961, p. 24.

[85] General Register Office, *1951 Census of England and Wales, General Report*, H.M. Stationery Office, Londres, 1958.

de la statistique, pour les faits à déclarer. La pratique consistant à ne pas inscrire dans le registre des décès les enfants nés vivants qui sont morts dans les 24 heures qui ont suivi la naissance ou avant son enregistrement peut fausser les statistiques dans une certaine mesure.

Il convient également de relever que tous les pays n'exploitent pas leurs données de la même façon : les uns le font selon la date de l'événement, d'autres selon celle de l'enregistrement. On a signalé en note les pays ou zones où les données sont normalement exploitées selon la date de l'enregistrement. Les conséquences de ce mode d'exploitation sont exposées à la page 64 mais il convient de noter qu'il présente une importance toute particulière en ce qui concerne les données mensuelles en raison de la diversité des délais réglementaires d'enregistrement des décès. Il convient en outre de remarquer, comme on l'a vu sous la rubrique « Portée » ci-dessus, que certaines des données mensuelles présentées dans ce tableau sont des données provisoires qui ont donc probablement été exploitées d'après la date de l'enregistrement et non d'après celle du décès. Sur le plan international, il est impossible de comparer ces deux types de séries.

Enfin, il convient d'indiquer que les chiffres présentés ont été établis d'après le mois de décès et qu'ils n'ont donc pas été ajustés pour tenir compte du fait que les mois civils sont de longueur variable, alors que cet ajustement doit être fait pour pouvoir déterminer les tendances et les variations saisonnières de la mortalité.

Tableau 33

On trouvera au tableau 33 des valeurs de l'espérance de vie ($\mathring{e}_x$) selon l'âge et le sexe pour les deux dernières années sur lesquelles on soit renseigné. Si l'on rapproche ces données de celles qui sont présentées dans les éditions antérieures de l'*Annuaire démographique,* on obtient pour certains pays ou zones des séries chronologiques portant sur une période de 74 ans.

Ce tableau donne les valeurs de l'espérance de vie extraites des deux dernières tables officielles de mortalité — complètes ou abrégées — et porte généralement sur la période 1900-1973. Les valeurs de l'espérance de vie pour la période 1950-1965 sont présentées dans l'*Annuaire démographique* de 1966. Les valeurs de l'espérance de vie pour la période 1940-1960 sont présentées au tableau 24 de l'*Annuaire démographique* de 1961, et, pour la période 1900-1940, dans les *Annuaires démographiques* de 1957 et 1953. En outre, la dernière valeur de l'espérance de vie est publiée chaque année dans l'*Annuaire démographique.*

Ces données proviennent surtout des tables officielles de mortalité des pays ou zones auxquels elles se rapportent. Toutefois, là où il n'existait pas de données officielles, on a présenté des estimations concernant l'espérance de vie à la naissance établies récemment par la Division de la population de l'ONU. Ces estimations de l'ONU ont été calculées à l'aide des techniques mentionnées dans le Manuel des Nations Unies sur les *Méthodes permettant d'estimer les mesures démographiques fondamentales à partir de données incomplètes*[86] et en appliquant des taux hypothétiques de gain d'espérance de vie fondés sur des tables types de mortalité[87] et sur d'autres renseignements. Les estimations des Nations Unies sont signalées en note dans le tableau.

L'*espérance de vie* est définie comme le nombre moyen d'années restant à vivre à des personnes du sexe masculin et du sexe féminin atteignant les âges indiqués et soumises aux conditions de mortalité de la période visée par la table.

Les chiffres sont présentés séparément pour chaque sexe à partir de la naissance (âge 0) et pour les âges suivants : 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 et 85 ans.

Les chiffres ont été reproduits tels qu'ils ont été communiqués par les services officiels, ce qui explique qu'ils comportent tantôt une et tantôt deux décimales.

Étant donné que les valeurs figurant dans ce tableau proviennent soit de tables officielles de mortalité, soit d'estimations calculées par les Nations Unies, elles sont toutes supposées exactes. En ce qui concerne les valeurs provenant de tables officielles de mortalité, on suppose que les données de base (chiffre de population et chiffre des décès selon l'âge et le sexe) ont été ajustées, en tant que de besoin, avant de servir à l'établissement de la table de mortalité.

Portée : Les valeurs figurant dans le tableau 33 sont des chiffres officiels dans le cas de 159 pays ou zones et des estimations des Nations Unies dans le cas de 38 autres. Faute de données de base acceptables, le nombre des pays ou zones pour lesquels les tables officielles de mortalité ont pu être établies est réduit, mais on a constaté, ces dernières années, un élargissement notable de la portée de ces statistiques.

Insuffisances des données : Les valeurs de l'espérance de vie sont soumises aux mêmes limitations que les statistiques de la population et de la mortalité.

La principale réserve à faire à propos des valeurs de l'espérance de vie est peut-être que, lorsqu'on interprète les données en question, il ne faut jamais oublier que, par hypothèse, les groupes de survivants sont soumis, pour chaque âge, aux conditions de mortalité de la période visée par la table de mortalité. Ainsi peut-on dire, à propos de la valeur $\mathring{e}_{50}$ dans la table de mortalité de 1970-1972 relative à l'Angleterre et au pays de Galles, que si les hommes atteignant l'âge de 50 ans restent soumis aux mêmes conditions de mortalité que pendant la période 1970-1972, ils vivront encore en moyenne 23,0 années, c'est-à-dire jusqu'à l'âge de 73,0 ans. Toutefois, l'évolution qui s'est produite au cours des dernières décennies a montré que la mortalité ne saurait être considérée comme stable; cela reviendrait à sous-évaluer l'espérance de vie, car la mortalité fléchit presque partout.

Tableau 34

Le tableau 34 indique les quotients de mortalité selon l'âge et le sexe. Ces données proviennent des tables officielles de mortalité des pays auxquels elles se rapportent;

[86] *Manuels sur les méthodes d'estimation de la population — Manuel IV* (publication des Nations Unies, numéro de vente : 67.XIII.2).

[87] *Manuels sur les méthodes d'estimation de la population — Manuel III, Méthodes de projections démographiques par sexe et par âge* (publication des Nations Unies, numéro de vente : 56.XIII.3); *Regional Model Life Tables and Stable Population,* de A. J. Coale et Paul Demeny (Princeton, Princeton University Press, 1966).

aucune donnée n'a été calculée par le Bureau de statistique des Nations Unies.

Ce tableau donne les valeurs extraites des deux dernières tables officielles de mortalité — complètes ou abrégées — et porte généralement sur la période 1900-1973. Les valeurs extraites des tables portant sur la période 1950-1965 sont présentées dans l'*Annuaire démographique* de 1966. Les valeurs extraites des tables portant sur la période 1940-1960 figurent au tableau 25 de l'*Annuaire démographique* de 1961 et celles correspondant à la période 1900-1940 figurent dans les *Annuaires démographiques* de 1957 et 1953.

Les *quotients de mortalité* constituent la fonction fondamentale de la table de mortalité, habituellement désignée par q_x « x » représentant l'âge. Les valeurs de q_x figurant dans le tableau sont exprimées en 1 000 q_x et indiquent le nombre de décès pendant l'année pour 1 000 personnes atteignant l'âge « x » ou encore la probabilité de décès, dans un délai d'un an (ou dans l'intervalle d'âge indiqué), de 1 000 personnes ayant atteint l'âge « x ».

Dans le tableau 34, les chiffres sont présentés séparément pour chaque sexe à partir de la naissance (âge 0) et pour les âges suivants : 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 et 85 ans.

Les quotients de mortalité diffèrent des taux de mortalité en ce qu'ils se rapportent à des personnes atteignant un âge déterminé au cours d'une année et non à des personnes atteignant cet âge au milieu de l'année. Les quotients reposent donc sur la même conception que les taux de mortalité infantile.

Les tables de mortalité complètes donnent des quotients pour chaque année d'âge. Au contraire, les tables abrégées ne donnent des valeurs que pour des groupes d'âge, généralement quinquennaux. Certaines séries du tableau 34 sont du deuxième type, ce que l'on a indiqué par des notes de bas de page. Le quotient de mortalité est alors la probabilité de décès des personnes d'un âge donné non au cours de l'année suivante, mais au cours de la période de plusieurs années visée par la table.

Étant donné que cette fonction est extraite d'une table officielle de mortalité et qu'on suppose que les données de base (chiffres de population et chiffres des décès selon l'âge et le sexe) ont été, en cas de besoin, ajustées avant l'élaboration de la table de mortalité, le Bureau de statistique n'a pas cherché à évaluer la qualité des données.

Portée : Les quotients de mortalité indiqués concernent 100 pays ou zones. Faute de données de base acceptables, le nombre des pays pour lesquels des tables de mortalité ont pu être établies est réduit mais on a constaté, ces dernières années, un élargissement notable de la portée géographique de ces statistiques.

Insuffisance des données : Les quotients de mortalité appellent toutes les réserves formulées à la page 66 à propos des tables de mortalité; en outre, ils sont soumis aux mêmes limitations que les statistiques de la population et de la mortalité en général.

La méthode utilisée pour calculer les quotients a été brièvement décrite à la page 66. Le calcul des valeurs de q_x pour les premiers âges et les âges avancés pose des problèmes spéciaux. On établit souvent les valeurs de q_x pour les premiers âges à partir des statistiques des naissances survenues au cours des années voisines en faisant une estimation du nombre d'enfants risquant de mourir pendant la période à laquelle se rapporte la table de mortalité. Pour les âges avancés, les données sont souvent si rares et si discutables qu'il faut sensiblement les remanier pour pouvoir obtenir une série vraisemblable de valeur de q_x. Dans de nombreux cas, les valeurs de q_x figurant dans la table de mortalité pour les âges avancés ne sont nullement liées aux décès enregistrés pour ces âges; elles sont établies par estimation à partir des valeurs de q_x concernant les personnes moins âgées.

Bien que l'on ait rectifié les écarts dus aux déclarations d'âge erronées pour obtenir, d'un âge à l'autre, une série de valeurs d'allure régulière, la comparabilité des données risque d'être compromise par les différences de méthode d'ajustement.

Tableau 35

Le tableau 35 indique les valeurs des tables de survie pour le sexe masculin et le sexe féminin à différents âges. Ces données proviennent des tables officielles de mortalité des pays auxquels elles se rapportent; aucune donnée n'a été calculée par le Bureau de statistique des Nations Unies.

Ce tableau donne les valeurs extraites des deux dernières tables officielles de mortalité — complètes ou abrégées — et porte généralement sur la période 1900-1973. Les valeurs extraites des tables portant sur la période 1956-1965 sont présentées dans l'*Annuaire démographique* de 1966. Les valeurs extraites des tables portant sur la période 1940-1960 sont présentées dans le tableau 26 de l'*Annuaire démographique* de 1961 et celles correspondant à la période 1900-1940 dans les *Annuaires démographiques* de 1957 et 1953.

Les valeurs des tables de survie, généralement désignées par l_x, sont calculées à partir des valeurs de q_x de la table de mortalité; elles représentent le nombre de personnes du sexe masculin ou féminin appartenant à une même cohorte de naissances vivantes et soumises à la mortalité définie par les quotients de la table de mortalité correspondante qui survivent jusqu'à chacun des âges indiqués. En d'autres termes, ces valeurs indiquent la proportion des personnes nées vivantes qui ont des chances de survivre jusqu'à un âge déterminé « x ». Dans le tableau 35, la racine des tables de survie (effectif initial de la cohorte) est généralement de 100 000, mais dans certains cas elle n'est que de 10 000 ou 1 000.

Les chiffres concernant les survivants sont présentés séparément pour chaque sexe à partir de la naissance (âge 0) et pour les âges suivants : 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 et 85 ans.

Étant donné que cette fonction est extraite d'une table officielle de mortalité et qu'on suppose que les données de base (chiffres de population et chiffres des décès selon l'âge et le sexe) ont été, en cas de besoin, ajustées avant l'élaboration de la table de mortalité, le Bureau de statistique n'a pas cherché à évaluer la qualité des données et par conséquent aucune d'entre elles n'est reproduite en italique.

Portée : Le tableau 35 fournit des valeurs de survie pour 100 pays ou zones. Comme on l'a dit à propos des tableaux 33 et 34, le nombre des pays pour lesquels on

dispose de données s'est accru malgré l'insuffisance générale des statistiques de base.

Insuffisances des données : Comme les autres fonctions de la table de mortalité, les nombres de survivants appellent toutes les réserves générales applicables aux statistiques de la population et de la mortalité; en outre, leur comparabilité est compromise par les différences entre les méthodes utilisées pour construire les tables de mortalité (voir page 66).

Comme on l'a déjà signalé à propos du tableau 34, les incertitudes relatives aux quotients de mortalité pour les premiers âges et les âges très avancés posent un problème spécial; en conséquence, les chiffres obtenus pour les âges très avancés en particulier n'ont guère plus de valeur que des estimations.

1. Population, rate of increase, birth and death rates, surface area and density for the world, macro regions and regions: selected years

Population, taux d'accroissement, taux de natalité et taux de mortalité, superficie et densité pour l'ensemble du monde, les grandes régions et les régions géographiques: diverses années

[Unless otherwise specified all figures are estimates of the order of magnitude and are subject to a substantial margin of error; all data except "surface area" are therefore set in italics. For composition of major areas and regions and for method of construction of estimates, see Technical Notes, page 25. — Sauf indication contraire, tous les chiffres sont des estimations de l'ordre de grandeur comportant une assez grande marge d'erreur; toutes les données à l'exception de celles relatives à la "superficie" sont de ce fait en italique. Pour la composition des grandes régions et régions et la méthode utilisée afin d'établir les estimations, voir Notes techniques, page 69.]

FOOT-NOTES

[1] Population per square kilometre of surface area. Figures are merely the quotients of population divided by surface area and are not to be considered as either reflecting density in the urban sense or as indicating the supporting power of a territory's land and resources.

[2] Hawaii, a state of the United States of America, is included in Northern America rather than Oceania.

[3] Excluding the USSR, shown separately.

[4] The European portion of Turkey is included with South Asia rather than Europe.

NOTES

[1] Habitants par kilomètre carré. Il s'agit simplement du quotient du chiffre de la population par celui de la superficie. Il ne faut pas y voir d'indication ni de la densité au sens urbain du terme, ni de l'effectif de population que les terres et les ressources du territoire sont capables de nourrir.

[2] Hawaii, un Etat des Etats-Unis d'Amérique, est compris dans l'Amérique septentrionale plutôt que dans l'Océanie.

[3] Non compris l'URSS, qui fait l'objet d'une rubrique distincte.

[4] La partie européenne de la Turquie est comprise dans l'Asie du Sud plutôt que dans l'Europe.

2. Estimates of population and its percentage distribution, by age and sex and sex ratio of total population for the world, macro regions and regions: 1970

[All figures are estimates of the order of magnitude and are subject to a substantial margin of error; all data are therefore set in italics. For composition of macro regions and regions and for method of construction of estimates, see Technical Notes, page 27.]

NOTES

[1] Hawaii, un Etat des Etats-Unis d'Amérique, est compris dans l'Amérique septentrionale plutôt que dans l'Océanie.
[2] Non compris l'URSS, qui fait l'objet d'une rubrique distincte.
[3] La partie européenne de la Turquie est comprise dans l'Asie du Sud plutôt que dans l'Europe.

WORLD SUMMARY

3. Population by sex, rate of population increase, surface area and density for each country or area of the world: latest census, and mid-year estimates for 1970 and 1974

Population selon le sexe, taux d'accroissement de la population, superficie et densité dans chaque pays ou zone du monde: dernier recensement et estimations au milieu de l'année pour 1970 et 1974

[Unless otherwise specified, population figures are present-in-area estimates for the present territory; area estimates include inland waters. Data shown in italics are estimates of questionable reliability. For explanation of method of construction of estimates and of method of evaluation, see Technical Notes, page 28. Foot-notes and explanation of symbols are shown at end of table. — Sauf indication contraire, les chiffres relatifs à la population se rapportent à la population présente du territoire actuel; les estimations de superficie comprennent les eaux intérieures. Les données en italiques sont des estimations discutables. Pour la méthode d'établissement des estimations et la méthode d'évaluation, voir Notes techniques page 72. Les notes et l'explication des signes figurent à la fin du tableau.]

3. Population by sex, rate of population increase, surface area and density (continued) — Population selon le sexe, taux d'accroissement de la population, superficie et densité (suite)

FOOT-NOTES

Italics indicate estimates of questionable reliability.

* Provisional.

x United Nations estimate.

[1] For explanation of code, see page 17.

[2] Population per square kilometer of surface area in 1974. Figures are merely the quotients of population divided by surface area and are not to be considered as either reflecting density in the urban sense or as indicating the supporting power of a territory's land and resources.

[3] In the Departments of Oasis and Saoura, enumeration took place between 22 December 1965 and 20 January 1966.

[4] Population is *de jure* and includes nationals living abroad numbering 268 868 at 1966 census.

[5] Including the enclave of Cabinda.

[6] Population is *de jure* and includes nomads estimated at 10 550 at 1971 census.

[7] Comprising Chagos Archipelago (formerly dependency of Mauritius) and the islands of Aldabra, Farquhar and Des Roches (formerly dependencies of Seychelles).

[8] Census of Chagos Archipelago taken 30th June 1962 gave total population of 747 persons. Census of Aldabra, Farquhar and Des Roches taken 4 May 1960 gave totals of 100, 172 and 112 respectively.

[9] Estimate based on results of a sample survey of population covering 25 000 persons.

[10] Estimate(s) not revised to take account of latest survey.

[11] Rate not computed because of apparent lack of comparability between estimates shown for 1970 and 1974.

[12] Estimate for *de jure* African population, in 1959-1960 (based on results of a sample survey, including estimates of 80 000 for population of Bangui town, 66 000 for population of East Oubangui and 40 000 for nomad population not covered by survey) was 1 202 910. Result of *recensement instantané* conducted in 1968 was 2 255 536. Estimate for 1970, based on 1959–1960 sample survey, was 1 612 000. Estimate based on 1968 *recensement instantané* was 2 370 000.

[12] Estimate for *de jure* African population based on results of sample survey; figure for "Both Sexes" includes estimates of 80 000 for population of Bangui town, 66 000 for population of East Oubangui and 40 000 for nomad population, not covered by survey.

[13] Estimate for *de jure* African population based on results of a sample survey covering 5 per cent of the population in 549 rural villages and 10 per cent of the population in 10 urban communes and a complete enumeration of the population of Fort-Archambault, Doba, Moundou, Koumra, Bongor and Abeche. Including estimates of 100 000 for Fort-Lamy, enumerated in 1962, and 630 000 for other areas not covered by survey.

[14] Estimate for African population based on results of a sample survey; figure for "Both sexes" includes an estimate for population of town of Abomey-Bohicon and Canton of Tchi, representing slightly more than 1 per cent of total population not covered by survey.

[15] Inhabited and cultivated territory accounts for 35 580 km^2; corresponding density is 1 001.

[16] Comprising Macías Nguemo Biyogo (which includes Pagalu) and Río Muni (which includes Corisco and Elobeys).

[17] Comprising the islands of St. Paul and Amsterdam, the Kerguelen and Crozet Archipelagos and Adélie Coast.

[18] Population numbered 171 and 190 for 1970 and 1974 respectively.

[19] Estimate for African population based on results of a sample survey.

[20] Estimate for African population based on results of a sample survey in selected rural areas.

[21] Population excludes absentee workers amounting to 12 per cent of total population at time of census.

[22] Population is *de jure*.

[23] Estimate based on results of a sample survey in 77 selected cantons (out of a total of approximately 650) having an average population of 6 000–8 000 inhabitants.

[24] Estimate based on results of sample survey; excluding nomad population estimated at 200 000 and persons in the zone controlled by the Niger Office estimated at 30 000.

(continued on next page)

NOTES

Italiques : estimations dont l'exactitude est discutable.

* Données provisoires.

x Estimation des Nations Unies.

[1] Pour l'explication du code, voir la page 17.

[2] Nombre d'habitants au kilomètre carré en 1974. Il s'agit simplement du quotient du chiffre de la population par celui de la superficie : il ne faut y voir d'indication ni de la densité au sens urbain du terme, ni de l'effectif de population que les terres et les ressources du territoire sont capables de nourrir.

[3] Dans les départements des Oasis et de la Saoura, le dénombrement a eu lieu entre le 22 décembre 1965 et le 20 janvier 1966.

[4] Population de droit, y compris les nationaux vivant à l'étranger, au nombre de 268 868 au recensement de 1966.

[5] Y compris l'enclave de Cabinda.

[6] Population de droit, y compris les nomades, au nombre de 10 550 au recensement de 1971 (estimation).

[7] Y compris l'archipel de Chagos (ancienne dépendance de l'île Maurice) et les îles Aldabra, Farquhar et Des Roches (anciennes dépendances des Seychelles).

[8] Le recensement de la population de l'archipel de Chagos au 30 juin 1962 a donné comme population totale 747 personnes. Le recensement de la population des îles Aldabra, Farquhar et Des Roches au 4 mai 1960 a donné respectivement 100, 172 et 112 personnes.

[9] Estimation fondée sur les résultats d'une enquête par sondage qui a porté sur 25 000 personnes.

[10] Les estimations n'ont pas été révisées en fonction des résultats du dernier sondage.

[11] On n'a pas calculé le taux parce que les estimations pour 1970 et 1974 ne paraissent pas comparables.

[12] L'estimation de la population de droit africaine pour 1959–1960, (fondée sur les résultats d'une enquête par sondage et comprenant des estimations de 80 000 pour la population de la ville de Bangui, 66 000 pour la population de l'Oubangui oriental et 40 000 pour la population nomade, non couvertes par l'enquête) est de 1 202 910. Le recensement instantané de 1968 a donné un résultat de 2 255 536. L'estimation pour 1970, fondée sur les résultats de l'enquête par sondage de 1959–1960 est de 1 612 000. L'estimation fondée sur le recensement instantané de 1968 est de 2 370 000.

[12] L'estimation de la population de droit africaine est fondée sur les résultats d'une enquête par sondage; les chiffres pour "Les deux sexes" comprennent des estimations de 80 000 pour la population de la ville de Bangui, 66 000 pour la population de l'Oubangui oriental et 40 000 pour la population nomade, non couvertes par l'enquête.

[13] L'estimation de la population de droit africaine est fondée sur les résultats d'une enquête par sondage ayant porté sur 5 p. 100 de la population de 549 villages ruraux et 10 p. 100 de la population de 10 communes urbaines et sur un dénombrement complet de la population de Fort-Archambault, Doba, Moundou, Koumra, Bongor et Abeche. Y compris une estimation de 100 000 pour Fort-Lamy, dénombrés en 1962, et de 630 000 pour d'autres régions non couvertes par l'enquête.

[14] L'estimation de la population africaine est fondée sur les résultats d'une enquête par sondage; les chiffres pour "Les deux sexes" comprennent une estimation sur la population d'Abomey-Bohicon et du Canton de Tchi, soit un peu plus de 1 p. 100 de la population totale, non couverte par l'enquête.

[15] La superficie du territoire habité et cultivé est de 35 580 km^2. La densité de population correspondante est de 1 001.

[16] Macías Nguemo Biyogo (qui comprend Pagalu) et Río Muni (qui comprend Corisco et Elobeys).

[17] Iles Saint-Paul et Nouvelle-Amsterdam, archipels des Kerguélen et Crozet et Terre Adélie.

[18] On comptait 171 personnes en 1970 et 190 en 1974.

[19] L'estimation de la population africaine est fondée sur les résultats d'une enquête par sondage.

[20] L'estimation de la population africaine est fondée sur les résultats d'une enquête par sondage menée dans certaines zones rurales spécialement choisies.

[21] Les chiffres pour la population ne comprennent pas les travailleurs absents, qui représentaient 12 p. 100 de la population totale au moment du recensement.

[22] Population de droit.

[23] Estimation fondée sur les résultats d'une enquête par sondage dans 77 cantons spécialement choisis (sur un total d'environ 650) ayant en moyenne 6 000 à 8 000 habitants.

[24] Estimation fondée sur les résultats d'une enquête par sondage; non compris 200 000 nomades (estimation) et 30 000 personnes (estimation) dans la zone relevant de l'Office du Niger.

(voir page suivante)

3. Population by sex, rate of population increase, surface area and density (continued) — Population selon le sexe, taux d'accroissement de la population, superficie et densité (suite)

FOOT-NOTES (continued)

[25] Estimate for *de jure* population based on results of sample survey covering 10 per cent of the population in 365 settled rural villages, and nomad population surveyed on a variable basis (5 to 50 per cent). Includes estimates of 20 000 for nomad subdivision of Tichitt and Boghe and of 70 000 for 27 urban centres enumerated in 1961–1962, not covered by survey.

[26] Population numbered 350 for 1974.

[27] Estimate(s) not revised in accord with latest census.

[28] Including data for Walvis Bay, which is an integral part of South Africa but is administered as if it were part of Namibia (surface area 1 124 km^2, population 12 648 in 1960).

[29] Estimate based on results of sample survey; excludes population of Niamey city (numbering 30 030 at census of April 1959), and also an estimate of 234 300 persons for the *cercle* of Agadès, the nomad subdivision of Tahoua and the northern part of the *cercles* of Maradi, Gouré, Zinder and N'Guigmi, not covered by survey.

[30] There is a possibility that the 1963 census overstated the population. The size of the possible overstatement may be judged from the United Nations mid-year estimates for 1970 and 1974 provided by the United Nations Population Division.

[31] Estimate based on results of sample survey of population covering 100 000 persons.

[32] Excluding data for dependencies, two of which are shown separately hereunder; the other dependencies, Gough, Inaccessible and Nightingale Islands (total surface area 105 km^2), are presumed to be uninhabited.

[33] Population estimated at 1 364 in 1970 and 1 206 in 1973.

[34] For 1969.

[35] Estimate for *de jure* population based on results of sample survey.

[36] Census results exclude and mid-year estimates include adjustments for underenumeration estimated as follows:

	Percentage adjustment	*Adjusted census total*
Bolivia	8.4	3 019 031
Chile	8.5	...
Hong Kong	1.05	...
Mexico	...	...
Netherlands Antilles	2.0	...
Sierra Leone	5.0	...
Thailand	2.01	35 103 000
Tunisia	4.0	...
Uruguay	...	...

For Bolivia, adjusted census total includes an estimate of 87 000 for Indian jungle population.

[37] Excluding data for Walvis Bay, which is an integral part of South Africa but is administered as if it were part of Namibia (surface area 1 124 km^2, population 12 648 in 1960).

[38] Type of estimates for Asiatic and White segments of population is A_5b_1.

[39] African population only. Census of non-African population taken 20 March 1969 gave total of 252 414.

[40] Comprising the Northern Region (former Saguia el Hamra) and the Southern Region (former Río de Oro).

[41] Including an estimated ajustment for underenumeration in the Blue Nile province and for the nomadic tribes.

[42] Summation of estimates derived from sample surveys conducted between 1960 and 1965, as follows:

	Date of Survey	*Population*
East Cameroon:		
North Cameroon Division	III-IV 1960	1 150 000
Adamaoua and Sud Bénoué	VI-VII 1961	240 000
Central and Eastern Division	1962	1 200 000
Yaoundé	V-XII 1962	90 000
Douala (estimate)	1964	187 000
Bamiléké Region	1965	1 120 000
Total East Cameroon:		3 987 000
West Cameroon:	I 1964 I 1965	1 030 000
Total country		5 017 000

(continued on next page)

NOTES (suite)

[25] L'estimation de la population de droit est fondée sur les résultats d'une enquête par sondage ayant porté sur 10 p. 100 de la population de 365 villages ruraux (population sédentaire) et sur un pourcentage variable de la population nomade (5 à 50 p. 100). Y compris une estimation de 20 000 pour les subdivisions nomades de Tichitt et Boghe et de 70 000 pour 27 centres urbains dénombrés en 1961–1962, non couverts par l'enquête.

[26] On comptait 350 personnes en 1974.

[27] Les estimations n'ont pas été révisées en fonction des résultats du dernier recensement.

[28] Y compris Walvis Bay (superficie : 1 124 kilomètres carrés; population : 12 648 habitants en 1960), qui fait partie intégrante de l'Afrique du Sud mais qui est administrée comme si elle relevait de la Namibie.

[29] Estimation fondée sur les résultats d'une enquête par sondage; non compris la population de la ville de Niamey (30 030 personnes au recensement d'avril 1959), le cercle d'Agadès, la subdivision nomade de Tahoua et la partie nord des cercles de Maradi, Gouré, Zinder et N'Guigmi, qui comptaient ensemble 234 300 habitants (estimation) non couverts par l'enquête.

[30] Il est possible que le recensement de 1963 ait surestimé la population. On peut se faire une idée de l'ordre de grandeur de ce surdénombrement éventuel d'après les estimations effectuées au milieu de l'année pour 1970 et 1974 et fournies par la Division de la population des Nations Unies.

[31] Estimation fondée sur les résultats d'une enquête par sondage qui a porté sur 100 000 personnes.

[32] Non compris les dépendances dont deux font l'objet de rubriques distinctes (voir plus bas); les autres dépendances, les îles Diego Alvarez (Gough), Inaccessible et Nightingale (superficie totale 105 km^2) sont présumées inhabitées.

[33] Population estimée à 1 364 personnes en 1970 et à 1 206 en 1973.

[34] Pour 1969.

[35] L'estimation de la population de droit est fondée sur les résultats d'une enquête par sondage.

[36] Les estimations au milieu de l'année tiennent compte d'un ajustement destiné à compenser les lacunes du dénombrement. Les données de recensement ne tiennent pas compte de cet ajustement. En voici le détail :

	Ajustement (en pourcentage)	*Chiffre de recensement ajusté*
Bolivie	8,4	3 019 031
Chili	8,5	...
Hong-kong	1,05	...
Mexique	...	...
Antilles néerlandaises	2,0	...
Sierra Leone	5,0	...
Thaïlande	2,01	35 103 000
Tunisie	4,0	...
Uruguay	...	...

Pour la Bolivie, le chiffre de recensement ajusté tient compte des Indiens de la jungle au nombre de 87 000 (estimation).

[37] Non compris Walvis Bay (superficie : 1 124 km^2; population : 12 648 habitants en 1964), qui fait partie intégrante de l'Afrique du Sud mais qui est administrée comme si elle relevait de la Namibie.

[38] Pour les Asiatiques et les Blancs, les estimations sont du type A_5b_1.

[39] Population africaine seulement. Le recensement de la population non africaine du 20 mars 1969 a donné un total de 252 414 personnes.

[40] Y compris la région septentrionale (ancien Seguiet el Hamra) et la région méridionale (ancien Río de Oro).

[41] Les données tiennent compte d'un ajustement estimé, destiné à compenser les lacunes du dénombrement dans la province du Nil Bleu et pour les tribus nomades.

[42] Voici une récapitulation des chiffres estimatifs obtenus sur la base des enquêtes par sondage menées entre 1960 et 1965 :

	Date de l'enquête	*Population*
Cameroun oriental :		
Division du Cameroun septentrional	III-IV 1960	1 150 000
Adamaoua et Sud Bénoué	VI-VII 1961	240 000
Division centrale et orientale	1962	1 200 000
Yaoundé	V-XII 1962	90 000
Douala (estimation)	1964	187 000
Région de Bamiléké	1965	1 120 000
Total pour le Cameroun oriental :		3 987 000
Cameroun occidental :	I 1964 I 1965	1 030 000
Total pour l'ensemble du pays :		5 017 000

(voir page suivante)

3. Population by sex, rate of population increase, surface area and density (continued) — Population selon le sexe, taux d'accroissement de la population, superficie et densité (suite)

FOOT-NOTES (continued)

[43] Estimate based on results of sample survey of 226 villages (covering 183 963 persons) and 12 urban centres surveyed on a 10 per cent basis; excludes an estimate of 100 000 persons for towns of Ouagadougou (numbering 59 000 at 1961 census) and Bobo-Dioulasso (estimated at 51 500 in 1959), not covered by survey.

[44] Figures are computed from percentage distribution of population by sex.

[45] Estimates for African population based on results of sample survey; figure for "Both Sexes" includes an adjustment for certain areas not covered by survey.

[46] Population is *de jure*, but excluding persons residing in institutions.

[47] Surface area of ice-free portion is 341 700 km^2, corresponding density is 0.1.

[48] Including data for Carriacou and other dependencies in the Grenadines.

[49] Including data for dependencies: Marie-Galante, la Désirade, les Saintes, Petite-Terre, St. Barthélemy and French part of St. Martin.

[50] Estimate for *de jure* population based on results of a 10 per cent sample survey of rural areas and a complete enumeration of all other areas. Last complete census was taken in 1950.

[51] Data are for 30 August of year stated.

[52] See Antigua, British Virgin Islands, Montserrat and St. Kitts-Nevis-Anguilla.

[53] Check with population register indicates underenumeration of about 7 per cent for both sexes.

[54] Comprising Saba, St. Eustatius and Dutch part of St. Martin.

[55] Excluding data for Canal Zone shown separately hereunder.

[56] Population is *de jure* but including armed forces stationed in the area.

[57] Including data for Bequia and other dependencies in the Grenadines.

[58] The census figure has not been adjusted for underenumeration.

[59] Excluding foreign personnel employed on United States bases.

[60] Shown elsewhere as "United States".

[61] Population is *de jure* but excludes civilian citizens absent from country for extended period of time. Census figures also exclude armed forces overseas.

[62] "Both sexes" includes a late revision made to correct errors found in total after detailed tabulations were complete.

[63] Excludes inland water.

[64] See Dominica, Grenada, St. Lucia and St. Vincent.

[65] Population excludes Indian jungle population, numbering 45 429 at 1950 census and estimated at 150 000 in 1956.

[66] Created 3 March 1962 and comprising former dependencies of Falkland Islands (Malvinas) south of 60° latitude, i.e. the South Orkney Islands (surface area 622 km^2), South Shetland Islands (surface area 4 622 km^2), Graham Land and the sector of Antarctic continent between longitudes 20° W. and 80° W.

[67] A formal census is not taken because the population consists entirely of scientists and technicians of British Antarctic Survey and the exact number of persons is known at all times. British population numbered 79 males in winter 1972.

[68] Data are for 15 July of year stated.

[69] Population excludes nomadic Indian tribes.

[70] Excluding data for dependencies, of which South Georgia ((area 3 755 km^2) had an estimated population of 499 in 1964 (494 males, 5 females). The other dependencies, i.e. the South Sandwich group (surface area 337 km^2) and a number of smaller islands, are presumed to be uninhabited.

[71] A dispute exists between the governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

[72] Excluding Indian jungle population.

[73] Population excludes transients afloat.

[74] Including 1 600 residents who were absent at the time of the census.

[75] Population registered. Figure for "Both sexes" includes an estimate of 7 591 298 for Taiwan Province and 8 397 477 for persons living in outlying areas where local registration offices were not established. No adjustment has been made for 0.1 per cent estimated net underenumeration. Source: *Communiqué* issued 1 November 1954 by the State Statistical Bureau concerning the result of the National Population Census and Registration, published in *Jen-min Jih-pao* (People's Daily), Peking, 1 November 1954.

(continued on next page)

NOTES (suite)

[43] Estimation fondée sur les résultats d'une enquête par sondage dans 226 villages (couverture : 183 963 personnes) et 12 centres urbains (fraction sondée : 10 p. 100; il n'est pas tenu compte d'environ 100 000 personnes (estimation) habitant les villes de Ouagadougou (population : 59 000 au recensement de 1961) et Bobo-Dioulasso (population estimée à 51 500 en 1959), non couvertes par l'enquête.

[44] Les chiffres ont été calculés d'après la répartition proportionnelle de la population par sexe.

[45] L'estimation de la population africaine est fondée sur les résultats d'une enquête par sondage; les chiffres pour "Les deux sexes" tiennent compte d'un ajustement pour certaines régions non couvertes par l'enquête.

[46] Population de droit, mais non compris les personnes dans les institutions.

[47] La superficie non recouverte par les glaces est de 341 700 km^2, la densité de 0,1.

[48] Y compris Carriacou et les autres dépendances du groupe des îles Grenadines.

[49] Y compris les dépendances : Marie-Galante, La Désirade, les Saintes, Petite-Terre, Saint-Barthélemy et la partie française de Saint-Martin.

[50] L'estimation de la population de droit est fondée sur les résultats d'une enquête par sondage qui a porté sur 10 p. 100 des zones rurales et sur un dénombrement complet de toutes les autres zones. Le dernier recensement complet a eu lieu en 1950.

[51] Chiffres au 30 août de l'année considérée.

[52] Voir Antigua, les îles Vierges britanniques, Montserrat et Saint-Christophe-et-Nièves et Anguilla.

[53] La comparaison avec le registre de population a fait apparaître un sous-dénombrement d'environ 7 p. 100 pour les deux sexes.

[54] Saba, Saint-Eustache et la partie néerlandaise de Saint-Martin.

[55] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte.

[56] Population de droit, mais y compris les militaires en garnison sur le territoire.

[57] Y compris Bequia et les autres dépendances du groupe des îles Grenadines.

[58] Le chiffre de recensement n'a pas été ajusté pour compenser les lacunes du dénombrement.

[59] Non compris le personnel étranger travaillant dans les bases des Etats-Unis.

[60] Désigné ailleurs sous le nom d' "Etats-Unis".

[61] Population de droit, mais non compris les ressortissants civils des Etats-Unis absents du pays pour une période prolongée. Les chiffres de recensement ne comprennent pas également les militaires à l'étranger.

[62] "Les deux sexes" comprennent une révision ultérieure faite pour corriger des erreurs découvertes dans le total après avoir terminé les tableaux mécanographiques.

[63] Non compris les eaux intérieures.

[64] Voir Dominique, Grenade, Sainte-Lucie et Saint-Vincent.

[65] Non compris les Indiens de la jungle, au nombre de 45 429 au recensement de 1950 et de 150 000 en 1956 (estimation).

[66] Créée le 3 mars 1962; comprend les anciennes dépendances des îles Falkland (Malvinas) au sud du 60ème parallèle, c'est-à-dire les Orcades du Sud (superficie : 622 km^2), les Shetland du Sud (superficie : 4 622 km^2), la terre de Graham et la partie du continent antarctique située entre 20° et 80° de longitude ouest.

[67] Il n'y a pas eu de recensement officiel car la population, dont le nombre exact est toujours connu, se compose entièrement de savants et de techniciens participant à l'étude de l'Antarctique britannique. La population britannique comptait 79 personnes du sexe masculin pendant l'hiver de 1972.

[68] Chiffres au 15 juillet de l'année considérée.

[69] Non compris les tribus d'Indiens nomades.

[70] Non compris les données pour les dépendances, parmi lesquelles figure la Géorgie du Sud (3 755 km^2) avec une population estimée à 499 personnes en 1964 (494 du sexe masculin et 5 du sexe féminin). Les autres dépendances, c'est-à-dire le groupe des Sandwich du Sud (superficie : 337 km^2) et certaines petites îles sont présumées inhabitées.

[71] La souveraineté sur les îles Falkland (Malvinas) fait l'objet d'un différend entre le Gouvernement argentin et le Gouvernement du Royaume-Uni de Grande-Bretagne et d'Irlande du Nord.

[72] Non compris les Indiens de la jungle.

[73] Non compris les personnes de passage à bord de navires.

[74] Y compris les résidents hors du pays pendant la période du recensement au nombre de 1 600.

[75] Population enregistrée. Le chiffre pour "Les deux sexes" tient compte d'une estimation de 7 591 298 personnes pour la Province de Taïwan et de 8 397 477 personnes pour les régions périphériques où il n'existe pas de bureau d'état civil. Il n'y a pas eu d'ajustement pour tenir compte du sous-dénombrement, estimé à 0,1 p. 100 net. Source : Communiqué du 1er novembre 1954 émanant du Bureau de statistique de l'Etat concernant le résultat du recensement et de l'enregistrement nationaux de la population, publié à *Jen-min Jih-pao* (*People's Daily*), Pékin, le 1er novembre 1954.

(voir page suivante)

3. Population by sex, rate of population increase, surface area and density (continued) — Population selon le sexe, taux d'accroissement de la population, superficie et densité (suite)

FOOT-NOTES (continued)

[76] Excludes persons living in bases and other areas retained by the United Kingdom after independence, numbering 3 602 at 1960 census; also excludes tourists numbering 447 at 1960 census.

[77] Comprising Hong Kong island, Kowloon and the New (leased) Territories.
[78] Excluding 11 549 transients.
[79] Land area only. Total including ocean area within administrative boundaries is 2 916 km^2.

[80] Including data for the Indian-held part of Jammu and Kashmir, the final status of which has not yet been determined. Excluding Sikkim shown separately below.
[81] Excluding West Irian, shown separately hereunder.

[82] Western part of island of New Guinea.
[83] For settled population only; nomadic tribes (numbering 462 146 for both sexes) and other unsettled population (numbering 244 141 for both sexes) were excluded.
[84] For 14 October of year stated.
[85] Includes data for East Jerusalem and Israeli residents in certain other territories under occupation by Israeli military forces since June 1967.

[86] Comprising Hokkaido, Honshu, Shikoku, Kyushu. Population excludes diplomatic personnel outside the country and foreign military and civilian personnel and their dependants stationed in the area.
[87] Including military and diplomatic personnel and their families abroad numbering 933 for both sexes at 1961 census, excluding foreign military and diplomatic personnel and their families in the country, numbering 389 for both sexes at 1961 census. Also including registered Palestinian refugees, numbering 654 092 and 722 687 at 30 June 1963 and 31 May 1967, respectively.

[88] Census results and mid-year estimates include adjustment for underenumeration estimated at 4 per cent.

[89] Data are for 18 November of year stated.
[90] Population excludes foreign diplomatic personnel and their dependants.

[91] Includes the area of the demilitarized zone (1 262 km^2).
[92] Excluding alien armed forces, civilian aliens employed by armed forces, foreign diplomatic personnel and their dependants and Korean diplomatic personnel and their dependants stationed outside the country.

[93] Including 754 Kuwaiti nationals outside the country.
[94] Based on results of the May 1958 administrative count which was adjusted upwards by 30 per cent.
[95] Data are for Lebanese nationals on population register, including those living outside the country. Excluding registered Palestinian refugees, numbering 187 529 on 30 June 1973.

[96] Estimate based on results of sample survey.
[97] Comprising Macau City and islands of Taipa and Coloane.
[98] Including 1 994 residents who were absent at the time of the census.

[99] Excluding transients afloat and persons residing in institutions (numbering 94 200 for both sexes).
[100] Data are for territory excluding Jammu and Kashmir, the final status of which has not yet been determined; data also exclude Junagardh, Manavadar, Gilgit and Baltistan.
[101] Former mandated territory administered by the United Kingdom until Armistice of 1949.
[102] Excludes United Kingdom armed forces, numbering 2 507 persons for both sexes.
[103] Comprising that part of Palestine under Egyptian administration following the Armistice of 1949 until June 1967, when it was occupied by Israeli military forces.
[104] The results have been officially repudiated.
[105] Population excludes transients afloat and non-locally domiciled military and civilian personnel and their dependants, numbering 4 565 and 47 959 respectively at 1970 census.

[106] Population includes Palestinian refugees numbering 141 028 on 31 December 1963 and 163 809 on 30 June 1971.
[107] Comprising 7 sheikdoms of Abu Dhabi, Dubai, Sharjah, Ajman, Umm al Qaiwain, Ras al Khaimah and Fujairah, and the area lying within the modified Riyadh line as announced in October 1955.

(continued on next page)

NOTES (suite)

[76] Non compris les personnes vivant dans les "bases" et dans d'autres régions conservées par le Royaume-Uni après l'indépendance : 3 602 au recensement de 1960; non compris également les touristes : 447 au recensement de 1960.
[77] Iles de Hong-kong, Kowloon et les Nouveaux Territoires (à bail).
[78] Non compris 11 549 personnes de passage.
[79] Superficie terrestre seulement; la superficie totale, qui comprend la zone maritime se trouvant à l'intérieur des limites administratives, est de 2 916 km^2.
[80] Y compris la partie du Jammu et Cachemire occupée par l'Inde dont le statut définitif n'a pas encore été déterminé. Non compris le Sikkim qui fait l'objet d'une rubrique distincte, ci-dessous.
[81] Non compris l'Irian occidental, qui fait l'objet d'une rubrique distincte (voir ci-dessous).
[82] Partie occidentale de la Nouvelle-Guinée.
[83] Population sédentaire seulement; non compris les tribus nomades (462 146 personnes des deux sexes) et autres habitants non sédentaires (244 141 personnes des deux sexes).
[84] Au 14 octobre de l'année indiquée.
[85] Y compris les données pour l'est de Jérusalem et les résidents israéliens dans certains autres territoires occupés depuis juin 1967 par les forces armées israéliennes.
[86] Y compris Hokkaido, Honshu, Shikoku, Kyushu. Non compris le personnel diplomatique hors du pays ni les militaires et agents civils étrangers en poste sur le territoire et les membres de leur famille les accompagnant.
[87] Y compris les militaires et le personnel diplomatique hors du pays et les membres de leur famille les accompagnant, soit 933 personnes des deux sexes au recensement de 1961; non compris les militaires et le personnel diplomatique étrangers sur le territoire et les membres de leur famille les accompagnant, soit 389 personnes des deux sexes au même recensement. Y compris également les réfugiés de Palestine immatriculés : 654 092 au 30 juin 1963 et 722 687 au 31 mai 1976.
[88] Les données de recensement et les estimations au milieu de l'année tiennent compte d'un ajustement destiné à compenser les lacunes du dénombrement, estimées à 4 p. 100.
[89] Chiffre au 18 novembre de l'année considérée.
[90] Non compris le personnel diplomatique étranger et les membres de leur famille les accompagnant.
[91] Y compris la zone démilitarisée (superficie : 1 262 km^2).
[92] Non compris les militaires étrangers, les civils étrangers travaillant pour les forces armées, le personnel diplomatique étranger et les membres de leur famille les accompagnant et le personnel diplomatique coréen hors du pays et les membres de leur famille les accompagnant.
[93] Y compris les ressortissants du Koweït hors du pays, au nombre de 754.
[94] D'après les résultats du dénombrement administratif de mai 1958, qui ont fait l'objet d'un ajustement de 30 p. 100 pour compenser les lacunes.
[95] Les données se rapportent aux ressortissants libanais inscrits sur un registre de population, y compris ceux qui vivent hors du pays. Non compris les réfugiés de Palestine immatriculés, au nombre de 187 529 au 30 juin 1973.
[96] Estimation fondée sur les résultats d'une enquête par sondage.
[97] Ville de Macao et îles de Taipa et de Colowane.
[98] Y compris les résidents hors du pays pendant la période du recensement au nombre de 1 994.
[99] Non compris les personnes de passage à bord de navires ni les personnes dans les institutions (94 200 personnes des deux sexes).
[100] Nom compris le Jammu et Cachemire, dont le statut définitif n'a pas encore été déterminé; non compris également le Junagardh, le Manavadar, le Gilgit et le Baltistan.
[101] Ancien territoire sous mandat administré par le Royaume-Uni jusqu'à l'armistice de 1949.
[102] Non compris les forces armées du Royaume-Uni (2 507 personnes des deux sexes).
[103] Comprend la partie de la Palestine administrée par l'Egypte depuis l'armistice de 1949 jusqu'en juin 1967, date à laquelle elle a été occupée par les forces armées israéliennes.
[104] Les résultats n'ont pas été acceptés officiellement.
[105] Non compris les personnes de passage à bord de navires ni les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant, soit 4 565 et 47 959 personnes respectivement au recensement de 1970.
[106] Y compris les réfugiés de Palestine au nombre de 141 028 au 31 décembre 1963 et de 163 809 au 30 juin 1971.
[107] Y compris les sept cheikhats de Abou Dhabi, Dabai, Ghârdja, Adjmân, Oumm-al-Quiwaïn, Ras al Khaïma et Foudjaïra, ainsi que la zone délimitée par la ligne de Riad modifiée comme il a été annoncé en octobre 1955.

(voir page suivante)

3. Population by sex, rate of population increase, surface area and density (continued) — Population selon le sexe, taux d'accroissement de la population, superficie et densité (suite)

FOOT-NOTES (continued)

[108] Source: *Nhan Dan* (The People), 2 November 1960, Democratic Republic of Viet-Nam.
[109] Excluding data for islands of Perim (13 km²) and Kamaran (57 km²).
[110] Excluding surface area of frontier rivers.
[111] Excluding 3 300 visitors in Jersey.
[112] Including data for dependencies: Aldermey, Brechou, Herm, Jethou, Lihou and Sark Islands.
[113] Excluding 3 300 visitors.
[114] Excluding Faeroe Islands and Greenland, shown separately.

[115] Excluding Overseas Departments, namely French Guiana, Guadeloupe, Martinique and Réunion, shown separately.

[116] Population is *de jure*, but excludes diplomatic personnel outside the country and includes foreign diplomatic personnel not living in embassies or consulates.
[117] Excluding military personnel stationed outside the country who do not have a personal residence in France, numbering about 16 000.
[118] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[119] Population excludes armed forces.
[120] Including armed forces stationed outside the country but excluding alien armed forces stationed in the area.
[121] Excludes armed forces stationed outside the country but includes alien armed forces stationed in the area.
[122] Population estimated at 646 in 1970 and 704 in 1974.
[123] Surface area is 0.44 km².
[124] Including data for Gozo and Comino Islands. Population excludes non-Maltese armed forces stationed in the area and includes civilian nationals temporarily outside the country.
[125] Surface area is 1.49 km².
[126] Population excludes civilian aliens within the country but includes civilian nationals temporarily outside the country.
[127] Continental Portugal, which includes the Azores and Madeira islands.
[128] Continental Spain which includes the Balearic and Canary Islands; also includes Alhucemas, Ceuta, Chafarinas, Melilla and Peñón de Vélez de la Gomera.
[129] Inhabited only during winter season. Census data are for total population while estimates refer to Norwegian population only, included also in the *de jure* population of Norway.

[130] Shown elsewhere as "United Kingdom" and excluding Channel Islands and Isle of Man, shown separately.
[131] Population excludes armed forces stationed outside the country, numbering 48 106 in May 1959.
[132] Comprising the Solomon Islands group (except Bougainville and Buka which are included with New Guinea below), Ontong, Java, Rennel and Santa Cruz Islands.
[133] Part of Phoenix Islands group (see also Gilbert and Ellice Islands shown below). Jointly administered as a condominium by United Kingdom and United States.
[134] Both islands were uninhabited at time of census.
[135] For 1960.
[136] Excluding Niue, shown separately, which is part of Cook Islands, but because of remoteness is administered separately.

[137] Comprising Austral, Gambier, Marquesas, Rapa, Society and Tuamotu Islands.
[138] Including also data for Christmas, Fanning, Ocean and Washington Islands, and the Phoenix Islands group except Canton and Enderbury Islands which are shown separately above.
[139] Including the islands of Huon, Chesterfield, Loyalty, Walpole and Belep Archipelago.
[140] Jointly administered as a condominium by United Kingdom and France.
[141] Includes an estimate (1 406 for both sexes) for villages where census was not taken.
[142] Including Campbell and Kermadec Islands (population 20 in 1961, surface area 148 km²) as well as Antipodes, Auckland, Bounty, Snares, Solander and Three Kings Islands, all of which are uninhabited. Population excludes diplomatic personnel and armed forces stationed outside the country, the latter numbering 1 936 at 1966 census; population also excludes alien armed forces within the country.
[143] Comprising the Caroline, Mariana and Marshall Islands except Guam, shown separately.

(continued on next page)

NOTES (suite)

[108] Source : *Nhan Dan* (Le Peuple), 2 novembre 1960, République démocratique du Viet-Nam.
[109] Non compris les îles de Périm (13 km²), de Kamaran (57 km²).
[110] Non compris la surface des cours d'eau frontières.
[111] Non compris 3 300 visiteurs dans l'île de Jersey.
[112] Y compris les données pour les dépendances : Aurigny, Brecqhou, Herm, Jethou, Lihou et les îles Sercq.
[113] Non compris 3 300 visiteurs.
[114] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.
[115] Non compris les départements d'outre-mer, c'est-à-dire la Guyane française, la Guadeloupe, la Martinique et la Réunion, qui font l'objet de rubriques distinctes.
[116] Population de droit, mais non compris le personnel diplomatique hors du pays et y compris le personnel diplomatique étranger qui ne vit pas dans les ambassades ou les consulats.
[117] Non compris les militaires en garnison hors du pays et sans résidence personnelle en France, au nombre de 16 000 environ.
[118] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[119] Non compris les militaires.
[120] Y compris les militaires en garnison hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.
[121] Non compris les militaires en garnison hors du pays, mais y compris les militaires étrangers en garnison sur le territoire.
[122] Population estimée à 646 en 1970 et à 704 en 1974.
[123] Superficie : 0,44 km².
[124] Y compris les îles de Gozo et de Comino. Non compris les militaires non maltais en garnison sur le territoire et y compris les civils nationaux temporairement hors du pays.
[125] Superficie : 1,49 km².
[122] Non compris les civils étrangers dans le pays, mais y compris les civils nationaux temporairement hors du pays.
[127] Portugal continental, y compris les Açores et Madère.
[128] Espagne continentale, y compris les Baléares et les Canaries; y compris également Al Hoceima, Ceuta, les îles Zaffarines, Melilla et Peñon de Velez de la Gomera.
[129] N'est habitée que pendant la saison d'hiver. Les données de recensement se rapportent à la population totale, mais les estimations ne concernent que la population norvégienne, comprise également dans la population de droit de la Norvège.
[130] Désigné ailleurs sous le nom de "Royaume-Uni". Non compris les îles Anglo-Normandes et l'île de Man, qui font l'objet de rubriques distinctes.
[131] Non compris les militaires en garnison hors du pays, au nombre de 48 106 en mai 1959.
[132] Désigne le groupe des îles Salomon (à l'exception de Bougainville et de Buka dont la population est comprise dans celle de la Nouvelle-Guinée) [voir plus loin], ainsi que les îles Ontong, Java, Rennel et Santa Cruz.
[133] Iles du groupe des Phoenix (voir également plus loin sous îles Gilbert et Ellice). Condominium exercé en commun par le Royaume-Uni et les Etats-Unis.
[134] Les deux étaient inhabitées au moment du recensement.
[135] Pour 1960.
[136] Non compris Nioué, qui fait l'objet d'une rubrique distincte et qui fait partie des îles Cook, mais qui, en raison de son éloignement, est administrée séparément.
[137] C'est-à-dire les îles Australes, Gambier, Marquises, Rapa, de la Société et Tuamotou.
[138] Y compris les données pour les îles Christmas, Fanning, Ocean et Washington, et pour le groupe des îles Phoenix, sauf les îles Canton et Enderbury qui font l'objet d'une rubrique distincte (voir plus haut).
[139] Y compris les îles Huon, Chesterfield, Loyalty et Walpole, et l'archipel Belep.

[140] Condominium, exercé en commun par le Royaume-Uni et la France.
[141] Y compris une estimation (1 406 pour les deux sexes) pour les villages qui n'ont pas été recensés.
[142] Y compris les îles Campbell et Kermadec (20 habitants en 1961, superficie : 148 km²) ainsi que les îles Antipodes, Auckland, Bounty, Snares, Solander et Three Kings, qui sont toutes inhabitées. Non compris le personnel diplomatique et les militaires en garnison hors du pays, ces derniers au nombre de 1 936 au recensement de 1966. Non compris également les militaires étrangers en garnison sur le territoire.
[143] Comprend les Carolines, les Mariannes et les îles Marshall, sauf Guam, qui fait l'objet d'une rubrique distincte.

(voir page suivante)

3. Population by sex, rate of population increase, surface area and density (continued) — Population selon le sexe, taux d'accroissement de la population, superficie et densité (suite)

FOOT-NOTES (continued)

144 Includes armed forces stationed in the area.

145 Comprising eastern part of New Guinea, the Bismark Archipelago, Bougainville and Buka of Solomon Islands group and about 600 smaller islands.

146 Estimate based on results of a 10 per cent sample survey of rural villages and complete enumeration of all other areas.

147 For 1971.

NOTES (suite)

144 Y compris les militaires en garnison sur le territoire.

145 Y compris l'est de la Nouvelle-Guinée, l'archipel Bismark, Bougainville et Buka (ces deux dernières du groupe des Salomon) et environ 600 îlots.

146 Estimations fondées sur les résultats d'une enquête par sondage qui a porté sur 10 p. 100 des villages ruraux et sur un dénombrement complet de toutes les autres zones.

147 Pour 1971.

4. Vital statistics rates, natural increase rates and expectation of life at birth: latest available year

Taux de la statistique de l'état civil, taux d'accroissement naturel et espérance de vie à la naissance: dernière année disponible

[Countries or areas not listed may be assumed to lack vital statistics of national scope. Italics indicate data from civil registers which are incomplete or of unknown reliability. Crude marriage, divorce, birth, death and natural increase rates are computed per 1 000 population; infant mortality rates are per 1 000 live births and fertility rates per 1 000 female population aged 10–49 years. For method of evaluation and limitations of data, see Technical Notes page 29. For more precise information in terms of coverage, basis of tabulation, etc., see tables 9, 11, 13, 20, 24 and 33. Foot-notes and explanation of symbols are shown at end of table. — Les pays ou zones ne figurant pas au tableau n'ont vraisemblablement pas de statistiques de l'état civil de portée nationale. Les caractères italiques indiquent qu'il s'agit de données provenant des registres de l'état civil qui sont incomplètes ou dont le degré d'exactitude n'est pas connu. Les taux bruts de nuptialité, de divortialité, de natalité, de mortalité et d'accroissement naturel sont calculés pour 1 000 habitants; les taux de mortalité infantile sont calculés pour 1 000 naissances vivantes et les taux de fécondité pour 1 000 femmes de 10 à 49 ans. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques page 74. Pour plus de détails sur la portée, la base d'exploitation des données, etc., voir tableaux 9, 11, 13, 20, 24 et 33. Les notes et l'explication des signes figurent à la fin du tableau.]

FOOT-NOTES

Italics indicate data from civil registers which are incomplete or of unknown reliability.

◇ Rates based on frequencies of less than 15.

[1] For 1967.

[2] Data are for Algerian population only.

[3] For 1963.

[4] Estimate(s) prepared by the United Nations Population Division for 1965–1970.

[5] For 1966.

[6] For 1965.

[7] For 1972.

[8] For 1960.

[9] Estimate based on results of a 10 per cent sample of households in the urban Commune of Bujumbura (population 71 000) and a 2 per cent sample of population in rural areas.

(continued on next page)

NOTES

Italiques : Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

◇ Taux établis sur la base de fréquences inférieures à 15.

[1] Pour 1967.

[2] Population algérienne seulement.

[3] Pour 1963.

[4] Estimation(s) établie(s) pour 1965–1970 par la Division de la population des Nations Unies.

[5] Pour 1966.

[6] Pour 1965.

[7] Pour 1972.

[8] Pour 1960.

[9] Estimation fondée sur les résultats d'un échantillon de 10 p. 100 des ménages de la commune urbaine de Bujumbura (71 000 habitants) et d'un échantillon de 2 p. 100 de la population des zones rurales.

(voir page suivante)

4. Vital statistics rates, natural increase rates and expectation of life at birth (continued) — Taux de la statistique de l'état civil, taux d'accroissement naturel et espérance de vie à la naissance (suite)

FOOT-NOTES (continued)

[10] For 1959–60; estimated annual average for African population based on events reported for 12-month period preceding sample survey described in table 2. Excludes data for approximately 15 per cent of total population, not covered by survey.

[11] Per 1 000 female population aged 14–49 years.
[12] Per 1 000 female population aged 15–49 years.
[13] For 1963–64; estimated annual average for African population based on events reported for 12-month period preceding sample survey described in table 2. Excluding data for approximately 22 per cent of total population not covered by survey.

[14] For 1952.
[15] For 1960–1961; estimated annual average for African population based on events reported for 12-month period preceding 1960–1961 sample survey described in table 2. Excludes data for approximately 25 per cent of total population not covered by survey.

[16] For 1961; for African population based on events reported for 12-month period preceding 1961 sample survey described in table 2. Excludes data for slightly more than 1 per cent of total population, not covered by survey.

[17] Per 1 000 female population aged 10–44 years.
[18] Estimate based on the first round of the National Sample Survey.

[19] For 1960–61; estimated annual averages for African population based on analysis of data from sample survey conducted at time of 1960–1961 census.

[20] For 1963; estimate based on events reported for 12-month period preceding 1963 census.
[21] For 1960; estimates based on events reported for 12-month period preceding June/July 1960 post-censal sample survey.

[22] Estimate(s) based on results of sample survey described in table 2.

[23] For 1955.
[24] For 1970.
[25] For 1969.
[26] For 1957–1958; data are derived from surveys carried out in different areas of the country during 1955–1958.
[27] For 1957–1958; data based on results of a sample survey of mortality conducted between October 1957 and April 1958 in 69 villages.

[28] For 1956; estimate based on events reported for given period preceding 1956 sample survey.
[29] Estimates based on the population growth survey which commenced in May 1969.
[30] For 1968.
[31] For 1953.
[32] For 1960–61; estimated annual average based on events reported for 12-month period preceding sample survey described in table 2.

[33] For 1964–65; estimated annual average based on births and deaths reported for 12-month period preceding sample survey described in table 2. Excluding data for approximately 9 per cent of total population not covered by survey.
[34] For 1971.
[35] For 1962; estimate based on events reported for 12-month period preceding sample survey. Excludes data for foreigners and approximately 70 000 persons in institutions, not covered by survey.

[36] For 1973.
[37] For 1959–60; estimated annual average based on events reported for 12-month period preceding sample survey described in table 2.

[38] For 1974.
[39] For 1970; estimate, basis unknown.
[40] For 1964.
[41] For 1960–1961.
[42] For 1954; estimate for indigenous African population in villages for 12-month period preceding 1953–1954 sample survey.

[43] For 1956.

(continued on next page)

NOTES (suite)

[10] Pour 1959–60; les données sont des moyennes annuelles estimatives concernant la population africaine et sont fondées sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage dont il est question au tableau 2. Non compris 15 p. 100 environ de la population totale, sur qui l'enquête n'a pas porté.
[11] Pour 1 000 femmes de 14 à 49 ans.
[12] Pour 1 000 femmes de 15 à 49 ans.
[13] Pour 1963–64; moyenne annuelle estimative concernant la population africaine et fondée sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage dont il est question au tableau 2. Non compris 22 p. 100 environ de la population totale, sur qui l'enquête n'a pas porté.
[14] Pour 1952.
[15] Pour 1960–1961; moyenne annuelle estimative concernant la population africaine et fondée sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage de 1960–1961 dont il est question au tableau 2. Non compris 25 p. 100 environ de la population totale, sur qui l'enquête n'a pas porté.
[16] Pour 1961; les données concernent la population africaine et sont fondées sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage de 1961 dont il est question au tableau 2. Non compris un peu plus de 1 p. 100 de la population totale, sur qui l'enquête n'a pas porté.
[17] Pour 1 000 femmes de 10 à 44 ans.
[18] Estimation fondée sur les résultats de la première phase de l'Enquête nationale par sondage.
[19] Pour 1960–61; les données sont des moyennes annuelles estimatives concernant la population africaine fondées sur une analyse des données provenant d'une enquête par sondage effectuée lors du recensement de 1960–1961.
[20] Pour 1963; estimation fondée sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé le recensement de 1963.
[21] Pour 1960; estimations fondées sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage post-censitaire de juin/juillet 1960.
[22] Estimations fondées sur les résultats d'une enquête par sondage dont il est question au tableau 2.
[23] Pour 1955.
[24] Pour 1970.
[25] Pour 1969.
[26] Pour 1957–1958; les données proviennent d'enquêtes effectuées dans plusieurs régions du pays de 1955–1958.
[27] Pour 1957–1958; les données sont fondées sur les résultats d'une enquête par sondage sur la mortalité, effectuée entre octobre 1957 et avril 1958 dans 69 villages.
[28] Pour 1956; estimation fondée sur les faits d'état civil déclarés pour une période déterminée précédant l'enquête par sondage 1956.
[29] Estimation fondée sur les résultats d'une enquête sur la croissance de la population qui a commencé en mai 1969.
[30] Pour 1968.
[31] Pour 1953.
[32] Pour 1960–61; moyenne annuelle estimative fondée sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage dont il est question au tableau 2.
[33] Pour 1964–65; moyenne annuelle estimative fondée sur les naissances et les décès déclarés pour la période de 12 mois qui a précédé l'enquête par sondage dont il est question au tableau 2. Non compris 9 p. 100 environ de la population totale sur qui l'enquête n'a pas porté.
[34] Pour 1971.
[35] Pour 1962: estimation fondée sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage. Non compris les étrangers ni 70 000 personnes environ vivant dans des institutions, sur qui l'enquête n'a pas porté.
[36] Pour 1973.
[37] Pour 1959–60; moyenne annuelle estimative fondée sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage dont il est question au tableau 2.
[38] Pour 1974.
[39] Pour 1970, estimation base inconnue.
[40] Pour 1964.
[41] Pour 1960–1961.
[42] Pour 1954; estimation pour la population indigène africaine des villages pour la période de 12 mois qui a précédé l'enquête par sondage de 1953–1954.
[43] Pour 1956.

(voir page suivante)

4. Vital statistics rates, natural increase rates and expectation of life at birth (continued) — Taux de la statistique de l'état civil, taux d'accroissement naturel et espérance de vie à la naissance (suite)

FOOT-NOTES (continued)

[44] For 1961; estimate for African population, based on births and deaths reported for 12-month period preceding 1961 sample survey.

[45] Estimate, basis unknown.
[46] Per 1 000 female population aged 16–45 years.
[47] For 1959; estimate for African population based on births and deaths reported for 12-month period preceding 1959 post-censal sample survey.

[48] Data are esimates prepared by the United Nations Economic Commission for Africa.
[49] Data are estimates based on births during lifetime of mother and deaths during given period preceding 1957 post-censal sample survey.

[50] For 1960–61. Data are estimates based on births and deaths reported for 12-month period preceding sample survey described in table 2.

[51] For 1955–1958; estimated annual averages for African population based on events reported for 12-month period preceding 1955–1958 sample survey described in table 2.

[52] Per 1 000 female population aged 15–54 years.
[53] For 1950; estimate for indigenous population based on reports for 12-month period preceding 1950 sample survey.

[54] Per 1 000 female population aged 14–44 years.
[55] For 1959.
[56] There is no provision for "divorce" in the sense used here.

[57] For 1962.
[58] For 1952; estimate, basis unknown.
[59] For 1958–1959. Estimate for rural India, based on results of the National Sample Survey.
[60] For 1951–1961.
[61] For 1962. Based on analysis of results of 1961 population census and sample surveys of December 1961 and December 1962.

[62] For 1959; estimated rate based on events reported for 12-month period preceding April 1959 sample survey in 345 villages.

[63] For 1965; estimated data based on information obtained from civil registration and surveys and adjusted upwards for under-registration.

[64] For 1961.
[65] Estimates based on data collected by Pakistan's Population Growth Survey (PGS).
[66] Including Bangladesh. Estimates based on data collected by Pakistan's Population Growth Estimation Project (PGE).

[67] Data are estimates based on births and deaths reported during 12-month period preceding 1954 sample survey covering 6.2 per cent of population of 1 700 villages.

[68] Estimates from the Turkish Demographic Survey.
[69] For 1960; estimate, basis unknown.
[70] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[71] Excluding Ceuta and Melilla.
[72] Estimate based on analysis of 1967 census.

NOTES (suite)

[44] Pour 1961; estimation concernant la population africaine et fondée sur les naissances et les décès déclarés pour la période de 12 mois qui a précédé l'enquête par sondage de 1961.
[45] Estimation, base inconnue.
[46] Pour 1 000 femmes de 16 à 45 ans.
[47] Pour 1959; estimation concernant la population africaine, fondée sur les naissances et les décès déclarés pour la période de 12 mois qui a précédé l'enquête par sondage postcensitaire de 1959.
[48] Les données sont des estimations établies par la Commission économique des Nations Unies pour l'Afrique.
[49] Les données sont des estimations fondées sur les naissances pendant la durée de vie de la mère et sur les décès pendant une période déterminée qui a précédé l'enquête par sondage postcensitaire de 1957.
[50] Pour 1960–61. Les données sont des estimations fondées sur les naissances et les décès déclarés pour la période de 12 mois qui a précédé l'enquête par sondage dont il est question au tableau 2.
[51] Pour 1955–58; les données sont des moyennes annuelles estimatives concernant la population africaine et fondées sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage de 1955–1958 dont il est question au tableau 2.
[52] Pour 1 000 femmes de 15 à 54 ans.
[53] Pour 1950; estimation pour la population indigène basée sur les déclarations pour la période de 12 mois qui a précédé l'enquête par sondage de 1950.
[54] Pour 1 000 femmes de 14 à 44 ans.
[55] Pour 1959.
[56] Il n'existe pas de dispositions législatives touchant le "divorce" au sens où on l'entend ici.
[57] Pour 1962.
[58] Pour 1952, estimation base inconnue.
[59] Pour 1958–1959. L'estimation concernant l'Inde rurale est fondée sur les résultats de l'Enquête nationale par sondage.
[60] Pour 1951–1961.
[61] Pour 1962. D'après l'analyse des résultats du recensement de population de 1961 et des enquêtes par sondage de décembre 1961 et de décembre 1962.
[62] Pour 1959; taux estimatif fondé sur les faits d'état civil déclarés pour la période de 12 mois qui a précédé l'enquête par sondage d'avril 1959 effectuée dans 345 villages.
[63] Pour 1965; les données estimatives sont fondées sur des renseignements provenant des registres de l'état civil et d'enquêtes, et qui ont été ajustés pour compenser les lacunes du dénombrement.
[64] Pour 1961.
[65] Les estimations sont fondées sur des données recueillies à l'occasion du *Pakistan's Population Growth Survey* (PGS).
[66] Y compris le Bangladesh. Les estimations sont fondées sur des données recueillies à l'occasion du *Pakistan's Population Growth Estimation Project* (PGE).
[67] Les données sont des estimations fondées sur les naissances et les décès déclarés pendant la période de 12 mois qui a précédé l'enquête par sondage de 1954 et qui a porté sur 6,2 p. 100 de la population de 1 700 villages.
[68] Estimations fondées sur les résultats de l'enquête démographique turque.
[69] Pour 1960, estimation base inconnue.
[70] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[71] Non compris Ceuta et Melilla.
[72] Estimation fondées sur une analyse des données du recensement de 1967.

5. Estimates of mid-year population: 1965-1974

Estimations de la population au milieu de l'année: 1965-1974

[Unless otherwise indicated, data are official estimates of population for 1 July, or averages of end-year estimates. Figures shown in italics are estimates of questionable reliability. For methods of construction and evaluation of estimates, see Technical Notes, page 30. Foot-notes and explanation of symbols are shown at end of table. — Sauf indication contraire, les données sont des estimations de population officielles au 1er juillet ou des moyennes d'estimations de fin d'année. Les chiffres en italique sont des estimations de qualité discutable. Pour les méthodes d'établissement et d'évaluation des estimations voir Notes techniques, p. 75. Les notes et l'explication des signes figurent à la fin du tableau.]

POPULATION

5. Estimates of mid-year population (continued) —
Estimations de la population au milieu de l'année (suite)

FOOT-NOTES

Italics indicate estimates of questionable reliability.

‖ Marked break in series.

* Provisional.

x United Nations estimate.

[1] *De jure* population, including nationals living abroad numbering 268 868 at 1966 census.

[2] For urban population, see table 6.

[3] Data not comparable with those for previous years.

[4] *De jure* population.

[5] Estimates for 1965-1971, based on results of a sample survey held in 1959–1960, described in table 3, are: 1.43, 1.47, 1.50, 1.54, 1.58, 1.61 and 1.64 respectively. Estimates for 1965, 1967, 1968, 1970 and 1974, based on results of the 1968 *recensement instantané*, described in table 3, are: 2.09, 2.20, 2.26, 2.37 and 2.61 respectively.

[6] Data relate to September of year stated.

[7] Data for 1965–1969 exclude seasonal farming immigrants, numbering 9 954 for 1965 and 16 097 for 1966.

[8] Excludes absentee workers amounting to about 12 per cent of the total population at 1966 census.

[9] Data are for 14–24 April of year stated.

[10] Based on results of a sample survey in 77 selected cantons (out of total of approximately 650) having an average population of 6 000–8 000 inhabitants.

[11] Comprising the islands of Mauritius, Rodrigues, Agalega and St. Brandon.

[12] Including population of Walvis Bay (c.f. [15]).

[13] Estimates are not in line with the census taken of 5–8 November 1963 which yielded a population of 55 670 055. There is a possibility that the census overstated the population. The size of this possible overstatement may be judged from these estimates which are provided by the United Nations Population Division.

[14] Estimates include adjustment for underenumeration at latest census; for further details, see table 2.

[15] Excluding population of Walvis Bay (numbering 12 648 in 1960) which is an integral part of South Africa but is administered as if it were part of Namibia.

[16] *De jure* population, but excluding persons residing in institutions.

[17] Data are for 30 August of year stated.

[18] Estimates exclude adjustment for underenumeration at latest census; for further details, see table 2.

[19] Excluding population of Canal Zone, shown separately hereunder.

[20] *De jure* population but including armed forces stationed in the area.

[21] Estimates not revised in accord with latest census.

[22] *De jure* population but excluding civilian citizens absent from country for extended period of time estimated at 764 701 at time of 1960 census.

[23] Excluding Indian jungle inhabitants, numbering 45 429 at 1950 census and estimated at 150 000 in 1956.

[24] Data are for the 15 of July of year stated.

[25] Excluding nomadic Indian tribes.

[26] Excluding Indian jungle population estimated at 100 830 in 1961.

[27] Excluding Indian jungle population estimated at 31 800 in 1961.

[28] Data are based on natural increase only, without taking account of migration.

[29] Including data for the Indian-held part of Jammu and Kashmir, the final status of which has not yet been determined.

[30] Excluding West Irian, shown separately hereunder.

[31] Estimates are for 14 October of year stated.

[32] Excluding diplomatic personnel outside the country and allied military and civilian personnel and their dependants stationed in the area.

[33] Including registered Palestinian refugees, numbering at mid-year 1965–1966, 688 327 and 706 568, respectively and 722 687 at 31 May 1967.

[34] Excluding foreign diplomatic personnel and their dependants.

[35] Excluding alien armed forces, civilian aliens employed by armed forces and foreign diplomatic personnel and their dependants. Also excluding Korean diplomatic personnel and their dependants outside the country.

(continued on next page)

NOTES

Italique : Estimations de qualité discutable.

‖ Discontinuité notable dans la série.

* Données provisoires.

x Estimation des Nations Unies.

[1] Population de droit, y compris les nationaux vivant à l'étranger, au nombre de 268 868 lors du recensement de 1966.

[2] Pour la population urbaine, voir le tableau 6.

[3] Les données ne sont pas comparables à celles des années précédentes.

[4] Population de droit.

[5] Les estimations pour 1965–1971, fondées sur les résultats d'une enquête par sondage effectuée en 1959–1960, dont il est question au tableau 3, sont : 1.43, 1.47, 1.50, 1.54, 1.58, 1.61 et 1.64 respectivement. Les estimations pour 1965, 1967, 1968, 1970 et 1974, fondées sur les résultats des recensements instantanés, dont il est question au tableau 3, sont: 2.09, 2.20, 2.26, 2.37 et 2.61 respectivement.

[6] Les données se rapportent au mois de septembre de l'année considérée.

[7] Les données pour 1965–1969 ne comprennent pas les travailleurs agricoles qui sont des immigrants saisonniers au nombre de 9 954 pour 1965 et de 16 097 pour 1966.

[8] Non compris les travailleurs absents, soit 12 p. 100 de la population totale lors du recensement de 1966.

[9] Chiffres au 14–24 avril de l'année considérée.

[10] Estimation fondée sur les résultats d'une enquête par sondage dans 77 cantons (sur un total d'environ 650) ayant en moyenne 6 000 à 8 000 habitants.

[11] Y compris les îles Maurice, Rodrigues, Agalega et Saint-Brandon.

[12] Y compris Walvis Bay (voir note [15]).

[13] Les estimations ne cadrent pas avec les résultats du recensement effectué du 5 au 8 novembre 1963. Celui-ci avait donné un chiffre de population de 55 670 055 habitants, peut-être par suite d'un surdénombrement dont on peut supputer l'ordre de grandeur d'après les présentes estimations, qui ont été fournies par la Division de la population des Nations Unies.

[14] Les estimations tiennent compte d'un ajustement destiné à compenser les lacunes du dénombrement lors du dernier recensement; pour plus de détails, voir le tableau 2.

[15] Non compris Walvis Bay (12 648 habitants en 1960), qui fait partie intégrante de l'Afrique du Sud mais qui est administrée comme si elle relevait de la Namibie.

[16] Population de droit, mais non compris les personnes dans les institutions.

[17] Chiffres au 30 août de l'année considérée.

[18] Les estimations ne tiennent pas compte d'un ajustement destiné à compenser les lacunes du dénombrement lors du dernier recensement; pour plus de détails, voir le tableau 2.

[19] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte.

[20] Population de droit, mais y compris les militaires en garnison sur le territoire.

[21] Les estimations n'ont pas été révisées en fonction du dernier recensement.

[22] Population de droit, mais non compris les civils hors du pays pendant une période prolongée, au nombre de 764 701 (estimation) lors du recensement de 1960.

[23] Non compris les Indiens de la jungle, au nombre de 45 429 au recensement de 1950, et de 150 000 (estimation) en 1956.

[24] Chiffres au 15 juillet de l'année considérée.

[25] Non compris les tribus d'Indiens nomades.

[26] Non compris les Indiens de la jungle, au nombre de 100 830 (estimation) en 1961.

[27] Non compris les Indiens de la jungle, au nombre de 31 800 (estimation) en 1961.

[28] Les données sont fondées sur l'accroissement naturel seulement et ne tiennent pas compte de la migration.

[29] Y compris la partie du Jammu et Cachemire occupée par l'Inde, dont le statut définitif n'a pas encore été déterminé.

[30] Non compris l'Irian occidental, qui fait l'objet d'une rubrique distincte.

[31] Chiffres au 14 octobre de l'année considérée.

[32] Non compris le personnel diplomatique hors du pays, les militaires et agents civils alliés sur le territoire et les membres de leur famille les accompagnant.

[33] Y compris les réfugiés de Palestine immatriculés, dont le nombre au milieu de chaque année pour la période 1965–1966 s'établit comme suit : 688 327 et 706 568, respectivement, et à 722 687 au 31 mai 1967.

[34] Non compris le personnel diplomatique étranger et les membres de leur famille les accompagnant.

[35] Non compris les militaires étrangers, les civils étrangers, travaillant dans les forces armées, le personnel diplomatique étranger et les membres de leur famille les accompagnant. Non compris également le personnel diplomatique coréen hors du pays et les membres de leur famille les accompagnant.

(voir page suivante)

5. Estimates of mid-year population (continued) — Estimations de la population au milieu de l'année (suite)

FOOT-NOTES (continued)

[36] Based on results of the May 1958 administrative count which was adjusted upwards by 30 per cent.

[37] For Lebanese nationals on population register including those living outside the country. Excluding non-resident foreigners and registered Palestinian refugees, the latter numbering at mid-year 1965–1966 and 1968–1970, 159 783, 163 904, 166 264, 171 517 and 175 958, respectively, 160 723 at 31 May 1967 and 181 764 at 31 December 1971 and at mid-year 1972–1973 184 043 and 187 529 respectively.

[38] Excluding data for the Pakistan-held part of Jammu and Kashmir, the final status of which has not yet been determined, Junagardh, Manavadar, Gilgit and Baltistan.

[39] Former mandated territory administered by the United Kingdom, until Armistice of 1949.

[40] Comprising that part of Palestine under Egyptian administration from the Armistice of 1949 until June 1967, when it was occupied by Israeli military forces.

[41] Excluding transients afloat and non-locally domiciled military and civilian service personnel and their dependants, numbering 4 565 and 47 959, respectively, at 1970 census.

[42] Including Palestinian refugees numbering at end-year 1965–1968, 152 184, 157 145, 163 041 and 149 537, respectively, and 163 809 at 30 June 1971.

[43] For census held 15 March to 16 April 1968.

[44] Excluding Faeroe Islands and Greenland, shown separately.

[45] *De jure* population but excluding personnel outside the country and including members of alien armed forces not living in military camps and foreign diplomatic personnel not living in embassies or consulates.

[46] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

[47] Excluding armed forces.

[48] Excluding armed forces stationed outside the country, but including alien armed forces stationed in the area.

[49] Excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside the country.

[50] Excluding civilian aliens within the country and including civilian nationals temporarily outside the country.

[51] Excluding Channel Islands and Isle of Man, shown separately.

[52] Excluding armed forces stationed outside the country, numbering 48 106 in May 1959.

[53] Excluding diplomatic personnel and armed forces outside the country (the latter numbering 1 936 at 1966 census) and alien armed forces within the country.

NOTES (suite)

[36] D'après les résultats du dénombrement administratif de mai 1958, qui ont fait l'objet d'un ajustement de 30 p. 100 pour compenser les lacunes.

[37] Ressortissants libanais inscrits sur le registre de la population, y compris ceux qui vivent hors du territoire. Non compris les étrangers non résidents ni les réfugiés de Palestine immatriculés; le nombre de ces derniers au milieu de chaque année, pour la période 1965–1966 et pour 1968–1970 s'établit comme suit : 159 783, 163 904, 166 264, 171 517 et 175 958 respectivement, 160 723 au 31 mai 1967 et 181 764 au 31 décembre 1971 et au milieu de 1972 et 1973, s'établit comme suit : 184 043 et 187 529 respectivement.

[38] Non compris les données concernant la partie du Jammu et Cachemire occupée par le Pakistan dont le statut définitif n'a pas encore été déterminé, ni le Junagardh, le Manavadar, le Gilgit et le Baltistan.

[39] Ancien territoire sous mandat administré par le Royaume-Uni jusqu'à l'armistice de 1949.

[40] Comprend la partie de la Palestine administrée par l'Egypte depuis l'armistice de 1949 jusqu'en juin 1967, date à laquelle elle a été occupée par les forces armées israéliennes.

[41] Non compris les personnes de passage à bord de navires, ni les militaires et agents domiciliés hors du territoire et les membres de leur famille les accompagnant, soit 4 565 et 47 959 personnes, respectivement, lors du recensement de 1970.

[42] Y compris les réfugiés de Palestine dont le nombre, à la fin de chaque année pour la période 1965–1968 s'établit comme suit : 152 184, 157 145, 163 041 et 149 537, respectivement, et 163 809 au 30 juin 1971.

[43] Recensement effectué du 15 mars au 16 avril 1968.

[44] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

[45] Population de droit, mais non compris le personnel diplomatique hors du pays et y compris les militaires étrangers ne résidant pas dans des camps et le personnel diplomatique étranger ne résidant pas dans les ambassades ou les consulats.

[46] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

[47] Non compris les militaires.

[48] Non compris les militaires en garnison hors du pays, mais y compris les militaires étrangers en garnison sur le territoire.

[49] Non compris les militaires non maltais en garnison sur le territoire et y compris les civils nationaux temporairement hors du pays.

[50] Non compris les civils étrangers dans le pays, mais y compris les civils nationaux temporairement hors du pays.

[51] Non compris les îles Anglo-Normandes et l'île de Man, qui font l'objet de rubriques distinctes.

[52] Non compris les militaires en garnison hors du pays, au nombre de 48 106 en mai 1959.

[53] Non compris le personnel diplomatique et les militaires hors du pays (ces derniers au nombre de 1 936, lors du recensement de 1966) ni les militaires étrangers sur le territoire.

6. Urban and total population by sex: 1966-1974

Population urbaine et population totale selon le sexe: 1966-1974

[(E) after date indicates estimated data (including results of Sample Surveys). Percentages are the population defined as "urban" per 100 total population for males, females and both sexes. For definitions of "urban", see end of table. Figures shown in italics are estimates of questionable reliability. For method of evaluation and limitations of data, see Technical Notes, page 30. Foot-notes and explanation of symbols are shown at end of table. — La lettre (E) indique qu'il s'agit de données estimatives (y compris les résultats d'enquêtes par sondage). Les pourcentages représentent le nombre de personnes définies comme vivant dans des "régions urbaines" pour une population totale de 100 personnes du sexe masculin, du sexe féminin et des deux sexes. Pour la définition du terme "urbain", voir à la fin du tableau. Les chiffres en italique sont des estimations de qualité douteuse. Pour la méthode d'évaluation et les insuffisances des données voir Notes techniques, p. 75. Les notes et l'explication des signes figurent à la fin du tableau.]

FOOT-NOTES

Italics indicate estimates of questionable reliability. (E) after date indicates estimated data.

* Provisional.

[1] *De jure* population.

[2] In the Departments of Oasis and Saoura, enumeration took place between 22 December 1965 and 20 January 1966.

[3] *De jure* population, but excluding 24 012 residents absent for less than one year and nomadic population estimated at 10 550 at 1971 census.

[4] Data are based on an administrative census and exclude refugees from Sudan numbering 28 000.

[5] Unrevised estimates.

[6] Data are based on the results of the Population Growth Survey.

[7] Data are based on results of a sample survey in 77 selected cantons (out of total of approximately 650) having an average population of 6 000–8 000 inhabitants.

[8] Data are based on results of a sample survey.

[9] Excluding data for Walvis Bay, which is an integral part of South Africa but is administered as if it were part of Namibia (population 12 648 in 1960).

[10] Census of non-African population held on 20 March 1969.

[11] Excluding 126 persons in transit.

[12] Excluding adjustment for underenumeration estimated at 4.0 per cent.

[13] Reported to be 100 per cent urban.

[14] Including adjustment for underenumeration.

[15] Excluding adjustment for underenumeration at latest census.

(continued on next page)

NOTES

Italique : estimations dont l'exactitude est discutable. (E) après la date indique qu'il s'agit de données estimatives.

* Données provisoires.

[1] Population de droit.

[2] Dans les départements des Oasis et de la Saoura, le dénombrement a eu lieu entre le 22 décembre 1965 et le 20 janvier 1966.

[3] Population de droit, mais non compris 24 012 résidents hors du pays pour une période inférieure à un an et les nomades estimés à 10 550 au recensement de 1971.

[4] Les données sont fondées sur un recensement administratif; non compris les réfugiés du Soudan au nombre de 28 000.

[5] Estimations non révisées.

[6] Les données sont basées sur les résultats de "*Population Growth Survey*".

[7] Les données sont fondées sur les résultats d'une enquête par sondage dans 77 cantons tirés d'un total approximatif de 650 cantons ayant chacun 6 000 à 8 000 habitants en moyenne.

[8] Les données sont fondées sur les résultats d'une enquête par sondage.

[9] Non compris Walvis Bay qui fait partie intégrante de l'Afrique du Sud mais qui est administrée comme si elle relevait de la Namibie (12 648 personnes en 1960).

[10] Le recensement de la population non-africaine a eu lieu le 20 mars 1969.

[11] Non compris 126 personnes de passage.

[12] Les données n'ont pas été ajustées pour compenser les lacunes du dénombrement, estimées à 4 p. 100.

[13] Considérée comme urbaine à 100 p. 100.

[14] Les données ont été ajustées pour compenser les lacunes du dénombrement.

[15] Les données n'ont pas été ajustées pour compenser les lacunes du dénombrement du dernier recensement.

(voir page suivante)

6. Urban and total population by sex (continued) —
Population urbaine et population totale selon le sexe (suite)

FOOT-NOTES (continued)

[16] Excluding data for Canal Zone, shown separately hereunder.
[17] *De jure* population but including armed forces stationed in the area.

[18] Excluding Anguilla.
[19] The census figure has not been adjusted for underenumeration.

[20] *De jure* population but excluding civilian citizens absent from the country for extended period of time.
[21] Excludes armed forces overseas.
[22] Excludes a late revision made to correct errors found in total after detailed tabulations were completed. Final census total is 203 235 298.

[23] Excluding Indian jungle population.
[24] Data based on a 5 per cent sample of census returns.

[25] Excluding nomadic Indian tribes.
[26] Excluding Indian jungle population estimated at 100 830 in 1961.

[27] Excluding Indian jungle population estimated at 31 800 at 1961 census.

[28] Excluding adjustment for underenumeration at 1961 census estimated at 5.8 per cent.
[29] Excluding tourists and persons living in bases and other areas retained by United Kingdom after independence.
[30] Excluding data for Sikkim shown separately on page 142; including data for the Indian-held part of Jammu and Kashmir, the final status of which has not yet been determined.
[31] Excluding West Irian, shown separately hereunder.
[32] For settled population only; unsettled population and nomadic tribes are excluded.
[33] Including data relating to certain territories under occupation by Israeli military forces since June 1967.
[34] Including data for East Jerusalem.
[35] Excluding diplomatic personnel outside the country and foreign military and civilian personnel and their dependants stationed in the area.

[36] Including registered Palestinian refugees.
[37] Excluding alien armed forces, civilian aliens employed by armed forces and foreign diplomatic personnel and their dependants.

[38] Excluding foreigners and Korean diplomatic personnel and their dependants stationed outside the country.
[39] Based on results of the May 1958 administrative count which was adjusted upward by 30 per cent.

[40] Including 1 994 residents who were absent at the time of the census.

[41] Excluding transients afloat and persons in institutions.

[42] Excluding data for Jammu and Kashmir, the final status of which has not yet been determined, Junagardh, Manavador, Gilgit and Baltistan.

[43] Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.
[44] Excluding population in institutions.
[45] Including Palestinian refugees, numbering 173 936 on 30 June 1973.
[46] Excluding data for islands of Perim and Kamaran.
[47] Series not strictly comparable due to differences of definitions of "urban".

[48] Excluding data for Faeroe Islands and Greenland.
[49] *De jure* population but excluding diplomatic personnel outside the country and including foreign diplomatic personnel not living in embassies or consulates.
[50] Data are based on a 25 per cent sample of census returns.

[51] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which *separate data have not been supplied. This is without prejudice to any* question of status which may be involved.
[52] Including armed forces stationed outside the country but excluding alien armed forces stationed in the area.
[53] Excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside the country.
[54] Excluding persons on the Central Register of population (containing persons belonging to Netherlands population but having no fixed municipality of residence).

(continued on next page)

NOTES (suite)

[16] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte.
[17] Population de droit mais y compris les militaires en garnison sur le territoire.
[18] Non compris Anguilla.
[19] Le chiffre de recensement n'a pas été ajusté pour compenser les lacunes du dénombrement.
[20] Population de droit mais non compris les ressortissants civils des Etats-Unis absents du pays pour une période prolongée.
[21] Non compris les militaires à l'étranger.
[22] Non compris une révision ultérieure faite pour corriger des erreurs découvertes dans le total après avoir terminé les tableaux mécanographiques. Le total définitif de ce recensement est de 203 235 298.
[23] Non compris les Indiens de la jungle.
[24] Les données sont fondées sur un échantillon de 5 p. 100 des bulletins de recensement.
[25] Non compris les tribus d'Indiens nomades.
[26] Non compris les Indiens de la jungle, soit 100 830 personnes en 1961 (estimation).
[27] Non compris les Indiens de la jungle estimés à 31 800 au recensement de 1961.
[28] Les données n'ont pas été ajustées pour compenser les lacunes du dénombrement du recensement de 1961, estimées à 5,8 p. 100.
[29] Non compris les touristes ni les personnes vivant dans des bases ou dans d'autres zones conservées par le Royaume-Uni après l'indépendance.
[30] Non compris le Sikkim, qui fait l'objet d'une rubrique distincte, page 142; y compris les données concernant la partie du Jammu et Cachemire occupée par l'Inde, dont le statut définitif n'a pas encore été déterminé.
[31] Non compris l'Irian occidental, qui fait l'objet d'une rubrique distincte.
[32] Population sédentaire seulement; non compris la population non sédentaire ni les tribus nomades.
[33] Y compris les données relatives à certains territoires occupés par les forces armées israéliennes depuis juin 1967.
[34] Y compris les données pour l'est de Jérusalem.
[35] Non compris le personnel diplomatique hors du pays ni les militaires et agents civils étrangers en poste sur le territoire et les membres de leur famille les accompagnant.
[36] Y compris les réfugiés de Palestine immatriculés.
[37] Non compris les militaires étrangers, les civils étrangers employés par les forces armées, ni le personnel diplomatique étranger et les membres de leur famille les accompagnant.
[38] Non compris les étrangers ni le personnel diplomatique coréen hors du pays et les membres de leur famille les accompagnant.
[39] Données fondées sur les résultats du dénombrement administratif de mai 1958 qui a fait l'objet d'un ajustement de 30 p. 100 destiné à compenser les lacunes.
[40] Y compris les résidents hors du pays pendant la période du recensement au nombre de 1994.
[41] Non compris les personnes de passage à bord de navires ni les personnes dans les institutions.
[42] Non compris les données concernant le Jammu et Cachemire, dont le statut définitif n'a pas encore été déterminé, le Junagardh, le Manavadar, le Gilgit et le Baltistan.
[43] Les données sont basées sur les résultats de "Population Growth Survey" de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.
[44] Non compris la population se trouvant dans les institutions.
[45] Y compris les réfugiés de Palestine, soit 173 936 personnes au 30 juin 1973.
[46] Non compris les îles de Périm et de Kamaran.
[47] Les séries ne sont pas strictement comparables en raison des différences existant dans la définition du mot "urbain".
[48] Non compris les îles Féroé et le Groenland.
[49] Population de droit, mais non compris le personnel diplomatique hors du pays et y compris le personnel diplomatique étranger qui ne vit pas dans les ambassades ou les consulats.
[50] Les données sont fondées sur un échantillon de 25 p. 100 des bulletins de recensement.
[51] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[52] Y compris les militaires en garnison hors du pays mais non compris les militaires étrangers en garnison sur le territoire.
[53] Non compris les militaires non maltais en garnison sur le territoire mais y compris les civils nationaux temporairement hors du pays.
[54] Non compris les personnes inscrites sur le Registre central de la population (personnes appartenant à la population néerlandaise mais sans résidence fixe dans l'une des municipalités).

(voir page suivante)

6. Urban and total population by sex (continued) —

Population urbaine et population totale selon le sexe (suite)

FOOT-NOTES (continued)

[55] Includes semi-urban population.
[56] Differs from corresponding estimate shown elsewhere because it is a mean of end-year estimates rather than an estimate as of 1 July.
[57] Excluding civilian aliens within the country and including civilian nationals temporarily outside the country.
[58] Data are based on a 10 per cent sample.
[59] Excluding armed forces outside the country.
[60] Excludes migratory population numbering 19 687 persons (17 115 males, 2 572 females); also excluding persons describing themselves as being more than 50 per cent Aboriginal or simply as "Aboriginal" estimated at 49 036.
[61] Data are based on an administrative census.
[62] Excluding estimate of 1 406 persons for villages where census was not taken.
[63] Excluding diplomatic personnel and armed forces outside the country, the latter numbering 1 936 at 1966 census; also excluding alien armed forces within the country.
[64] Based on results of a 10 per cent sample survey of rural villages and a complete enumeration of all other areas.

NOTES (suite)

[55] Y compris la population semi-urbaine.
[56] Diffère de l'estimation correspondante donnée ailleurs car il s'agit d'une moyenne des estimations de fin d'année et non d'une estimation au 1er juillet.
[57] Non compris les civils étrangers dans le pays et y compris les civils nationaux temporairement hors du pays.
[58] Les données sont fondées sur un échantillon de 10 p. 100.
[59] Non compris les militaires hors du pays.
[60] Non compris la population non sédentaire au nombre de 19 687 personnes (17 115 du sexe masculin et 2 572 du sexe féminin); non compris également les personnes qui se disent aborigènes à plus de 50 p. 100 ou tout simplement aborigènes, soit 49 036 (estimation).
[61] Les données sont fondées sur un recensement administratif.
[62] Non compris une estimation de 1 406 personnes pour les villages qui n'ont pas été recensés.
[63] Non compris le personnel diplomatique ni les militaires en poste hors du pays, ces derniers au nombre de 1 936 au recensement de 1966; non compris également les militaires étrangers dans le pays.
[64] Les données sont fondées sur les résultats d'une enquête par sondage ayant porté sur 10 p. 100 des villages ruraux et sur un dénombrement complet de toutes les autres zones.

6. Urban and total population by sex (continued) — Population urbaine et population totale selon le sexe (suite)

DEFINITION OF "URBAN"

AFRICA

Algeria: Fifty-five of the most important communes having local self-government.
Botswana: The cities of Gaberone and Lobatsi and the urban agglomeration of Francistown.
Burundi: Commune of Bujumbura.
Central African Republic: 20 principal centres with a population of over 3 000 inhabitants.
Chad: 10 urban centres.
Dahomey: Towns of Cotonou, Porto-Novo, Ouidah, Parakou and Djougou.
Egypt: Governorates of Cairo, Alexandria, Port Said, Ismailia, Suez, frontier governorates and capitals of other governorates as well as district capitals (Markaz).
Ethiopia: Not available.
Gabon: Towns having a population of over 2 000 inhabitants.
Gambia: Banjul only.
Ghana: Localities of 5 000 or more inhabitants.
Guinea: Urban centres.
Kenya: Towns of 2 000 or more inhabitants.
Liberia: Localities having more than 2 000 inhabitants.
Libyan Arab Republic: Total population of Tripoli and Benghazi plus the urban parts of Beida and Derna.
Madagascar: Centres having more than 5 000 inhabitants.
Malawi: All townships and town planning areas and all district centres.

Mauritania: Urban centres.
Mauritius: 1962: Proclaimed townships, according to enlarged limits as of August 1963, plus the town of Makebourg.
Morocco: 117 urban centres.
Nigeria: Not available.
Rwanda: Not available.
St. Helena ex. dep.: Not available.
Seychelles: Port Victoria, the capital.
South Africa: All areas of 500 or more inhabitants and adjoining suburban areas, excluding predominantly rural agricultural settlements, temporary villages for construction work in rural areas and alluvial diamond diggings; well-established towns with specified urban characteristics with fewer than 500 inhabitants but having at least approximately 100 white inhabitants; "rural" portions of certain districts in which large metropolitan areas fall and where the percentage of the "rural" population is small compared with the urban and a considerable proportion of the workers follow urban-type occupations.

Southern Rhodesia: Main towns including suburbs.
Spanish Sahara: Not available.
Sudan: Sixty-eight towns.
Swaziland: Localities proclaimed as urban.
Togo: 1961: Localities having been given the status of communes.
Tunisia: 1966: Population living in communes.
Uganda: 1969: Not available.
United Republic of Cameroon: Urban centres.
United Republic of Tanzania: 16 gazetted townships.
Tanganyika: 1967: 15 gazetted townships.
Zanzibar: 1967: Administratively gazetted township of Zanzibar.

Zaire: Agglomerations of 2 000 or more inhabitants where the predominant economic activity is of the non-agricultural type and also mixed agglomerations which are considered urban because of their type of economic activity but are actually rural in size.
Zambia: Beginning 1961: Main towns and as many small townships as could be separately identified.

AMERICA, NORTH

Antigua: St. John City.
Bahamas: Island of New Providence.
Barbados: *Bridgetown.*
Belize: Not available.
Canada: Cities, towns and villages of 1 000 or more inhabitants, whether incorporated or unincorporated, including urbanized fringes of cities classed as metropolitan areas and other major urban areas. Beginning 1961, also including urbanized fringes of certain smaller cities if the population of the city and its urban fringe was 10 000 or more.

Cayman Islands: Georgetown.

(continued on next page)

DEFINITIONS DES "REGIONS URBAINES"

AFRIQUE

Algérie : Les 55 communes les plus importantes dotées d'une administration locale autonome.
Botswana : Villes de Gaberone et de Lobatsi et agglomération urbaine de Francistown.
Burundi : Commune de Bujumbura.
République centrafricaine : 20 centres principaux ayant une population de plus de 3 000 habitants.
Tchad : 10 centres urbains.
Dahomey : Villes de Cotonou, Porto-Novo, Ouidah, Parakou et Djougou.
Egypte : Chefs-lieux de gouvernements du Caire, d'Alexandrie, de Port Saïd, d'Ismaïlia, de Suez; chefs-lieux de gouvernements frontaliers, autres chefs-lieux de gouvernements et chefs-lieux de districts (Markaz).
Ethiopie : Définition non communiquée.
Gabon : Villes ayant une population de plus de 2 000 habitants.
Gambie : Banjul seulement.
Ghana : Localités de 5 000 habitants et plus.
Guinée : Centres urbains.
Kenya : Villes de 2 000 habitants et plus.
Libéria : Localités ayant plus de 2 000 habitants.
République arabe libyenne : Population totale de Tripoli et de Benghazi et sections urbaines de Beida et de Derna.
Madagascar : Centres ayant plus de 5 000 habitants.
Malawi : Toutes les villes et zones urbanisées et tous les chefs-lieux de districts.
Mauritanie : Centres urbains.
Maurice : 1962 : Localités érigées en communes, conformément aux limites élargies fixées en août 1963 et ville de Makebourg.
Maroc : 117 centres urbains.
Nigéria : Définition non communiquée.
Rwanda : Définition non communiquée.
Sainte-Hélène sans dép. : Définition non communiquée.
Seychelles : La capitale, Victoria.
Afrique du Sud : Toutes les zones de 500 habitants et plus et les zones suburbaines adjacentes, mais non compris les peuplements de caractère essentiellement rural et agricole, les villages créés à titre temporaire pour des travaux de construction dans les régions rurales ou pour la prospection de diamants alluvionnaires; les villes bien établies de moins de 500 habitants, mais comprenant au moins une centaine d'habitants blancs, ayant des caractéristiques spécifiquement urbaines; et les sections "rurales" de certains districts où se trouvent d'importantes zones métropolitaines, où le pourcentage de la population "rurale" est faible par rapport à la population urbaine et où une proportion considérable des travailleurs ont une occupation de caractère urbain.
Rhodésie du Sud : Villes principales, y compris la banlieue.
Sahara espagnol : Définition non communiquée.
Soudan : 68 villes.
Souaziland : Localités déclarées urbaines.
Togo : 1961 : Localités érigées en communes.
Tunisie : 1966 : Population vivant dans les communes.
Ouganda : 1969 : Définition non communiquée.
République-Unie du Cameroun : Centres urbains.
République-Unie de Tanzanie : 16 villes érigées en communes.
Tanganyika : 1967 : 15 villes érigées en communes.
Zanzibar : 1967 : Ville administrativement érigée en commune de Zanzibar.
Zaïre : Agglomérations de 2 000 habitants et plus dont l'activité économique prédominante n'est pas de type agricole, et agglomérations mixtes qui sont considérées comme urbaines en raison de leur type d'activité économique mais qui par leur dimension sont en fait rurales.
Zambie : A partir de 1961 : Villes principales et toutes les petites communes constituant des agglomérations distinctes.

AMERIQUE DU NORD

Antigua : Ville de Saint John.
Bahamas : Ile de New Providence.
Barbade : Bridgetown.
Belize : Définition non communiquée.
Canada : Grandes villes, villes et villages de 1 000 habitants ou plus, érigés ou non en municipalités, y compris la couronne urbaine des grandes villes classées comme zones métropolitaines et autres grandes zones urbaines. A partir de 1961, y compris également la couronne urbaine de certaines villes de moindre importance lorsque la population de la ville et de sa couronne urbaine atteint 10 000 habitants ou plus.
Iles Caïmanes : Georgetown.

(voir page suivante)

POPULATION

6. Urban and total population by sex (continued) — Population urbaine et population totale selon le sexe (suite)

AMERICA, NORTH (continued)

Costa Rica: 1963: "Metropolitan area" of Sam José city (excluding rural sector of district of Las Pavas), Cartago city, and administrative centres of all cantons except San Pablo (province of Heredia), Nandayure (province of Guanacaste) and Buenos Aires (province of Puntarenas).
Cuba: Population living in a nucleus of 2 000 or more inhabitants.

Dominican Republic: Administrative centres of *municipios* and municipal districts, some of which include suburban zones of rural character.

El Salvador: Administrative centres of *municipios*.
Greenland: Localities of 200 or more inhabitants.
Guatamala: 1964: *Municipio* of Guatemala Department and officially recognized centres of other departments and municipalities.
Haiti: Not available.
Honduras: Localities of 1 000 or more inhabitants having essentially urban characteristics.
Jamaica: Kingston Metropolitan area and selected main towns.

Mexico: Localities of 2 500 or more inhabitants.
Montserrat: Not available.
Nicaragua: Administrative centres of departments and *municipios*.
Panama: Localities of 1 500 or more inhabitants having essentially urban characteristics.
Canal Zone: Localities of 2 500 or more inhabitants.
Puerto Rico: Places of 2 500 or more inhabitants and densely settled urban fringes of urbanized areas.
St. Kitts-Nevis-Anguilla: Town of Basse-Terre.
Trinidad and Tobago: Port of Spain, Arima borough and San Fernando town.
United States: Places of 2 500 inhabitants or more incorporated as cities, boroughs (except Alaska), villages and towns (except towns in New England, New York and Wisconsin) but excluding persons living in rural portions of extended cities; the densely settled urban fringe whether incorporated or unincorporated of urbanized areas, unincorporated places of 2 500 inhabitants or more.

U.S. Virgin Islands: Localities of 2 500 or more inhabitants.

AMERICA, SOUTH

Brazil: Urban and suburban zones of administrative centres of *municipios* and districts.
Chile: Populated centres which have definite urban characteristics contributed by certain public and municipal services.
Colombia: Population living in a nucleus of 1 500 or more inhabitants.

Ecuador: Capitals of provinces and cantons.
French Guiana: Communes of Cayenne and Saint-Laurent du Maroni.
Guyana: 1970: Not available.
Paraguay: Cities, towns and administrative centres of departments and districts.
Peru: Capitals of districts and those populated centres with such urban characteristics as streets, plazas, water supply systems, sewerage systems, electric lights, etc.
Venezuela: Centres with a population of 1 000 or more inhabitants.

ASIA

Afghanistan: Not available.
Bahrain: Beginning 1959: Towns of Manama, Muharraq (including Muharraq suburbs), Hedd, Jiddhafs, Sitra, Rifa'a and Awali.
Bangladesh: Not available.
Brunei: Not available.
Cyprus: 6 district towns and Nicosia suburbs.
India: 1961: Towns (places with municipal corporation, municipal area committee, town committee, notified area committee or cantonment board); also, all places having 5 000 or more inhabitants, a density of not less than 1 000 persons per square mile, pronounced urban characteristics and at least three fourths of the adult male population employed in pursuits other than agriculture.

Indonesia: Municipalities, regency capitals and other places with urban characteristics.
West Irian: Not available.
Iran: All Shahrestan centres, regardless of size, and all places of 5 000 or more inhabitants.

(continued on next page)

AMERIQUE DU NORD (suite)

Costa Rica : 1963 : "Zone métropolitaine" de la ville de San José (non compris le secteur rural du district de Las Pavas), ville de Cartago et chefs-lieux de tous les cantons sauf San Pablo (province de Heredia), Nandayure (province de Guanacaste) et Buenos Aires (province de Puntarenas).
Cuba : Population vivant dans des agglomérations de 2 000 habitants ou plus.
République Dominicaine : Chefs-lieux de *municipios* et districts municipaux, dont certains comprennent des zones suburbaines ayant des caractéristiques rurales.
El Salvador : Chefs-lieux de *municipios*.
Groenland : Localités de 200 habitants et plus.
Guatemala : 1964 : *Municipio* du département de Guatemala et centres officiellement reconnus d'autres départements et municipalités.
Haïti : Définition non communiquée.
Honduras : Localités de 1 000 habitants au plus ayant des caractéristiques essentiellement urbaines.
Jamaïque : Zone métropolitaine de Kingston et quelques villes principales choisies.
Mexique : Localités de 2 500 habitants et plus.
Montserrat : Définition non communiquée.
Nicaragua : Chefs-lieux des départements et des *municipios*.
Panama : Localités de 1 500 habitants et plus ayant des caractéristiques essentiellement urbaines.
Zone du Canal : Localités de 2 500 habitants et plus.
Porto Rico : Localités de 2 500 habitants et plus et couronne urbaine à forte densité de population des zones urbanisées.
Saint-Christophe-et-Nièves et Anguilla : Ville de Basse-Terre.
Trinité-et-Tobago : Port of Spain, bourg d'Arima et ville de San Fernando.

Etats-Unis : Grandes villes, bourgs (sauf Alaska), villages et villes de 2 500 habitants et plus érigés en municipalités (sauf les villes de Nouvelle-Angleterre, de l'Etat de New York et du Wisconsin), mais non compris les personnes vivant dans les parties rurales des villes prolongées; la couronne urbaine à forte densité de population, érigée ou non en municipalité, des zones urbanisées; les localités non érigées en municipalités et ayant 2 500 habitants et plus.
Iles Vierges américaines : Localités de 2 500 habitants et plus.

AMERIQUE DU SUD

Brésil : Zones urbaines et suburbaines des chefs-lieux des *municipios* et des *distritos*.
Chili : Centres de peuplement ayant des caractéristiques nettement urbaines dues à la présence de certains services publics et municipaux.
Colombie : Population vivant dans des agglomérations de 1 550 habitants ou plus.
Equateur : Capitales de province et chefs-lieux de canton.
Guyane française : Communes de Cayenne et de Saint-Laurent-du-Maroni.
Guyane : 1970 : Définition non communiquée.
Paraguay : Grandes villes, villes et chefs-lieux des départements et des districts.
Pérou : Capitales des districts et agglomérations présentant des caractéristiques urbaines (par exemple rues, places, système d'approvisionnement en eau et système d'égouts, éclairage électrique, etc.).
Venezuela : Centres de 1 000 habitants et plus.

ASIE

Afghanistan : Définition non communiquée.
Bahreïn : A partir de 1959 : Villes de Manama, Muharraq (y compris la banlieue de Muharraq), Hedd, Jiddhafs, Sitra, Rifa'a et Awali.
Bangladesh : Définition non communiquée.
Brunei : Définition non communiquée.
Chypre : Six villes de district et faubourgs de Nicosie.
Inde : 1961 : Villes (localités dotées d'une charte municipale, d'un comité de zone municipal, d'un comité municipal, d'un comité de zone déclarée urbaine ou d'un comité de zone de cantonnement); également toutes les localités qui ont une population de 5 000 habitants au moins, une densité de population d'au moins 1 000 habitants au mile carré, où les trois quarts au moins des adultes du sexe masculin ont une occupation non agricole et qui ont des caractéristiques urbaines prononcées.
Indonésie : Municipalités, capitales de régence et autres localités présentant des caractéristiques urbaines.
Irian occidental : Définition non communiquée.
Iran : Tous les chefs-lieux de Shahrestan, quelle qu'en soit la dimension, et toutes les agglomérations de 5 000 habitants et plus.

(voir page suivante)

6. Urban and total population by sex (continued) — Population urbaine et population totale selon le sexe (suite)

ASIA (continued)

Iraq: The area within the boundaries of Municipality Councils (Al-Majlis Al-Baldei).
Israel: Beginning 1957: All settlements of more than 2 000 inhabitants, except those where at least one third of the heads of households, participating in the civilian labour force, earn their living from agriculture.
Japan: City (*shi*) having 30 000 or more inhabitants with 60 per cent or more of the houses located in the main built-up areas and 60 per cent or more of the population (including their dependants) engaged in manufacturing, trade or other urban type of business. Alternatively, a *shi* having urban facilities and conditions as defined by the prefectural order is considered as urban.

Jordan: District headquarters; localities of 10 000 or more inhabitants (excluding Palestinian refugee camps in rural areas) and those localities of 5 000–9 000 inhabitants and the suburbs of Amman and Jerusalem cities in which two thirds or more of the economically active males are not engaged in agriculture.
Korea, Republic of: Seoul City and municipalities of 5 000 or more inhabitants (*shi*).
Laos: Not available.
Lebanon: Not available.
Macau: *Concelho* of Macau (Macau City) including *area maritima*.
Malaysia:
Sabah: Gazetted areas with population of 10 000 or more.
Sarawak: Gazetted areas with population of 10 000 or more.
West Malaysia: Gazetted areas with population of 10 000 or more.

Maldives: Malé, the capital.
Mongolia: Capital and districts centres.
Nepal: Not available.
Pakistan: Municipalities, civil lines, cantonments not included with municipal limits, any other continuous collection of houses inhabited by not less than 5 000 persons and having urban characteristics and also a few areas having urban characteristics but fewer than 5 000 inhabitants.
Philippines: Cities and municipalities having a population density of 1 000 or more persons per square kilometre. Central districts of municipalities and cities having a population density of 500 or more persons per square kilometre. Central districts regardless of population density having the following: net-work of streets; six or more commercial or recreational establishments and some amenities of a city e.g. town hall, church, public plaza, market place, school, hospital, etc. *Barrios* conforming to the conditions listed above and having 1 000 or more inhabitants whose occupation is neither farming nor fishing.

Sikkim:
(i) Localities having Municipal Corporations, Municipal or Town Committee, Notified Area Committee, etc.
(ii) All other localities having a density of 400 or more persons per square kilometre, a population of 5 000 and three-fourths of the employed male population working outside agriculture.

(iii) Any other locality which possesses urban characteristics and amenities as defined by the Director of Census Operations.
Sri Lanka: Municipalities, urban councils and towns.
Syrian Arab Republic: Cities, *Mohafaza* centres and *Mantika* centres.

Thailand: Municipalities.
Turkey: Population of the localities within the municipality limits of administrative centres of provinces and districts.
Viet-Nam, Republic of: Not available.
Yemen, Democratic: The entire former colony of Aden excluding the Oil Refinery and villages of Bureika and Fugum.

EUROPE

Albania: Towns and other industrial centres of more than 400 inhabitants.
Austria: Communes (*Gemeinden*) of more than 5 000 inhabitants.
Belgium: Cities, urban agglomerations and urban communes.
Bulgaria: Towns, i.e., localities legally established as urban.
Channels Islands:
Guernsey: Civil parish of St. Peter Port.

(continued on next page)

ASIE (suite)

Irak : La zone relevant des conseils municipaux (Al-Majlis Al-Baldei).

Israël : A partir de 1957 : Tous les peuplements de plus de 2 000 habitants à l'exception de ceux où le tiers au moins des chefs de ménage faisant partie de la population civile active vivent de l'agriculture.
Japon : Villes (*shi*) comptant 30 000 habitants ou plus, où 60 p. 100 au moins des habitations sont situées dans les principales zones bâties, et dont 60 p. 100 au moins de la population (dépendants compris) vit d'emplois s'exerçant dans les industries manufacturières, le commerce et autres branches d'activités essentiellement urbaines. D'autre part, tout *shi* possédant les équipements et présentant les caractères définis comme urbains par l'administration préfectorale est considéré comme zone urbaine.
Jordanie : Chefs-lieux de district; localités de 10 000 habitants et plus (non compris les camps de réfugiés palestiniens dans les régions rurales) ainsi que les localités de 5 000 à 9 000 habitants et les banlieues d'Amman et de Jérusalem où les deux tiers au moins de la population active du sexe masculin ne pratiquent pas l'agriculture.
Corée, République de : Ville de Séoul et municipalités de 5 000 habitants et plus (*shi*).
Laos : Définition non communiquée.
Liban : Définition non communiquée.
Macao : *Concelho* de Macao (ville de Macao) y compris la zone maritime.
Malaisie :
Sabah : Zones déclarées telles et comptant au moins 10 000 habitants.
Sarawak : Zones déclarées telles et comptant au moins 10 000 habitants.
Malaisie occidentale : Zones déclarées telles et comptant au moins 10 000 habitants.
Maldives : La capitale, Malé.
Mongolie : Capitale et chefs-lieux de district.
Népal : Définition non communiquée.
Pakistan : Municipalités, zones civiles, zones de cantonnement non comprises dans les limites municipales, autres ensembles urbains groupant au moins 5 000 habitants ainsi que quelques zones de caractère urbain, mais de moins de 5 000 habitants.
Philippines : Villes et municipalités dont la densité de population atteint ou dépasse 1 000 habitants au kilomètre carré. Districts centraux de municipalités et de villes dont la densité de population est d'au moins 500 habitants au kilomètre carré densité. Districts centraux qui, quelle que soit leur population, possèdent : un réseau de rues, au moins six établissements de commerce ou établissements récréatifs, et certains des équipements caractéristiques d'une ville, tels qu'hôtel de ville, église, place publique, marché, école, hôpital, etc. *Barrios* répondant aux conditions énumérées ci-dessus et comptant au moins 1 000 habitants qui ne vivent ni de l'agriculture ni de la pêche.
Sikkim :
(i) Localités dotées d'une municipalité, d'un conseil municipal ou urbain, d'un comité de zonage, etc.
(ii) Toutes autres localités de 5 000 habitants ou plus dont la densité de population est d'au moins 400 habitants au kilomètre carré et où les trois quarts de la population active masculine exerce des emplois non agricoles.
(iii) Toute autre localité qui possède les équipements urbains et les caractères spécifiés par le directeur des opérations de recensement.
Sri Lanka : Municipalités, conseils urbains et villes.
République arabe syrienne : Villes, centres de districts (*Mohafaza*) et centres de sous-districts (*Manatik*).
Thaïlande : Municipalités.
Turquie : Population des localités contenues à l'intérieur des limites municipales des chefs-lieux des provinces et des districts.
Viet-Nam, République de : Définition non communiquée.
Yémen démocratique : Toute l'ancienne colonie d'Aden, mais non compris la raffinerie de pétrole et les villages de Bureika et Fugum.

EUROPE

Albanie : Villes et autres centres industriels de plus de 400 habitants.
Autriche : Communes (*Gemeinden*) de plus de 5 000 habitants.
Belgique : Villes et agglomérations urbaines et communes urbaines.
Bulgarie : Villes, c'est-à-dire localités reconnues comme urbaines.
Iles Anglo-Normandes :
Guernesey : Paroisse civile du port de Saint-Pierre.

(voir page suivante)

POPULATION

6. Urban and total population by sex (continued) — Population urbaine et population totale selon le sexe (suite)

EUROPE (continued)

Czechoslovakia: Large towns, usually of 5 000 or more inhabitants, having a density of more than 100 persons per hectare of built-up area, three or more living quarters in at least 15 per cent of the houses, piped water and a sewerage system for the major part of the town, at least five physicians and a pharmacy, a nine-year secondary school, a hotel with at least twenty beds, a network of trade and distributive services which serve more than one town, job opportunities for the population of the surrounding area, the terminal for a system of bus lines and not more than 10 per cent of the total population active in agriculture; small towns, usually of 2 500 or more inhabitants, having a density of more than seventy-five persons per hectare of built-up area, three or more living quarters in at least 10 per cent of the houses, piped water and a sewerage system for at least part of the town, at least two physicians and a pharmacy, other urban characteristics to a lesser degree and not more than 15 per cent of the total population active in agriculture; agglomerated communities which have the characteristics of small towns in regard to size, population density, housing, water supply and sewerage, and the percentage of the population active in agriculture, but which lack such town characteristics as educational facilities, cultural institutions, health services and trade and distributive services, because these facilities and services are supplied by a town in the vicinity.
1970: Not available.

Denmark: Provincial capitals plus capital city. At the 1965 census 64.8 per cent of the population was living in localities of over 2 000 inhabitants. 1970: Agglomerations of 200 or more inhabitants.
Faeroe Islands: Towns of more than 200 inhabitants.
Finland: Urban communes.
1970: Localities.
France: Communes containing an agglomeration of more than 2 000 inhabitants living in contiguous houses or with not more than 200 metres between houses, also communes of which the major portion of the population is part of a multi-communal agglomeration of this nature.

German Democratic Republic: Communities with 2 000 and more inhabitants.

Germany, Federal Republic of: Not available.
Greece: Urban: Population of municipalities and communes in which the largest population centre has 10 000 or more inhabitants. Including also the population of the 12 urban agglomerations, as these were defined at the census of 1961, namely: Greater Athens, Salonika, Patras, Volos, Iraklian, Canea, Kalamata, Katerini, Agrinion, Chios, Aegion and Hermoupolis in their whole, irrespective of the population size of the largest locality in them. Semi-urban: Population of those municipalities or communes in which the largest population centre has 2 000-9 999 inhabitants (except those belonging to the above urban agglomerations). 1971: not available.

Hungary: Budapest and all legally designated towns.

Iceland: The capital with suburbs.
Ireland: Cities and towns including suburbs of 1 500 or more inhabitants.

Isle of Man: Towns of Castletown, Douglas, Peel and Ramsey.
Luxembourg: Communes having more than 2 000 inhabitants in the administrative centre.
Malta: 1966: Old walled cities and their outgrowths bordering the Grand Harbour.
1967: Towns of 1 500 or more inhabitants.
Netherlands: Urban: Municivalities with a population of 2 000 and more inhabitants. Semi-urban: Municipalities with a population of less than 2 000 but with not more than 20 per cent of their economically active male population engaged in agriculture, and specific residential municipalities of commuters.
Norway: Town municipalities.
Poland: Towns and settlements of urban type, e.g. workers' settlements, fishermen's settlements, health resorts.
Portugal: Not available.
Romania: Cities, towns and 183 other localities (comprising 13 per cent of total urban population) having urban socio-economic characteristics.

San Marino: Not available.
(continued on next page)

EUROPE (suite)

Tchécoslovaquie : Villes importantes comptant généralement 5 000 habitants et plus, ayant une densité de 100 personnes au moins par hectare de surface bâtie, dont au moins 15 p. 100 des habitations comportent trois pièces d'habitation ou davantage, et dont la plus grande partie est dotée d'un système d'adduction d'eau et d'égouts; ces villes doivent compter au moins cinq médecins et une pharmacie, une école secondaire dont l'enseignement est étalé sur neuf ans, un hôtel comprenant 20 lits au moins, un réseau d'établissements de commerce et de services de distribution desservant plusieurs villes et offrir des possibilités d'emploi à la population des environs; en outre, elles doivent posséder le terminus d'un réseau de lignes d'autobus et le pourcentage de la population totale pratiquant l'agriculture ne doit pas dépasser 10 p. 100; petites villes ayant généralement 2 500 habitants et plus, une densité de plus de 75 personnes par hectare de surface bâtie et dont au moins 10 p. 100 des habitations comportent trois pièces d'habitation au moins; ayant un système d'adduction d'eau et d'égouts tout au moins dans une partie de la ville, comptant deux médecins et une pharmacie au minimum et présentant les autres caractéristiques urbaines à un degré moindre; le pourcentage de la population totale pratiquant l'agriculture ne doit pas dépasser 15 p. 100; communautés groupées ayant les caractéristiques de petites villes en ce qui concerne l'importance et la densité de la population; l'habitation, l'approvisionnement en eau et le système d'égouts, et le pourcentage de la population pratiquant l'agriculture, mais ne présentant pas les autres éléments caractéristiques des petites villes (établissements d'enseignement, institutions culturelles, services de santé, commerçants, services de distribution, etc.), la localité dépendant d'une ville du voisinage dans tous ces domaines.
1970 : Définition non communiquée.
Danemark : Capitales des provinces et capitale du pays. Au recensement de 1965, 64,8 p. 100 de la population vivait dans des localités de plus de 2 000 habitants. 1970 : Agglomérations de 200 habitants et plus.
Iles Féroé : Villes de plus de 200 habitants.
Finlande : Communes urbaines.
1970 : Localités.
France : Communes comprenant une agglomération de plus de 2 000 habitants vivant dans des habitations contiguës ou qui ne sont pas distantes les unes des autres de plus de 200 mètres et communes où la majeure partie de la population vit dans une agglomération multicommunale de cette nature.
République démocratique allemande : Agglomération de 2 000 habitants et plus.
Allemagne, République fédérale d' : Définition non communiquée.
Grèce : Régions urbaines : municipalités et communes de 10 000 habitants et plus pour l'agglomération principale. Y compris également 12 agglomérations urbaines, selon la définition qui en a été donnée lors du recensement de 1961, à savoir : le Grand Athènes, Salonique, Patras, Volos, Iraklion, la Canée, Calamata, Katerini, Agrinion, Chio, Aegion et Hermoupolis dans leur ensemble, c'est-à-dire indépendamment du nombre d'habitants pour l'agglomération principale. Régions semi-urbaines : municipalités et communes de 2 000 à 9 999 habitants pour l'agglomération principale (non compris les agglomérations urbaines mentionnées ci-dessus). 1971 : Définition non communiquée.
Hongrie : Budapest et toutes les autres localités reconnues officiellement comme urbaines.
Islande : La capitale et sa banlieue.
Irlande : Villes de toutes dimensions, y compris leur banlieue, comptant 1 500 habitants ou plus.
Ile de Man : Villes de Castletown, Douglas, Peel et Ramsey.
Luxembourg : Communes dont le chef-lieu a plus de 2 000 habitants.

Malte : 1966 : vieilles villes à remparts et leurs prolongements bordant le Grand Port.
1967 : villes de 1 500 habitants ou plus.
Pays-Bas : Régions urbaines : municipalités de 2 000 habitants et plus. Régions semi-urbaines : municipalités de moins de 2 000 habitants mais où 20 p. 100 au maximum de la population active du sexe masculin pratiquent l'agriculture et certaines municipalités de caractère résidentiel dont les habitants travaillent ailleurs.
Norvège : Municipalités urbaines.
Pologne : Villes et peuplements de type urbain, par exemple groupements de travailleurs ou de pêcheurs et stations climatiques.
Portugal : Définition non communiquée.
Roumanie : Villes importantes et moyennes et 183 autres localités (comprenant 13 p. 100 de la population urbaine totale) ayant des caractéristiques sociologiques urbaines.
Saint-Marin : Définition non communiquée.
(voir page suivante)

6. Urban and total population by sex (continued) — Population urbaine et population totale selon le sexe (suite)

EUROPE (continued)

Sweden: Built-up areas with at least 200 inhabitants and usually not more than 200 metres between houses.

Switzerland: Communes of 10 000 or more inhabitants, including suburbs.
United Kingdom:
England and Wales: Area classified as urban for local government purposes, i.e. county boroughs, municipal boroughs and urban districts.

Northern Ireland: Administrative county boroughs, municipal boroughs and urban districts.
Scotland: Cities and all burghs.
Yugoslavia: Localities of 15 000 or more inhabitants; localities of 5 000–14 999 inhabitants of which at least 30 per cent are not engaged in agriculture; localities of 3 000–4 999 inhabitants of which at least 70 per cent are not engaged in agriculture; and localities of 2 000–2 999 inhabitants of which at least 80 per cent are not engaged in agriculture. 1971: not available.

OCEANIA

Australia: For the larger urban centres: Population clusters of 1 000 or more persons having a minimum density of 500 persons per square mile and some areas of lower population and/or density classified on other grounds (e.g. holiday areas). For other urban centres: Built-up areas as determined from aerial photographs.
British Solomon Islands: Centres with population of 2 000 or more; this, until 1970, includes only the township of Honiaria.

Fiji: Not available.
French Polynesia: Not available.
Gilbert and Ellice Islands: Not available.
Guam: Localities of 2 500 inhabitants or more.
New Caledonia: City of Noumea.
New Hebrides: Not available.
New Zealand: 1971: All cities, plus boroughs, town districts, townships and country towns with a population of 1 000 or more.
Estimates: Central cities or boroughs, including neighbouring boroughs and town districts and parts of counties which are regarded as suburban to the centre of population.
Niue Island: Not available.
Pacific Islands: District centre areas plus Ebeye in Kwajalein atoll of the Marshall Islands and Rota in the Marianna Islands.
Papua New Guinea: Centres with population of 500 or more but excluding separately located schools, hospitals, missions, plantations, rural settlements and rural villages regardless of population size.
Western Samoa: Urban area of Apia, comprising the Faipule districts of Vaimauga West and Foleata East.

UNION OF SOVIET SOCIALIST REPUBLICS

USSR: Cities are urban-type localities, officially designated as such by each of the constituent Republics, usually according to the criteria of number of inhabitants and predominance of agricultural, or number of non-agricultural workers and their families.
Byelorussian SSR: See USSR above.
Ukrainian SSR: See USSR above.

EUROPE (suite)

Suède : Zones bâties, groupant au moins 200 habitants et où les habitations ne sont généralement pas distantes les unes des autres de plus de 200 mètres.
Suisse : Communes de 10 000 habitants et plus, et leurs banlieues.
Royaume-Uni :
Angleterre et Galles : Zones considérées comme urbaines du point de vue de l'administration locale, c'est-à-dire *county boroughs, municipal boroughs* et districts urbains.
Irlande du Nord : *County boroughs, municipal boroughs* et districts urbains administratifs.
Ecosse : villes de toutes dimensions et *burghs*.
Yougoslavie : Localités de 15 000 habitants et plus; localités de 5 000 à 14 499 habitants dont 30 p. 100 au moins ne pratiquent pas l'agriculture; localités de 3 000 à 4 999 habitants dont 70 p. 100 au moins ne pratiquent pas l'agriculture et localités de 2 000 à 2 999 habitants dont 80 p. 100 au moins ne pratiquent pas l'agriculture. 1971 : Définition non communiquée.

OCEANIE

Australie : Pour les grands centres urbains : agglomérations de 1 000 personnes et plus ayant une densité de 500 personnes au moins au mile carré et certaines zones où la population et la densité sont moindres mais qui sont classées dans ce groupe pour d'autres raisons (centres de villégiature, zones industrielles). Pour les autres centres urbains : zones construites, déterminées d'après des photographies aériennes.
Iles Salomon britanniques : centres de 2 000 habitants et plus; cela, jusqu'en 1970, ne concerne que la ville de Honiara.
Fidji : Définition non communiquée.
Polynésie française : Définition non communiquée.
Iles Gilbert et Ellice : Définition non communiquée.
Guam : Localités de 2 500 habitants et plus.
Nouvelle-Calédonie : Ville de Nouméa.
Nouvelles-Hébrides : Définition non communiquée.
Nouvelle-Zélande : 1971 : Grandes villes, *boroughs*, chefs-lieux, municipalités et chefs-lieux des comtés de 1 000 habitants et plus.
Estimations : "Noyaux urbains" (villes ou *boroughs*) y compris les *boroughs*, districts urbains et parties de comtés adjacents qui sont considérés comme suburbains par rapport au centre de population.
Ile Nioué : Définition non communiquée.
Iles du Pacifique : Zones des chefs-lieux de district, ainsi qu'Ebeye dans l'atoll de Kwajalein (îles Marshall) et Rota (îles Mariannes).
Papua-Nouvelle-Guinée : Centres de 500 habitants et plus, mais non compris les écoles, hôpitaux, missions, et plantations sis à part, les peuplements ruraux et villages ruraux, quelle que soit l'importance de la population.
Samoa-Occidental : Zone urbaine d'Apia, y compris les districts de Faipule (Vaimauga West et Foleata East).

UNION DES REPUBLIQUES SOCIALISTES SOVIETIQUES

URSS : Grandes villes et localités de type urbain, officiellement désignées comme telles par chacune des républiques fédérées, généralement sur la base du nombre d'habitants et de la prédominance des travailleurs agricoles ou non agricoles avec leur famille.
RSS de Biélorussie : Voir URSS.
RSS d'Ukraine : Voir URSS.

7. Population by sex, age and urban/rural residence: latest available year, 1965-1974

[(C) after date indicates data are results of a census. Unless otherwise specified, age is defined as age at last birthday (completed years). For classification by urban/rural residence see end of table. For definitions of "urban" areas see end of table 6. Figures shown in italics are estimates of questionable reliability. For method of evaluation and limitations of data, see Technical Notes page 31. Foot-notes and explanation of symbols are shown at end of table.]

7. Population selon le sexe, l'âge et la résidence urbaine/rurale: dernière année disponible, 1965-1974

[(C) après la date indique qu'il s'agit de données de recensement. Sauf indication contraire, l'âge désigne l'âge au dernier anniversaire (années révolues). Pour le classement selon la résidence urbaine/rurale voir la fin du tableau. Pour les définitions des zones "urbaines", se reporter à la fin du tableau 6. Les chiffres en italique sont des estimations de qualité douteuse. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 76. Les notes et l'explication des signes figurent à la fin du tableau.]

7. Population by sex, age and urban/rural residence (continued)

Population selon le sexe, l'âge et la résidence urbaine/rurale (suite)

FOOT-NOTES

Italics indicate estimates of questionable reliability. (E) after date indicates estimated data.

* Provisional.

[1] For classification by urban/rural residence see end of table.

[2] *De jure* population.

[3] In the Departments of Oasis and Saoura, enumeration took place between 22 December 1965 and 20 January 1966.

[4] *De jure* population, but excluding 24 012 residents absent for less than one year and nomad population estimated at 10 550 at 1971 census.

[5] Estimate based on results of a 10 per cent sample of households in the urban commune of Bujumbura (population 71 000) and a 2 per cent sample of population in rural areas.

[6] Data are based on administrative census, excluding refugees from Sudan numbering 28 000.

[7] Data are based on results of National Sample Survey and censuses held in Addis Ababa and Asmara.

[8] Data include absentee workers amounting to 12 per cent of total population at the time of the census.

[9] Data are based on the results of the Population Growth Survey which covers 5 per cent of the total population.

[10] Data are based on results of sample survey described in table 2.

[11] Moslem population only.

[12] For 15–20 years, 21–25 years, 26–30 years, 31–35 years, 36–40 years, 41–45 years, 46–50 years, 51–55 years, 56–60 years, 61–65 years, as appropriate.

[13] Excluding data for Walvis Bay, which is an integral part of South Africa but is administered as if it were part of Namibia (population 12 648 for both sexes).

[14] Data are based on a sample of census returns.

[15] Excluding 126 persons in transit (108 males, 18 females).

[16] Data include adjustment for underenumeration at latest census.

[17] Data are for *de jure* population, based on results of sample survey. Age distributions are smoothed.

[18] Reason for discrepancy between these figures and those shown elsewhere is due to error in mechanical processing.

[19] Data include adjustment for underenumeration at 1960 census.

[20] Estimates not revised in accord with latest census.

[21] For under 2 years, 2–14 years, 15–44 years, 45–64 years and 65 years and over, as appropriate.

[22] *De jure* population, but excluding persons residing in institutions.

[23] Data exclude adjustment for underenumeration.

[24] For under 2 years and 2–4 years, as appropriate.

[25] Excluding data for Canal Zone, shown separately hereunder.

[26] *De jure* population, but including armed forces stationed in the area.

[27] Age classification based on year of birth rather than completed years of age.

[28] Because of rounding totals are not in all cases the sum of the parts.

[29] Excluding foreign personnel employed on United States bases.

[30] *De jure* population but excluding civilian citizens absent from country for extended period of time.

[31] Excluding Indian jungle population.

[32] Data are based on a 5 per cent sample of census returns.

[33] Excluding nomadic Indian tribes.

[34] Including adjustment for underenumeration at 1962 census.

[35] Excluding transients afloat.

[36] Excluding tourists numbering 447 persons (344 males and 103 females) at 1960 census, and persons in sovereign bases and other areas retained by the United Kingdom after independence numbering 3 602 persons (2 961 males and 641 females) at 1960 census.

[37] Including data for the Indian—held part of Jammu and Kashmir, the final status of which has not yet been determined.

[38] Excluding West Irian.

(continued on next page)

NOTES

Italiques : Estimations dont l'exactitude est discutable. (E) après la date indique qu'il s'agit de données estimatives.

* Données provisoires.

[1] Pour le classement selon la résidence urbaine/rurale voir la fin du tableau.

[2] Population de droit.

[3] Dans les départements des Oasis et de la Saoura, le dénombrement a eu lieu entre le 22 décembre 1965 et le 20 janvier 1966.

[4] Population de droit, mais non compris 24 012 résidents hors du pays pour une période inférieure à un an et les nomades estimés à 10 550 au recensement de 1971.

[5] Estimation fondée sur les résultats d'un échantillon de 10 p. 100 des ménages de la commune urbaine de Bujumbura (71 000 habitants) et d'un échantillon de 2 p. 100 de la population des zones rurales.

[6] Les données sont fondées sur un recensement administratif; non compris les réfugiés du Soudan, au nombre de 28 000.

[7] Les données sont fondées sur les résultats de l'enquête nationale par sondage et sur les recensements qui ont eu lieu à Addis-Abéba et à Asmara.

[8] Les données comprennent les travailleurs absents, soit 12 p. 100 de la population totale lors du recensement.

[9] Les données sont basées sur les résultats de "Population Growth Survey" qui a porté sur 5 p. 100 de la population totale.

[10] Les données sont fondées sur les résultats de l'enquête par sondage dont il est question au tableau 2.

[11] Population musulmane seulement.

[12] Pour les groupes d'âge 15–20 ans, 21–25, 26–30, 31–35, 36–40, 41–45, 46–50, 51–55, 59–60 et 61–65 ans, selon le cas.

[13] Non compris Walvis Bay, qui fait partie intégrante de l'Afrique du Sud, mais qui est administrée comme si elle faisait partie de la Namibie (12 648 habitants des deux sexes).

[14] Les données sont fondées sur un échantillon des bulletins de recensement.

[15] Non compris 126 personnes en transit (108 du sexe masculin et 18 du sexe féminin).

[16] Les données ont été ajustées pour compenser les lacunes du dénombrement lors du dernier recensement.

[17] Les données concernent la population de droit et sont fondées sur les résultats d'une enquête par sondage. Les répartitions par âge sont lissées.

[18] Les divergences entre ces chiffres et les chiffres correspondants indiqués ailleurs s'expliquent par des erreurs mécanographiques.

[19] Les données ont été ajustées pour compenser les lacunes du dénombrement du recensement de 1960.

[20] Les estimations n'ont pas été révisées en fonction du dernier recensement.

[21] Pour les groupes d'âge de moins de 2 ans, 2–14, 15–44, 45–64 et 65 ans et plus, selon le cas.

[22] Population de droit, mais non compris les personnes dans les institutions.

[23] Les données ne tiennent pas compte d'un ajustement destiné à compenser les lacunes du dénombrement.

[24] Pour les groupes d'âge de moins de 2 ans et 2–4 ans, selon le cas.

[25] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte.

[26] Population de droit, mais y compris les militaires en garnison sur le territoire.

[27] La classification par âge est fondée sur l'année de naissance et non sur l'âge en années révolues.

[28] Les chiffres étant arrondis, les totaux ne correspondent pas toujours rigoureusement à la somme des chiffres partiels.

[29] Non compris le personnel étranger travaillant dans les bases des Etats-Unis.

[30] Population de droit, mais non compris les civils hors du pays pendant une période prolongée.

[31] Non compris les Indiens de la jungle.

[32] Les données sont fondées sur un échantillon de 5 p. 100 des bulletins de recensement.

[33] Non compris les tribus d'Indiens nomades.

[34] Les données ont été ajustées pour compenser les lacunes du dénombrement du recensement de 1962.

[35] Non compris les personnes de passage à bord de navires.

[36] Non compris 447 touristes (344 du sexe masculin et 103 du sexe féminin) dénombrés au recensement de 1960, ni 3 602 personnes ((2 961 du sexe masculin et 641 du sexe féminin) qui, lors du recensement de 1960, vivaient dans des bases souveraines et dans d'autres zones conservées par le Royaume-Uni après l'indépendance.

[37] Y compris les données concernant la partie du Jammu et Cachemire occupée par l'Inde, dont le statut définitif n'a pas encore été déterminé.

[38] Non compris l'Irian occidental.

(voir page suivante)

7. Population by sex, age and urban/rural residence (continued)

Population selon le sexe, l'âge et la résidence urbaine/rurale (suite)

FOOT-NOTES (continued)

[39] Includes data relating to certain territories under occupation by Israeli military forces since June 1967.
[40] Excluding diplomatic personnel outside the country, and foreign military and civilian personnel and their dependants stationed in the area.

[41] Including military and diplomatic personnel and their families abroad, numbering 933 at 1961 census, but excluding foreign military and diplomatic personnel and their families in the country, numbering 389 at 1961 census. Also including registered Palestinian refugees numbering 722 687 at 31 May 1967.

[42] Excluding alien armed forces, civilian aliens employed by armed forces and foreign diplomatic personnel and their dependants.

[43] Including 754 Kuwaiti nationals outside the country.
[44] Data are for Lebanese nationals on population register, including those living outside the country. Excluding registered Palestinian refugees.

[45] Including 1 994 residents who were absent at the time of the census.

[46] Excluding transients afloat and persons in institutions.

[47] Excluding data for Jammu and Kashmir, the final status of which has not yet been determined, Junagardh, Manavadar, Gilgit and Baltistan.

[48] Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.
[49] Former mandated territory administered by the United Kingdom until Armistice of 1949.
[50] Comprising that part of Palestine under Egyptian administration from the Armistice of 1949 until June 1967, when it was occupied by Israeli military forces.
[51] Excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants, numbering 4 565 and 47 959 respectively at 1970 census.

[52] Including Palestinian refugees.
[53] Excluding adjustment for underenumeration estimated at 2,01 per cent.

[54] For 10–15 years, 16–20 years, 21–30 years, 31–40 years, 41–50 years, 51–60 years, 61–75 years and 76 years and over, as appropriate.
[55] For under 10 years, 11–16 years, 17–18 years, 19–20 years, 21–30 years, 31–40 years, 41–50 years, 51–60 years, 61–65 years and 66 years and over, as appropriate.
[56] Excluding migratory population.
[57] Excluding 3 300 visitors.
[58] Excluding data for Faeroe Islands and Greenland, shown separately.

[59] *De jure* population, but excluding diplomatic personnel outside the country and including foreign diplomatic personnel not living in embassies or consulates.
[60] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of states which may be involved.
[61] Excluding armed forces.
[62] Excluding armed forces stationed outside the country, but including alien armed forces stationed in the area.
[63] Excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside the country.
[64] Excluding civilian aliens within the country and including civilian nationals temporarily outside the country.
[65] Data are based on a 2 per cent sample of census returns.

[66] Excluding armed forces stationed outside the country, numbering 48 106 in May 1959.
[67] Excluding diplomatic personnel and armed forces outside the country, the latter numbering 1 936 at 1966 census; also excluding alien armed forces within the country.
[68] Data are based on a 10 per cent sample of census returns, excluding military personnel in barracks, people in hospitals for more than 6 months, prisoners and nomad population.

(continued on next page)

NOTES (suite)

[39] Y compris les données concernant certains territoires occupés par les forces armées israéliennes depuis juin 1967.
[40] Non compris le personnel diplomatique hors du pays ni les militaires et civils étrangers en poste sur le territoire et les membres de leur famille les accompagnant.
[41] Y compris les militaires et le personnel diplomatique à l'étranger et les membres de leur famille les accompagnant (933 personnes au recensement de 1961), mais compris les militaires et le personnel diplomatique étranger en poste dans le pays et les membres de leur famille les accompagnant 389 personnes au recensement de 1961). Y compris également les réfugiés de Palestine immatriculés, au nombre de 722 687 au 31 mai 1967.
[42] Non compris les militaires étrangers, les civils étrangers employés par les forces armées ni le personnel diplomatique étranger et les membres de leur famille les accompagnant.
[43] Y compris les ressortissants du Koweït hors du pays, au nombre de 754.
[44] Les données se rapportent aux ressortissants libanais inscrits sur un registre de population, y compris ceux qui vivent hors du pays. Non compris les réfugiés de Palestine immatriculés.
[45] Y compris les résidents hors du pays pendant la période du recensement au nombre de 1 994.
[46] Non compris les personnes de passage à bord de navires ni les personnes dans les institutions.
[47] Non compris les données concernant le Jammu et Cachemire, dont le statut définitif n'a pas encore été déterminé, le Junagardh, le Manavadar, le Gilgit et le Baltistan.
[48] Les données sont basées sur les résultats de "Population Growth Survey" de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.
[49] Ancien territoire sous mandat administré par le Royaume-Uni jusqu'à l'armistice de 1949.
[50] Y compris la partie de la Palestine administrée par l'Egypte après l'armistice de 1949 jusqu'en juin 1967, date à laquelle elle a été occupée par les forces armées israéliennes.
[51] Non compris les personnes de passage à bord de navires ni les militaires et agents civils non résidents et les membres de leur famille les accompagnant, soit 4 565 et 47 959 personnes respectivement au recensement de 1970.
[52] Y compris les réfugiés de Palestine.
[53] Les données n'ont pas été ajustées pour compenser les lacunes du dénombrement, estimées à 2,01 p. 100.
[54] Pour les groupes d'âge 10–15 ans, 16–20, 21–30, 31–40, 41–50, 51–60, 61–75 et 76 ans et plus, selon le cas.
[55] Pour les groupes d'âge de moins de 10 ans, 11–16, 17–18, 19–20, 21–30, 31–40, 41–50, 51–60, 61–65 et 66 ans et plus selon le cas.

[56] Non compris la population migrante.
[57] Non compris 3 300 visiteurs.
[58] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.
[59] Population de droit, mais non compris le personnel diplomatique hors du pays et y compris le personnel diplomatique étranger qui ne vit pas dans les ambassades ou les consulats.
[60] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[61] Non compris les militaires.
[62] Non compris les militaires en garnison hors du pays, mais y compris les militaires étrangers en garnison sur le territoire.
[63] Non compris les militaires non maltais en garnison sur le territoire et y compris les civils nationaux se trouvant temporairement hors du pays.
[64] Non compris les civils étrangers dans le pays et y compris les civils nationaux temporairement hors du pays.
[65] Les données sont fondées sur un échantillon de 2 p. 100 des bulletins de recensement.
[66] Non compris les militaires en garnison hors du pays, au nombre de 48 106 en mai 1959.
[67] Non compris le personnel diplomatique et les militaires hors du pays, ces dernier au nombre de 1 936 au recensement de 1966; non compris également les militaires étrangers dans le pays.
[68] Les données sont fondées sur un échantillon de 10 p. 100 des bulletins de recensement; non compris les militaires logés en caserne, les personnes dans les hôpitaux pour plus de 6 mois, les prisonniers et la population nomade.

(voir page suivante)

7. Population by sex, age and urban/rural residence (continued)

Population selon le sexe, l'âge et la résidence urbaine/rurale (suite)

FOOT-NOTES (continued)

[69] Data exclude adjustment for underenumeration, estimated at 4 per cent.

[70] Excluding armed forces overseas.
[71] Data are based on a 1 per cent sample of census returns.

[72] Data are based on a 10 per cent sample of census returns.

[73] Excluding foreigners and Korean diplomatic personnel and their dependants outside the country.
[74] Estimate based on the Turkish Demographic Survey.
[75] Data are based on a 25 per cent sample of census returns.

[76] Including armed forces stationed outside the country, but excluding alien armed forces stationed in the area.
[77] Excluding persons on the Central Register of Population (containing persons belonging to Netherlands population but having no fixed municipality of residence).
[78] For 60–63 years and 64–69 years, as appropriate.

NOTES (suite)

[69] Les données n'ont pas été ajustées pour compenser les lacunes du dénombrement estimées à 4 p. 100.
[70] Non compris les militaires à l'étranger.
[71] Données fondées sur un échantillon de 1 p. 100 des bulletins de recensement.
[72] Données fondées sur un échantillon de 10 p. 100 des bulletins de recensement.
[73] Non compris les étrangers ni le personnel diplomatique coréen hors du pays et les membres de leur famille les accompagnant.
[74] Estimation fondée sur les résultats de l'enquête démographique turque.
[75] Les données sont fondées sur un échantillon de 25 p. 100 des bulletins de recensement.
[76] Y compris les militaires hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.
[77] Les données ne tiennent pas compte des personnes inscrites sur le Registre central de la population (personnes appartenant à la population néerlandaise mais sans résidence fixe dans l'une des municipalités).
[78] Pour les groupes d'âge 60–63 ans et 64–69 ans, selon le cas.

8. Population of capital city and cities of 100 000 and more inhabitants: latest available year

Population des capitales et des villes de 100 000 habitants et plus: dernière année disponible

[The capital city of each country or area is shown in capital letters. (C) after the date indicates that data are results of a national or municipal census; all other data (including results of sample surveys) are estimates. Figures shown in italics are estimates of questionable reliability. For definition of city proper and urban agglomeration, method of evaluation and limitations of data, see Technical Notes, page 32. Foot-notes and explanation of symbols are shown at end of table. — Le nom de la capitale de chaque pays ou zone est imprimé en majuscules. Le signe (C) après la date indique qu'il s'agit de données de recensements nationaux ou municipaux; toutes les autres données (y compris les résultats des enquêtes par sondage) sont des estimations. Les chiffres en italique sont des estimations de qualité douteuse. Pour la définition de la ville proprement dite et de l'agglomération urbaine et pour les insuffisances des données, voir Notes Techniques, page 77. Les notes et l'explication des signes figurent à la fin du tableau.]

8. Population of capital city and cities of 100 000 and more inhabitants (continued) — Population des capitales et des villes de 100 000 habitants et plus (suite)

FOOT-NOTES

Italics indicate estimates of questionable reliability.

* Provisional.

[1] *De jure* population.

[2] Data are the result of a municipal census.

[3] For "*cercle*".

[4] Including Kombo St. Mary.

[5] For 30 June 1967; for corresponding city proper data, see *Demographic Yearbook 1973*.

[6] Data refer to "Accra-Tema Metropolitan area".

[7] Comprises Sekondi (population 33 713) and Takoradi (population 58 161). Data for urban agglomeration refer to the Sekondi-Takoradi Municipal Council.

[8] Estimate based on results of sample survey.

[9] Data are based on results of the Population Growth Survey which commenced in May 1969.

[10] Dual capitals.

[11] Data are for the urban commune of Tananarive.

[12] For commune(s) which may contain rural area as well as urban centre.

[13] For Commune of Dakar, comprising city proper, the suburban villages and Gorée.

[14] Pretoria is the administrative capital, Cape Town the legislative capital.

[15] For 24 May 1966.

[16] Data are estimates based on administrative censuses held between 1 February and 31 May 1970.

[17] *De jure* population, but excluding persons residing in institutions.

[18] For 1 July 1966.

[19] For 1 June 1971; for corresponding urban agglomeration data, see *Demographic Yearbook 1973*.

[20] "Metropolitan area" comprising *cantón central* of San José (including San José city) *cantones* Curridabat, Escazú, Montes de Oca and Tibás and parts of *cantones* of Alajuelita, Desemparados, Goicoechea and Moravia.

[21] For 1 July 1970; for corresponding city proper data, see *Demographic Yearbook 1973*.

[22] For 30 June 1967; for corresponding urban agglomeration data, see *Demographic Yearbook 1973*.

[23] Comprising *municipios* of La Habana, Marianao and Regla, the urban zones of Cojimar and San Miguel del Padrón (*municipio* de Guanabacoa). The population of "Gran Habana" which comprises the urban agglomeration plus the *municipios* of Santa María del Rosario and Santiago de las Vegas was 1 700 300 on 30 June 1967.

[24] Estimate based on results of sample survey.

[25] Comprises the city and extension of the city which includes the ore refinery, the airport and a few separate living quarters.

[26] Comprising *corregimientos* of Bella Vista, Betania, Calidonia, El Chorillo, Juan Díaz, Parque Lefevre, Pedregal, Pueblo Nuevo, Río Abajo, San Felipe, San Francisco, San Miguelito and Santa Ana.

[27] *De jure* population but including armed forces stationed in the area.

[28] Data for urban agglomeration refer to "standard metropolitan area" comprised of municipality of Ponce, which includes Ponce proper.

[29] Data for urban agglomeration refer to "standard metropolitan statistical area", comprising *municipios* of San Juan, Carolina, Cataño, Guaynabo, Río Piedras and Trupillo Alto.

[30] *De jure* population but excluding armed forces overseas and civilian citizens absent from country for extended period of time.

[31] Unless otherwise noted, data for urban agglomeration refer to "standard metropolitan statistical area".

[32] Albany-Schenectady-Tray, New York "standard metropolitan statistical area".

[33] Allentown-Bethlehem-Eaton, Pennsylvania-New Jersey "standard metropolitan statistical area".

[34] Anaheim-Santa Ana-Garden Grove, California "standard metropolitan statiscal area".

[35] Appleton-Oshkosh, Wisconsin "standard metropolitan statistical area".

[36] Augusta, Georgia-South Carolina "standard metropolitan statistical area".

[37] Beaumont-Port Arthur-Orange, Texas "standard metropolitan statistical area".

[38] Included in urban agglomeration of San Francisco.

[39] Biloxi-Gulfport, Mississippi "standard metropolitan statistical area".

[40] Binghamton, New York-Pennsylvania "standard metropolitan statistical area".

[41] Bloomington-Normal, Illinois "standard metropolitan statistical area".

(continued on next page)

NOTES

Italiques : Estimations de qualité discutable.

* Données provisoires.

[1] Population de droit.

[2] D'après les résultats d'un recensement municipal.

[3] Pour le "cercle".

[4] Y compris Kombo St. Mary.

[5] Au 30 juin 1967; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.

[6] Pour la "zone métropolitaine d'Accra-Tema".

[7] Y compris Sekondi (33 713 personnes) et Takoradi (58 161 personnes). Les données concernant l'agglomération urbaine se rapportent au Conseil municipal de Sekondi-Takoradi.

[8] Estimation fondée sur les résultats d'une enquête par sondage.

[9] Les données sont basées sur les résultats de "*Population Growth Survey*" qui a commencé en mai 1969.

[10] Le pays a deux capitales.

[11] Les données se rapportent à la commune urbaine de Tananarive.

[12] Commune(s) pouvant comprendre un centre urbain et une zone rurale.

[13] Commune de Dakar, comprenant la ville proprement dite, les villages suburbains et Gorée.

[14] Pretoria est la capitale administrative, Cape Town la capitale législative.

[15] Au 24 mai 1966.

[16] Les données sont des estimations fondées sur des recensements administratifs effectués entre le 1er février et le 31 mai 1970.

[17] Population de droit, mais non compris les personnes dans les institutions.

[18] Au 1er juillet 1966.

[19] Au 1er juin 1971; pour le chiffre correspondant relatif à l'agglomération urbaine, voir l'*Annuaire démographique 1973*.

[20] "Zone métropolitaine" comprenant le canton central de San José (et la ville de San José), les cantons de Curridabat, Escazú, Montes de Oca et Tibás et certaines parties des cantons de Alajuelita, Desamparados, Goicoechea et Moravia.

[21] Au 1er juillet 1970; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.

[22] Au 30 juin 1967; pour le chiffre correspondant relatif à l'agglomération urbaine, voir l'*Annuaire démographique 1973*.

[23] Y compris les *municipios* de La Havane, Marianao et Reglo, les zones urbaines de Cojimar et San Miguel del Padrón (*municipio* de Guanabacoa). La population de la "Grande Havane", qui comprend l'agglomération urbaine, plus les *municipios* de Santa Maria del Rosario et Santiago de las Vegas, était de 1 700 300 au 30 juin 1967.

[24] Estimation fondée sur les résultats d'une enquête par sondage.

[25] Les données concernent la ville et le prolongement de la ville qui comprend la raffinerie de pétrole, l'aéroport et quelques maisons d'habitations.

[26] Y compris les *corregimientos* de Bella Vista, Betania, Calidonia, El Chorillo, Juan Díaz, Parque Lefebvre, Pedregal, Pueblo Nuevo, Río Abajo, San Felipe, San Francisco, San Miguelito et Santa Ana.

[27] Population de droit, mais y compris les militaires en garnison sur le territoire.

[28] Les données relatives à l'agglomération urbaine se rapportent à la "zone métropolitaine officielle" qui comprend la municipalité de Ponce, comprenant Ponce proprement dite.

[29] Les données concernant l'agglomération urbaine se rapportent à la "zone métropolitaine statistique officielle" qui comprend les *municipios* de San Juan, Carolina, Cataño, Guavnabo, Río Piedras et Trujillo Alto.

[30] Population de droit, mais non compris les militaires à l'étranger ni les civils hors du pays pendant une période prolongée.

[31] Sauf indication contraire, les données relatives à l'agglomération urbaine se rapportent à la "zone métropolitaine statistique officielle".

[32] "Zone métropolitaine statistique officielle" d'Albany-Schenectady-Troy (New York).

[33] "Zone métropolitaine statistique officielle" d'Allentown-Bethlehem-Eaton (Pennsylvanie-New Jersey).

[34] "Zone métropolitaine statistique officielle" d'Anaheim-Santa Ana-Garden Grove (Californie).

[35] "Zone métropolitaine statistique officielle" d'Appleton-Oshkoh (Wisconsin).

[36] "Zone métropolitaine statistique officielle" d'Augusta (Georgie-Caroline du Sud).

[37] "Zone métropolitaine statistique officielle" du Beaumont-Port Arthur-Orange (Texas).

[38] Comprise dans l'agglomération urbaine de San Francisco.

[39] "Zone métropolitaine statistique officielle" de Biloxi-Gulfport (Mississippi).

[40] "Zone métropolitaine statistique officielle" de Binghamton (New York-Pennsylvanie).

[41] "Zone métropolitaine statistique officielle" de Bloomington-Normal (Illinois).

FOOT-NOTES (continued)

[84] New York "standard statistical metropolitan area" comprising New York City and Nassau, Rockland, Suffolk and Westchester counties. New York-Northeastern New Jersey standard consolidated area including New York, Jersey City, Newark and Paterson-Clifton-Passaic "standard metropolitan statistical areas" and Middlesex and Somerset counties in New Jersey had a population of 16 037 395 in 1970.

[85] Norfolk-Porstmouth, Virginia "standard metropolitan statistical area".
[86] Included in San Francisco-Oakland "standard metropolitan statistical area".

[87] Omaha, Nebraska-Iowa "standard metropolitan statistical area".
[88] Oxnard-Ventura, California "standard metropolitan statistical area".
[89] Included in Los Angeles-Long Beach, California "standard metropolitan statistical area".
[90] Paterson-Clifton-Passaic, New Jersey "standard metropolitan statistical area".
[91] Petersburg-Colonial Heights, Virginia "standard metropolitan statistical area".
[92] Philadelphia, Pennsylvania-New Jersey "standard metropolitan statistical area".
[93] Portland, Oregon-Washington "standard metropolitan statistical area".

[94] Included in Norfolk-Portsmouth, Virginia "standard metropolitan statistical area".
[95] Providence-Pawtucket-Warwick, Rhode Island, Massachusetts "standard metropolitan statistical area".
[96] Provo-Orem, Utak "standard metropolitan statistical area".
[97] Included in urban agglomeration of San Bernardino.
[98] St. Louis, Missouri-Illinois "standard metropolitan statistical area".
[99] Included in Minneapolis-St-Paul, Minnesota "standard metropolitan statistical area".
[100] Included in Tampa-St. Petersburg, Florida "standard metropolitan statistical area".
[101] Salinas-Monterey, California "standard metropolitan statistical area".
[102] San Bernardino-Riverside-Ontario, California "standard metropolitan statistical area".
[103] San Francisco-Oakland, California, "standard metropolitan statistical area".

[104] Seattle-Everett, Washington "standard metropolitan statistical area".
[105] Sioux City, Iowa-Nebraska "standard metropolitan statistical area".
[106] Springfield-Chicopee-Holyoke, Massachusetts-Connecticut "standard metropolitan statistical area".
[107] Steubenville-Waiton, Ohio-West Virginia "standard metropolitan statistical area".
[108] Tampa-St. Petersburg, Florida "standard metropolitan statistical area".

[109] Texarkana, Texas-Arkansas "standard metropolitan statistical area".
[110] Toledo, Ohio-Michigan "standard metropolitan statistical area".
[111] Utica-Rome, New York "standard metropolitan statistical area".
[112] Vallejo-Napa "urbanized area".
[113] Vineland-Millville-Bridgetown, New Jersey "standard metropolitan statistical area".
[114] Washington, District of Columbia-Maryland-Virginia "standard metropolitan statistical area".
[115] Wheeling, West Virginia-Ohio "standard metropolitan statistical area".

[116] Wilkes-Barre-Hazelton, Pennsylvania "standard metropolitan statistical area".
[117] Wilmington, Delaware-Maryland-New Jersey "standard metropolitan statistical area".
[118] Included in Greensboro-Winston-Salem-High Point, North Carolina "standard metropolitan statistical area".
[119] Included in New York, New York "standard metropolitan statistical area".

[120] Youngstown-Warren, Ohio "standard metropolitan statistical area".
[121] La Paz is the actual capital and the seat of the Government, but Sucre is the legal capital and the seat of the judiciary.
[122] Estimated data refer to *municipios* which may contain rural area as well as urban centre.
[123] For 1970, *de jure* population.
[124] "Metropolitan area" (Gran Santiago).
[125] For 15 July 1972; for corresponding city proper data, see *Demographic Yearbook 1973*.
[126] For 14 October 1962; includes population of locality of Lambaré.
[127] "Metropolitan area", comprising Asunción proper and localities of Trinidad, Zeballos Cué, Campo Grande and Lambaré.
[128] "Metropolitan area" (Gran Lima).

(continued on next page)

NOTES (suite)

[84] "Zone métropolitaine statistique officielle" de New York qui comprend la ville de New York et les comtés de Nassau, Rockland, Suffolk et Westchester. La conurbation de New York et du nord-est du New Jersey, qui comprend les "zones métropolitaines statistiques officielles" de New York, Jersey City, Newark et Paterson-Clifton-Passaic ainsi que les comtés du Middlesex et du Somerset dans le New Jersey, comptait 16 037 395 habitants en 1970.
[85] "Zone métropolitaine statistique officielle" de Norfolk-Portsmouth (Virginie).
[86] Comprise dans la "zone métropolitaine statistique officielle" de San Francisco-Oakland.
[87] "Zone métropolitaine statistique officielle" d'Omaha (Nebraska-Iowa).
[88] "Zone métropolitaine statistique officielle" de Oxnard-Ventura (Californie).
[89] Comprise dans la "zone métropolitaine statistique officielle" de Los Angeles-Long Beach (Californie).
[90] "Zone métropolitaine statistique officielle" de Paterson-Clifton-Passaic (New Jersey).
[91] "Zone métropolitaine statistique officielle" de Petersburg-Colonial Heights (Virginie).
[92] "Zone métropolitaine statistique officielle" de Philadelphie (Pennsylvanie-New Jersey).
[93] "Zone métropolitaine statistique officielle" de Portland (Oregon-Washington).
[94] Comprise dans la "zone métropolitaine statistique officielle" de Norfolk-Portsmouth (Virginie).
[95] "Zone métropolitaine statistique officielle" de Providence-Pawtucket-Warwick (Rhode Island, Massachusetts).
[96] "Zone métropolitaine statistique officielle" de Provo-Orem (Utah).
[97] Comprise dans l'agglomération urbaine de San Bernardino.
[98] "Zone métropolitaine statistique officielle" de St. Louis (Missouri-Illinois).
[99] Comprise dans la "zone métropolitaine statistique officielle" de Minneapolis-St. Paul (Minnesota).
[100] Comprise dans la "zone métropolitaine statistique officielle" de Tampa-St. Petersburg (Floride).
[101] "Zone métropolitaine statistique officielle" de Salinas-Monterey (Californie).

[116] "Zone métropolitaine statitique officielle" de Wilkes-Barre-Hazelton (Pennsylvanie).
[117] "Zone métropolitaine statistique officielle" de Wilmington (Delaware-Maryland-New Jersey).
[118] Comprise dans la "zone métropolitaine statistique officielle" de Greensboro-Winston-Salem-High Point (Caroline du Nord).
[119] Comprise dans la "zone métropolitaine statistique officielle" de New York (New York).
[120] "Zone métropolitaine statistique officielle" de Youngstown-Warren (Ohio).
[121] La Paz est la capitale effective et le siège du gouvernement, mais Sucre est la capitale constitutionnelle et le siège du pouvoir judiciaire.
[122] Les estimations se rapportent aux *municipios* qui peuvent comprendre un centre urbain et une zone rurale.
[123] Pour 1970, population de droit.
[124] "Zone métropolitaine" (Grand Santiago).
[125] Au 15 juillet 1972; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
[126] Au 14 octobre 1962; y compris la population de la localité de Lambaré.
[127] "Zone métropolitaine" comprenant la ville d'Asunción proprement dite et les localités de Trinidad, Zeballos Cué, Campo Grande et Lamboré.
[128] "Zone métropolitaine" (Grand Lima).

(voir page suivante)

8. Population of capital city and cities of 100 000 and more inhabitants (continued) — Population des capitales et des villes de 100 000 habitants et plus (suite)

FOOT-NOTES (continued)

[129] For 1970. "Metropolitan area" comprising Caracas proper (the urban parishes of Department of Libertador) and a part of district of Sucre in State of Miranda.
[130] For 1 July 1971.
[131] Data for 1953 and 1957 released by the State Statistical Bureau, Peking.

[132] Information based on data published in *The World Atlas*, The Cartographic Institute (China), Peking, Feb. 1972.
[133] Comprises Sinpu, Tunghai and Lienyünkang.
[134] Comprises Hankow, Wuchang and Hanyang.
[135] Excluding data for the Indian-held part of Jammu and Kashmir, the final status of which has not yet been determined; estimated population of cities of Jammu and Srinagar were 155 338 and 403 413, respectively, on 1 April 1971.
[136] For Ambala Municipal Corporation.
[137] For 1 July 1970; for corresponding city proper data see *Demographic Yearbook, 1973*.
[138] Included in urban agglomeration of Calcutta.
[139] Includes Durg.
[140] For Calcutta Municipal Corporation.
[141] Includes Bally, Baranagar, Bhatpara, Calcutta Municipal Corporation, Hooghly-Chinsura, Howrah, Kamarhati, Panihati, Serampore, South Dum Dum and South Suburban urban agglomeration (including Garden Reach).

[142] For Delhi Municipal Corporation.
[143] Includes New Delhi.
[144] Included in urban agglomeration of Calcutta and South Suburban.

[145] Includes Dharwar.
[146] Included in urban agglomeration of Delhi.
[147] Includes Doranda Notified Committee.
[148] Included in urban agglomeration of Coimbatore.
[149] For 1 July 1970; for corresponding city proper data, see *Demographic Yearbook 1973*. Data include Garden Reach.

[150] For Trivandrum Municipal Corporation.
[151] Comprises Karkh, Rasafah, Adhamiya and Kadhimain Qadha Centres and Maamoon, Mansour and Karradah-Sharqiya *Nahiyas*.
[152] Including East Jerusalem.
[153] Data exclude diplomatic personnel outside country and foreign military and civilian personnel and their dependants stationed in the area.

[154] Except for Tokyo, all data refer to *Shi*, a minor division which may include some scattered or rural population as well as an urban centre.

[155] Comprises Kokura, Moji, Tobata, Wakamatsu and Yahata (Yawata).
[156] Data for city proper refer to 23 wards (*ku*) of the old city.

[157] The urban agglomeration figures refer to Tokyo-to (Tokyo Prefecture), comprising the 23 wards plus 14 urban counties (*shi*) 18 towns (*machi*) and 8 villages (*mura*). The "Tokyo Metropolitan Area" comprises the 23 wards of Tokyo-to, plus 21 cities, 20 towns and 2 villages. The "Keihin Metropolitan Area" (Tokyo-Yokohama Metropolitan Area) comprises the Tokyo Metropolitan Area plus 9 cities (one of which is Yokohama City) and 2 towns, with a total population of 20 485 542 on 1 October 1965.

[158] For 25 April 1965; for corresponding city proper data, see *Demographic Yearbook 1973*.
[159] Comprises *area maritima and concelho* of Macau.
[160] Excluding data for the Pakistan-held part of Jammu and Kashmir, the final status of which has not yet been determined, Junagardh, Manavadar, Gilgit and Baltistan. For cities in Jammu and Kashmir (cf[135]).

[161] For 1 July 1971; for corresponding city proper data, see *Demographic Yearbook 1973*.
[162] Excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.

[163] For 24 October 1965; for corresponding city proper data, see *Demographic Yearbook 1973*.
[164] Including Altindag, Cankaya and Yenimahalle.
[165] Including Adalar, Bakirköy, Besistas, Beykoz, Beyoglu, Eminönü, Eyüp, Fâtih, Gazi Osmanpasa, Kadiköy, Sariyer, Sisli, Usküdar and Zeytinburnu.
[166] Including Karsiyaka.
[167] Data are for Abu Dhabi State.
[168] Including Cholon.

(continued on next page)

NOTES (suite)

[129] Pour 1970. "Zone métropolitaine", comprenant la ville de Caracas proprement dite (paroisses urbaines du Département du Libertador) et une partie du district de Sucre dans l'Etat de Miranda.
[130] Au 1er juillet 1971.
[131] Données pour 1953 et 1957 communiquées par le Bureau de statistique d'Etat (Pékin).
[132] Renseignements fondés sur les données publiées dans l'*Atlas mondial*, Institut cartographique, Chine, Pékin, février 1972.
[133] Y compris Sinpu, Tunghai et Lienyükang.
[134] Y compris Hankow, Wuchang et Hanyang.
[135] Non compris les données concernant la partie du Jammu et Cachemire occupée par l'Inde, dont le statut définitif n'a pas encore été déterminé; la population des villes de Jammu et de Srinagar était estimée à 155 338 et 403 413 habitants, respectivement, au 1er avril 1971.
[136] *Municipal Corporation* d'Ambala.
[137] Au 1er juillet 1970; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire Demographique 1972*.
[138] Comprise dans l'agglomération urbaine de Calcutta.
[139] Y compris Durg.
[140] *Municipal Corporation* de Calcutta.
[141] Y compris Bally, Baranagar, Bhatpara, la *Municipal Corporation* de Calcutta, Hooghly-Chinsura, Howrah, Kamarhati, Panihati, Serampore et South Dum Dum, l'agglomération urbaine de South Suburban (y compris Garden Reach).
[142] *Municipal Corporation* de Delhi.
[143] Y compris New Delhi.
[144] Comprise dans les agglomérations urbaines de Calcutta et de South Suburban.
[145] Y compris Dharwar.
[146] Comprise dans l'agglomération urbaine de Delhi.
[147] Y compris le *Notified Committee* de Doranda.
[148] Comprise dans l'agglomération urbaine de Coimbatore.
[149] Au 1er juillet 1970; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*. Les données comprennent Garden Reach.
[150] *Municipal Corporation* de Trivandrum.
[151] Comprend les *cazas* de Karkh, Rasafah, Adhamiya et Kadhemain ainsi que les *nahiyas* de Maamoon, Mansour et Karradah-Sharqiya.
[152] Y compris l'est de Jérusalem.
[153] Les données ne comprennent pas le personnel diplomatique en poste hors du territoire ni les militaires et agents civils étrangers se trouvant sur le territoire et les membres de leur famille les accompagnant.
[154] Sauf pour Tokyo, toutes les données se rapportent à des *Shi*, petites divisions administratives qui peuvent comprendre des peuplements dispersés ou ruraux en plus d'un centre urbain.
[155] Y compris Kokura, Moji Tobata Wakamatsu et Yahata (Yawata).
[156] Les données concernant la ville proprement dite se rapportent aux 23 circonscriptions de la vieille ville.
[157] Les chiffres pour l'agglomération urbaine se rapportent à Tokyo-To (préfecture de Tokyo), comprenant les 23 circonscriptions, plus 14 cantons urbains (*Shi*), 18 villes (*machi*) et 8 villages (*mura*). La "zone métropolitaine de Tokyo" comprend les 23 circonscriptions de Tokyo-to, plus 21 municipalités, 20 villes et 2 villages. La "zone métropolitaine de Keihin" (zone métropolitaine de Tokyo-Yokohama) comprend la zone métropolitaine de Tokyo, plus 9 municipalités, dont l'une est Yokohama, et 2 villes; elle comptait 20 485 542 habitants au 1er octobre 1965.
[158] Au 25 avril 1965; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
[159] Y compris la zone maritime et le *Concelho* de Macao.
[160] Non compris la partie du Jammu et Cachemire occupée par le Pakistan dont le statut définitif n'a pas encore été déterminé, ni le Junagardh, le Manavadar, le Gilgit et le Baltistan. Pour les villes du Jammu et Cachemire, voir la note [135].
[161] Au 1er juillet 1971; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
[162] Non compris les personnes de passage à bord de navires ni les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant.
[163] Au 24 octobre 1965; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
[164] Y compris Altindag, Cankaya et Yenimahalle.
[165] Y compris Adalar, Bakirköy, Besistas, Beykoz, Beyoglu, Eminönü, Eyüp, Fatih, Gazi Osmanpasa, Kadiköy, Sariyer, Sisli, Usküdar et Zeytinburnu.
[166] Y compris Karsiyaka.
[167] Les données sont pour l'Etat d'Abu Dhabi.
[168] Y compris Cholon.

(voir page suivante)

8. Population of capital city and cities of 100 000 and more inhabitants (continued) — Population des capitales et des villes de 100 000 habitants et plus (suite)

FOOT-NOTES (continued)

169 Data for cities proper refer to communes which may contain rural area as well as urban centre.
170 Included in the urban agglomeration of Bruxelles.
171 Including Anderlecht and Schaerbeek.
172 For 1 December 1965; for corresponding city proper data, see *Demographic Yearbook 1973*.
173 For 27 September 1965; for corresponding city proper data, see *Demographic Yearbook 1973*.
174 Included in urban agglomeration of Kobenhavn.
175 Includes Frederiksberg and Gentofte.
176 Data for cities proper refer to communes which are centres of urban agglomerations.
177 *De jure* population, but excluding diplomatic personnel outside country and including members of foreign diplomatic personnel not living in embassies or consulates.
178 Included in urban agglomeration of Paris.
179 There is no "city proper" since agglomeration of Hagondange-Briey is made up of several relatively small communes.

180 Data refer to population of French territory of this international agglomeration.
181 Includes Villeurbanne.
182 Data presumably refer to the *agglomération étendue*, comprising the city of Paris, its urban surroundings (Department of Seine and 36 communes in Department of Seine-et-Oise) and the suburban surroundings (98 additional communes in Department of Seine-et-Oise and 6 communes in Department of Seine-et-Marne). The population of the *agglomération étendue* was 7 369 387 at 1962 census. Population of the *complexe résidentiel de l'agglomération de Paris*, comprising also 90 additional communes in Department of Seine-et-Oise, 16 additional communes in Department of Seine-et-Marne and 4 communes in Department of Oise, was 7 735 342 at 1962 census.
183 Included in urban agglomeration of Lille.
184 Included in urban agglomeration of Lyon.
185 Excluding armed forces.
186 Excluding armed forces stationed outside country, but including alien armed forces stationed in the area.
187 Included in urban agglomeration of Athens.
188 For 17 April 1966; for corresponding city proper data, see *Demographic Yearbook 1973*.
189 Excluding non-Maltese armed forces stationed in the area, but including civilian nationals temporarily outside country.
190 Data for cities proper refer to administrative units (municipalities).

191 For 1970. For Lisbon proper and *concelhos* (administrative division) of Almada, Barreiro, Cascais, Loures, Moita, Oeiras, Seikal, Sintra; and *frequezias* (parish area) of Montijo and Vila Franca de Xira.
192 For 1970. For Porto proper and *concelhos* (administrative division) of Espinho, Gondomar, Maia, Motoshinhos, Volongo, Vila Nova de Gaia.

193 For 15 March 1966; for corresponding city proper data, see *Demographic Yearbook 1973*.
194 For 1966. Including the following villes: Codlea, Predeal, Risnov, Sácela and Zárnesti.
195 For 1966. Including the following villes: Eforie, Mangalia and Tekirgiol.
196 Data refer to *municipios* which may contain rural area as well as urban centre.
197 Data for cities proper refer to County Boroughs, Municipal Boroughs and Urban Districts.
198 Greater London Borough included in figure for "Greater London" conurbation.
199 Data refer to West Midlands conurbation, of which Birmingham is the nucleus; includes Solihull, Walsall and Wolverhampton.
200 Capital of Wales for certain purposes.
201 Data refer to West Yorkshire conurbation, of which Leeds is the nucleus; includes Bradford and Huddersfield.
202 Data refer to Merseyside conurbation, of which Liverpool is the nucleus; includes Birkenhead and Wallasey.
203 "Greater London" conurbation as reconstituted in 1965 and comprising 32 new Greater London Boroughs (cf 198).
204 Data refer to South East Lancashire conurbation, of which Manchester is the nucleus; includes Bolton, Oldham, Salford and Stockport.

205 Data refer to Tyneside conurbation, of which Newcastle upon Tyne is the nucleus; includes Gateshead and South Shields.
206 For 9 October 1966; for corresponding city proper data, see *Demographic Yearbook 1973*.

(continued on next page)

NOTES (suite)

169 Les données concernant les villes proprement dites se rapportent à des communes qui peuvent comprendre un centre urbain et une zone rurale.
170 Comprise dans l'agglomération urbaine de Bruxelles.
171 Y compris Anderlecht et Schaerbeek.
172 Au 1er décembre 1965; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
173 Au 27 septembre 1965; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
174 Comprise dans l'agglomération urbaine de Copenhague.
175 Y compris Frederiksberg et Gentofte.
176 Les données concernant les villes proprement dites se rapportent à des communes qui sont des centres d'agglomérations urbaines.
177 Population de droit, mais non compris le personnel diplomatique hors du pays et y compris le personnel diplomatique étranger ne vivant pas dans les ambassades ou consulats.
178 Comprises dans l'agglomération urbaine de Paris.
179 Il n'y a pas de "ville proprement dite", étant donné que l'agglomération d'Hagondange-Briey se compose de plusieurs communes relativement petites.
180 Les données se rapportent aux habitants de cette agglomération internationale qui vivent en territoire français.
181 Y compris Villeurbanne.
182 Les données se rapportent vraisemblablement à l'agglomération étendue, qui comprend la ville de Paris et sa couronne urbaine (département de la Seine et 36 communes du département de Seine-et-Oise) et la couronne suburbaine (98 autres communes du département de Seine-et-Oise et 6 communes de Seine-et-Marne). La population de l'agglomération étendue était de 7 369 387 habitants au recensement de 1962. La population du complexe résidentiel de l'agglomération de Paris, qui comprend également 90 autres communes du département de Seine-et-Oise, 16 autres communes du département de Seine-et-Marne et 4 communes du département de l'Oise, était de 7 735 342 habitants au recensement de 1962.
183 Comprise dans l'agglomération urbaine de Lille.
184 Comprise dans l'agglomération urbaine de Lyon.
185 Non compris les militaires.
186 Non compris les militaires hors du pays, mais y compris les militaires étrangers en garnison sur le territoire.
187 Comprise dans l'agglomération urbaine d'Athènes.
188 Au 17 avril 1966; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
189 Non compris les militaires non maltais en garnison sur le territoire, mais y compris les civils nationaux temporairement hors du pays.
190 Les données concernant les villes proprement dites se rapportent à des unités administratives (municipalités).
191 Pour 1970. Lisbonne proprement dite et *concelhos* (division administrative) d'Almada, Barreiro, Cascais, Loures, Moita, Oeiras, Seikal, Sintra; et *frequezias* (paroisses) de Montijo et Vila Franca de Xira.
192 Pour 1970. Ville de Porto proprement dite et *concelhos* (division administrative) d'Espinho, Gondomar, Maia, Matoshinhos, Valongo, Vila Nova de Gaia.
193 Au 15 mars 1966; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.
194 Pour 1966. Y compris les villes suivantes : Codlea, Predeal, Risnov, Sácele et Zárnesti.
195 Pour 1966. Y compris les villes suivantes : Eforie, Mangalia et Tekirghiol.
196 Les données se rapportent à des *municipios* qui peuvent comprendre un centre urbain et une zone rurale.
197 Les données concernant les villes proprement dites se rapportent à des *County Boroughs, Municipal Boroughs* et *Urban districts*.
198 Le chiffre relatif à l'ensemble urbain du "Grand Londres" comprend le *Greater London Borough*.
199 Les données se rapportent à l'ensemble urbain des West Midlands, dont Birmingham est le centre; y compris Solihull, Walsall et Wolverhampton.
200 Considérée à certain égards comme la capitale du Pays de Galles.
201 Les données se rapportent à l'ensemble urbain du West Yorkshire, dont Leeds est le centre; y compris Bradford et Huddersfield.
202 Les données se rapportent à l'ensemble urbain des rives de la Mersey, dont Liverpool est le centre; y compris Birkenhead et Wallasey.
203 Ensemble urbain du "Grand Londres", tel qu'il a été reconstitué en 1965, comprenant 32 nouveaux *Greater London Boroughs* (voir la note 198).
204 Les données se rapportent à l'ensemble urbain du South East Lancashire, dont Manchester est le centre; y compris Bolton, Oldham, Salford et Stockport.
205 Les données se rapportent à l'ensemble urbain des rives de la Tyne, dont Newcastle upon Tyne est le centre; y compris Gateshead et South Shields.
206 Au 9 octobre 1966; pour le chiffre correspondant relatif à la ville proprement dite, voir l'*Annuaire démographique 1973*.

(voir page suivante)

8. Population of capital city and cities of 100 000 and more inhabitants (continued) — Population des capitales et des villes de 100 000 habitants et plus (suite)

FOOT-NOTES (continued)

[207] For 1971. Comprises Central Clydeside conurbation, of which Glasgow is the nucleus.
[208] Data for urban agglomeration refer to metropolitan areas defined for census purposes and normally comprising city proper (municipality) and contiguous urban areas.
[209] Data are for local government area.
[210] Data for urban agglomeration comprise the Commune of Papeete and the districts of Pirae and Faaa.
[211] For 28 May 1967; for corresponding urban agglomeration data, see *Demographic Yearbook 1973*.
[212] For 15 January 1970; for corresponding urban agglomeration data, see *Demographic Yearbook 1973*.
[213] Includes communities under the authority of the Town Council (city Soviet).
[214] Capital of the Ukrainian Soviet Socialist Republic.
[215] Capital of the Byelorussian Soviet Socialist Republic.

NOTES (suite)

[207] Pour 1971. Y compris l'ensemble urbain central des rives de la Clyde, dont Glasgow est le centre.
[208] Les données relatives aux agglomérations urbaines se rapportent à la zone métropolitaine définie aux fins du recensement, qui comprend généralement la ville proprement dite (municipalité) et la zone urbaine contiguë.
[209] Les données sont pour la zone du gouvernement local.
[210] Les données relatives aux agglomérations urbaines comprennent la commune de Papeete et les districts de Pirae et Faaa.
[211] Au 28 mai 1967; pour le chiffre correspondant relatif à l'agglomération urbaine, voir l'*Annuaire démographique 1973*.
[212] Au 15 janvier 1970; pour le chiffre correspondant relatif à l'agglomération urbaine, voir l'*Annuaire démographique 1973*.
[213] Y compris les communautés qui relèvent du Conseil (Soviet) municipal.
[214] Capitale de la République socialiste soviétique d'Ukraine.
[215] Capitale de la République socialiste soviétique de Biélorussie.

9. Live births and crude live-birth rates, by urban/rural residence: 1970-1974

Naissances vivantes et taux bruts de natalité selon la résidence urbaine/rurale: 1970-1974

[Rates are the number of live births per 1 000 corresponding population. For classification by urban/rural residence see end of table. For definitions of "urban" areas, see end of table 6. Italics indicate data from civil registers which are incomplete or of unknown reliability. For methods of evaluation and limitations of data, see Technical Notes, page 33. Foot-notes and explanation of symbols are shown at end of table. — Les taux représentent le nombre de naissances vivantes pour 1 000 habitants. Pour le classement selon la résidence urbaine/rurale voir la fin du tableau. Pour les définitions des zones "urbaines", se reporter à la fin du tableau 6. Les caractères italiques indiquent qu'il s'agit de données provenant des registres de l'état civil qui sont incomplètes ou dont le degré d'exactitude n'est pas connu. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 78. Les notes et l'explication des signes figurent à la fin du tableau.]

NATALITY

9. Live births and crude live-birth rates, by urban/rural residence (continued) — Naissances vivantes et taux bruts de natalité selon la résidence urbaine/rurale (suite)

FOOT-NOTES

Italics indicate data from civil registers which are incomplete or of unknown reliability.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Civil registration data said to be relatively complete are coded "C", those said to be unreliable (incomplete) are coded "U". The code does not apply to estimated rates. For further details, see Technical Notes.

[2] Data exclude live-born infants dying before registration of birth.

[3] Estimate prepared by the United Nations Population Division for 1965–1970. For recorded rates, where available, for 1970–1974, see page 254.

[4] Data based on baptisms recorded in Roman Catholic church registers.

[5] For classification by urban/rural residence see end of table.

[6] Data are not representative of Ghana as they are for compulsory registration centres only; these numbered 153 in 1969 and served approximately 15 per cent of the total population in 1967 and 35 per cent in 1969.

[7] Data are based on the results of the Demographic Component of the Rural Household Consumption and Expenditure Survey.

[8] Data are based on the results of the Population Growth Survey which commenced in May 1969.

[9] Data are based on births reported to the Registration Office in the Eastern and Western Divisions, together comprising 95 per cent of total population at 1964 census.

[10] Birth registration estimated to be 70 per cent complete.

[11] Comprising the islands of Mauritius, Rodrigues, Agalega and St. Brandon.

[12] Increase due to improvement in registration procedures.

[13] Comprising the former Colony.

[14] Data exclude live-born infants dying within 24 hours of birth.

[15] Estimate, basis unknown.

[16] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

[17] Data are births registered in National Consumers Register established 31 December 1964.

[18] Including residents outside the islands if one or both parents are listed in the population register of Netherlands Antilles. Except for Curaçao, data exclude live-born infants dying before registration of birth.

[19] For Aruba, Bonaire and Curaçao only.

[20] Excluding data for Canal Zone, shown separately hereunder.

[21] Excluding data for Anguilla.

[22] Excluding nomadic Indian tribes.

[23] Excluding Indian jungle population estimated at 31 800 in 1961.

[24] Data are estimates based on current recorded data adjusted upwards according to experience of 1952–1954.

[25] Includes data for East Jerusalem and Israeli residents in certain other territories under occupation by Israeli military forces since June 1967.

[26] Data are for Japanese nationals in Japan only.

[27] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

[28] Beginning May 1967, not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

[29] Data include births to Kuwaiti nationals residing outside Kuwait numbering 299 and 281 in 1969 and 1970 respectively.

(continued on next page)

NOTES

Italiques : Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne des données relativement complètes et la lettre "U" des données discutables (incomplètes) provenant des registres de l'état civil. Le code ne s'applique pas aux taux estimatifs. Pour plus de détails, voir Notes techniques.

[2] Non compris les enfants nés vivants, décédés avant l'enregistrement de leur naissance.

[3] Estimations établies pour la Division de la population de l'Organisation des Nations Unies pour 1965–1970. Pour les taux enregistrés pour 1970–1974, lorsqu'il en existe, voir page 254.

[4] D'après les baptêmes inscrits sur les registres des églises catholiques romaines.

[5] Pour le classement selon la résidence urbaine/rurale voir la fin du tableau.

[6] Les données ne sont pas représentatives de l'ensemble du Ghana, car elles se rapportent à des centres où l'enregistrement est obligatoire; ces centres étaient au nombre de 153 en 1969 et représentaient environ 15 p. 100 de la population totale en 1967 et 35 p. 100 en 1969.

[7] Les données sont basées sur les résultats de "Demographic Component of the Rural Household Consumption and Expenditure Survey".

[8] Les données sont basées sur les résultats de "Population Growth Survey" qui a commencé en mai 1969.

[9] Données fondées sur les naissances déclarées au bureau d'état civil dans les Divisions orientale et occidentale, qui comptaient ensemble 95 p. 100 de la population totale au recensement de 1964.

[10] On estime que 70 p. 100 environ des naissances ont été enregistrées.

[11] Y compris les îles Maurice, Rodrigues, Agalega et St-Brandon.

[12] L'augmentation notable s'explique par l'amélioration des méthodes d'enregistrement.

[13] Désigne l'ancienne colonie.

[14] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

[15] Estimation, base inconnue.

[16] Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

[17] D'après les naissances inscrites sur le registre national des consommateurs, établi le 31 décembre 1964.

[18] Y compris les résidents hors des îles si l'un des parents au moins est inscrit sur le registre de population des Antilles néerlandaises. Sauf pour Curaçao, non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[19] Pour Aruba, Bonaire et Curaçao seulement.

[20] Non compris la zone du Canal, qui fait l'objet d'une rubrique distincte.

[21] Non compris Anguilla.

[22] Non compris les tribus d'Indiens nomades.

[23] Non compris les Indiens de la jungle, soit 31 800 personnes en 1961 (estimation).

[24] Estimations fondées sur les statistiques courantes de l'enregistrement ajustées pour compenser les lacunes en se fondant sur l'expérience de 1952–1954.

[25] Y compris les données pour Jérusalem-Est et les résidents israéliens dans certains autres territoires occupés depuis juin 1967 par les forces armées israéliennes.

[26] Les données ne concernent que les ressortissants japonais se trouvant au Japon.

[27] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

[28] A partir de mai 1967, non compris le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes.

[29] Y compris les naissances survenues parmi les ressortissants du Koweït résidant hors du pays, au nombre de 299 et 281 pour les années 1969 et 1970, respectivement.

(voir page suivante)

9. Live births and crude live-birth rates, by urban/rural residence (continued) — Naissances vivantes et taux bruts de natalité selon la résidence urbaine/rurale (suite)

FOOT-NOTES (continued)

[30] Data are for Lebanese nationals on population register including those living outside country but excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see table 5.

[31] Events recorded by Health Service only.
[32] Birth registration estimated to be about 80 per cent complete in 1952.
[33] Including data for Bangladesh.
[34] Data include reports from sources other than civil registers.

[35] Rates computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.

[36] Births exclude data for nomad population and Palestinian refugees, but rates are computed on total population. See table 5 for number of Palestinian refugees among whom births numbered 5 681 in 1968.

[37] Data relate only to the former Colony of Aden excluding Perim and Kamaran Island, but including military personnel and population of the port.
[38] Excluding Faeroe Islands and Greenland, shown separately.

[39] Including data for nationals temporarily outside country.
[40] Data include births among national armed forces outside country.
[41] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[42] Rates computed on population excluding armed forces.

[43] Data are births registered within one year of occurrence.

[44] Rates computed on population excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside country.
[45] Data are for *de jure* population.
[46] Including births among residents outside country if listed in a Netherlands population register.
[47] Total live births include persons on the Central Register of Population (containing persons belonging to Netherlands population but having no fixed municipality of residence).

[48] Beginning 1971, data exclude Ceuta and Melilla.
[49] Data tabulated by year of occurrence for England and Wales, and by year of registration for Northern Ireland and Scotland.

[50] Including United States military personnel, their dependants and contract employees.
[51] For year ending 1 July.
[52] Excluding United States military personnel, their dependants and contract employees.
[53] Excluding infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 7 days of birth.
[54] Data are based on Sample Registration Scheme and exclude a few states where sampling did not commence until later.
[55] Includes births of unknown residence numbering 17, 12 and 16 for 1971, 1972 and 1973 respectively.
[56] Includes births of unknown residence numbering 193 for 1970.

[57] Excluding births of unknown residence.

(continued on next page)

NOTES (suite)

[30] Les données se rapportent aux ressortissants libanais inscrits sur le registre de la population, y compris ceux qui vivent hors du pays, mais non compris les étrangers non-résidents et les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.
[31] Données enregistrées par le Service de santé seulement.
[32] On estime que 80 p. 100 environ des naissances ont été enregistrées en 1952.
[33] Y compris le Bangladesh.
[34] Les données comprennent des renseignements provenant d'autres sources que le registre de l'état civil.
[35] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant.
[36] Les données ne comprennent pas les naissances survenues parmi la population nomade et les réfugiés de Palestine, mais les taux sont calculés sur la base de la population totale. Voir le tableau 5 pour le nombre de réfugiés de Palestine, parmi lesquels les naissances s'établissent à 5 681 pour 1968.
[37] Les données ne concernent que l'ancienne colonie d'Aden et ne comprennent pas Périm et l'île de Kamaran, mais y compris le personnel militaire et la population du port.
[38] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.
[39] Y compris les nationaux se trouvant temporairement hors du pays.
[40] Y compris les naissances parmi les militaires nationaux hors du pays.
[41] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[42] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.
[43] Les données concernent les naissances enregistrées dans l'année qui suit l'événement.
[44] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire mais qui comprend les civils nationaux temporairement hors du pays.
[45] Population de droit.
[46] Y compris les naissances survenues parmi les résidents hors du pays, s'ils sont incrits sur un registre de population néerlandais.
[47] Le total des naissances vivantes comprend les personnes inscrites sur le Registre central de la population (c'est-à-dire compte tenu des personnes qui font partie de la population néerlandaise mais qui n'ont pas de domicile fixe dans une municipalité).
[48] A partir 1971, non compris Ceuta et Mélilla.
[49] Les données sont exploitées selon l'année de l'événement pour l'Angleterre et le pays de Galles et selon l'année de l'enregistrement pour l'Irlande du Nord et l'Ecosse.
[50] Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.
[51] Période annuelle se terminant le 1er juillet.
[52] Non compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.
[53] Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 cm et décédés dans les sept jours qui ont suivi leur naissance.
[54] Données fournies par le Programme d'enregistrement pilote; non compris certains états où ce programme n'a commencé qu'ultérieurement.
[55] Y compris les naissances d'enfants dont on ignore la résidence : 17 en 1971, 12 en 1972 et 16 en 1973.
[56] Y compris les naissances d'enfants dont on ignore la résidence : 193 en 1970.
[57] Non compris les naissances d'enfants dont on ignore la résidence.

(voir page suivante)

FOOT-NOTES

Italics indicate data from civil registers which are incomplete or of unknown reliability.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data exclude live-born infants dying before registration of birth.

[2] Excluding data for the two Departments of the Sahara.

[3] Data are estimates based on births reported for 12-month period preceding 1959–1960 sample survey described in table 2. Data relate to women aged 14–49 years only and exclude approximately 15 per cent of total population, not covered by survey.

[4] For classification by urban/rural residence see end of table.

[5] Data are estimates based on births reported for 12-month period preceding 1963–1964 sample survey described in table 2. Data relate to women aged 15–49 years only and exclude approximately 22 per cent of total population, not covered by survey.

[6] Data are estimates based on births reported for 12-month period preceding 1960–1961 sample survey described in table 2. Data relate to women aged 15–49 years only and exclude approximately 25 per cent of total population, not covered by survey.

[7] Because of rounding, total is not the sum of the parts.

[8] Data are estimates based on births reported for 12-month period preceding 1961 sample survey described in table 2. Data relate to women aged 15–54 years only and exclude slightly more than 1 per cent of total population, not covered by survey.

[9] Data are estimates based on births reported for 12-month period preceding October 1960–May 1961 sample survey. Data relate to women aged 15–49 years only.

[10] Data are estimates based on births reported for 12-month period preceding 15 January–31 May 1955 sample survey.

[11] Data are based on the results of the Population Growth Survey.

[12] For 10 years and over and 10–14 years, as appropriate.

[13] Data are believed to be complete only for Tananarive.

[14] Age classification based on difference between year of birth of mother and year of birth of child.

[15] Data are estimates based on births reported for 12-month period preceding 1961 sample survey.

[16] Summation of frequencies for age groups give total of 84 170 for both sexes, 41 315 for male and 42 855 for female; reason for discrepancies not ascertained.

[17] For under 17 and 17–19 years, as appropriate.

[18] Data are estimates based on births reported for 12-month period preceding January 1964–January 1965 sample survey. Date relate to women aged 10–49 years only.

(continued on next page)

NOTES

Italiques : données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[2] Non compris les deux départements du Sahara.

[3] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage de 1959–1960 dont il est question au tableau 2. Les données se rapportent exclusivement à la population féminine âgée de 14 à 49 ans. Non compris environ 15 p. 100 de la population totale, sur qui l'enquête n'a pas porté.

[4] Pour le classement selon la résidence urbaine/rurale voir la fin du tableau.

[5] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage de 1963–1964 dont il est question au tableau 2. Les données se rapportent exclusivement à la population féminine âgée de 15 à 49 ans. Non compris environ 22 p. 100 de la population totale, sur qui l'enquête n'a pas porté.

[6] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage de 1960–1961 dont il est question au tableau 2. Les données se rapportent exclusivement à la population féminine âgée de 15 à 49 ans. Non compris environ 25 p. 100 de la population totale, sur qui l'enquête n'a pas porté.

[7] Les chiffres étant arrondis, les totaux ne correspondent pas à la somme des chiffres partiels.

[8] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage de 1961 dont il est question au tableau 2. Les données se rapportent exclusivement à la population féminine âgée de 15 à 54 ans. Non compris un peu plus de 1 p. 100 de la population totale, sur qui l'enquête n'a pas porté.

[9] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage d'octobre 1960–mai 1961. Les données se rapportent exclusivement à la population féminine âgée de 15 à 49 ans.

[10] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage qui a eu lieu du 15 janvier au 31 mai 1955.

[11] Les données sont basées sur les résultats de "Population Growth Survey."

[12] Plus de 10 ans et 10–14 ans, selon le cas.

[13] On pense que les données ne sont complètes que pour Tananarive.

[14] La classification par âge repose sur la différence entre l'année de naissance de la mère et l'année de naissance de l'enfant.

[15] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage de 1961.

[16] La somme des fréquences par groupes d'âge donne un total de 84 170 personnes pour les deux sexes, soit 41 315 personnes du sexe masculin et 42 855 du sexe féminin; on ne sait pas comment s'explique cette divergence.

[17] Moins de 17 ans et 17–19 ans, selon le cas.

[18] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage de janvier 1964–janvier 1965. Les données se rapportent exclusivement à la population féminine âgée de 10 à 49 ans.

(voir page suivante)

10. Live births by age of mother, by sex and by urban/rural residence (continued) — Naissances vivantes selon l'âge de la mère, selon le sexe et selon la résidence urbaine/rurale (suite)

FOOT-NOTES (continued)

[19] Data are estimates based on births reported for 12-month period preceding June 1955–December 1957 survey.
[20] Excluding data for Newfoundland. Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[21] Data are births recorded in the National Register of Consumers.
[22] For 10–14 years.
[23] Data are confinements resulting in live births.
[24] Data are for Aruba, Bonaire and Curaçao only. Including residents outside the islands if listed in the population register of Netherlands Antilles. Except for Curaçao, data exclude live-born infants dying before registration of birth.
[25] Excluding data for Canal Zone, shown separately hereunder.
[26] Excluding data for Anguilla.
[27] For under 18 years and 18–19 years, as appropriate.
[28] Data are baptisms recorded in Roman Catholic church registers.

[29] Excluding nomadic Indian tribes.
[30] Excluding Amerindian population.
[31] Data are for an area covered by 44 Health Units and 76 Health "Posts" which is not representative of Paraguay and for which population is not available.
[32] Excluding Indian jungle population estimated at 100 830 in 1961. Data include an upward adjustment for under-registration.

[33] Data are based on a 10 per cent sample of recorded births.

[34] Excluding Indian jungle population estimated at 31 800 in 1961.
[35] Data are for 50 towns having a population of approximately 2 million.

[36] Data are estimates based on current recorded data adjusted upward according to experience of 1952–1954.
[37] Excluding live births of unknown legitimacy.
[38] Data are for 66 towns having a population of over 100 000 each and a total population of 24 700 000.
[39] Note suppressed.
[40] Data are results of the Socio-Economic National Sample Survey 1964–1965. Excluding Djakarta Raja (capital), Nusa Tenggara Timur (eastern part of Lesser Sunda Islands including Indonesian Timor) and Maluku (Moluccas).

[41] Summation of frequencies for age groups give total of 3 182 617; reason for discrepancy not ascertained.
[42] Data are for Japanese nationals in Japan only.

[43] Excluding data for Jordanian territory under occupation since June 1967 by Israeli military forces.
[44] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.
[45] Data are estimates based on births reported for 12-month period preceding April 1959 sample survey in 345 villages.

[46] Includes 281 births to Kuwaiti nationals residing outside the country.

[47] Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.
[48] Excluding non-locally domiciled military and civilian service personnel and their dependants.
[49] Data are based on the unadjusted figures from the Turkish Demographic Survey.
[50] Excluding Faeroe Islands and Greenland, shown separately.

[51] Including data for nationals temporarily outside the country.
[52] Data include births among armed forces outside the country.
[53] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[54] *Data are births registered within one year of occurrence.*
[55] Birth are for *de jure* population.
[56] Including births among residents outside the country if listed in a Netherlands population register.
[57] Excluding data for Ceuta and Melilla.
[58] Data exclude live-born infants dying within 24 hours of birth.

(continued on next page)

NOTES (suite)

[19] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage de juin 1955–décembre 1957.
[20] Non compris Terre-Neuve. Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.
[21] D'après les naissances inscrites au Registre national des consommateurs.
[22] Pour le groupe d'âge 10–14 ans.
[23] Les données se rapportent aux accouchements d'enfants vivants.
[24] Aruba, Bonaire et Curaçao seulement. Y compris les résidents hors du territoire s'ils sont inscrits sur le registre de population des Antilles néerlandaises. Sauf pour Curaçao, non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[25] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte.
[26] Non compris Anguilla.
[27] Moins de 18 ans et 18–19 ans, selon le cas.
[28] Les données sont fondées sur les baptêmes inscrits sur les registres des églises catholiques romaines.
[29] Non compris les tribus d'Indiens nomades.
[30] Non compris les Amérindiens.
[31] Les données se rapportent à une zone couverte par 44 unités sanitaires et 76 "postes" sanitaires, qui n'est pas représentative du Paraguay et dont on ne connaît pas la population.
[32] Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation). Les données ont été ajustées pour combler les lacunes de l'enregistrement.
[33] Les données sont fondées sur un échantillon de 10 p. 100 des naissances enregistrées.
[34] Non compris les Indiens de la jungle, au nombre de 31 800 en 1961.
[35] Les données se rapportent à 50 villes représentant au total environ 2 millions de personnes.
[36] Estimations fondées sur les statistiques courantes ajustées, pour compenser les lacunes de l'enregistrement, d'après l'expérience de 1952–1954.
[37] Non compris les naissances vivantes dont on ignore si elles sont légitimes.
[38] Les données se rapportent à 66 villes de plus de 100 000 habitants, représentant au total 24 700 000 personnes.
[39] Note supprimée.
[40] Les données sont fondées sur les résultats de l'enquête nationale socio-économique par sondage de 1964–1965. Non compris le district de Djakarta, les petites îles de la Sonde orientale dont Timor (Nusa Tenggara Timur), et les Moluques.
[41] La somme des fréquences par groupes d'âge donne un total de 3 182 617; on ne sait pas comment s'explique la divergence.
[42] Les données ne concernent que les ressortissants japonais se trouvant au Japon.
[43] Non compris le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes.
[44] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.
[45] Estimations fondées sur les naissances déclarées pour la période de 12 mois qui a précédé l'enquête par sondage d'avril 1959, qui a porté sur 345 villages.
[46] Y compris 281 naissances survenues parmi les ressortissants du Koweït résidant hors du pays.
[47] Les données sont basées sur les résultats de "Population Growth Survey" de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.
[48] Non compris les militaires et agents civils non résidents et les membres de leur famille les accompagnant.
[49] Données d'après les chiffres non révisés provenant de l'enquête démographique turque.
[50] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.
[51] Y compris les nationaux se trouvant temporairement hors du pays.
[52] Y compris les naissances parmi les militaires hors du pays.
[53] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[54] Naissances enregistrées dans l'année qui suit l'événement.
[55] Naissances survenues dans la population de droit.
[56] Y compris les naissances parmi les résidents hors du pays, s'ils sont inscrits sur un registre de population néerlandais.
[57] Non compris les données pour Ceuta et Melilla.
[58] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

(voir page suivante)

10. Live births by age of mother, by sex and by urban/rural residence (continued) — Naissances vivantes selon l'âge de la mère, selon le sexe et selon la résidence urbaine/rurale (suite)

FOOT-NOTES (continued)

[9] Births to mothers of unknown age have been proportionately distributed among known ages; these numbered in 1973, 1 438 for both sexes (784 for males and 654 for females).

[60] Including United States military personnel, their dependants and contract employees.
[61] Excluding United States military personnel, their dependants and contract employees.
[62] Data exclude infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 7 days of birth.
[63] Excluding births of unknown residence.
[64] Data exclude persons on the Central Register of Population (containing persons belonging in the Netherlands population but having no fixed municipilatiy of residence).

NOTES (suite)

[59] Les naissances parmi les mères d'âge inconnu ont été réparties proportionnellement entre les groupes d'âge indiqués. Ces naissances étaient au nombre de 654 pour les deux sexes en 1973, soit 1 438 du sexe masculin et 784 du sexe féminin.
[60] Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.
[61] Non compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.
[62] Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les sept jours qui ont suivi leur naissance.
[63] Non compris les naissances d'enfants dont on ignore la résidence.
[64] Les données ne tiennent pas compte des personnes inscrites sur le Registre central de la population (personnes appartenant à la population néerlandaise mais sans résidence fixe dans l'une des municipalités).

11. Marriages and crude marriage rates, by urban/rural residence: 1970-1974

Mariages et taux bruts de nuptialité, selon la résidence urbaine/rurale: 1970-1974

[Rates are the number of legal (recognized) marriages performed and registered, i.e., excluding unions established by mutual consent or by tribal or native custom, per 1 000 population. For classification by urban/rural residence see end of table. For definitions of "urban" areas, see end of table 6. Italics indicate data from civil registers which are incomplete or of unknown reliability. For method of evaluation and limitations of data, see Technical Notes, page 35. Foot-notes and explanation of symbols are shown at end of table. — Les taux représentent le nombre de mariages reconnus par la loi — c'est-à-dire non compris les unions formées par consentement mutuel ou selon la coutume tribale ou indigène — qui ont été célébrés pour 1 000 habitants. Pour le classement selon la résidence urbaine/rurale voir la fin du tableau. Pour la définition des zones "urbaines", voir à la fin du tableau 6. Les caractères italiques indiquent qu'il s'agit de données provenant des registres de l'état civil qui sont incomplètes ou dont le degré d'exactitude n'est pas connu. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 81. Les notes et l'explication des signes figurent à la fin du tableau.]

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data said to be relatively complete are coded "C", those said to be unreliable (incomplete) are coded "U". For further details, see Technical Notes.

[2] Data include marriages resumed after "revocable divorce", which is roughly equivalent to legal separation.

[3] Rate is based on the results of the Population Growth Survey which commenced in May 1969.

[4] Data are marriages reported to the Registration Office in the Eastern and Western Divisions, together comprising 95 per cent of total population at 1964 census.

[5] Registration not compulsory; believed to be complete for non-African population only, which represents a relatively small proportion of the total.

[6] For Asiatic, Coloured and European population.

[7] For classification by urban/rural residence see end of table.

[8] For Aruba, Bonaire and Curaçao only.

[9] Excluding data for Canal Zone, shown separately hereunder; also excluding tribal Indian population, numbering 62 187 in 1960.

[10] Data are marriage licences issued.

[11] Excluding data for Anguilla.

[12] Data for 1970 and 1971 are for 25 state capitals; data for 1972 are for 21 state capitals.

[13] Except for Bogotá, data are marriages recorded in Roman Catholic church registers only.

[14] Excluding nomadic Indian tribes.

[15] Excluding Indian jungle population.

[16] Data are estimates based on annual survey of marriage and divorce initiated in mid-1964. Turkish marriages are excluded.

[17] Fluctuations in figures reflect prejudice against leap-year marriages.

(continued on next page)

NOTES

Italiques : Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne des données relativement complètes et la lettre "U" des données discutables (incomplètes). Pour plus de détails, voir Notes techniques.

[2] Y compris les unions reconstituées après un "divorce révocable", qui est à peu près l'équivalent d'une séparation légale.

[3] Le taux est basé sur les résultats de "Population Growth Survey" qui a commencé en mai 1969.

[4] Mariages déclarés au bureau d'état civil des divisions orientale et occidentale, qui comptaient ensemble 95 p. 100 de la population totale au recensement de 1964.

[5] L'enregistrement des mariages n'est pas obligatoire; on pense qu'il n'est complet que pour la population non africaine, qui représente une fraction relativement faible de la population totale.

[6] Asiatiques, personnes de couleur et Européens.

[7] Pour le classement selon la résidence urbaine/rurale, voir la fin du tableau.

[8] Pour Aruba, Bonaire et Curaçao seulement.

[9] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte; non compris également les Indiens vivant en tribus, au nombre de 62 187 en 1960.

[10] Statistiques établies d'après le nombre d'autorisations de mariage délivrées.

[11] Non compris Anguilla.

[12] Les données pour 1970 et 1971 se rapportent à 25 capitales des états; et pour 1972 à 21 capitales des états.

[13] Sauf pour Bogota, les statistiques sont établies d'après le nombre de mariages inscrits sur les registres des églises catholiques romaines.

[14] Non compris les tribus d'Indiens nomades.

[15] Non compris les Indiens de la jungle.

[16] Estimations fondées sur l'enquête annuelle sur les mariages et les divorces entreprise au milieu de l'année 1964. Non compris les mariages turcs.

[17] Les fluctuations des chiffres traduisent des préjugés contre les mariages célébrés les années bissextiles.

(voir page suivante)

11. Marriages and crude marriage rates, by urban/rural residence (continued) — Mariages et taux bruts de nuptialité, selon la résidence urbaine/rurale (suite)

FOOT-NOTES (continued)

[18] Marriages are for Japanese nationals in Japan only.
[19] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.
[20] Not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.
[21] Excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see table 5.
[22] Data include marriages under Christian marriage ordinance.

[23] Rates computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.

[24] Kandyan marriages are completely registered; registration of Moslem and general marriages is incomplete.
[25] Date exclude nomads, estimated at 179 722 at end of 1956 but rates computed on population including them.

[26] Excluding aliens temporarily in the area.
[27] Data include marriages among armed forces stationed outside the country and alien armed forces in the area unless performed by local foreign authority.
[28] Data include marriages of Bulgarian nationals outside the country, but exclude those of aliens in the area.
[29] Excluding Faeroe Islands and Greenland, shown separately.

[30] Data relate only to marriages in which the bride was domiciled in Finland.

[31] Including armed forces stationed outside the country. Rates computed on population excluding alien armed forces living in military camps within the country.
[32] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[33] Rates computed on population excluding armed forces.

[34] Data are for *de jure* population.
[35] Data include marriages among armed forces stationed outside the country, but rates computed on population excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside the country.
[36] Including persons on the Central Register of Population (containing persons Belonging to Netherlands population, but having no fixed municipality of residence).
[37] Data are marriages in which the groom was domiciled in Norway.

[38] Beginning 1971, excluding Ceuta and Melilla.
[39] Including United States military personnel, their dependants and contract employees.
[40] Data are for years ending 1 July.

[41] Includes marriages of unknown residence numbering 1 147,192 and 567 respectively in 1971, 1972 and 1973.
[42] Excluding marriages of unknown residence.

NOTES (suite)

[18] Les mariages ne concernent que les nationaux japonais au Japon.
[19] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.
[20] Non compris les données pour le territoire jordanien occupé par les forces armées israéliennes depuis juin 1967.
[21] Non compris les étrangers non résidents ni les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.
[22] Y compris les mariages célébrés conformément à la *Christian marriage ordinance*.
[23] Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant.
[24] Tous les mariages de Kandyens sont enregistrés; l'enregistrement des mariages musulmans et des autres mariages est incomplet.
[25] Non compris la population nomade, soit 179 722 personnes à la fin de 1956 (estimation); toutefois, les taux sont calculés sur la base d'un chiffre de population qui comprend les nomades.
[26] Non compris les étrangers se trouvant temporairement sur le territoire.
[27] Y compris les mariages de militaires nationaux hors du pays et les mariages de militaires étrangers en garnison sur le territoire, sauf s'ils ont été célébrés par l'autorité étrangère locale.
[28] Y compris les mariages de nationaux bulgares à l'étranger, mais non compris les mariages d'étrangers sur le territoire.
[29] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.
[30] Les données ne concernent que les mariages où l'épouse était domiciliée en Finlande.
[31] Y compris les militaires nationaux hors du pays. Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires étrangers en garnison sur le territoire.
[32] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[33] Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.
[34] Population de droit.
[35] Y compris les mariages de militaires en garnison hors du pays; toutefois, les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire mais qui comprend les civils nationaux temporairement hors du pays.
[36] Y compris les personnes inscrites sur le Registre central de la population (personnes qui font partie de la population néerlandaise, mais qui n'ont pas de domicile fixe dans l'une des municipalités).
[37] Les données ne concernent que les mariages où l'époux était domicilié en Norvège.
[38] A partir de 1971, non compris Ceuta et Melilla.
[39] Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.
[40] Les données se rapportent à des périodes annuelles se terminant le 1er juillet.
[41] Y compris les mariages pour lesquels le lieu de résidence n'est pas connu, au nombre de 1 147 en 1971, 192 en 1972 et 567 en 1973.
[42] Non compris les mariages pour lesquels le lieu de résidence n'est pas connu.

12. Marriages by age of bridegroom and by age of bride: latest available year

Mariages selon l'âge de l'époux et selon l'âge de l'épouse: dernière année disponible

[Data are legal (recognised) marriages performed and registered, i.e., excluding unions established by mutual consent or by tribal or native custom. Italics indicate data from civil registers which are incomplete or of unknown reliability. For method of evaluation and limitations of data, see Technical Notes, page 36. Foot-notes and explanation of symbols are shown at end of table. — Les données représentent le nombre de mariages reconnus par la loi, c'est-à-dire non compris les unions formées par consentement mutuel ou selon la coutume tribale ou indigène. Les caractères italiques indiquent qu'il s'agit de données provenant des registres de l'état civil qui sont incomplètes ou dont le degré d'exactitude n'est pas connu. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 82. Les notes et l'explication des signes figurent à la fin du tableau.]

12. Marriages by age of bridegroom and by age of bride (continued) — Mariages selon l'âge de l'époux et selon l'âge de l'épouse (suite)

FOOT-NOTES

Italics indicate data from civil registers which are incomplete or of unknown reliability.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Age below which marriage is unlawful or invalid without dispensation by competent authority.

[2] Excluding marriages in the two Departments of the Sahara, numbering 102.

[3] Data are marriages recorded in Roman Catholic church registers only.

[4] For under 16 years, 16–21 years and 22 years and over, as appropriate.

[5] Data include marriages resumed after "revocable divorce" which is roughly equivalent to legal separation. These resumed marriages numbered 6 454 in 1965.

[6] Age classification based on difference between year of birth and year of marriage.

[7] For under 18 years and 18–19 years, as appropriate.

[8] For under 16 years and 16–19 years, as appropriate.

[9] For under 17 years and 17–19 years, as appropriate.

[10] Varies among major civil divisions, or ethnic or religious groups.

[11] Including marriages of residents outside the country.

[12] Data are for Aruba, Bonaire and Curaçao only.

[13] For under 21 years and 21 years and over, as appropriate.

[14] Excluding data for Canal Zone; also excluding tribal Indian population numbering 62 187 in 1960.

[15] Data are for 40 States only. They are not to be considered as necessarily representative of the country.

[16] Data are based on returns of sample marriage records.

[17] Except for Bogotá, data are marriages recorded in Roman Catholic church registers only.

[18] Excluding nomadic Indian tribes.

[19] Data are for mainly Christian marriages and exclude some marriages performed under the Indian Labour Ordinance.

[20] Excluding Indian jungle population, estimated at 100 830 in 1961.

[21] Excluding Indian jungle population, estimated at 31 800 in 1961.

[22] Excluding data for Turkish marriages.

[23] Data are estimates based on annual survey on marriage and divorce initiated in mid-1964.

[24] For under 21 years, 21–25 years, 26–30 years, 31–40 years, 41–50 years, 51–60 years and 61 years and over, as appropriate.

[25] No minimum age has been fixed for males.

[26] Data are marriages of Japanese nationals in Japan only and refer to brides and grooms married for the first time whose marriages occurred during 1972 and 1973 and were registered in 1973.

[27] Excluding foreigners but including Palestinian refugees, numbering 722 687 at 31 May 1967.

[28] Excluding data for Jordanian territory under occupation since June 1967 by Israeli military forces.

[29] Data are non-Moslem civil marriages and Christian ritual marriages only.

[30] Data are for 21 provinces and the prefecture of Saigon.

[31] For under 18 years, 18–20 years and 21–24 years, as appropriate.

[32] Excluding aliens temporarily in the area.

[33] Including marriages among armed forces stationed outside the country, and among alien armed forces in the area unless performed by local foreign authority.

[34] Including marriages of Bulgarian nationals outside the country but excluding those of aliens in the area.

[35] Excluding Faeroe Islands and Greenland.

[36] Data are marriages in which the bride was domiciled in Finland.

(continued on next page)

NOTES

Italiques : Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] Age au-dessous duquel le mariage est illégal ou nul en l'absence d'une dispense accordée par l'autorité compétente.

[2] Non compris les mariages pour les deux départements du Sahara, au nombre de 102.

[3] Les données ne concernent que les mariages inscrits sur les registres des églises catholiques romaines.

[4] Moins de 16 ans, 16–21 ans et 22 ans et plus, selon le cas.

[5] Y compris les unions reconstituées après un "divorce révocable", qui est à peu près l'équivalent d'une séparation légale. Le nombre de ces "remariages" était de 6 454 en 1965.

[6] La classification selon l'âge est fondée sur la différence entre l'année de naissance et l'année du mariage.

[7] Moins de 18 ans et 18–19 ans, selon le cas.

[8] Moins de 16 ans et 16–19 ans, selon le cas.

[9] Moins de 17 ans et 17–19 ans, selon le cas.

[10] Varie selon les grandes divisions administratives ou selon les groupes ethniques ou religieux.

[11] Les données comprennent des mariages de résidents vivant hors du pays.

[12] Aruba, Bonaire et Curaçao seulement.

[13] Moins de 21 ans et 21 ans et plus, selon le cas.

[14] Non compris la zone du Canal; non compris également les Indiens vivant en tribus, au nombre de 62 187 en 1960.

[15] Les données se rapportent à 40 Etats seulement. Elles ne sont donc pas nécessairement représentatives de l'ensemble des Etats-Unis.

[16] Les données sont fondées sur un échantillon extrait des registres de mariages.

[17] Sauf pour Bogotá, les données ne concernent que les mariages inscrits sur les registres des églises catholiques romaines.

[18] Non compris les tribus d'Indiens nomades.

[19] Les données concernent principalement les mariages chrétiens et ne comprennent pas certains mariages célébrés en vertu de l'*Indian Labour Ordinance*.

[20] Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

[21] Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

[22] Non compris les mariages turcs.

[23] Les données sont les estimations établies d'après l'enquête annuelle sur les mariages et les divorces entreprise pour la première fois au milieu de 1964.

[24] Moins de 21 ans, 21–25 ans, 26–30 ans, 31–40 ans, 41–50 ans, 51–60 ans et 61 ans et plus, selon le cas.

[25] Il n'y a pas d'âge minimum pour les hommes.

[26] Les données ne concernent que les ressortissants japonais se trouvant au Japon et les époux et épouses mariés pour la première fois, dont le mariage a été célébré en 1972 ou en 1973 et enregistré en 1973.

[27] Non compris les étrangers, mais y compris les réfugiés de Palestine, au nombre de 722 687 au 31 mai 1967.

[28] Non compris les données pour le territoire jordanien occupé depuis juin 1967 par les forces israéliennes.

[29] Les données se rapportent aux mariages civils non musulmans et aux mariages célébrés selon le rite chrétien seulement.

[30] Les données concernent 21 provinces et la préfecture de Saigon.

[31] Moins de 18 ans, 18–20 ans et 21–24 ans, selon le cas.

[32] Non compris les étrangers temporairement sur le territoire.

[33] Y compris les mariages de militaires nationaux hors du pays et les mariages de militaires étrangers en garnison sur le territoire, sauf s'ils ont été célébrés par l'autorité étrangère locale.

[34] Y compris les mariages de nationaux bulgares à l'étranger, mais non compris les mariages d'étrangers sur le territoire.

[35] Non compris les îles Féroé et le Groenland.

[36] Les données ne concernent que les mariages où l'épouse était domiciliée en Finlande.

(voir page suivante)

12. Marriages by age of bridegroom and by age of bride (continued) — Mariages selon l'âge de l'époux et selon l'âge de l'épouse (suite)

FOOT-NOTES (continued)

[37] Including armed forces stationed outside the country.
[38] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[39] Marriages are for *de jure* population.
[40] Data are marriages in which the groom was domiciled in Norway.

[41] Excluding data for Ceuta and Melilla.
[42] For civil marriages only. Canonical marriages are not valid under 16 years for males and 14 years for females.
[43] 276 bridegrooms and 338 brides of unknown age have been proportionally distributed in age groups 21 years and over.

NOTES (suite)

[37] Y compris les militaires hors du pays.
[38] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[39] Les données concernent les mariages parmi la population de droit.
[40] Les données ne concernent que les mariages où l'époux était domicilié en Norvège.
[41] Non compris les données pour Ceuta et Melilla.
[42] Mariages civils seulement. Les mariages religieux sont nuls au-dessous de 16 ans pour les hommes et de 14 ans pour les femmes.
[43] On a réparti proportionnellement entre les groupes d'âge de plus de 21 ans 276 époux et 338 épouses d'âge inconnu.

13. Divorces and crude divorce rates: 1970-1974

Divorces et taux bruts de divortialité: 1970-1974

[Rates are the number of final divorce decrees granted under civil law, per 1 000 population. Annulments and legal separations are excluded, unless otherwise specified. Italics indicate data from civil registers which are incomplete or of unknown reliability. For method of evaluation and limitations of data, see Technical Notes, page 37. Foot-notes and explanation of symbols are shown at end of table. — Les taux représentent le nombre de jugements de divorce définitifs prononcés par les tribunaux pour 1 000 habitants. Sauf indication contraire, il n'est pas tenu compte des annulations, ni des séparations légales. Les caractères italiques indiquent qu'il s'agit de données provenant des registres de l'état civil qui sont incomplètes ou dont le degré d'exactitude n'est pas connu. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 83. Les notes et l'explication des signes figurent à la fin du tableau.]

FOOT-NOTES

Italics indicate data from civil registers which are incomplete or of unknown reliability.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data said to be relatively complete are coded "C", those said to be unreliable (incomplete) are coded "U". For further details, see Technical Notes.

[2] Data include annulments.

[3] Data include "revocable divorces" (among Moslem population), which approximate legal separations.

[4] Data are divorces reported to the Registration Office in the Eastern and Western Divisions, together comprising 95 per cent of total population at 1964 census.

[5] Data include annulments and legal separations.

[6] For Asiatic, Coloured and European population.

[7] Due to a change in the law, divorces for persons married outside the country are no longer granted.

[8] For Aruba, Bonaire and Curaçao only.

[9] Excluding data for Canal Zone, shown separately hereunder; also excluding tribal Indian population, numbering 62 187 in 1960.

[10] There is no legal provision for "divorce" in the sense used here.

[11] Data are estimates based on divorces and annulments reported by a varying number of States.

[12] Data include annulments. High numbers attributable to divorces among non-permanent residents.

[13] Excluding nomadic Indian tribes.

[14] Excluding Indian jungle population.

[15] Data are estimates based on annual survey on marriage and divorce initiated in mid–1964.

[16] Data are for Japanese nationals in Japan only.

NOTES

Italiques : Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne des données relativement complètes et la lettre "U" des données discutables (incomplètes). Pour plus de détails, voir Notes techniques.

[2] Y compris les annulations.

[3] Les données comprennent les "divorces révocables" (parmi la population musulmane), qui sont à peu près l'équivalent de séparations légales.

[4] Divorces déclarés au Bureau d'état civil des divisions orientale et occidentale, qui comptaient ensemble 95 p. 100 de la population totale au recensement de 1964.

[5] Y compris les séparations légales et les annulations.

[6] Asiatiques, personnes de couleur et Européens.

[7] A cause d'une modification dans la loi, les divorces ne sont plus accordés aux personnes mariées hors du pays.

[8] Pour Aruba, Bonaire et Curaçao seulement.

[9] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte; non compris également les Indiens vivant en tribus, au nombre de 62 187 en 1960.

[10] La loi ne prévoit pas le "divorce" au sens où on l'entend ici.

[11] Les données sont des estimations établies d'après les chiffres (divorces et annulations) communiqués par un nombre variable d'Etats.

[12] Y compris les annulations. Les divorces parmi les résidents non permanents ont contribué au relèvement des taux.

[13] Non compris les tribus d'Indiens nomades.

[14] Non compris les Indiens de la jungle.

[15] Estimations fondées sur l'enquête annuelle sur les mariages et les divorces entreprise au milieu de l'année 1964.

[16] Les données ne concernent que les ressortissants japonais au Japon.

13. Divorces and crude divorce rates (continued) — Divorces et taux bruts de divortialité (suite)

FOOT-NOTES (continued)

[17] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.
[18] Data are not included for Jordanian territory under occupation since June 1967 by Israeli military forces.
[19] Excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see table 5.
[20] Excluding divorces among Moslem population.
[21] Data exclude nomads, estimated at 179 722 at end of 1956, but rates computed on population including them.

[22] Excluding aliens temporarily in the area.
[23] Data include divorces among armed forces stationed outside the country and among alien armed forces in the area.
[24] Data include divorces of Bulgarian nationals living outside the country, but exclude those of aliens in the area.
[25] Excluding the Faeroe Islands shown separately and Greenland.

[26] Including nationals temporarily outside the country.
[27] Rates computed on population including armed forces stationed outside the country but excluding alien armed forces living in military camps within the country.
[28] The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[29] Excluding full-blooded aborigines estimated at 49 036 in June 1966.

NOTES (suite)

[17] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.
[18] Non compris les données pour le territoire jordanien occupé par les forces armées israéliennes depuis juin 1967.
[19] Non compris les étrangers non résidents ni les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.
[20] Non compris les divorces parmi la population musulmane.
[21] Non compris la population nomade, soit 179 722 personnes à la fin de 1956 (estimation); toutefois, les taux sont calculés sur la base d'un chiffre de population qui comprend les nomades.
[22] Non compris les étrangers se trouvant temporairement sur le territoire.
[23] Y compris les divorces de militaires nationaux hors du pays et les divorces de militaires étrangers en garnison sur le territoire.
[24] Y compris les divorces de nationaux bulgares hors du pays, mais non compris les divorces d'étrangers sur le territoire.
[25] Non compris les îles Féroé, qui font l'objet d'une rubrique distincte, ni le Groenland.
[26] Y compris les nationaux temporairement hors du pays.
[27] Taux calculés sur la base d'un chiffre de population qui comprend les militaires nationaux hors du pays, mais non les militaires étrangers en garnison sur le territoire.
[28] Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[29] Non compris les aborigènes purs, soit 49 036 personnes en juin 1966 (estimation).

14. International arrivals and departures: 1967-1973

[Unless otherwise specified, statistics refer to nationals and aliens arriving or departing over national boundaries by any means of transport. Frontier traffic is excluded, wherever possible. For definitions and limitations of data see Technical Notes, pages 37. Foot-notes and explanation of symbols are shown at end of table.]

14. Entrées et sorties internationales: 1967-1973

[Sauf indication contraire, les données se rapportent aux nationaux et étrangers qui entrent dans le pays ou qui en sortent par n'importe quel moyen de transport. En principe le trafic de frontière n'est pas compris. Pour les définitions et les insuffisances des données, voir Notes techniques, page 84. Les notes et explications des signes figurent à la fin du tableau.]

14. Arrivals and departures (continued)

Entrées et sorties (suite)

FOOT-NOTES

* Provisional.
[1] Data exclude arrivals and departures by land.
[2] For 12 months beginning 1 July of year stated.
[3] Excluding West Africans arriving and departing by land.

[4] Prior to 1968, data exclude departures to and arrivals from Uganda and the United Republic of Tanzania.
[5] Data include traffic between Rodrigues and the Island of Mauritius but exclude transit visitors and seamen.
[6] Data include traffic between Ascension Island and St. Helena.
[7] Data are for Europeans, Asians and Coloureds only.
[8] Data exclude arrivals from and departures to Kenya and the United Republic of Tanzania.
[9] Data exclude arrivals from and departures to Kenya, Uganda and Zanzibar.

[10] Data exclude undocumented border crossings of Canadian and United States citizens from the United States.
[11] Data are arrivals in and departures from the United States, Guam, Puerto Rico and the U.S. Virgin Islands but do not include traffic between these countries.
[12] Data exclude undocumented border crossings of Canadian and United States citizens from and to Canada and of Mexican and United States citizens from and to Mexico; data for arrivals include informally admitted visitors from Canada staying for over 24 hours but less than six months.

[13] Data are for aliens only.
[14] Data exclude one-day visitors by plane.
[15] Data exclude illegal entrants.
[16] Data exclude foreign military and civilian personnel and their dependants.

[17] Beginning May 1967, not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.
[18] Data exclude arrivals from and departures to Singapore but include those from and to Sabah and Sarawak.

[19] Data exclude visitors in transit.
[20] Data relate only to residents, visitors and long-term immigrants and emigrants.
[21] Excluding Faeroe Islands and Greenland.
[22] Data exclude all movements between the five countries of the Nordic Passport Zone (Denmark, Finland, Iceland, Norway and Sweden).
[23] Data include frontier traffic.
[24] The data which relate to the Federal Republic of Germany include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.
[25] Data exclude residents returning after short absence.
[26] Data are approximate figures only.
[27] Data are for 12 months ending 31 March of the year following the one indicated.
[28] Data are for 12 months ending 30 June of the year following the one indicated.

NOTES

* Données provisoires.
[1] Non compris les entrées et sorties par terre.
[2] Pour la période annuelle commençant le 1er juillet de l'année indiquée.
[3] Non compris les autochtones d'Afrique occidentale entrés et sortis par terre.
[4] Jusqu'en 1968, non compris les entrées et les sorties en provenance et à destination de l'Ouganda et de la République-Unie de Tanzanie.
[5] Y compris les déplacements entre l'île Rodrigues et l'île Maurice, mais non compris les visiteurs en transit et les marins.
[6] Y compris les déplacements entre l'île de l'Ascension et l'île de Ste-Hélène.
[7] Européens, Asiatiques et personnes de couleur seulement.
[8] Non compris les entrées et les sorties en provenance et à destination du Kenya et de la République-Unie de Tanzanie.
[9] Non compris les entrées et les sorties en provenance et à destination du Kenya, de l'Ouganda et de Zanzibar.
[10] Non compris les ressortissants canadiens et les ressortissants des Etats-Unis qui franchissent la frontière de Etats-Unis sans documents.
[11] Entrées et sorties en provenance et à destination des Etats-Unis, de Guam, de Porto-Rico et des îles Vierges (Etats-Unis) mais non compris les déplacements entre ces pays.
[12] Non compris les ressortissants canadiens et les ressortissants des Etats-Unis en provenance et à destination du Canada, ni les ressortissants mexicains et les ressortissants des Etats-Unis en provenance et à destination du Mexique qui franchissent la frontière sans documents; les données pour les entrées comprennent les visiteurs venant du Canada admis sans formalités pour un séjour de plus de 24 heures mais de moins de six mois.
[13] Etrangers seulement.
[14] Non compris les visiteurs venant par avion pour la journée.
[15] Non compris les entrées illégales.
[16] Non compris les militaires et agents civils étrangers et les membres de leur famille les accompagnant.
[17] A partir de mai 1967, non compris les données pour le territoire jordanien occupé par les forces armées israéliennes depuis juin 1967.
[18] Non compris les entrées et sorties en provenance et à destination de Singapour mais y compris celles en provenance et à destination du Sabah et du Sarawak.
[19] Non compris les visiteurs en transit.
[20] Résidents, visiteurs, immigrants et émigrants à long terme seulement.

[21] Non compris les îles Féroé et le Groenland.
[22] Non compris tous les déplacements entre les cinq pays de la zone de voyage nordique (Danemark, Finlande, Islande, Norvège et Suède).
[23] Y compris le trafic de frontière.
[24] Les données relatives à la République fédérale d'Allemagne incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.
[25] Non compris les résidents rentrant après une courte absence.
[26] Chiffres approximatifs seulement.
[27] Pour la période annuelle se terminant le 31 mars de l'année qui suit l'année indiquée.
[28] Pour la période annuelle se terminant le 30 juin de l'année qui suit l'année indiquée.

15. LEGALLY INDUCED ABORTIONS 1965-1974

FOOT-NOTES

For method of evaluation and limitations of data, see Technical Notes, page 38.

1/ Explanation of code:

a. Continuance of pregnancy would involve risk to the life of the pregnant woman greater than if the pregnancy were terminated.
b. Continuance of pregnancy would involve risk of injury to the physical health of the pregnant woman greater than if the pregnancy were terminated.
c. Continuance of pregnancy would involve risk of injury to the mental health of the pregnant woman greater than if the pregnancy were terminated.
d. Continuance of pregnancy would involve risk of injury to mental or physical health of any existing children of the family greater than if the pregnancy were terminated.
e. There is a substantial risk that if the child were born it would suffer from such physical or mental abnormalities as to be seriously handicapped.
f. Other.

2/ Excluding Canal Zone, shown separately hereunder.

3/ Data are for the total number of abortions reported to Center for Disease Control. Abortions in New York State alone for 1971 numbered 262 807.

4/ Excluding Okinawa.

5/ Data are for Japanese nationals in Japan only.

6/ Excluding Faeroe Islands and Greenland shown separately.

7/ Data related to 12 months beginning 1 April of year indicated.

8/ For 27 April-31 December only.

9/ Data are for residents of England and Wales only.

10/ Data are for the State of South Australia only.

NOTES

Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 84.

1/ Explication du code:

a. La prolongation de la grossesse exposerait la vie de la femme enceinte davantage que son interruption.
b. La prolongation de la grossesse causerait des complications pouvant affecter la santé physique de la femme enceinte davantage que son interruption.
c. La prolongation de la grossesse causerait des complications affectant les facultés mentales de la femme enceinte davantage que son interruption.
d. La prolongation de la grossesse causerait des complications affectant les facultés mentales ou physiques des enfants vivants de cette famille, davantage que son interruption.
e. Il y aurait des risques majeurs pour l'enfant de naître avec des anomalies physiques ou mentales qui l'handicaperaient gravement.
f. Autres.

2/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous.

3/ Les données représentent le nombre total des avortements déclarés au Center for Disease Control. Les avortements dans l'Etat de New York seule, pour 1971 se chiffrent à 262 807.

4/ Non compris Okinawa.

5/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

6/ Non compris les iles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

7/ Les données se rapportent à la période annuelle commençant le 1er avril de l'année indiquée.

8/ Pour le 27 avril-31 décembre seulement.

9/ Les données sont pour les résidents d'Angleterre et de Galles seulement.

10/ Les données concernent l'Etat d'Australie méridionale seulement.

FOOT-NOTES

For method of evaluation and limitations of data, see Technical Notes, page 38.

1/ Excluding Canal Zone, shown separately hereunder.

2/ Excluding Okinawa.

3/ Data are for Japanese nationals in Japan only.

4/ Excluding Faeroe Islands shown separately and Greenland.

5/ For 1 April 1972-31 March 1973.

6/ Birth order based on number of previous deliveries.

7/ Data are for residents of England and Wales only.

8/ Data are for the State of South Australia only.

NOTES

Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 84.

1/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous.

2/ Non compris Okinawa.

3/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

4/ Non compris les îles Féroé, qui font l'objet d'une rubrique distincte, et le Groenland.

5/ Pour le 1er avril 1972-31 mars 1973.

6/ Le rang de naissance est déterminé par le nombre d'accouchements antérieures.

7/ Les données sont pour les résidents d'Angleterre et de Galles seulement.

8/ Les données sont pour l'état d'Australie méridionale seulement.

FOOT-NOTES

"Late foetal deaths" are those of at least 28 weeks' gestation. Foetal deaths of unknown gestational age are included. Ratios are the number of late foetal deaths per 1 000 live births. Reliability and comparability of data are known to be greatly affected by incomplete or irregular registration of foetal deaths and/or live births, and by variation in definitions. For definitions of "urban" areas, see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 38.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Civil registration data said to be relatively complete are coded "C", those said to be unreliable (incomplete) are coded "U". The code does not apply to estimated data. For further details, see Technical Notes.

2/ Live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in the computation of ratios.

3/ For Algerian population.

4/ Ratio(s) computed on number of baptisms recorded in Roman Catholic church registers.

5/ Data are deaths of foetuses of 180 days' (6 calendar months' or 26 weeks') or more gestation.

6/ Data tabulated by year of registration rather than occurrence.

7/ Live-born infants dying within 24 hours of birth are included among late foetal deaths but are excluded from live births used in computation of ratios.

8/ For Banjul only.

9/ Data relate to foetal deaths of all periods of gestation.

10/ Data are believed to be complete only for Tananarive which represents a relatively small proportion of the total.

11/ For Lagos only.

12/ For Freetown only.

13/ For classification by urban/rural residence, see end of table.

14/ Data are based on hospital records.

15/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

16/ Except for Curaçao, live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in computation of ratios. Ratios are computed on live births which include those among residents outside the country if listed in a Netherlands Antilles population register.

17/ For Aruba, Bonaire and Curaçao only.

18/ Data are all foetal deaths irrespective of gestational age, although registration is compulsory only for deaths of foetuses of 28 weeks' or more gestation.

19/ Excluding data for Canal Zone, shown separately hereunder; numbers also exclude tribal Indian population, numbering 62 187 in 1960, but ratios computed on live births including them.

20/ Beginning in 1968, excluding Anguilla.

21/ Data are deaths of foetuses of 20 weeks' or more gestation.

22/ Data based on burial permits but ratios computed on number of baptisms recorded in Roman Catholic church registers.

23/ Excluding nomadic Indian tribes.

24/ Data are based on burial permits and exclude Indian jungle population estimated at 100 830 in 1961.

25/ Registration, as measured by burial permits, estimated to be 50 per cent complete.

NOTES

Les "morts foetales tardives" sont celles qui surviennent après 28 semaines de gestation au moins. Les données du présent tableau comprennent les morts foetales survenues après une période de gestation de durée inconnue. Les rapports représentent le nombre de morts foetales tardives pour 1 000 naissance vivantes. La qualité et la comparabilité des données sont considérablement réduites en raison de l'enregistrement incomplet des morts foetales, des naissances vivantes ou des unes et des autres et du manque d'uniformité dans les définitions. Pour les définitions des zones "urbaines", se reporter à la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques p. 85.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

1/ La lettre "C" désigne des données relativement complètes et la lettre "U" des données discutables (incomplètes). Le code ne s'applique pas aux estimations. Pour plus de détails, voir Notes techniques.

2/ Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts foetales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports.

3/ Pour la population algérienne.

4/ Rapport(s) calculé(s) d'après le nombre de baptêmes inscrits sur les registres des églises catholiques romaines.

5/ Les données se rapportent aux morts foetales survenues après 180 jours (6 mois civils ou 26 semaines) au moins de gestation.

6/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

7/ Il est tenu compte des enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance pour établir le nombre des morts foetales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports.

8/ Pour Banjul seulement.

9/ Les données se rapportent à l'ensemble des morts foetales, quelle que soit la durée de gestation.

10/ Les données ne sont vraisemblablement complètes que pour Tananarive, qui représente un pourcentage relativement faible du total.

11/ Pour Lagos seulement.

12/ Pour Freetown seulement.

13/ Pour la classification selon la résidence urbaine/rurale, voir la fin du tableau.

14/ Les données sont fondées sur les registres des hopitaux.

15/ Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

16/ Sauf pour Curaçao, il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts foetales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports. Les rapports sont calculés sur la base d'un chiffre des naissances vivantes qui comprend les naissances parmi les résidents hors du pays s'ils sont inscrits sur un registre de population des Antilles néerlandaises.

17/ Pour Aruba, Bonaire et Curaçao seulement.

18/ Les données concernent toutes les morts foetales, quelle que soit la durée de gestation, mais l'enregistrement n'est obligatoire que pour les morts foetales survenues après 28 semaines de gestation au moins.

19/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous; il n'est pas tenu compte non plus des Indiens vivant en tribus (62 187 en 1960) pour établir le nombre des morts foetales; toutefois, ils sont compris dans le nombre des naissances vivantes qui sert au calcul des rapports.

20/ A partir de 1968, non compris Anguilla.

21/ Les données se rapportent aux morts foetales survenues après 20 semaines au moins de gestation.

22/ Les données sont fondées sur les permis d'inhumer délivrés, mais les rapports sont calculés d'après le nombre de baptêmes inscrits sur les registres des églises catholiques romaines.

23/ Non compris les tribus d'Indiens nomades.

24/ Les données sont fondées sur les permis d'inhumer délivrés et ne tiennent pas compte des Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

25/ On estime, d'après les permis d'inhumer délivrés, que 50 p. 100 des morts foetales tardives sont enregistrées.

FOOT-NOTES (continued)

26/ Excluding Indian and Negro population living in tribes, numbering 32 006 at 1964 census.

27/ Excluding Indian jungle population estimated at 31 800 in 1961.

28/ Data are for a changing number of towns having a population of approximately 4 million.

29/ Data are for Japanese nationals in Japan only.

30/ Prior to 1968, excluding data for Okinawa.

31/ Former mandated territory administered by the United Kingdom, until Armistice of 1949.

32/ Comprising that part of Palestine under Egyptian administration following the Armistice of 1949 until June 1967 when it was occupied by Israeli military forces.

33/ Data include reports from sources other than civil registers.

34/ Ratios computed on live births tabulated by year of occurrence.

35/ Data are for selected ("Proclaimed") urban areas in which the registrar is a medical practitioner.

36/ For provincial capitals and district centres only.

37/ Data are for changing territory representing about 70 per cent of total population in 1965.

38/ Data relate only to the former Colony of Aden excluding the islands of Perim and Kamaran but including military personnel and population of the port.

39/ For Jersey only.

40/ Excluding Faeroe Islands and Greenland, shown separately.

41/ Including data for nationals temporarily outside the country.

42/ Data are deaths of foetuses of 24 weeks' or more gestation.

43/ Ratios computed on data including live births among national armed forces outside the country.

44/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

45/ Data are for de jure population.

46/ Total events include residents outside country if listed on the Central Register of Population (containing persons belonging to the Netherlands population but having no fixed municipality of residence).

47/ Beginning in 1971, excluding Ceuta and Melilla.

48/ Prior to 1967, excluding full-blooded aborigines, estimated at 49 036 in June 1966.

49/ Excluding events among United States military personnel, their dependants and contract employees.

50/ Excluding late foetal deaths of unknown residence.

NOTES (suite)

26/ Non compris les Indiens, et les Noirs vivant en tribus, au nombre de 32 006 lors du recensement de 1964.

27/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

28/ Les données se rapportent à un nombre variable de villes, qui comptaient environ 4 millions d'habitants.

29/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

30/ Pour les années antérieures à 1968, non compris les données pour Okinawa.

31/ Ancien territoire sous mandat administré par le Royaume-Uni jusqu'à l'armistice de 1949.

32/ Comprend la partie de la Palestine administrée par l'Egypte après l'armistice de 1949 jusqu'en juin 1967, date à laquelle elle a été occupée par les forces armées israéliennes.

33/ Les données comprennent des renseignements provenant de sources autres que les registres de l'état civil.

34/ Les rapports sont calculés sur la base des naissances vivantes classées selon l'année de l'événement.

35/ Les données se rapportent à certaines zones urbaines à régime spécial ("Proclaimed") où l'officier d'état civil est un médecin.

36/ Pour capitales de provinces et chefs-lieux de districts seulement.

37/ Les données se rapportent à un territoire variable qui comptait 70 p. 100 environ de la population totale en 1965.

38/ Les données ne concernent que l'ancienne colonie d'Aden et ne comprennent pas Perim et l'île de Kamaran; toutefois, il est tenu compte des militaires et de la population du port.

39/ Pour Jersey seulement.

40/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

41/ Y compris les nationaux se trouvant temporairement hors du pays.

42/ Morts foetales survenues après 24 semaines au moins de gestation.

43/ Les rapports sont fondés sur des données qui tiennent compte des naissances vivantes parmi les militaires nationaux hors du pays.

44/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

45/ Les données concernent la population de droit.

46/ Les totaux comprennent les résidents hors du pays s'ils sont inscrits sur le Registre central de la population (c'est-à-dire compte tenu des personnes qui font partie de la population néerlandaise mais qui n'ont pas de domicile fixe dans une municipalité).

47/ A partir de 1971, non compris Ceuta et Melilla.

48/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 49 036 en juin 1966 (estimation).

49/ Non compris les événements survenus dans les familles des militaires et des agents contractuels des Etats-Unis.

50/ Non compris les morts foetales tardives dont on ignore la residence.

FOOT-NOTES

Ratios are the number of foetal deaths at each gestational age per 1,000 total live births. Gestational age reported in months has been allocated to corresponding intervals in weeks according to conversion scale set forth on page 39. Reliability and comparability of data known to be greatly affected by incomplete or irregular registration of foetal deaths, and/or live births, and by variations in definitions. For method of evaluation and limitations of data, see Technical Notes, page 39.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Data tabulated by date of registration rather than occurrence.

2/ Data are deaths of foetuses of 180 days' (6 calendar months' or 26 weeks') or more gestation (those for which registration is compulsory).

3/ Excludes deaths of foetuses of less than 180 days' (6 calendar months' or 26 weeks') gestation.

4/ Live-born infants dying before registration of birth are included among foetal deaths but excluded from live births used in computation of ratios.

5/ Excluding Newfoundland. Including Canadian residents temporarily in the United States but excluding United States residents temporarily in Canada.

6/ Data are deaths of foetuses of 28 weeks' or more gestation (those for which registration is compulsory).

7/ Registration of deaths of foetuses of less than 28 weeks' gestation is not compulsory.

8/ Data are deaths of foetuses of 3 calendar months' or more gestation.

9/ Excludes deaths of foetuses of less than 3 calendar months' gestation.

10/ Excluding data for Canal Zone, shown separately hereunder; foetal deaths also exclude tribal Indian population, but beginning 1966, ratios are computed on live births including them.

11/ Data are deaths of foetuses of 5 lunar months' (20 weeks') or more gestation (those for which registration is compulsory).

12/ Compulsory registration requirements vary from state to state and include minima between "any product of conception" to "completed 6 months of gestation". The majority place the minimum at 20 weeks of gestation.

13/ Prior to 1967, ratios are computed on live births based on a 50 per cent sample of recorded births; for 1967, ratios are computed on live births based on a 20-50 per cent sample of recorded births.

14/ Precise specification of compulsory registration requirements not available.

15/ Foetal deaths based on burial permits; ratios computed on number of baptisms recorded in Roman Catholic church registers.

16/ Excluding nomadic Indian tribes.

17/ Excluding Indian jungle population estimated at 31 800 in 1961.

18/ Data are for Japanese nationals in Japan only.

19/ Data are deaths of foetuses of 11 weeks' or more gestation (those for which registration is compulsory).

20/ Except for 1973, excluding Okinawa.

21/ Excludes deaths of foetuses of less than 11 weeks' gestation.

22/ For 20-29, 30-34 and 35-39 weeks' gestation, as appropriate.

23/ Ratios computed on foetal deaths excluding non-locally domiciled military and civilian service personnel and their dependants.

24/ Excluding Faeroe Islands and Greenland.

25/ Including data for nationals temporarily outside the country.

26/ For 29-32 and 33-36 weeks' gestation, as appropriate.

27/ For 28-29, 30-33, 34-37 and 38-39 weeks' gestation, as appropriate.

NOTES

Les rapports représentent le nombre de morts foetales à chaque période de gestation pour 1 000 naissances vivantes. Les renseignements fournis pour les périodes de gestation exprimées en mois ont été reclassés d'après le nombre de semaines au moyen de la table de conversion figurant à la page 86. La qualité et la comparabilité des données sont considérablement réduites en raison de l'enregistrement incomplet ou irrégulier des morts foetales, des naissances vivantes ou des unes et des autres et du manque d'uniformité dans les définitions. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 86.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

1/ Données exploitées selon la date de l'enregistrement et non la date de l'événement.

2/ Morts foetales survenues après 180 jours (6 mois civils ou 26 semaines) au moins de gestation, dont l'enregistrement est obligatoire.

3/ Non compris les morts foetales survenues après moins de 180 jours de gestation (soit 6 mois civils ou 26 semaines).

4/ Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts foetales mais non celui des naissances vivantes qui sert au calcul des rapports.

5/ Non compris Terre-Neuve. Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

6/ Morts foetales survenues après 28 semaines au moins de gestation, dont l'enregistrement est obligatoire.

7/ L'enregistrement des morts foetales survenues après moins de 28 semaines de gestation n'est pas obligatoire.

8/ Morts foetales survenues après trois mois civils au moins de gestation.

9/ Non compris les morts foetales survenues après moins de trois mois civils de gestation.

10/ Non compris la Zone du canal, qui fait l'objet d'une rubrique distincte ci-dessous; il n'est pas tenu compte non plus des Indiens vivant en tribus pour établir le nombre des morts foetales, mais à partir de 1966, ils sont compris dans le nombre des naissances vivantes qui sert au calcul des rapports.

11/ Morts foetales survenues après 5 mois lunaires (20 semaines) au moins de gestation, dont l'enregistrement est obligatoire.

12/ Les règles régissant l'enregistrement obligatoire varient d'un Etat à l'autre, les critères allant de "tout produit de conception" à "6 mois de gestation révolus". La majorité situe le minimum à 20 semaines de gestation.

13/ Pour les années antérieures à 1967, les rapports sont calculés sur la base du nombre de naissances vivantes établi d'après un échantillon de 50 p. 100 des naissances enregistrées; pour 1967, les rapports sont calculés sur la base du nombre de naissances vivantes établi d'après un échantillon de 20 à 50 p. 100 des naissances enregistrées.

14/ On ne connaît pas les règles précises qui régissent l'enregistrement obligatoire.

15/ Les morts foetales sont fondées sur le nombre de permis d'inhumer; les rapports sont calculés sur la base du nombre de baptêmes inscrits sur les registres des églises catholiques romaines.

16/ Non compris les tribus d'Indiens nomades.

17/ Non compris les Indiens de la jungle au nombre de 31 800 en 1961 (estimation).

18/ Les données ne concernent que les ressortissants japonais au Japon.

19/ Morts foetales survenues après 11 semaines au moins de gestation, dont l'enregistrement est obligatoire.

20/ Sauf pour 1973, non compris Okinawa.

21/ Non compris les morts foetales survenues après moins de 11 semaines de gestation.

22/ Pour 20-29, 30-34 et 35-39 semaines de gestation, selon le cas.

23/ Les rapports sont calculés sur la base d'un nombre de morts foetales qui ne tient pas compte des militaires et agents civils non résidents et des membres de leur famille les accompagnant.

24/ Non compris les Iles Féroé et le Groenland.

25/ Y compris les nationaux temporairement hors du pays.

26/ Pour 29-32 et 33-36 semaines de gestation, selon le cas.

27/ Pour 28-29, 30-33, 34-37 et 38-39 semaines de gestation, selon le cas.

FOOT-NOTES (continued)

28/ Live-born infants dying before registration of birth are included among foetal deaths, as well as among live-births used in computation of ratios. Ratios computed on data including live births among national armed forces outside the country.

29/ Including foetal deaths among residents outside country if listed in a Netherlands population register.

30/ Data are deaths of foetuses of 16 weeks' (4 calendar months') or more gestation, declared by midwives and physicians.

31/ Excludes deaths of foetuses of less than 16 weeks' (4 calendar months') or more gestation.

32/ Excluding foetal deaths among United States military personnel, their dependants and contract employees.

NOTES (suite)

28/ Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts foetales ainsi que le nombre de naissances vivantes qui sert au calcul des rapports. Les rapports sont fondés sur des données qui tiennent compte des naissances vivantes parmi les militaires nationaux hors du pays.

29/ Y compris les morts foetales survenues parmi les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

30/ Morts foetales survenues après 16 semaines (4 mois civils) au moins de gestation, déclarées par les sages-femmes et les médecins.

31/ Non compris les morts foetales survenues après moins de 16 semaines (4 mois civils) de gestation.

32/ Non compris les morts foetales survenues parmi les familles des militaires et des agents contractuels des Etats-Unis.

FOOT-NOTES

Perinatal deaths are the sum of late foetal deaths (those of at least 28 weeks' gestation) and semanatal deaths (deaths under 1 week of age). Deaths of foetuses of unknown gestational age included among late foetal deaths. Ratios are the number of perinatal deaths per 1 000 live births. For definitions of "urban" areas, see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 40.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Civil registration data said to be relatively complete are coded "C", those said to be unreliable (incomplete) are coded "U". For further details, see Technical Notes.

2/ Ratios computed on number of baptisms recorded in Roman Catholic church registers.

3/ Data include deaths of foetuses of 180 days' (6 calendar months' or 26 weeks') or more gestation.

4/ Data tabulated by date of registration rather than occurrence.

5/ For Banjul only.

6/ Data are believed to be complete only for Tananarive, which represents a relatively small proportion of the total.

7/ Live born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in computation of ratios.

8/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

9/ Ratios are based on births registered in National Consumers Register established 31 December 1964.

10/ Foetal deaths tabulated by date of occurrence, infant deaths and live births tabulated by date of registration.

11/ Except for Curaçao, live born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in computation of ratios. Ratios are computed on live births which include those among residents outside the country if listed in a Netherlands Antilles population register.

12/ Beginning in 1969, data are for Aruba, Bonaire and Curaçao only.

13/ Excluding data for Canal Zone, shown separately hereunder; numbers also exclude tribal Indian population, but ratios are based on live births which include them.

14/ For classification by urban/rural residence, see end of table.

15/ Excluding data for Anguilla.

16/ Perinatal deaths based on burial permits; ratios computed on number of baptisms recorded in Roman Catholic church registers.

17/ Excluding nomadic Indian tribes.

18/ Excluding Indian and Negro population living in tribes, estimated at 32 006 at 1964 census.

19/ Excluding Indian jungle population, estimated at 31 800 in 1961.

20/ Data are for a changing number of towns having a combined population of approximately 2 million.

21/ Data are for Japanese nationals in Japan only.

22/ Except for 1973, excluding Okinawa.

23/ Data exclude perinatal deaths among non-locally domiciled military and civilian services personnel and their dependants.

NOTES

Les morts périnatales comprennent les morts foetales tardives (survenues après 28 semaines au moins de gestation) et les morts survenues dans la première semaine qui suit la naissance. Les morts foetales survenues après une période de gestation de durée inconnue sont comptées avec les morts foetales tardives. Les rapports représentent le nombre de morts périnatales pour 1 000 naissances vivantes. Pour les définitions des zones "urbaines", se reporter à la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 87.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes) provenant des registres de l'état civil. Pour plus de détails, voir Notes techniques.

2/ Les rapports sont calculés d'après le nombre de baptêmes inscrits sur les registres de l'Eglise catholique romaine.

3/ Y compris les morts foetales survenues après 180 jours (six mois civils ou 26 semaines) au moins de gestation.

4/ Données exploitées selon la date de l'enregistrement et non la date de l'événement.

5/ Pour Banjul seulement.

6/ Les données ne sont vraisemblablement complètes que pour Tananarive qui représente un pourcentage relativement faible du total.

7/ Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts foetales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports.

8/ Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

9/ Les rapports sont calculés d'après les naissances inscrites sur le Registre national des consommateurs établi le 31 décembre 1964.

10/ Les morts foetales sont classées selon la date de l'événement, les décès d'enfants et les naissances vivantes selon la date de l'enregistrement.

11/ Sauf pour Curaçao, il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts foetales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports. Les rapports sont calculés sur la base d'un chiffre des naissances vivantes qui comprend les naissances parmi les résidents se trouvant hors du pays s'ils sont inscrits sur le registre de population des Antilles néerlandaises.

12/ A partir de 1969, les données se rapportent à Aruba, Bonaire et Curaçao seulement.

13/ Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte ci-dessous; les chiffres absolus ne comprennent pas non plus les Indiens vivant en tribus, mais les rapports sont calculés sur la base d'un chiffre des naissances vivantes qui les comprend.

14/ Pour la classification selon la résidence urbaine/rurale, voir la fin du tableau.

15/ Non compris Anguilla.

16/ Les chiffres absolus reposent sur les permis d'inhumer délivrés; les rapports sont calculés d'après le nombre de baptêmes inscrits sur les registres de l'Eglise catholique romaine.

17/ Non compris les tribus d'Indiens nomades.

18/ Non compris les Indiens et les Noirs vivant en tribus, au nombre de 32 006 au recensement de 1964 (estimation).

19/ Non compris les Indiens de la jungle, soit 31 800 personnes en 1961 (estimation).

20/ Les données se rapportent à un nombre variable de villes comptant ensemble environ 2 millions d'habitants.

21/ Ne concerne que les ressortissants japonais se trouvant au Japon.

22/ Sauf pour 1973, non compris Okinawa.

23/ Non compris les morts périnatales parmi les militaires et le personnel civil non résidents et les membres de leur famille les accompagnant.

FOOT-NOTES (continued)

24/ Ratios computed on live births tabulated by year of occurrence.

25/ Excluding Faeroe Islands and Greenland, shown separately.

26/ Including nationals temporarily outside country.

27/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

28/ Including events among residents outside country if listed in a Netherlands population register.

29/ Prior to 1967, excluding events among full-blooded aborigine population estimated at 49 036 in June 1966.

30/ Excluding events among United States military personnel, their dependants and contract employees.

31/ Excluding perinatal deaths of unknown residence.

NOTES (suite)

24/ Rapports calculés sur la base des naissances vivantes classées selon l'année de l'événement.

25/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

26/ Non compris les nationaux se trouvant temporairement hors du pays.

27/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

28/ Y compris les événements survenus parmi les résidents se trouvant hours du pays s'ils sont inscrits sur un registre de population néerlandais.

29/ Pour les années antérieures à 1967, non compris les événements survenus parmi les aborigènes purs au nombre de 49 036 en juin 1966 (estimation).

30/ Non compris les événements survenus parmi les militaires des Etats-Unis, les membres de leur famille les accompagnant, ni les agents contractuels des Etats-Unis.

31/ Non compris les morts périnatales pour lesquels le lieu de résidence n'est pas connu.

FOOT-NOTES

Data exclude foetal deaths. Rates are number of deaths of infants under 1 year of age per 1 000 corresponding live births. For definitions of "urban" areas, see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 41.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Civil registration data said to be relatively complete are coded "C", those said to be unreliable (incomplete) are coded "U". The code does not apply to estimated data. For further details, see Technical Notes.

2/ For the Algerian population only.

3/ Data exclude live-born infants dying before registration of birth.

4/ Rates computed on number of baptisms recorded in Roman Catholic church registers.

5/ Estimate based on events reported for 12-month period preceding 1965 sample survey.

6/ For classification by urban/rural residence, see end of table.

7/ Data tabulated by year of registration rather than occurrence.

8/ Infant death registration estimated to be 70 per cent complete.

9/ Data exclude live-born infants dying within 24 hours of birth.

10/ For Banjul only.

11/ Data are not representative of Ghana as they are for compulsory registration centres only; these numbered 153 in 1969 and served approximately 35 per cent of the total population in 1969.

12/ Data exclude late registrations.

13/ European, Asiatic and Arab population, which represents a relatively small proportion of the total.

14/ Data are based on the results of the Demographic Component of the Rural Household Consumption and Expenditure Survey.

15/ Data are based on the results of the Population Growth Survey.

16/ Estimate, basis unknown.

17/ For Western Area.

18/ Comprising the former Colony.

19/ Including Canadian residents temporarily in the United States but excluding United States residents temporarily in Canada.

20/ Rates are based on births registered in National Consumers Register established 31 December 1964.

21/ Except for Curaçao, data exclude live-born infants dying before registration of birth. Rates are computed on live births which include those among residents outside the country if listed in the population register of the Netherlands Antilles.

22/ For Aruba, Bonaire and Curaçao only.

23/ Excluding data for Canal Zone, shown separately hereunder. Prior to 1966, excluding data for tribal Indian population except in provinces of Bocas del Toro and Darién.

24/ Beginning in 1967, excluding data for Anguilla.

25/ Infant deaths based on number of burial permits, but rates computed on number of baptisms recorded in Roman Catholic church registers.

26/ Excluding nomadic Indian tribes.

27/ Excluding Amerindian population.

28/ Excluding Indian jungle population, estimated at 100 830 in 1961.

29/ Excluding Indian and Negro population living in tribes, number 32 006 at 1964 census.

30/ Excluding Indian jungle population estimated at 31 800 in 1961.

31/ Data are for a changing number of towns having a population of approximately 3 million for 1965 and 4 million for 1966-1968.

32/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

NOTES

Les données ne comprennent pas les morts foetales. Les taux représentent le nombre de décès d'enfants de moins d'un an pour 1 000 naissances vivantes de la catégorie correspondante. Pour les définitions des zones "urbaines", se reporter à la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, p. 88.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

1/ La lettre "C" désigne des données relativement complètes et la lettre "U" des données discutables (incomplètes). Le code ne s'applique pas aux estimations. Pour plus de détails, voir Notes techniques.

2/ Pour la population algérienne seulement.

3/ Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

4/ Taux calculé d'après le nombre de baptêmes inscrits sur les registres des églises catholiques romaines.

5/ Estimation fondée sur les décès déclarés d'enfants de moins d'un an pour la période de 12 mois qui a précédé l'enquête par sondage de 1965.

6/ Pour la classification selon la résidence urbaine/rurale, voir à la fin du tableau.

7/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

8/ On estime que 70 p. 100 des décès d'enfants de moins d'un an sont enregistrés.

9/ Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

10/ Pour Banjul seulement.

11/ Les données ne sont pas représentatives de l'ensemble du Ghana, car elles se rapportent seulement à des centres où l'enregistrement est obligatoire, ces centres étant au nombre de 153 en 1969 et représentant environ 35 p. 100 de la population total en 1969.

12/ Non compris les enregistrements tardifs.

13/ Population d'origine européenne, asiatique et arabe, représentant un pourcentage relativement faible du total.

14/ Les données sont basées sur les résultats de Demographic Component of the Rural Household Consumption and Expenditure Survey.

15/ Les données sont basées sur les résultats de Population Growth Survey.

16/ Estimation, base inconnue.

17/ Pour la région occidentale.

18/ Désigne l'ancienne colonie.

19/ Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

20/ Taux calculés d'après les naissances inscrites sur le Registre national des consommateurs établi le 31 décembre 1964.

21/ Sauf pour Caraçao, les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance. Les taux sont calculés sur la base d'un chiffre des naissances vivantes qui comprend les naissances vivantes parmi les résidents hors du pays s'ils sont inscrits sur le registre de population des Antilles néerlandaises.

22/ Pour Aruba, Bonaire et Curaçao seulement.

23/ Non compris la zone du Canal qui fait l'objet d'une rubrique distincte ci-dessous. Pour les années antérieures à 1966, non compris les Indiens vivant en tribus, excepté dans les provinces de Bocas del Toro et de Darién.

24/ A partir de 1967, non compris Anguilla.

25/ Les données sont fondées sur les permis d'inhumer délivrés, mais les taux sont calculés d'après le nombre de baptêmes inscrits sur les registres des églises catholiques romaines.

26/ Non compris les tribus d'indiens nomades.

27/ Non compris les Amérindiens.

28/ Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

29/ Non compris les Indiens et les Noirs vivant en tribus, au nombre de 32 006 au recensement de 1964.

30/ Non compris les Indiens de la jungle au nombre de 31 800 en 1961 (estimation).

31/ Les données se rapportent à un nombre variable de villes qui comptaient environ 3 millions d'habitants en 1965 et 4 millions en 1966-1968.

32/ Estimations fondées sur les statistiques courantes de l'enregistrement, ajustées pour compenser les lacunes en se fondant sur l'expérience de 1952-1954.

FOOT-NOTES (continued)

33/ Data are for Japanese nationals in Japan only.

34/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

35/ Beginning May 1967, not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

36/ Infant death registration estimated to be about 15-20 per cent complete in 1963-1966.

37/ Data are infant deaths registered by Health Service only.

38/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.

39/ Data include reports from sources other than civil registers.

40/ Rates computed on live births tabulated by date of occurrence.

41/ Excluding infant deaths among non-locally domiciled military and civilian services personnel and their dependants.

42/ Excluding nomad population estimated at 179 722 at end of 1956 and Palestinian refugees. For number of refugees, see table 5.

43/ Data are infant deaths registered within one month of occurrence.

44/ For provincial capitals and district centres only.

45/ Estimate based on incomplete returns of Turkish Demographic Survey.

46/ Data are for changing territory representing about 70 per cent of total population in 1965.

47/ Data relate only to the former Colony of Aden excluding Perim and Kamaran Islands.

48/ Excluding Faeroe Islands and Greenland, shown separately.

49/ Including data for nationals temporarily outside the country.

50/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

51/ Data are infant deaths registered within one year of occurrence.

52/ Data are for de jure population.

53/ Including residents outside the country if listed in a Netherlands population register.

54/ Including persons on the central register of population (containing persons belonging to the Netherlands population, but having no fixed municipality of residence).

55/ Including residents temporarily outside the country.

56/ Beginning in 1971, excluding Ceuta and Melilla.

57/ Data tabulated by year of occurrence for England and Wales, and by year of registration for Northern Ireland and Scotland.

58/ Prior to 1967, excluding full-blooded aborigines estimated at 40 081 in June 1961 and 49 036 in June 1966.

59/ Including infant deaths among United States military personnel, their dependants and contract employees.

60/ Excluding infant deaths among United States military personnel, their dependants and contract employees.

61/ Data exclude infants born alive of less than 28 weeks' gestation, less than 1 000 grammes in weight and 35 centimetres in length, who die within 7 days of birth.

62/ Rate(s) not computed by the Statistical Office of the United Nations.

63/ Data include infant deaths of unknown residence.

NOTES (suite)

33/ Ne concerne que les ressortissants japonais se trouvant au Japon.

34/ Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

35/ A partir de mai 1967, non compris les données pour le territoire jordanien occupé par les forces armées israéliennes depuis juin 1967.

36/ On estime que 15 à 20 p. 100 des décès d'enfants de moins d'un an ont été enregistrés en 1963-1966.

37/ Les données ne concernent que les décès d'enfants de moins d'un an enregistrés par le Service de santé.

38/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.

39/ Les données comprennent des renseignements provenant de sources autres que les registres de l'état civil.

40/ Les taux ont été calculés d'après les naissances vivantes classées selon la date de l'événement.

41/ Non compris les décès d'enfants de moins d'un an parmi les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant.

42/ Non compris la population nomade, soit 179 722 personnes à la fin de 1956 (estimation) ni les réfugiés de Palestine. Pour le nombre de réfugiés, voir le tableau 5.

43/ Décès d'enfants de moins d'un an enregistrés dans le mois qui suit l'événement.

44/ Pour capitales de provinces et chefs-lieux de districts seulement.

45/ Estimation fondée sur des résultats incomplets de l'enquête démographique turque.

46/ Les données se rapportent à un territoire variable qui groupait environ 70 p. 100 de la population totale en 1965.

47/ Les données ne concernent que l'ancienne colonie d'Aden et ne comprennent pas Perim et l'île de Kamaran.

48/ Non compris les îles Féroé, ni le Groenland, qui font l'objet d'une rubrique distincte.

49/ Y compris les nationaux se trouvant temporairement hors du pays.

50/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

51/ Décès d'enfants de moins d'un an enregistrés dans l'année qui suit l'événement.

52/ Les données concernent la population de droit.

53/ Y compris les résidents hors du pays, s'ils sont inscrits sur un registre de population néerlandais.

54/ Y compris les personnes inscrites sur le Registre central de la population (personnes faisant partie de la population néerlandaise, mais sans domicile fixe dans l'une des municipalités).

55/ Y compris les résidents se trouvant temporairement hors du pays.

56/ A partir de 1971, non compris Ceuta et Melilla.

57/ Données exploitées selon l'année de l'événement pour l'Angleterre et Galles et selon l'année de l'enregistrement pour l'Irlande du Nord et l'Ecosse.

58/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 40 081 en juin 1961 et de 49 036 en juin 1966 (estimations).

59/ Y compris les décès d'enfants de moins d'un an survenus parmi les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels de Etats-Unis.

60/ Non compris les décès d'enfants de moins d'un an survenus parmi les militaires des Etats-Unis, les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

61/ Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestations, pesant moins de 1 000 grammes, mesurant moins de 35 cm et décédés dans les sept jours qui ont suivi leur naissance.

62/ Le calcul de ces taux n'a pas été fait par le Bureau de statistique de l'ONU.

63/ Les données comprennent les décès d'enfants de moins d'un an pour lesquels le lieu de résidence n'est pas connu.

FOOT-NOTES

Data exclude foetal deaths. "Month" as used in foot-notes refers to calendar rather than lunar period. For definitions of "urban" areas, see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 42.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Data tabulated by date of registration rather than occurrence.

2/ For Banjul only.

3/ Data are not representative of Ghana as they are for compulsory registration centres only serving approximately 35 per cent of the total population in 1969.

4/ For 1-7 days and 8 days to less than 1 month, as appropriate.

5/ Data exclude deaths of infants dying before registration of birth.

6/ Including Asiatic population.

7/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

8/ Data are for Aruba, Bonaire and Curaçao only.

9/ Including infant deaths among residents outside the islands, if they were listed in the population register of the islands mentioned.

10/ Except for Curaçao, data exclude deaths of infants dying before registration of birth.

11/ For classification by urban/rural residence, see end of table.

12/ Excluding data for Canal Zone, shown separately hereunder.

13/ Beginning in 1967, excluding data for Anguilla.

14/ Data are based on burial permits.

15/ Excluding nomadic Indian tribes.

16/ Excluding Indian jungle population, estimated at 100 830 in 1961.

17/ Excluding Indian and Negro population living in tribes, number 32 006 at 1964 census.

18/ Excludes infant deaths of unknown sex.

19/ Excluding Indian jungle population, estimated at 31 800 in 1961.

20/ Data are for a number of towns having a combined population of approximately 2 million.

21/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

22/ Except for 1973, excluding Okinawa.

23/ Data are for Japanese nationals in Japan only.

24/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

25/ Beginning 1967, not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

26/ Data are infant deaths registered by Health Service only.

27/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D.I. Khan and Peshawar Divisions.

28/ Data include reports from sources other than civil registers.

29/ Data exclude infant deaths among non-locally domiciled military and civilian services personnel and their dependants.

30/ For provincial capitals only.

31/ Excluding Faeroe Islands and Greenland shown separately.

32/ Including nationals temporarily outside the country.

NOTES

Les données ne comprennent pas les morts foetales. Le mot "mois" au sens où il est employé dans les notes désigne le mois civil et non le mois lunaire. Pour la définition du terme "urbain", voir la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 89.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Données exploitées selon la date de l'enregistrement et non la date de l'événement.

2/ Pour Banjul seulement.

3/ Les données ne sont pas représentatives de l'ensemble du Ghana car elles se rapportent à des centres où l'enregistrement est obligatoire et qui ne comptaient en 1969 que 35 p. 100 environ de la population totale.

4/ Pour 1-7 jours et 8 jours à moins d'un mois, selon le cas.

5/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

6/ Y compris la population d'origine asiatique.

7/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

8/ Pour Aruba, Bonaire et Curaçao seulement.

9/ Y compris les décès d'enfants de moins d'un an survenus parmi les résidents hors du territoire, s'ils étaient inscrits sur le registre de la population de ces îles.

10/ Sauf pour Curaçao, non compris les décès d'enfants de moins d'un an survenus avant l'enregistrement de leur naissance.

11/ Pour la classification selon la résidence urbaine/rurale, voir la fin du tableau.

12/ Non compris la Zone du canal, qui fait l'objet d'une rubrique distincte ci-dessous.

13/ A partir de 1967, non compris Anguilla.

14/ D'après les permis d'inhumer délivrés.

15/ Non compris les tribus d'Indiens nomades.

16/ Non compris les Indiens de la jungle, au nombre du 100 830 en 1961 (estimation).

17/ Non compris les Indiens et les Noirs vivant en tribus, au nombre de 32 006 au recensement de 1964.

18/ Non compris les décès d'enfants de moins d'un an dont le sexe est inconnu.

19/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

20/ Les données se rapportent à des villes comptant ensemble environ 2 millions d'habitants.

21/ Estimations fondées sur les statistiques courantes de l'enregistrement, ajustées pour compenser les lacunes d'après l'expérience de 1952-1954.

22/ Sauf pour 1973, non compris Okinawa.

23/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

24/ Non compris les étrangers mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

25/ A partir de 1967, non compris les données pour le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes.

26/ Les données ne concernent que les décès d'enfants de moins d'un an enregistrés par le Service de santé.

27/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.

28/ Les données comprennent des renseignements provenant de sources autres que les registres de l'état civil.

29/ Non compris les décès d'enfants de moins d'un an survenus parmi les militaires et agents civils non résidents et les membres de leur famille les accompagnant.

30/ Pour capitales provinciales seulement.

31/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

32/ Y compris les nationaux temporairement hors du pays.

FOOT-NOTES (continued)

33/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

34/ Age classification based on difference between date of birth and date of death rather than on computed days of life.

35/ Data are infant deaths registered within one year of occurrence.

36/ Data are for de jure population.

37/ Including residents outside the country if listed in a Netherlands population register.

38/ Including residents temporarily outside the country.

39/ Excluding full-blooded aborigine population, estimated at 49 036 in June 1966.

40/ Including infant deaths among United States military personnel, their dependants and contract employees.

41/ Excluding infant deaths among United States military personnel, their dependants and contract employees.

42/ Excluding infant deaths of unknown residence.

NOTES (suite)

33/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

34/ La classification par âge repose sur la différence entre la date de la naissance et la date du décès et non sur l'âge en jours révolus.

35/ Décès d'enfants de moins d'un an enregistrés dans l'année qui suit l'événement.

36/ Les données concernent la population de droit.

37/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

38/ Y compris les résidents temporairement hors du pays.

39/ Non compris les aborigènes purs, au nombre de 49 036 en juin 1966 (estimation).

40/ Y compris les décès d'enfants de moins d'un an survenus parmi les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

41/ Non compris les décès d'enfants de moins d'un an survenus parmi les militaires des Etats-Unis et les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

42/ Non compris les décès d'enfants de moins d'un an dont on ignore la résidence.

FOOT-NOTES

Data exclude foetal deaths. "Month" as used in foot-notes refers to calendar rather than lunar period. For definitions of "urban" areas, see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 43.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Data tabulated by date of registration rather than occurrence.

2/ For Banjul only.

3/ Data are not representative of Ghana as they are for compulsory registration centres only serving approximately 35 per cent of the total population in 1969.

4/ For 1-7 days and 8 days to less than 1 month, as appropriate.

5/ Data are based on the results of the Population Growth Survey.

6/ For classification by urban/rural residence, see end of table.

7/ Data exclude deaths of infants dying before registration of birth.

8/ Including Asiatic population.

9/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

10/ Data are for Aruba, Bonaire and Curaçao only.

11/ Including infant deaths among residents outside the islands, if they were listed in the population register of the islands mentioned.

12/ Except for Curaçao, data exclude deaths of infants dying before registration of birth.

13/ Excluding Canal Zone, shown separately hereunder.

14/ Beginning in 1967, excluding Anguilla.

15/ Data are based on burial permits.

16/ Excluding nomadic Indian tribes.

17/ Excluding Indian jungle population, estimated at 100 830 in 1961.

18/ Excluding Indian and Negro population living in tribes, number 32 006 at 1964 census.

19/ Excluding Indian jungle population, estimated at 31 800 in 1961.

20/ Data are for a number of towns having a combined population of approximately 2 million.

21/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

22/ Except for 1973, excluding Okinawa.

23/ Data are for Japanese nationals in Japan only.

24/ Excluding foreigners but including registered Palestinian refugess. For number of refugees, see table 5.

25/ Beginning in 1967, not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

26/ Data are infant deaths registered by Health Service only.

27/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.

28/ Data include reports from sources other than civil registers.

29/ Data exclude infant deaths among non-locally domiciled military and civilian services personnel and their dependants.

30/ Rates computed on live births tabulated by date of occurrence.

31/ Excluding Faeroe Islands and Greenland shown separately.

32/ Including nationals temporarily outside the country.

NOTES

Les données ne comprennent pas les morts foetales. Le mot "mois" au sens où il est employé dans les notes désigne le mois civil et non le mois lunaire. Pour la définition du terme "urbaine", voir la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 90.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Données exploitées selon la date de l'enregistrement et non la date de l'événement.

2/ Pour Banjul seulement.

3/ Les données ne sont pas représentatives de l'ensemble du Ghana car elles se rapportent à des centres où l'enregistrement est obligatoire et qui ne comptaient en 1969 que 35 p. 100 environ de la population totale.

4/ Pour 1-7 jours et 8 jours à moins d'un mois, selon le cas.

5/ Les données sont basées sur les résultats de Population Growth Survey.

6/ Pour la classification selon la résidence urbaine/rurale, voir la fin du tableau.

7/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

8/ Y compris la population d'origine asiatique.

9/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

10/ Pour Aruba, Bonaire et Curaçao seulement.

11/ Y compris les décès d'enfants de moins d'un an survenus parmi les résidents hors du territoire, s'ils étaient inscrits sur le registre de la population de ces îles.

12/ Sauf pour Curaçao, non compris les décès d'enfants de moins d'un an survenus avant l'enregistrement de leur naissance.

13/ Non compris la Zone du canal, qui fait l'objet d'une rubrique distincte ci-dessous.

14/ A partir de 1967, non compris Anguilla.

15/ D'après les permis d'inhumer délivrés.

16/ Non compris les tribus d'Indiens nomades.

17/ Non compris les Indiens de la jungle, au nombre du 100 830 en 1961 (estimation).

18/ Non compris les Indiens et les Noirs vivant en tribus, au nombre de 32 006 au recensement de 1964.

19/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

20/ Les données se rapportent à des villes comptant ensemble environ 2 millions d'habitants.

21/ Estimations fondées sur les statistiques courantes de l'enregistrement, ajustées pour compenser les lacunes d'après l'expérience de 1952-1954.

22/ Sauf pour 1973, non compris Okinawa.

23/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

24/ Non compris les étrangers mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

25/ A partir de 1967, non compris les données pour le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes.

26/ Les données ne concernent que les décès d'enfants de moins d'un an enregistrés par le Service de santé.

27/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.

28/ Les données comprennent des renseignements provenant de sources autres que les registres de l'état civil.

29/ Non compris les décès d'enfants de moins d'un an survenus parmi les militaires et agents civils non résidents et les membres de leur famille les accompagnant.

30/ Les taux ont été calculés d'après les naissances vivantes classées selon la date de l'événement.

31/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

32/ Y compris les nationaux temporairement hors du pays.

FOOT-NOTES (continued)

33/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

34/ Age classification based on difference between date of birth and date of death rather than on computed days of life.

35/ Data are infant deaths registered within one year of occurrence.

36/ Data are for de jure population.

37/ Including residents outside the country if listed in a Netherlands population register.

38/ Including residents temporarily outside the country.

39/ Excluding Ceuta and Melilla.

40/ Data exclude deaths of infants dying within 24 hours of birth.

41/ Prior to 1967, excluding full-blooded aborigine population, estimated at 49 036 in June 1966.

42/ Including infant deaths among United States military personnel, their dependants and contract employees.

43/ Excluding infant deaths among United States military personnel, their dependants and contract employees.

44/ Excluding infant deaths of unknown residence.

NOTES (suite)

33/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des quesions de status qui peuvent se poser à cet égard.

34/ La classification par âge repose sur la différence entre la date de la naissance et la date du décès et non sur l'âge en jours révolus.

35/ Décès d'enfants de moins d'un an enregistrés dans l'année qui suit l'événement.

36/ Les données concernent la population de droit.

37/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

38/ Y compris les résidents temporairement hors du pays.

39/ Non compris Ceuta et Melilla.

40/ Non compris les enfants décédés dans les 24 heures qui ont suivi leur naissance.

41/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 49 036 en juin 1966 (estimation).

42/ Y compris les décès d'enfants de moins d'un an survenus parmi les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

43/ Non compris les décès d'enfants de moins d'un an survenus parmi les militaires des Etats-Unis et les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

44/ Non compris les décès d'enfants de moins d'un an dont on ignore la résidence.

FOOT-NOTES

Data exclude foetal deaths. For method of evaluation and limitations of data, see Technical Notes, page 43.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Data tabulated by date of registration rather than occurrence.

2/ Data exclude live-born infants dying within 24 hours of birth.

3/ For Banjul only.

4/ Data are not representative of Ghana as they are for compulsory registration centres only; these numbered 153 in 1969 and served approximately 35 per cent of the total population in 1969.

5/ Data exclude live-born infants dying before registration of birth.

6/ Including Asiatic population.

7/ Includes infant deaths not classified by month of occurrence.

8/ Including Canadian residents temporarily in the United States but excluding United States residents temporarily in Canada.

9/ For Aruba, Bonaire and Curaçao only.

10/ Except for Curaçao, data exclude live-born infants dying before registration of birth.

11/ Excluding data for Canal Zone, shown separately hereunder.

12/ Excluding data for Anguilla.

13/ Data based on burial permits.

14/ Excluding nomadic Indian tribes.

15/ Excluding Indian jungle population, estimated at 100 830 in 1961.

16/ Excluding Indian jungle population, estimated at 31 800 in 1961.

17/ Data are for a changing number of towns having a combined population of approximately 3 million in 1965.

18/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

19/ Except for 1973, excluding Okinawa.

NOTES

Les données ne comprennent pas les morts foetales. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 91.

*Données provisoires

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Données exploitées selon la date de l'enregistrement et non la date de l'événement.

2/ Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

3/ Pour Banjul seulement.

4/ Les données ne sont pas représentatives de l'ensemble du Ghana, car elles se rapportent seulement à des centres où l'enregistrement est obligatoire, ces centres étant au nombre de 153 en 1969 et représentant environ 35 p. 100 de la population totale en 1969.

5/ Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

6/ Y compris la population d'origine asiatique.

7/ Y compris les décès d'enfants de moins d'un an non classés selon le mois de décès.

8/ Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

9/ Pour Aruba, Bonaire et Curaçao seulement.

10/ Sauf pour Curaçao, les données ne comprennent pas les enfants nés vivants décédés avant l'enregistrement de leur naissance.

11/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous.

12/ Non compris Anguilla.

13/ Les données sont fondées sur les permis d'inhumer délivrés.

14/ Non compris les tribus d'Indiens nomades.

15/ Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

16/ Non compris les Indiens de la jungle, soit 31 800 personnes en 1961 (estimation).

17/ Les données se rapportent à un nombre variable de villes, qui comptaient ensemble environ 3 millions en 1965.

18/ Estimations fondées sur les statistiques courantes de l'enregistrement, ajustées pour compenser les lacunes d'après l'expérience de 1952-1954.

19/ Sauf pour 1973, non compris Okinawa.

FOOT-NOTES (continued)

20/ Data are for Japanese nationals in Japan only.

21/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

22/ Excluding data for Jordanian territory under occupation since June 1967 by Israeli military forces.

23/ Excluding infant deaths among non-locally domiciled military and civilian services personnel and their dependants.

24/ Except for 1967, for provincial capitals and district centres only.

25/ Estimate based on returns from Turkish Demographic Survey.

26/ Data relate only to the former Colony of Aden excluding Perim and Kamaran Island. Data exclude infant deaths among military personnel and population of the port.

27/ Excluding data for Faeroe Islands and Greenland, shown separately.

28/ Including data for nationals temporarily outside the country.

29/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

30/ Data are infant deaths registered within one year of occurrence.

31/ Data are for de jure population.

32/ Including residents outside the country, if listed in a Netherlands population register.

33/ Including residents temporarily outside the country.

34/ Excluding Ceuta and Melilla.

35/ Prior to 1967, excluding full-blooded aborigine population, estimated at 49 036 in June 1966.

36/ Including infant deaths among United States military personnel, their dependants and contract employees.

37/ Excluding infant deaths among United States military personnel, their dependants and contract employees.

38/ Data exclude infants born alive of less than 28 weeks' gestation, less than 1 000 grammes in weight and 35 centimetres in length, who die within 7 days of birth.

NOTES (suite)

20/ Ne concerne que les ressortissants japonais se trouvant au Japon.

21/ Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

22/ Non compris les données pour le territoire jordanien occupé par les forces armées israéliennes depuis juin 1967.

23/ Non compris les décès d'enfants de moins d'un an parmi les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant.

24/ Sauf pour 1967, les données se rapportent aux capitales de provinces et chefs-lieux de districts seulement.

25/ Estimation fondée sur les résultats de l'enquête démographique turque.

26/ Les données ne se rapportent qu'à l'ancienne colonie d'Aden, non compris Perim et l'île de Kamaran. Elles ne comprennent pas les décès d'enfants de moins d'un an survenus parmi les militaires et la population du port.

27/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

28/ Y compris les nationaux temporairement hors du pays.

29/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

30/ Décès d'enfants de moins d'un an enregistrés dans l'année qui suit l'événement.

31/ Les donnees concernent la population de droit.

32/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

33/ Y compris les résidents temporairement hors du pays.

34/ Non compris les données pour Ceuta et Melilla.

35/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 49 036 en juin 1966 (estimation).

36/ Y compris les décès d'enfants de moins d'un an parmi les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

37/ Non compris les décès d'enfants de moins d'un an parmi les militaires des Etats-Unis, les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

38/ Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les sept jours qui ont suivi leur naissance.

(SEE NOTES AT END OF TABLE.)

FOOT-NOTES

Data exclude foetal deaths. Rates are the number of deaths per 1 000 corresponding population. For definitions of "urban" areas, see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 44.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Civil registration data said to be relatively complete are coded "C", those said to be unreliable (incomplete) are coded "U". The code does not apply to estimated data. For further details, see Technical Notes.

2/ Data exclude deaths of infants dying before registration of birth.

3/ For Algerian population only.

4/ Estimate prepared by the United Nations Population Division for 1965-1970.

5/ Based on births and deaths reported for 12-month period preceding 1965 sample survey.

6/ For classification by urban/rural residence see end of table.

7/ Data exclude deaths of infants dying within 24 hours of birth.

8/ Data tabulated by year of registration rather than occurrence.

9/ Data are not representative of Ghana as they are for compulsory registration centres only; these numbered 153 in 1969 and served approximately 35 per cent of the total population in 1969.

10/ Data are based on the results of the Demographic Component of the Rural Household Consumption and Expenditure Survey.

11/ Data are based on the results of the Population Growth Survey.

12/ Data are deaths beported to the Registration Office in the Eastern and Western Divisions, together comprising 95 per cent of total population at 1964 census.

NOTES

Les données ne comprennent pas les morts foetales. Les taux représentent le nombre de décès pour 1 000 personnes de la catégorie correspondante. Pour les définitions des zones "urbaines", se reporter à la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 91.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ La lettre "C" désigne des données relativement complètes et la lettre "U" des données discutables (incomplètes) provenant des registres de l'état civil. Le code ne s'applique pas aux données estimatives. Pour plus de détails, voir Notes techniques.

2/ Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

3/ Pour la population algérienne seulement.

4/ Estimation pour 1965-1970 établie par la Division de la population de l'Organisation des Nations Unies.

5/ D'après les naissances et les décès déclarés pour la période de 12 mois qui a précédé l'enquête par sondage de 1965.

6/ Pour la classification selon la résidence urbaine/rurale voir à la fin du tableau.

7/ Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

8/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

9/ Les données ne sont pas représentatives de l'ensemble du Ghana car elles se rapportent uniquement à des centres où l'enregistrement est obligatoire; ces centres étaient au nombre de 153 en 1969 et représentaient environ 35 p. 100 de la population totale en 1969.

10/ Les données sont basées sur les résultats de Demographic Component of the Rural Household Consumption and Expenditure Survey.

11/ Les données sont basées sur les résultats de Population Growth Survey.

12/ Décès déclarés au Bureau d'état civil dans les divisions orientale et occidentale, qui comptaient ensemble 95 p. 100 de la population totale au recensement de 1964.

(VOIR NOTES A LA FIN DU TABLEAU.)

49 442	...	...	...	...	...	...	...	...	...	...	10.4	...	2

FOOT-NOTES (continued)

13/ Death registration estimated to be 50 per cent complete.

14/ For Western Area only.

15/ Death registration among Tunisian Moslem population estimated to be only about 50 per cent complete.

16/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

17/ Death registration estimated to be 75-85 per cent complete.

18/ Including residents outside the islands if listed in the population register of Netherlands Antilles. Except for Curaçao, data exclude deaths of infants dying before registration of births.

19/ For Aruba, Bonaire and Curaçao only.

20/ Excluding data for Canal Zone, shown separately hereunder.

21/ Beginning in 1967, excluding Anguilla.

22/ Data based on burial permits.

23/ Excluding nomadic Indian tribes.

24/ Excluding Amerindian population, shown separately hereunder.

25/ Excluding Indian jungle population, estimated at 100 830 in 1961.

26/ Excluding Indian and Negro population living in tribes, numbering 32 006 at 1964 census.

27/ Excluding Indian jungle population, estimated at 31 800 in 1961.

28/ Data are for a changing number of towns having a population of approximately 3 million for 1965 and 4 million for 1966-1968.

29/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

30/ Including an upward adjustment for under-registration.

NOTES (suite)

13/ On estime que 50 p. 100 des décès sont enregistrés.

14/ Pour la région occidentale seulement.

15/ On estime qu'environ 50 p. 100 seulement des décès de Tunisiens musulmans sont enregistrés.

16/ Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

17/ On estime que 75-85 p. 100 des décès sont enregistrés.

18/ Y compris les résidents hors du territoire s'ils sont inscrits sur le registre de population des Antilles néerlandaises. Sauf pour Curaçao, non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

19/ Pour Aruba, Bonaire et Curaçao seulement.

20/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous.

21/ A partir de 1967, non compris Anguilla.

22/ D'après les permis d'inhumer délivrés.

23/ Non compris les tribus d'Indiens nomades.

24/ Non compris les Amérindiens, qui font l'objet d'une rubrique distincte ci-dessous.

25/ Non compris les Indiens de la jungle, soit 100 830 personnes en 1961 (estimation).

26/ Non compris les Indiens et les Noirs vivant en tribus, au nombre de 32 006 au recensement de 1964.

27/ Non compris les Indiens de la jungle, soit 31 800 personnes en 1961 (estimation).

28/ Les données se rapportent à un nombre variable de villes qui comptaient environ 3 millions d'habitants en 1965 et 4 millions en 1966-1968.

29/ Les données sont des estimations fondées sur les statistiques courantes de l'enregistrement, ajustées pour compenser les lacunes d'après l'expérience de 1952-1954.

30/ Compte tenu d'un ajustement pour compenser les lacunes de l'enregistrement.

FOOT-NOTES (continued)

31/ Death registration estimated to be about 60 per cent complete around 1960, and primarily urban in coverage.

32/ Data are for Japanese nationals in Japan only.

33/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

34/ Beginning in May 1967, not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

35/ Death registration estimated to be about 35-40 per cent complete in 1963-1966.

36/ Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel and their dependants.

37/ Death registration regarded as being approximately 71 per cent complete.

38/ Data include deaths among Kuwait nationals residing outside Kuwait.

39/ Data are for Lebanese nationals on population register including those living outside the country but excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see table 5.

40/ Data are deaths recorded by Health Service only.

41/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.

42/ Former mandated territory administered by the United Kingdom, until Armistice of 1949.

43/ Comprising that part of Palestine under Egyptian administration following the Armistice of 1949 until June 1967 when it was occupied by Israeli military forces.

44/ Data include reports from sources other than civil registers.

45/ Rates computed on population excluding transients afloat and non-locally domiciled military and civilian service personnel and their dependants.

46/ Deaths exclude data for nomad population and Palestinian refugees, but rates computed on population including them. See table 5 for number of Palestinian refugees, among whom deaths numbered 765 for 1968.

47/ Data are deaths registered within one month of occurrence; additional late registrations made during years 1965 to 1968 numbered 4 967, 5 221, 4 881 and 5 848 respectively.

48/ For Provincial capitals and district centres only.

49/ Data are for changing territory representing about 70 per cent of total population in 1965.

50/ Data relate only to the former Colony of Aden excluding Perim and Kamaran Island. Data exclude deaths among military personnel and population of the port, but rates computed on population including them.

51/ Including armed forces stationed outside the country, but excluding alien armed forces stationed in the area.

52/ Excluding data for Faeroe Islands and Greenland, shown separately.

53/ Including data for nationals temporarily outside the country.

54/ Including armed forces stationed outside the country.

55/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

56/ Excluding armed forces.

57/ Data are deaths registered within one year of occurrence.

58/ Data include deaths among armed forces stationed outside the country and exclude those among non-Maltese armed forces stationed in the area; rates computed on population excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside the country.

59/ Data are for de jure population.

NOTES (suite)

31/ On estime que 60 p. 100 environ des décès étaient enregistrés vers 1960, l'enregistrement portant surtout sur les zones urbaines.

32/ Les données ne concernent que les nationaux japonais au Japon.

33/ Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

34/ A partir de mai 1967, non compris les données pour le territoire jordanien occupé par les forces armées israéliennes depuis juin 1967.

35/ On estime que 35-40 p. 100 environ des décès ont été enregistrés en 1963-1966.

36/ Non compris les militaires étrangers, les civils étrangers employés par les forces armées ni le personnel diplomatique étranger et les membres de leur famille les accompagnant.

37/ On estime que 71 p. 100 environ des décès sont enregistrés.

38/ Les données comprennent les décès survenus parmi les ressortissants du Koweït résidant hors du pays.

39/ Les données se rapportent aux ressortissants libanais inscrits sur le registre de la population, y compris ceux qui vivent hors du pays, mais non compris les étrangers non résidents et les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

40/ Les données ne concernent que les décès enregistrés par le Service de santé.

41/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.

42/ Ancien territoire sous mandat administré par le Royaume-Uni jusqu'à l'armistice de 1949.

43/ Désigne la partie de la Palestine administrée par l'Egypte depuis l'armistice de 1949 jusqu'en juin 1967, date à laquelle elle a été occupée par les forces armées israéliennes.

44/ Les données comprennent des renseignements provenant de sources autres que les registres de l'état civil.

45/ Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant.

46/ Les décès ne comprennent pas la population nomade ni les réfugiés de Palestine, mais les taux sont calculés sur la base d'un chiffre de population qui les comprend. Voir le tableau 4 pour le nombre de réfugiés de Palestine, parmi lesquels les décès s'établissent à 765 pour 1968.

47/ Les données représentent les décès enregistrés dans le mois qui suit l'événement; les autres décès, qui ont fait l'objet d'un enregistrement tardif, sont au nombre de 4 967 pour 1965, 5 221 pour 1966, 4 881 pour 1967 et 5 848 pour 1968.

48/ Pour capitales de provinces et chefs-lieux de districts seulement.

49/ Les données se rapportent à un territoire variable qui comptait environ 70 p. 100 de la population totale en 1965.

50/ Les données ne se rapportent qu'à l'ancienne colonie d'Aden, non compris Perim et l'île de Kamaran. Elles ne comprennent pas les décès survenus parmi les militaires et la population du port; toutefois, les taux sont calculés sur la base d'un chiffre de population qui les comprend.

51/ Y compris les militaires nationaux hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

52/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

53/ Y compris les nationaux temporairement hors du pays.

54/ Y compris les militaires hors du pays.

55/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

56/ Non compris les militaires.

57/ Décès enregistrés dans l'année qui suit l'événement.

58/ Les données comprennent les décès survenus parmi les militaires hors du pays mais non ceux des militaires non maltais en garnison sur le territoire; les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire, mais qui comprend les civils nationaux temporairement hors du pays.

59/ Les données se rapportent à la population de droit.

FOOT-NOTES (continued)

60/ Including residents outside the country, if listed in a Netherlands population register.

61/ Including persons on the Central Register of Population (containing persons belonging to Netherlands population, but having no fixed municipality of residence).

62/ Including residents temporarily outside the country.

63/ Excluding Ceuta and Melilla.

64/ Data tabulated by year of occurrence for England and Wales and by year of registration for Northern Ireland and Scotland.

65/ Prior to 1967, excluding full-blooded aborigines estimated at 40 081 in June 1961 and 49 036 in June 1966.

66/ Including United States military personnel, their dependants and contract employees.

67/ Excluding United States military personnel, their dependants and contract employees.

68/ Death registration estimated to be 60-70 per cent complete in 1963.

69/ Data exclude deaths of infants born alive of less than 28 weeks' gestation, less than 1 000 grammes in weight and 35 centimetres in length, who die within 7 days of birth.

70/ Excludes non-locally domiciled military and civilian service personnel and their dependants.

71/ Excluding deaths of those of unknown residence.

NOTES (suite)

60/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

61/ Y compris les personnes inscrites sur le Registre central de la population (personnes faisant partie de la population néerlandaise, mais sans domicile fixe dans l'une des municipalités).

62/ Y compris les résidents temporairement hors du pays.

63/ Non compris Ceuta et Melilla.

64/ Données exploitées selon l'année de l'événement pour l' Angleterre et Galles, et selon l'année de l'enregistrement pour l'Irlande du Nord et l'Ecosse.

65/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 40 081 en juin 1961 et de 49 036 en juin 1966.

66/ Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

67/ Non compris les militaires des Etats-Unis, les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

68/ On estime que 60-70 p. 100 des décès ont été enregistrés en 1963.

69/ Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les sept jours qui ont suivi leur naissance.

70/ Non compris les militaires et agents civils domiciliés hors du territoire et les membres de leur famille les accompagnant.

71/ Non compris les décès pour lesquels le lieu de résidence n'est pas connu.

FOOT-NOTES

For infant deaths by age and sex, see table 21. Data exclude foetal deaths. For definitions of "urban", see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 45.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Data exclude deaths of infants dying before registration of birth.

2/ Algerian population only.

3/ For classification by urban/rural residence, see end of table.

4/ For Banjul only.

5/ Data are not representative of Ghana as they are for compulsory registration centres only serving approximately 35 per cent of the total population in 1969.

6/ Data tabulated by year of registration rather than occurrence.

7/ Data are based on the results of the Population Growth Survey.

8/ Data are deaths reported to the Registration Office in the Eastern and Western Divisions, together comprising 95 per cent of total population at 1964 census.

9/ Including Asiatic population.

10/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

11/ Data are medically certified deaths only, comprising 94.3 per cent of total deaths in 1969.

12/ Data are for Aruba, Bonaire and Curaçao only and include deaths among residents outside the islands, if they were listed in the population register of the islands mentioned.

13/ Except for Curaçao, data exclude deaths of infants dying before registration of birth.

14/ Excluding data for Canal Zone, shown separately hereunder.

15/ Beginning in 1967, excluding data for Anguilla.

16/ Because of rounding, totals are not in all cases the sum of the parts.

17/ Data are based on burial permits.

18/ Excluding nomadic Indian tribes.

19/ Excluding Indian jungle population, estimated at 100 830 in 1961.

20/ Excluding Indian and Negro population living in tribes, numbering 32 006 at 1964 census.

21/ Excluding deaths of unknown residence.

22/ Excluding Indian jungle population, estimated at 31 800 in 1961.

23/ Data are for a number of towns having a combined population of approximately 2 million.

24/ Except for 1973, excluding Okinawa.

25/ Data are for Japanese nationals in Japan only.

26/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

27/ Not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

28/ Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel and their dependants.

29/ Data are deaths registered by Health Service only.

30/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.

31/ Data exclude deaths of non-locally domiciled military and civilian services personnel and their dependants.

NOTES

Pour les décès d'enfants de moins d'un an selon l'âge et le sexe, voir le tableau 21. Les données ne comprennent pas les morts foetales. Pour la définition du terme "urbaine" voir la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 93.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

2/ Population algérienne seulement.

3/ Pour la classification selon la résidence urbaine/rurale voir à la fin du tableau.

4/ Pour Banjul seulement.

5/ Les données ne sont pas représentatives de l'ensemble du Ghana car elles se rapportent à des centres où l'enregistrement est obligatoire et qui ne comptaient en 1969 que 35 p. 100 environ de la population totale.

6/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

7/ Les données sont basées sur les résultats de Population Growth Survey.

8/ Décès déclarés au Bureau d'état civil dans les divisions orientale et occidentale, qui comptaient ensemble 95 p. 100 de la population totale au recensement de 1964.

9/ Y compris la population d'origine asiatique.

10/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

11/ Décès médicalement certifiés seulement, soit 94,3 p. 100 du nombre total des décès en 1969.

12/ Pour Aruba, Bonaire et Curaçao seulement. Y compris les décès survenus parmi les résidents hors du territoire, s'ils étaient inscrits sur le registre de la population de ces îles.

13/ Sauf pour Curaçao, non compris les décès d'enfants de moins d'un an survenus avant l'enregistrement de leur naissance.

14/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous.

15/ A partir de 1967, non compris Anguilla.

16/ Les chiffres étant arrondis, les totaux ne correspondent pas toujours rigoureusement à la somme des chiffres partiels.

17/ D'après les permis d'inhumer délivrés.

18/ Non compris les tribus d'Indiens nomades.

19/ Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

20/ Non compris les Indiens et les Noirs vivant en tribus, au nombre de 32 006 au recensement de 1964.

21/ Non compris les décès pour lesquels le lieu de résidence n'est pas connu.

22/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

23/ Les données se rapportent à des villes comptant ensemble environ 2 millions d'habitants.

24/ Sauf pour 1973, non compris Okinawa.

25/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

26/ Non compris les étrangers mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

27/ Non compris les données pour le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes.

28/ Non compris les militaires étrangers, les civils étrangers employés par les forces armées ni le personnel diplomatique et les membres de leur famille les accompagnant.

29/ Les données ne concernent que les décès enregistrés par le Service de santé.

30/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D.I. Khan et de Peshawar.

31/ Non compris les décès survenus parmi les militaires et agents civils non résidents et les membres de leur famille les accompagnant.

FOOT-NOTES (continued)

32/ Data relate only to deaths for which the cause of death is known (this comprises about 84 per cent of total reported deaths).

33/ Provincial capitals only.

34/ Data relate only to the former Colony of Aden excluding Perim and Kamaran Islands and also exclude military personnel and the population of the port.

35/ Including armed forces stationed outside the country, but excluding alien armed forces stationed in the area.

36/ Excluding the Faeroe Islands and Greenland, shown separately.

37/ Including nationals temporarily outside the country.

38/ Including armed forces stationed outside the country.

39/ For ages 5 years and over, age classification based on difference between year of birth and year of death rather than completed years of age.

40/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

41/ Data exclude deaths among armed forces.

42/ Data are deaths registered within one year of occurrence.

43/ Deaths are for de jure population.

44/ Including armed forces stationed outside the country and excluding non-Maltese armed forces in the area.

45/ Including residents outside the country if listed in a Netherlands population register, but excluding alien armed forces stationed in the area.

46/ Excludes deaths of persons on the population register who had no fixed municipality of residence.

47/ Including residents temporarily outside the country.

48/ Excluding Ceuta and Melilla.

49/ Data exclude deaths of infants dying within 24 hours of birth.

50/ Prior to 1967, excluding full-blooded aborigine population, estimated at 49 036 in June 1966.

51/ Including United States military personnel, their dependants and contract employees.

52/ For year ending 30 June.

53/ Excluding United States military personnel, their dependants and contract employees.

54/ Data are for Tongan population only.

NOTES (suite)

32/ Les données ne concernent que les décès dont la cause est connue (soit environ 84 p. 100 des décès déclarés).

33/ Capitales de province seulement.

34/ Les données ne concernent que l'ancienne colonie d'Aden, non compris Perim et l'île de Kamaran. Non compris également les militaires et la population du port.

35/ Y compris les militaires hors du pays mais non compris les militaires étrangers en garnison sur le territoire.

36/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

37/ Y compris les nationaux temporairement hors du pays.

38/ Y compris les militaires en garnison hors du pays.

39/ A partir de cinq ans, la classification par âge repose sur la différence entre l'année de la naissance et l'année du décès et non sur l'âge en années révolues.

40/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

41/ Non compris les décès survenus parmi les militaires.

42/ Décès enregistrés dans l'année qui suit l'événement.

43/ Les décès concernent la population de droit.

44/ Y compris les militaires en garnison hors du pays, mais non compris les militaires non maltais en garnison sur le territoire.

45/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire.

46/ Non compris les décès de personnes inscrites sur un registre de population qui n'avaient pas de résidence fixe.

47/ Y compris les résidents temporairement hors du pays.

48/ Non compris Ceuta et Melilla.

49/ Non compris les enfants décédés dans les 24 heures qui ont suivi leur naissance.

50/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 49 036 en juin 1966 (estimation).

51/ Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

52/ Période annuelle se terminant le 30 juin.

53/ Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

54/ Tongans seulement.

FOOT-NOTES

Data exclude foetal deaths. Rates are the number of deaths in each sex-age-urban/rural residence group per 1 000 population of the same sex, age and urban/rural residence. For definitions of "urban", see end of table 6. For method of evaluation and limitations of data, see Technical Notes, page 46.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Including deaths where age is unknown.

2/ Deaths are not representative of Ghana as they are for compulsory registration centres only serving approximately 35 per cent of the total population in 1969.

3/ Data tabulated by year of registration rather than occurrence.

4/ Data are based on the results of the Population Growth Survey.

5/ For classification by urban/rural residence, see end of table.

6/ Data are estimates based on deaths reported for 12-month period preceding sample survey described in table 3.

7/ Rates for "All ages" and "Under one year" exclude deaths of infants dying before registration of birth.

8/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

9/ Data are for Aruba, Bonaire and Curaçao only and include deaths among residents outside the islands, if they were listed in the population register of the islands mentioned.

10/ Except for Curaçao, data exclude deaths of infants dying before registration of birth.

11/ Excluding data for Canal Zone, shown separately hereunder.

12/ Excluding Anguilla.

13/ Excluding nomadic Indian tribes.

14/ Excluding Indian jungle population, estimated at 100 830 in 1961.

15/ Excluding Indian jungle population, estimated at 31,800 in 1961.

16/ Except for 1973, excluding Okinawa.

17/ Data are for Japanese nationals in Japan only.

18/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

19/ Beginning in 1969, excluding deaths for Jordanian territory under occupation since June 1967 by Israeli military forces, but rates computed on total population.

20/ Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel and their dependants.

21/ Data are deaths registered by Health Service only, but rates computed on total population.

22/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of D. I. Khan and Peshawar Divisions.

23/ Data exclude non-locally domiciled military and civilian services personnel and their dependants.

24/ Data relate only to deaths for which the cause of death is known (this comprises about 84 per cent of total reported deaths), but rates computed on total population.

25/ Deaths are for Provincial capitals only, but rates computed on total population.

26/ Including armed forces stationed outside the country, but excluding alien armed forces stationed in the area.

27/ Including dependencies. Rates computed on population excluding armed forces.

28/ Excluding Faeroe Islands and Greenland, shown separately.

29/ Including nationals temporarily outside the country.

30/ Including armed forces stationed outside the country.

NOTES

Il n'est pas tenu compte des morts fœtales. Les taux représentent le nombre de décès des personnes de sexe, d'âge et de résidence urbaine/rurale donnés pour 1 000 personnes du même sexe, du même âge et de la même résidence urbaine/rurale. Pour les définitions du terme régions "urbaines", se reporter à la fin du tableau 6. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 94.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Y compris les décès dont l'âge est inconnu.

2/ Les décès ne sont pas représentatifs de l'ensemble du Ghana car ils se rapportent à des centres où l'enregistrement est obligatoire et qui ne comptaient en 1969 que 35 p. 100 environ de la population totale.

3/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

4/ Les données sont basées sur les résultats de Population Growth Survey.

5/ Pour la classification selon la résidence urbaine/rurale voir à la fin du tableau.

6/ Les données sont des estimations fondées sur les décès déclarés pour la période de 12 mois qui a précédé l'enquête par sondage dont il est question au tableau 3.

7/ Les taux pour "Tous âges" et "Moins d'un an" ne tiennent pas compte des décès d'enfants de moins d'un an survenus avant l'enregistrement de leur naissance.

8/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

9/ Pour Aruba, Bonaire et Curaçao seulement. Y compris les décès survenus parmi les résidents hors du territoire, s'ils étaient inscrits sur le registre de la population de ces îles.

10/ Sauf pour Curaçao, non compris les décès d'enfants de moins d'un an survenus avant l'enregistrement de leur naissance.

11/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous.

12/ Non compris Anguilla.

13/ Non compris les tribus d'Indiens nomades.

14/ Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

15/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

16/ Sauf pour 1973, non compris Okinawa.

17/ Les données ne concernent que les resortissants japonais se trouvant au Japon.

18/ Non compris les étrangers mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

19/ A partir de 1969, non compris les décès pour le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes, mais les taux sont basés sur la population totale.

20/ Non compris les militaires étrangers, les civils étrangers employés par les forces armées ni le personnel diplomatique et les membres de leur famille les accompagnant.

21/ Les données ne concernent que les décès enregistrés par le Service de santé, mais les taux sont basés sur la population totale.

22/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.

23/ Non compris les militaires et agents civils non résidents et les membres de leur famille les accompagnant.

24/ Les données ne concernent que les décès dont la cause est connue (soit environ 84 p. 100 des décès déclarés), mais les taux sont basés sur la population totale.

25/ Les décès se rapportent aux capitales de provinces seulement, mais les taux sont basés sur la population totale.

26/ Y compris les militaires hors du pays mais non compris les militaires étrangers en garnison sur le territoire.

27/ Y compris les dépendances. Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.

28/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

29/ Y compris les nationaux temporairement hors du pays.

30/ Y compris les militaires en garnison hors du pays.

FOOT-NOTES (continued)

31/ For ages 5 years and over, age classification based on difference between year of birth and year of death rather than completed years of age.

32/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

33/ Rates computed on population excluding armed forces.

34/ Data are deaths registered within one year of occurrence.

35/ Deaths are for de jure population.

36/ Including armed forces stationed outside the country and excluding non-Maltese armed forces in the area.

37/ Including residents outside the country if listed in a Netherlands population register, but excluding alien armed forces stationed in the area.

38/ Including residents temporarily outside the country.

39/ Excluding Ceuta and Melilla.

40/ Data exclude deaths of infants dying within 24 hours of birth.

41/ Prior to 1967, excluding full-blooded aborigine population, estimated at 49 036 in June 1966.

42/ Including United States military personnel, their dependants and contract employees.

43/ Excluding United States military personnel, their dependants and contract employees.

44/ Data are for Tongan population only.

45/ Excludes deaths of persons on the population register who had no fixed municipality of residence.

NOTES (suite)

31/ A partir de cinq ans, la classification par âge repose sur la différence entre l'année de la naissance et l'année du décès et non sur l'âge en années révolues.

32/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

33/ Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.

34/ Décès enregistrés dans l'année qui suit l'événement.

35/ Les décès concernent la population de droit.

36/ Y compris les militaires en garnison hors du pays, mais non compris les militaires non maltais en garnison sur le territoire.

37/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire.

38/ Y compris les résidents temporairement hors du pays.

39/ Non compris Ceuta and Melilla.

40/ Non compris les enfants décédés dans les 24 heures qui ont suivi leur naissance.

41/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 49 036 en juin 1966 (estimation).

42/ Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

43/ Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

44/ Les données se rapportent aux Tongans seulement.

45/ Non compris les décès de personnes inscrites sur un registre de population, qui n'avaient pas de résidence fixe dans l'une des municipalités.

27. DEATHS AND DEATH RATES BY CAUSE, AND PERCENTAGE MEDICALLY CERTIFIED 1965-1973

DÉCÈS SELON LA CAUSE, NOMBRES ET TAUX, POURCENTAGE DE CERTIFICATION MÉDICALE 1965-1973

PART A. CLASSIFIED ACCORDING TO ABBREVIATED INTERNATIONAL LIST, 1955 REVISION

PARTIE A. DÉCÈS CLASSÉS SELON LA LISTE INTERNATIONALE ABRÉGÉE DE LA RÉVISION DE 1955

B12 Poliomyélite antérieure aiguë (080)

B13 Variole (084)

B14 Rougeole (085)

B15 Typhus et autres maladies à Rickettsia (100-108)

B16 Paludisme (110-117)

B17 Toutes autres maladies classées comme infectieuses et parasitaires (030-039, 041, 042, 044, 049, 052-054, 059-074, 081-083, 086-096, 120-138)

B18 Tumeurs malignes, y compris les tumeurs des tissus lymphatiques et hématopoiétiques (140-205)

B19 Tumeurs bénignes et tumeurs de nature non précisée (210-239)

B20 Diabète sucré (260)

B21 Anémies (290-293)

B22 Lésions vasculaires affectant le système nerveux central (330-334)

B23 Méningite non méningococcique (340)

B24 Rhumatisme articulaire aigu (400-402)

B25 Cardiopathie rhumatismale chronique (410-416)

B26 Artériosclérose des coronaires et myocardite dégénérative (420-422)

B27 Autres maladies du coeur (430-434)

B28 Hypertension avec maladie du coeur (440-443)

B29 Hypertension, sans mention du coeur (444-447)

B30 Grippe (480-483)

B31 Pneumonie (490-493)

B32 Bronchite (500-502)

B33 Ulcère de l'estomac et du duodénum (540, 541)

B34 Appendicite (550-553)

B35 Occlusion intestinale et hernie (560, 561, 570)

B36 Gastrite, duodénite, entérite et colite sauf diarrhée du nouveau-né (543, 571, 572)

B37 Cirrhose du foie (581)

B38 Néphrite et néphrose (590-594)

B39 Hypertrophie de la prostate (610)

B40 Accouchements, et complications de la grossesse, de l'accouchement et des suites de couches (640-689)

B41 Malformations congénitales (750-759)

B42 Lésions obstétricales, et asphyxie et atélectasie postnatales (760-762)

B43 Infections du nouveau-né (763-768)

B44 Autres maladies particulières à la première enfance, et débilité sans précisions (769-776)

B45 Sénilité, sans mention de psychose, et causes mal définies ou inconnues (780-795)

B46 Toutes autres maladies (le reste)

BE47 Accidents dus à des véhicules à moteur (E810-E835)

BE48 Tous autres accidents (E800-E802, E840-E962)

BE49 Suicide et blessure faite à soi-même (E963, E970-E979)

BE50 Homicide et blessures de guerre (E964, E965, E980-E999)

PART B. CLASSIFIED ACCORDING TO ABBREVIATED INTERNATIONAL LIST, 1965 REVISION

PARTIE B. DÉCÈS CLASSÉS SELON LA LISTE INTERNATIONALE ABRÉGÉE DE LA RÉVISION DE 1965

(SEE NOTES AT END OF TABLE. - VOIR NOTES A LA FIN DU TABLEAU.)

B 1 Cholera (000)

B 2 Typhoid fever (001)

B 3 Bacillary dysentery and amoebiasis (004, 006)

B 4 Enteritis and other diarrhoeal diseases (008, 009)

B 5 Tuberculosis of respiratory system (010-012)

B 6 Other tuberculosis, including late effects (013-019)

B 7 Plague (020)

B 8 Diphtheria (032)

B 9 Whooping cough (033)

B10 Streptococcal sore throat and scarlet fever (034)

B11 Meningococcal infection (036)

B12 Acute poliomyelitis (040-043)

B13 Smallpox (050)

B14 Measles (055)

B15 Typhus and other rickettsioses (080-083)

B16 Malaria (084)

B17 Syphilis and its sequelae (090-097)

B18 All other infective and parasitic diseases (Remainder of 000-136)

B19 Malignant neoplasms, including neoplasms of lymphatic and haematopoietic tissue (140-209)

B20 Benign neoplasms and neoplasms of unspecified nature (210-239)

B21 Diabetes mellitus (250)

B22 Avitaminoses and other nutritional deficiency (260-269)

B23 Anaemias (280-285)

B24 Meningitis (320)

B25 Active rheumatic fever (390-392)

B26 Chronic rheumatic heart disease (393-398)

B27 Hypertensive disease (400-404)

B28 Ischaemic heart disease (410-414)

B29 Other forms of heart disease (420-429)

B30 Cerebrovascular disease (430-438)

B31 Influenza (470-474)

B32 Pneumonia (480-486)

B33 Bronchitis, emphysema and asthma (490-493)

B34 Peptic ulcer (531-533)

B35 Appendicitis (540-543)

B36 Intestinal obstruction and hernia (550-553, 560)

B37 Cirrhosis of liver (571)

B38 Nephritis and nephrosis (580-584)

B39 Hyperplasia of prostate (600)

B40 Abortion (640-645)

B41 Other complications of pregnancy, childbirth and the puerperium. Delivery without mention of complication (630-639, 650-678)

B42 Congenital anomalies (740-759)

B43 Birth injury, difficult labour and other anoxic and hypoxic conditions (764-768, 772-776)

B44 Other causes of perinatal mortality (760-763, 769-771, 773-775, 777-779)

B45 Symptoms and ill-defined conditions (780-796)

B46 All other diseases (Remainder of 240-738)

BE47 Motor vehicle accidents (E810-E823)

BE48 All other accidents (E800-E807, E825-E949)

BE49 Suicide and self-inflicted injuries (E950-E959)

BE50 All other external causes (E960-E999)

B 1 Choléra (000)

B 2 Fièvre typhoïde (001)

B 3 Dysenterie bacillaire et amibiase (004, 006)

B 4 Entérites et autres maladies diarrhéiques (008, 009)

B 5 Tuberculose de l'appareil respiratoire (010-012)

B 6 Autres formes de tuberculose et leurs séquelles (013-019)

B 7 Peste (020)

B 8 Diphtérie (032)

B 9 Coqueluche (033)

B10 Angine à streptocoques et scarlatine (034)

B11 Infections à méningocoques (036)

B12 Poliomyélite aiguë (040-043)

B13 Variole (050)

B14 Rougeole (055)

B15 Typhus et autres rickettsioses (080-083)

B16 Paludisme (084)

B17 Syphilis et ses séquelles (090-097)

B18 Toutes autres maladies infectieuses et parasitaires (le reste de 000-136)

B19 Tumeurs malignes, y compris les tumeurs des tissus lymphatiques et hématopoïétiques (140-209)

B20 Tumeurs bénignes et tumeurs de nature non précisée (210-239)

B21 Diabète sucré (250)

B22 Avitaminoses et autres états de carence (260-269)

B23 Anémies (280-285)

B24 Méningite (320)

B25 Rhumatisme articulaire aigu (390-392)

B26 Cardiopathies rhumatismales chroniques (393-398)

B27 Maladies hypertensives (400-404)

B28 Maladies ischémiques du coeur (410-414)

B29 Autres formes de cardiopathies (420-429)

B30 Maladies cérébro-vasculaires (430-438)

B31 Grippe (470-474)

B32 Pneumonie (480-486)

B33 Bronchite, emphysème et asthme (490-493)

B34 Ulcère de l'estomac et du duodénum (531-533)

B35 Appendicite (540-543)

B36 Occlusion intestinale et hernie (550-553, 560)

B37 Cirrhose du foie (571)

B38 Néphrite et néphrose (580-584)

B39 Hypertrophie de la prostate (600)

B40 Avortements (640-645)

B41 Autres complications de la grossesse, de l'accouchement et des suites de couches. Accouchement sans mention de complication (630-639, 650-678)

B42 Anomalies congénitales (740-759)

B43 Lésions obstétricales, accouchements dystociques et autres états anoxémiques et hypoxémiques (764-768, 772, 776)

B44 Autres causes de mortalité périnatale (760-763, 769-771, 773-775, 777-779)

B45 Symptômes et états morbides mal définis (780-796)

B46 Toutes autres maladies (le reste de 240-738)

BE47 Accidents de véhicule à moteur (E810-E823)

BE48 Tous autres accidents (E800-E807, E825-E949)

BE49 Suicide et lésions faites volontairement à soi-même (E950-E959)

BE50 Toutes autres causes extérieures (E960-E999)

27. DEATHS AND DEATH RATES BY CAUSE, AND PERCENTAGE MEDICALLY CERTIFIED 1965-1973

DECES SELON LA CAUSE, NOMBRES ET TAUX, POURCENTAGE DE CERTIFICATION MEDICALE 1965-1973

PART A. CLASSIFIED ACCORDING TO ABBREVIATED INTERNATIONAL LIST, 1955 REVISION

PARTIE A. DECES CLASSES SELON LA LISTE INTERNATIONALE ABREGEE DE LA REVISION DE 1955

FOOT-NOTES

Data exclude foetal deaths. In Part A of this table, cause of death is classified according to the 1955 Revision of the Abbreviated List of 50 Causes for Tabulation of Mortality of the International Statistical Classification of Diseases, Injuries and Causes of Death. In Part B, data classified according to the 1965 Revision are shown. Rates are the number of deaths from each cause per 100 000 population except for the rates for B 39, B 40 and B 42-44 in Part A and B 39, B 40, B 43 and B 44 in Part B where, as specified in foot-notes, the base has been changed in order to relate the deaths more closely to the population actually at risk. For method of evaluation and limitations of data, see Technical Notes, page 46.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ For title of each cause group and detailed list categories included, see beginning of table.

2/ Data are reported deaths only, but rates computed on total population.

3/ Data tabulated by years of registration rather than occurrence.

4/ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B 45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

5/ Per 100 000 females.

6/ Per 100 000 live-born.

7/ Data exclude deaths of infants dying within 24 hours of birth.

8/ For Banjul only.

9/ Per 100 000 males of 50 years and over.

10/ Data exclude deaths of infants dying before registration of birth.

11/ Reason for discrepancy between this figure and corresponding figure shown elsewhere not ascertained.

12/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

13/ Excluding data for Canal Zone, shown separately.

14/ Beginning in 1967, excluding Anguilla.

15/ Data are for a changing number of State capitals.

16/ Death statistics based on burial permits.

17/ Excluding nomadic Indian tribes.

18/ Excluding Amerindian population, and infant deaths.

19/ Data exclude deaths for which information by cause was not available.

20/ Excluding Indian and Negro population living in tribes, estimated at 32 006 at 1964 census.

21/ Excluding Indian jungle population, estimated at 31 800 in 1961.

22/ Data are for a number of towns having a combined population of approximately 2 million.

23/ Except for 1973, excluding Okinawa.

24/ Deaths are for Japanese nationals in Japan only but rates computed on population including foreigners except foreign military and civilian personnel and their dependants stationed in the area.

25/ Beginning in 1967, excluding data for Jordanian territory under occupation since June 1967 by Israeli military forces, but rates computed on total population.

26/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

27/ Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel and their dependants.

28/ Data are deaths recorded by Health Service only, but rates computed on total population.

29/ Data are medically certified or inspected deaths only, comprising 50.2 per cent of total deaths, but rates computed on total population.

NOTES

Il n'est pas tenu compte des morts fœtales. Dans la partie A du tableau, les causes de décès sont classées selon la Révision de 1955 de la Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité du Classement statistique international des maladies, traumatismes et causes de décès. Les données classées selon la Révision de 1965 figurent dans la partie B du tableau. Les taux représentent le nombre de décès attribuables à chaque cause pour 100 000 personnes dans la population totale. Font exception à cette règle les taux pour les catégories B 39, B 40 et B 42-44 dans la partie A du tableau et pour les catégories B 39, B 40, B 43 et B 44 dans la partie B du tableau, où, comme il est indiqué dans les notes, on a changé la base pour mieux relier les décès à la population effectivement exposée au risque. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 95.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

1/ Pour le titre de chaque groupe de causes et les catégories de la nomenclature détaillée, voir le début du tableau.

2/ Les données se rapportent aux décès déclarés seulement, mais les taux sont basés sur la population totale.

3/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

4/ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 p. 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

5/ Pour 100 000 personnes du sexe féminin.

6/ Pour 100 000 enfants nés vivants.

7/ Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

8/ Pour Banjul seulement.

9/ Pour 100 000 personnes du sexe masculin âgées de 50 ans et plus.

10/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

11/ On ne sait pas comment s'explique la divergence entre ce chiffre et le chiffre correspondant indiqué ailleurs.

12/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

13/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte.

14/ A partir de 1967, non compris Anguilla.

15/ Les données concernent un nombre variable de capitales d'Etat.

16/ Statistiques établies d'après les permis d'inhumer délivrés.

17/ Non compris les tribus d'Indiens nomades.

18/ Non compris les Amérindiens, ni les décès d'enfants de moins d'un an.

19/ Non compris les décès dont il n'a pas été possible de connaître la cause.

20/ Non compris les Indiens et les Noirs vivant en tribus au nombre de 32 006 au recensement de 1964.

21/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

22/ Les données se rapportent à des villes comptant ensemble environ 2 millions d'habitants.

23/ Sauf pour 1973, non compris Okinawa.

24/ Les données ne concernent que les ressortissants japonais se trouvant au Japon; toutefois les taux sont calculés sur la base d'un chiffre de population qui comprend les étrangers, mais qui ne comprend pas les militaires et agents civils étrangers en poste sur le territoire, ni les membres de leur famille les accompagnant.

25/ A partir de 1967, non compris les données pour le territoire jordanien occupé depuis juin 1967 pas les forces armées israéliennes, mais les taux sont basés sur la population totale.

26/ Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

27/ Non compris les militaires étrangers, les civils étrangers employés par les forces armées ni le personnel diplomatique et les membres de leur famille les accompagnant.

28/ Données enregistrées par le Service de santé seulement, mais les taux sont basés sur la population totale.

29/ Décès médicalement certifiés ou attestés, soit 50,2 p. 100 du nombre total des décès, mais les taux sont basés sur la population totale.

FOOT-NOTES (continued)

30/ Data are for medically certified or inspected deaths only, comprising 33.2 per cent of total deaths, but rates computed on total population.

31/ Rates are computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants, numbering 4 565 and 47 959 respectively at 1970 census.

32/ Data are for medically certified deaths only.

33/ For capitals and districts centres only.

34/ Data relate only to the former Colony of Aden, excluding Perim and Kamaran islands and also exclude military personnel and the population of the port.

35/ Including armed forces stationed outside the country but excluding alien armed forces stationed in the area.

36/ Excluding Faeroe Islands and Greenland, shown separately.

37/ Including nationals temporarily outside the country.

38/ Including armed forces stationed outside the country.

39/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

40/ Data are deaths registered within one year of occurrence.

41/ Deaths are for de jure population.

42/ Data include deaths among armed forces outside the country and exclude those among non-Maltese armed forces in the area; rates computed on population including civilian nationals temporarily outside the country.

43/ Including residents outside the country if listed in a Netherlands population register.

44/ Including residents temporarily outside the country.

45/ For B 46 to BE 50.

46/ For BE 47 to BE 50.

47/ Excluding Ceuta and Melilla.

48/ Prior to 1967, excluding full-blooded aborigines extimated at 49 036 in 1966.

49/ Including United States military personnel, their dependants and contract employees.

50/ Excluding United States military personnel, their dependants and contract employees.

NOTES (suite)

30/ Décès médicalement certifiés ou attestés seulement, soit 33,2 p. 100 du nombre total des décès, mais les taux sont basés sur la population totale.

31/ Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et agents civils non résidents et les membres de leur famille les accompagnant, soit respectivement 4 565 et 47 959 personnes au recensement de 1970.

32/ Décès médicalement certifiés seulement.

33/ Pour capitales de provinces et chefs-lieux de districts seulement.

34/ Les données ne concernent que l'ancienne colonie d'Aden, non compris Perim et l'Île de Kamaran. Non compris également les militaires et la population du port.

35/ Y compris les militaires hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

36/ Non compris les Iles Féroé et le Groenland, qui font l'objet d'une rubrique distincte.

37/ Y compris les nationaux temporairement hors du pays.

38/ Y compris les militaires en garnison hors du pays.

39/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

40/ Les données concernent les décès enregistrés dans l'année qui suit l'événement.

41/ Décès pour la population de droit.

42/ Y compris les décès de militaires nationaux en garnison hors du pays, mais non compris les décès de militaires non maltais en garnison sur le territoire; les taux sont calculés sur la base d'un chiffre de population qui comprend les civils nationaux temporairement hors du pays.

43/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

44/ Y compris les résidents temporairement hors du pays.

45/ Pour B 46 à BE 50.

46/ Pour BE 47 à BE 50.

47/ Non compris Ceuta et Melilla.

48/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 49 036 en juin 1966 (estimation).

49/ Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

50/ Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

FOOT-NOTES

Data exclude foetal deaths. In Part A of this table, cause of death is classified according to the 1955 Revision of the Abbreviated List of 50 Causes for Tabulation of Mortality of the International Statistical Classification of Diseases, Injuries and Causes of Death. In Part B, data classified according to the 1965 Revision are shown. Rates are the number of deaths from each cause per 100 000 population except for the rates for B 39, B 40 and B 42-44 in Part A and B 39, B 40, B 43 and B 44 in Part B where, as specified in foot-notes, the base has been changed in order to relate the deaths more closely to the population actually at risk. For method of evaluation and limitations of data, see Technical Notes, page 46.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ For title of each cause group and detailed list categories included, see beginning of table 27.

2/ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B 45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000, or because male and female population figures were not available.

3/ Data tabulated by year of registration rather than occurrence.

4/ Data exclude deaths of infants dying within 24 hours of birth.

5/ For Banjul only.

6/ Per 100 000 male live-born.

7/ Per 100 000 female live-born.

8/ Reason for discrepancy between this figure and corresponding figure shown elsewhere not ascertained.

9/ Excluding Amerindian population.

10/ Excluding Indian and Negro population living in tribes, numbering 32 006 at 1964 census.

11/ Data are for a number of towns having a combined population of approximately 2 million.

12/ Excluding alien armed forces, civilian aliens employed by armed forces and foreign diplomatic personnel and their dependants.

13/ Data are deaths recorded by Health Service only, but rates computed on total population.

14/ Per 100 000 males of 50 years and over.

15/ Data are for medically certified deaths only.

16/ Data relate only to the former Colony of Aden excluding Perim and Kamaran Islands and also exclude military personnel and the population of the port.

17/ Data are reported deaths only.

18/ Data exclude deaths of infants dying before registration of birth.

19/ Including Asiatic population.

20/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

21/ Excluding data for Canal Zone shown separately.

22/ Excluding Anguilla.

23/ Data are based on a 10 per cent sample of total deaths.

24/ Death statistics based on burial permits.

25/ Excluding nomadic Indian tribes.

26/ Data exclude deaths for which information by cause was not available.

27/ Excluding Indian jungle population, estimated at 100 830 in 1961.

28/ Excluding Indian jungle population, estimated at 31 800 in 1961.

29/ Deaths are for Japanese nationals in Japan only but rates computed on population including foreigners except foreign military and civilian personnel and their dependants stationed in the area.

NOTES

Il n'est pas tenu compte des morts fœtales. Dans la partie A du tableau, les causes de décès sont classées selon la Révision de 1955 de la Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité du Classement statistique international des maladies, traumatismes et causes de décès. Les données classées selon la Révision de 1965 figurent dans la partie B du tableau. Les taux représent le nombre de décès attribuables à chaque cause pour 100 000 personnes dans la population totale. Font exception à cette règle les taux pour les catégories B 39, B 40 et B 42-44 dans la partie A du tableau et pour les catégories B 39, B 40, B 43 et B 44 dans la partie B du tableau, où, comme il est indiqué dans les notes, on a changé la base pour mieux relier les décès à la population effectivement exposée au risque. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 95.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

1/ Pour le titre de chaque groupe de causes et les catégories de la nomenclature détaillée, voir le début du tableau 27.

2/ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B 45) représentent plus de 25 p. 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000, ni lorsque les chiffres pour la population du sexe masculin ou du sexe féminin n'ont pas été disponibles.

3/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

4/ Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

5/ Pour Banjul seulement.

6/ Pour 100 000 enfants nés vivants du sexe masculin.

7/ Pour 100 000 enfants nés vivants du sexe féminin.

8/ On ne sait pas comment s'explique la divergence entre ce chiffre et le chiffre correspondant indiqué ailleurs.

9/ Non compris les Amérindiens.

10/ Non compris les Indiens et les Noirs vivant en tribus au nombre de 32 006 au recensement de 1964.

11/ Les données se rapportent à des villes comptant ensemble environ 2 millions d'habitants.

12/ Non compris les militaires étrangers les civils étrangers employés par les forces armées ni le personnel diplomatique et les membres de leur famille les accompagnant.

13/ Données enregistrées par le Service de santé seulement, mais les taux sont basés sur la population totale.

14/ Pour 100 000 personnes du sexe masculin âgées de 50 ans et plus.

15/ Décès médicalement certifiés seulement.

16/ Les données ne concernent que l'ancienne colonie d'Aden, non compris Perim et l'île de Kamaran. Non compris également les militaires et la population du port.

17/ Les données se rapportent aux décès déclarés seulement.

18/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

19/ Y compris la population d'origine asiatique.

20/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

21/ Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte.

22/ Non compris Anguilla.

23/ Les données sont fondées sur un échantillon de 10 p. 100 du total des décès.

24/ Statistiques établies d'après les permis d'inhumer délivrés.

25/ Non compris les tribus d'Indiens nomades.

26/ Non compris les décès dont il n'a pas été possible de connaître la cause.

27/ Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

28/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

29/ Les données ne concernent que les ressortissants japonais se trouvant au Japon; toutefois les taux sont calculés sur la base d'un chiffre de population qui comprend les étrangers, mais qui ne comprend pas les militaires et agents civils étrangers en poste sur le territoire, ni les membres de leur famille les accompagnant.

FOOT-NOTES

30/ Not including data for Jordanian territory under occupation since June 1967 by Israeli military forces, but rates computed on total population.

31/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

32/ Data are for medically certified deaths only, but rates computed on total population.

33/ Rates are computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants, numbering 4 565 and 47 959 respectively at 1970 census.

34/ For Provincial capitals and districts centres only.

35/ Including armed forces stationed outside the country but excluding alien armed forces stationed in the area.

36/ Excluding Faeroe Islands and Greenland. Including armed forces stationed in the country.

37/ Including nationals temporarily outside the country.

38/ Including armed forces stationed outside the country.

39/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

40/ Data are deaths registered within one year of occurrence.

41/ Deaths are for de jure population.

42/ Data include deaths among armed forces outside the country and exclude those among non-Maltese armed forces in the area; rates computed on population including civilian nationals temporarily outside the country.

43/ Including residents outside the country if listed in a Netherlands population register.

44/ Including residents temporarily outside the country.

45/ For BE 47 to BE 50.

46/ Excluding Ceuta and Melilla.

47/ Including United States military personnel, their dependants and contract employees.

48/ Excluding United States military personnel, their dependants and contract employees.

NOTES

30/ Non compris les données pour le territoire jordanien occupé depuis juin 1967 pas les forces armées israéliennes, mais les taux sont calculés sur la base de la population totale.

31/ Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

32/ Décès médicalement certifiés seulement, mais les taux sont calculés sur la base de la population totale.

33/ Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et agents civils non résidents et les membres de leur famille les accompagnant, soit respectivement 4 565 et 47 959 personnes au recensement de 1970.

34/ Pour capitales de provinces et chefs-lieux de districts seulement.

35/ Y compris les militaires hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

36/ Non compris les Iles Féroé et le Groenland. Y compris les militaires en garnison sur le territoire.

37/ Y compris les nationaux temporairement hors du pays.

38/ Y compris les militaires en garnison hors du pays.

39/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

40/ Les données concernent les décès enregistrés dans l'année qui suit l'événement.

41/ Décès pour la population de droit.

42/ Y compris les décès de militaires nationaux en garnison hors du pays, mais non compris les décès de militaires non maltais en garnison sur le territoire; les taux sont calculés sur la base d'un chiffre de population qui comprend les civils nationaux temporairement hors du pays.

43/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

44/ Y compris les résidents temporairement hors du pays.

45/ Pour BE 47 à BE 50.

46/ Non compris Ceuta et Melilla.

47/ Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

48/ Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

FOOT-NOTES

Data exclude foetal deaths. In Part A of this table, cause of death is classified according to the 1955 Revision of the Abbreviated List of 50 Causes for Tabulation of Mortality of the International Statistical Classification of Diseases, Injuries and Causes of Death. In Part B data classified according to the 1965 Revision are shown. For method of evaluation and limitations of data, see Technical Notes, page 48.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ For title of each cause group and detailed list categories included, see beginning of table 27.

2/ Including persons of unknown age.

3/ Excluding persons of unknown sex.

4/ Data are deaths recorded by Health Service only.

5/ Data are medically certified or inspected deaths only, comprising 50.2 per cent of total deaths.

6/ Data are reported deaths only.

7/ Data tabulated by year of registration rather than occurrence.

8/ Data exclude deaths of infants dying before registration of birth.

9/ Including Asiatic population.

10/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

11/ Excluding data for Canal Zone.

12/ Data are based on a 10 per cent sample of total deaths.

13/ Death statistics based on burial permits.

14/ Data exclude deaths for which information by cause was not available.

15/ Excluding nomadic Indian tribes.

16/ Excluding Indian jungle population, estimated at 100 830 in 1961.

17/ Excluding Indian jungle population, estimated at 31 800 in 1961.

18/ Deaths are for Japanese nationals in Japan only.

19/ Not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

20/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

21/ Data are for medically certified or inspected deaths only, comprising 33.2 per cent of total deaths.

22/ Excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants, numbering 4 565 and 47 959 respectively at 1970 census.

23/ For Provincial capitals and district centres only.

24/ Including armed forces stationed outside the country but excluding alien armed forces stationed in the area.

25/ Excluding Faeroe Islands and Greenland.

26/ Including nationals temporarily outside the country.

27/ Including armed forces stationed outside the country.

28/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

29/ Data are deaths registered within one year of occurrence.

30/ Deaths are for de jure population.

31/ Data include deaths among armed forces outside the country and exclude those among non-Maltese armed forces in the area; rates computed on population including civilian nationals temporarily outside the country.

32/ Including residents outside the country if listed in a Netherlands population register.

33/ Including residents temporarily outside the country.

34/ Excluding Ceuta and Melilla.

NOTES

Il n'est pas tenu compte des morts foetales. Dans la partie A du tableau, les causes de décès sont classées selon la Révision de 1955 de la Liste abrégée de 50 rubriques pour la mise en tableau des causes de mortalité du Classement statistique international des maladies, traumatismes et causes de décès. Les données classées selon la Révision de 1965 figurent dans la partie B du tableau. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 97.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu provenant des registres de l'état civil.

1/ Pour le titre de chaque groupe de causes et les catégories de la nomenclature détaillée, voir le début du tableau 27.

2/ Y compris les personnes d'âge inconnu.

3/ Non compris les personnes dont le sexe est inconnu.

4/ Données enregistrées par le Service de santé seulement.

5/ Décès médicalement cerfitiés ou attestés seulement, soit 50,2 p. 100 du nombre total des décès.

6/ Les données se rapportent aux décès déclarés seulement.

7/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

8/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

9/ Y compris la population d'origine asiatique.

10/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

11/ Non compris la Zone du Canal.

12/ Les données sont fondées sur un échantillon de 10 p. 100 du total des décès.

13/ Statistiques établies d'après les permis d'inhumer délivrés.

14/ Non compris les décès dont il n'a pas été possible de connaître la cause.

15/ Non compris les tribus d'Indiens nomades.

16/ Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

17/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

18/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

19/ Non compris les données pour le territoire jordanien occupé depuis juin 1967 pas les forces armées israéliennes.

20/ Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

21/ Décès médicalement certifiés ou attestés seulement, soit 33,2 p. 100 du nombre total des décès.

22/ Non compris les personnes de passage à bord de navires, ni les militaires et agents civils non résidents et les membres de leur famille les accompagnant, soit respectivement 4 565 et 47 959 personnes au recensement de 1970.

23/ Pour capitales de provinces et chefs-lieux de districts seulement.

24/ Y compris les militaires hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

25/ Non compris les Iles Féroé et le Groenland.

26/ Y compris les nationaux temporairement hors du pays.

27/ Y compris les militaires en garnison hors du pays.

28/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

29/ Les données concernent les décès enregistrés dans l'année qui suit l'événement.

30/ Décès pour la population de droit.

31/ Y compris les décès de militaires nationaux en garnison hors du pays, mais non compris les décès de militaires non maltais en garnison sur le territoire; les taux sont calculés sur la base d'un chiffre de population qui comprend les civils nationaux temporairement hors du pays.

32/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais.

33/ Y compris les résidents temporairement hors du pays.

34/ Non compris Ceuta et Melilla.

FOOT-NOTES

Data exclude foetal deaths. For method of evaluation and limitations of data, see Technical Notes, page 49.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Data exclude deaths of infants dying before registration of birth.

2/ Including Asiatic population.

3/ Data tabulated by year of registration rather than occurrence.

4/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

5/ Excluding persons who have not reached the age of puberty.

6/ Excluding 17 males and 15 females of unknown marital status.

7/ Excludes deaths under 15 years of age.

8/ Excludes deaths under 10 years of age.

9/ For 10-14 years of age only.

10/ Excludes deaths under 12 years of age.

11/ For 12-14 years of age only.

12/ Data are based on burial permits.

13/ Excluding nomadic Indian tribes.

14/ Excluding Indian jungle population, estimated at 31 800 in 1961.

15/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

16/ Data are for Japanese nationals in Japan only.

17/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

18/ Not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

19/ Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel and their dependants.

20/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D.I. Khan and Peshawar Divisions.

21/ Data exclude non-locally domiciled military and civilian services personnel and their dependants.

22/ For Provincial capitals only.

23/ Including armed forces stationed outside the country, but excluding alien armed forces stationed in the area.

24/ Excluding the Faeroe Islands and Greenland, shown separately.

25/ Including nationals temporarily outside the country.

26/ Including armed forces stationed outside the country.

27/ For ages 5 years and over, age classification based on difference between year of birth and year of death rather than completed years of age.

28/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

29/ Deaths are for de jure population.

30/ Including armed forces stationed outside the country and excluding non-Maltese armed forces in the area.

31/ Including residents outside the country if listed in a Netherlands population register, but excluding alien armed forces stationed in the area.

32/ Including residents temporarily outside the country.

33/ Excluding Ceuta and Melilla.

34/ Including United States military personnel, their dependants and contract employees.

35/ Excluding United States military personnel, their dependants and contract employees.

NOTES

Les données ne comprennent pas les morts foetales. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 98.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

2/ Y compris la population d'origine asiatique.

3/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

4/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

5/ Non compris les personnes n'ayant pas atteint l'âge de la puberté.

6/ Non compris 17 personnes du sexe masculin et 15 personnes du sexe féminin dont l'état matrimonial est inconnu.

7/ Non compris les décès de personnes âgées de moins de 15 ans.

8/ Non compris les décès de personnes âgées de moins de 10 ans.

9/ Pour 10-14 ans seulement.

10/ Non compris les décès de personnes âgées de moins de 12 ans.

11/ Pour 12-14 ans seulement.

12/ D'après les permis d'inhumer délivrés.

13/ Non compris les tribus d'Indiens nomades.

14/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

15/ Les données sont des estimations fondées sur les statistiques courantes de l'enregistrement, ajustées pour compenser les lacunes d'après l'expérience de 1952-1954.

16/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

17/ Non compris les étrangers mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

18/ Non compris les données pour le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes.

19/ Non compris les militaires étrangers, les civils étrangers employés par les forces armées ni le personnel diplomatique et les membres de leur famille les accompagnant.

20/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D.I. Khan et de Peshawar.

21/ Non compris les militaires et agents civils non résidents et les membres de leur famille les accompagnant.

22/ Pour capitales de province seulement.

23/ Y compris les militaires hors du pays non compris les militaires étrangers en garnison sur le territoire.

24/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

25/ Y compris les nationaux temporairement hors du pays.

26/ Y compris les militaires en garnison hors du pays.

27/ A partir de cinq ans, la classification par âge repose sur la différence entre l'année de la naissance et l'année du décès et non sur l'âge en années révolues.

28/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de status qui peuvent se poser à cet égard.

29/ Les décès concernent la population de droit.

30/ Y compris les militaires en garnison hors du pays, mais non compris les militaires non maltais en garnison sur le territoire.

31/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire.

32/ Y compris les résidents temporairement hors du pays.

33/ Non compris Ceuta et Melilla.

34/ Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

35/ Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

FOOT-NOTES

Rates are the number of deaths in each age-sex-marital status group per 1 000 population of the same age, sex and marital status. For method of evaluation and limitations of data, see Technical Notes, page 50.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Rates exclude deaths of infants dying before registration of birth.

2/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

3/ Data tabulated by year of registration rather than occurrence.

4/ Data are based on burial permits.

5/ Including "Consensually married" and "Divorced".

6/ Excluding Indian jungle population, estimated at 31 800 in 1961.

7/ Excludes deaths of persons under 15 years of age.

8/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

9/ Including "Widowed" and "Divorced".

10/ Data are for Japanese nationals in Japan only.

11/ Excluding Okinawa.

12/ Including "Separated".

13/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.

14/ Data exclude non-locally domiciled military and civilian services personnel and their dependants.

15/ Including armed forces stationed outside the country, but excluding alien armed forces stationed in the area.

16/ Excluding the Faeroe Islands and Greenland, shown separately.

17/ Including nationals temporarily outside the country.

18/ Including armed forces stationed outside the country.

19/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

20/ Deaths are for de jure population.

21/ Including armed forces stationed outside the country and excluding non-Maltese armed forces in the area.

22/ Including residents outside the country if listed in a Netherlands population register, but excluding alien armed forces stationed in the area.

23/ Including residents temporarily outside the country.

24/ Excluding Ceuta and Melilla.

NOTES

Les taux représentent le nombre de décès des personnes d'âge, de sexe et d'état matrimonial donnés pour 1 000 personnes du même groupe d'âge, du même sexe et du même état matrimonial. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 99.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Les taux ne comprennent pas les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

2/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

3/ Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

4/ D'après les permis d'inhumer délivrés.

5/ Y compris les personnes vivant "En union consensuelle" et les "Divorcés".

6/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

7/ Non compris les décès de personnes âgées de moins de 15 ans.

8/ Les données sont des estimations fondées sur les statistiques courantes de l'enregistrement, ajustées pour compenser les lacunes d'après l'expérience de 1952-1954.

9/ Y compris les "Veufs" et les "Divorcés."

10/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

11/ Non compris Okinawa.

12/ Y compris les "Séparés."

13/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus des zones rurales des divisions de D. I. Khan et de Peshawar.

14/ Les données ne comprennent pas les militaires et agents civils non résidents et les membres de leur famille les accompagnant.

15/ Y compris les militaires hors du pays mais non compris les militaires étrangers en garnison sur le territoire.

16/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

17/ Y compris les nationaux temporairement hors du pays.

18/ Y compris les militaires en garnison hors du pays.

19/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de status qui peuvent se poser à cet égard.

20/ Les décès concernent la population de droit.

21/ Y compris les militaires en garnison hors du pays, mais non compris les militaires non maltais en garnison sur le territoire.

22/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire.

23/ Y compris les résidents temporairement hors du pays.

24/ Non compris Ceuta et Melilla.

FOOT-NOTES

Data exclude foetal deaths. For method of evaluation and limitations of data, see Technical Notes, page 51.

*Provisional.

**Data from civil registers which are incomplete or of unknown reliability.

1/ Data exclude deaths of infants dying before registration of birth.

2/ Data are for Algerian population only.

3/ Data tabulated by date of registration rather than occurrence.

4/ Data exclude deaths of infants dying within 24 hours of birth.

5/ For Banjul only.

6/ Data are not representative of Ghana as they are for compulsory registration centres only serving approximately 35 per cent of the total population in 1969.

7/ Data are based on the results of the Population Growth Survey.

8/ Data are deaths reported to the Registration Office in the Eastern and Western Divisions, together comprising 95 per cent of total population at 1964 census.

9/ Including Asiatic population.

10/ For European population only.

11/ Includes deaths not classified by month of occurrence.

12/ Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

13/ Data include 30 persons killed when an aircraft flying from Martinique to Antigua crashed into Montserrat.

14/ Including deaths among residents outside the islands, if they were listed in the population register of Netherlands Antilles. Except for Curaçao, data exclude deaths of infants dying before registration of birth.

15/ For Aruba, Bonaire and Curaçao only.

16/ Excluding data for Canal Zone, shown separately hereunder.

17/ Excluding data for Anguilla.

18/ Data are based on burial permits.

19/ Excluding nomadic Indian tribes.

20/ Excluding Indian jungle population estimated at 100 830 in 1961.

21/ Excluding Indian and Negro population living in tribes, numbering 32 006 at 1964 census.

22/ Excluding Indian jungle population, estimated at 31 800 in 1961.

23/ Data are for a number of towns having a combined population of approximately 2 million.

24/ Data are estimates based on current recorded data adjusted upward according to experience of 1952-1954.

25/ Prior to 1973, excluding Okinawa.

26/ Data are for Japanese nationals in Japan only.

27/ Excluding foreigners but including registered Palestinian refugees. For number of refugees, see table 5.

28/ Beginning in 1967, not including data for Jordanian territory under occupation since June 1967 by Israeli military forces.

29/ Data include deaths among Kuwait nationals residing outside Kuwait.

30/ Data are for Lebanese nationals on population register including those living outside the country but excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see table 5.

31/ Data are deaths registered by Health Service only.

32/ Data are estimates based on deaths for the year according to the longitudinal registration system of Pakistan's Population Growth Estimation Project (PGE). Including Bangladesh.

33/ Data are based on the results of the Population Growth Survey of 1968. Excluding the population of rural tribal areas of D. I. Khan and Peshawar Divisions.

NOTES

Les données ne comprennent pas les morts foetales. Pour la méthode d'évaluation, et les insuffisances des données, voir Notes techniques, p. 100.

*Données provisoires.

**Données incomplètes ou dont le degré d'exactitude n'est pas connu, provenant des registres de l'état civil.

1/ Non compris les enfants de moins d'un an décédés avant l'enregistrement de leur naissance.

2/ Pour la population algérienne seulement.

3/ Données exploitées selon la date de l'enregistrement et non la date de l'événement.

4/ Non compris les enfants décédés dans les 24 heures qui ont suivi leur naissance.

5/ Pour Banjul seulement.

6/ Les données ne sont pas représentatives de l'ensemble du Ghana car elles se rapportent à des centres où l'enregistrement est obligatoire et qui ne comptaient en 1969 que 35 p. 100 environ de la population totale.

7/ Les données sont basées sur les résultats de Population Growth Survey.

8/ Décès déclarés au Bureau d'état civil dans les divisions orientale et occidentale, qui comptaient ensemble 95 p. 100 de la population totale au recensement de 1964.

9/ Y compris la population d'origine asiatique.

10/ Pour la population européenne seulement.

11/ Y compris les décès non classés selon le mois de décès.

12/ Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.

13/ Y compris 30 personnes qui ont été tuées lorsqu'un avion se rendant de la Martinique à Antigua s'est écrasé sur Montserrat.

14/ Y compris les décès survenus parmi les résidents hors du territoire, s'ils étaient inscrits sur le registre de la population des Antilles néerlandaises. Sauf pour Curaçao, non compris les décès d'enfants de moins d'un au survenus avant l'enregistrement de leur naissance.

15/ Pour Aruba, Bonaire et Curaçao seulement.

16/ Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte ci-dessous.

17/ Non compris Anguilla.

18/ D'après les permis d'inhumer délivrés.

19/ Non compris les tribus d'Indiens nomades.

20/ Non compris les Indiens de la jungle, au nombre de 100 830 en 1961 (estimation).

21/ Non compris les Indiens et les Noirs vivant en tribus, au nombre de 32 006 au recensement de 1964.

22/ Non compris les Indiens de la jungle, au nombre de 31 800 en 1961 (estimation).

23/ Les données se rapportent à des villes comptant ensemble environ 2 millions d'habitants.

24/ Les données sont des estimations fondées sur les données courantes de l'enregistrement ajustées pour compenser les lacunes, d'après l'expérience de 1952-1954.

25/ Pour les années antérieures à 1973, non compris Okinawa.

26/ Les données ne concernent que les ressortissants japonais se trouvant au Japon.

27/ Non compris les étrangers mais y compris les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

28/ A partir de 1967, non compris les données pour le territoire jordanien occupé depuis juin 1967 par les forces armées israéliennes.

29/ Les données comprennent les décès survenus parmi les ressortissants du Koweït résidant hors du pays.

30/ Les données se rapportent aux ressortissants libanais inscrits sur le registre de la population, y compris ceux qui vivent hors du pays, mais non compris les étrangers non résidents et les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 5.

31/ Les données ne concernent que les décès enregistrés par le Service de santé.

32/ Les données sont des estimations fondées sur les décès survenus dans l'année selon le système d'enregistrement longitudinal du Pakistan's Population Growth Estimation Project (PGE). Y compris Bangladesh.

33/ Les données sont basées sur les résultats de Population Growth Survey de 1968. Non compris la population des tribus, des zones rurales des divisions de D. I. Khan et de Peshawar.

FOOT-NOTES (continued)

34/ Data exclude deaths of non-locally domiciled military and civilian services personnel and their dependants.

35/ Deaths exclude data for nomad population and Palestinian refugees. For number of refugees, see table 5.

36/ Except for 1967, for Provincial capitals and district centres only.

37/ Estimate based on the returns from Turkish Demographic Survey.

38/ Data relate only to the former Colony of Aden excluding Perim and Kamaran Islands and also exclude military personnel and the population of the port.

39/ Including armed forces stationed outside the country, but excluding alien armed forces stationed in the area.

40/ Excluding the Faeroe Islands and Greenland, shown separately.

41/ Including nationals temporarily outside the country.

42/ Including armed forces stationed outside the country.

43/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

44/ Data exclude deaths among armed forces.

45/ Including armed forces stationed outside the country and excluding non-Maltese armed forces in the area.

46/ Including residents outside the country if listed in a Netherlands population register, but excluding alien armed forces stationed in the area.

47/ Including residents temporarily outside the country.

48/ Excluding Ceuta and Melilla.

49/ Prior to 1967, excluding full-blooded aborigines estimated at 49 036 in June 1966.

50/ Including United States military personnel, their dependants and contract employees.

51/ Excluding United States military personnel, their dependants and contract employees.

52/ Data exclude deaths of infants born alive of less than 28 weeks' gestation, less than 1 000 grammes in weight and 35 centimetres in length, who die within 7 days of birth.

NOTES (suite)

34/ Non compris les décés survenus parmi les militaires et agents civils non résidents et les membres de leur famille les accompagnant.

35/ Les décès ne comprennent pas la population nomade ni les réfugiés de Palestine. Pour le nombre de réfugiés, voir le tableau 5.

36/ Sauf pour 1967, les données se rapportent aux capitales de provinces et chefs-lieux de districts seulement.

37/ Estimation fondée sur les résultats de l'enquête démographique turque.

38/ Les données ne concernent que l'ancienne colonie d'Aden, non compris Perim et l'Île de Kamaran. Non compris également les militaires et la population du port.

39/ Y compris les militaires hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

40/ Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

41/ Y compris les nationaux temporairement hors du pays.

42/ Y compris les militaires en garnison hors du pays.

43/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de statut qui peuvent se poser à cet égard.

44/ Non compris les décès survenus parmi les militaires.

45/ Y compris les militaires en garnison hors du pays, mais non compris les militaires non maltais en garnison sur le territoire.

46/ Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire.

47/ Y compris les résidents temporairement hors du pays.

48/ Non compris Ceuta et Melilla.

49/ Pour les années antérieures à 1967, non compris les aborigènes purs, au nombre de 49 036 en juin 1966.

50/ Y compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

51/ Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant ni les agents contractuels des Etats-Unis.

52/ Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les sept jours qui ont suivi leur naissance.

FOOT-NOTES

Average number of years of life remaining to persons surviving to exact age specified, if subject to mortality conditions of period indicated. For limitations of data, see Technical Notes, page 52.

*Provisional.

1/ For Algerian population only.

2/ Source: United Nations Economic Commission for Africa.

3/ Estimate prepared in the Population Division of the United Nations.

4/ Estimate based on results of a 10 per cent sample of households in the urban commune of Bujumbura (population 71 000) and a 2 per cent sample of population in rural areas.

5/ Data are based on results of sample survey described in table 3.

6/ Data are based on results of sample survey; excludes population of Brazzaville and Pointe-Noire not covered by survey.

7/ Data are based on results of sample survey of mortality conducted at time of October 1960-May 1961 census.

8/ Data are based on results of a sample survey of mortality conducted between October 1957 and April 1958 in 69 villages.

9/ Based on analysis of data from 1962 post-censal sample survey.

10/ Data are based on results of a sample survey.

11/ Data based on the results of the Population Growth Survey .

12/ For Vallée du Niger, based on results of 1957-1958 sample survey of mortality in 79 rural villages and 3 urban centres.

13/ Data are for rural areas only and were based on the Rural Demographic Sample Survey conducted in 1965-1966.

14/ For Basse Vallée (population estimated at 270,000),based on results of 1957-1958 sample survey of 77 rural villages and 5 urban centres.

15/ Data are estimates, based on results of 1960 population census.

16/ Based on results of 1953-1955 sample survey of indigenous population in villages.

17/ Based on results of 1962 population census.

18/ Data are based on results of 1961 sample survey of mortality.

19/ For Afro-Arab population for the island of Zanzibar only; expectation of life at birth for island of Pemba is 40.3 for both sexes; based on results of 1958 population census.

20/ Data are based on results of a sample survey of mortality of about 3.6 per cent of the population, except for ages 70 and over, which are estimated.

21/ Based on results of 1963 population census.

22/ Data for ages 1, 2, 3 and 4 years are based on mortality rates computed on population assumed to have same age distribution as Jamaica, 1946.

23/ Includes also mortality experience of Martinique for which no separate life table values for 1951-1955 were calculated.

24/ Data are based on mortality rates implied from apparent survivorship rates between census of 1950 and an estimate for 1951 which was constructed on an assumed rate of growth.

25/ For 1951-1955, see Guadeloupe.

26/ Excluding data for Canal Zone; also excluding tribal Indian population numbering 62 187 in 1960.

27/ Excluding nomadic Indian tribes.

28/ Excluding Amerindians.

29/ Data are for 46 municipal towns and are based on the 1953 census of population and the vital statistics returns for 1954.

NOTES

Nombre moyen d'années restant à vivre aux personnes ayant atteint l'âge donné si elles sont soumises aux conditions de mortalité de la période indiquée. Pour les insuffisances des données, voir Notes techniques, page 101.

*Données provisoires.

1/ Pour la population algérienne seulement.

2/ Source: Commission économique des Nations Unies pour l'Afrique.

3/ Estimation établie par la Division de la population de l'Organisation des Nations Unies.

4/ Estimation fondée sur les résultats d'un échantillon de 10 p. 100 des ménages de la commune urbaine de Bujumbura (71 000 habitants) et d'un échantillon de 2 p. 100 de la population des zones rurales.

5/ Données fondées sur les résultats de l'enquête par sondage dont il est question au tableau 3.

6/ Données fondées sur les résultats de l'enquête par sondage; non compris la population de Brazzaville ni de Pointe-Noire, non couverte par l'enquête.

7/ Données fondées sur les résultats d'une enquête par sondage sur la mortalité effectuée au moment du recensement d'octobre 1960-mai 1961.

8/ Données fondées sur les résultats d'une enquête par sondage sur la mortalité effectuée entre octobre 1957 et avril 1958 dans 69 villages.

9/ Données fondées sur l'analyse des résultats de l'enquête postcensitaire par sondage de 1962.

10/ Données fondées sur les résultats de l'enquête par sondage.

11/ Les données sont basées sur les résultats de Population Growth Survey .

12/ Pour la vallée du Niger; ce chiffre a été obtenu à partir des résultats de l'enquête par sondage sur la mortalité effectuée en 1957-1958 dans 79 villages ruraux et 3 centres urbains.

13/ Les données ne concernent que les régions rurales et sont fondées sur les résultats de l'enquête par sondage sur la population rurale effectuée en 1965-1966.

14/ Pour la Basse Vallée (population estimée à 270 000 habitants); d'après les résultats de l'enquête par sondage effectuée en 1957-1958 dans 77 villages ruraux et 5 centres urbains.

15/ Estimations établies à partir des résultats du recensement de population de 1960.

16/ D'après les résultats de l'enquête par sondage de 1953-1955 portant sur la population indigène des villages.

17/ Données fondées sur les résultats du résultats du recensement de 1962.

18/ Données fondées sur les résultats de l'enquête par sondage de 1961 sur la mortalité.

19/ Population africano-arabe de Zanzibar seulement; l'espérance de vie à la naissance pour l'île de Pemba est de 40,3 pour les deux sexes; données fondées sur les résultats du recensement de population de 1958.

20/ Données fondées sur les résultats d'une enquête par sondage sur la mortalité ayant porté sur un échantillon d'environ 3,6 p. 100 de la population, sauf pour le groupe d'âges 70 ans et plus où il s'agit d'estimations.

21/ Données fondées sur les résultats du recensement de 1963.

22/ Pour les groupes d'âges 1, 2, 3 et 4 ans, les données reposent sur des quotients de mortalité calculés pour une population qui est censée avoir la même structure par âge que celle de la Jamaïque en 1946.

23/ Y compris les chiffres de mortalité pour la Martinique pour laquelle aucune table de mortalité distincte pour 1951-1955 n'a été calculée.

24/ Données fondées sur les quotients de mortalité résultant des taux de survie obtenus sur la base des chiffres du recensement en 1950 et d'une estimation pour 1951 établie en appliquant un taux de croissance hypothétique.

25/ Pour 1951-1955, voir Guadeloupe.

26/ Non compris la Zone du Canal; non compris également les Indiens vivant en tribus, au nombre de 62 187 en 1960.

27/ Non compris les tribus d'Indiens nomades.

28/ Non compris les Amérindiens.

29/ Les données se rapportent à 46 municipalités urbaines et sont fondées sur le recensement de population de 1953 et sur les bulletins d'état civil de 1954.

FOOT-NOTE (continued)

30/ Data for age 0 based on average infant mortality rate for 1945-1947; for 1-4 years, on mortality rates estimated on basis of "English experience"; for 5 years and over, on mortality rates based on apparent survivorship rates between censuses.

31/ Data are based on the results of a sample survey taken on 2 August 1966.

32/ Data are for an area comprising a population of 294 749 000 in 1951 or about 82 per cent of total population. Data are values derived from mortality rates implied from apparent survivorship rates between censuses, except that values for ages under 5 and for 60 years and over are estimated.

33/ Excluding Okinawa.

34/ Data are for Japanese nationals in Japan only.

35/ Data are estimates based on analysis of 1961 population census results and annual average of reported deaths during 1959 to 1965.

36/ Data are based on the results of April 1959 sample survey of mortality in 345 villages.

37/ Data are based on mortality rates estimated during 1962 according to Pakistan's Population Growth Estimation Project (PGE).

38/ Including data for Bangladesh.

39/ For sixty-three Provincial capitals only.

40/ Based on incomplete returns of Turkish Demographic Survey.

41/ Excluding Faeroe Islands and Greenland.

42/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

43/ Excluding Ceuta and Melilla.

44/ Excluding full-blooded aborigines, estimated at 40 081 in June 1961.

NOTE (suite)

30/ Pour l'âge 0, les données reposent sur le taux moyen de mortalité infantile pour 1945-1947; pour 1-4 ans, elles reposent sur les quotients de mortalité estimés d'après les observations faites sur la population anglaise; pour 5 ans et plus, elles sont fondées sur les quotients de mortalité résultant des taux de survie obtenus sur la base des chiffres de deux recensements successifs.

31/ Données fondées sur les résultats de l'enquête par sondage effectuée le 2 août 1966.

32/ Les données se rapportent à une zone qui comptait 294 749 000 habitants en 1951, soit 82 p. 100 environ de la population totale. Elles reposent sur les quotients de mortalité résultant des taux de survie obtenus sur la base des chiffres de deux recensements successifs; toutefois, jusqu'à 5 ans et à partir de 60 ans les données sont des estimations.

33/ Non compris Okinawa.

34/ Ne concerne que les ressortissants japonais se trouvant au Japon.

35/ Les données sont des estimations fondées sur l'analyse des résultats du recensement de population de 1961 et sur la moyenne annuelle des décès enregistrés entre 1959 et 1965.

36/ Données fondées sur les résultats de l'enquête par sondage sur la mortalité effectuée en avril 1959 dans 345 villages.

37/ Données fondées sur les taux de mortalité estimés en 1962 conformément au Pakistan's Population Growth Estimation Project (PGE).

38/ Y compris les données pour le Bangladesh.

39/ Pour soixante-trois capitales de provinces seulement.

40/ D'après des résultats incomplets de l'enquête démographique turque.

41/ Non compris les îles Féroé et le Groenland.

42/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de status qui peuvent se poser à cet égard.

43/ Non compris Ceuta et Melilla.

44/ Non compris les aborigènes purs, soit 40 081 personnes en juin 1961 (estimation).

FOOT-NOTES

Number of deaths during specified year of age (or age interval) per 1 000 persons alive at beginning of year of age (or age interval). For limitations of data, see Technical Notes, page 52.

*Provisional.

1/ Estimate based on results of a 10 per cent sample of households in the urban commune of Bujumbura (population 71 000) and a 2 per cent sample of population in rural areas.

2/ For 1-4 years inclusive.

3/ For 5-year age group beginning with age specified in boxhead.

4/ For 70 years and over.

5/ Data are based on results of sample survey described in table 3.

6/ For 5-9 years inclusive.

7/ For 10-year age group beginning with lower age specified in boxhead.

8/ Data are based on results of a sample survey of mortality conducted between October 1957 and April 1958 in 69 villages.

9/ Data based on the results of the Population Growth Survey.

10/ Data are for rural areas only and were based on the Rural Demographic Sample Survey conducted in 1965-1966.

11/ Data are based on results of 1961 sample survey of mortality.

12/ Data are based on results of a sample survey of mortality of about 3.6 per cent of the population, except for ages 70 and over, which are estimated.

13/ Data for ages 1, 2, 3 and 4 years are based on mortality rates computed on population assumed to have same age distribution as Jamaica, 1946.

14/ For 75 years and over.

15/ Includes also mortality experience of Martinique for which no separate life table values for 1951-1955 were calculated.

16/ For 85 years and over.

17/ Data are based on apparent survivorship rates between census of 1950 and an estimate for 1951 which was constructed on an assumed rate of growth.

18/ For 1951-1955, see Guadeloupe.

19/ Excluding data for Canal Zone; also excluding tribal Indian population numbering 62 187 in 1960.

20/ For 2-4 years inclusive.

21/ Data are for 7 Departments: Antioquia, Atlántico, Caldas, Cundinamarca, Santander, Tolima and Valle, comprising approximately 60 per cent of total population.

22/ Excluding Amerindians.

23/ Data are for 46 municipal towns and are based on the 1953 census of population and the vital statistics returns for 1954.

24/ For 80 years and over.

25/ Rate for age 0 based on average infant mortality rate for 1945-1947; for 1-4 years, estimated on basis of "English experience"; for 5 years and over, based on apparent survivorship rates between censuses.

26/ Data are based on the results of a sample survey taken on 2 August 1966.

27/ Data are for an area comprising a population of 294 749 000 in 1951 or about 82 per cent of total population. Data are based on apparent survivorship rates between censuses, except that rates for ages under 5 and for 60 years and over are estimated.

28/ Excluding Okinawa.

29/ Data are for Japanese nationals in Japan only.

30/ Data are estimates based on analysis of 1961 population census results and annual average of reported deaths during 1959 to 1965.

31/ Data are based on the results of April 1959 sample survey of mortality in 345 villages.

NOTES

Nombre de décès à l'âge (ou dans l'intervalle d'âge) donné pour 1 000 personnes vivantes ayant atteint cet âge (ou cet intervalle d'âge). Pour les insuffisances des données, voir Notes techniques, page 10.

*Données provisoires.

1/ Estimation fondée sur les résultats d'un échantillon de 10 p. 100 des ménages de la commune urbaine de Bujumbura (71 000 habitants) et d'un échantillon de 2 p. 100 de la population des zones rurales.

2/ Groupe d'âge de 1 à 4 ans inclusivement.

3/ Groupe d'âge quinquennal dont la limite inférieure est l'âge indiqué en tête de colonne.

4/ Pour 70 ans et plus.

5/ Données fondées sur les résultats de l'enquête par sondage dont il est question au tableau 3.

6/ Groupe d'âge de 5 à 9 ans inclusivement.

7/ Group d'âge décennal dont la limite inférieure est l'âge indiqué en tête de colonne.

8/ Données fondées sur les résultats d'une enquête par sondage sur la mortalité effectuée entre octobre 1957 et avril 1958 dans 69 villages.

9/ Les données sont basées sur les résultats de Population Growth Survey.

10/ Les données ne concernent que les régions rurales et sont fondées sur les résultats de l'enquête par sondage sur la population rurale effectuée en 1965-1966.

11/ Données fondées sur les résultats de l'enquête par sondage de 1961 sur la mortalité.

12/ Données fondées sur les résultats d'une enquête par sondage sur la mortalité ayant porté sur un échantillon d'environ 3,6 p. 100 de la population, sauf pour le groupe d'âges 70 ans et plus où il s'agit d'estimations.

13/ Pour les groupes d'âges 1, 2, 3 et 4 ans, les données reposent sur des quotients de mortalité calculés pour une population qui est censée avoir la même structure par âge que celle de la Jamaïque en 1946.

14/ Pour 75 ans et plus.

15/ Y compris les chiffres de mortalité pour la Martinique pour laquelle aucune table de mortalité distincte pour 1951-1955 n'a été calculée.

16/ Pour 85 ans et plus.

17/ Données fondées sur des taux de survie obtenus sur la base des chiffres du recensement en 1950 et d'une estimation pour 1951 établie en appliquant un taux de croissance hypothétique.

18/ Pour 1951-1955, voir Guadeloupe.

19/ Non compris la Zone du Canal; non compris également les Indiens vivant en tribus, au nombre de 62 187 en 1960.

20/ Groupe d'âge de 2 à 4 ans inclusivement.

21/ Les données se rapportent à 7 départements: Antioquia, Atlántico, Caldas, Cundinamarca, Santander, Tolima et Valle qui comptent 60 p. 100 environ de la population totale.

22/ Non compris les Amérindiens.

23/ Les données se rapportent à 46 municipalités urbaines et sont fondées sur le recensement de population de 1953 et sur les bulletins d'état civil de 1954.

24/ Pour 80 ans et plus.

25/ Pour l'âge 0, le quotient est fondé sur le taux de mortalité infantile moyen pour 1945-1947; pour 1-4 ans, il s'agit d'une estimation établie d'après les observations faites sur la population anglaise; pour 5 ans et plus, le quotient repose sur les taux de survie obtenus d'après les chiffres de deux recensements successifs.

26/ Données fondées sur les résultats de l'enquête par sondage effectuée le 2 août 1966.

27/ Les données se rapportent à une zone qui comptait 294 749 000 habitants en 1951, c'est-à-dire 82 p. 100 environ de la population totale. Les données sont fondées sur les taux de survie résultant des chiffres de deux recensements successifs; toutefois, jusqu'à 5 ans et à partir de 60 ans, il s'agit de taux estimatifs.

28/ Non compris Okinawa.

29/ Ne concerne que les ressortissants japonais se trouvant au Japon.

30/ Les données sont des estimations fondées sur l'analyse des résultats du recensement de population de 1961 et sur la moyenne annuelle des décès enregistrés entre 1959 et 1965.

31/ Données fondées sur les résultats de l'enquête par sondage sur la mortalité effectuée en avril 1959 dans 345 villages.

FOOT-NOTES (continued)

32/ Data are based on mortality rates estimated during 1962 according to Pakistan's Population Growth Estimation Project (PGE).

33/ Including data for Bangladesh.

34/ For 63 Provincial capitals only.

35/ Excluding data for Faeroe Islands and Greenland.

36/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

37/ Fluctuations in rates due to inaccuracies in age reporting.

38/ Excluding full-blooded aborigines, estimated at 49 036 in June 1966.

NOTES (suite)

32/ Données fondées sur les taux de mortalité estimés en 1962 conformément au Pakistan's Population Growth Estimation Project (PGE).

33/ Y compris les données pour le Bangladesh.

34/ Pour 63 capitales de provinces seulement.

35/ Non compris les îles Féroé et le Groenland.

36/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de status qui peuvent se poser à cet égard.

37/ Les fluctuations des taux sont dues aux inexactitudes des déclarations d'âge.

38/ Non compris les aborigènes purs, soit 49 036 personnes en juin 1966 (estimation).

FOOT-NOTES

Number of persons surviving to the exact age specified, out of 100 000 born alive and subject to mortality conditions of the period indicated. For limitations of data, see Technical Notes, page 53.

*Provisional.

1/ Estimate based on results of a 10 per cent sample of households in the urban commune of Bujumbura (population 71 000) and a 2 per cent sample of population in rural areas.

2/ Data are survivors out of 10 000 born alive.

3/ Data are based on results of sample survey described in table 3.

4/ Data are survivors out of 1 000 born alive.

5/ Data are based on results of a sample survey of mortality conducted between October 1957 and April 1958 in 69 villages.

6/ Data based on the results of the Population Growth Survey.

7/ Data are for rural areas only and were based on the Rural Demographic Sample Survey conducted in 1965-1966.

8/ Data are based on results of 1961 sample survey of mortality.

9/ Data are based on results of a sample survey of mortality of about 3.6 per cent of the population, except for ages 70 and over, which are estimated.

10/ Survivors at ages under 5 years calculated from estimated mortality rates.

11/ Data for ages 1, 2, 3 and 4 years are based on mortality rates computed on population assumed to have same age distribution as Jamaica, 1946.

12/ Includes also mortality experience of Martinique for which no separate life table values for 1951-1955 were calculated.

13/ Data are based on mortality rates implied from apparent survivorship rates between census of 1950 and an estimate for 1951 which was constructed on an assumed rate of growth.

14/ For 1951-1955, see Guadeloupe.

15/ Excluding data for Canal Zone; also excluding tribal Indian population numbering 62 187 in 1960.

16/ Data are for 7 Departments: Antioquia, Atlántico, Caldas, Cundinamarca, Santander, Tolima and Valle, comprising approximately 60 per cent of total population.

17/ Excluding Amerindians.

18/ Data are for 46 municipal towns and are based on the 1953 census of population and the vital statistics returns for 1954.

19/ Survivors for age 1-4 years calculated from mortality rates estimated on basis of "English experience"; for 5 years and over, from mortality rates based on apparent survivorship rates between censuses.

20/ Data are based on the results of a sample survey taken on 2 August 1966.

21/ Data are for an area comprising a population of 294 749 000 in 1951 or about 82 per cent of total population. Data are survivors out of 100 000 alive at age 5. Values for ages under 5 and for 60 years and over are estimated.

22/ Excluding Okinawa.

23/ Data are for Japanese nationals in Japan only.

24/ Data are estimates based on analysis of 1961 population census results and annual average of reported deaths during 1959 to 1965.

25/ Data are based on the results of April 1959 sample survey of mortality in 345 villages.

26/ Data are based on mortality rates estimated during 1962 according to Pakistan's Population Growth Estimation Project (PGE).

27/ Including data for Bangladesh.

28/ For 63 Provincial capitals only.

29/ Excluding data for Faeroe Islands and Greenland.

30/ The data which relate to the Federal Republic of Germany and the German Democratic Republic include the relevant data relating to Berlin for which separate data have not been supplied. This is without prejudice to any question of status which may be involved.

31/ Excluding full-blooded aborigines, estimated at 49 036 in June 1966.

NOTES

Nombre de survivants à l'âge exact indiqué sur 100 000 naissances vivantes et soumis aux conditions de mortalité de la période considérée. Pour les insuffisances des données, voir Notes techniques, page 102.

*Données provisoires.

1/ Estimation fondée sur les résultats d'un échantillon de 10 p. 100 des ménages de la commune urbaine de Bujumbura (71 000 habitants) et d'un échantillon de 2 p. 100 de la population des zones rurales.

2/ Les données représentent le nombre de survivants sur 10 000 nés vivants.

3/ Données fondées sur les résultats de l'enquête par sondage dont il est question au tableau 3.

4/ Les données représentent le nombre de survivants sur 1 000 nés vivants.

5/ Données fondées sur les résultats d'une enquête par sondage sur la mortalité effectuée entre octobre 1957 et avril 1958 dans 69 villages.

6/ Les données sont basées sur les résultats de Population Growth Survey.

7/ Les données ne concernent que les régions rurales et sont fondées sur les résultats de l'enquête par sondage sur la population rurale effectuée en 1965-1966.

8/ Données fondées sur les résultats de l'enquête par sondage de 1961 sur la mortalité.

9/ Données fondées sur les résultats d'une enquête par sondage sur la mortalité ayant porté sur un échantillon d'environ 3,6 p. 100 de la population, sauf pour le groupe d'âges 70 ans et plus où il s'agit d'estimations.

10/ Le nombre des survivants jusqu'à 5 ans repose sur des taux de mortalité estimatifs.

11/ Pour les groupes d'âges 1, 2, 3 et 4 ans, les données reposent sur des quotients de mortalité calculés pour une population qui est censée avoir la même structure par âge que celle de la Jamaïque en 1946.

12/ Y compris les chiffres de mortalité pour la Martinique pour laquelle aucune table de mortalité distincte pour 1951-1955 n'a été calculée.

13/ Données fondées sur les quotients de mortalité résultant des taux de survie obtenus sur la base des chiffres du recensement en 1950 et d'une estimation pour 1951 établie en appliquant un taux de croissance hypothétique.

14/ Pour 1951-1955, voir Guadeloupe.

15/ Non compris la Zone du Canal; non compris également les Indiens vivant en tribus, au nombre de 62 187 en 1960.

16/ Les données se rapportent à 7 départements: Antioquia, Atlántico, Caldas, Cundinamarca, Santander, Tolima et Valle, qui comptent 60 p. 100 environ de la population totale.

17/ Non compris les Amérindiens.

18/ Les données se rapportent à 46 municipalités urbaines et sont fondées sur le recensement de population de 1953 et sur les bulletins d'état civil de 1954.

19/ Les données sur les survivants de 1-4 ans sont fondées sur des taux de mortalité estimatifs établis d'après les observations faites sur la population anglaise; pour 5 ans et plus, elles reposent sur les taux de mortalité résultant des taux de survie obtenus sur la base des résultats de deux recensements successifs.

20/ Données fondées sur les résultats de l'enquête par sondage effectuée le 2 août 1966.

21/ Les données se rapportent à une zone qui comptait 294 749 000 habitants en 1951, c'est-à-dire 82 p. 100 environ de la population totale. Elles représentent le nombre de survivants sur 100 000 personnes vivantes à 5 ans. Jusqu'à 5 ans et à partir de 60 ans, il s'agit d'estimations.

22/ Non compris Okinawa.

23/ Les données ne concernent que les ressortissants japonais se trouvant au Japon seulement.

24/ Les données sont des estimations fondées sur l'analyse des résultats du recensement de population de 1961 et sur la moyenne annuelle des décès enregistrés entre 1959 et 1965.

25/ Données fondées sur les résultats de l'enquête par sondage sur la mortalité effectuée en avril 1959 dans 345 villages.

26/ Données fondées sur les taux de mortalité estimés en 1962 conformément au Pakistan's Population Growth Estimation Project (PGE)

27/ Y compris les données pour le Bangladesh.

28/ Pour 63 capitales de provinces seulement.

29/ Non compris les îles Féroé et le Groenland.

30/ Les données relatives à la République fédérale d'Allemagne et à la République démocratique allemande incluent les données pertinentes relatives à Berlin, pour lequel des données séparées n'ont pas été fournies. Cela sans préjudice des questions de status qui peuvent se poser à cet égard.

31/ Non compris les aborigènes purs, soit 49 036 personnes en juin 1966 (estimation).

SUBJECT-MATTER INDEX

[This cumulative index covers the contents of each of the twenty six issues of the *Demographic Yearbook*. "Year of issue" stands for the particular issue in which the indicated subject-matter appears. Unless otherwise specified, "Time coverage" designates the years for which annual statistics are shown in the *Demographic Yearbook* referred to in "Year of issue" column. "Latest" or "2-Latest" indicates that data are for latest available year(s) only.]

INDEX PAR SUJET

[Cet index alphabétique donne la liste des sujets traités dans chacune des vingt-six éditions de l'*Annuaire démographique*. La colonne «Année de l'édition» indique l'édition spécifique dans laquelle le sujet a été traité. Sauf indication contraire, la colonne «Période considérée» désigne les années pour lesquelles les statistiques annuelles apparaissant dans l'*Annuaire démographique* sont indiquées sous la colonne «Année de l'édition». La rubrique «Dernière» ou «2-Dernières» indique que les données représentent la ou les dernières années disponibles seulement.]
