1. The activities of the Commission in the development of water resources have been rather limited but it can be expected that its role in this field will from now on become much more important. In documents E/CN.14/INR/35, 36 and 38, information is given on a number of problems related to water resource development which should have the full attention of the Commission.

2. Paper E/CN.14/INR/38 refers to the role that the Economic Commission for Africa can play in promoting the development of international river basins. It mentions also the activities, up to the present, of the United Nations organizations in respect of some of these basins: Senegal basin, Niger basin, Mono basin.

3. The Commission is now in a position to increase its activities in this field. An economic study of the Lake Chad basin will be undertaken, which will investigate those fields in which close co-operation between the countries concerned is required for the optimum development of this basin. Another study envisaged concerns the economy of navigation on certain parts of the Niger River. The secretariat of the commission will foster the development of the international rivers on a continuous basis, and will initiate or give full assistance to such meetings and studies as are relevant to the promotion of international river basin development.

4. Applied research related to water resources development under African conditions, the spreading of information on methods and techniques resulting from this research and on practical experience obtained in certain parts of the continent are also important means of promoting development. Paper E/CN.14/INR/36 reviews the activities of agencies and institutions working in the

field of water resources in Africa. It is believed that the international co-ordination in Africa in respect of research, surveys and development work should be strengthened, and the secretariat envisages to explore further the possibilities of intensifying this co-ordination with the organizations concerned and it hopes to report on this to the next meeting of the Standing Committee.

5. The first hydrological bibliography on literature relating to Africa has already been published. In co-operation with the Commission for Technical Co-operation in Africa (CCTA) and UNESCO, additional information on recent literature will be compiled and published.

6. During the month of October, the secretariat of ECA published an introductory issue of the Natural Resources Bulletin which appeared in both English and French. ECA is planning to issue this newsletter on a quarterly basis beginning as from 1 January 1964.

7. In line with the activities proposed under the United Nations Development Decade (Water Resources Development), the secretariat will give much attention to the development of ground-water resources, whereby close co-operation will be aimed at by the specialized agencies and other bodies working in this field. Document E/CN.14/INR/35 gives some details on the possible role the regional commission could play. Is it envisaged to prepare a study on the present stage of ground-water development in Africa which should form a basis for further action. In accordance with the work programme for 1963, a seminar on large-scale ground-water development is being organized for 1964.

8. In order to strengthen the national policies in respect of the development of water resources, country surveys of water resources and needs have been proposed as a major item in the United Nations Development Decade. As pointed out in Document E/CN.14/INR/35, the secretariat of the regional commission will be able, in close co-operation with the Water Resources Development Centre, to assist the governments in the preparation of requests under the United Nations Technical Assistance Programme for a team of experts which would make such a survey. With a view to the same purpose of assisting the governments to strengthen the national water policies, the secretariat plans to organize a seminar in 1966 on water legislation and public administration aspects of water resources development.

9. The secretariat also intends to organize a training course on the construction and management of small surface water storage schemes for 1965.

Economic Commission for Asia and the Far East

1. The principal activities of the Economic Commission for Asia and the Far East in the water domain have been directed towards the following fields: (i) undertaking investigations and studies on subjects of common importance to countries in the region; (ii) promotion of regional co-operation; (iii) rendering advisory services; and (iv) organizing regional meetings on water matters.

2. The Regional Conference on Water Resources Development, the immediate governing body under the Commission which decides the programme of work and priorities of the secretariat in the field of water resources development, convenes biennially. The Conference makes biennial review of the progress made in the field of water resources development in the region and proposes special studies and research to be carried out by the secretariat on subjects of specific importance to the countries in the region. It recommends the organization of seminars and symposia to deal in detail with various regional problems.

3. The results of these studies and research projects and the proceedings of meetings are published in printed form for dissemination to the member countries. Among the studies already com-

^b United Nations publication, Sales No.: 58.II.B.1.

^c United Nations publication, Sales No.: 58.II.B.3.

^d United Nations publication, Sales No.: 60.II.B.3.

pleted, mention may be made of: *Manual of River Basin Planning*; ^e *Standards for Methods and Records of Hydrologic Measurements*; ^f *Earthmoving by Manual Labour and Machines*; ^g *River Training and Bank Protection*; ^h and *The Sediment Problem*.¹ A manual of standards and criteria for planning water resource projects is being readied for publication. For the coming years, the following studies are programmed: water code for Asia and the Far East; comparative study of cost of water resources development projects, including relative costs for different methods of construction; hydrologic investigation on typhoons; run-off coefficients and maximum floods in monsoon areas; and application of modern techniques in hydrologic studies.

4. In relation to the proposed preliminary country surveys of water needs and resources as recommended in the present report, the secretariat has since 1953, completed 15 country surveys in the region. These surveys are continually being kept under review and brought up-to-date. They deal with the country's water resources and their present stage of development with respect to flood control, irrigation and drainage, hydroelectric power, inland navigation, water supply, watershed management and multiple-purpose development. The needs and possibilities for further development are examined and a description is given of future plans of development. Problems facing the country in developing its water resources are discussed, touching on relevant organizational, social, economic and technical aspects. These surveys are published in the Water Resources Series and are kept up-to-date by continuous review and publication from time to time in the quarterly Water Resources Journal.

5. In the promotion of regional co-operation for the development of international rivers, the secretariat initiated as far back as 1951 the study on the development of the Lower Mekong Basin which has now developed into one of the biggest regional projects in the United Nations programme.

Economic Commission for Europe

Water pollution

1. The ECE, as part of its activities in the water field, systematically co-operates with the secretariats of FAO, WHO, WMO, UNESCO and IAEA on water pollution control problems in Europe. It also maintains contact with the Water Resources Development Centre, and with the Inter-Governmental Maritime Consultative Organization (IMCO) when problems of pollution of inland seas and coastal areas are concerned.

2. In July 1962 and 1963 the ECE Secretariat convened the second and third meetings respectively between secretariat officials of international organizations for the exchange of information, and to concert relevant programmes and activities in the fields of water pollution and water utilization; the scope of these meetings has now been widened to cover the utilization of water resources. In 1963, for the first time, two non-governmental professional organizations, namely the International Water Supply Association and the International Institute of Administrative Sciences, were invited to take part in the discussion of specific items with which they are particularly concerned.

3. A compendium of information and documentation on various aspects of water pollution control in Europe, originally issued in 1960 (Water Poll./Conf. 1), has recently been brought up-to-date and reissued (Water Poll./Gen. 1). This document contains, *inter alia*, a list of administrative units or officials "to whom governments desiring to contribute to the solution of water pollution problems may address requests, and from whom they may obtain advice on the various aspects of the problem".

^e United Nations publication, Sales No.: 55.II.F.1.

^g United Nations publication, Sales No.: 61.II.F.4.

^h United Nations publication, Sales No.: 53.II.F.6.

¹ United Nations publication, Sales No.: 53.II.F.7.

4. The ECE Secretariat, in co-operation with WHO and IAEA, organized a travelling seminar on the Rhine on water pollution control problems between 30th September and 10th October 1962. During a boat trip from Basle to Rotterdam, 45 experts from 17 European countries acquainted themselves at first hand with specific pollution problems through lectures, discussions and visits. The report on this seminar by the Executive Secretary was issued as document A/ECE/496.

5. The first part of this document contains an account of the seminar's proceedings; the second part incorporates certain tentative observations of the ECE Secretariat on what appear to be the major pollution problems of an international river passing through highly industrialized areas.

6. The lectures delivered at the seminar on the Rhine have been issued as a separate volume in the languages in which they were delivered (Water Poll./Sem. 5).

7. The ECE Secretariat has continued its co-operation with the Secretariat of the Organization for Economic Co-operation and Development (OECD) to establish a Directory of Water Pollution Research Laboratories in countries which are members of these two organizations. This Directory will contain information about the research programmes of the laboratories and, more specifically, about any work done on the most urgent water pollution problems requiring attention. The Directory will be published at the beginning of 1964.

8. ECE is exploring with UNESCO the possibility of bringing out a popular pamphlet on the problems of water pollution and the need for international co-operation in this field. The ECE Secretariat has also co-operated with the United Nations Office of Public Information on the preparation of a short documentary film dealing with practical measures against pollution, on the basis of the visual material collected during the seminar on the Rhine (*Water Pollution in Europe*, duration 8.3 minutes, English commentary, black and white).

9. A draft questionnaire on the quality criteria for usage of water in various industrial processes has been sent for comments to four experts representing steel, paper pulp, distilling and chemical industries. When the suggestions of these experts have been received, this questionnaire modified where appropriate, will be circulated to governments for completion by the industrial sectors concerned. On the basis of the replies to this questionnaire, and taking into account the possibilities of economically feasible water treatment, the ECE Secretariat envisages to entrust to a small group of experts the task of trying to establish a system of river classification.

10. A meeting of legal experts on the establishment of certain rules concerning responsibilities, and the settlement of claims arising from water pollution, is being prepared by the ECE Secretariat.

11. Consideration is being given to the possibility of working out a methodology for the study of economic aspects of water pollution control. It is intended to convene a meeting of a small group of experts to discuss a preliminary draft to be prepared by the ECE Secretariat.

Hydroelectric power

12. Through its Sub-committee on Electric Power, ECE continues to study and assess the hydroelectric resources of European countries on a common basis. Much of this work is concerned with the application of standardized concepts and methods to define streamflow conditions for power production.

13. A group of experts is investigating the maximum water storage potential in European countries, and a long-term work programme on the determination and appraisal of the water resources of the region has been adopted. This programme has particular reference to hydroelectric power, and to the analysis

of its rational and effective use, both nationally and internationally (E/ECE/472/Add.2 and EP/146-EP/WP.2/26).

14. A report on methods for comprehensive evaluation of hydro-electric resources was prepared by the ECE Secretariat as one of a number of contributions to the African Electric Power Meeting, which was held in Addis Ababa in October 1963.

Other activities

15. By its resolution 3 (XVI), ECE considered its role regarding the rational utilization of water resources in Europe, and the Executive Secretary reported on various possibilities in this connexion (E/ECE/472). His report dealt with the basic pattern of Europe's watersheds, existing water resources, and present and future demands. It also considered the nature of the need for international action, described existing activities within ECE and other organizations, and made proposals for a possible work programme for the Commission.

16. Among other relevant activities ECE participated in the organization of the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas held early in 1963.

17. By its resolution 10 (XVIII), ECE decided to convene, in the course of 1964, an *ad hoc* meeting of governmental experts to identify problems and examine possibilities for further action in the field of water resources development. Preparatory work to implement this resolution is in hand, and the meeting is expected to be held in the latter half of 1964.

Economic Commission for Latin America

1. Among the activities in the water field carried out by ECLA since the publication of the second biennial report of the Water Resources Development Centre (E/3587) are the following:

(a) Provisional reports on water resources and their utilization in Colombia and Bolivia (E/CN.12/688) were completed, and have been circulated for comments. Such comments are now being received, and publication of the reports themselves is being prepared.

(b) A progress report on the water resources mission to Argentina was submitted to the Tenth Session of ECLA (E/CN.12/625). The provisional text is now under preparation and is scheduled to be distributed for comments about March 1964.

(c) Preliminary work is in progress on a similar mission to Peru, and also on one to Central America. Resolutions 9 and 13 of the second meeting of the Sub-committee on Electric Power, appointed by the Central American Economic Co-operation Committee (May 1963), deals with these surveys of water resources within the region.

2. Additional documents presented to the Tenth Session of ECLA (May 1963) dealing with water resources includes:

(a) "Los recursos hidráulicos de América Latina" (E/CN.12/650)

(b) "Los recursos naturales en América Latina" (E/CN.12/670, Add. 1-5)

FOOD AND AGRICULTURE ORGANIZATION OF THE UNITED NATIONS

The Principal Activities of FAO in Connexion With Water

General

1. Water resources and their conservation, treatment, development and utilization are of considerable interest to FAO, which is responsible primarily for questions relating to agriculture, fisheries, forestry and food.

2. Within the general framework of these main sectors of activity, FAO participates in the following tasks: surveys of surface-water resources (hydrology) or ground-water resources (hydrogeology); development of major river basins and major natural regions; hydraulic engineering; irrigation and drainage, flood and tide control; watershed management, correction of flow; ground-water surveys and ground-water recharge; water supplies for rural population and animals; water pollution control, protection of rivers, particularly with regard to fisheries; legislation concerning water, organization of national water management services; technical training, training of rural leaders, and agricultural extension services in connexion with water; statistics, water economy, scientific and technical documentation with regard to water.

3. The part played by FAO in these main fields of activity is carried on either independently, that is, entirely with its own resources, or within the framework of technical assistance supplied in various forms to the governments of the various countries, or in confident co-operation with the other United Nations agencies concerned with certain broad aspects of water problems.

4. The special interest of FAO in these water problems stems chiefly from the fact that agriculture in most countries is the largest consumer of water, and is likely to become so shortly throughout most of the world owing to the considerable expansion of irrigated areas.

5. No well-planned national agricultural development scheme can be drawn up and applied without a detailed inventory of water resources that gives special attention to the specific needs and the overriding interests of agriculture. It is accordingly natural for FAO to be given the responsibility for surveys of surface or ground-water resources whenever agriculture (in the widest sense of the term) is to be the principal user of these resources.

6. In order to meet the considerable problems raised by the expanding world population, a survey of these resources must sometimes embrace a number of main, often international, river basins or a number of water tables common to several countries. FAO must be associated with such surveys, which, when carried out in conjunction with surveys of other natural resources such as agricultural soils, are the only means of ensuring an equitable distribution of water among the various countries concerned.

7. The available water resources already seem to be inadequate in many countries to meet priority needs. FAO should accordingly be fully associated with the research, surveys and experiments designed to achieve maximum efficiency in the use of these resources.

Principal activities of FAO

8. FAO engages in many forms of action which are principally as follows:

9. With regard to technical assistance, FAO is providing some forty countries with about 100 experts in hydrology, hydrogeology, watershed management, irrigation, drainage and hydraulic engineering.

10. In the case of some countries — for example, Nepal, Afghanistan and Tanganyika — FAO has dispatched groups of experts qualified to carry out topographical, civil engineering and irrigation surveys. It has thus been possible, in close co-operation with the national technical agencies, to prepare development projects and then to follow their progress as they are carried out.

11. In regard to water questions, FAO is taking an especially active part in projects financed through the Special Fund. FAO is at present the executing agency for about forty projects in which hydrological and water resource surveys are of particular importance.

12. Altogether, FAO is responsible for the activities of about 160 experts in the various branches of hydrology, water conser-

vation, irrigation, drainage, etc., under projects assisted by the Special Fund.

13. A growing number of countries are also assisted by FAO in connexion with the Freedom from Hunger Campaign and the World Food Programme.

14. Although the surveys and activities under this heading have been on a rather small scale, their value lies in the fact that they result immediately in concrete achievements of direct practical interest. The activities of FAO in this sector include various joint projects connected with water supplies for semi-nomadic populations and flocks and pumping projects for the irrigation of small areas.

15. The regular and continuing activities of FAO include training, leadership training and agricultural extension services in rural areas. These activities have been and continue to be as follows:

(a) Preparation, publication and distribution of technical publications of a fairly general nature dealing with such matters as sprinkler irrigation, modern methods of irrigation, various types of apparatus for raising water for irrigation, organization and proper conduct of irrigation experiments, the price of water and the irrigation economy;

(b) The organization of technical courses, training centres, symposia and seminars;

(c) Collection of voluminous technical documentation on water resources and the distribution of such documentation to various countries, agencies and individuals on request;

(d) Participation of FAO representatives in conferences or working groups organized by other United Nations agencies and by governmental or non-governmental groups.

Co-operation with United Nations agencies

16. This co-operation is carried on within the framework of specific projects or of medium or long-term studies. In some cases, FAO joins with another agency in carrying out a specific project or in setting up a technical training centre.

17. A case in point is the International Sourcebook on Irrigation and Drainage of Arid Land, in relation to Salinity and Alkalinity, which is now being prepared in collaboration with UNESCO.

18. In other cases, FAO lends its aid to studies or projects which are under the leadership of another agency.

19. An instance of this is a survey undertaken by WHO in Kenya in connexion with public water supplies.

20. In other cases FAO assumes the leadership of studies or projects but benefits by the valuable assistance of other specialized agencies, such, for example, as WHO in connexion with water-borne diseases, or IAEA in connexion with ground-water exploration with the aid of radio isotopes.

21. It is apparent from the foregoing that the activities of FAO concern many aspects of water resources. The agency believes that it cannot assume its responsibilities at the world level unless it continues to take a leading part in research and projects whose essential purpose is the development of agriculture and fisheries and the improvement of living conditions for rural populations and animals.

22. The main trends in FAO activities for the future will be as follows:

(a) To participate actively in efforts to allocate activities in connexion with water resources among the various United Nations agencies in an efficient manner in order to avoid overlapping and the confusion and waste of time that it causes, and in order to develop the necessary co-operation between FAO and those agencies;

(b) To speed up the technical training of water-resources experts in many countries, and, in particular, to promote the training of specialists skilled in both engineering and agronomy;

(c) To ensure that the necessary preliminary basic data, particularly with regard to water resources and needs, are available for all medium and long-term planning and for all water development projects;

(d) To promote research and experiments that are directed towards specific, practical and readily applicable results;

(e) To participate in the compilation of objective data on natural resources (water and soils) as a basis for the preparation of international agreements for the equitable distribution of water resources common to several countries;

(f) To participate in research, studies and experiments directed towards a more efficient use of water resources (particularly as regards water conservation and irrigation) and greater utilization of water resources potentially useful for agriculture (particularly, demineralization of salt water, and ground-water recharge);

(g) To provide guidance in connexion with projects for rural drinking-water supplies and irrigation so that they may contribute to improved living conditions and prevent the spread of disease;

(h) To analyse the principal causes for the failure of water resources development projects in many countries, and to draw the necessary lessons from such failures in order to prevent their recurrence;

(i) To encourage an increased measure of responsibility in the execution and management of water resources development schemes by the principal beneficiaries of such schemes; in that connexion, to promote in particular, the training of rural leaders capable of participating in the preparation, financing and management of the schemes.

THE INTERNATIONAL ATOMIC ENERGY AGENCY

1. Upon request, the IAEA provides services to Member States with respect to the application of both stable and radioactive isotopes, as they can be used effectively in conjunction with standard hydrological, geological and meteorological methods in the investigation and development of water resources.

IAEA's Precipitation Sampling Programme

2. An early large-scale programme of the IAEA was the world-wide survey of hydrogen and oxygen isotopes in rain waters, carried out in collaboration with WMO and with the assistance of their world-wide network of sampling stations. The co-operation of several laboratories in addition to the laboratory and staff facilities of the IAEA have provided data for the past three years and this work is continuing.

IAEA Laboratory Facilities and Isotope Technique Developments

3. Laboratory facilities for the electrolytic enrichment and both gas-phase and liquid-scintillation counting of environmental levels of tritium are operational. In addition, equipment for making ground-water velocity and tracing experiments and stream flow and siltation measurements are available. Through the IAEA Research Contract Programme, and as part of the activities of the staff, new and refined techniques are being developed for future direct application in water resources investigations and development. This programme has resulted in development of radioisotope techniques for investigating the rate of water flow in canals, closed conduits and rivers; siltation in harbours, rivers and estuaries; in studying the movement of sand along the beds of rivers; and investigating the velocity and direction of ground-water movement and assessment of annual recharge to aquifers. The economy

and effectiveness of utilizing isotope techniques, which may offer the only possible solution to certain hydrological problems, are brought to the attention of interested groups in developing countries when planning projects for the study or use of water resources.

Representative Cases of IAEA Hydrologic Investigations

4. On-the-spot investigations have been made in the Trieste area (Italian/Yugoslav frontier), Greece, Lower Mekong Basin, Cambodia and the Antalya area in Turkey. Advisory missions have been sent to Argentina, Chile, India, Kenya, Nyasaland, East and West Pakistan, Rhodesia and Yugoslavia. Development of projects in some of these areas is progressing.

Special Fund Projects

5. In Greece hydrological studies of ground-water resources by means of radioactive tracers have been undertaken by the IAEA, under sub-contract from FAO, of a Special Fund irrigation project. A similar arrangement has been made in collaboration with FAO in Turkey. Plans are being drawn up for collaboration in the Azraq (Jordan) ground-water project and it is expected that further similar activities will materialize elsewhere.

Dissemination of Information

6. The report on the proceedings of the Panel on Application of Isotope Techniques in Hydrology¹ and the report of the Panel on Use of Isotopes in Hydrology^k have been published and the proceedings are available to governments and institutions interested in the application of isotope techniques in the investigation and development of water resources. These publications may be used as interim guides which indicate the general scope and limitations of available isotope techniques applicable to hydrologic problems. In addition IAEA sponsored a Symposium on the Application of Radioisotopes in Hydrology in Tokyo during March 1963, the proceedings of which include reports of specific results of investigations made by a wide variety of scientists in both advanced and developing nations, relating their experience in the application of isotopes to hydrologic investigations.¹

Radioactive Waste Management

7. The IAEA is concerned with the establishment of water quality criteria with particular respect to radioactivity. The results of this work are available to Member States as guides for establishing limits of release of radioactive wastes, particularly inasmuch as they affect the quality of water resources. It is particularly noteworthy that some of the knowledge gained from the study of the disposition of fission products released by waste disposal practices has direct hydrologic significance. Some of this technology, in connexion with standard methods, is applicable in research for developing knowledge of the hydrologic cycle.

Desalination Programme of the IAEA

8. At the request of the Tunisian Government, IAEA is studying means of water desalination for municipal and industrial supplies in conjunction with the generation and use of nuclear power. This study is primarily concerned with the potential of dual purpose installations for use in areas where the economic situation is favourable.

¹ *Application of Isotope Techniques in Hydrology, Technical Reports Series, No. 11, International Atomic Energy Agency, Vienna, 1962.*

^k *Isotope Techniques for Hydrology, Technical Report Series, No. 23, International Atomic Energy Agency, Vienna, 1964.*

¹ *Radioisotopes in Hydrology, International Atomic Energy Agency, Vienna, 1963.*

Participation of the IAEA in the International Hydrology Decade

9. The IAEA expects to participate in the International Hydrology Decade, being developed by UNESCO, by making its laboratory and staff capabilities available upon request of Member States and within budgetary limitations insofar as the applications of isotope techniques are desired in conjunction with established investigative methods. The IAEA's laboratory provides training in the application of isotopes in hydrology. If regional training courses are organized, the IAEA can provide lecturers to elaborate on isotope applications in hydrology. If requested, the IAEA can contribute experts to participate in advisory missions which may arise out of preliminary country surveys. The IAEA will carry out on-the-spot investigations, when requested.

THE INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT AND THE INTERNATIONAL DEVELOPMENT ASSOCIATION

1. The International Bank for Reconstruction and for Development (the Bank) and its affiliate, the International Development Association (IDA), have expanded their activities in the field of water and both organizations are currently considering many projects in this field in various parts of the world.

2. In order to take care of the increased demand for financing in the field of water, the Bank organized in the last year a Division of Water within the Department of Technical Operations to consider the many requests which are presented for financing in this field. This division also serves to analyse and make the recommendations necessary for the financing of the projects.

3. IDA has granted five grants for water works and sewage projects in the last three years:

Country	Purpose	Amount (million \$)
China	Taipei Waterworks	4.4
Jordan	Amman Water Supply	2.0
Nicaragua	Managua Water Supply	3.0
Pakistan	Dacca Water and Sewerage, Chittagong Water and Sewerage ..	26.0

4. The Bank has also provided \$200,000 for a study of the Manila (Philippines), Water Supply.

5. As said above, both the Bank and IDA are currently engaged in study of additional projects in this field in many developing countries.

6. The Bank has also agreed to serve as executing agency for various projects of the Special Fund in fields related to water. These projects are the following:

- (a) Port Siltation Project in the Port of Bangkok—Thailand;
- (b) Port Siltation Project in the Port of Georgetown—British Guiana;
- (c) Niger River Dam's Survey in Nigeria;
- (d) Sudan Electric Power Survey;
- (e) Electric Power—Irrigation Survey in Guatemala;
- (f) Two electric power surveys in areas of Brazil.

UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANIZATION

1. The activities of UNESCO concerned with hydrology are focused on the scientific aspects of the subject — both theoretical and applied — and on the problems of training scientific personnel or technicians.

2. Through its activities under the regular programme (arid zone and humid tropics research programmes), the Expanded Pro-

gramme of Technical Assistance and, more recently, the Special Fund, UNESCO has from its inception contributed to the progressive development of the science of surface and underground hydrology and to the establishment of a number of specialized institutes and agencies in various countries.

3. Through its various scientific publications and the records of meetings, round tables and symposia published by UNESCO or under its auspices, the organization has acquired, particularly in arid zone hydrology, a degree of competence in certain activities which, in the course of a decade, has made it a centre of attraction for a growing number of specialists and agencies.

4. In addition to this range of operations — each of which, be it noted, covers a relatively narrow field — the General Conference of UNESCO decided at its twelfth session in September 1962 to prepare a long-term programme of international co-operation in scientific hydrology.

5. A series of meetings (expert committees in November 1962 and an inter-governmental meeting in May 1963) led to the preparation of a provisional programme, to be reviewed in 1964, defining the objectives and programme of an International Hydrology Decade to begin in 1965.

6. The main objectives of this Decade are as follows:

(a) to intensify the study of water resources and of their regimen with a view to their rational utilization;

(b) to apply to the utilization and conservation of those resources the established scientific principles of all branches of hydrology;

(c) to promote the teaching of hydrology and to train the necessary hydrological specialists at all levels.

7. The programme will have national, regional, continental and global aspects and will consist of a number of basic operations, the most important of which will be the following: appraisal of the state of our knowledge of hydrology, followed by the exchange of information and the dissemination of available knowledge, particularly of the great international basis; a thorough study of "representative basins", leading to the establishment of basic networks and of bench-mark stations to be called "Decade stations"; research on specific hydrological problems calling for effort at the international level; the scientific and technical training of specialists.

8. The projected scientific programme is to be developed along the following broad lines: study of the water balance; the geochemistry of natural waters; erosion, stream bed evolution, sediment transport and alluviation; influence of man on hydrological phenomena.

9. The study of the water balance accounts for the greater part of this programme; the fundamental primary operations will be concerned with precipitation, evaporation and evapotranspiration, surface waters, soil moisture, ground-water, snow and ice.

10. The methods of implementing this vast programme of international scientific co-operation include the establishment of:

(a) a national committee for the Decade in each Member State;

(b) a scientific committee to be set up by the International Council of Scientific Unions (ICSU) to supervise the scientific conduct of the programme;

(c) an International Council for the Decade, composed of eight representatives of Member States and representatives of the competent international organizations in the United Nations family, as the executive organ for the Decade.

11. The Decade secretariat will consist of an appropriate unit in the UNESCO Department of Natural Science, possibly augmented by specialists from the other international organizations most directly concerned. It will act as the necessary co-ordinating organ in this international venture.

THE WORLD HEALTH ORGANIZATION

The Community Water Supply Programme

1. By a resolution of the Twelfth World Health Assembly, the WHO embarked on a global Community Water Supply Programme, with the object of assisting Member States in the provision of urban water supplies essential to the public health and well-being of urban peoples, and for the economic growth of cities. This programme is being undertaken in addition to the similar service which the Organization had been, and still is, providing in connexion with rural water supplies.

2. The immediate results of the installation of an adequate and safe water supply to a community are ample justification for the involvement of WHO in this activity, consisting as they do of a general improvement in health, the reduction — in some cases the eradication — of water-borne diseases, and a decrease in infantile mortality from such causes as enteric and diarrhoeal infections. Nevertheless, the benefits to the people of the community do not stop here.

3. Many diseases transmitted by water, particularly those caused by parasites, do not immediately kill their victims but debilitate them over long periods to such an extent that they are unable to work efficiently, or even work at all in many cases. Hence food production and the general economy of the community suffers, and unnecessary poverty and malnutrition are added to the misery of the disease. An effective water supply will reduce or eliminate such parasitic infections.

4. In many parts of the world women spend a large proportion of their lives carrying water: by eliminating the necessity for this they may use their time in more economically rewarding tasks.

5. Many diseases other than those described as waterborne flourish under conditions of dirt: improved hygiene standards, which can only be based on adequate water supplies, go far to reduce such diseases. Again the economic effect of such reduction is often considerable.

6. Industrial development in the community, with its provision of employment and raising of living standards, is normally impossible without a reliable and adequate water supply.

7. Only one third of the urban populations in developing countries, and less than one tenth of their total populations, enjoy the benefits of a piped water supply, and a similar number have access only to public outlets, situated sometimes hundreds of yards from their homes, involving laborious carrying of small quantities of water which may become contaminated before use.

8. A recent survey conducted by WHO covered 75 developing countries in Africa, Asia and Latin America,^m whose urban population totals 320 million at present, and is estimated to increase by 64 per cent by 1975. Of the present urban population only 35 per cent have piped water in the home, and approximately one half of this group receives supplies which are inadequate or unsafe.

9. In order to give the urban dwellers in these 75 countries a piped supply reasonably accessible to their homes, an average expenditure of at least \$400 million per annum over the next fifteen years will be necessary; this represents about one quarter of one per cent of the gross national product of the countries concerned. The present expenditure on this vital service is estimated at less than one eighth of this amount.

10. Hence the problem gets worse daily, since the population growth outstrips the rate at which supplies are being provided in almost every developing country.

^m Bernd H. Dieterich and John M. Henderson, *Urban Water Supply Conditions and Needs in Seventy-five Developing Countries*, Public Health Papers, No 23, World Health Organization, Geneva, 1963.

11. The Community Water Supply Programme of WHO is operating at three levels; at headquarters, in regional offices and within individual countries.

12. At the Geneva headquarters, liaison is maintained with all the participating organizations, as well as with such bodies as UNICEF, and joint action with one or other of the agencies is frequently arranged. In addition, panels of consultants are called to study particular problems, committees and seminars arranged, publications prepared which are generally accepted as authoritative reference works, and support is given to work in the regions and in the field.

13. In its six regional offices studies are made of conditions within the countries of each particular region, and action is taken at the request of governments to initiate and carry out work within those countries. Collaboration is maintained with the United Nations Economic Commission, training programmes, seminars and fellowships arranged, advisory services provided as requested to the Member States, and field work is planned, supervised and supported.

14. It is in the field where the greatest impact is felt, and this year the Organization is actually working on community water supplies in 61 Member States, in which they have posted either a member of their own staff or a consultant. Within the next two years this number will be increased by a further 16. It would not be practicable to list there all the work which is being carried out in these countries, but the following brief descriptions of some of the major undertakings in hand or recently completed will give an idea of some types of work carried out.

(a) In Ghana, a team of WHO expert consultants with special competence in technical, administrative and financial aspects of water supplies was furnished that Government in 1961 in order to advise on a national community water supply programme. The recommendations of this group of consultants were accepted by the Government who, as a sequel, made a request to the Special Fund for assistance in the preparation of a master plan for water supply and sewerage for the Accra-Tema metropolitan area, and the establishment of the National Authority for Water Supply and Sewerage. This United Nations Special Fund project is now in progress with WHO acting as executing agency.

(b) In the Malagasy Republic, a similar team of experts provided advice to the Government on the organization and execution of a national water supply programme with special attention to the sanitary problems of the capital city, Tananarive, and to the difficulties of supplying water in the arid areas of the southern part of the island. Subsequently the Government has requested expert assistance from WHO in the preparation of a request to the Special Fund for a pre-investment project with relation to water supply in that country.

(c) In co-operation with the Special Fund, technical assistance is being continued in the Calcutta metropolitan area to prepare long-term sanitary plans for the area and to work out technological details involved in the creation of a Metropolitan Water and Sewerage Authority, as recommended by a WHO team of expert consultants in 1960.

(d) A consultant team of three members was provided to West Pakistan in 1961 to develop a province-wide programme for community water supply improvement. A resident sanitary engineer was provided to follow up on the team's recommendations and to provide specific engineering assistance on the improvement of water supplies in several of the major cities of the province. A substantial rural water supply project, in which both WHO and UNICEF are assisting the Government, is in progress.

(e) In eastern Nigeria, a team of three expert consultants was provided to assess the region's programme for community water supplies and to make recommendations on the governmental organization desirable to expedite the programme.

(f) In Taiwan, a three-man expert consultant team was provided in late 1961 to advise the Government on organizational, managerial and financial aspects of the national community water supply programme, along with the resident engineering advice of a WHO sanitary engineer who is assisting in the development of detailed sewerage designs for the Taipei area. A resident sanitary engineering adviser is provided to assist in the follow-through of the recommendations of the WHO consultant team.

(g) In Greece, a team of two experts has made a report after studying the national community water supply programme, and has given special review to the administrative, organizational and financial aspects of regional water supply projects in the Thessaly area.

(h) A consultant was provided to review planning and management of the Monrovia water supply, Liberia, and to recommend measures suited to improve conditions in this rapidly growing city. A consulting engineering firm was retained to prepare preliminary engineering studies and economic feasibility reports.

15. To summarize, the World Health Organization assists Member States to furnish adequate and safe water supplies to their communities in the following ways:

(a) By encouraging governments and local authorities to initiate action to improve present water supply conditions.

(b) By advising them on methods of financing such improvements.

(c) By assisting them in preliminary planning and design of water schemes.

(d) By advising them on the engineering, health, administrative, economic, financial, and legal aspects, and encouraging them to set up sound organizations for managing their undertakings.

(e) By acting as the executing agency for Special Fund projects.

(f) By arranging training programmes courses, seminars and fellowships to ensure that local staffs are competent to manage and operate the works on completion.

(g) By making studies of problems peculiar to the areas in which works are to be carried out.

(h) By publishing reports, manuals and monographs on all phases of community water supplies, to assist local staffs in the efficient management of their undertakings.

(i) By collaborating with other organizations and joining them in any activities involving the health and safety of water consumers.

(j) By supporting national and international research and training institutions.

Control of Parasites

16. It is not only by drinking water that man can become infected with diseases through the agency of water. Malaria, bilharziasis, dracuntiasis, filariasis, onchocerciasis, to name but a few, are all spread by means of water, and any control works such as irrigation, drainage, or hydroelectric projects are likely to affect the incidence of such diseases—sometimes for the better but usually for the worse.

17. Bilharziasis in particular, from which it is estimated that 150 million people, or one in twenty of the world's population, are suffering at the present moment, is encouraged and spread by irrigation projects. Onchocerciasis, or river blindness, may be aggravated by hydropower construction. Malaria may be increased by flood control reservoirs.

18. The role of WHO is not primarily concerned with the cure of these diseases, but with their prevention. Research into methods of eliminating the parasites and their vectors is continually being carried out all over the world, together with experimental work

on actual projects to discover means of preventing these from becoming infested.

19. The World Health Organization co-operates with any international or national agency engaged in water development of any description, and assists, as requested, with investigations and design of precautionary measures against water related diseases of all kinds.

Control of Pollution

20. Pollution of streams, rivers and underground water is an all-too-frequent outcome of providing water to communities for industrial use.

21. The problem in industrial and highly developed countries is an extremely serious one, on which a great deal of work is being carried out by WHO. A description of this work in such countries would not be relevant in this document.

22. In newly developing countries WHO is more concerned in preventing the problem of pollution from arising, and at the same time as its work in furthering the installation and improvement of community water supplies, it encourages countries to make due provision for the treatment and disposal of their wastes, and assists with technical and other advice to this end. It offers the same service to those responsible for the development of industry, and co-operates with other organizations for that purpose. In particular, it works closely with the IAEA when the question of treatment of radioactive wastes is involved.

THE WORLD METEOROLOGICAL ORGANIZATION

General

1. The purposes of the WHO, as stated in its Convention are *inter alia* as follows: To facilitate world-wide co-operation in the establishment of networks of stations for the making of meteorological observations or other geophysical observations related to meteorology and to promote the establishment and maintenance of meteorological centres charged with the provision of meteorological services.

2. The Third and Fourth World Meteorological Congresses (1959 and 1963) have interpreted these responsibilities of WMO as including hydrometeorology, and particularly those aspects of hydrology which are closely related to meteorology and which could be referred to as surface hydrology. The main body of WMO charged with the implementation of these directives is the Commission for Hydrometeorology, which has the following terms of reference:

(a) Keeping abreast of and promoting developments in hydrology related to meteorology, both in scientific and practical fields, and bringing these to the attention of other relevant constituent bodies;

(b) Developing, improving, promoting the international standardization of methods, procedures, techniques and terminology for:

(i) Studies of the water balance, the global hydrologic cycle and hydrological forecasting;

(ii) Hydrometeorological aspects of design of systems for water management and control;

(c) Formulating of observational requirements (including design and promotion of networks) for the activities cited in sub-paragraph (b) above;

(d) Co-ordinating of international hydrometeorological requirements and assistance in the arrangements for international exchange and dissemination of hydrometeorological data, analysis, forecasts and warnings;

(e) Considering questions relating to the reliability and homogeneity of hydrometeorological observations;

(f) Standardizing the form for recording and exchanging hydro-meteorological observations;

(g) Standardizing of methods of computation of hydrological data for research and publication (means, ranges, frequencies, etc.);

(h) Considering questions relating to the specialized training of meteorological personnel for activities of concern to the Commission;

(i) Considering questions relating to instruments and methods of observation concerning the Commission for which co-ordination with the Commission for Instruments and Methods of Observation is not necessary.

3. The Fourth World Meteorological Congress held at Geneva in April 1963, reviewed the activities of WMO in the fields of hydrology and water resources development and adopted the following resolution with regard to the Water Resources Development Programme of the United Nations and the specialized agencies:

“ *The Congress,*

“ ...

“ *Considering,*

“ (1) The important role of meteorology in many scientific and operational sectors of hydrology and water resources development;

“ (2) That the World Meteorological Organization is essentially involved in the development and execution of the long-term programme in water resources development and scientific hydrology;

“ (3) That the activities of the World Meteorological Organization technical commission dealing with water resources problems (Commission for Hydrometeorology) have been re-defined to meet both meteorological and related hydrological requirements in the field of water resources;

“ *Endorses* the action of the Executive Committee directed towards ensuring that the World Meteorological Organization play its appropriate part in the International Hydrological Decade and the United Nations Development Decade Priority Programme in Water Resources; and

“ *Decides* that the policy of the World Meteorological Organization will be to collaborate as feasible with the United Nations, the specialized agencies and other international organizations in carrying out both long-term programmes;

“ *Directs* the Executive Committee,

“ (1) To keep itself informed on the water resources development programme of the United Nations, its organs, the specialized agencies and other international organizations;

“ (2) To promote co-ordination of efforts for the development of water resources by arranging for participation of the World Meteorological Organization in the activities of the Water Resources Development Centre in accordance with Resolution 876 (XXXIII) of the United Nations Economic and Social Council;

“ (3) To arrange for the World Meteorological Organization to collaborate as required in projects within the field of water resources development with the organs of the United Nations, the specialized agencies, and other international organizations; ...”

4. In accordance with the Convention (see paragraph 1 above), WMO will endeavour to reach, by the end of the United Nations Development Decade, the following objectives:

(a) That each country of the world should have basic networks of stations for making hydrological and hydrometeorological observations;

(b) That each country of the world should have a sound hydro-meteorological service or a hydrological service, working in close collaboration with the meteorological service.

5. On the basis of experience, WMO believes that the above objectives are fundamental for an effective solution of most aspects of water resources development and utilization, and that they therefore must have the highest priority.

6. The activities of WMO aiming towards the above objectives may be grouped in the following categories:

(a) Elaboration of international standards and preparation and dissemination of guidance material;

(b) Dissemination of hydrometeorological knowledge through technical publications, seminars, symposia, and scientific conferences;

(c) Assistance to national governments in the establishment and expansion of observation hydrometeorological networks and related services, mainly through EPTA and the Special Fund;

(d) Training of manpower required by means of training centres, fellowships, seminars, etc.;

(e) Assistance to hydrological services and water resources authorities by giving advice on the questions concerned and, if required, by assisting them in obtaining the necessary climatological data, maps and summaries, current meteorological data and forecasts, etc.

7. Several international guides have been prepared by WMO on various fields of meteorology (for instance, the Guide to Meteorological Instruments and Observing Practices, the Guide to Climatological Practices, etc.). An international Guide to Hydro-meteorological Practices is now being prepared. This work will be completed in 1964. The Guide will consist of the following chapters: instruments and observing practices; network design; collection, processing and publication of data; methods of analysis; hydrological forecasting; applications to water resources development.

8. Some Technical Notes on subjects related to hydrology have already been prepared and published by WMO. Among these were Technical Notes on measurement of evaporation (Technical Notes No. 11 and 21), design of hydrological networks (No. 25), techniques for surveying surface-water resources (No. 26). Several Technical Notes are planned to be prepared and published during 1964-1965; in particular, on processing of hydrological data by means of electronic and other computers, on hydrological forecasting, etc.

9. The World Meteorological Organization will continue to organize training seminars, usually in co-operation with sister agencies and regional economic commissions. Many of the seminars organized in the past were related to hydrology and hydro-meteorology, for instance: on hydrological forecasting and water balance (Belgrade, 1957), on flood control, drainage and irrigation (Prague, 1958), on hydrological networks and methods (Bangkok, 1959), on fields methods and equipment used in hydrology and hydrometeorology (Bangkok, 1961). The Third Inter-regional Seminar (WMO/ECAFE/BTAO) on Methods of Hydrological Forecasting for the Utilization on Water Resources will take place in Bangkok in August 1964. Various other seminars and symposia are planned for the fourth financial period (1964-1965). In accordance with the recommendation of the Commission for Hydrometeorology, at least one seminar should be held each year. WMO is also planning to take an active part in all conferences and other meetings organized within the framework of the International Hydrology Decade.

10. The WMO secretariat, in collaboration with the secretariat of the Economic Commission for Asia and the Far East, have carried out work which resulted in a report on major defi-

ciencies in hydrological data in the ECAFE region. It is planned that similar work will be carried out by WMO jointly with the Economic Commission for Africa. Such work may be extended to other regions.

11. WMO is active in the execution of technical assistance projects through EPTA and the Special Fund. So far, 17 projects, directly related to the field of hydrology and the study of water resources, have been executed by WMO. It is expected that the number of projects will increase in the future.

12. At present, there are many projects in the field of water resources, executed under EPTA and the Special Fund by agencies other than WMO. These projects include considerable hydrological and hydrometeorological work, such as the establishment of stations, collection of data, surveys, etc. These activities are often linked with specific projects and therefore do not necessarily aim towards a common national plan for networks and services. It is considered that it would be more economical and would facilitate all projects relating to water resources development and utilization if the establishment and expansion of basic hydrometeorological networks and the organization of the basic services of collection and collation of data from the networks were developed as separate projects in all countries where the present situation in this respect is not satisfactory. Such activities now included as parts of other projects in water resources questions could then be omitted and all such projects could be planned with the knowledge that these basic requirements are being met.

ANNEX II

Activities and plans in the field of training and general requirements of trained personnel

1. This annex contains contributions from the member organizations on the subject of:

(a) Indications on the activities and plans of each agency in the field of training of water personnel.

(b) General requirements of trained personnel in relation to long-term water programmes.

2. Contributions from the following member organizations have been received:

United Nations, Department of Economic and Social Affairs, Resources and Transport Division;
Economic Commission for Africa;
Economic Commission for Asia and the Far East;
Food and Agriculture Organization of the United Nations;
International Atomic Energy Agency;
United Nations Educational, Scientific and Cultural Organization;
World Health Organization.

UNITED NATIONS: DEPARTMENT OF ECONOMIC AND SOCIAL AFFAIRS, RESOURCES AND TRANSPORT DIVISION

A. Activities and Plans in the Field of Training in Relation to Water Resources Development

1. Within the United Nations, training in relation to water resources development is effected through three major types of activity, namely the fellowship programme; training of counterpart personnel within the context of technical assistance and Special Fund projects; and seminars and study tours or conferences.

2. Fellowship awards in the technical assistance programme have been relatively few, to be counted in dozens rather than hun-

dreds each year in the water field. Despite the limited financial facilities and an apparent government preference to request experts, it is felt that there is a considerable scope for increased activity in this sector. Most Special Fund projects executed by the United Nations include provision for fellowships, usually for four or more people, for training abroad to enable them to carry on similar activities later or to become qualified counterpart personnel.

3. On-site training is obviously received by a large number of local technicians working alongside technical assistance experts and in Special Fund projects, some of which are particularly designed for training as in the new hydraulic laboratories. Careful attention is always given to training as part of all assistance projects. This aspect will have to be strengthened to meet growing requirements of trained personnel.

4. In the category of relevant seminars, close co-operation may be noted with ECA on a ground-water seminar to be held in 1964 in Africa. The plans and work programme of the Resources and Transport Division include several inter-regional seminars and similar arrangements, designed in most cases for senior government officials and technicians. Among them is a seminar and study tour of water resources development in the Soviet Union, with emphasis on multi-purpose projects, long-distance water transportation, evaluation and project programming approaches, scheduled for August 1964 if possible, and now being worked out with the co-sponsoring government. Another is an inter-regional seminar on techniques for alternative water supply, with special reference to practical application of demineralization, prospectively to be held at United Nations Headquarters in 1965. Other inter-regional seminars, to pool and disseminate experience on a global scale, are tentatively scheduled for a later stage to deal with integrated river basin development and ground-water exploration techniques.

5. By such activities the United Nations thus helps to train a considerable number of technicians through presently available means and channels. These are, however, totally insufficient in relation to future requirements in the countries concerned and in the prospective assistance activities.

B. General Requirements of Trained Personnel in relation to Long-term Programmes in the Water Resources Field

6. There already exist notable deficiencies in manpower within the many disciplines and specialties in the broad field of water resources development, management and related planning; in fact, manpower limitations will in many cases place a ceiling on water resources activities of the United Nations Development Decade unless immediate action is taken to augment the manpower base.

7. The developing countries generally suffer manpower shortages in almost all categories, and large efforts will be required to promote education and training at different levels; these efforts may include, for the training of high-level personnel, the setting up by several neighbouring countries jointly of international water resources development institutes and seminars aimed at practical development and drawing together such relevant disciplines as meteorology, hydrology, geology and hydrogeology, hydraulics, chemistry, engineering, economics, administration and law.

8. The manpower shortages are also felt already in certain categories and levels of the international assistance programmes and are likely to grow more severe with expansion of activities, unless further action is taken. Among the categories involved, several of which are of key importance for the prosecution of the current priority proposals, are water resources economists, river basin development experts, hydrologists, hydrogeologists and project managers. In part, therefore, effectiveness will depend on greater willingness in the industrial countries to release manpower

and on better training of potential experts in languages and cultivation of interest in work abroad, while at the same time better arrangements will have to be made for international careers in this field for engagement of associate experts to gain experience, for service agreements with institutions regarding experts and technical support of field activities and for more effective on-the-job training and follow-up.

Economic Commission for Africa

1. Following the recommendations made by the Standing Committee on Industry and Natural Resources, held in Addis Ababa, December 1962, the Economic Commission for Africa at its fifth Session, March 1963, decided to:

“Investigate requirements for sub-regional training programmes for intermediate grade and subordinate hydrological staff and arrange for such training programmes in co-operation with specialized agencies such as UNESCO and other bodies.”^a

2. In compliance with the above decision the secretariat has made studies in the east African countries and discussed the possibility of establishing training centres in the sub-region where the need for middle grade hydrologists is enormous. Two sites were found suitable for this purpose, namely:

(a) The existing training centre of the Ministry of Works, Nairobi, (Kenya); or

(b) The planning and research Station of the Water Development and Irrigation Department at “Ubungo”, (Tanganyika).

Any of these two institutions can be used as a nucleus for a regional training centre.

3. Following this visit, exploratory letters to Ethiopia, Somalia, Kenya, Uganda and Tanganyika were sent requesting information concerning the number, the responsibilities and back-ground of trainees which each Government wishes to train. Replies are still awaited.

4. During the preparatory meeting for the International Conference on the Organization of Research and Training in Africa in Relation to the Study, Conservation and Utilization of Natural Resources which was held in Paris in June 1963, ECA delegates noted the interest of African countries in technical training and it was decided to include the training of technicians in the scope of the conference.

5. Recent discussions with WMO pointed out that their training programmes for middle-grade meteorologists are at a well advanced stage and that they are establishing five training centres in Africa. Since hydrology and meteorology have some common subjects, the possible addition of hydrology to the scope of these centres is being investigated.

6. The possibility of establishing these centres jointly with FAO is also being investigated, since they plan to commission an expert to East Africa and another to West Africa to estimate the needs of different countries for specialists in water techniques (hydrology, hydraulic engineering, irrigation and drainage), to make the inventory of the existing training facilities and to submit proposals for a long-term plan for the creation of the necessary institutions.

7. As for the general requirements of trained personnel in this field, the Secretariat agrees with the views of the First Inter-African Conference on hydrology held in Nairobi, January 1961 which noted that three categories of personnel are required:

(a) Senior officers who must be qualified engineers or hydrologists with advanced training. This is an universal problem

^a See *Official Records of the Economic and Social Council, Thirty-sixth Session, Supplement No. 10*, para. 316.

which can be solved only in terms of University of higher education.

(b) Hydrological assistants who have followed their secondary education with about one year of special training and who are capable of supervising work in this field.

(c) Hydrological operators who, with about one year of training can carry out the normal field operation of taking gauge-reading, simple survey, etc.

Economic Commission for Asia and the Far East

Activities dealing with water resources

1. The principal activities of the Economic Commission for Asia and the Far East in the water domain have been directed towards the following fields: (i) undertaking investigations and studies on subjects of common importance to countries in the region; (ii) promotion of regional co-operation; (iii) rendering advisory services; and (iv) organizing regional meetings on water matters.

2. The Regional Conference on Water Resources Development, the immediate governing body under the Commission which decides the programme of work and priorities of the secretariat in the field of water resources development, convenes biennially. The Conferences make biennial review of the progress made in the field of water resources development in the region and proposes special studies and research to be carried out by the secretariat on subjects of specific importance to the countries in the region. It recommends the organization of seminars and symposia to deal in detail with various regional problems.

3. The results of these studies and research projects and the proceedings of meetings are published in printed form for dissemination to the member countries. Among the studies already completed, mention may be made of: *Manual of River Basin Planning*; *Standards for Methods and Records of Hydrologic Measurements*; *Earthmoving by Manual Labour and Machines*; *River Training and Bank Protection*, and *The Sediment Problem*.^b A manual of standards and criteria for planning water resource projects is being readied for publication. For the coming years, the following studies are programmed: water code for Asia and the Far East; comparative study of cost of water resources development projects, including relative costs for different methods of construction; hydrologic investigation on typhoons; run-off coefficients and maximum floods in monsoon areas; and application of modern techniques in hydrologic studies.

4. In relation to the proposed preliminary country surveys of water needs and resources as recommended in the present report, the secretariat has since 1953, completed fifteen country surveys in the region. These surveys are continually being kept under review and brought up to date. They deal with the country's water resources and their present stage of development with respect to flood control, irrigation and drainage, hydroelectric power, inland navigation, water supply, watershed management and multiple-purpose development. The needs and possibilities for further development are examined and a description is given of future plans of development. Problems facing the country in developing its water resources are discussed, touching on relevant organizational, social, economic and technical aspects. These surveys are published in the Water Resources Series and are kept up to date by continuous review and publication from time to time in the quarterly Water Resources Journal.

5. In the promotion of regional co-operation for the development of international rivers, the secretariat initiated as far back as 1951 the study on the development of the Lower Mekong Basin which has now developed into one of the biggest regional projects

in the United Nations programme. Under the aegis of ECAFE, a Committee for Co-ordination of Investigations of the Lower Mekong Basin comprising representatives of the four riparian countries, was established in 1957 to direct the entire programme with a secretariat provided by the United Nations. Twenty countries outside the basin, eleven United Nations agencies, three foundations and several private companies are assisting the Mekong Committee in the implementation of its programme. Resources as of today, including grants and loans, have reached \$42 million equivalent. The experience gained in the implementation of this project has encouraged the secretariat to plan for the promotion of co-operation for the development of other major international river basins in the region. Under this programme, the following measures will be taken: (a) collection of data and undertaking of preliminary studies on potentialities and identification of scope of regional co-operation; (b) arrangements for joint meetings among riparian countries concerned to formulate programmes for concerted action.

6. On the operational side, the secretariat provides advisory services on specific problems at the request of member governments. These services have been well appreciated in the past and an increasing number of such requests have been received in recent years. The secretariat also participates actively in the execution of a number of technical assistance projects in the region through the Expanded Programme and the Special Fund.

7. A series of seminars and symposia on hydrology, groundwater resources development, dams and reservoirs, and development of deltaic areas have been organized in the past years jointly with BTAO, WMO and UNESCO. As a follow-up to these meetings, two advisory groups of experts have been programmed for the coming years; namely, an advisory group on development of deltaic areas and an advisory group on interpretation and use of hydrologic data. At the request of countries in the region, the advisory groups are to visit the countries and render on-the-spot advisory services.

Activities and plans in the field of training in relation to water resources development

8. Since 1952, ECAFE has emphasized the necessity and urgency of establishing regional training centres to provide systematic and practical training in the planning and operation of water resource development projects. On the initiative of ECAFE, and with the help of the Government of India, a Water Resources Development Training Centre was established as an integral part of the University of Roorkee, India, in 1955. Facilities for training at the Centre are made available, by the University by scholarships approved by BTAO. The Government of India also grants fellowships to foreign students under the Colombo Plan for study at the Centre.

9. A series of training seminars and one symposium have been organized during the past years, namely, the first ECAFE/WMO Inter-Regional Seminar on hydrologic networks and methods (1959) the second ECAFE/WMO Inter-Regional Seminar on field methods and equipment used in hydrology and hydrometeorology (1961), the ECAFE/UNESCO seminar on the Development of Groundwater Resources with Special Reference to Deltaic Areas (1962) and the Regional Symposium on Flood Control, Reclamation, Utilization and Development of Deltaic Areas (1963). The Third ECAFE/WMO/BTAO Inter-Regional Seminar on Methods of Hydrological Forecasting for the Utilization of Water Resources is being organized for August 1964.

10. The complex Mekong Basin project offers a wide field of training opportunities, especially for trainees from the riparian countries, viz. Cambodia, Laos, Thailand and the Republic of Viet-Nam. Many of the Mekong component programmes thus include, or have included, fellowships or other training elements and training in the field is provided under a number of projects

^b For the reference to the publication of the above studies, see footnotes e, b, g, k, i in Annex I.

being undertaken by participating countries. For example, geologic investigations undertaken by Australia provided training of geologists and drillers; Canada gave training in various parts in Canada tailored for individual senior officials; France has extended numerous fellowships for technical training in France; the Indian work at Tonle Sap has included training in soil sampling; Israel has extended a number of grants for study in Israel; under United States aid programmes, training is offered to 98 hydrologists in the basin, and 6 trainees are receiving technical training in the United States in land classification techniques; the Special Fund/UNESCO/Mekong Mathematical Delta project contains an important training element.

11. The Office of the executive agent of the Lower Mekong Basin Committee provides for a number of posts in its core of international staff to qualified officers from the riparian countries. A number of in-service assignments of approximately six months' duration each have also been programmed to offer on-the-job learning in component projects of the Mekong scheme. A systematic series of seminars in Mekong development fields have also been planned over the coming five years. Under this programme, one six-day training seminar per year will be organized in each of three major fields; engineering, navigation improvement and economic analysis. A total of some twenty overseas fellowships have also been arranged for the coming five years.

FOOD AND AGRICULTURE ORGANIZATION OF THE UNITED NATIONS

A. FAO Training Activities and Programmes connected with the Development of Water Resources

1. During the next two years, FAO plans to organize training courses in various parts of the world and to co-operate with other agencies in organizing such courses. For example, a training course on the problems of waterlogging and salinity connected with irrigation is to be organized in Pakistan in 1964.

2. In co-operation with the Economic Commission for Africa, FAO will organize a training course on small earth-dams and one on water legislation and the organization of public water services.

3. With the co-operation and material assistance of the Soviet Union, it will arrange a two-month training course on problems relating to irrigation and drainage.

4. Apart from these projects, which are cited as examples, FAO will continue with the field training of water resources specialists both under its technical assistance programme and as part of the many specific projects for which it is responsible. In each case the Government concerned has to co-operate, as for example, by assigning to each programme or project local technicians who can undergo training for fairly long periods. It is estimated that, by means of such projects, FAO is now participating in the continuous training of several hundred specialists on water problems for some fifty different countries.

5. FAO also organizes and supervises the studies and research work of a large number of fellowship students, who go to foreign countries for supplementary technical training.

B. General Needs of Trained Personnel for Water Resources Development

6. These needs are tremendous but very difficult to assess. Although they will be determined by each country's long-term development plans and the rate at which they are carried out, the fact remains that proper facilities for the training of water resources specialists fall far short of the need and will continue to do so for a long time to come.

7. In the case of irrigation and drainage, for example, it has been estimated that the new areas to be irrigated throughout the world in the next twenty years will amount to tens of millions of hectares, and that there should be an average of two or three qualified technicians (engineers, agronomists or instructors) for every 1,000 hectares of newly irrigated land. As a result, additional tens of thousands of specialists in irrigation and drainage would have to become available each year. The problem is especially vast, since the thorough training of such specialists is apt to take several years of constant effort, particularly if competence in both agronomy and civil engineering is to be the goal.

8. The same is doubtless true of most of the water resources sectors, owing more particularly to population growth and the general improvement in living conditions, which constantly increase the need for water resources specialists.

9. It seems that an undertaking of such magnitude cannot be left to the United Nations and the specialized agencies alone, but that the countries concerned must assume some or even most of the burden.

10. Concurrently with the training of water resources technicians, attention must also be given to the training of specialists in water legislation, water administration and management, planning, etc.

11. This training will be continued by FAO under programmes and activities which in some cases go beyond the development of water resources, for example, study groups on agricultural training or rural development planning.

THE INTERNATIONAL ATOMIC ENERGY AGENCY

1. The IAEA grants fellowships to scientists of Member States for specific training in specialized centres, where the desired technology is available. The facilities of the IAEA's laboratories are also used for training purposes. In addition, as a by-product of the IAEA Technical Assistance Programme local scientists become acquainted with isotope techniques while participating in projects of local importance.

2. General requirements for persons accepted as trainees in this programme are sound basic technical education and fundamental knowledge of radioactivity and radioisotope handling.

UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANIZATION

A. Activities of UNESCO in the Training of Specialists in Hydrology

1. The problem of training specialists in the various aspects of the study and development of water resources has always been regarded by UNESCO as inseparable from the various essentially scientific operations under the regular programme. The action taken under this programme is concerned: with the organization of regional courses, particularly on arid-zone groundwater hydrology; with the secondment of a number of expert missions to organize or develop research and training institutes; with the co-ordination of a personnel exchange programme, involving the award of many post-graduate fellowships, generally in conjunction with the activities of the aforesaid experts.

2. For example, regional courses have been organized at Tunis, Antogafasta, Cairo, Lahore, etc., and training and research institutes have been established at Istanbul, Cairo, Mexico City, Recife, etc.

3. Side by side with these activities, the training programme for specialists in hydrology must be given high priority among the ancillary operations of the International Hydrology Decade. The first steps in that direction have already been taken.

4. UNESCO intends to concentrate mainly on the training of research hydrologists specializing either in surface-water problems or in ground-water problems, the basic knowledge required being different in each case.

5. With that end in view UNESCO plans to prepare, beginning in 1964:

(a) An inventory of the institutions and universities which provide training in hydrology;

(b) A comparative study of the various syllabi;

(c) A selection of those institutions and universities which provide the most appropriate instruction in each specialized field.

6. As early as 1964 — i.e., during the current stage of preparation for the Decade — UNESCO will award contracts to two universities for the organization of training courses and will organize two short regional post-graduate courses, one in the Middle East and the other in Latin America.

7. The long-term plans of UNESCO in this field include: detailed studies of specialist personnel requirements in surface and underground hydrology, both for basic surveys and for the execution of development projects; the gradual elaboration of a programme for the establishment or reorganization of national or, where appropriate, regional institutions for training and applied research.

B. *Qualified Personnel Requirements for a Long-term Programme*

8. The various aspects of the development of a country's water resources — to take only the stages embracing the various pre-investment or pre-development studies — can be accurately defined only in the light of specific surveys, most of which have yet to be carried out.

9. The experience of UNESCO indicates, however, that the severest shortage is of scientific specialists such as hydrologists or hydrogeologists, for the simple reason that there are only a very few institutes anywhere in the world which provide instruction in these two disciplines.

10. In the case of surface hydrology, for instance, the preparation of the programme for the International Hydrology Decade has revealed that every future "hydrological service" will need an appropriate number of the following specialists: observers, technical assistants, hydrometrists, hydrologists, research hydrologists.

11. A groundwater study centre needs geologists, water engineers, technical assistants and chemists. In this instance, too, their number will depend on the magnitude of the problems awaiting solution.

12. At all events, it must be stressed that the many surveys and appraisals currently under way in connexion with surface waters or groundwaters only rarely take account of the problem of specialist training, and indeed, tend to intensify the existing shortage.

Moreover, these various surveys cannot yield the expected benefits simply because of the lack of technicians capable of putting to use all the information obtained and surveys carried out by international experts, particularly those working under the Expanded Programme of Technical Assistance and the Special Fund.

13. Side by side with the proposed investigations into the water requirements of various countries, it is essential that provision should be made for a thorough inquiry into qualified personnel requirements for the survey and development of water resources. Such an inquiry, as indicated under A above, has a place among UNESCO activities in connexion with the International Hydrology Decade. This study will of course include a programme for the organization of national and regional teaching institutes and bodies.

WORLD HEALTH ORGANIZATION

1. There are increasing indications that the lack of trained personnel in the entire range of skills required for the development and operation of national community water supply programmes is retarding the progress of these programmes to a significant extent. The World Health Organization is, therefore, placing high priority on assistance to Member States in the education and training of these personnel.

2. It is planned within the limits of available funds to assist in initiating studies on the numbers and types of trained personnel now available in developing countries, the pool of manpower from which additional personnel may be trained, an inventory of the training institutions and centres now under operation or planned and an estimate of general requirements for trained personnel for a long-term period to meet the needs of the developing countries studied.

3. There are training components in each of the activities within the Community Water Supply Programme of WHO. Special emphasis has been placed upon the training of national personnel in projects where direct assistance is being provided for preliminary engineering and economic feasibility studies and in some instances, as for example, the Special Fund project for assistance to Ghana in preparation of a master plan for water supply and sewerage for the Accra-Tema metropolitan area, provision has been made for formal training to be initiated by the consulting engineering firms with whom the World Health Organization as executive agency has a contractual relationship. The numerous regional and inter-regional seminars on community water supply sponsored by WHO have been working seminars in which knowledge and experience in this specialized field has been made available to nationals of developing countries who attended the meetings as participants.

4. Proposed activities within the Community Water Supply Programme call for developmental work, the end result of which is expected to be improved methods, procedures and design criteria which will enable developing countries to plan and execute water supply systems geared to their economies and utilizing local materials to the fullest extent. This developmental work is expected to include important aspects of training.

DOCUMENT E/3894/Rev.1

Future of the United Nations Water Resources Development Centre: note by the Secretary-General

[Original text: English]
[31 July 1964]

The Secretary-General has the honour to refer to Section X (paras. 95-98) of the twenty-ninth report of the Administrative Committee on Co-ordination (E/3886) of 5 May 1964, and to Chapter I (paras. 10-18)

of the third biennial report of the United Nations Water Resources Development Centre (E/3881). In the light of the findings here recorded, he proposes that the United Nations Water Resources Development Centre

should be again an integral part of the Resources and Transport Division of the Department of Economic and Social Affairs at the United Nations Headquarters, New York, and that the Director of the Division, under the Secretary-General for Economic and Social Affairs, should assume responsibility for the functioning of the Centre. The terms of reference¹² of the Centre would be as follows:

(a) to keep the inter-related problems of water resources development and utilization under continuous review;

(b) to pay special attention to the administrative and legislative problems related to water resources development in developing countries;

¹² See *Official Records of the Economic and Social Council, Twenty-ninth Session, Special Supplement.*

(c) to foster the diffusion of relevant information among governments and interested organizations;

(d) to foster in the case of international rivers, as appropriate, the collection of relevant data, the study of tentative programme schemes and the bringing together of the parties concerned;

(e) to promote efforts towards the formulation of principles of international law applicable to water resources development;

(f) to facilitate co-ordination of activities between Headquarters and the regional economic commissions;

(g) to perform, as required, on behalf of the Administrative Committee on Co-ordination, the organizational and secretarial functions for the inter-agency and *ad hoc* meetings on water resources development and utilization.

CONCLUSIONS AND RECOMMENDATIONS	171-172

Introduction

In its resolution 885 (XXXIV) of July 1962 on new sources of energy, the Economic and Social Council invited the Secretary-General:

“ Having regard to the report on the United Nations Conference on New Sources of Energy, to examine, with special reference to the provision of energy for the developing countries, methods of co-ordinating and facilitating research into new sources of energy and its applications, particularly solar energy, wind power and geothermal energy; this examination to be made in consultation with the appropriate organs of the United Nations, the specialized agencies and the International Atomic Energy Agency and, as appropriate, other international and national bodies active in this field;

“ To report on progress made in this examination to the thirty-seventh session of the Council. ”

The present report is submitted in response to this request, and is based partly on replies to questionnaires and, to a somewhat larger extent, upon studies made by consultants who are specialists in the fields of solar power, geothermal power and wind power respectively. This survey of developments takes into account the studies and reports of various organs and units of the United Nations active in the development of new sources of energy as well as related activities of the various specialized agencies.

The report covers developments that have taken place since the United Nations Conference on New Sources of Energy, held in Rome in August 1961, and evaluates on the one hand the progress that has been made since that time in the development of new sources of energy, and on the other hand examines the methods of co-ordinating and facilitating research into the new sources of energy.

PART I

Summary of recent developments in new sources of energy

1. In the three years since the United Nations Conference on New Sources of Energy held in Rome, there have been several significant developments which affect the future of the applications of new sources of energy to useful purposes. These developments are of both a general nature and, in some cases, of a specific nature dealing with particular applications, and are discussed in this introductory summary.

2. The Rome Conference provided a unique opportunity for the exchange of information between scientists, engineers, economists, government officials and others interested in the development of the new sources of energy and their applications. This exchange of information has had notable effects on research in, and development of, solar energy, wind power and geothermal energy.

SOLAR ENERGY

3. In assessing the impact of the Rome Conference on the development of solar energy, it may, in general, be said that the solar energy picture is cast in a more realistic light than prevailed before the Conference and that there is a better understanding of both the possibilities and the limitations of solar energy. An early and unwarranted feeling of optimism regarding the feasibility of large-scale solar energy applications held by many who were not fully aware of the engineering and economic problems, has now largely disappeared. The scientific, engineering and economic progress is now on firmer ground than was the case before 1961. The result of this basic improvement should be to hasten practical applications of solar energy. Some of these are now beginning to appear.

4. In general, it appears that on a world-wide basis, the level of activity of research and development on terrestrial applications of solar energy (as distinguished from applications on space vehicles) has been maintained or slightly increased since 1961, and the quality of these efforts has been improved. This trend is attributed in substantial measure to the Rome Conference.

5. There is an increase in activity in the field of solar radiation measurements, reporting, and correlation. This trend has developed because of increased awareness of the importance of data on the availability of this raw material—solar energy.

6. Significant progress has been made in solar collectors, particularly of the focusing type. This broader understanding of their operation is the basis for improvements in methods of construction of collectors, which are generally the most costly item in solar apparatuses, and is necessary for economic evaluation and useful application of solar energy. In particular, there has been important work on the performance of focusing collectors, and of flat plate collector systems operating at temperatures sufficiently high for operation of solar air conditioners and low temperature heat engines. The use of plastic materials in flat plate collectors has been subjected to careful analysis and realistic evaluation.

7. There has been a general clarification of the economics of solar energy. This has led to more realistic appraisal of the potential of various solar applications and has served as a guide for solar energy research and development. For example, the early optimism over photovoltaic power converters has been replaced by emphasis on thin film photovoltaics or high flux operations which might possibly lead to economic use of this process.

8. In the field of solar distillation for demineralization of brackish or saline waters for human consumption, the work reported at Rome on the development of permanent stills has continued. There are now prospects for early installation of stills using these basic designs in an arid area of southern Spain for community water supplies. Stills for supply of drinking water to animals are in an advanced stage of development. In a parallel development, better understanding of distiller operation is leading to improvements in design. In Israel a new type of solar pond is being developed for desalination pur-

poses. This collector can provide thermal energy from solar radiation which could be used in distillation or other saline water conversion processes. While still in the experimental stage, preliminary studies have shown that it could economically be applied to desalination particularly in a freezing process. Improvements in materials are also contributing to the potential of solar distillation for practical application, and it is expected that a plastic still will soon be installed on an island in the Aegean Sea as part of a community water supply.

9. In the application of solar energy for driving cooling equipment, there has been a shift in emphasis from refrigeration to air conditioning. Significant analytical and experimental studies are now underway in the field of solar air conditioning; these are aimed at application in well-developed economies but will also provide the technological basis for use in less developed areas.

10. These developments, which were stimulated and directed to a significant extent by the exchanges of information at the Rome Conference, indicated real progress toward the economic utilization of solar energy. Increases in solar water heater manufacture in several countries are perhaps the best examples of this trend. While it may be somewhat disappointing that more practical uses of solar energy have not resulted from the Conference, applications are beginning to be made, and the long-range benefits are expected to be more significant than the short-range benefits could be.

11. In a related field, there is continuing large-scale research into the use of solar energy in space vehicles. The funds invested in this kind of research and development are very much larger than those invested in terrestrial applications development. Although much of this effort is of a highly specialized nature and will not provide useful technology for conventional use, some of these space programmes are producing knowledge of solar operations that can have terrestrial utility. Electric power generated by photovoltaic, thermoelectric and thermionic systems may ultimately be of significance in everyday use. It is interesting to note, for example, that silicon solar cells are now available at a cost of something over \$100 per watt of capacity; without the substantial demand from space programmes, the cost of these devices would be probably ten times this amount, and they would probably not have reached their present state of development. This cost is far too high for ordinary energy supply, but the basic process has the potential of economic use through special techniques now being developed. Thus, some of the research work done on solar power in space may be of direct benefit in earth applications of solar energy.

12. A notable development in the field of education related to solar energy has been initiated by the Brace Experiment Station of McGill University (in Barbados, West Indies) which offers a new educational programme in solar and wind energy to students from all parts of the world. This programme was just getting underway at the time of the Rome Conference. The first students to complete this training are now making significant contributions to solar energy development in the Mediterranean area and the Middle East.

13. There is a series of meetings, of national and international character, dealing in part or in whole with solar energy applications. COMPLES (Coopération méditerranéenne pour l'énergie solaire) organizes a series of meetings for its members in the Mediterranean area. The Solar Energy Applications Committee of the American Society of Mechanical Engineers holds an annual symposium. The University of Florida organizes an informal symposium each spring. Other meetings are conducted at irregular intervals. (None of these, however, is designed to bring together interested persons from the world over, as did the United Nations Conference in Rome.)

14. In the area of international co-operation, there has been a sizeable increase in the exchange of personnel and in the establishment of projects involving laboratories in more than one country. Developing countries, notably in Africa, attach great hopes to the potentialities of solar energy and at the sixth session of the Economic Commission for Africa, resolution 113 (VI) adopted on 2 March 1964, recommends, *inter alia*, the establishment "of a solar energy experimental centre to perfect the various prototypes of solar apparatus and to disseminate the results of research and experience".

WIND POWER

15. Although interest in wind power as a source of energy had experienced a revival since the end of the Second World War, the international meetings devoted to wind power (London in 1951 and New Delhi in 1954) had been limited in scope or participation. The Rome Conference provided the first opportunity, on a world-wide basis, for the exchange of information between all those interested in wind power and its applications.

16. The Rome Conference took stock of the considerable scientific and engineering progress that had taken place in the intervening period and delineated areas still in need of research and development. It discussed frankly the economic aspects of wind power applications, which in the years immediately before the Conference had brought about a certain decrease in the level of activity of research and development in this field. As a result of the Rome Conference, it appears that this decrease has since been arrested, and the quality of the work has been improved.

17. The specific developments that have taken place in this field include an increase in activity in the field of wind measurements and a renewed interest in rationalizing the methods of site selection.

18. A new large-scale wind power plant has been installed in France, and valuable experience has been added in continuing operation of other large wind plants in France and elsewhere. In the field of wind power applications, there has been some progress in the uses of wind-driven electric generators by communities in remote areas.

19. As indicated earlier, the Brace Experiment Station is providing an educational programme in wind power. This is part of a post-graduate diploma course in engineering aspects of arid land development.

GEOHERMAL ENERGY

20. The United Nations Conference held in Rome (1961) appears to have been a turning point in the development of scientific and technological research in the field of geothermal energy and its practical applications.

21. The Conference was instrumental in bringing the potentialities of geothermal energy to the attention of many Government administrators and economists, in many cases for the first time. Furthermore, the Conference facilitated the dissemination of valuable data on the cost of exploration for and exploitation of geothermal energy and the data indicated that this is, at present, one of the cheapest sources of energy.

22. The numerous theoretical and technological papers dealing with all stages of geothermal development which were presented at the Conference provided an indication of the encouraging progress that had been made in this field. The new data made available in this way have contributed to a substantial reduction in the costs and risks involved in geothermal exploration.

23. One of the results of the Rome Conference was the stimulation of wide-spread interest in the possibilities of geothermal energy by focusing attention on the successful developments which had already taken place, notably, in Italy, Iceland, New Zealand and the United States.

24. Since the Conference, there has been substantial progress in the development of geothermal resources. Existing steam fields have been expanded, projects under discussion at the time of the Rome Conference have been completed (Larderello-Monte Amiata; Wairakei Stage II) and exploration has been undertaken in many countries in which, prior to the Conference, there had been no attempt to investigate geothermal resources. Geothermal investigations are being undertaken both by governments and private enterprise; and the United Nations is providing assistance in this field, within its programmes of technical co-operation (see paras. 121-127). Geologists and vulcanologists are studying surface indications such as hot springs, geysers, steam vents, fumaroles, etc., as a preliminary step in geothermal exploration. United Nations experts have recently completed missions to the Philippines, Mali, Costa Rica, Chile and El Salvador to assist these countries in the evaluation, and advise on the possible exploitation, of their geothermal resources. In addition, general or detailed feasibility studies in new areas are in progress in Guadeloupe, Iceland, Israel, Italy, Japan, Kenya, Mexico, New Zealand, Taiwan, Tunisia, Turkey, the United States of America, the Union of Soviet Socialist Republics and Venezuela.

25. Another outcome of the Rome Conference which needs to be emphasized is that it led to a better understanding of the economic limitations as well as the advantages of geothermal energy and has indicated that due caution needs to be exercised before proceeding to the more expensive forms of geothermal exploration, such as the drilling of deep wells. Nevertheless, private capital is finding this field increasingly attrac-

tive — a number of major banks have indicated an interest in geothermal development and this interest is beginning to be shared by the petroleum and electric power industries.

26. The world-wide interest in geothermal developments since the Rome Conference has revealed an acute shortage of specialists trained in geothermal techniques. It is somewhat unfortunate that the promising practical developments in this field have not been accompanied by similar progress in the education and training of specialists in geothermal energy and this could have the effect of hampering progress. At the present time, the only attempt to fill this gap seems to be that being made by the Italian National Research Council which is planning to create a geothermal institute. The institute is intended to provide advanced courses in geothermics for students from all parts of the world, and would establish an international reference centre.

27. With regard to international co-operation, it is worthy of note that the Institute of Petrology of the University of Pisa (Italy) and the Institute for Applied Geology of the University of Liège (Belgium) have created, within the framework of the European Economic Community, a Geothermal and Vulcanological Centre.

28. There have been several meetings of international character dealing in part with geothermal energy. The United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas, held in Geneva in February 1963, devoted special sessions to geothermal energy. An international symposium on isotope geology of geothermal areas sponsored by the Italian National Research Council was held in Spoleto, Italy, in September 1963 and was attended by thirty-five leading scientists from nine different countries. At the thirteenth General Assembly of the International Union of Geodesy and Geophysics, held at Berkeley, United States of America, in August 1963, several scientific and technological papers dealing with geothermal energy were presented by Italian and New Zealand scientists. Finally, at the African Electric Power Conference, organized by the United Nations Economic Commission for Africa in October 1963, a detailed study of the economics of geothermal energy was presented and aroused considerable interest.

PART II

Research, development and applications

REVIEW OF PRESENT ACTIVITIES IN SOLAR ENERGY

Solar energy availability and instruments for measurements: radiation data — networks — instrumentation

29. In the field of radiation data, there have been significant improvements in measurements and in the recording and distribution of radiation data, a continuation of efforts started before and particularly during

the International Geophysical Year. Significant efforts in this direction have been made, for example, in the Mediterranean area and in Chile, with planned networks of radiation-measuring instruments designed to provide adequate data for evaluation of solar processes. In the field of data reporting, the World Meteorological Organization is making available substantial International Geophysical Year and International Geophysical Committee data, and analyses of world-wide solar data are forthcoming.

30. Developments have been modest in radiation instrumentation. Some efforts have gone into the design of better and cheaper devices for integrating solar radiation, but radiation detectors themselves have not received much new attention since the Conference.

31. The integration of the output of radiation detectors, to obtain total radiation, is a significant problem in providing radiation data in useful form. Several developments are being made in this field, including the use of coulometers or milliwatt hour meter-type instruments. There are active programmes at Santa Maria University in Chile, the Brace Experiment Station in Barbados, and the University of Wisconsin.

32. The collection, analysis and publication of solar radiation data has been undertaken by the University of Wisconsin. This project is part of economic evaluation of solar processes and includes the acquisition from all available public and private sources of world-wide solar radiation and related data, and their publication in the form of maps and tables. This report should be available in 1964.

33. One of the commissions of COMPLES is concerned with solar radiation measurements and the development of an adequate instrumentation network in the Mediterranean area; this effort spans the Mediterranean, from Spain to Israel, and includes Senegal. A planned programme of acquisition of solar radiation data has been undertaken by several universities in Chile interested in applications of solar energy. Other significant radiation measurements programmes are continuing in the post-conference period, including efforts at the University of Paris (France), in the Soviet Union, and in many other laboratories.

New materials in solar energy utilization: plastics, metals, glass, selective surfaces and other materials

34. The recent work in this field includes the same range of subjects as was covered in this session at Rome: properties of energy-absorbing materials, transparent materials, refracting and reflecting materials and their effects on solar collector design, performance and cost.

35. Among the interesting developments of the past thirty months have been the following: a careful analytical and experimental study has been carried out on a new solar air heater of folded metal foil; a butyl rubber sheet material is now commercially available in very large sheets and may have applications for lining power ponds, stills, and evaporation basins; significant outdoor weathering data are becoming available on transparent

plastic films which are of potential interest in solar collectors and stills.

36. Floating covers for ponds have been made by the Commonwealth Scientific and Industrial Research Organization (CSIRO) in Australia in the form of inflated two-layer covers constructed in a manner similar to air mattresses. The covers float on the water, serving to reduce thermal losses by evaporation, convection and radiation. The broader applications of this kind of system, to power ponds or other solar collector developments, have not yet been explored; applications to date have been for heating swimming pools. A similar development has been made by Yellott Laboratories (United States of America).

37. The Brace Experiment Station has conducted analytical and experimental studies on the effects of partial transparency of plastic materials on the performance of flat plate collectors. Tedlar-covered collectors have been shown to have performance very similar to that of glass-covered collectors.

38. The structure and theory of selective surfaces are being studied at the National Physical Laboratory of Israel. Interference effects in thin layer absorbing coatings are receiving particular attention. More effective and more stable coatings are being sought.

39. Simple chemical methods for producing selective surfaces on copper sheets have been studied recently by the CSIRO of Australia.

40. A series of outdoor weathering tests, under conditions approximating those of solar distillation, was started in 1959 by the Battelle Memorial Institute in Florida, United States of America. The results from the first four years of these tests show that some plastic films have sufficient lifetime on outdoor exposure to be potentially useful in solar equipment. (The data support the predictions made for some of the materials at Rome.)

41. Large area butyl rubber sheeting is now available in sizes of potential interest for lining of solar stills, evaporating ponds, and power ponds. This material provides a waterproof basin in a structure provided by the walls of the excavation. Solar application has been investigated by Battelle and others.

42. A new plastic foam with cell sizes averaging about one centimetre has been developed by an American chemical company. Layers about one inch thick have a transparency equivalent to three layers of glass and a low coefficient of heat transfer. These foams have potential use as cover materials for flat plate collectors.

43. Research is in progress at the Yellott Laboratory on a treatment for glass which is designed to produce a surface having low emissivity for long-wave radiation. Such a glass would yield improved collector performance, and more effective insulation when used in windows.

44. An air heater based on the concept of a through-flow radiation-absorbing matrix of many layers of expanded aluminium foil is being investigated at the University of Wisconsin. The potential advantages of this device lie in relative simplicity of construction and maintenance; theoretical studies indicate that good performance should be obtained.

45. Several small-scale solar stills have been constructed in Florida by the Battelle Memorial Institute for testing materials having possible use in solar stills.

46. The use of plastic structural components for interior and exterior parts of solar water heaters is being investigated by the Atomic Energy Commission of Greece.

Use of solar energy for mechanical power and electricity production

(a) *By means of piston engines and turbines*

47. The status of developments in this field has not changed significantly in the last two and one half years. Work has continued on small turbines and solar concentrators, and on the larger saline power ponds. Improvements in the design and operation of these systems have resulted, but no practical applications have occurred. Clarification of objectives at the United Nations Conference seems to have caused a desirable reassessment of research and development needs.

48. Among the projects which are continuing to advance knowledge in this field, the small low-pressure turbine announced at Rome is being further developed by the National Physical Laboratory of Israel, with the objectives of greatly simplifying its operation and maintenance. Its potential applicability extends beyond solar energy supply, and appears to be the most promising engine in the five horsepower range for early power applications. The same institution has made further design studies on cylindrical solar concentrators of air-supported plastic film and their application to power generation systems.

49. Research on several problems associated with solar heat collection in brine ($MgCl_2$) ponds has continued at the National Physical Laboratory of Israel, and a new study in this field has been initiated at Universidad Técnica Federico Santa María (Chile) within the past two and one half years. The problems of pond stability are particularly pressing.

50. New machines for generating power from flat solar absorbers operating at moderately low temperatures have been studied in Senegal and Italy.

(b) *By direct conversion to electricity by means of thermoelectric convertors*

51. Most of the optimism over early applicability of this system has yielded to the more realistic view that much additional research and development are needed. Discussions at the United Nations Conference in Rome contributed to this change in opinion. Recent studies have been directed toward the development of improved thermoelectric materials of increased service life and efficiency, and toward a more efficient and cheaper solar heat supply. It is possible that small practical solar power units may evolve from the current studies, but extensive research, development, and engineering will be required.

52. Thermoelectric Components:

(i) The service life of thermoelectric elements at high temperature, heretofore too short for practical, terrestrial

power systems, has been extended through the development in the United States of America of silicongermanium thermocouple materials.

(ii) Studies by several American industrial laboratories have led to improvements in the design of thermoelectric generators of less than 1 kW size, potentially suitable for solar energy supply.

53. Solar Components:

(i) A co-operative programme of the University of Marseille and the University of Genoa has been initiated for the development of a concentrator-cellular receiver system capable of high temperature operation for high pressure steam generation (or thermoelectric operation). This programme is a continuation of that reported by the University of Genoa at the United Nations Conference.

(ii) Theoretical studies on the optimization of solar concentrator design for thermoelectric and other applications have been published by the University of Wisconsin.

(iii) Studies have been launched at the University of Algeria for development of thermoelectric systems with and without solar concentrators; a theoretical investigation of cellular collectors has also been published.

(c) *By direct conversion to electricity by means of photoelectric cells*

54. Developments in solar cell technology during the past thirty months have been largely in the fabrication and assembly of power units for satellites and other space vehicles. Reduction of specific weight, increase of power output, and increase of service life have been the principal efforts. For potential terrestrial applications basic studies of photovoltaic converters have the long range objective of cost reduction.

Energy storage problems

55. The storage of energy other than by short-term accumulation of heat, remains a formidable problem. Limited work has been done in this field since the United Nations Conference in Rome (1961). Specialized applications are being developed in connexion with small power units on space vehicles, and the chemical storage of power by electrolytic processes is being considered. This field unquestionably is in need of increased effort.

56. Further investigations of short-term heat storage for electric power production are being made by the National Physical Laboratory of Israel, in connexion with the solar power system first announced at the United Nations Conference.

57. The commercial supply of heat-of-fusion type of thermal storage units for shipping containers has been commenced by several American companies. There may be possibilities in this work for applications in solar energy storage.

Use of solar energy for heating purposes

(a) *Water heating*

58. Solar water heaters had reached an advanced stage of development prior to the United Conference in Rome,

and activities since that time have been largely devoted to manufacture and sale in several countries. A few improvements have been introduced recently, and new designs, particularly for industrial hot water supply, have been investigated. The outstanding commercial success of the cheap plastic solar water heaters in Japan appears to have stimulated interest in this application elsewhere. Japanese manufacturers have produced several hundred thousand plastic domestic solar water heaters, and the market appears to be expanding. Limited export efforts have also been made by these companies.

59. Commercial production and application has grown substantially in Israel, and water heaters are being exported to countries in the Middle East and in Africa. Manufacture and sale of domestic units has also been expanded in the southern part of the Soviet Union.

60. A successful water heater design has been developed and is now being produced commercially in all Australian states. Several thousand units are now in use, mainly in northern areas.

61. Two investigations have been directed toward large hot water systems for industrial application. Texas A and M University and the University of Arizona are investigating the use of large, plastic-covered channels and tubes in which salt water is solar heated for subsequent demineralization by distillation or solvent extraction. Success in these efforts could lead to application in other fields.

62. The CSIRO in Australia and Yellott Laboratories in the United States have been developing floating plastic covers for direct solar heating of small ponds and pools, also with industrial application in view.

63. A project for the processing of hides—using solar water heating facilities—has recently been undertaken in the Sudan with the support of the Food and Agriculture Organization of the United Nations (FAO).

64. Solar water heating is one of the principal objectives of the new solar energy development programme in Chile. A general appraisal of methods is being undertaken in preparation for experimental and development work on specific designs.

(b) *Space heating*

65. The extensive exchange of information at the United Nations Conference, on the solar heating of houses appears to have answered numerous technical and economic questions in this field. It also focused attention on the problems which remain, particularly the need for economic improvement in the systems. There now appears to be less emphasis on new solar heated houses, and more consideration of economic and technical problems which would affect large-scale manufacture of equipment. The necessarily slow pace of development in this field (from design concept to completed solar heated building seems to average more than five years) has precluded much new work since the Rome meeting. It may be expected that subsequent developments will be substantially influenced by the extensive data made available at the Conference.

(c) *Solar drying*

66. Studies in solar drying are both product-oriented and process-oriented. The level of activity has risen somewhat since the United Nations Conference, with emphasis continuing on drying of agricultural products.

67. The Forest Products Laboratories of the United States Government have been experimenting with plastic covered, solar heated structures for lumber drying. The preliminary conclusion is that this method of drying may have economic advantages over outdoor lumber drying processes in some situations.

68. At Kansas State University, as plastic covered air heater has been used to supply warm air to bins of moist grain, for drying in storage. Experiments have indicated that substantial economic gains are possible.

69. Under the auspices of COMPLES, a co-operative crop drying programme is being undertaken by laboratories in France and Greece, while the drying of grapes and other fruits and vegetables in new types of drying apparatus is being studied by FAO specialists in Syria. Continued studies of drying of fruits have also been reported from USSR.

Solar cooking

70. The prospects of an inexpensive yet useful solar cooker continue to intrigue several groups, although some laboratories have reduced their efforts in this field. The problems of social acceptance of these devices remain formidable, and it is yet to be demonstrated that significant use of solar cookers can be made by large numbers of people.

71. Two "new" ideas or approaches are under consideration. One of these involves local construction with indigenous materials and is aimed at the development of local industries and the greater acceptance of solar cookers through information from local sources. The other concerns the development of special purpose solar cookers.

72. The cooker development programme of the University of Wisconsin discussed at the United Nations Conference in Rome has been substantially terminated, with a recognition of the great problem of social acceptance encountered in the Mexico field experiments. A corollary study of the local manufacture and use of cookers of the reflective type has been carried out in Mexico.

73. The Brace Experiment Station in Barbados is making a study of an indirect solar cooker which employs a cylindrical paraboloid collector to supply boiling water to a cooking vessel. The device is being designed for use in Peru in co-operation with the FAO.

74. Several other solar cooker experiments have been carried out, in Burma, Japan, Niger and elsewhere.

Use of solar energy for high temperature processing (solar furnaces): equipment — research — potential uses

75. Since the United Nations Conference in Rome, several new solar furnace installations have been com-

pleted and put in operation, and progress has been made on the construction of a very large furnace with multiple heliostats at Font-Romeu in the Pyrenees (France). These furnaces continue to have their primary use as laboratory tools for producing high levels of radiant flux, for use in materials studies and for studies of space power conversion systems utilizing thermionic or other converters. No new and significant industrial use of solar furnaces is known.

76. Among the largest of the recent solar furnace installations is that of the Solar Energy Laboratory of the Centre national de la recherche scientifique, France, which is continuing with the construction of the very large semi-industrial scale solar furnace, designed to deliver energy on the order of 10^6 watts. The furnace is to be located near Font-Romeu, near the Montlouis laboratory. In Australia, a 12-foot inverted solar furnace has been developed and put into operation at the University of New South Wales, and a new 10-metre diameter solar furnace has been put into operation by Tohoku University at Sendai, Japan.

Use of solar energy for cooling purposes

(a) Food preservation by refrigeration

77. Refrigeration for food preservation purposes using solar energy on a small scale has attracted relatively little attention since the United Nations Conference. Some further efforts have been put on the equipment and the refrigerant systems for intermittent, absorption-type cooling cycles, but in general there have been few important developments in the past 30 months, and previously reported work has continued at a diminished pace.

(b) Space cooling and dehumidification

78. In spite of some pessimism expressed at the United Nations Conference, the level of activity in solar air conditioning has significantly increased in the two and one-half years since the meeting. Most of the work is aimed at potential applications in the more highly developed economies, such as Australia. However, the technologies developed will certainly be applicable to the solution of cooling problems in newly developing countries. Significant progress is being made in evaluating the possibilities of this solar application.

79. A part of the solar energy laboratory at the University of Wisconsin has been experimentally air conditioned with a solar operated absorption-type cooler. The technical feasibility of this system has thus been demonstrated but many problems remain to be solved before economic feasibility can also be shown.

80. A new programme on solar air conditioning is being developed at the University of Queensland (Australia). A member of the staff has spent a year at the University of California in Los Angeles working on computer simulation of the solar absorption air conditioner operation. An experimental programme is to be undertaken in Brisbane in 1964.

81. The regeneration of salt solutions used in cooling cycles by means of solar distillation is being studied by

the CSIRO in Australia. This is an investigation of the idea that an inexpensive solar still might be an economical device for concentration of these absorbent solutions. Specifically, solar stills are being experimentally used for concentration of lithium chloride solutions for use in cooling or dehumidification-type cycles.

82. A new analytical study of a combination of a flat plate collector and an absorption air conditioner has been undertaken at the Massachusetts Institute of Technology.

Use of solar energy for production of fresh water small and large scale distillers

83. The solar distillation of saline water is among the more active development fields for terrestrial application of solar energy. Most of the current projects are continuations of those already established at the time of the United Nations Conference (1961), but a few new studies have been undertaken. There seems to be a greater international outlook in this field, studies in one country being viewed more carefully by workers in other countries. There is good reason to believe that this use of solar energy may soon be commercially applied, possibly on a scale larger than any other solar energy utilization system.

84. Among recent developments of note was the approval by the Organization for Economic Co-operation and Development of a co-operative project for development of solar distillation by the Spanish Commission for Special Energies. Practical use on the southeast coast of Spain (and elsewhere in the Mediterranean region) for community water supplies is anticipated.

85. Though not directly connected at present with any specific desalination process, a new type of solar collector is being investigated in a research project run in conjunction with the National Physical Laboratory in Israel. This collector may provide thermal energy from solar radiation which could be used in distillation or other sea water conversion processes. The collector, which is a solar pond, utilizes a large surface of water of about 1 metre depth to collect the sun's rays. A linear density gradient is constructed such that the bottom of the pond consists of a denser salt solution than the top. Under these conditions, convection currents are eliminated and the solution layer adjacent to the pond's floor is heated up. A thermal gradient is set up in which the pond surface is near ambient atmospheric temperature while the lower layer may reach up to 96°C under summer radiation conditions. Hydrodynamic studies have shown that it is possible, by suitable conditions of flow, to extract the lower hot layer without disturbing any of the upper layers and maintain the gradient in its stable form. The extracted brine may be flashed to produce condensate. Alternatively, the thermal energy may be used in an absorption refrigeration process to desalinate sea water by the freezing method.

86. The Battelle Memorial Institute, in co-operation with the Office of Saline Water (OSW) of the United States Department of the Interior, has improved the durability and efficiency of large glass-covered solar

stills, and has reduced the cost by use of new structural materials.

87. The Church World Service, a charitable organization, in co-operation with Battelle and OSW, is testing a plastic-covered solar distillation plant in Florida in preparation for a large installation on an arid island in the Aegean Sea.

88. Several studies have been undertaken for small solar distillers suitable for individual or family potable water supply. These are being carried on in the Soviet Union; by the University of Wisconsin and Battelle Memorial Institute in the United States of America; by the CSIRO in Australia (with the added objective of a water supply for domestic and farm animals); by the Universidad Técnica Federico Santa María in Chile; and by the National Commission for Special Energies in Spain.

89. Investigations of low-cost materials suitable for solar distiller construction have been undertaken by Battelle (several small distillers employing different materials for the salt water basin are being tested), and exposure testing of plastic films are beginning to show the useful service life of these transparent covers.

90. Fundamental studies on solar distiller vapour transfer processes have recently been reported by the Helio-laboratory of the Soviet Union. Important information on the mechanism of the distillation process has been obtained.

91. A new solar distillation process is being investigated at the University of Arizona, in co-operation with the Office of Saline water (United States Department of Interior). Salt water is solar heated and then partially evaporated in a separate unit; fresh water is recovered in a condenser. A pilot plant is being built in northern Mexico.

92. Solar evaporation of radioactive wastes has been proposed for study by a research group in Greece.

93. Cheap, disposable solar stills made of plastic film or other materials, have received recent study and experiment at the University of Wisconsin, the University of California and Battelle Memorial Institute (United States of America). Emergency water supplies might be practically furnished by solar distillation in this kind of equipment.

REVIEW OF PRESENT ACTIVITIES IN WIND POWER

Studies of wind behaviour and investigation of suitable sites for wind-driven plants

94. One of the outstanding results of the United Nations Conference on New Sources of Energy held in Rome, in 1961, was the realization of the need for a comprehensive study of wind flow over hills to provide guidance in the study of wind power installations. The relevant proposals were tabled by the secretariat of the World Meteorological Organization at the October 1961 meeting of the Commission for Aerology, which adopted a

resolution setting up a working group on sites for wind power installations under the chairmanship of Professor B. Davidson of the United States. The terms of reference of the working group were: (a) to prepare a technical note summarizing the theoretical and experimental studies of air flow over hills of arbitrary shape, with particular attention to the estimation of wind speeds over the summits of such hills; (b) to suggest experimental and/or theoretical studies which are required in order that more specific guidance could be provided in the siting of wind power installations. The working group has now almost completed its work, and information covering item (a) has been summarized under four headings: (i) variation of wind with height over relatively flat terrain; (ii) variation of wind in various local wind systems; (iii) wind flow over slight to moderate relief; and (iv) wind flow over high relief.

95. Some results of a study of gusts over wind power sites were published recently. These show that a reduction of mean wind speed vertical gradient is associated with a corresponding reduction of vertical gradient in gusts.

96. No new instruments for wind surveys have been reported since the Rome Conference but wind surveys have continued in several countries, including Barbados (West Indies), United Arab Republic (Egypt), and Uruguay.

The Design of wind power plants

97. At the Rome Conference, representatives of Electricité de France gave details of two large-scale wind power plants which had been constructed. One was a three-bladed (30 metre diameter) fixed-pitch propeller plant rotating in permanent synchronism with the network; the other was a three-bladed (35 metre diameter) variable pitch propeller plant. The first of these machines had been set up some years before at Nogent-le-Roi (Dept. of Eure-et-Loir, France). In exhaustive tests the machine generated upward of 900 kW in winds of 20 metres per second. To reduce the cost of the machine, a new, more rapid propeller with thinner blades was designed and tested in 1963 but the results so far have not been satisfactory. The site at Nogent-le-Roi is not sufficiently windy and it is therefore intended to move the existing machine to another site, probably in Brittany. It is also planned to simplify the machine to minimize the cost of servicing.

98. The second machine was ordered shortly before the Rome Conference, following the highly successful experimental operation of reduced-scale model which had been set up two years earlier at Saint-Rémy-des-Landes (Dept. of Manche, France). The smaller model, in its final form, had a variable pitch, plastic propeller of 21.2 metres diameter. The maximum power attained, with pitch controls operating, was about 150 kW. This machine has now been in continuous operation, without full-time personnel in attendance, for about three years.

99. The full-size aerogenerator (analogous to the reduced scale model) was set up in the same vicinity in the

summer of 1963. It started operation on 30 October 1963, and during the following thirty-one days, produced 222,500 kWh (equivalent to 300 kW, on the average, at the terminals of its asynchronous generator). This constitutes the highest recorded amount of wind-produced energy generated in one month by a single wind-driven machine. The succeeding winter months were exceptionally calm, however, and only 96,000 kWh were generated in three months.

100. The initial success of the new French aerogenerator seems to add weight to the view expressed at the Rome Conference that, for large-scale wind-driven machines, a variable pitch propeller is preferable. Performance data for another large-scale variable pitch propeller, namely the 34 metre diameter plant built under the sponsorship of Studiengesellschaft Windkraft at Stötten in the Federal Republic of Germany, point in the same direction.

101. Two smaller plants with fixed blades have been in operation in Gedser, Denmark, and in the Isle of Man (United Kingdom). The 100 kW Isle of Man plant was reported to be performing satisfactorily, but no recent information has been received regarding the 200 kW Gedser plant, although it is known to have operated successfully for several years.

*Recent developments and potential improvements
in wind power utilization*¹³

102. A strong case for use of wind power to fill individual energy requirements in outlying districts was made at the United Nations Conference. At the Brace Research Institute of McGill University (Canada) plans are well advanced for the establishment of a model estate with power requirements for irrigated agriculture to be provided by a local electricity network supplied by wind-generated power.

103. Wind power installations have recently been put to use in Israel to meet some special needs for small amounts of energy such as the actuation of railway level crossing lights in some remote districts and for the supply of power for telemetering water levels in outlying water reservoirs.

104. A new approach to water pumping by wind power is being studied in Egypt. In the western desert there is a problem of pumping water for irrigation and the present method consists of using a large number of non-electric water-pumping wind mills situated over the wells in the valleys and, therefore, very often screened from strong winds. It is proposed to set up a wind-driven electric generator on the ridge overlooking one of the valleys. From this machine the power is to be conveyed by electric cables to a number of wells in the valley using a load-distributing device, so that the number of pumps in operation at any time can be adjusted automatically according to the wind speed.

¹³ The economics of small-scale wind power utilization has been the subject of study by La société grenobloise d'études et d'applications hydrauliques (SOGREAH), France, but no details are available.

REVIEW OF PRESENT ACTIVITIES
IN GEOTHERMAL ENERGY

105. In contrast to the other new sources of energy under discussion in this report, geothermal energy is already, to a considerable extent, in the realm of practical utilization and, consequently, theoretical work is proceeding side by side with studies based upon operational experience. While there has been a tendency for research to be concentrated in those countries which have already successfully developed their geothermal resources, such as Italy, New Zealand and the United States, there has recently been a significant geographical expansion of research and development in this field.

*Scientific studies, conferences
and field investigations*

Italy

106. A symposium on Isotope Geology of Geothermal Areas was held in Spoleto, Italy, in September 1963, under the sponsorship of the Italian National Research Council. It was attended by thirty-five scientists from various parts of the world including the leading experts in hot water isotope research from France, Germany, Iceland, Italy, New Zealand, Switzerland and the United States. Discussions were held on the new field data concerning the chemistry, origin and age of the hot waters of various regions of the world. The proceedings of this symposium are due to be published during 1964 and will contain valuable data relating to some of the major geothermal fields.

107. Problems of geothermal development were also treated at the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas held in Geneva in February 1963. Two papers were presented by leading Italian experts — one discussing the cost of exploration and of power plants and the other dealing with the most important technical and industrial aspects of geothermal power.

108. The economics of geothermal power were discussed at the African Electric Power Meeting organized by the United Nations Economic Commission for Africa and held in Addis Ababa in October 1963. A paper on geothermal power presented to this meeting by two Italian geothermal scientists examined the generating costs of various types of operating or projected thermal, nuclear and hydroelectric installations and considered the hypothetical case of a geothermal exploration venture from the preliminary exploration stage to the completion of a 140 MW power plant. The conclusions drawn by this paper were that, in spite of the risk element involved in geothermal exploration, this may be one of the cheapest forms of energy currently available.

109. The Larderello Company has achieved further progress in gradient surveys. Both theoretical studies and extensive field work have been completed and have indicated that shallow gradient wells (30-35 metres) appear to be an extremely useful exploratory tool.

110. The Consiglio Nazionale delle Ricerche (CNR) created a new organization for scientific and techno-

logical research in geothermal energy — the Italian Geothermal Commission. This non-profit organization plans to establish an Italian geothermal institute which will promote international collaboration in geothermal energy research.

New Zealand

111. An interesting paper on the Wairakei power plant dealt primarily with the engineering problem of extracting electrical power from steam and hot water. The paper describes the sites, the bore-holes, the plants, the equipment and the building as well as some of the main design problems and also gives an account of operating experience and cost estimates.

112. Samples of water, gas and minerals have been collected from different parts of the thermal area for determination of the isotopic ratio of hydrogen, oxygen, carbon and sulphur. In certain areas samples have been collected over periods of several years in order to follow possible changes in some of these ratios resulting from natural changes in the associated hydrothermal system or from the effect of draw-off by drill-holes in areas such as Wairakei. The most important conclusions to have emerged from this work, which is still in progress, is that, from the evidence provided by the stable hydrogen and oxygen isotope ratios, the water discharged by hot springs and drill-holes at Wairakei must almost completely be of surface origin.

113. Thermodynamic calculations have indicated that significant amounts of energy may be obtained both from the natural hydrothermal systems and from artificial systems formed by the forced circulation of water through dry or isolated permeable beds or joints at depth in areas of high geothermal gradient. The results of this highly interesting work are in course of publication.

114. Rapid and inexpensive methods for the measurement of surface temperature-gradient and rate of heat discharge from hot grounds, fumaroles, hot lakes and boiling pools have been applied to several important thermal areas, including a great part of the Wairakei, Rotokawa and Taupo areas.

115. During 1962 temperature and heat-flow surveys were carried out in the Onepu Spring thermal area, Kawerau, as part of a programme of investigation for the large pulp and paper mill, which draws some of its supply of process steam and generates some power from drill-holes sited on the margin of this area.

Union of Soviet Socialist Republics

116. Considerable scientific research into the problems of geothermal energy is being carried out in the Union of Soviet Socialist Republics. Much of this work is being concentrated on the utilization of hot underground waters which are very extensive. The Hydrogeological Problems Laboratory of the Union of Soviet Socialist Republics Academy of Sciences recently published a book on thermal water of the USSR and problems of their use as heat and power which contains a schematic map showing the distribution of thermal waters in the Union of Soviet Socialist Republics. The

country has fifty large reservoirs of underground hot and warm waters and, in particular, one of the world's largest reservoirs of hot water, extending over 3 million square kilometres in western Siberia and having a water temperature of 93 degrees centigrade.

United States of America

117. A considerable amount of research is being carried out in the United States, especially in California where the geothermal developments to date have been the most promising.

118. Extensive analyses have been made of the chemical composition of many kinds of sub-surface waters and of gases from volcanic fumaroles.

119. The mercury deposits of Sulphur Bank and Wilbur Springs, California, have been studied and analyses of mercury-bearing brines and crude oil from the Cymric Oil field, California, have provided important links between mercury deposits of the Coast Range and thermal waters of a connate and metamorphic origin that are associated with many of these deposits.

120. The utilization of geothermal steam for the dehydration of food has been the subject of investigation. The prospects appear interesting.

United Nations activities

Costa Rica

121. In November 1963, two United Nations technical assistance experts visited Costa Rica, at the request of the Government, to review the prospects of finding geothermal steam in that country. Their report was favourable and recommended further investigation. In February 1964, other United Nations experts visited Costa Rica to follow up this matter and discussions were held with the Instituto Costarricense de Electricidad (I.C.E.). Geological and Geophysical surveys are now to be undertaken and the Government will request United Nations assistance if it appears that drilling will be necessary. The Government expressed their interest in joining and contributing to a regional geothermal project if one were to be established.

Nicaragua

122. In February 1964, two United Nations experts visited Nicaragua to discuss geothermal prospects with the appropriate authorities. Considerable interest was expressed in the possibilities of geothermal development, and the Government has now approached the United Nations for technical assistance in evaluating the geothermal resources of the country.

El Salvador

123. In the period 1953-1960, a considerable amount of geothermal investigation was carried out by the Servicio Geológico Nacional, financed by the Comisión Ejecutiva del Rio Lempa (C.E.L.). The work included geological and geophysical surveys, and the drilling of a number of relatively shallow small-diameter holes in the thermal areas near Ahuachapan, in the northern part of the country.

Some of these wells discovered steam and/or hot water and one was still blowing a mixture of these in February 1964. In December 1962, a member of the New Zealand Geological Survey spent three weeks in the country at the Government of El Salvador and made a survey of the geothermal areas of the country, recommending further development. In December 1963 and again in February 1964, United Nations technical assistance experts visited the area and also reported favourably. The Government of El Salvador is now preparing to submit a request to the United Nations Special Fund for assistance with a programme of exploratory drilling.

Guatemala

124. In December 1962, a member of the New Zealand Geological Survey visited Guatemala at the invitation of the Government. At that time, however, there appeared to be little interest in geothermal development on the part of the appropriate authorities. In March 1964, two United Nations experts visited Guatemala and held meetings with a number of geologists and the Instituto Nacional de Electrificación. Interest was expressed in the possibilities of geothermal development and a request was made for more technical and economic information, which the United Nations experts agreed to supply. A request was also made for a draft outline of legal regulations to control geothermal development.

Chile

125. In December 1962, a United Nations expert visited Chile at the request of the Government in order to evaluate the geothermal prospects in the northern part of the country, in the hinterland of Antofagasta close to the large copper mines. As a result of this mission, the Government of Chile has made a request to the United Nations Special Fund for financial assistance in carrying out a programme of geothermal exploration. In connexion with this request, two experts were sent to Chile by the United Nations Special Fund in January 1964 and submitted a report on their findings. At the time of writing these findings were not yet available for publication, but it is believed that they were very favourable.

Mali

126. In response to a request from the Government of Mali, a United Nations technical assistance mission was sent to that country to investigate surface indications that were reported in the Lake Faguibine area. At the time of writing no further details are available.

Philippines

127. A United Nations expert visited the Philippines during December and January, 1963-1964, under the auspices of the Special Fund to examine the possibilities of utilizing geothermal steam in the Island of Luzon for the generation of electric power. The study was part of a pre-investment study on power, including nuclear power, in Luzon, undertaken by Government of the Philippines with the assistance of the Special Fund, for which the International Atomic Energy Agency is acting as the executing agency. The purpose of this pre-investment

study is to examine the relative economics of different methods of power generation to meet the future load growth of the Luzon Grid. In his report, the United Nations expert made proposal for investigating the geothermal resources of the most promising areas in Luzon; the proposed programme includes various geophysical surveys — heat flow, magnetic gravity and resistivity. The drilling of an investigation drill-hole was recommended following the completion of the preliminary surveys.

Operational developments

Italy

128. The Larderello Company expanded its production of geothermally-generated electric power to 2.3 billion kWh in 1962, and to 2.6 billion kWh in 1963. Step-out drilling in the Larderello area, both to the north and to the south, resulted in the discovery of good steam wells and the planning of a new power plant. The productive Larderello area is wider than anticipated; further step-out drilling might enlarge the field considerably. In the drilled area, a deep well penetrated the basement (Verrucano formation) to a depth of 2,850 metres. The same temperature was recorded from the top to the bottom of the producing series.

129. Outside of the Larderello area, exploration was very active and new wells were drilled in the Bagnore field (Monte Amiata). The CO₂ content, originally amounting to 95 per cent of the fluids produced, slowly decreased to 15 per cent and continues to drop. Two 6,000 kW power plants were in operation at a high load factor.

130. During 1963 a new field was discovered on the eastern flank of Monte Amiata, a Pliocene extinct volcano where little surface evidence of hyper-thermalism is known; a few sources of 30°-50° water and some CO₂ emanations. A number of 30 metre deep wells were drilled in the course of a geothermal gradient survey. The gradient contour map indicated a geothermal "high" of 3.6 °C for every 10 metres of depth. The discovery wells were drilled in this high gradient area; production tests were satisfactory and a 6,000 kW non-condensing mobile power plant was put in production.

131. A five-year geothermal plan is being examined by the Government and the Ente Nazionale Energia Elettrica (E.N.E.L.) authorities. A total geothermal production of 12.5 billion kWh per year is expected upon completion of the plan.

132. In Sicily, preliminary exploration work was carried out in the Etna region: eight gradient wells, 80 metres deep, were drilled and a new photogeological map was completed. A report will soon be published by the Sicilian Regional Government, which was the operator for the surveys.

133. In Sardinia, the regional Government began geological-geothermal exploration.

New Zealand

134. In the Wairakei area, a total of ninety-one holes has been drilled, ranging in depth from about 160 to

1,300 metres. The output of the generating plants is now 145 mW as compared to 69 mW in 1961 and considerably more than 20 million kWh per week. The power potential of the holes drilled is sufficient to generate more than the planned 150 mW. Of the ninety-one holes drilled, seventeen have been sited for exploration purposes. The information which they provide gives a fairly complete overall picture of the physical and general conditions as well as of the geology over the entire Wairakei field, to a depth of about 1,000 metres. The basis for further production plans has thus been established.

135. As a result of the successful development of the Wairakei field, plans are being made to go ahead with investigation of several other geothermal fields in New Zealand.

136. According to the New Zealand National Report, presented at the Berkeley Assembly of the International Union of Geodesy and Geophysics in 1963, the average rate of production from the Kawerau area over the period 1957-1962 was equivalent to about 18 mW of generated power: much of the heat was used for processing rather than for power production.

United States of America

137. From 1955 to 1962, approximately forty wells were drilled in fifteen thermal areas in California for the purpose of exploring for and developing natural steam to be utilized for electric power generation. Twenty-four of the wells were drilled in the three areas which at present seem to have the greatest potential for the production of natural steam: The Geysers, Sonoma County; Casa Diablo, Mono County; and the Salton Sea area, Imperial County.

138. Since June 1960, steam from the Geysers thermal area, produced at a rate of approximately 250,000 lb/hr, has been utilized to operate a 12,500 kW generating unit. Completion of a second generating unit increased the total capacity of this area to approximately 28,000 kW.

139. A company producing geothermal steam from eleven producing wells of the Geysers area is selling it to a large gas and electric utility company which is using the steam for a base load, automatically operated power plant with an output of 28 mW. The electric power utility intends to expand its geothermal generating capacity as soon as the necessary steam production is available and has indicated that the geothermal steam is now the lowest cost energy available to the company.

140. In the Geysers Valley, one mile from the existing plant, nine successful wells have been completed in a new producing area called the Sulphur Bank field which is possibly linked to the Geysers' field. In March 1964, the nine new wells were put into production for a three-week test as a preliminary step in the construction of a new power plant which is to have a capacity of 50 mW and is due to be put on stream during 1965.

141. The Casa Diablo thermal area is located on the south-west side of the volcano-tectonic collapse structure which is approximately twenty-three miles long and twelve miles wide. Four of the tested wells flow saturated steam at rates ranging between 19,000 and 69,300 lb/hr at 7.5 to 39 psig wellhead pressure.

142. The Salton Sea thermal area is located in the vicinity of five small volcanic domes on the south-east shore of the sea. A 5,230-foot well, drilled over this anomaly in late Tertiary and Quaternary sediments, flowed 123,000 lb/hr steam and 457,000 lb/hr concentrated brine at 200 psig wellhead pressure. Extensive geothermal development is proceeding in the Salton Sea area and two major oil companies own leases in this promising area.

143. Several steam wells have been drilled in the Surprise Valley in California and the operating company has indicated that further exploratory drilling is warranted and that, on the basis of present evidence, this should result in the discovery of a prolific geothermal steam field.

144. Three wells have been drilled at Beowawe, about sixty miles west of Elko, Nevada. Each well produces about 40,000 lbs. of steam per hour and about 1,500,000 lbs. of water per hour at 340 °F. This means that the greater part of the usable heat source is in the hot water. The total steam, together with the hot water flashed into steam could operate a 27 mW plant.

Iceland

145. The main development has been the drilling of fifteen new wells, 800 to 1,500 metres deep, in the city of Reykjavik. The purpose of this drilling is the production of hot water for heating of houses in the city. The new wells yield approximately 200 l/sec of water at 135 °C.

146. One successful steam well of 230 metres has been drilled in the Namafjall area in northern Iceland. The production has not yet been measured. Plans are now being worked out for building a 15 mW natural steam power plant in the Hengill area; construction of the plant will probably be started in 1964.

Mexico

147. Pathé: The geothermal field of Pathé, in which fourteen wells were drilled, has been producing electric energy from a small experimental 3,500 kW plant connected to one of the wells which produces seven tons of dry steam per hour at a pressure of 1.2 atmospheres. Further drilling is planned in order to develop this geothermal field to its maximum potential. Deep wells are being drilled in this field in the hope of penetrating to volcanic rocks and reaching the massive limestones which are believed to underlie them, and which may provide a better reservoir. These may lie at about 1,100 metres depth—that is, 350 metres deeper than the deepest wells drilled up to the present.

148. Ixtlan de los Hervores: Production of steam in this zone of geysers has been promising. One of two wells that were drilled to depths of 130 metres produces wet steam. Exploration in this geothermal field is in its early stages.

149. Mexicali: The significant hot water, steam and mud volcano manifestations lying to the south-east of Cerro Prieto, on the northern end of the Gulf of California, have attracted considerable interest. Three wells were drilled in 1960 to depths ranging from 400 to

700 metres. Well No. 1-A was a success, producing wet steam at a rate of 900 tons per hour with a pressure of 6 atmospheres. In 1961 and 1962, this geothermal area was explored gravimetrically and seismically; further drilling for steam in this area is scheduled for the near future. An Italian technical mission, sponsored by the Larderello Company, visited the area in 1963.

Union of Soviet Socialist Republics

150. In the Kamchatka peninsula, a region with twenty-eight active volcanoes on a relatively small territory, extensive geothermal exploration and development is taking place. In the region of the Pauzketka river twenty-one geothermal wells have been drilled, of which eighteen are producers and yield 240 litres of hot water per second at a mean temperature of 170 degrees centigrade. To utilize this hot water, the USSR is constructing its first thermal water power station with a capacity of 5,000 kW. Another power station of 12,000 kW capacity is being designed and will be built over the hot waters in Daghستان in the north Caucasus.

151. At the same time, installations are being designed to utilize the energy of underground reservoirs situated relatively close to the surface and with water temperatures between 30 and 70 degrees centigrade. This hot water could be employed in farming (hot-beds and greenhouses) and town heating.

Kenya

152. A number of farms located mainly on the slopes of the Eburu volcano are provided with equipment for condensing underground steam and its utilization as a heating medium. The geothermal heat, thus obtained, serves two purposes: the production of fresh water by way of condensation, and the drying of pyrethrum, a valuable crop grown on a large scale in Kenya. The condensing installations, of simple design, consist primarily of vertical iron pipes, with or without horizontal sheets of corrugated iron as an additional cooling surface.

Venezuela

153. A geothermal steam field in the hinterland of Carupano (an important port in north-eastern Venezuela situated in a water-deficient area along the coast) has been explored since 1952 by the Venezuelan Sulphur Corporation. As a result of systematic topographical and geological survey work, numerous sulphur-depositing fumaroles and hot and cold springs have been discovered, and, while drilling at depths ranging from 33 to 55 metres, superheated steam has been encountered. The company wishes to enter into an agreement with the Venezuelan Government for the generation of electric power and the extraction of minerals from the steam. The production of demineralized water for the water-short coastal areas, twenty kilometres away, might be an important by-product if this natural steam deposit were developed and exploited industrially. Preliminary studies on the possibilities for carrying the steam to the coast by insulated pipeline have already been made.

PART III

International co-operation in research and development of new sources of energy

154. There is no doubt that the United Nations Conference on New Sources of Energy greatly stimulated the efforts to establish the exchange of information between research workers in different countries. This may have been, in fact, the greatest benefit of the meeting. In addition to establishing good person-to-person communications, much used since the Conference, a considerable number of formal international organizations and projects have been created, mainly concerned with solar energy but, to a lesser extent, embracing geothermal and wind power also. Some of these are actually societies or organizations, whereas others are symposia or projects of other international bodies.

SOLAR ENERGY

155. The Solar Energy Society (formerly the Association for Applied Solar Energy) has established a group of International Secretaries representing the members of the Society in each country concerned. Now numbering thirteen, these officers of the Society maintain liaison between members in their respective countries and the Society headquarters in Phoenix, Arizona. In addition, branches of the Society have been established in three areas: Chile, Italy, and Australia-New Zealand.

156. The formation of COMPLES (Coopération méditerranéenne pour l'énergie solaire) immediately following the United Nations Conference was for the coordination and stimulation of solar research and development among the countries of the Mediterranean. Within COMPLES there have been created seven commissions dealing with specific problems; these are: solar radiation, agricultural drying, distillation, thermo-dynamic conversion, low temperature heating of water, photo-chemistry, and direct electrical conversion. Several meetings of the group, now numbering about forty members from nine countries, have resulted in co-operative efforts on radiation data procurement, co-operative studies of solar energy applications, and the publication of technical papers.

157. At the World Power Conference meeting in Australia in 1962, a division dealt with applications of solar energy. Several papers have resulted indirectly from investigations reported at the United Nations Conference.

158. The United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas (1963) included on its programme papers on solar energy from the Union of Soviet Socialist Republics, Ceylon and Senegal. These papers dealt with technological and economic problems involved in several solar energy applications.

159. Three organizations of the United Nations have increased their direct interest in solar energy developments. The FAO has enlarged its attention to this resource by making an arrangement with the solar energy establishment of the Brace Experiment Station, in Bar-

bados, to undertake various development and testing programmes on solar energy applications of possible use in FAO fields of interest. Along similar lines, UNESCO has requested and sponsored a project at the Observatorium Davos, in Davos, Switzerland, for procurement and publication of solar radiation data throughout the world. UNESCO has also sent two technical assistance experts for solar energy investigations in northern Chile, and is continuing efforts (under the United Nations Technical Assistance programme) to stimulate and coordinate new research in relevant fields. WMO is encouraging member countries to expand their solar radiation measurement stations, lending assistance in radiation instrumentation calibration, and five working groups in WMO regions have been established to assist in these programmes.

160. The Brace Research Institute of McGill University (Canada) has established an educational programme, primarily in engineering, in connexion with their Barbados field station, which is oriented toward specialized training in solar and wind technology for graduate students from other countries.

161. The OECD has initiated a research project for solar demineralization of sea water in Spain. An important objective is the establishment of a centre to which technicians from other countries will come for specialized training and information in this field. It is expected that this programme will result in practical application of solar distillation to community water supply.

162. Finally, at the sixth session of the Economic Commission for Africa, held in Addis Ababa in February-March 1964, a resolution on the utilization of solar energy proposed by Niger and Upper Volta was adopted by the Commission. This resolution recommends that the technical experts of the Governments concerned should meet with a view to exchanging useful information on this subject; and further recommends the setting up in conjunction with the sub-regional office at Niamey of a solar energy experimental centre to perfect the various prototypes of solar apparatus and to disseminate the results of research and experience.

163. The considerable number of international activities in the field of solar energy resulting directly and indirectly from the United Nations Conference is clearly indicative of the importance of that meeting in establishing this type of co-operation. There is every reason to expect that this sort of activity will continue in the coming years and that the benefits will increase.

GEOTHERMAL ENERGY

164. While the United Nations Conference on New Sources of Energy has had the effect of greatly facilitating a much efficient interchange of information between scientists and technicians interested in the development of geothermal energy, it has not yet resulted in the creation of any formal international organization for this purpose. As of this time, only two projects of this nature have even passed the planning stage. One is the Belgo-Italian Geothermal and Vulcanological Centre which is being organized under the auspices of the European

Economic Community and for which limited financial aid has been promised by the Italian and Belgian Governments in 1964; the other is the Italian project for a geothermal institute which is designed to foster international co-operation in this field and is intended to lead to the creation of an international geothermal association and the publication of an international geothermal bulletin.

165. The United Nations Conference on the Application of Science and Technology for the Benefit of Less Developed Areas devoted part of its programme to the new sources of energy and two interesting papers on geothermal energy were presented. The first African Electric Power Meeting held by the United Nations Economic Commission for Africa in 1963 again brought the possibilities of geothermal energy to the attention of a new audience.

166. Following the United Nations meetings at which geothermal energy had been discussed, several countries with geothermal potentialities have been encouraged to investigate them. After the Rome Conference, the Mining Research and Exploration Institute of Turkey requested the advice of two geothermal experts in drafting a programme on geothermal exploration in Turkey. This programme has since been included in Turkey's five-year economic development plan.

167. As a result of the United Nations African Electric Power Meeting, the State Gas and Electricity Board of Tunisia invited two geothermal power experts to study the feasibility of geothermal exploration in Tunisia. Finding conditions favourable for geothermal development, these experts have drafted an initial programme for geothermal exploration in Tunisia.

168. The United Nations, through the Special Fund and the Technical Assistance Programme, has been actively assisting developing countries in the exploitation of their geothermal resources; as indicated in more detail in Part II of this report, projects assisted by the United Nations are currently in progress in Central America, South America, Africa and the Far East. This technical assistance in the field of geothermal reconnaissance and exploration tends to be hampered by the lack of qualified technicians. The United Nations has consequently been drawing upon the expertise of those countries with a developed experience of geothermal exploration and exploitation such as Iceland, and New Zealand. These countries have also been providing technical advice on a bilateral basis to developing countries which have requested it.

169. In the absence of any one international body to co-ordinate the various activities in this field, the United Nations is attempting, in a limited and informal way, to facilitate the exchange of information and experience and to pass on knowledge of new developments and techniques to developing countries.

WIND POWER

170. In this field, there has been disappointingly little progress made in international co-operation since the Rome Conference. The World Meteorological Organization, as the international body most directly interested in

this field, has fostered international co-operation and the exchange of information on wind power research and development but this has tended to be on an *ad hoc* basis and incidental to other activities rather than an organized effort. After the early promise shown by this source of energy, interest has diminished and experimental work appears to be confined to rather few countries, of which France appears to be the most active. The exchange of information on a formal organized basis appears to be extremely limited, if not completely non-existent. However, whatever information is exchanged seems to take place as a result of private correspondence between individuals, many of whom established contact with each other for the first time at the United Nations Conference in Rome.

PART IV

Conclusions and recommendations

171. On the basis of the evidence available, it may be concluded that the United Nations Conference on New Sources of Energy held in Rome in 1961 had a beneficial effect on the development of solar and geothermal energy and, to a far lesser extent, on wind power. The Conference facilitated the establishment of personal contact between isolated research workers in various parts of the world and greatly increased the dissemination of technical information on new sources of energy. The result has been an increased awareness of the potential value of these forms of energy in developing countries, combined with a better appreciation of the technical and economic limitations to their application. The effect of the Conference is evidenced by the increasing number of requests for technical and financial assistance for solar and geothermal development which are being received by the United Nations. The full benefit of the Conference can only be derived if sufficient funds are made available to follow up these requests and to continue the encourage-

ment of a wider exchange and dissemination of knowledge in these fields.

172. In particular, it is recommended that:

(i) In the field of solar energy, close contact should be maintained with national and international bodies active in this sphere and efforts should be made to encourage and support the development of practical applications of solar energy;

(ii) The possibility of convening a symposium on the applications of solar energy to facilitate the exchange of information and experience in this field should be considered;

(iii) In the field of geothermal energy, a further increase in requests from developing countries for assistance in the exploration for and exploitation of geothermal energy resources should be anticipated and United Nations activities in this field strengthened accordingly;

(iv) The possibility should also be considered of convening a symposium on the various aspects of geothermal energy under the auspices of the United Nations, preferably not later than 1967, so as to permit the exchange of ideas and experience and to establish closer contact between those working in this field.

(v) The preparation of a manual for geothermal exploration should be envisaged. This handbook should be based upon the experience gained by United Nations' experts and others in the exploration for and utilization of geothermal resources in various parts of the world. This experience would provide valuable material for this handbook, the purpose of which would be to make widely available the latest information on technological advances, primarily for the benefit of developing countries.

(vi) Given the increasing interest in and potentialities of new sources of energy, consideration should be given to clearing house activities for the interchange of ideas and experience and for assisting organizations working in these fields.

<i>Appendix.</i> Special Fund projects approved in the field of non-agricultural natural resources and cartography up to 31 January 1964	51

Introduction

1. This report is submitted in compliance with Economic and Social Council resolution 877 (XXXIII) which requested the Secretary-General to prepare a report biennially on the work being done in the field of non-agricultural resources.

2. In the last report on this subject, submitted to the Council at its thirty-third session,¹⁴ reference was made to the marked expansion of United Nations work in the field of non-agricultural resources arising from the programmes of technical co-operation, particularly from that of the Special Fund. This expansion of operational activities continued in the period now under review. Indeed, the underlying importance of the role of natural resources in the economic development of developing countries has been receiving ever wider recognition, as was attested repeatedly, for example,

¹⁴ *Official Records of the Economic and Social Council, Thirty-third Session, Annexes*, agenda item 8, document E/3578.

in the report on the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas (1963).¹⁵

3. An indication of the importance and growth of this phase of United Nations work during the period 1960-1963 may be had from the statistics of the number of experts serving on field assignments, as well as from those related to Special Fund approved projects dealing with non-agricultural natural resources development. There were twenty-four such projects at the time of the last report. By the end of January 1964, the figure risen to forty-eight, representing some 75 per cent of all projects of the Special Fund assigned to the United Nations as executing agency. The total funds, including counter-part contributions in cash and in kind, earmarked for these projects amount to approximately \$70 million.¹⁶

¹⁵ *Science and Technology for Development, Volume II—Natural Resources* (United Nations publication, Sales No.: 63.I.22).

¹⁶ See the Appendix of this document for a list of the titles of these projects.

UNITED NATIONS EXPERTS ON FIELD ASSIGNMENTS IN NATURAL RESOURCES DEVELOPMENT — 1960-1963^a

Year	Surveying and Mapping	Geology, Hydrogeology and Mining	Water Resources	Energy and Electricity	Total
1960	15	72	34	20	141
1961	28	69	65	47	209
1962	27	118	79	53	277
1963	21	148	78	44	291

^a At the end of each year, under the United Nations regular and Expanded Programmes, the Special Fund, OPEX and Extra-Budgetary Programmes, not including personnel employed by contractors.

^a The first year of Special Fund operations.

^b Up to 31 January 1964.

^c In addition, six requests were submitted to the March 1964 meeting of the Special Fund Consultative Board, and some fourteen requests in the field of natural resources development are under preparation, at the time of writing, for submission later in the year.

4. This rapid expansion of work has necessitated recruitment in the last two years of additional personnel, and thirteen full-time technical advisers¹⁷ are now co-operating with the staff of economists in the Resources and Transport Division. In addition to their regular duties at Headquarters, economists and technical advisers are frequently required to travel to the field for short-term missions. In the course of 1963 alone their assistance was requested in thirty different countries.

5. The following chapters present a brief review of the work of the Department of Economic and Social Affairs in respect of surveying and mapping, geology and mining, energy and water resources respectively.¹⁸ At the end of the report some priorities for further action are presented to the Council for its consideration.

CHAPTER I

Surveying and mapping for resources development

6. Reports on the activities of the Resources and Transport Division in the field of cartography, including those arising from its responsibility for international co-operation and co-ordination in this field are regularly submitted to the Council. The present chapter therefore is confined to a review of the work done during the last two years in respect of surveying and mapping in connexion with resources development.

7. Reference was made in the previous report on non-agricultural resources to the growing interest, particularly on the part of newly independent countries, in basic survey programmes and the establishment of national cartographic services equipped to undertake regular mapping programmes and specific surveying projects. A number of the projects of this type that were being aided by the United Nations at that time are still in progress. Among them the following deserve special mention: topographic mapping, in Afghanistan; photogrammetry and topography, in Cambodia; the establishment of a national cartographic service, in Somalia; geodetic surveying and photogrammetry, in the Sudan; and photogrammetry, in the Republic of Viet-Nam.

8. A number of new projects have been initiated during the last two years, for example, a project in general cartography, in Cameroon; cadastral surveys, in Cambodia, Congo (Brazzaville) and Laos; topography and photogrammetry, in Mali; map reproduction, in Ceylon and the Philippines. Other countries, namely Burundi, Ghana, the Ivory Coast, Saudi Arabia, Senegal and Yemen, were in assisted in the evaluation of similar projects which, at the time of writing, were

¹⁷ Comprising 1 cartographer 2 civil engineers, 1 drilling specialist, 2 mining engineers, 1 geologist, 1 petroleum geologist, 2 hydrogeologists, 1 geophysicist, 1 electrical engineer and 1 transport adviser.

¹⁸ Since the activities of the regional economic commissions are covered in their annual reports to the Council, the present report is limited to activities directly initiated and supervised at Headquarters, for which the substantive office, in the field of natural resources, is the Resources and Transport Division.

the planning and organization stages. In many instances, assistance included the training of national technicians, the provision of modern equipment for training and demonstration purposes, and the award of fellowships in cartographic disciplines.

9. An important consideration in developing the programmes of assistance in the cartographic field, as in others, has been the need to increase the rate of transmission to developing countries of the benefits of the advances in science and technology. The application of recently developed surveying and mapping techniques in Afghanistan, to name but one country, has already proved significantly fruitful in that specific follow-up studies have been commenced that would not otherwise have been feasible. The sequence of developments was as follows. A programme of aerial photography was carried out during the flying seasons of 1957, 1958 and 1959. On the basis of the resultant material, a series of photo-mosaics was prepared in the early 1960's on the scales 1:50,000 or 1:100,000. This in turn was followed by the preparation, still in progress, of a series of topographical maps on the scales of 1:50,000, 1:100,000 and 1:250,000 by use of up-to-date photogrammetric map-compilation techniques. These maps will constitute the first complete map coverage of the country. The aerial photographs, the photo-mosaics, and the topographic maps have already proved useful for many purposes including the carrying out of geological studies, mineral prospecting, road building, land and water development, selection of sites for airports, and archeological investigations. Incidentally, it should be noted that this programme in Afghanistan constitutes a typical example of mutual co-operation between international and bilateral assistance programmes.

10. Surveying and mapping are an integral part of pre-investment projects and in follow-up surveys are of vital importance. Accordingly, the Special Fund has increasingly been devoting attention to the strengthening of the national cartographic services of various developing countries. In so doing, high priority is given to equipping the services to deal with special-purpose surveys. Approved recently was a project calling for the establishment of a pilot map production centre in India for this type of surveying and mapping. The additional special-purpose surveys and maps that the centre will make possible is in turn expected to contribute towards more rapid and efficient implementation of many bilaterally and multilaterally sponsored projects in resources development. The original request for this assistance was evaluated and reformulated with the help of a Headquarters adviser under a preparatory allocation. Preparatory allocation missions for similar projects in the field of cartography have been carried out in Pakistan and Jamaica, at the request of the Governments of those countries.

11. In view of the increasing interest manifested by developing countries, an inter-regional seminar on cartography and economic development is under preparation. The seminar will be financed through the Danish Special Contribution to the Expanded Programme of Technical Assistance and is scheduled to be held in Denmark in 1965.

CHAPTER II

Geology and mining

12. As can be seen from the statistics given in the introduction, the range of activities for which the Resources and Transport Division has been responsible during the period under review in the fields of geology, hydrogeology and mining has expanded considerably. In this context, it might be interesting to present briefly the policy which guided those activities, to select a few examples of the methods utilized and results obtained in assisting developing countries, and to indicate the main avenues along which research and studies are being programmed.

THE GUIDING POLICY

13. A paper prepared for the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas¹⁹ noted that assistance sponsored by the Department of Economic and Social Affairs through mineral and ground water development schemes endeavours to meet three major needs in developing countries. They are: the gathering of basic geological and mineral data; the strengthening of government technical services; and the improvement of existing mining legislation.

14. Efforts have been concentrated on mineral exploration in carefully selected areas, chosen for their indication of mineralization and for their accessibility to transport facilities. A number of Special Fund projects for which the United Nations is the executing agency have been prepared on this "selected area" principle. Other projects were designed specifically to locate minerals needed for the establishment of particular industries which would help to diversify the local economy.

15. Since the basic techniques used in ground water exploration are closely related to those applied in mineral exploration, and because many developing countries are located in arid or semi-arid areas, it has been a policy of the Department of Economic and Social Affairs to encourage combined mineral and ground-water explorations wherever this approach was feasible.

16. Another problem with which the Department has had to cope, arose from the fact that the combined application of photogeological, geophysical and other modern exploration methods permits completion of the reconnaissance of a country and discovery of important mineral indices or deposits in such a short period of time that the government often finds itself unprepared for the subsequent or follow-up stage—the stage of exploitation for the domestic or export market. The follow-up measures call for the existence of administrative machinery embracing such technical services as a geological survey or a mining bureau, and certain laboratories. It is for this reason that high priority has been given to the provision of assistance to developing countries to aid them in building up sound technical services.

¹⁹ "An approach to a mineral resources development policy in developing countries" (E/CONF.39/A.388).

17. Finally, assistance has been intensified to help governments to reformulate their mining legislation. In many countries the mining laws and traditional mining rights are outmoded and were designed for purposes that do not now apply. One shortcoming is that they tend to limit the size of exploration areas to a degree that makes impracticable the use of such modern methods as airborne geophysical surveying. This can be applied only where the area to be explored is sufficiently large to yield meaningful results. When concessions are granted over large areas, it is not admissible that the concessionaires should hold these over long periods without adequate investment and development. Therefore, it should be emphasized that mineral resources represent a source of wealth for the country as a whole and their development must be oriented to this end. Other shortcomings make themselves felt in the post-exploration stage, in some instances creating serious obstacles to exploitation, whether by the government or by private interests. For instance the exploitation of their mineral wealth often entails, for developing countries, the importation from abroad of the necessary capital, skill and processing facilities. Hence, to be effective and to contribute to the development of a country there must be suitable legal provisions in respect of such matters as exploration and exploitation rights, taxation on minerals, the repatriation of capital, the importing of equipment, and other related questions. It is the awareness of this fact that has led to emphasis being directed towards encouraging and assisting developing countries in the thorough revision of their mining codes and in the enactment of modern legislation to foster development.

OPERATIONAL ACTIVITIES: METHODS AND RESULTS

18. One discernible trend in operational activities in the fields of geology, hydrogeology and mining is the wider introduction into developing countries of modern technology in general. This has come about as a result of the general practice of the United Nations of applying up-to-date techniques in the implementation of development projects, since these are vital factors in ensuring an economic and expeditious approach to natural resources development. In geology and mining, wide use is made of photogeology, airborne and ground geophysics as well as geochemistry — techniques which have radically changed the economics and efficacy of mineral resources exploration. For instance, because the application of photogeological techniques makes possible the rapid production of geological base maps, they have been used in over half of the thirty-three Special Fund mineral development projects for which the United Nations is executing agency. Similarly, aero-geophysical surveying techniques are particularly suitable for use in developing countries. They have been, or will be, used in many countries, but notably in Bolivia, British Guiana, British Solomon Islands, Chile, Ecuador, Madagascar, Mexico, Nicaragua, Nigeria, Togo and Uganda. Thirdly, geochemical techniques are being used increasingly in mineral exploration because of their simplicity, low cost and their utility

in assisting in locating concealed metallic ore bodies. For this reason, provision is frequently made for the inclusion of an experienced field geochemist in the internationally recruited staff used in Special Fund projects in the field of mineral exploration.

19. Another recent trend is the increasing interest on the part of countries putting forwards requests for assistance in mineral production as distinct from resource surveys and investigations. Cases in point are: mica mining in the Sudan, ilmenite production in the United Arab Republic; non-metallic minerals production in Tunisia; semi-precious and ornamental stone-cutting techniques in Madagascar; and a project concerning the mining of phosphate in Jordan.

20. Work carried out by the Resources and Transport Division under the Technical Assistance Programmes (as distinguished from that arising from Special Fund operational activities, which are reviewed below), may be briefly summarized as follows. Advice continued to be given on numerous specific problems — in a large number of countries — ranging from mining legislation and mine operation through ground water development and salt production. For example, assistance was given to Ethiopia, Guatemala, Nicaragua and Upper Volta in the drafting of modern mining legislation; the services of a metallurgist were provided to British Guiana and India; the Ivory Coast had the help of a mineral analyst to establish a mineralogical laboratory; two alluvial gold geologists were recruited to work in Madagascar and one expert in the production of ceramics was assigned to Tunisia. Another phase of activity involved those longer-term geological or mineral projects, such as the projects in Afghanistan, Bolivia, and Chile, that were begun in the period prior to that covered by the present report. Still another phase was the assistance given in ground water projects, of which some were begun prior to the period covered herein and others were initiated more recently. Among the countries so helped were Barbados, Dahomey, Ecuador, Guinea, Iran, Niger, Nigeria, Peru, and Upper Volta. Lastly, work was undertaken in connexion with a number of production projects, to which reference has already been made in paragraph 19 above.

21. In so far as the activities specifically arising under Special Fund projects are concerned, it may first be noted that these projects normally take several years to carry through. They also range in scope from the investigation of ground-water in such countries as Cyprus, Jordan, and Lebanon through assistance in the proving of lead and zinc in Burma and coal in Pakistan. Two were completed in the period under review — completed, moreover, on schedule and with notable success. These were the Aerial Geophysical Survey in Uganda, and the Mineral Resources Survey in northern Chile.

22. The Uganda Geophysical Survey was undertaken in order to delineate those areas in which the economic mineral potential was considered to be high, and to provide a prior basis for an intensive ground exploration programme. Some 30,000 line-miles were flown under contract, with the United Nations as executing agency. This resulted in the identification of a consid-

erable number of magnetic and electromagnetic anomalies. The Uganda Geological Survey is now undertaking follow-up field investigations, with assistance provided under a bilateral arrangement.

23. In Chile, an airborne survey followed by ground exploration and test drilling was carried out, during the period 1960-1963, in the Atacama Province, an area that had theretofore remained largely unexplored because of its thick (200 to 300 metres) overburden. The survey resulted in the discovery of a major deposit of high-grade iron ore. Its significance is such that the Corporación de Fomento de Chile has been able to raise over \$1 million for the proving of the ore reserves. It is to be expected that the discovery will have a considerable impact on the iron-ore supply situation in Latin America.

24. Several other Special Fund projects are now at an advanced stage of implementation, and are also showing significant results. Two of these are the Survey of Lead and Zinc Mining and Smelting in Burma and the Mineral Survey in Pakistan. They are briefly described below.

25. Two of Burma's principal exports are the lead and zinc produced by the Burma Bawdwin Mine Corporation, a joint Government/private venture. After many years of production of lead and zinc concentrates at this mine, it became obvious that the mine's high-grade ore reserves would be exhausted in another few years' time. This would have caused a major setback to the economy of the country and thrown several thousand skilled workmen out of work. The Government turned to the United Nations with a request that a survey be undertaken to assess the remaining ore reserves, to evolve means of improving the mining method, and to apply and develop such new ore-dressing and smelting techniques as would make possible the economic exploitation of low-trade ores. The resultant survey revealed the existence of an additional ten million tons of low-grade ore, the potential value of which is estimated at over \$200,000,000. It also provided the basis for the plans which have since been drawn up for a change of the mining method, the installation of a new ore-dressing plant and new ore-smelting facilities as well as for the improvement of the mine-to-plant ore-transport facilities.

26. The Special Fund Mineral Survey Project in Pakistan, started in 1960, had as its objective the carrying out of a search for iron ore in West Pakistan and coal in East Pakistan in the hope of finding reserves adequate to serve as a basis for a national steel industry. As a result of the survey, coal has been found in East Pakistan. The coal seams range in thickness from eighty-five to one hundred feet, but they are located at a depth of 3,000 feet. A drilling programme is now under way to explore the possibility of finding an extension of these seams nearer the surface.

RESEARCH AND STUDIES

27. The range, diversity and magnitude of operational activities over the past five years have been such as to warrant some conclusions as to the major obstacles

to mineral development in developing countries. Accordingly, the Secretariat plans to undertake a study on this subject with the objective of evolving guidelines for administrators handling the kind of problems that have been found to recur widely. This study will discuss the hindrances to mineral development noted in the early part of this chapter. It will also attempt to examine ways of overcoming certain technical and economic difficulties that often prevent selected area and other surveys being used to best advantage within the framework of a country's economic development plan.

28. Again, as part of the continuing programme of facilitating the transfer of the benefits of science and technology to developing countries, preliminary preparations have been made for the holding of an inter-regional seminar on mineral resources development in arid areas, with special emphasis on the dry processing of ores. It is proposed that this seminar be held at Headquarters in 1965. Similarly, consultations have been commenced for holding an inter-regional seminar and study tour on new techniques, including geochemistry, for the exploration, exploitation, and extraction of minerals.

29. Finally, it is proposed to bring up-to-date the *Survey of World Iron Ore Resources: Occurrence, Appraisal and Use* published in 1954.²⁰ Since this survey has been issued, important new iron-ore deposits have been discovered in various parts of the world. The development of some of these new deposits has been started and this, together with the exploitation schemes presently in operation, is affecting both the regional and world iron-ore supply market. They are both markedly different now from those of ten years ago. Moreover, the development of iron-steel based industries has considerably increased in industrialized countries. It has also made remarkable headway in newly-emerging countries in the recent decade. It is important, therefore, that the 1954 survey be brought up-to-date by a panel of international experts working in collaboration with the Secretariat.

CHAPTER III

Energy

30. There is a close relationship between the work in the field of energy and electricity and the activities related to geology and mining on the one hand, and those concerned with water resources on the other. It suffices to mention the paramount importance of a mineral fuels policy in all the domains affecting economic development, and the role that hydropower and geothermal energy are called upon to play when available in an electrification programme.

ENERGY RESOURCES SURVEYS

31. Generally speaking, there appears to be an increasing awareness, on the part of developing countries, of the need for comprehensive surveys of their energy

resources and for co-ordinated programming for energy development. This is reflected in the nature of the requests for United Nations assistance. Afghanistan and Mali, for example, have asked for advice on over-all energy policy; the Philippines requested that an evaluation be made of the energy resources of the Island of Luzon — a task which has been undertaken by the IAEA, with the participation of the United Nations; and the Republic of Korea asked for similar assistance which is also being provided by these two organizations.

32. During the period under review, advisers were provided, at the request of Governments, to assist the national petroleum organizations in the broad field of petroleum development in several countries in Africa, the Middle East and Asia. A number of countries have also evinced interest in the possibilities of exploiting and utilizing natural gas where this occurs as a wasting resource in petroleum production. Assistance with natural gas projects is being provided in China (Taiwan), and in Trinidad and Tobago, and other requests of a similar nature are under consideration.

33. Work in the field of petroleum and gas has included the training of national personnel and applied research. The Special Fund has financed the establishment of an institute for petroleum exploration in India, the dual objectives of which are to foster applied research and to train personnel at various levels. In addition, a number of fellowships have been awarded for the training of petroleum and gas specialists.

34. In the domain of coal resources, missions were sent to Venezuela and the Philippines. The study made in the latter country led to a Special Fund project for the survey of coal resources in Malangas, Mindanao, with the objective of assessing the reserves, improving the mining methods at existing mines, and the training of local engineers in mine exploration, exploitation and management.

35. The Council has before it a report submitted in response to Council resolution 885 (XXXIV) on developments that have taken place in the field of new sources of energy since the Rome Conference of 1961 (E/3903). This report indicates, *inter alia*, that the Rome Conference has been a turning point in the development of scientific and technological research in the field of geothermal energy and its industrial applications. The United Nations has been active in facilitating the exchange of information and experience in this field and in passing on knowledge of new developments and techniques to developing countries. It is also playing an important role through technical assistance, and projects related to geothermal exploration are currently in progress in Central America, South America, Africa and the Far East.

ELECTRIFICATION PROBLEMS

36. In the domain of electrification, a number of countries sought and received assistance in overcoming fundamental institutional problems, such as the management of electric-power utilities, the formulation of a tariff policy and the reorganization of their electric-

²⁰ United Nations publication, Sales No.: 54.II.D.5.

power supply and distribution systems. Nepal and British Guiana were among the countries assisted through the OPEX programme, while Burma, the Central African Republic, Somalia and Togo received assistance through the technical assistance programme.

37. The joint utilization of energy resources by countries contiguous to each other has been encouraged whenever it is feasible. Technical assistance is being provided to a joint project of El Salvador and Honduras for the development of a hydropower site, possibly involving the installation of cross-frontier transmission lines. Again the Special Fund has approved a request presented by Dahomey and Togo for a project which entails a market study covering each town and village in two countries, feasibility studies for power plants and transmission lines, and a training school for operating technicians. It also envisages the establishment of a Joint Electricity Board.

38. Still another phase of work in electrification is that undertaken on power-system planning. Technical assistance in this field was rendered in Syria and the United Arab Republic, and is being provided in Colombia.

39. In order to help solve typical problems which have been met in technical assistance operations, the Resources and Transport Division has developed a research programme leading to the publication of several studies and reports dealing, *inter alia*, with the forecasting of demand for electricity in developing countries; inter-relationships between costs and tariffs; the training of professional and semi-skilled personnel for electric power undertakings; and the energy resources endowment of Africa.

40. The paper on the forecasting of electricity demand points out that the methods of measuring growth trends in industrialized countries have proved to be an inadequate tool for developing areas. The study, therefore, describes alternative forecasting techniques. Reference is also made to various formulæ evolved for correlating electricity demand with the Gross National Product and other indices, though it is suggested that such formulæ be used as a check on forecasts made by other means, rather than as a primary method of forecasting.

41. In the study on tariff problems, it is shown that only after the costs have been ascertained with reasonable accuracy is it possible to build a rational tariff structure. The tariff structure depends upon the policy adopted and this may aim at one of three targets — the matching of revenue and expenditure, the obtaining of profits from the sale of electricity, or the subsidizing of electricity prices for the purpose of providing indirect economic or social benefits to consumers. There is also a refinement of this latter policy which may sometimes be pursued, namely, that of internal subsidization or the raising of prices to one category of consumer in order to subsidize another. However, unless the administration has a sound knowledge of costs it will be working without a firm base and will have no means of implementing its policy in a logical manner. The study also demonstrates how tariffs can be used as an

instrument for stimulating electrical growth by offering incentives.

42. The paper on the training of professional and semi-skilled personnel for electric power undertakings sets out the different types of skills and qualifications needed in an electric utility enterprise, and discusses training programmes such as in-service training, curricula organized by local vocational schools and universities, and overseas scholarships. Explored also is the need for incentives to acquire new skills as well as the incentives necessary to retain skilled personnel in the undertaking. The study recommends *inter alia* that the establishment of regional and sub-regional training centres be considered; that training officers be appointed in electricity enterprises; and that seminars for such training officers be organized.

43. The paper reviewing the energy resources of Africa contains discussion on the distribution of various sources of energy throughout the continent and includes an appendix which reviews the energy resources of each individual country or territory. An attempt has been made to confine the quantitative estimates of energy resources to those which can be considered to be economically exploitable at the present time.

44. "Approaches to an energy policy in a developing country" was the title of a paper presented to the United Nations Conference on Science and Technology for the Benefit of the Less Developed Areas (1963).²¹ In it an attempt was made to point out what seems to be a necessary sequence of steps to be taken prior to framing an energy policy. Also discussed was the necessity for an integrated approach to energy problems covering mineral fuels and electricity, as well as non-conventional sources of energy; the setting of goals consistent with over-all economic and social aims to be achieved; and the advantages of international co-operation in the field of energy development, especially in the case of smaller countries and those not richly endowed with energy resources.

SELECTED PROJECTS FOR THE COMING TWO YEARS

45. On the basis of experience gained in technical assistance operations it is proposed, in addition to other activities of a continuing nature, to devote special attention during the coming two years to two main categories of problems: those raised by over-all energy planning and those concerning electricity supplies for areas not yet provided with power.

46. An inter-regional seminar on fuel and electric power policy to be held in 1965 is under preparation by the Resources and Transport Division. The objective of the seminar will be to examine the complex issues raised by over-all energy planning through discussing such topics as the choice of energy source, the co-ordination of various complementary or competing forms of energy, and the problems of investment, financing, timing and other aspects of programming. The seminar will address itself primarily to responsible administra-

²¹ Document E/CONF.39/A/387.

tors in the field in question. It will also provide an opportunity for the United Nations to put to use its previous experience in holding seminars and symposia on energy problems, even though most of these meetings were regional rather than inter-regional, and somewhat more restricted in subject matter.²²

47. One of the problems that has come to the fore as warranting special attention concerns the supplying of electricity to power deficient areas which are so located as to make impracticable, under present circumstances, the provision of electricity through long-distance transmission lines. Experience has shown that the introduction of electricity in such localities through the installation of small-scale thermal or hydropower plants can be an important stimulant to social and economic development. Small-scale thermal plants have a special advantage in that they can be run on any one of a wide range of fuels — oil, natural gas, industrial or agricultural wastes, wood or even geothermal steam, if this is available. For these reasons, and in accord with a recommendation made at the recent United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas (1963), a study on the methods of small-scale power generation has been undertaken. The main objective of this study is to define the criteria that should be applied in selecting the type of plant and equipment best suited to a particular situation.

CHAPTER IV

Water resources

48. In the field of water resources, the Resources and Transport Division at Headquarters deals primarily with matters pertaining to over-all surveys designed to meet multiple objectives, reconnaissance of river basins, groundwater inventories, and such individual aspects of water development as hydropower, river navigation, water for industry and desalination.

49. When conducting research in those various domains, or dealing with operational assistance, full consideration is given not only to the technological and economic aspects of water schemes, but also to related legal, organizational, and administrative problems. The approach adopted, as a result of experience gained through the application of technical assistance, was the object of a paper prepared for the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas.²³

50. Since the third biennial report of the Water Resources Development Centre (E/3881), now before the Coun-

cil, presents a comprehensive review of the activities of the United Nations and the other organizations of the United Nations family concerned with water, it would be repetitious to describe them again in this report. It is felt, however, that the Council may wish to have a more detailed account of some of the more salient features of the activities characterizing the work of the Resources and Transport Division during the last two years, namely, the assistance given to some countries in Africa for the development of international river basins, and the research conducted throughout the world on the economic application of desalination in areas short of fresh-water resources.

THE SENEGAL RIVER BASIN DEVELOPMENT SCHEME

51. Following a series of contacts between the four riparian countries of the Senegal river — the Republic of Guinea, the Republic of Mali, the Islamic Republic of Mauritania and the Republic of Senegal — and the United Nations, a proposal for a systematic inquiry relating to the problems raised by the development of the Senegal river basin was submitted to the Governments concerned in June 1962. A month later, during an inter-State conference held in Conakry, a joint request was addressed to the United Nations to send a mission to the area to undertake an inventory of the data available in the various technical fields of interest for the development of the basin, to determine the complementary studies which might be necessary, and to formulate proposals for the establishment of a permanent organization which would be responsible for the execution of development schemes.

52. The United Nations Mission for the study of the Senegal River visited the four countries concerned from the beginning of October 1962 to January 1963. In addition to a team-leader and two advisers, the mission was composed of specialists in the fields of hydrology, agronomy, rural sociology, hydropower, navigation and harbour installation.

53. The report of the mission, which was submitted to the four Governments in July 1963, consisted of two parts: the first, of a general character, dealt with the basin as an entity and concluded with a number of suggestions aimed at ensuring proper co-ordination of questions of common interest, and the second recounted the technical findings and recommendations of each expert in the field for which he was responsible.

54. During an inter-State meeting held in Bamako in July 1963, a convention on the Senegal river basin was signed by the four Governments concerned, an Inter-State Committee at the ministerial level was established, and provisions were made for the establishment of a permanent general secretariat to assist the Committee. It was also decided that government experts would meet before the end of the year and advise the Inter-State Committee on the report submitted by the United Nations mission. In addition, the experts would have to advise on the formulation of a general policy concerning the development of the basin and on a programme of basic studies in accordance with this policy.

²² The symposia on the Development of Petroleum Resources of Asia and the Far East, New Delhi, December 1958 and Teheran, September 1962; the Latin American Electric Power Seminar, held in Mexico City, July-August 1961; the Regional Seminar on Energy Resources and Electric Power Development, held at Bangkok, December 1961; the United Nations Inter-regional Seminar on Techniques of Petroleum Development held at Headquarters January-February 1962; and the African Electric Power Meeting held at Addis Ababa, October 1963.

²³ "Approaches to water resources development in developing countries" (E/CONF.39/A/213).

The expert meeting, which took place in Nouakchott in December 1963, endorsed the main conclusions of the report of the United Nations mission, in particular those relating to a feasibility study of an important hydropower dam and reservoir in the upper reaches of the river, the problems related to the reconversion of agricultural methods in the lower part of the basin, mining and industrial development possibilities, and complementary reservoirs on important tributaries.

55. On the basis of the recommendations made by the expert meeting held in Nouakchott, the Inter-State Committee Conference held in Dakar in February 1964 submitted to the Special Fund a certain number of requests for pre-investment projects which are now under consideration.

THE INTERNATIONAL ACT CONCERNING NAVIGATION AND ECONOMIC CO-OPERATION BETWEEN THE STATES OF THE NIGER RIVER BASIN

56. Nine countries are interested in the various parts of the Niger river basin, namely the Federal Republic of Cameroon, the Republic of Chad, the Republic of Dahomey, the Republic of Guinea, the Republic of the Ivory Coast, the Republic of Mali, the Republic of the Niger, the Federal Republic of Nigeria and the Republic of Upper Volta.

57. As early as 1961 four of the countries riparian to the main stream had requested the United Nations to undertake a study on the consequences which projects planned by the Governments concerned may have on the régime of the Niger river. The study team started its work in January 1962, and in August 1963 completed a comprehensive report which examined successively the general characteristics of the basin, the hydrologic characteristics of the main river, the schemes already in execution or planned in the various riparian States, and the effect of upper stream projects on those down stream.

58. Meanwhile, negotiations took place between the Governments concerned to hold meetings dealing not only with technical problems of common interest for the development of the basin but also with the possibility of drafting a convention. Two conferences, at which United Nations representatives participated, were held in Niamey in February and October 1963. They resulted in the formulation of an International Act "concerning navigation and economic co-operation between the States of the Niger basin", known as the Act of Niamey, 26 October 1963.

59. Among its salient features it may be noted that, while maintaining the principle of freedom of navigation, the Niamey Act abrogates the General Act of Berlin, the General Act and Declaration of Brussels, and the Convention of Saint-Germain-en-Laye "as far as they concern the river Niger, its tributaries and sub-tributaries". It also sets the foundation for "close co-operation in regard to the study and execution of any projects likely to have an appreciable effect on the régime of the river", and for "the establishment of an inter-governmental organization which will be entrusted

with the task of encouraging, promoting, and coordinating the studies and programmes concerning the exploitation of the resources of the river Niger basin".

ECONOMIC APPLICATIONS OF DESALINATION IN AREAS SHORT OF FRESH WATER

60. In the last report on non-agricultural resources (E/3578), it was mentioned that a grant by the Ford Foundation had made it possible to carry out a survey of potential economic applications of desalination of sea and brackish water in areas of developing countries experiencing fresh-water shortages.

61. The Council has now before it a report entitled *Water Desalination in Developing Countries*,²⁴ resulting from a survey of forty-three countries and territories. The first part of the report reviews water conditions in water-short areas and gives information on costs, prices and utilization patterns of water as well as of electricity; it analyses technical and economic data relating to the principal plants in operation; it comments on some of the more important cost and price components as well as on policy considerations confronting Governments with respect to desalination; and, finally, it endeavours to delineate perspectives for the wider application of water desalination in developing countries. The second part of the report contains summaries of the situation in each of the forty-three countries and territories surveyed.

62. Information was gathered on sixty-one desalination plants currently in operation, with a total installed capacity of some 77,000 m³ per day. As of the end of 1962, nineteen new plants with a combined daily capacity of 43,000 m³ had been approved or were under construction. The range in the size of existing installations is considerable, and varies from less than 20 m³ per day to the 12,000 m³ per day capacity of the plant recently installed at Curaçao (Netherlands Antilles). The output of the plants in operation is primarily for household use. However, many small plants are meeting the needs of other consumer categories such as mining, tourism, and industry.

63. The survey highlights the fact that there appears to be at least fifty water-short areas, in the countries and territories surveyed, in which technical and economic feasibility studies are warranted to establish whether or not possibilities exist for the economic utilization of desalinated water.

64. Prospects for the growth in the application of desalinated water in developing countries will be largely dependent on the availability of capital (public or private), the ability or the willingness of consumers or of Governments to meet the price of desalinated water, and on the economic growth potential of the area and the related demand for fresh water.

65. Two factors will be specially meaningful in this connexion: foreseeable reductions in the cost of desalinated water and government policy with respect to desalination. With respect to the former, conversion costs are

²⁴ United Nations publication, Sales No.: 64.II.B.5.

at present of the order of \$0.25-\$0.35/m³ for installations with capacities of approximately 4,500 m³/day and utilizing relatively low cost energy. A number of contributing factors may singly or collectively help to lower conversion costs in the not too distant future: (i) improvements in the characteristics and efficiency of equipment and in the types of materials used in the three major processes (distillation, electro-dialysis and freezing); (ii) the existence of favourable conditions for the establishment of multiple-purpose plants producing more than one saleable product (water, electricity, salts and their by-products); (iii) the possibility of installing very large plants with capacities of many tens of thousands of cubic metres per day and the attendant economies of scale which would ensue; and (iv) the optimising of plant operations so as to maintain the plant at or close to base load and reduce shut-down time to a minimum. As far as government policy with respect to desalination is concerned, this will primarily entail the need to establish if, and the extent to which, governments may wish to adopt a subsidization policy. Judgements will necessarily have to be based on comprehensive comparative analyses of all sources of water supply and, within the field of desalination, seek out comparisons between different process types and size of plant.

66. The survey has already prompted a number of countries — Argentina, the Netherlands Antilles, Tunisia, Saudi Arabia and the United Arab Republic — to undertake further investigations, and to request United Nations assistance. The case of Tunisia illustrates the kind of assistance that can be provided. A three-member team of BTAO experts studied the fresh-water problems in Tunisia's southern region, with particular reference to an industrial complex to be established there. With the aid of several specialists from Headquarters, a comprehensive report was prepared on the findings and on the economic alternatives for desalination, including recommendations on the closely related subject of power generation.

FUTURE PROGRAMME

67. There is every reason to expect a continued growth in the volume of operational activities in the field of water resources development, and a corresponding growth in the need for their substantive servicing. The amount of experience that has been accumulated and tested — through the pragmatic approaches developed over the years in response to new situations and new needs — should enable the Secretariat to meet the challenge, and its activities may be expected to make a significant contribution to the goals of the Economic Development Decade, in terms both of practical schemes and facilitating the transfer to developing countries of the benefits of science and technology.

68. The requirements of the operational activities, and the recurring and ubiquitous problems that are encountered in servicing them, point to certain priorities in the sphere of research and study. First, it would appear

that the time has come to give consideration to the preparation of an inter-regional meeting on the economics of desalination under various water and electricity conditions. Urgently needed, also, is a study into the economics of transporting water — including the relationship between methods, distance and costs — with a view to the preparation at a later stage of a comprehensive guide designed specifically for administrators and policy makers in this field.

69. Lastly, the Council may wish to consider the question of whether a United Nations inter-regional symposium on water resources development problems should be convened. It may be relevant at this point to note the following opinion in the report of the first session of the Advisory Committee on the Application of Science and Technology to Development in connexion with its consideration of the possibility of an immediate world-wide attack on a limited number of especially important problems of research or application: "In view not only of the fundamental importance of water supplies to agricultural production (as well as to industrial and other uses), but of the need for an authoritative assessment of the nature of the problems to be solved and the most promising directions for future research and development, we consider that an international conference of experts covering all aspects of the water problems common to developing countries should be accorded the highest priority" (see E/3866, Annex III, para. 6).

CHAPTER V

Priorities for further work

70. Besides the continuing and expanding work of substantive support for operational activities, the Secretariat plans to give priority in the next two years to certain projects indicated and briefly described in the foregoing chapters. These projects are based on experience gained in operational activities and reflect needs indicated in the developing countries.

71. For the convenience of the Council, these priority projects are listed below:

Cartography

An inter-regional seminar on cartography and economic development (provided for in the 1965 technical assistance programme).

Geology and mining

(1) A study on administrative and legislative measures facilitating mineral development (provided for in the 1964 technical assistance programme). (2) A survey of world iron ore resources (1954) to be up-dated, as part of a larger undertaking also covering world demand and steel industry potential (tentative). (3) An inter-regional seminar on mineral resources development in arid areas, with special emphasis on dry processing of ores (under consideration).

Energy

(1) An inter-regional seminar on energy policy, 1965 (under consideration). (2) A study on methods of small-scale power generation (tentative).

Water resources

(1) An inter-regional seminar on desalination economics (tentative). (2) A study on economic and technical aspects of transporting water (tentative).

APPENDIX

Special Fund projects approved in the field of non-agricultural natural resources and cartography up to 31 January 1964 *

<i>Country and Project</i>	<i>Session at which approved by Governing Council</i>	<i>Plan of Operation signed (date)</i>	<i>Authorization to commence execution (date)</i>
Afghanistan			
Ground-water Investigation	January 1963	14 January 1964	—

DOCUMENT E/3975

Report of the Economic Committee

[Original text: English]
[13 August 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President of the Council, Mr. Akira Matsui (Japan), considered at its 346th-349th and 354th meetings on 30 and 31 July and 3, 5 and 10 August 1964 (E/AC.6/SR.346-349, 354) item 14 of the Council's agenda which had been referred to it by the Council at its 1337th meeting on 29 July 1964 (E/SR.1337).

2. The Committee had before it the following documents: E/3863, E/3881, E/3894 and Rev.1, E/3903, E/3904 and ST/ECA/82.

3. The Committee received also the following draft resolutions in connexion with its consideration of this item:

(i) Draft resolution by Algeria, Argentina, Chile, Colombia, Ecuador and Mexico entitled "Water desalination" (E/AC.6/L.298/Rev.1);

(ii) Draft resolution by Australia, Chile and Ecuador entitled "New sources of energy" (E/AC.6/L.299);

(iii) Draft resolution by Algeria, India, Indonesia, Iran, Iraq, United Arab Republic and Yugoslavia entitled "Non-agricultural resources" (E/AC.6/L.300);

(iv) Draft resolution by Czechoslovakia, Ecuador, Senegal and the United Kingdom of Great Britain and Northern Ireland entitled "Water resources development" (E/AC.6/L.301 and Rev.1 and 2).

4. The sponsors of the six-Power draft resolution on Water desalination (E/AC.6/L.298/Rev.1) agreed to accept the following changes in their text:

(i) the following new preambular paragraph was inserted between the second and third preambular paragraphs: "Noting with satisfaction the understandings reached between the Governments of the Union of Soviet Socialist Republics and the United States of America regarding co-operation in the field of water desalination with special reference to the problem of economic development of developing countries,";

(ii) in operative paragraph 1, the word "governments" was replaced by the words "Member States";

(iii) in operative paragraph 4, the words "nature and scope of" were deleted; the words "and to facilitate" were changed to "in order to facilitate"; and the words "when developments warrant" were replaced by the phrase "whenever appropriate".

5. The Committee unanimously approved the six-Power draft resolution (E/AC.6/L.298/Rev.1) as revised by the sponsors.²⁵

²⁵ At the 1350th meeting of the Council, reservations were expressed regarding the first and third preambular paragraphs of the draft resolution.

6. As regards the draft resolution by Australia, Chile and Ecuador (E/AC.6/L.299) on new sources of energy, the sponsors agreed to make the following changes in the text:

(i) in operative paragraph 1, the word "decision" was replaced by the word "proposal";

(ii) the following new paragraph was inserted between operative paragraphs 2 and 3: "Requests the Secretary-General to prepare periodic reports on new sources of energy;"

(iii) in operative paragraph 3 (now paragraph 4), the words "in co-operation with the interested specialized agencies" were inserted after the words "Requests the Secretary-General";

(iv) the following phrase was added at the end of the introductory part of operative paragraph 4 (now paragraph 5): "in the light of the expressed needs and priorities of developing countries";

(v) the following phrase was added at the end of operative paragraph 4 (i) (now paragraph 5 (a)): "in accordance with the normal policy and administrative procedures of those programmes";

(vi) operative paragraph 4 (ii) (now paragraph 5 (b)) was revised to read as follows: "Consulting the Member States and the related agencies of the United Nations on the desirability of holding the symposia proposed and taking consequent action as appropriate".

7. The Committee then approved unanimously the three-power draft resolution (E/AC.6/L.299) with the foregoing revisions which had been made by the sponsors.

8. As regards the seven-power draft resolution on non-agricultural resources (E/AC.6/L.300), the sponsors agreed to accept the following changes in their text:

(i) the words "as well as the training of national personnel in these fields" were added at the end of operative paragraph 2;

(ii) the following new paragraph was inserted between operative paragraphs 2 and 3: "Further recommends that a high priority be assigned to the world survey of iron ore deposits;"

(iii) the phrase "to give due emphasis" in operative paragraph 3 (now paragraph 4) was re-worded to read "to continue to give due emphasis".

9. The delegations of Chile and Senegal joined the sponsors of this draft resolution. The financial implications of the draft resolution were submitted in document E/AC.6/L.300/Add.1.

10. The Committee then unanimously approved the nine-power draft resolution (E/AC.6/L.300) with the foregoing changes in the text.

11. As regards the draft resolution on water resources development submitted by Czechoslovakia, Ecuador Senegal and the United Kingdom (E/AC.6/L.301), the Committee, after considering the text, decided that certain parts of the draft resolution which fell within the competence of the Co-ordination Committee should be referred to that Committee for comment. This was accordingly done, and the Co-ordination Committee's comments were made available to the Economic Committee in document E/AC.24/SR.261.

12. The sponsors of the draft resolution submitted a new text (E/AC.6/L.301/Rev.2) in which they had introduced certain modifications which had been suggested during the discussion in the Co-ordination Committee. Subsequently the sponsors agreed that the words "great and" in the third preambular paragraph of their text should be deleted and that the words "national and international" should be inserted after the words "co-ordinated and well-balanced" in the same paragraph.

13. The Committee then approved the four-power draft resolution (E/AC.6/L.301/Rev.2) with the above mentioned change, by eighteen votes to none, with one abstention.

14. The Committee therefore recommends the adoption by the Council of the following draft resolutions:

A. WATER DESALINATION

[Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council".]

B. NEW SOURCES OF ENERGY

[Text adopted by the Council as amended at its 1350th meeting. See below, "Resolutions adopted by the Economic and Social Council".]

C. NON-AGRICULTURAL RESOURCES

[Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council".]

D. WATER RESOURCES DEVELOPMENT

[Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council".]

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1033 (XXXVII). Development of natural resources

A

WATER DESALINATION

The Economic and Social Council,
Having noted the report on water desalination,²⁶

Bearing in mind the increased interest in and importance of water desalination, especially as a means of alleviating water shortages in arid and semi-arid areas of developing countries where conditions are suitable, thereby facilitating the processes of economic development.

Noting with satisfaction the understandings reached between the Governments of the Union of Soviet Socialist Republics and the United States of America regarding co-operation in the field of water desalination with special reference to the problem of economic development of developing countries,

Recognizing that a number of technical and economic factors are involved in the practical application and study of water desalination, and that various sources of energy may be used in desalinating sea or brackish water,

Taking into account the views of the Advisory Committee on the Application of Science and Technology to Development on the subject (E/3866, Annex III),

1. Draws the attention of Member States to the report and to the facilities offered by the United Nations for technical assistance to investigate prospects for the economic application of water desalination in water-short areas;

2. Recommends that the Secretary-General in consultation with the specialized agencies and the International Atomic Energy Agency continue and intensify the activities of the United Nations Secretariat in the field of water desalination;

3. Requests the Secretary-General to submit the report on water desalination in developing countries to the Third International Conference of the United Nations on the Peaceful Uses of Atomic Energy, to be held in Geneva, in connexion with the possible use of atomic power in desalination processes;

4. Further requests the Secretary-General to keep under review the activities in the field of water desalination being conducted by governmental and non-governmental institutions as well as by private enterprises; to consider the means that may be envisaged to promote co-operation in these activities, to encourage the exchange of information on developments, in order to facilitate

²⁶ *Water Desalination in Developing Countries*, (United Nations publication, Sales No.: 64.II.B.5.).

meeting the water and power needs of the developing countries; and to report thereon to the Council whenever appropriate.

*1350th plenary meeting,
14 August 1964.*

B

NEW SOURCES OF ENERGY

The Economic and Social Council,

Recalling its resolution 885 (XXXIV) of 24 July 1962, on new sources of energy which was concerned especially with the encouraging results and important implications of the United Nations Conference on New Sources of Energy, held in Rome in August 1961,

Reaffirming the considerations listed in the first preambular paragraph of resolution 885 (XXXIV):

(a) That demands on conventional sources of energy are increasing very rapidly and that new sources of energy promise to make a useful supplementary contribution to energy supply and economic growth in future years,

(b) The importance of progress in the field of industrialization for the economic and social development of developing countries.

(c) That in the majority of developing countries there is an acute scarcity of energy in a form which can be readily utilized,

Noting the Secretary-General's report on recent developments relating to new sources of energy (E/3903);

Taking into account the views of the Advisory Committee on the Application of Science and Technology to Development on the subject (E/3866, Annex III),²⁷

1. Commends the proposal of the Economic Commission for Africa to establish a solar energy experimental centre in the Niger;²⁸

2. Endorses the recommendations in the Secretary-General's report;

3. Requests the Secretary-General to prepare periodic reports on new sources of energy;

4. Requests the Secretary-General, in co-operation with the interested specialized agencies, to continue to encourage studies on wind power in order to develop new techniques and equipment as well as new applications for wind power;

5. Authorizes the Secretary-General to proceed as envisaged in his recommendations (E/3903), in the light of the expressed needs and priorities of developing countries:

(a) Utilizing resources available to the Secretariat and, where appropriate, in the Regular Programme and the Expanded Programme of Technical Assistance and

²⁷ Paragraph included as amendment by the Council.

²⁸ See *Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 10, (E/3864/Rev.1), Part III, reso. 113 (VI).*

the Special Fund, in accordance with the normal policy and administrative procedures of those programmes;

(b) Consulting the Member States and the related agencies of the United Nations on the desirability of holding the symposia proposed and taking consequent action as appropriate;

6. Urges Member States, both in respect of those activities undertaken by the Secretary-General and in other appropriate ways, to do what they can to facilitate the exchange of information and the extension of assistance in the fields of solar energy, wind power and geothermal energy.

*1350th plenary meeting,
14 August 1964.*

C

NON-AGRICULTURAL RESOURCES

The Economic and Social Council,

Bearing in mind the importance of the development and utilization of natural resources for the over-all economic advancement of developing countries,

Having considered the report of the Secretary-General on work being done in the field of non-agricultural resources, and the programme for future work submitted by the Secretary-General (E/3904, Chap. V),

1. Takes note of the work done in this field in the Secretariat, the regional economic commissions and in the specialized agencies;

2. Recommends that due priority be given to programmes having direct impact on the economic development of the developing countries, such as: geology and mining, water resources and energy including natural gas, as well as the training of national personnel in these fields;

3. Further recommends that a high priority be assigned to the world survey of iron ore deposits;

4. Requests the Technical Assistance Committee and the Governing Council of the Special Fund to continue to give due emphasis, in the light of the expressed needs and priorities of the developing countries, to technical assistance programmes and projects in the above-mentioned fields of non-agricultural sources of energy, within the framework of their activities.

*1350th plenary meeting,
14 August 1964.*

D

WATER RESOURCES DEVELOPMENT

The Economic and Social Council,

Having considered the Note by the Secretary-General on the future of the United Nations Water Resources Development Centre and the Third Biennial Report of this Centre, as well as the Proposals for a Priority Programme of Co-ordinated Action in the field of water

resources within the framework of the United Nations Development Decade (E/3863/E/3881, E/3894/Rev.1),

Recalling its resolutions 675 (XXV) of 2 May 1958, 753 A (XXVIII) of 31 July 1959, 876 (XXXIII) of 16 April 1962, 916 (XXXIV) of 3 August 1962 and 978 (XXXVI) of 1 August 1963,

Recognizing the vital importance of water within the over-all economic development of the developing countries and the need for co-ordinated and well-balanced national and international programmes for the development of water resources in the world as a whole,

Appreciating the valuable and growing activities of the regional economic commissions in this field as indicated in their annual report to the Council,

Taking into consideration the views and recommendations submitted by the Administrative Committee on Co-ordination concerning arrangements to facilitate effective co-ordination and the role of the Water Resources Development Centre in the United Nations (E/3886, Chap. X),

1. *Notes with satisfaction* the Third Biennial Report of the Water Resources Development Centre;

2. *Approves* the report and recommendations on Proposals for a Priority Programme of Co-ordinated Action in the field of water resources within the framework of

the United Nations Development Decade as prepared by the Centre and submitted by the Secretary-General;

3. *Endorses* the Secretary-General's proposals concerning the future of the United Nations Water Resources Development Centre, its terms of reference (E/3894/Rev.1) and its organizational re-arrangement;

4. *Approves* the recommendation of the Administrative Committee on Co-ordination that the focal point for co-ordination among the participating organizations should henceforth be provided by the inter-agency meetings on water resources development, functioning as a sub-committee of the Administrative Committee on Co-ordination, and supplemented by *ad hoc* consultations on important projects and continuing exchange of information at a technical level; and requests that the Administrative Committee on Co-ordination should include in its future reports to the Council a section describing progress in this field;

5. *Calls upon* the Secretary-General to develop, by means of these new arrangements, more effective co-ordination with the specialized agencies and the International Atomic Energy Agency in work on the development of water resources.

*1350th plenary meeting,
14 August 1964.*

CHECK LIST OF DOCUMENTS

NOTE. This check list includes the documents pertaining to agenda item 14 which are not reproduced in the present fascicle.

CONTENTS

	<i>Paragraphs</i>
INTRODUCTION	1-9
I. NATIONAL MEASURES AFFECTING THE OWNERSHIP OR USE OF NATURAL RESOURCES BY FOREIGN NATIONALS OR ENTERPRISES	9-92
A. Investment legislation	9-59
1. Algeria	16-19
2. Dahomey	20-22
3. Ghana	23-26
4. Greece	27-34
5. Guinea	35-39
6. Indonesia: Production-sharing Law	40-47
7. Ivory Coast	48-51
8. Mauritania	51-56
9. Senegal	57-59
B. Legislation in respect of land and mining rights	60-80
1. Indonesia: Petroleum legislation	60-62
2. Kenya: Constitutional provisions in respect of land and mining rights	63-68
3. Mexico: Extension of mining régimes to additional mineral substances	69-72
4. Niger: Mining Law	73-77
5. United Arab Republic: Terms of concession in the Western Desert	78-80
C. Exportation and other forms of taking	81-92
1. Constitutional provisions	81-83
Kenya	81-83
2. Legislative measures	84-92
(a) Brazil: Decree of 30 May 1962	84-89
(b) Ceylon: Ceylon Petroleum Corporation Act, 1961, and Ceylon Petroleum Corporation (Amendment) Act, 1963	90-91
(c) Iraq: Law Defining the Exploitation Areas for the Oil Companies	92
II. INTERNATIONAL AGREEMENTS AFFECTING THE FOREIGN EXPLOITATION OF NATURAL RESOURCES	93-199
A. Bilateral agreements	93-177
1. Agreements relating to State succession	94-144
(a) France-Algeria	94-142
(i) Principles and policies regarding State succession with special reference to natural resources	94-120

	<i>Paragraphs</i>
(1) Acquired rights	95-100
Acquired rights within the framework of general principles of economic and financial co-operation	98-100
(2) Exploitation of mineral resources of the Sahara	101-112
(a) Acquired rights	104-105
(b) Discriminatory and arbitrary measures	106-109
(c) Special provisions for grants of rights to French companies in respect of hydrocarbons	110-111
(d) Settlement of disputes	112
(3) Guarantees in respect of the economic activities of French nationals and enterprises	113-116
(a) General guarantees of equal treatment	114
(b) Guarantees against discriminatory measures and against taking without compensation	115-116
(4) Repurchase of French property rights	117-118
(5) Settlement of disputes	119
(6) Financing of investment	120
(ii) Modalities of the transfer of powers and functions, with special reference to natural resources	121-142
(1) Protocol on the implementation of commitments entered into by the Organisation commune des régions sahariennes (OCRS) regarding Algeria	122-123
(2) Convention on the application of the provisions on the special status of French petroleum companies set forth in the Declaration of Principles of Co-operation for the Exploitation of Saharan Subsoil Resources	124-130
(3) Convention on the establishment of a joint Franco-Algerian organ for the exploitation of Saharan subsoil resources	131-142
Area of jurisdiction	132
Administration	133
Functions and powers	134-137
Agreement regarding application of the Saharan Petroleum Code and the transfer of related powers and functions	138-142
(b) Netherlands-Indonesia (with respect to West New Guinea (West Irian))	143-144
2. Agreements relating to investment or establishment	145-172
(a) Pakistan-Federal Republic of Germany: Treaty for the Promotion and Protection of Investments	145-150
(i) Basic considerations and provisions	146
(ii) Provisions in respect of expropriation and compensation	147
(iii) Guarantee of investments	148
(iv) Settlement of disputes	149-150
(b) Pakistan-Japan: Treaty of Friendship and Commerce	151-154
(c) France-United States of America: Convention of Establishment	155-159
(d) Cameroon-United Kingdom: Agreement on Commercial and Economic Co-operation	160-166
(i) Protection of investments	161
(ii) Expropriation	162
(iii) Operation of enterprises	163
(iv) Settlement of disputes	164-166
(e) Guinea-Switzerland: Agreement on Commerce, investment protection and technical co-operation	167-172
(i) Most-favoured-nation treatment	168
(ii) Investment protection	169-170
Expropriation or nationalization	170
(iii) Arbitration clause with respect to the protection of investments	171-172
3. Agreements on compensation in respect of nationalized or appropriated property ..	173-177
(a) Bulgaria-United States of America	173-175
(b) Belgium and Luxembourg-Yugoslavia	176-177
B. Treaty Rights of States in Foreign Territories Pertaining to Natural Resources	178-187
1. Treaty rights and State succession	178-183
Tanganyika	178-183
2. Mining rights	184-187
Netherlands-Federal Republic of Germany	184-187
C. Multilateral Agreements and Draft Measures	188-193
1. European Economic Community: Convention of Association (1963)	188-189
(a) Trade	
(b) Right of establishment; movement of payments and capital	
(c) The institutions	
(d) General provisions	
2. Council of Europe: Draft recommendation on private foreign investments in developing countries	190-192
D. International Declarations	193-199
The Cairo Declaration of Developing Countries	193-199

	<i>Paragraphs</i>
III. INTERNATIONAL ADJUDICATION AND ARBITRATION	200-244
A. Arbitration and conciliation machinery for the settlement of disputes between States and private (corporate) parties	200-220
1. Machinery under international auspices	200-210
(a) The Permanent Court of Arbitration	200-204
(b) International Bank for Reconstruction and Development: Proposed international machinery for the settlement of investment disputes	208-210
2. Bilateral machinery	211-220
International court of arbitration established by Algeria and France	211-220
B. International adjudication and arbitration: State responsibility for property rights of aliens in cases of State succession	221-239
State responsibility for State contracts	
1. Subrogation and the successor State in respect of rights and duties under the concession contract	224-228
2. Respect for private acquired rights	229
3. Observance in good faith of agreements	230-231
4. Requirement for compensation in the event of a taking	322-233
5. Standards of compensation	234-239
C. Studies under the auspices of the United Nations	240-244
1. Succession of States and Governments	240-242
2. State responsibility	243-244
IV. STATUS OF PERMANENT SOVEREIGNTY OVER NATURAL WEALTH AND RESOURCES IN NON-SELF-GOVERNING AND TRUST TERRITORIES	245-262
Legislative and factual information	
1. Trust Territory of Nauru	245-247
Royalty payments to the indigenous population	245-247
2. Basutoland	248
Mining	248
3. Bechuanaland	248-252
(a) Land	249-251
(b) Mining	252
(c) Factual data on mineral production	
4. Kenya	253-258
Land	253-258
5. Nyasaland	259
Land	259
6. Swaziland	260-262
(a) Land	260
(b) Mining	261-262
(c) Factual data on mineral production	
V. ECONOMIC DATA PERTAINING TO THE STATUS OF SOVEREIGNTY OVER NATURAL WEALTH AND RESOURCES IN VARIOUS COUNTRIES	263-268
A. Data relating to the international flow of capital and the extent of foreign investment	263-265
1. International flow of capital	263-264
2. Indonesia: distribution of petroleum production between foreign companies and State enterprises	
3. Pakistan: Government participation in petroleum exploration costs	265
B. Activities of regional economic associations	266-268
European Coal and Steel Community: Mineral exploration in Africa	266-268
C. Concession and development agreements with foreign nationals and companies for the development of resources	269-297
1. Australia: Pechiney Company	269-273
2. Gabon: Compagnie des Mines d'Uranium de Franceville	274-297
(a) Basic economic considerations	278-279
(b) Domicile	280
(c) Guarantees provided by the grantor State	281-292
(i) General guarantees and guarantees of non-discrimination	281-282
(ii) Guarantees in respect of the effect of jurisdictional or institutional changes in the grantor State	283
(iii) Financial guarantees	284-285
(iv) Economic guarantees	286-288
(v) Juridical guarantees	289-292
(d) Settlement of disputes	293-296
(e) Duration of the agreement	297

2. Documents of other international organizations	39

Introduction

1. The present report is submitted in accordance with the terms of part III of General Assembly resolution 1803 (XVII) of 14 December 1962, by which the Assembly requested the Secretary-General

“... to continue the study of the various aspects of permanent sovereignty over natural resources, taking into account the desire of Member States to ensure the protection of their sovereign rights while encouraging international co-operation in the field of economic development, and to report to the Economic and Social Council and to the General Assembly, if possible at its eighteenth session.”

2. In its basic structure, the present report follows the pattern of the Secretariat study entitled *The Status of Permanent Sovereignty over Natural Wealth and Resources*,¹ which it is designed to supplement and to bring up to date.

3. Chapter I deals with national measures affecting the ownership or use of natural resources by foreign nationals or enterprises, and primarily covers recent examples of investment and mining legislation, with particular stress on the developing countries. Due account is taken of recent trends in the areas of production-sharing and investment-incentive measures, as well as of legislative provisions for the settlement of disputes under the measures reviewed.

4. Chapter II deals with international agreements affecting foreign participation in the development of natural resources. It covers the principles, policies and modalities germane to the ownership and exploitation of natural resources in recent instances of State succession, as well as certain recent bilateral agreements on the encouragement and protection of investment as between developing and capital-exporting countries and on compensation for nationalized property. Attention is also given to the question of treaty rights of States in foreign territory.

5. Multilateral agreements reviewed include the recent modified Convention of Association between the European Economic Community and the Associated States of Africa, and a draft recommendation of the Council of Europe on private foreign investments in developing countries. The Cairo Declaration of Developing Countries is dealt with under a separate sub-heading of the chapter.

6. Chapter III, on international arbitration and adjudication, includes a summary of three interrelated cases between France, Greece and Italy, in respect of a concession on lighthouses granted by the Ottoman Empire and questions arising out of a subsequent taking of that contract by a successor State. It also briefly covers new provisions of a bilateral and multilateral character for the settlement of disputes between States and private parties. Reference is also made to the work of the International Law Commission on the topics of State succession and State responsibility.

¹ United Nations publication, Sales No.: 62.V.6.

7. Chapter IV reviews legislative and factual information on the status of permanent sovereignty in Non-Self-Governing and Trust Territories. Chapter V provides factual information on the extent of foreign participation in certain resources exploration and exploitation arrangements, reviews recent developments relating to exploration arrangements under the auspices of a regional economic association, and deals with concession arrangements with foreign companies for the development of resources.

8. The report has drawn upon materials from official sources, including additional information requested from the Governments concerned, or from specialized agencies.

9. Special consideration has been given to subject areas which, in the course of the Assembly's debate on the agenda item of permanent sovereignty over natural resources at the seventeenth session, had attracted special attention or where, since the publication of the above-mentioned Secretariat study, new developments had taken place, e.g., the various aspects of State succession, and measures and machinery for conciliation and arbitration. In terms of geographical coverage, particular attention has been given to the developing countries, especially Africa, where new legislation has been enacted and treaties concluded.

I. National measures affecting the ownership or use of natural resources by foreign nationals or enterprises

A. INVESTMENT LEGISLATION

10. The present introductory section is designed to highlight certain trends that may be regarded as innovations in the realm of legislation bearing on the topic of permanent sovereignty over natural resources and related subjects, notably the encouragement of, and control over, foreign investments.

Profit remittances and export earnings

11. The various examples of national legislation set forth below show instances in which profit remittances by foreign companies are linked to those companies' exports earnings of foreign currency, either by making remittances entirely conditional upon foreign-currency earnings (e.g., Indonesia, production-sharing law) or by placing a percentage limit, based upon export earnings, on such remittances by the investor (e.g., Greece).

12. In essence, these are legislative mechanisms by which States protect their balance of payments — especially in "hard" currencies — against an outflow of funds that is not tied to a performance requirement in terms of export earnings. It is thus a monetary variant of other types of working obligations incumbent upon the investor.

Tax and other incentives

13. A notable feature of recent investment legislation, especially in countries where the large-scale exploitation

of natural resources might play a major part in the economy, is the flexibility provided for in respect of tax and other incentives for major investments (e.g., Algeria, Greece, Guinea, Ivory Coast, Mauritania, Senegal).

Provisions for the settlement of disputes

14. The recent investment legislation examined here is notable for the fact that it suggests an increase in provisions for recourse to arbitration in the event of disputes between the investor and the host Government (e.g., Dahomey, Ghana, Greece, Ivory Coast, Mauritania, Senegal). Arbitration by non-national tribunals is permitted either explicitly (e.g., Greece) or by implication in the case of legislation which provides for the establishment of arbitration modalities in each individual convention between the host Government and the investor (e.g., Algeria, Dahomey, Guinea, Ivory Coast, Mauritania, Senegal). This also applies to the recent minerals-exploitation concession granted by Gabon which is dealt with in detail in chapter V below. In the case of Ghana, provision is made for arbitration through the agency of the International Bank for Reconstruction and Development.

Expropriation

15. General guarantees against expropriation are provided for under the legislation of Ghana, while the the Investment Code of Algeria provides a guarantee against expropriation until the cumulative net profits of an enterprise equal the original capital investment.

1. ALGERIA

16. The Investment Code of 26 July 1963² provides for a variety of guarantees and incentives in the form of tax exemptions or abatements in respect of approved foreign enterprises of satisfactory financial standing, using modern or appropriate equipment which, by virtue of their location or their sector of activity, would contribute to the country's economic development in accordance with the Government's plans and programmes.

17. Provision is made for the conclusion of conventions with enterprises investing a minimum of 5 million francs and providing permanent employment for at least 100 Algerian nationals, subject to the conditions that they operate in an officially designated priority sector of the economy and that they locate in a designated priority area. Such instruments may provide for special long-range fiscal régimes for the enterprise in question and for the settlement of disputes arising out of the convention by arbitration.

18. The Code further provides for the establishment of mixed enterprises in which the Algerian State and foreign or national private capital participate jointly in sectors of vital importance for the national economy. The operations of such mixed companies are subject to conditions to be set forth in a *cahier des charges*; such

² Law No. 63-277, *Journal officiel de la République algérienne*, No. 53, 2 August 1963, p. 774.

companies may benefit from the incentives available to approved enterprises and to those operating under a convention.

Expropriation

19. A salient feature of the Code is the provision, in article 6, that expropriation within the framework of the law may not take place until the cumulative amount of net profits has attained the amount of the investment capital imported initially. Any expropriation gives rise to a right to fair compensation.

2. DAHOMEY

20. The investment Code of 31 December 1961³ provides for special régimes in respect of small and medium enterprises, and of major undertakings of primary importance to the country's economic development. Among inducements offered are guarantees in respect of equitable compensation in the event of expropriation; non-discriminatory treatment under the law; free transfer, within the framework of the exchange-control system, of profits and of liquidation capital; and maintenance of tax incentives in respect of reinvested profits up to 1975.

21. Benefits under the special régimes in question are accorded individually, by decree in the case of small and medium enterprises, and by special law in the case of major undertakings, on the basis of an establishment convention.

*Settlement of disputes*⁴

22. In the event of dispute regarding the provisions of investment contracts or conventions, the law provides for arbitration procedure, whose modalities are to be set forth in each contract of convention and which must cover the following points:

- (a) Nomination of an arbitrator by each of the parties;
- (b) Nomination of a third arbitrator by agreement between the parties or by a highly qualified authority, to be designated in the convention. This authority may be the highest judicial authority in the country of which the investor is a national;
- (c) The definitive and executive character of the award promulgated by a majority of the arbitrators, who are masters of their own procedure and adjudicate in equity.

3. GHANA

23. The Capital Investments Act, 1963,⁵ provides for the establishment of a Capital Investments Board whose functions are to include the initiation and organization of activities for the encouragement of investment of foreign capital, and the granting of approval for

capital investments. The Act provides for the approval of investments in the form of an agreement between the Government and the investor concerned, "not being inconsistent with the provisions of this Act," setting out the conditions of the approval and the benefits conferred by the agreement (section 2).

24. Approved investment objectives are defined as

- (a) The development of the productive capacity of the national economy through the efficient utilization of its resources and economic potential;
- (b) The full utilization and expansion of the productive capacity of existing enterprises;
- (c) The saving on imports, the increase of exports and the improvement of services which will assist the strengthening of the payments position of the country; or
- (d) A high level of employment and the importation of technical skill to persons who are citizens of Ghana (section 5).

(a) *Investment incentives*

25. The Act provides for a variety of tax benefits, including exemption from certain indirect taxes, capital allowances and deferred payment of registration fees and stamp duties. It is, however, noted that the grant of exemption from indirect taxes "shall be made in such a manner as will not create privileges in the competitive position of similar projects nor tend to the establishment of monopolies" (section 14).

(b) *Protection of investments*

26. Section 8 of the Act entitled "Compensation for nationalization", states that;

- (i) Subject to the provisions of this section, no investment under this Act shall be subject to expropriation by the Government;
- (ii) Where, however, in exceptional circumstances an approved project is taken over in the public interest, the Government shall pay fair compensation in the currency in which the investment was originally made;
- (iii) Where there is a dispute as to the amount of compensation payable under this section, the matter shall be referred to an arbitrator appointed by the parties and failing such appointment to arbitration through the agency of the International Bank for Reconstruction and Development.

4. GREECE

27. Law No. 4171/1961 on measures to stimulate the development of the country's economy is of special interest in that it specifies advance determination of the rights and obligations of the Government and of the investor, and in that it prohibits subsequent modification of these terms by the Government without the investor's consent. It further provides for the settlement of disputes by arbitration by the terms of the agreement concluded, in derogation of any existing rules barring arbitration on State contracts.

³ Law No. 61-53, *Journal officiel de la République du Dahomey*, 15 January 1962, p. 175.

⁴ *Ibid.*, article 38.

⁵ Act 172, 19 April 1963.

(a) *Legislative scope*

28. The law is designed to "stimulate investment that will help to speed up the growth rate of the Greek economy" and applies to "important productive investment projects".

29. Such projects are defined as

"those which contribute to the economic progress of the country and which would produce a substantial increase in national output and employment, or an important increase in exports, or save significant amounts of foreign exchange, or would cause a substantial inflow of foreign exchange, provided, however, that the value of such investment projects shall be in excess of 90 million drachma." (Article 1, para. 2)

30. The law provides for a wide range of exemptions from, or reductions in, taxes, import duties, stamp and licence fees relating to the initial installation of the facility in question and in respect of income and capital taxes up to a period of fifteen years. In the case of foreign companies, profits on capital invested may be repatriated at the rate of 6 per cent *per annum*, provided that such remittances do not exceed 8 per cent *per annum* of the earnings in foreign exchange of such enterprises from the sale abroad of their products.

(b) *Terms of agreement*

31. The determination whether a given project meets the requirements set forth above is subject to the decision of the Ministers of Co-ordination, Finance, and the Minister appropriate in each case. By the same decision, or by a separate instrument, this ministerial committee shall determine

"The rights and obligations of the Government and of the investor, as well as the consequences of the latter's non-compliance therewith." (Article 1, para. 4)

32. The Government is empowered to

"underkake commitments within the limits of the provisions of the present law and other legislation which might be in force, the duration whereof might be guaranteed for a certain period of time. Modification of the terms of the decision shall be permitted only with the consent of the investor." (*Ibid.*)

33. In the case of productive investment projects exceeding the amount of 180 million drachmas in value, the joint ministerial decision described above may be replaced by an agreement between the Government and the investing enterprise.

"This agreement shall determine the rights and obligations both of the Government and of the party making the investment. The Government may commit itself within the limits of the provisions of this law and any other provisions currently in effect, the duration of which may be guaranteed for a specific period of time from the end of the calendar year during which the enterprise commenced its productive operations." (Article 4, para. 1.)

"Such an agreement and the transfer of the rights accruing thereunder to the corporation to be established by the contracting party prior to the commencement of productive operations by the latter, shall be exempt from all Government and third party taxes, dues, contributions, levies and any other charges." (Article 4, para. 2.)

(c) *Settlement of disputes*

34. With respect to both the above-mentioned agreements between the Government and the investing enterprise, and to cases subject to the issuance of a joint ministerial decision, the law provides that

"Any disputes arising between the Greek Government and enterprises coming under the provisions of the present law which might relate to the interpretation of, or to possible deficiencies in, the agreement to be executed, shall be resolved by arbitration as provided under the agreement, in deviation from standing regulations on arbitration in which the Government is involved. A foreign national may also be designated to act as arbitrator in such arbitration. (Article 4, para. 4.)

5. GUINEA

35. The investment Code of 5 April 1962⁶ sets up a system of priorities for investments of particular importance to the country's economy, to the exclusion of enterprises engaged solely in commerce, but including, among others, those engaged in the mining industry and in the refining or processing of minerals.

36. Investment incentives available to priority enterprises cover a variety of tax reductions or exemptions, and tariff protection, for a period of from seven to ten years in the case of small or medium enterprises with an invested capital of at least 150 million Guinea francs, and for a period of up to twenty-five years in the case of major enterprises making a substantial investment.

37. Priority enterprises will be permitted to repatriate their capital by way of write-offs at the rate of 10 to 15 per cent annually after the last financial year of tax exemption. Foreign investors or lessees may transfer interest in full and at least 20 per cent of their share of net profits.

38. A system of individual conventions is to apply to enterprises in the mining, petroleum and hydroelectric industries. Establishment conventions setting forth general guarantees may be entered into and may comprise guarantees in respect of the extension of grants of mining rights.

39. Disputes arising out of the interpretation of establishment conventions shall be subject to an arbitration procedure to be agreed upon by the parties in the case of each convention.

6. INDONESIA: PRODUCTION-SHARING LAW

40. In a statement issued on 3 August 1962,⁷ the President of Indonesia formulated the policy of production-sharing in Indonesia's relations with foreign investors. The statement, issued in accordance with the Presidential Decree of 8 May 1962 on national economic policy, consists of six articles setting forth basic policy considerations, and an appendix of nine articles which define the modalities of the policy's application.

⁶ Law No. 50 AN/62. *Journal officiel*, 4th year, No. 6, 7 April 1962.

⁷ *Report on Indonesia*, Embassy of Indonesia, Washington D.C., vol. 11, No. 10, September 1962, pp. 2 to 4.

41. The basic elements of production-sharing are the acceptance of foreign credits or loans, with repayment of the foreign creditor out of the proceeds, in foreign currency, of the sale of the products of the new production unit established with the aid of the funds so lent. The policy rationale, as set forth in article VI of the statement, stresses that production-sharing thus avoids any strain on the country's balance of payment by, in effect, tying service of the loan or credit directly to the performance of the venture concerned.

42. The statement rejects "foreign investment in its classical sense" on political grounds and on the ground that it involves the free transfer of profits beyond the point of total amortization of the investment; it similarly rejects credits or loans not tied to production-sharing on the grounds that their service constitutes a burden on the country's balance of payments by establishing a prior claim on its foreign-currency receipts, regardless of the actual performance of the investment concerned.

43. The statement notes that one of the purpose of the introduction of the production-sharing concept is to

"secure the national ownership and management of an enterprise or production unit;"

it goes on to state that

"Inherent in the concept of credit based on production sharing is the idea that new enterprises or production units be owned by [the State of] Indonesia or by Indonesian private parties, and that management be in the hand of [Indonesian] nationals."⁸

44. Essentially similar terms are used in defining the objectives of production-sharing set forth in the appendix to the statement in question.

45. As regards areas of activity, set forth in article II of the appendix, these are defined as follows:⁹

(a) In general, the production areas of the Indonesian natural wealth which have world commercial value shall be open for credit based on production sharing;

(b) In the area of establishing local projects which primarily will supply domestic consumption, production sharing shall also be permitted;

(c) By the integrating projects which produce goods for domestic consumption [as indicated under (b) above] with projects producing goods for foreign consumption, the financing of the former projects can ultimately be covered by the receipts from export commodities.

46. Article I of the appendix re-emphasizes that title and management of a project or production unit is, from the outset, to be in the hands of Indonesian nationals; in addition, such projects will be under Government supervision with regard to the utilization of the credits involved, and the Government guarantees the execution of each production-sharing agreement.

47. As regards repayment, the modalities are to be established individually for each project, subject to the basic provision that

"Repayment commences after the project starts producing or after the project starts additional production brought about by the use of credit."¹⁰

In addition, during the term of the agreement, the creditor will be allowed to participate in the sale of the production on terms to be established individually for each project.¹¹

7. IVORY COAST

48. The Law on Private Investments of 3 September 1959¹² establishes certain priority industries, covering the following sectors of the economy: (1) real-estate development; (2) industrial crops (sugar, rubber, oil-bearing plants); (3) food-processing industries; (4) major consumer-goods industries; (5) mining and petroleum exploration; and (6) power generation.

49. Major enterprises in the above-noted categories may, by individual legislation, be admitted to a *régime fiscal de longue durée* providing for major tax benefits, to be determined in each case and to be incorporated in an establishment convention, which must be approved by the Council of Ministers and promulgated by decree.

Settlement of disputes

50. In the event of a dispute regarding the provisions of an establishment convention or the determination of compensation for a breach of contract, the parties may have recourse to arbitration under conditions to be established for each convention (article 10).

8. MAURITANIA

51. The Law on Private Investments (26 June 1961)¹³ is designed to attract new enterprises into priority sectors of the economy, including (1) mining and petroleum exploration, and related activities; (2) food and allied processing industries; (3) consumer-goods manufacturing and assembly; (4) fisheries and fish processing; (5) power generation; (6) shipbuilding; (7) real-estate development; and (8) the general development of the country's basic economic infrastructure.

52. Enterprises in these sectors must fulfil certain working and investment obligations, and must undertake to co-operate in the economic and social development plans of the Government. A minimum investment of 75 million francs CFA over a two-year period, the employment of at least twenty Mauritanian nationals, and incorporation in Mauritania are among the qualifying requirements.

53. Incentives offered include a variety of tax reductions or exemptions, as well as exemption from import

¹⁰ Article VIII (a).

¹¹ Article V.

¹² Law No. 59-134, *Journal officiel de la République de Côte d'Ivoire*, No. 58, 10 September 1959, p. 823.

⁸ Statement, article VI.

⁹ Appendix, article II.

duties, for periods of three to five years. Specific modalities in these and other respects are to be established individually in the light of the size and importance to the national economy of the enterprise concerned. Enterprises making an investment of at least 100 million francs CFA may be given guarantees against adverse changes in tax structure for up to twenty-five years. Specific conditions are to be set forth in an establishment convention concluded under the *régime fiscal de longue durée*,¹⁴ subject to legislative approval.

Settlement of disputes

54. The settlement of disputes relating to compliance or otherwise with the provisions of establishment conventions may take place through international arbitration, whose modalities are to be set forth in the convention.

55. Similarly, serious cases of non-compliance with the obligations contained in the legislative instrument admitting a company to the *régime fiscal de longue durée* may, once such non-compliance has been determined by a Mauritanian Court, be submitted to arbitration by the company concerned under the terms of the establishment convention. Resort to arbitration suspends execution of action against the company.

56. Abrogation of the agreement must be promulgated by decree in the light of the arbitral award, which may include retroactive penalties. (Article 14.)

9. SENEGAL

57. The Investment Code of 22 March 1962¹⁵ provides, among others, for guarantees regarding free transfer of profits and capital in respect of approved foreign investments, and for a broad range of tax reductions and exemptions, with special additional inducements for enterprises establishing facilities outside the Cap-Vert (Dakar) region.

58. Provision is made for the conclusion, between the State and individuals or companies, of establishment conventions, to be promulgated by decree, which may embody a variety of guarantees in respect of operational and tax matters, subject to a minimum investment of 100 million francs CFA. Special arrangements outside the framework of the law quoted above may be made in respect of mineral exploration and exploitation.

Settlement of disputes

59. An establishment convention may provide for the settlement of disputes by arbitration, the modalities of which are to be established by said convention.¹⁶

¹⁴ A special *régime fiscal de la longue durée* applicable to holders of iron-mining concessions was established by Law No. 59.060 of 10 July 1959 (*loc. cit.*, 19 August 1959, p. 193) and extended to the MIFERMA company by Law No. 59.061 of the same date (*ibid.*, p. 195).

¹⁵ Law No. 61-33, *Journal officiel de la République du Sénégal*, No. 3520, 31 March 1962, p. 587.

¹⁶ *Ibid.*, article 37.

B. MINING LEGISLATION

1. INDONESIA: PETROLEUM LEGISLATION¹⁷

60. In October 1960, a Government regulation replacing Law No. 44 on the mining of mineral oil and gas was enacted. In accordance with this regulation, the natural riches in Indonesian territory, land and water, belong to the Indonesian people and are national property.

61. Concession on rights and other rights over mining areas for mineral oil and gas based on the Indies Mining Law, S.1899, No. 214 in conjunction with S.1906, No. 434, as since amended can no longer be valid. With the introduction of this Government regulation in place of the Law on Mining of Mineral Oil and Gas, the position of the foreign enterprises working in Indonesia in the field of mineral oil and gas mining will be modified. Foreign enterprises may no longer acquire mining rights in certain Indonesian territories; and only state enterprises will be allowed to manage a mineral oil and gas area and this right will be substantially different from the former concession right.

62. However, as the mineral oil and gas industry requires a very large capital outlay as well as a high level of technical skill, it is still possible, according to this regulation, for foreign companies to work in Indonesia as the contractor of a state enterprise, on satisfactory terms. The granting of a contract is entirely in the discretion of the Government.

2. KENYA: CONSTITUTIONAL PROVISIONS IN RESPECT OF LAND AND MINING RIGHTS

(a) *Land tenure*¹⁸

63. Under the terms of the Kenya Constitution of 1963, all Crown lands and lands vested in the Governor on behalf of the Crown in right of the Government of Kenya outside the Nairobi area are to be vested in the region¹⁹ concerned on the day the Constitution comes into operation. Crown lands and lands held by the Land Trust Board in the Nairobi area will be vested in right of the Government of Kenya. Additional land areas in the regions may be scheduled for vesting in the Government of Kenya.

64. There are established, as Trust lands vested in the County Council concerned, land in the Special Areas formerly registered in the name of the Trust Land Board, and all former Special Reserves, Special Leasehold Areas and Special Settlement Areas.

(b) *Mineral and mining rights*²⁰

65. The regional assemblies may enact laws empowering county councils to set apart any area of Trust land

¹⁷ *Mining Developments in Asia and the Far East, 1960*, Mineral Resources Development Series No. 16, United Nations publication, Sales No. 62.II.F.6, p. 46.

¹⁸ *Statutory Instruments* 1963, part I, No. 791, schedule 2, sections 192-202.

¹⁹ *Ibid.*, section 82. Under the Constitution, Kenya is divided into seven regions, in addition to the Nairobi area.

²⁰ *Statutory Instruments* 1963, part I, No. 791, schedule 2, sections 198 (7-11); 199 (1) and 203.

for the purpose, *inter alia*, of the extraction of minerals and mineral oils. In such cases any rights previously vested in any tribe, group, family or individual under African customary law shall be extinguished, subject to prompt payment of full compensation. In the case of land vested in a region, the Prime Minister of Kenya, in consultation with the President of the regional assembly, may vest in the Government of Kenya any land required for, *inter alia*, the extraction of minerals (other than common minerals) or mineral oils, subject to prompt payment of full compensation.

66. All unextracted minerals (other than common minerals) and mineral oils that are situated in any part of Kenya shall be deemed to have vested in the Governor on behalf of Her Majesty in right of the Government of Kenya on the day on which this Constitution came into operation.

67. All unextracted common minerals in the Nairobi area are vested in the Government of Kenya, while those in the regions are vested in the region concerned.

68. Provision is made for recognition of any grants of rights vested in any person in respect of minerals and mineral oils, and of any grants of rights that may be made by the Governor or the regional assemblies.

3. MEXICO: EXTENSION OF MINING RÉGIMES TO ADDITIONAL MINERAL SUBSTANCES

69. By decree of 30 August 1962,²¹ Mexico extended the applicability of the Regulatory Law for Article 27 of the Constitution relating to the exploitation and utilization of mineral resources²² to certain mineral substances, notably coal, which had previously been treated as exempt from the concessionary régimes applicable to all other minerals.

70. The decree had the additional effect of extending the provisions regarding Mexican participation in the exploitation of minerals laid down by the above-mentioned Regulatory Law to the coal-mining industry.

71. The decree noted, in its *consideranda*, that the Mining Law of 1930 had provided for the confirmation of titles to mining rights for coal, bog iron, alluvial iron ore, placer tin and others when such rights had originated prior to the enactment of the Constitution of 1917, and when they were coupled with rights to the use of the surface of the land. These provisions were, however, at variance with the reformed Constitution of 6 January 1960 which provided for the application of concessionary régimes to all mineral exploitation.

72. The decree in question accordingly annulled all rights protected by titles to the exploitation of coal and provided for the extension of the concessionary régime to coal mining. Applications for concessions were to be submitted by 31 May 1963, by which date interested companies should have changed their economic and legal capital structure so as to adapt it to the provisions of the

Regulatory Law for Article 27 of the Constitution relating to the exploitation and utilization of mineral resources.

4. NIGER: MINING LAW

73. Under the Mining Law of 29 May 1961,²³ concession rights may be granted in respect of mineral substances other than those that are normally subject to exploitation by quarrying (article 4). Mining titles may be granted to companies only if these are constituted in accordance with the Company Law of Niger (article 6).

(a) Exploration

74. Exploration permits are granted by decree of the Council of Ministers on the basis of proof of the applicant's financial and technical capabilities, and in the discretion of the State (article 12). Each permit is valid for a maximum period of five years and may be renewed twice, to a total maximum of fifteen years (article 13). It gives rise to a right to an exploitation permit if the mineral discoveries warrants this, or to a concession if, apart from the presence of the minerals concerned in exploitable quantities, the applicant has the necessary financial and technical capabilities (article 14).

(b) Exploitation and concessions

75. Exploitation permits are granted by decree and cover the same minerals as the exploration permits from which they derive (article 20). The validity of exploitation permits is four years, renewable to a maximum total of twenty years (article 21).

76. Concessions are similarly granted by decree, for a period of seventy-five years, renewable for an unlimited number of twenty-year periods (article 30). Minimum working requirements must be met (article 34).

(c) Strategic minerals

77. Provision is made (title IV) for special treatment of strategic minerals whose exploitation and export are subject to agreements which the Republic of Niger may have, or may in future conclude with a third State.

5. UNITED ARAB REPUBLIC: TERMS OF CONCESSION IN THE WESTERN DESERT

78. The 1960 terms of concession²⁴ applicable to the Western Desert area of the United Arab Republic lay down a variety of requirements and desiderata on the basis of which the Government declared its readiness to accept offers for the grant of concessions. Provisions of special interest in the context of the present study are set forth below.

²³ Law No. 61-8, *Journal officiel de la République du Niger*, 15 July 1961, p. 32.

²⁴ Issued in pursuance of articles 50 and 51 of Law 86 of 1956, authorizing special terms exempt from the provisions of Law 66 of 1953 (Mining Law).

²¹ Mexico, *Diario Oficial*, 31 August 1962.

²² See *The Status of Permanent Sovereignty over Natural Wealth and Resources, Study by the Secretariat*, United Nations publication, Sales No.: 63.V.6., chapter I, note 96.

(a) *Domestic participation*

79. The legislation concerned makes provision for the

"Formation of an Arab company for the exploitation of oilfields discovered, with the right of national capital to participate in this company (article 9)."

"The Government is entitled to the option of applying either: (a) participation of national capital in the Arab company formed according to Article 9, in this case the Government receives either the aggregate sum of royalties, rentals and taxes or 50 per cent of the net profits without stipulating its share as participant in the Arab company; [or] (b) no participation of national capital and in this case the Government is entitled to receive either the aggregate sum of royalty, rentals and taxes or a percentage higher than 50 per cent of the net profits."

It is for the applicant to select, in advance, either of these bases for the grant of concession.

(b) *Refining obligation*

80. Article 11 notes that acceptance of an obligation by the applicant to refine and manufacture locally part of the production in excess of a certain limit will "be highly considered in granting a concession".

C. EXPROPRIATION AND OTHER FORMS OF TAKING

1. CONSTITUTIONAL PROVISIONS

Kenya

81. The Constitution of Kenya, promulgated by the Kenya Order in Council 1963²⁵ and to come into operation by proclamation provides that all persons in Kenya are entitled to "protection...from deprivation of property without compensation" [section I (c)].

82. More specific provisions are laid down in section 6 (1), as set forth below.

"No property of any description shall be compulsory taken possession of, and no interest in or right over property of any description shall be compulsorily acquired, except where the following conditions are satisfied, that is to say—"

"(a) the taking of possession or acquisition is necessary in the interests of defence, public safety, public order, public morality, public health, town and country planning or the development or utilisation of any property in such manner as to promote the public benefit; and"

"(b) ... [there is reasonable justification for causing hardships];"

"(c) Provision is made by a law applicable to that taking of possession or acquisition for the prompt payment of full compensation."²⁶

²⁵ *Statutory Instruments* 1963, part I, No. 791, London, H.M. Stationery Office, 1963. The Constitution itself is attached as schedule 2 to the Order.

²⁶ Essentially similar provisions are contained in section 17 (1) of the Constitution of Sierra Leone (*op. cit.*, 1961, No. 741, The Sierra Leone (Constitution) Order in Council 1961), London, H.M. Stationery Office, 1961.

83. For the purposes of determining the legality of the taking and the amount of compensation due, as well as of obtaining payment of that compensation, every person affected by a taking shall have a right of direct access to the Supreme Court. Such access shall be way of appeal if the relevant legislation provides for the jurisdiction of any other authority or tribunal.

2. LEGISLATIVE MEASURES

(a) *Brazil: Decree of 30 May 1962*

84. An example of a measure of expropriation that, in its legislative text, also voices concern about the measure's effect on new foreign investment is provided by Brazilian Decree No. 1106 on direct operation of public utility services formerly under concession.²⁷

85. The preambular considerations, after noting the desirability, in the national interest, of direct operation of public service or utilities,²⁸ state that "the constitutional principles of the guarantee of private property; both domestic and foreign, must be observed;" and recall that the Council of Ministers, in its plan of government submitted to Congress "recognized the necessity for the participation of foreign investments in the country as a supplement to the formation of internal capital..."

86. The final considerandum then states that:

"Whereas the nationalization of public utility companies should not result in a reduction of foreign investments in the country, nor in the creation of a climate discouraging to new investments, nor constitute a source of substantial increase in the exchange burdens arising out of such investments;"

87. The decree's substantive provisions cover (1) the compilation of a list of the utility services to be taken over, in order of priority; and (2) negotiations with concession holders to establish compensation conditions and procedures.

88. Compensation agreements are to be based on the following principles:

(a) Initial payment of a portion not to exceed 10 per cent of the agreed total;

(b) Deferred payment of a portion in installments compatible, whenever possible, with the funds accumulated by the utility concerned and with a minimum of additional public funds;

(c) The assumption, by the concession holder, of an obligation to reinvest in the country, in sectors or activities defined by the National Planning Commission as enjoying priority for social and economic development, of not less than 75 per cent of the net amounts received by way of reimbursement or compensation, such reinvestment not to be applied to the financing of, or participation in, any Brazilian enterprise already in operation.

²⁷ *Diario Oficial*, 30 May 1962.

²⁸ Provision is made for the exemption of municipal services or services of limited regional scope, where private concessions are justified, from the effects of the decree.

In the event of dispute on the amount of compensation due, provision is made for a decision on that point by the President of the Council of Ministers, with Cabinet approval.

89. The compulsory reinvestment provisions noted above are a novel feature in legislation of this type and are designed as a means of channelling the bulk of compensation funds into under-developed sectors of the country's economic or social structure, as directed by the Government.

(b) *Ceylon: Ceylon Petroleum Corporation Act, 1961, and Ceylon Petroleum Corporation (Amendment), Act 1963*

90. The Ceylon Petroleum Corporation Act, No. 28 of 1961,²⁹ established a government corporation to import, export, sell and distribute petroleum products and provided for the compulsory acquisition of all necessary facilities. Under the 1963 amendment Act,³⁰ the corporation's terms of reference were extended to the exploration, exploitation, production and refining of petroleum, and the exclusive right to carry on all these activities in Ceylon was vested in the corporation with effect from 1 January 1964.

91. The 1963 measure introduces no changes in those sections of the original Act which relate to measures of compensation³¹ and which provide for the establishment of a Compensation Tribunal, nominated by the Government of Ceylon, which is to determine the entitlement to compensation of claimants and to make all relevant awards. Under the terms of section 65 (4) of the 1961 Act "An award of the Tribunal shall be final and shall not be called in question in any court".

(c) *Iraq: Law Defining the Exploitation Areas for the Oil Companies*

92. Under the terms of Law No. 80 of 1961 Defining the Exploitation Areas for the Oil Companies, the Government of Iraq may free lands, other than those defined in a schedule appended to the law and defining areas in which the oil companies (the Iraq Petroleum Co. Ltd., the Mosul Petroleum Co. Ltd., and the Basrah Petroleum Co. Ltd.) have rights to carry out their operations, of all such rights as have come to be held by the companies therein. The relevant provision (Article 4), however, adds that

"Arrangements necessary for the pumping and transportation of oil across such lands shall remain valid, provided that this shall not infringe any legal or reasonable use of the land."

²⁹ Came into force 29 May 1961.

³⁰ Act No. 5, 22 August 1963.

³¹ The principal provision in respect of property vested in the corporation (section 47 (1)) states that

"the amount of compensation to be paid ... shall be the actual price paid by the owner for the purchase of such property and an additional sum which is equal to the reasonable value of any additions and improvements made to such property by any person who was interested or if such purchase price is not ascertainable, be an amount equal to the price which such property would have fetched if it had been sold in the open market on the day on which the property was vested in the Corporation."

In essence, the law affects areas in which the companies hold exploration rights but are said, in an explanatory statement accompanying the law, not to have been sufficiently diligent in their rate of exploration.

II. International agreements affecting the foreign exploitation of natural resources

A. BILATERAL AGREEMENTS

93. The present section covers, under appropriate headings, (1) agreements relating to the principles, policies and modalities of recent instances of State succession in so far as these are germane to the ownership and exploitation of natural resources; (2) agreements relating to investment or establishment; and (3) agreements on compensation in respect of nationalized or appropriated property.

1. AGREEMENTS RELATING TO STATE SUCCESSION³²

(a) FRANCE — ALGERIA

(i) *Principles and policies regarding State succession, with special reference to natural resources*

94. A number of the Declarations drawn up in Common Agreement by the Government of France and the Algerian National Liberation Front at Evian-les-Bains on 18 March 1962³³ and defined in their modalities of application by the Protocols, Conventions and Agreements between the Government of France and the Provisional Executive of Algeria of 28 August 1962³⁴ relate to various aspects of the topic of permanent sovereignty over natural resources, with special refer-

³² This paper has not covered more general types of agreements relating to State succession which make no specific reference to property and related rights. An example of a general agreement is that concluded on 1 October 1960 between the United Kingdom and Nigeria, by which the parties agree that:

(i) All obligations of the Government of the United Kingdom which arise from any valid international instrument shall henceforth, in so far as such instrument may be held to have application to Nigeria, be assumed by the Government of the Federation of Nigeria;

(ii) The rights and benefits heretofore enjoyed by the Government of the United Kingdom in virtue of the application of any such international instrument to Nigeria shall henceforth be enjoyed by the Government of the Federation of Nigeria. (*Federation of Nigeria, International Rights and Obligations, Exchange of letters between the Government of the United Kingdom and the Government of the Federation of Nigeria*, London, H.M. Stationery Office, Cmnd. 1214).

For a full discussion of succession treaties, see *Summary of the Practice of the Secretary-General as Depositary of Multilateral Agreements* (ST/LEG. 7) and *Yearbook of the International Law Commission 1962*, vol. II, document A/CN.4/150.

³³ France, *Journal officiel*, No. 67, 20 March 1962, pp. 3019-3039.

³⁴ France, *Journal officiel*, No. 204, 30 August 1962, pp. 8506-8526; Algeria, *Organisme technique de mise en valeur des richesses du sous-sol Saharien, Bulletin juridique*, January 1963 (Decree No. 62-515, 7 September 1962), p. I-1.

ence to the protection of acquired rights of French nationals and juridical persons in Algeria and to the exploitation of Saharan mineral resources, especially petroleum and natural gas.

(1) *Acquired rights*

95. The protection of the acquired rights of French nationals and juridical persons in Algeria is enunciated as a general principle both in the preamble and, under an appropriate separate heading, in Title IV of the Declaration of Principles Concerning Economic and Financial Co-operation. The preambular statement makes it clear that the protection of French acquired rights in Algeria rests on a contractual reciprocal basis, in which French technical assistance constitutes a *quid pro quo*.

96. The protection of French acquired rights in the exploitation and transport of the mineral resources of the Algerian *départements* other than those of the Cases and the Sahara is dealt with in a separate article of the above-mentioned Declaration.

97. The subject of acquired rights with respect to the subsoil resources of the Sahara is dealt with separately in the Declaration of Principles of Co-operation for the Exploitation of Saharan Subsoil Resources (see paragraphs 104-105 below).

Acquired rights within the framework of general principles of economic and financial co-operation

98. The Declaration of Principles Concerning Economic and Financial Co-operation speaks, in its preamble, of such co-operation between France and Algeria "on a contractual basis" in accordance with the following principles:

"1. Algeria shall guarantee French interests and the acquired rights of individuals and juridical persons;

"2. France shall undertake in return to grant Algeria its technical and cultural assistance and to make to its economic and social development any preferential contribution that is justified by the extent of French interests in Algeria;

"3. In the framework of these reciprocal commitments, France and Algeria will maintain privileged relations, particularly with respect to trade and currency."

99. Under the heading of Guarantees of Acquired Rights and Previous Commitments, Title IV of the Declaration states that

"Algeria will ensure without any discrimination the free and peaceful enjoyment of patrimonial rights acquired on its territory before self-determination. No one will be deprived of these rights without fair compensation previously determined." (Article 12).

100. A restatement of the principle of the protection of French acquired rights with respect to mining or transport titles in the thirteen northern Algerian *départements* (excluding the Sahara region, which is the subject of a special declaration — see below) is contained in article 14 of the Declaration.

(2) *Exploitation of mineral resources of the Sahara*

101. The General Declaration drawn up at Evian-les-Bains provides³⁵ that in the *départements* of the Oases and of the Sahara the development of subsoil resources shall be ensured by a joint French-Algerian technical organ for Saharan co-operation. The Algerian State will issue mining titles and will enact mining legislation in full exercise of its sovereignty.

102. It is further provided that French interests will be assured in particular by:

"The exercise, in accordance with the regulations of the Sahara Petroleum Code³⁶ as presently in force, of the rights attached to mining titles granted by France;

"Preference being given, in the case of equal offers, in the granting of new mining titles, to French companies, in accordance with the terms and conditions provided for under Algerian mining legislation;

"Payment in French francs for Saharan hydrocarbons up to the amount of the supply requirements of France and of other countries of the franc currency area."

103. The Declaration of Principles of Co-operation for the Exploitation of Saharan Subsoil Resources provides for French-Algerian co-operation, within the framework of Algerian sovereignty, in the continued exploitation of Saharan subsoil resources. In particular, it is provided that

"Algeria succeeds to France in the latter's rights, prerogatives and obligations, in the exercise of State functions in respect of the grant of concessions in the Sahara, for the application of the mining and petroleum legislation ...³⁷"

(a) *Acquired rights*

104. The Declaration relating to Saharan mineral resources contained, under Title I (Liquid and Gaseous Hydrocarbons), a section A entitled "Guarantee of Acquired Rights and of their Prolongation", paragraph 1 of which reads as follows:

"Algeria shall confirm all the rights attached to the mining and transport titles granted by the French Republic in pursuance of the Sahara Petroleum Code."

105. Essentially similar language appears in paragraph 11 of Title II (Other Mineral Substances) with respect to minerals other than hydrocarbons.

(b) *Discriminatory and arbitrary measures*

106. The Declaration quoted above states³⁸ that the provisions of Title I (Liquid and Gaseous Hydrocarbons)

"shall be applicable without distinction to all holders of mining or transport titles and to their associates, whatever the legal nature, origin or distribution of their capital and irrespective of any conditions as to nationality of the persons concerned or the situs of incorporation." (Paragraph 6).

³⁵ Chapter II, section B, paragraph 2.

³⁶ Ordinance No. 58-1111, 22 November 1958.

³⁷ Preamble, paragraph 2.

³⁸ Title I.

107. It further provides that

“Algeria will refrain from any measure burdening or hindering the exercise of the rights guaranteed above, taking into account normal economic conditions. It will not infringe upon the rights and interests of the stockholders, shareholders or creditors of persons holding mining or transport titles, of their associates, or of enterprises acting for their account.” (Paragraph 7).

108. A second section of Title I is headed “Guarantees for the Future (New Mining or Transport Titles)” and includes the provision that

“Algeria shall refrain from any discriminatory measures to the detriment of French companies and their associates in the exploration, exploitation or transport of liquid or gaseous hydrocarbons.” (Paragraph 9.)

109. As noted in sub-section (c) below, provision is made for the special position of French corporations in respect of petroleum exploitation and transport titles; on the other hand, the Declaration provides for most-favoured-nation treatment of French corporations in respect of titles to minerals other than hydrocarbons:³⁹

“French companies may submit claims for new permits and concessions under the same conditions as other companies; they will enjoy treatment as favourable as that accorded to the latter companies for the exercise of the rights deriving from these mining titles.” (Paragraph 12.)

(c) *Special provisions for grants of rights to French companies in respect of hydrocarbons*

110. For a period of six years from the entry into force of the Declaration, French companies will be given preference with regard to exploration and exploitation permits in the case of equal offers for areas available for allocation. The relevant provision (Title I, paragraph 8) further stipulates that

“The applicable regulations will be those defined by existing Algerian legislation, French companies, however, remaining subject to the Sahara Petroleum Code...⁴⁰ as regards mining titles covered by the guarantees in respect of acquired rights.”

111. French companies are then defined as companies whose control is in fact exercised by French nationals or juridical persons.

(d) *Settlement of disputes*

112. The Declaration provides⁴¹ that, notwithstanding any provisions to the contrary, all litigations or disputes between the public authorities and holders of acquired rights in respect of hydrocarbon minerals shall be dealt with by an international court of arbitration. This court was subsequently established under the terms of the Agreement on Arbitration⁴² concluded between Algeria and France on 26 June 1963.

³⁹ Title II.

⁴⁰ See paragraphs 104-105 above.

⁴¹ Title IV.

⁴² For the modalities governing the functioning of this court, see chapter III, paragraphs 211-220 below.

(3) *Guarantees in respect of the economic activities of French nationals and enterprises*

113. The Declaration of Guarantees assures French nationals resident in Algeria as aliens equal treatment with Algerian nationals in respect of certain economic rights, which may conveniently be set out under the headings of (i) general guarantees of equal treatment; and (ii) guarantees against discriminatory measures and against taking possession without compensation.

(a) *General guarantees of equal treatment*

114. Guarantees under this heading cover equal treatment in respect of (1) free access to all occupations and the rights necessary to practise them effectively, in particular the right of conducting and establishing businesses; (2) the right to acquire and to dispose of the ownership of all personal property and real estate, the right to administer it and to have use of it, subject to the provisions on land reform;⁴³ (3) participation in the activities of associations for the protection of professional rights and organizations representing economic interests;⁴⁴ (4) the enjoyment by trading and non-trading companies established under French law with registered offices in France, which conduct or will carry on economic activities in Algeria, of all the rights to which a legal entity is entitled;⁴⁵ and (5) obtaining on Algerian territory concessions, authorizations and permissions, and entering into public contracts under the same conditions as Algerian nationals.⁴⁶

(b) *Guarantees against discriminatory measures and against taking without compensation*

115. The Declaration guarantees that no arbitrary or discriminatory measures will be taken against the vested property, interests and rights of French nationals, and stipulates that no one may be deprived of his rights without fair compensation previously agreed upon.⁴⁷

116. It further provides that French nationals on Algerian territory may not be subject to duties, taxes or levies, under whatever name, different from those collected from Algerian nationals.⁴⁸

(4) *Repurchase of French property rights*

117. The Declaration of Principles Concerning Economic and Financial Co-operation provides, under Title IV (Guarantees of Acquired Rights and Previous Commitments), for the grant by France of “specific aid with a view to the repurchase in whole or in part of property rights held by French nationals” within the framework of land reform (article 13).

118. The repurchase plan will be drawn up by the competent Algerian authorities, while the terms and

⁴³ Part Three, paragraph 2.

⁴⁴ *Ibid.*, paragraph 8.

⁴⁵ *Ibid.*, paragraph 9.

⁴⁶ *Ibid.*, paragraph 10.

⁴⁷ *Ibid.*, paragraph 5.

⁴⁸ *Ibid.*, paragraph 11.

conditions of aid are to be determined by agreement between the two countries.

(5) *Settlement of disputes*

119. The sole paragraph of the Declaration of Principles Concerning the Settlement of Disputes states that

“France and Algeria shall settle disputes that may arise between them by peaceful means. They will have recourse either to conciliation or to arbitration. Failing agreement on these procedures, each of the two States may refer the matter directly to the International Court of Justice.”

(6) *Financing of investment*

120. The Declaration of Principles Concerning Economic and Financial Co-operation provides that

“French financial and technical aid will apply especially to the study, execution and financing of the public or private investment projects presented by the competent Algerian authorities; ...” (article 2).

(ii) *Modalities of the transfer of powers and functions, with special reference to natural resources*

121. The specific modalities of the transfer of powers and functions within the framework of the principles and policies set forth in the several Franco-Algerian Declarations discussed in the preceding section are contained in a series of protocols, conventions and agreements signed by the parties on 28 August 1962.⁴⁹

(1) *Protocol on the implementation of commitments entered into by the Organisation commune des régions sahariennes (OCRS) regarding Algeria*

122. Under the terms of this protocol,⁵⁰ Algeria empowers the Organisation commune des régions sahariennes (OCRS)⁵¹ to continue to implement commitments entered into with respect to Algeria in connexion with the OCRS development programme prior to 1 July 1962.

⁴⁹ Decree No. 62-1020, 20 August 1962, notifying protocols, conventions and agreements signed on 28 August 1962 by the Government of France and the Provisional Executive of Algeria: France, *Journal officiel*, No. 204, 30 August 1962, pp. 8506-8527.

⁵⁰ *Ibid.*, p. 8515.

⁵¹ The *Organisation commune* was established by Law No. 57-27 of 10 January 1957 to co-ordinate and intensify the development of the Sahara, among other things, by planning and sponsoring, through a special technical assistance programme, the development of communications, mining, industry and agriculture. Its initial area of activity covered the Saharan departments of the Oases and of Saoura (then administered separately from Algeria); subsequently the Republics of Chad and Niger joined the organization with respect to their Saharan zones. The royalties received from petroleum operations within the OCRS area were to be allotted in their entirety to the economics and social developments of the Saharan and neighbouring regions. (*Basic Facts on the Sahara*, French Embassy, Press and Information Service, New York, African Affairs, No. 17, April 1957; France and the Sahara, French Embassy, Press and Information Service, New York, June 1962).

Major functions with respect to the administration of petroleum operations in the Saharan region were allocated to OCRS under the Sahara Petroleum Code (Ordinance No. 58-1111 of 22 November 1958). The transfer modalities in respect of these functions are discussed in paragraphs 138-142 below.

123. To cover its one-third share of the related costs, Algeria will allocate 60 per cent of the tax and other revenues receivable in respect of payments by the petroleum companies engaged in exploration and exploitation activities in Algeria. In no case shall such payment by Algeria exceed 60 per cent of the tax and other revenues due in respect of petroleum operations during the second-semester accounting period of 1962.

(2) *Convention on the application of the provisions on the special status of French petroleum companies set forth in the Declaration of Principles of Co-operation for the Exploitation of Saharan Subsoil Resources*

124. The Convention quoted above⁵² sets forth the rules of implementation of the provisions⁵³ of the relevant Evian Declaration.⁵⁴

125. The preamble of the Convention states that Algerian legislation on the grant of mineral rights shall “be compatible” with the rules of implementation set forth in the Convention itself.

126. Applications by non-French companies for grants of rights are to be published in the Algerian official gazette and are to be subject to a public inquiry of a minimum duration of thirty days. While this inquiry is in progress, other applications in respect of wholly or partly co-extensive areas may be submitted, or confirmed by earlier applicants.

127. The Convention further provides that any French applicant for grants of rights covering areas that are wholly or in part co-extensive with those applied for by non-French applicants is to be informed by the Government of Algeria of all details of the offers made by the non-French applicants. Within fifteen days of receiving this information, the French applicant will be granted preference with respect to equal offers (or offers providing for equivalent advantages to Algeria).

“The French applicant, however, is exempt from submitting offers equal or equivalent to those that may be submitted by the non-French applicant with respect to the implementation of the régime of acquired rights in respect of the mining rights previously acquired by the French applicant.”⁵⁵

128. Within the meaning of the Convention, companies are defined as French if (1) control in terms of stock ownership or management is exercised directly or indirectly by French nationals or juridical persons; or (2) in the case of a partnership, if at

⁵² Convention on the Application of Paragraph 8 of Title I of the Declaration of Principles of Co-operation for the Exploitation of Saharan Subsoil Resources; France, *Journal officiel*, No. 204, 30 August 1963, p. 8515.

⁵³ The text of the relevant paragraph reads as follows: “During a period of six years dating from the entry into force of the present provisions, Algeria will give preference to French companies with regard to exploration and exploitation permits in the case of equal offers for areas that have not as yet been allocated or have again become available. The applicable regulations shall be those defined by existing Algerian legislation, French companies, however, remaining subject to the Sahara Petroleum Code ... as regards titles covered by the guarantee of acquired rights.”

⁵⁴ For a review of the relevant provisions, see paragraphs 101-103 above.

⁵⁵ See paragraphs 104-105 above.

least 50 per cent of the participating interests are under French control and if the Algerian State or an Algerian public body participates in the venture.

129. Preferential rights similar to those granted to French companies are also granted to companies whose capital is held by the Algerian State or by an Algerian public body, or to companies in which French and Algerian interests each effectively held one third of the shares.

130. The extent of French or Algerian control exercised at the time of the application may not be reduced during the period of validity of the grant of right under penalty of revocation of that grant.

(3) *Convention on the establishment of a joint Franco-Algerian organ for the exploitation of Saharan subsoil resources*

131. This Convention⁵⁶ declares operative the joint Franco-Algerian technical organ for the exploitation of Saharan subsoil resources provided for under the terms of the Evian Declaration of Principles of Co-operation for the Exploitation of Saharan Subsoil Resources.⁵⁷ The statute of that organ is annexed to the Convention.

(a) *Area of jurisdiction*

132. The statute provides that the geographical jurisdiction of the joint technical organ, whose seat shall be Algiers, extends to the present *départements* of the Oases and of the Sahara; with respect to hydrocarbon transport, its jurisdiction extends to the points of refining or of shipment.

(b) *Administration*

133. The joint organ is to be administered by a managing board, consisting of twelve members, with six each to be nominated by the two parties.

(c) *Functions and powers*

134. Within the framework of the terms of reference set forth in the relevant Declaration (see paragraphs 101-103 above), the joint organ is charged with the study of optimal conditions for the development of subsoil resources and the supervision of the proper measures to encourage such development within the framework of Franco-Algerian co-operation.

135. The joint organ is further charged with the review, prior to their enactment, of all legislative and regulatory measures contemplated by Algeria with respect to mining and petroleum régimes. In this connexion, the joint organ has full powers to voice opinions and to make suggestions to the Government of Algeria.

136. All applications for mining titles and for related transport rights, or for rights derived from such titles, must be submitted to the joint organ. Applications for

mining rights which do not derive from a mining title must, however, be submitted to the Algerian authorities. The joint organ will then make its recommendations to the Algerian Government in the light of the legislation currently in force. The Algerian Government may, if it so desires, return such recommendations to the joint organ for further review in the light of the views expressed by the Government.

137. The joint organ is also charged with broad supervisory functions with respect to mining and related transport operations. It is further charged with the technical and financial planning, implementation and maintenance of such public works as are essential to the exploitation of subsoil resources. It may also request technical assistance from the Governments of France and Algeria in connexion with the enforcement of oil conservation measures.

(d) *Agreement regarding application of the Sahara Petroleum Code and the transfer of related powers and functions*

138. This Agreement⁵⁸ sets forth, in its annex, details of the powers and functions of the various authorities as provided under the Sahara Petroleum Code.⁵⁹

139. In general, the powers of granting rights under the Sahara Petroleum Code are transferred from the French Council of State, acting on the recommendation of the Minister for Sahara Affairs and the Minister of Mines, to the Algerian State, acting on the recommendation of the joint organ.

140. More specifically, State and regulatory functions formerly in the jurisdiction of the Organisation commune des régions sahariennes (OCRS) pass to the Algerian State, acting upon recommendation of the joint organ in respect of matters concerning subsoil resources; in related matters concerning general development of the Sahara region, the Algerian State alone succeeds. In matters of French ministerial functions alone, the Algerian State succeeds alone.

141. Under the original terms of the Sahara Petroleum Code, the Minister of Mines and the chief administrative officer of the OCRS held powers to co-ordinate the joint use of pipelines by petroleum producers exploiting adjacent fields; in the case of dispute among such producers, the matter was to be submitted to arbitration. Failing agreement on the person of the arbitrator to be designated, such designation was to be carried out by the Vice-President of the General Council of Mines.⁶⁰ The co-ordinating powers pass, under the Agreement in question, to the joint organ alone, while appointment of the arbitrator passes to the President of the International Chamber of Commerce.

142. It is to be noted that changes in the model convention provide, as before, for the enforcement of production regulations based on the requirements of the franc currency zone with respect to hydrocarbon products, and provision is made for joint action by the

⁵⁶ Convention concerning the Technical Organ for the Exploitation of the Saharan Subsoil, in implementation of Title III of the Declaration of Principles of Co-operation for the Exploitation of Saharan Subsoil Resources, *op. cit.*, pp. 8515-8517.

⁵⁷ See paragraphs 101-103 above.

⁵⁸ *Op. cit.*, pp. 8517-8526.

⁵⁹ See paragraph 102 above.

⁶⁰ Article 46.

competent Algerian minister and the French minister in charge of petroleum-product supply for the franc currency zone.

(b) NETHERLANDS-INDONESIA (WITH RESPECT TO WEST NEW GUINEA (WEST IRIAN))

143. Under the terms of the Agreement of 15 August 1962 between the Republic of Indonesia and the Kingdom of the Netherlands concerning West New Guinea (West Irian)⁶¹

“The UNTEA [United Nations Temporary Executive Authority] will take over existing Netherlands commitments in respect of concessions and property rights.⁶²

“After Indonesia has taken over the administration it will honour those commitments which are not inconsistent with the interests and economic development of the people of the territory. A joint Indonesian/Netherlands commission will be set up after the transfer of administration to Indonesia to study the nature of the above-mentioned concessions and property rights.”⁶³

144. With respect to the topic of previous treaties and agreements, the Agreement makes the following provision:⁶⁴

“The present Agreement will take precedence over any previous agreement on the territory. Previous treaties and agreements regarding the territory may therefore be terminated or adjusted as necessary to conform to the terms of the present Agreement.”

2. AGREEMENTS RELATING TO INVESTMENT OR ESTABLISHMENT

(a) PAKISTAN-FEDERAL REPUBLIC OF GERMANY: TREATY FOR THE PROMOTION AND PROTECTION OF INVESTMENTS⁶⁵

145. This treaty — the precursor of a series of similar agreements concluded between the Federal Republic of Germany and other developing States⁶⁶ constitutes a departure from the traditional pattern of treaties of friendship, commerce and navigation in that its sole expressed purpose is “to create favourable conditions for investments by nationals and companies of either State in the territory of the other State”.

(i) *Basic considerations and provisions*

146. These are contained in articles 1 and 2, which are set forth in full below. Special attention may be drawn to

⁶¹ See *Official Records of the General Assembly, Seventeenth Session, Annexes*, agenda item 89, document A/5170.

⁶² Article XXII, paragraph 2.

⁶³ *Ibid.*, paragraph 3.

⁶⁴ Article XXV.

⁶⁵ Dated 25 November 1959, registered with the Secretary-General of the United Nations, March 1963. (See *United Nations, Treaty Series*, vol. 457 (1963), No. 6575).

⁶⁶ For example, Federation of Malaya (22 December 1960), Greece (25 March 1961); Togo (16 May 1961), Morocco (31 August 1961), Liberia (12 December 1961), Thailand (13 December 1961), and Guinea (13 April 1962). (See *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes*, agenda item 6, document E/3665/Rev.1, annex III).

the reference, in article 1 (1), to Pakistan's economic planning policies.

“Article 1

“(1) Each contracting State ... will endeavour to admit in its territory, in accordance with its legislation and rules and regulations framed thereunder the investing of capital by nationals or companies of the other Party and to promote such investments and will give sympathetic consideration to requests for the grant of necessary permissions. In the case of Pakistan such permissions shall be given with due regard also to their published plans and policies.

“(2) Capital investments by nationals or companies of either Party in the territory of the other Party shall not be subjected to any discriminatory treatment on the ground that ownership of or influence upon it is vested in nationals or companies of the former Party, unless legislation and rules and regulations framed thereunder existing at the time of coming into force of this Treaty provide otherwise.

“Article 2

“Neither Party shall subject to discriminatory treatment any activities carried on in connexion with investments including the effective management, use or enjoyment of such investments by the nationals or companies of either Party in the territory of the other Party unless specific stipulations are made in the documents of admission of an investment.”

(ii) *Provisions in respect of expropriation and compensation*

147. Article 3, after providing for the mutual protection and security of investments in the territory of either Party, stipulates that

“Nationals or companies of either Party shall not be subjected to expropriation of their investments in the territory of the other Party except for public benefit against compensation, which shall represent the equivalent of the investments affected. Such compensation shall be actually realizable and freely transferable in the currency of the other Party without undue delay. Adequate provision shall be made at or prior to the time of expropriation for the determination and the grant of such compensation. The legality of any such expropriation and the amount of compensation shall be subject to review by due process of law.”

(iii) *Guarantee of investments*

148. Under the terms of article 4, the Treaty guarantees the transfer of profits and of the invested capital in the event of liquidation, while article 5 provides for the succession, by the guarantor State, to any title in respect of which a claim has been brought under the terms of an investment guarantee.

(iv) *Settlement of disputes*

149. Article 11 of the Treaty provides that

“(1) In the event of disputes as to the interpretation or application of the present Treaty, the Parties shall enter into consultation for the purpose of finding a solution in a spirit of friendship.

“(2) If no such solution is forthcoming, the dispute shall be submitted

“(a) To the International Court of Justice if both Parties so agree or

“(b) If they do not so agree to an arbitration tribunal upon the request of either Party.

“(3) (a) The tribunal referred to in paragraph (2) (b) above shall be formed in respect of each specific case and it shall consist of three arbitrators. Each Party shall appoint one arbitrator and the two members so appointed shall appoint a chairman who shall be a national of a third country.”

Provision is then made for the alternative appointment of arbitrators by the President of the International Court of Justice or the ranking senior judge of the Court.

“(e) Unless the Parties otherwise decide, the arbitration tribunal shall determine its own rules of procedure.”

Finally, provision is made for the tribunal's decision by majority vote and in respect of the binding nature of such decisions.

150. In an exchange of notes annexed to the Treaty, the Parties state that

“It was... agreed that without prejudice to the provisions of this Treaty any concessions that are granted by either Party to the nationals or companies of the other Party shall be governed by the documents of admission, namely the Memoranda or the Articles of Association established for the creation and operation of a particular enterprise or such other instruments as either Party may choose keeping in view the requirements of each case.

“In admitting investments by nationals or companies of the other Party each Party may in the documents of admission mentioned above impose conditions regarding the administration, use or enjoyment of an investment or regarding the operation of an enterprise based on such investment or regarding the training and employment of nationals of the Party concerned.

“The favours and immunities... [which may be granted by either Party to the investments of nationals or companies of the other Party in specific cases] and the conditions mentioned in the... [preceding paragraph] may fall outside the scope of national or most-favoured-nation treatment.”

(b) PAKISTAN — JAPAN: TREATY OF FRIENDSHIP AND COMMERCE ⁶⁷

151. In so far as the property of nationals of the Parties is concerned, the Treaty, after providing for the most constant protection and security of such property within the territory of the other Party, stipulates (article IV) that

“Neither Party shall take unreasonable or discriminatory measures that would impair the legally acquired rights or interests within its territory of nationals and companies of the other Party in the enterprises which they have established, in their capital, or in the skills, arts or technology which they have supplied.

“Property of nationals and companies of either Party shall not be taken within the territory of the other Party except for a public purpose, nor shall it be taken without prompt payment of just compensation. Such compensation shall be in an effectively realizable form and shall represent the full equivalent of the property taken.”

⁶⁷ Signed 18 December 1960, came into force on 20 August 1961. United Nations, *Treaty Series*, vol. 423 (1962), No. 6093.

152. Article VI deals with the enforceability of contracts providing for the settlement of controversies by arbitration and provides that such contracts

“shall not be deemed unenforceable within the territory of such other Party merely on the grounds that the place designated for the arbitration proceedings is outside such territory or that the nationality of one or more of the arbitrators is not that of such other Party”.

Awards duly rendered shall thus be deemed valid and be granted effective means of enforcement.

153. With regard to the award of government contracts and concessions, each Party shall accord to the nationals, companies and commerce of the other Party “fair and equitable treatment” as compared with that accorded to nationals and companies of any third country (article X).

154. Under the terms of paragraph 3 of the Protocol annexed to the Treaty,

“Each Party reserves the right to limit the extent to which aliens may establish or acquire interests in enterprises engaged within its territory in activities for gain (business activities) provided that in any event not less than most-favoured-nation treatment shall be accorded. However, new limitations imposed by either Party upon the extent to which aliens nationals or companies are permitted to carry on such activities within its territory shall not be applied as against enterprises which are engaged in such activities therein at the time such limitations are adopted and which are owned or controlled by nationals and companies of the other Party.”

(c) FRANCE — UNITED STATES OF AMERICA: CONVENTION OF ESTABLISHMENT

155. The Convention of Establishment concluded between France and the United States of America on 25 November 1959,⁶⁸ states in its preambular paragraph that the Parties,

“desirous... of encouraging closer economic intercourse between their peoples, conscious of the contribution which may be made to these ends by arrangements that provide in each country reciprocal rights and privileges on behalf of nationals and companies of the other country, thus encouraging mutually advantageous investments and mutually beneficial commercial relations,”

have agreed on the articles that are summarized below in so far as they bear on the topic of the present report.

156. The substantive articles of the Convention provide, *inter alia*, for entry, travel and residence by nationals of the Parties, in particular, for the purpose

“of developing and directing the operation of an enterprise in which they have invested, in which they are actively in the process of investing, a substantial amount of capital”.

Entry and sojourn are subject to the relevant laws applicable to aliens (article II).

157. The lawfully acquired rights and interests of nationals and companies of either Party shall not be subjected to impairment within the territory of the other Party by any discriminatory measure (article IV); pro-

⁶⁸ Came into force 21 December 1961. United Nations, *Treaty Series*, vol. 401 (1961), No. 5764.

vision is made to accord national treatment to the nationals and companies of either Party in respect of access to the courts and administrative tribunals (article III); permission to engage in commercial, industrial and financial activities (article V); occupation of real property (article VII); and patents (article VIII).

158. With respect to expropriation, the Convention provides that the

“Property of nationals and companies of either High Contracting Party shall not be expropriated within the territories of the other High Contracting Party except for a public purpose and with payment of just compensation. Such compensation shall represent the equivalent of the property taken; it shall be accorded in effectively realizable form and without needless delay.”

Provision for the determination and payment of compensation must have been made no later than at the time of taking; no less than national treatment shall be accorded with respect to the matters dealt with above (article IV).

159. With regard to capital movements,

“The two High Contracting Parties, recognizing that the freedom of movement of investment capital and of the returns thereon would be conducive to the realization of the objectives of the present Convention, are agreed that such movements shall not be unnecessarily hampered. In this spirit, each High Contracting Party will make every effort to accord, in the greatest possible measure, to nationals and companies of the other High Contracting Party the opportunity to make investments and to repatriate the proceeds of the liquidation thereof.” (Article X.)

(d) CAMEROON — UNITED KINGDOM: AGREEMENT ON COMMERCIAL AND ECONOMIC CO-OPERATION

160. The Agreement on Commercial and Economic Co-operation⁶⁹ concluded between Cameroon and the United Kingdom on 29 July 1963 contains a number of provisions of relevance to various aspects of the topic of permanent sovereignty over natural resources. These provisions are dealt with below under their various topical headings.

(i) *Protection of investments*

161. Under this heading, article V (1) of the Agreement provides that

“Within the framework of national legislation in force on the date of signature of this Agreement relating to investment each Contracting Government shall accord to investments, real property, rights and interests owned by, or held indirectly by, nationals, concerns, associations or companies of the other country in its territory fair and equitable treatment.”

(ii) *Expropriation*

162. Article V (2) states that

“Nationals, concerns, companies and associations of one country shall only be subjected to expropriation in the other

on the grounds of public interest. If one of the Contracting Governments expropriates or nationalizes or takes, any other confiscatory measures against the property, rights or interests of the nationals, concerns, associations or companies of the other country it shall, in accordance with international law, make provision for the payment of adequate and effective compensation. Such compensation shall be paid without undue delay to those entitled to it. Measures of expropriation, nationalization or confiscation shall not be discriminatory or contrary to a specific undertaking.”

(iii) *Operation of enterprises*

163. Each Party undertakes to accord to enterprises of the other Party, within the framework of its laws and regulations, the legal protection necessary to ensure their secure operation (article VII).

(iv) *Settlement of disputes*

164. The Agreement provides (article IX) for the establishment of a mixed commission to supervise the operation of the Agreement. Under the terms of article VI, disputes arising out of the interpretation or application of the provisions of article V (protection of investments, expropriation; see above) that are not satisfactorily settled through diplomatic channels or by the mixed commission within six months of formal notice that such a dispute has arisen, may, at the request of either Party, be submitted to an arbitral tribunal consisting of three members, with one each appointed by the Parties, and the third — the national of a third country — to be appointed by the two arbitrators chosen by the Parties.

165. Failing appointment of its arbitrator by one of the Parties, or in the absence of agreement on the nomination of the third arbitrator, the necessary appointments shall be made by the President of the International Court of Justice, the Vice-President, or the senior member of the Court who is not a national of either of the Parties.

166. Unless the Parties otherwise decide, the tribunal will determine its own procedure; decisions of the tribunal, taken by majority vote, will be binding on the Parties. No appeal shall lie against decisions of the tribunal, which shall be final.

(e) GUINEA-SWITZERLAND: AGREEMENT ON COMMERCE, INVESTMENT PROTECTION AND TECHNICAL CO-OPERATION

167. A number of the provisions of the Agreement on Commerce, Investment Protection and Technical Cooperation⁷⁰ concluded between Guinea and Switzerland⁷¹ on 26 April 1962, bear upon the topic of the present report and are set forth under the original article headings below.

⁷⁰ Switzerland, *Feuille fédérale*, 114th year, vol. I, No. 26, Berne, 28 June 1962, p. 1497.

⁷¹ Essentially similar provisions are contained in the Agreement of the same title concluded between Niger and Switzerland on 28 March 1962 (*ibid.*, p. 1491).

⁶⁹ Registered with the Secretary-General in September 1963; came into force on date of signature. See United Nations, *Treaty Series*, vol. 478 (1963), No. 6935.

(i) *Most-favoured-nation treatment*

168. Article 2 of the Agreement provides for most-favoured-nation treatment between the Parties in all their economic contacts, excepting, however, special advantages granted or to be granted in respect of trade with adjacent frontier zones with countries with which either of the Parties is in customs union or free-trade association (article 2).

(ii) *Investment protection*

169. The Agreement provides for just and equitable treatment for the direct and indirect investments of the Parties, and the application of, at least, national or most-favoured-nation standards, whichever is the more favourable, in such treatment. Provision is further made for the free transfer of profits, dividends, interest and, in the event of complete liquidation, of the proceeds thereof (article 7).

Expropriation or nationalization

170. Paragraph 2 of article 7 reads as follows:

"In the event that one of the Parties expropriates or nationalizes the property, rights or interests belonging to nationals, foundations, associations or companies of the other Party or held indirectly by such nationals, foundations, associations or companies, or should it [one of the Parties] carry out any other measures of dispossession, direct or indirect, with respect to such nationals, foundations, associations or companies, it must make provision for the payment of effective and adequate compensation, in accordance with international law. The amount of this indemnity, which shall be determined at the time of the expropriation, nationalization or taking over, shall be paid in transferable currency and without unjustified delay to those entitled to it, regardless of their place of residence. Measures of expropriation, nationalization or taking over shall, in any event, be neither discriminatory nor contrary to a specific undertaking."

(iii) *Arbitration clause with respect to the protection of investments*

171. Article 8 of the Agreement deals with arbitration arrangements in respect of any dispute arising out of the interpretation of article 7 (see above) that cannot be settled within six months through diplomatic channels. In the absence of such settlement, the dispute shall be submitted to a three-member arbitral tribunal at the request of either of the Parties, each of which shall nominate one member of the tribunal. These two members, in turn, shall designate the third member, who shall be the national of a third State. (The provisions applicable in the event of failure to appoint one of the arbitrators are essentially similar to those contained in the Agreement between Cameroon and the United Kingdom; see sub-section (d) above.)

172. In the absence of the Parties' wishes to the contrary, the tribunal shall determine its own procedure. The tribunal's decision shall be binding upon the Parties.

3. AGREEMENTS ON COMPENSATION IN RESPECT OF NATIONALIZED OR APPROPRIATED PROPERTY

(a) BULGARIA-UNITED STATES OF AMERICA

173. The Agreement Regarding Claims of United States Nationals and Related Financial Matters ⁷² signed on 2 July 1963 provides (article I) that the payment of a lump sum

"will constitute full and final settlement and discharge of the claims of nationals of the United States, whether natural or juridical persons, against the Government of the People's Republic of Bulgaria which are described below:

"(a) ...

"(b) Claims of nationals of the United States of America for the nationalization, compulsory liquidation or other taking of property and of rights and interests (direct and indirect) in and with respect to property prior to the effective date of this Agreement; ⁷³

"(c) ..."

174. The Agreement further provides, in article III (1), that the distribution of the above-mentioned lump sum

"falls within the exclusive competence of the Government of the United States of America in accordance with its legislation, without any responsibility arising therefrom for the Government of the Peoples' Republic of Bulgaria."

175. The United States, in turn, undertakes (article IV) to release, within thirty days of the date of the Agreement, its blocking controls over all Bulgarian property in the United States.

(b) BELGIUM AND LUXEMBOURG — YUGOSLAVIA

176. Under the Agreement concerning the settlement of certain Belgian and Luxembourg financial claims, ⁷⁴ signed on 15 April 1960, provision is made for the compulsory repurchase of Serbian and Yugoslav foreign public loan obligations dating from before the second World War and held by Belgian and Luxembourg nationals, "bearing in mind the payment and transfer capabilities of Yugoslavia".

⁷² U.S. TIAS 5387; entered into force on day of signature. Essentially similar provisions are contained in the Agreement Regarding the Settlement of Claims of Nationals of the United States signed by Poland and the United States of America on 16 July 1960 (U.S. TIAS 4545; entered into force on day of signature), and in the Agreement between Romania and the United States Relating to Financial Questions signed on 30 March 1960 (U.S. TIAS 4451; entered into force on day of signature).

⁷³ In the U.S.-Romanian Agreement (see footnote 72 above), however, this paragraph reads as follows:

"[property, rights and interests] directly owned by corporations or other legal entity organized under the laws of the United States of America or a constituent state or other political entity thereof, if more than fifty per centum of the outstanding capital stock or other beneficial interest in such legal entity was owned directly by natural persons who were nationals of the United States of America; ..."

⁷⁴ Registered with the Secretary-General by Belgium on 15 July 1963; came into force on 6 April 1963. See United Nations, *Treaty Series*, vol. 470 (1963), No. 6811.

177. The Agreement calls for the payment by Yugoslavia of lump sums in respect of obligations held by Belgian and Luxembourg nationals (article 1). The distribution of the amounts in question falls within the exclusive competence of the Governments of Belgium and of Luxembourg, and does not engage the responsibility of the Government of Yugoslavia (article 3).

B. TREATY RIGHTS OF STATES IN FOREIGN TERRITORY PERTAINING TO NATURAL RESOURCES

1. TREATY RIGHTS AND STATE SUCCESSION

TANGANYIKA

178. Under the terms of a Convention concluded between Belgium and the United Kingdom in 1921,⁷⁵ certain transit and port facilities in the then Mandated Territory of Tanganyika were made available to transit traffic from the Belgian Congo. These facilities included, notably, Belgian zones, leased at a nominal rent, at the Tanganyikan ports of Dar-es-Salaam and Kigoma (on Lake Tanganyika).

179. When Tanganyika acceded to independence on 8 December 1961, it announced certain steps to adapt its rights and duties under treaties concluded on its behalf, or extending to it, by the United Kingdom to its new status. The proposed steps bore specifically upon the treaty rights at Dar-es-Salaam and Kigoma referred to above and are dealt with in detail below.⁷⁶

180. In a statement⁷⁷ before the Tanganyika National Assembly, the Prime Minister explained the country's position and proposed policy on the subject of treaty obligations entered into on behalf of Tanganyika by the United Kingdom as Mandatory and, later, Administering Authority. Referring to the above-mentioned agreements in respect of transit and port facilities, he noted that Tanganyika would have welcomed the transit facilities in question if they had been granted "in a manner fully compatible with our sovereign rights and our new status of complete independence", but that a lease in perpetuity was incompatible with the country's sovereignty when such lease had been granted by an authority whose rights in Tanganyika were limited in duration.

181. The Prime Minister stated that Tanganyika would notify Belgium that the leases in question were invalid and that the installations so leased should be returned to

⁷⁵ Convention between Great Britain and Belgium with a view to facilitating Belgian traffic through the territories of East Africa, 15 March 1921. League of Nations, *Treaty Series*, vol. V (1921), No. 138, see also United Nations, *Treaty Series*, vol. 110 (1951), No. 1496.

⁷⁶ It may be noted that the proposed action by Tanganyika in this context is also discussed in a working paper presented to the Sub-Committee on Succession of States and Governments by Mr. Bartoš at the 15th session of the International Law Commission (*Yearbook of the International Law Commission 1963*, vol. II, pp. 293-297).

⁷⁷ Statement of 30 November 1961, Tanganyika National Assembly, 36th session, 6th meeting.

Tanganyika by the end of 1963, whereupon they would be operated by the East African Common Services Organization on behalf of Tanganyika. He went on to note that, over the years, the Belgian authorities had spent considerable sums on establishing facilities at the two ports concerned; at the same time, they had recovered a substantial amount of the investment through charges made for the use of the facilities.

"However, it is not part of the policy of the Government of Tanganyika to deprive foreigners, whether governments or individuals, of their property without the payment of compensation. ... We propose to start by applying this standard to the Belgian sites at Kigoma and Dar-es-Salaam."

182. Tanganyika was now preparing a valuation of the Belgian investment in the facilities in question, deducting from that valuation the amounts already recovered by amortization. "We shall offer the balance to the authorities who may be entitled to it." There was some question whether the facilities were the property of Belgium, the Congo (Leopoldville) or Ruanda-Urundi.

"Consequently, we are informing the Belgian Government that if there is any possibility that all or part of the compensation is due to the Governments of Congo [Leopoldville] or Ruanda-Urundi, and if those Governments wish to press this claim, we consider that the distribution of compensation is a matter to be determined by arbitration, or agreement between the authorities concerned."

Tanganyika would not wish to be a party to such arbitration or agreement, but would be prepared to pay compensation to the people established to be entitled to it.

183. The position of the Government of Tanganyika was further set out in a note from the Prime Minister to the Secretary-General of the United Nations dated 9 December 1961⁷⁸ in the following terms:

"The Government of Tanganyika is mindful of the desirability of maintaining, to the fullest extent compatible with the emergence into full independence of the State of Tanganyika, legal continuity between Tanganyika and the several States with which, through the action of the United Kingdom, the territory of Tanganyika was prior to independence in treaty relations. Accordingly, the Government of Tanganyika takes the present opportunity of making the following declaration:

"As regards bilateral treaties validly concluded by the United Kingdom on behalf of the territory of Tanganyika, or validly applied or extended by the former to the territory of the latter, the Government of Tanganyika is willing to continue to apply within its territory, on a basis of reciprocity, the terms of all such treaties for a period of two years from the date of independence (i.e., until 8 December 1963) unless abrogated or modified earlier by mutual consent. At the expiry of that period, the Government of Tanganyika will regard such of these treaties which could not be the application of the rules of customary international law be regarded as otherwise surviving, as having terminated.

"It is the earnest hope of the Government of Tanganyika that during the aforementioned period of two years, the normal processes of diplomatic negotiations will enable it to reach satisfactory accord with the States concerned upon the possibility of the continuance or modification of such treaties.

⁷⁸ See *Yearbook of the International Law Commission 1963*, vol. II, p. 290.

"The Government of Tanganyika is conscious that the above declaration applicable to bilateral treaties cannot with equal facility be applied to multilateral treaties. As regards these, therefore, the Government of Tanganyika proposes to review each of them individually and to indicate to the depositary in each case what steps it wishes to take in relation to each such instrument—whether by way of confirmation of termination, confirmation of succession or accession. During such interim period of review, any party to a multilateral treaty which has prior to independence been applied or extended to Tanganyika may, on the basis of reciprocity, rely as against Tanganyika on the terms of such treaty."

2. MINING RIGHTS

NETHERLANDS — FEDERAL REPUBLIC OF GERMANY

184. In a further development along the lines briefly referred to in the Secretariat study on Permanent Sovereignty over Natural Wealth and Resources,⁷⁹ the Netherlands and the Federal Republic of Germany concluded a treaty⁸⁰ providing, essentially, for the modalities of the extension of underground shafts of Netherlands coal mines into German territory.

185. In terms of applicable legislation, it is provided that the Treaty itself, together with the Prussian mining law in respect of foreign corporations (1909) shall be applicable to the coalfields concerned (article 2). A mining boundary, marked by a barrier wall, is to be agreed between the parties without prejudice to the Netherlands-German international frontier for the purpose of mining in the treaty area. This wall shall not be pierced save with the consent of the mining authorities of both parties (article 4).

186. Mining operation as such are to be carried out under Netherlands law (article 3), but measures to protect surface facilities shall, upon request by the German mining authority, be taken by the Netherlands mining authority in accordance with the regulations normally applicable in similar cases in the Federal Republic of Germany (article 6); while the supervision of shafts and associated surface installations in the treaty area shall be governed by German legislative and administrative provisions which, "as far as is reasonably possible, shall be in agreement with the relevant Netherlands provisions" (article 7).

187. Two further articles of the Treaty are of special interest: under the terms of article 12

"Acts of commission or omission in underground operations within the treaty area shall be treated in criminal and civil law as having been done in the Netherlands."

while article 19 provides that

"(1) Coal mined in the treaty area shall be counted for economic purposes as part of the coal production of the Netherlands,

⁷⁹ United Nations publication, Sales No.: 62.V.6, p. 78, footnote 154.

⁸⁰ Treaty between the Kingdom of the Netherlands and the Federal Republic of Germany concerning the mining of coal in the Netherlands-German frontier area west of Wegberg-Brüggen, signed on 28 January 1958, registered with the Secretary-General by the Netherlands on 18 February 1963 (United Nations, *Treaty Series*, vol. 453 (1963), No. 6525).

"(2) The Netherlands shall be entitled to dispose of coal produced in the treaty area in the same manner as coal produced inside Netherlands territory."

C. MULTILATERAL AGREEMENTS AND DRAFT MEASURES

1. EUROPEAN ECONOMIC COMMUNITY: CONVENTION OF ASSOCIATION (1963)

188. The new Convention of Association between the European Economic Community (EEC) and the Associated States⁸¹ of Africa and Madagascar was signed on 20 July 1963 with a period of validity of five years. The terms of the Convention, which replaces the earlier Implementing Convention⁸² were adopted in the text initialled by the parties of 20 December 1962 and are summarized,⁸³ with respect to those provisions that are germane to the present paper, as set forth below.

(a) TRADE

189. The new provisions adapt and complete those concerning customs duties and quotas in part IV of the Treaty of Rome, establishing the EEC and in the former Implementing Convention. The principle of reciprocity between associated States and member States is retained in this field.

"Exports from the associated States to the member States will benefit from the same gradual elimination of duties and expansion of quotas as the member States apply amongst themselves. As soon as the Convention comes into force, the following products of the associated States will enter the member States duty-free: pineapples, coconuts, coffee, tea, cocoa, pepper, vanilla, cloves and nutmeg. At the same time the common external tariff will come into operation for these products at reduced rates. The community undertakes to pay due regard to the interests of the associated States when fixing its common agricultural policy with respect to those of their products which are similar to, or compete with, European products, particularly oilseeds and sugar.

"On the other hand, no later than six months after the effective date of the Convention, the associated States will extend the same tariff treatment to products originating in member States and will gradually abolish quantitative restrictions and measures with equivalent effect on the importation of such products. The associated States may, however, retain or introduce customs duties and charges with equivalent effect on products imported from the member States when such duties and charges correspond to the requirements of their development and industrialization or are intended to contribute to their budgets. If such measures prove inadequate to cope with these requirements, or in the event of balance-of-payments difficulties, the associated States may also retain or introduce quantitative restrictions.

⁸¹ Burundi, Cameroon, Central African Republic, Chad, Congo (Brazzaville), Congo (Leopoldville), Dahomey, Gabon, Ivory Coast, Madagascar, Mali, Mauritania, Niger, Rwanda, Senegal, Somalia, Togo and Upper Volta.

⁸² See *Permanent Sovereignty over Natural Wealth and Resources, Study by the Secretariat*, United Nations publication, Sales No.: 62.V.6, p. 84, note 207.

⁸³ *Bulletin of the European Economic Community*, No. 2, 6th year, Brussels, February 1963, pp. 21-25. See also Economic Commission for Africa, "Information Paper on Recent Developments in Western European Groupings", E/CN.14/207, 28 January 1963.

"The Contracting Parties will freely frame their trade policies but will inform and consult each other concerning their policy on trade with third countries wherever this policy could injure the interest of one or more Contracting Parties. Customs unions or free-trade areas between one or more associated States and one or more third States may be maintained or established provided they do not conflict with the principles and provisions of the Convention. However, the system applied by the associated States to products originating in member States may not be less favourable than that applied to products originating in the most-favoured third State.

"Provision has also been made for the Community to help finance schemes which will enable certain products of the associated States to be marketed throughout the Community at competitive prices. Such measures will encourage the rationalization of crops and of sales methods and the diversification of production and help producers to carry out any necessary adaptation.

"(b) RIGHT OF ESTABLISHMENT; MOVEMENT OF PAYMENTS AND OF CAPITAL

"The basic principle underlying the provisions on establishment is non-discrimination in the associated States against nationals and companies from EEC member States. The application of this principle is, however, subject to reciprocity with respect to nationals and companies from the associated States in the member States. At the same time, the signatories undertake to free payments and capital movements connected with the facilities for establishment thus afforded.

"Within three years, European nationals and companies in the associated States, and nationals and companies from the associated States in the Community should be placed on an equal footing. If special difficulties arise, an associated State may be permitted on request to suspend, for a given period, the application of this principle to a particular activity.

"(c) THE INSTITUTIONS

"The Convention provides for the establishment of the following institutions, in which the Community and the associated States are to be equally represented:

"i. The Council of Association, assisted by the Association Committee;

"ii. The Parliamentary Conference of the Association;

"iii. The Court of Arbitration of the Association.

"The Court of Arbitration of the Association is to find on disputes concerning association matters which have not been susceptible of amicable settlement in the Council of Association.

"The Court is to have five members appointed by the Council: the President and two judges are to be appointed after nomination by the Council of ECC, and the other two after nomination by the associated States. The Court is to hand down majority rulings; its decisions are binding on the parties to the dispute.

"(d) GENERAL PROVISIONS

"Any request for association with the Community submitted by a State whose economic structure and pattern of production are comparable with those of the associated States will be laid before the Council of Association for consultation after it has been studied by EEC. The agreement for association between EEC and such a State may provide for the accession of that State to the present Association Convention. The State in question will then enjoy the same rights and be subject to the same obligations as apply to the associated States, provided that

this does not impair the advantages which the latter enjoy as regards financial and technical co-operation."

190. The Convention, in addition, makes extensive provision for financial and technical co-operation, primarily through the European Development Fund and the European Investment Bank.

2. COUNCIL OF EUROPE: DRAFT RECOMMENDATION ON PRIVATE FOREIGN INVESTMENTS IN DEVELOPING COUNTRIES

191. A draft recommendation on the protection of private foreign investments in developing countries⁸⁴ submitted by the Legal Committee of the Council of Europe to its Consultative Assembly notes, in its preamble, that

"private investments in developing countries are one of the means of promoting the economic and social progress of these countries and of improving the living conditions of their people;"

and that "at present, the absence of sufficient legal protection and the likelihood of non-commercial risks limit the flow of private foreign investments". It further expresses the conviction that "a system of compulsory arbitration of disputes arising in connexion with private foreign investments should in any case be established"

192. The substantive part of the recommendation is set forth in full below.

"With regard to a multilateral investment convention:

"(a) That the member Governments should actively support the work of OECD for the preparation and conclusion of an international convention⁸⁵ reaffirming the general rules of international law for the protection of foreign property and should seek to obtain the adherence to such a convention by both capital supplying and capital receiving States.

"With regard to an international guarantee fund:

(b) That it should appoint a committee of experts with instructions to examine urgently the proposal already made by the Assembly for the institution of an international guarantee fund against non-commercial risks⁸⁶ and consider and report whether a second convention should be prepared which could later serve as a basis for discussion with regional groupings of interested countries, not merely in Africa, as proposed earlier by the Assembly, but, where appropriate, in other parts of the world.

"With regard to compulsory arbitration:

"(c) That both conventions should contain a clause providing for compulsory arbitration in the event of disputes of [sic] for their settlement by other judicial means;

"(d) That similar provisions for compulsory arbitration should be included in future bilateral treaties, such as those concluded in recent years by the Governments of the United

⁸⁴ Council of Europe, Document 1419, 23 May 1962. Appended to the draft recommendation is a memorandum by the Rapporteur, Mr. Robert Mathew, with explanatory comments on the various recommendations set forth above.

⁸⁵ This reference relates to the draft Convention on the Protection of Foreign Property of the Organization for Economic Co-operation and Development (Document 15 637/December 1962).

⁸⁶ Council of Europe, Document 1027, 8 September 1959, and Recommendation 211 (1959).

States of America and the Federal Republic of Germany, and in contracts made between investors and capital receiving Governments.

“ Finally:

“(e) That the long-term objective should be a world-wide investment convention. The conclusion of such an instrument, that is to say a generally acceptable convention probably stemming from the OECD Convention and providing for compulsory arbitration in the event of disputes arising over the treatment accorded to foreign property would, if feasible, constitute a valuable step forward.”

D. INTERNATIONAL DECLARATIONS

THE CAIRO DECLARATION OF DEVELOPING COUNTRIES

193. The Conference on the Problems of Economic Development held at Cairo in July 1962, adopted a Declaration⁸⁷ which, both in its Preamble and in its substantive parts voiced views and made recommendations bearing upon the topic of permanent sovereignty over natural resources.

194. These views and recommendations are essentially based on the Conference's concern with the “growing disparity in the standards of living prevailing in different parts of the world” and with the need to accelerate the pace of development in the developing countries.

195. In more specific terms, and bearing on the topic of this paper:

“The Conference recalling the United Nations Declaration on granting independence to dependent countries, urges complete decolonization as being necessary for the economic development of the dependent peoples and the exercise of sovereign rights over their natural resources.”⁸⁸

196. The Declaration, in its substantive parts, then deals with internal problems of development and cooperation among developing countries. Under the latter heading, one of the paragraphs states that

“The Conference took note of the concern expressed by certain landlocked countries regarding transit facilities, including access to the sea and recommends that appropriate facilities of access to the sea, and the use of ports, transport and transit facilities would be extended to and from ports in the littoral countries.”⁸⁹

197. There is also general reference to the need for joint action to promote the study and forecasting of world market trends, production, consumption and price fluctuations in respect of raw materials.⁹⁰

198. In the opening paragraph⁹¹ of the section on Regional Economic Groupings,

“the Conference expressed its apprehension that regional economic groupings of industrialized countries will adversely

⁸⁸ Preamble, paragraph 8.

⁸⁹ Section II, paragraph 25.

⁹⁰ *Ibid.*, paragraph 26.

⁹¹ Section IV, paragraph 37.

affect the interests of the developing economies, if conceived and operated in a restrictive or discriminatory manner.”

199. The section on economic aid for development stressed international aid in this respect and calls for a channelling of such assistance to a greater extent through the United Nations; it urges, in particular, that the Special United Nations Fund for Economic Development (SUNFED) “start its work without delay in accordance with resolution 1521 (XV) of the General Assembly”.⁹² The balance of the Declaration relates to international technical assistance and United Nations development activities.

III. International adjudication and arbitration

A. ARBITRATION AND CONCILIATION MACHINERY FOR THE SETTLEMENT OF DISPUTES BETWEEN STATES AND PRIVATE (CORPORATE) PARTIES

200. The present section is concerned with existing and proposed machinery for the settlement of disputes between States and private (corporate) parties. The discussion covers (1) machinery under international auspices and (2) bilateral machinery set up by treaty for the settlement of disputes relating specifically to grants of rights to, or the exploitation of, natural resources. Coverage is limited to formal structures and does not touch upon *ad hoc* proceedings such as are provided for under the terms of many contracts between States and private parties. The latter provisions frequently call for the appointment as sole arbitrator or as neutral third arbitrator of an eminent personage who is the national of a third State, e.g., the President of one of the Swiss cantonal tribunals.

1. MACHINERY UNDER INTERNATIONAL AUSPICES

(a) THE PERMANENT COURT OF ARBITRATION

201. In February 1962, the Permanent Court of Arbitration at The Hague issued annotated rules of arbitration and conciliation for the settlement of international disputes between two parties of which only one is a State.

202. Such procedure is open provided that the State party to the dispute is a contracting power to the conventions for the Pacific Settlement of International Disputes of 1899 or 1907.

203. Certain salient procedural rules are summarized below:

If both parties are agreed on settling the dispute by arbitration, either, or both together, may submit the request to the Bureau of the Permanent Court (article 3).

The arbitral tribunal, which shall be the judge of its own competence, shall have the power to interpret the instruments on which that competence is based (article 4).

⁹² Section V, paragraph 49.

Unless otherwise stipulated by the parties, the tribunal shall be composed of three arbitrators. In the absence of agreement on the choice of arbitrators, either party may solicit the Bureau's co-operation. If the lists of names which shall then be submitted by the Bureau fail to lead to the completion or constitution of the tribunal, the latter shall continue its efforts to that effect in agreement with the parties (article 5).

In the absence of agreement under the provisions of article 5, the Secretary-General of the Permanent Court shall, where so entrusted by the parties, appoint the arbitrators; he may also do so if the tribunal has not been constituted within the time limit fixed by the parties (article 6).

The arbitration shall take place at The Hague, unless the parties decide otherwise in agreement with the Bureau (article 7).

204. The tribunal constituted under the rules quoted above has wide powers to deal with a non-appearance on the part of the respondent and may, in such a case give judgement in favour of the claimant, provided it is satisfied that his claims are well founded in fact and in law (article 16).

205. With respect to the award, the Rules provide that: The award shall state the reasons on which it is based for every point on which it rules, unless the parties agree otherwise (article 20); the tribunal shall decide on the basis of the respect for law, unless an agreement between the parties provides for it to rule *ex aequo et bono* (article 30); once rendered, the award shall be binding upon the parties (article 31).

206. Essentially similar rules to those outlined above apply to the procedural aspects of conciliation proceedings.

207. Of special interest is the *Elucidation of the Model Set of Rules for Arbitration and Conciliation* appended to the Rules themselves. The initial paragraphs of this Elucidation are set forth below:

"The Bureau of the Permanent Court of Arbitration is authorized, under the rules regarding this Court, to put its organization and premises at the disposal of State Members, desirous of settling a dispute, even if the other party is not a State. Notably are concerned disputes between a State, on the one part, and an important private company or "concern", on the other part.⁹³

⁹³ We may relevantly note that, in its Award of 24 July 1956 (published on 27 July 1956) in the lighthouses case, the Permanent Court of Arbitration, while holding that the arbitration proceedings were of a clearly international character, drew attention to certain special characteristics of the case in these terms:

"... déjà dans la première phase, judiciaire, du différend, le Gouvernement Français a clairement pris fait et cause pour la Société [Messrs. Collas and Michel, the concessionary of the Imperial Ottoman Lighthouses Administration], la seule personne pour laquelle le point de droit formulé au premier considérant du Compromis put avoir de l'intérêt et le Gouvernement Hellénique y a consenti en termes exprès. ... C'est donc évidemment le Gouvernement Français qui, selon le Compromis, devait continuer, même après la solution du premier point de droit fondamental par la Cour Permanente de Justice Internationale, à appuyer la Société française devant une instance internationale qu'il devait organiser lui-même en collaboration avec le Gouvernement Hellénique.

"With a view to settling disputes between States and private companies or persons, the Bureau of the Permanent Court of Arbitration has elaborated a model set of rules of procedure. This set of rules opens the way for arbitration or conciliation, and even offers the possibility of first having recourse to conciliation and afterwards, if that fails, to arbitration. The parties are free to follow the way which is convenient to them; the insertion of a simple clause in their agreement at the moment of its conclusion can mention these possibilities or one of them.

"The set of rules has the character of a model. The parties are at liberty, if they deem this desirable, to fix other rules of procedure. These model rules have been based on a certain number of general stipulations which are customary in practice."

(b) INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT: PROPOSED INTERNATIONAL MACHINERY FOR THE SETTLEMENT OF INVESTMENT DISPUTES

208. In his statement⁹⁴ before the thirty-fifth session of the Economic and Social Council in the spring of 1963, the President of the International Bank for Reconstruction and Development noted that the Bank was considering the possibility of establishing facilities, linked in some way to the Bank, which would be available to foreign investors and host Governments wishing to bring investment disputes to conciliation or arbitration.

209. Under this, so far quite tentative, plan, the Bank might sponsor the establishment of a centre or secretariat for conciliation and arbitration under whose auspices conciliation panels or arbitration tribunals would be set up when necessary. Resort to these facilities would be subject to the agreement of both the Government concerned and the foreign investor.⁹⁵ The award of the tribunal would be binding upon the parties.

210. The Bank believed this approach to be sufficiently promising to justify further study and investigation. At the time of preparation of this report, the Bank's proposal had been given the form of a draft convention, to be discussed at a series of conferences of legal experts of member countries to be held at the seats of the United Nations regional economic commissions at Addis Ababa, Bangkok, Geneva and Santiago.⁹⁶

Reference is then made to the fact that the French claim was, under the terms of the Special Agreement governing the arbitration, submitted by the company in question, and that the Greek counter-claims are made against that company.

Il s'ensuit aussi que le Gouvernement Français ... doit apparaître à titre de *dominus litis* habilité éventuellement à retirer certaines réclamations, consentir à un accord, renoncer à l'instance, etc....

(Bureau International de la Cour Permanente d'Arbitrage, *Différend au sujet de diverses réclamations et contre-réclamations relatives à la concession des phares de l'Empire Ottoman* ("Affaire des Phares"), Award of 24 July 1956, made public at The Hague on 27 July 1956, pp. 46-47.

⁹⁴ *Official Records of the Economic and Social Council, Thirty-fifth Session, 1247th meeting, para. 9.*

⁹⁵ It may be noted that the Ghana Capital Investments Act, 1963 (see chapter I, section A above) provides that disputes regarding the amount of compensation in the event of expropriation shall, failing appointment of an arbitrator by the parties, be submitted to arbitration "through the agency of the International Bank for Reconstruction and Development".

⁹⁶ Statement by the President of the International Bank for Reconstruction and Development, the International Finance Corporation and the International Development Association to their Boards of Governors, Washington, D.C., 30 September 1963.

2. BILATERAL MACHINERY

INTERNATIONAL COURT OF ARBITRATION ESTABLISHED
BY ALGERIA AND FRANCE

211. Title IV — in the settlement of disputes — of the General Declaration drawn up at Evian-les-Bains on 18 March 1962 provides that, notwithstanding any provisions to the contrary, all litigations or disputes between the public authorities [of Algeria] and holders of acquired rights in respect of hydrocarbon minerals shall be dealt with

“in the first and last resort by an international court of arbitration whose organization and procedure shall be based on the following principles:

“Each of the parties shall appoint an arbitrator, and the two arbitrators shall nominate a third arbitrator who will preside over the court of arbitration; failing agreement on the nomination of this arbitrator, the President of the International Court of Justice will be asked to make this appointment at the request of the party instituting the proceedings;

“The court of arbitration shall render its award by majority vote;

“Recourse to this court shall constitute a stay;

“Awards shall be enforceable in the territory of both parties without proceedings to enforce judgement in the other country; an award shall be recognized as lawfully enforceable outside these territories during the three days following its handing down.”

212. Pursuant to these provisions, an Agreement on Arbitration⁹⁷ was concluded between Algeria and France on 26 June 1963. The Agreement provides for the establishment of an international court of arbitration, to be located at Algiers. It is to have a permanent secretariat, under the joint authority of two officials appointed by Algeria and France respectively (article 1).

213. The Agreement further provides that

“The international court of arbitration shall be empowered to pronounce judgement in the first and final instance on all litigation and disputes referred to in Title IV of the Declaration.

“In all cases, the proceedings shall be directed against, or be instituted by, the Algerian State, without thereby prejudicing the status of the technical agency for the exploitation of the Algerian subsoil resources, since this status flows from the Declaration. (Article 2.)

“Appeal to the international court of arbitration shall exclude all other appeal.” (Article 3.)

214. Article 4 repeats the provisions with respect to the enforceability of the court's awards set forth in the Declaration itself.

215. Finally, the Agreement provides that

“The Government of the French Republic and the Government of the Democratic and Popular Republic of Algeria shall undertake to accept the jurisdiction of the international court of arbitration, both in claim and defence, in all the litigations referred to in Article 2 above and to carry out the judgements of the international court of arbitration or to facilitate their enforcement.” (Article 5.)

⁹⁷ French Embassy, Press and Information Service, *French Affairs*, No. 160, New York, 22 July 1963.

216. The Annex to the Agreement sets forth the rules and procedures of the court and provides, *inter alia*, for the appointment of the third arbitrator, in the first instance, by the President of the International Chamber of Commerce in the event of failure on the part of the arbitrators appointed by the parties to agree on the nomination of this third person; in the second instance, such appointment, as well as the nomination of such arbitrator as one of the parties may have failed to appoint, falls to the President of the International Court of Justice. If the latter is of the nationality of one of the parties, or is otherwise prevented from carrying out his duties, the appointments shall be made by the Vice-President or one of the judges of the Court, in order of seniority.

217. The president of the court of arbitration shall not be, or have been, of the nationality of one of the parties, save with the consent of the other party.

218. The court has wide powers to make inquiries and to hear expert testimony. The institution of the arbitration procedure shall constitute a stay of execution by the parties of the measure or decision which is the subject of the dispute. The court may order any measures of protection it may deem necessary; such orders shall be as binding upon the parties as awards on the substance of the dispute. The court may order the payment of damages and interest; it may do so in the award on the substance of the case or in a separate award.

219. The applicable law shall be the Sahara Petroleum Code as defined in Title I-A of the Declaration. Where the Code is not applicable, the court may have recourse to the general principles of law. The court may, especially, order the annulment of any measure recognized as being contrary to the applicable law. The court may, further, decide on its own competence.

220. All awards shall be substantiated. Awards are final and not subject to appeal. The court may order a time-limit for the enforcement of any award and may institute enforcement measures.

B. INTERNATIONAL ADJUDICATION AND ARBITRATION: STATE RESPONSIBILITY FOR PROPERTY RIGHTS OF ALIENS IN CASES OF STATE SUCCESSION

STATE RESPONSIBILITY FOR STATE CONTRACTS

221. The question of the performability of State contracts with private (corporate) parties by the successor State in case of State succession is explored in its several aspects by an arbitral tribunal in the 1956 Lighthouses arbitration.⁹⁸

222. The case, briefly, deals with pecuniary claims and counter-claims by, and against, the French company Messrs. Collas and Michel, known as the *Administration générale des phares de l'Empire Ottoman*, and hereafter

⁹⁸ Bureau International de la Cour Permanente d'Arbitrage, *Différend au sujet de diverses réclamations et contre-réclamations relatives à la concession des phares de l'Empire Ottoman*, Award of 24 July 1956, made public on 27 July 1956 at The Hague.

called the Company. This Company had held a concession granted by the Imperial Ottoman Government in 1860 and last renewed in 1913 with validity up to 1949 for the construction and operation of lighthouses and similar navigational aids in the Ottoman Empire. As a result of territorial changes after the Balkan Wars (1912-1913) and the First World War, and the consequent peace treaties, including the Treaty of Lausanne (1923), Greece had acquired large areas where lighthouses and similar equipment had been installed under the terms of the concession. In 1934, the Permanent Court of International Justice had held⁹⁹ that

"The contract of April 1st/14th, 1913, between the French firm Collas and Michel..., and the Ottoman Government, extending from September 4th, 1924, to September 4th, 1949, concession contracts granted to the said firm, was duly entered into and is accordingly operative as regards the Greek Government in so far as concerns lighthouses situated in the territories assigned to it after the Balkan Wars or subsequently."

223. Before considering the several claims and counter-claims, the Arbitral Tribunal regrouped¹⁰⁰ these chronologically, by categories that are of significance in the context of the present discussion:

A. Facts that may fall to Turkish responsibility and antedating the year 1924;

B. Alleged acts by Crete prior to 1913;¹⁰¹

C. Alleged acts and omission by Greece as occupying or belligerent power, for the periods 1912-13 and 1919-24;

D. Alleged acts and omission by Greece as successor State and grantor of the concession by subrogation, for the period between 1913 and 1949.

1. Subrogation of the successor State in respect of rights and duties under the concession contract¹⁰²

224. French claim No. 8 concerned the seizure by Greek forces at Salonika in 1912 of lighthouse-dues receipts collected by the Company. Under a consequent provisional *modus vivendi*, the Greek Treasury reimbursed the Company for its operating expenses out of receipts of lighthouse dues, pending a final settlement, which never materialized, even after Greece had acquired sovereignty over Salonika. It may be noted that the Ottoman concession contract, as renewed, had called for a fifty-fifty division of dues between the Company and the Ottoman Treasury.

225. As regards the period of belligerent occupation of Salonika by Greece, i.e., up to 25 August 1913, the

⁹⁹ *Lighthouses case between France and Greece*, Judgment of 15 March 1934, Permanent Court of International Justice, Series A/B, No. 62, pp. 28-29.

¹⁰⁰ Bureau International de la Cour Permanente d'Arbitrage, *loc. cit.*, pp. 47-48.

¹⁰¹ Crete had, between 1886 and 1913, been an autonomous State, though nominally under Turkish suzerainty.

¹⁰² The discussion under this and certain subsequent sub-headings has, in part, also drawn upon the United Nations Secretariat study *Digest of decisions of international tribunals relating to State succession* prepared for the International Law Commission. (See *Yearbook of the International Law Commission 1962*, vol. II, document A/CN.4/151.

Tribunal held¹⁰³ that the claim on behalf of the Company succeeded on the ground that the lighthouse dues were not public enemy property but the property of the concession holder, and therefore protected by the Hague Regulations [on the Laws and Customs of War on Land] of 1907. As regards the period after sovereignty had passed to Greece, however, the Tribunal held that

"A partir de cette date [25 August 1913], la Grèce fut subrogée, par l'effet rétroactif retardé de l'article 9 du Protocole XII du Traité de paix de Lausanne de 1923,¹⁰⁴ à l'Empire Ottoman dans tous les droits et charges de ce dernier par rapport à la concession."

226. Greece was therefore held to be entitled to the share of the lighthouse dues receipts formerly payable to the Ottoman Government, subject, however, to a previous assignment of those revenues which had been made by the Ottoman Government to its creditors. This assignment operated to confer a private right which Greece was bound to respect.

227. Counter-claim No. 1 concerned the Greek State's share of the lighthouse dues collected by the Company between 1913 and 1928. The Tribunal held¹⁰⁵ that the claim must fail on the ground that, although Greece had succeeded the Ottoman Empire in its position as the grantor State in respect of the lighthouses concession, its right to receive the Ottoman Empire's former share of the dues was subject to the latter's prior assignment of that share to certain creditors as security for State loans raised in 1904, 1907 and 1913.

228. The loans in question had been maintained by the Treaty of Lausanne and Greece was among the States upon which responsibility for repayment devolved.

2. Respect for private acquired rights

229. In the part of the Award dealing with Greek counter-claim No. 1, the Arbitral Tribunal held¹⁰⁶ that

"Le maintien des avances et leur répartition entre la Turquie et les Etats successeurs était en accord complet avec les principes généraux du droit international public commun, prescrivant le

¹⁰³ *Loc. cit.*, pp. 86-88 and pp. 95-96.

¹⁰⁴ Protocol relating to certain Concessions granted in the Ottoman Empire, signed at Lausanne, 24 July 1923. Article 9 reads as follows:

"In territories detached from Turkey under the Treaty of Peace signed this day, the State which acquires the territory is fully subrogated as regards the rights and obligations of Turkey towards the nationals of the other Contracting Powers, and companies in which the capital of the nationals of the said Powers is preponderant, who are beneficiaries under concessionary contracts entered into before the 29th October, 1914, with the Ottoman Government or any local Ottoman authority. The same provision will apply in territories detached from Turkey after the Balkan Wars so far as regards concessionary contracts entered into with the Ottoman Government or any Ottoman local authority before the coming into force of the Treaty providing for the transfer of the territory. This subrogation will have effect as from the coming into force of the treaty by which the transfer of territory was effected except as regards territories detached by the Treaty of Peace signed this day, in respect of which the subrogation will have effect as from the 30th October, 1918." League of Nations, *Treaty Series*, vol. XXVIII (1924), No. 707.

¹⁰⁵ *Loc. cit.*, pp. 122-124.

¹⁰⁶ *Ibid.*, p. 122.

respect des droits patrimoniaux acquis en cas de changements territoriaux. La seule question douteuse dans ce domaine est celle de savoir si un droit patrimonial particulier compte parmi ces droits acquis, Le Tribunal n'hésite pas, toutefois, à considérer comme tels des droits découlant d'un contrat d'emprunt, tel que les contrats précités,¹⁰⁷ conclus entre un Etat et une ou plusieurs personnes privées."

3. Observance in good faith of agreements

230. Claim No. 8 concerned losses incurred by the Company as a result of the collection of lighthouse dues between 1919 and 1929 in Greek drachmas, which had been subject to severe devaluation, without any attendant reasonable increase in dues granted in good faith.

231. The Tribunal went to some length to disclaim any intention to suggest that the dues should have been calculated to any gold value equivalent, although the original contract of 1860 had, in fact, been entered into at a time when the Turkish currency had been based on the gold standard. The claim succeeded, however, to the extent that the Tribunal held that Greece was bound by the principle of good faith to permit a reasonable adjustment of the relevant terms of the concession.

*"En effet, le principe de la bonne foi dans l'interprétation de la concession commandait qu'à raison de la dévaluation de la drachme et des perturbations qui en résultaient pour l'équilibre financier de la concession, l'Etat successeur procédât aux mesures nécessaires pour assurer la continuation de l'exploitation de la concession à des conditions équitables."*¹⁰⁸

4. Requirement for compensation in the event of an appropriation

232. The concession contracts between the Ottoman Government and the Company provided that the former might take over the lighthouse administration subject to payment of compensation previously agreed upon between the parties, or determined by arbitration.¹⁰⁹ In 1929, Greece appropriated the Company's concession without payment of compensation, and claim No. 27 concerned this act.

233. The Tribunal held that the Company's claim to compensation should succeed, for Greece had been subrogated to the position of the Ottoman Empire under the concession contracts and could therefore only take over the lighthouses administration under the conditions under which the Ottoman Empire might have done so.

"Par sa mainmise sur le service des phares de la Société à partir du 1^{er} janvier 1929 sans paiement — ou garantie de paiement — préalable d'une indemnité, arrêtée dans des conditions qui en assurent l'équité, le Gouvernement Hellénique, en tant

¹⁰⁷ This reference is to the loan agreements, concluded between the Ottoman Government and the French *Administrateur général des Phares de l'Empire Ottoman*, acting in that capacity as well as in a second capacity of representative of certain foreign subscribers to the loans in question.

¹⁰⁸ *Loc. cit.*, p. 111-112.

¹⁰⁹ Treaty of 8/20 August 1860, Article XIX (*ibid.*, p. 149); Contract extending the concession, 30 June/12 July 1879, Article VII (*ibid.*, p. 151).

*que successeur dans la concession par subrogation, a accompli un acte d'autorité directement contraire à une de ses clauses essentielles."*¹¹⁰

5. Standards of compensation

234. with respect to the standard of compensation applicable to the case in question the Tribunal held¹¹¹ that the Company was entitled to compensation *indemnité de rachat de la concession* which should, as far as possible, be equal to the advantages of which it had been deprived by the expropriation of the concession twenty years before it was due to expire.

*"Pour leur évaluation on doit se reporter à la date à laquelle s'est produite la voie de fait du Gouvernement Hellénique qui a donné naissance à ce droit d'indemnisation et le préjudice infligé à la Société ne peut être évalué que d'après les données existantes au moment de la reprise de la concession. Les faits ultérieurs, en tant qu'imprévisibles à ce moment aussi bien pour le Gouvernement Hellénique qui s'empara de la concession que pour la Société qui en fut dépossédée, ne peuvent être pris en considération en cas d'octroi d'une indemnité qui devait être non seulement fixée, mais aussi mise à la disposition de la concessionnaire avant son éloignement."*¹¹²

235. In the case of the Société Collas and Michel before the Franco-Italian Conciliation Commission,¹¹³ Italy claimed exemption from the requirement, set forth in Article 78, paragraph 7 of the Treaty of Peace with Italy signed in Paris, on 10 February 1947, to compensate nationals of the United Nations for war damages sustained in territories to be ceded under the terms of the said Treaty, on the ground that the property in question had been largely or wholly written off by its owners and that the property would have lost all value with the expiration, in 1949, of the concession contract under which it had previously been operated.¹¹⁴

236. France, on the other hand, maintained that the claim had been brought against Italy under the terms of the Treaty of Peace in respect of wartime damages and not in respect of Italy's rights and obligations as the grantor of the concession by subrogation. The claim thus concerned only the property rights to the lighthouses of the Company at the time the Treaty had come into force.

¹¹⁰ *Ibid.*, p. 133.

¹¹¹ *Ibid.*

¹¹² In so holding, the Tribunal cites Decision No. 164 of the Franco-Italian Conciliation Commission which is discussed below.

¹¹³ *Recueil des Décisions de la Commission de Conciliation Franco-Italienne*, Différend Société Collas et Michel, Decision No. 146, 21 January 1953, 4th fascicle, p. 134.

¹¹⁴ This case parallels the substance of the *Lighthouses* arbitration discussed above, but relates to lighthouses on former Turkish islands in the Dodecanese (Rhodes, Prassonisi, Andileousa, Kos, Kalimnos and Levitha) which had passed to Italy under the Treaty of Lausanne (1923) and had been ceded to Greece under the Treaty of Peace with Italy. Eight of the nine lighthouses in question had suffered destruction during the Second World War. The concession contract was that granted by the Ottoman Government, Italy being the successor State in this case. Upon the cession of the Italian Dodecanese Islands to Greece, the latter extended the expropriation of the lighthouses concession, effected in Greek territory at the end of 1928, to the ceded islands.

237. The Conciliation Commission, in its award, held ¹¹⁵ that the internal arrangements to write off a property that an owner might have made as a matter of good management [*"à titre de mesure de prudence"*] or even under a legal requirement, could not reduce the value of the property in question with respect to a third party called upon to pay compensation either under municipal law or in fulfilment of an international obligation.

238. On the other hand, the award continues, the intrinsic value of the installations constructed in order to operate a State concession cannot be assessed without taking the concession itself into account, for the installations are of value only to the extent to which they are the means of putting the concession right granted by the public authority into operation (e.g., mines, hydro-electric power installations, etc.).

239. In a subsequent award in the same case and on the same subject, the Conciliation Commission held ¹¹⁶ that

"lorsqu'il s'agit d'installation construite pour l'exploitation d'une concession d'Etat, pour lesquelles " la perte ou le dommage " résultant de la destruction, ne peuvent s'estimer en considérant seulement le coût de la reconstruction, elle [the Commission] doit rechercher, pour chaque cas et selon les critères d'équité, compte tenu aussi des conditions de la concession, la méthode la plus adéquate pour la détermination de l'indemnité".

C. STUDIES UNDER THE AUSPICES OF THE UNITED NATIONS

5. SUCCESSION OF STATES AND GOVERNMENTS ¹¹⁷

240. At the 15th session of the International Law Commission, a sub-committee considered the topic of the succession of States and Governments. The Sub-Committee's report,¹¹⁸ by its Chairman, Mr. Manfred Lachs, made certain recommendations concerning the relationship between the topic of state succession and those of the law of treaties and of state responsibility, notably in respect of the need to co-ordinate the codification efforts on these topics; succession in the matter of treaties should be considered in connexion with the succession of States rather than in the context of the law of treaties. This recommendation was approved by the Commission, as were the Sub-Committee's proposed objectives and the broad outline of headings proposed for the guidance of the Rapporteur.

241. Among the proposed headings, the following are special interest in the context of the topic of permanent sovereignty over natural resources:

...

(b) *Ratione materiae*:

Treaties; territorial rights; nationality; public property; concessionary rights; public debts; certain other questions of public law; property, rights, interests and other relations under private law; torts.

(c) *Ratione personae*:

Rights and obligations:

- (i) Between the new State and the predecessor State;
- (ii) Between the new States and the third States;
- (iii) Of the new State with respect to individuals (including legal persons).

...

242. The full report ¹¹⁹ of the Chairman of the Sub-Committee includes a number of working papers submitted by individual members.¹²⁰ In the context of the work of the International Law Commission on this topic, the Secretariat has prepared a number of papers, some of which are of general relevance to the topic of the present report.¹²¹

2. STATE RESPONSIBILITY

243. At its fifteenth session, the International Law Commission considered the report ¹²² of the Sub-Committee on State Responsibility and endorsed the general conclusions ¹²³ of the report:

(1) That, in an attempt to codify the topic of State responsibility, priority should be given to the definitions of the general rules governing the international responsibility of the State, and

(2) That, in defining these general rules the experience and material gathered in certain special sectors, specially that of responsibility for injuries to the persons or property of aliens, should not be overlooked and that careful attention should be paid to the possible repercussions which developments in international law may have had on responsibility.

244. The Sub-Committee endorsed an outline programme ¹²⁴ of work proposed by its Chairman, Mr. Roberto Ago, for the guidance of the future Special Rapporteur.

¹¹⁹ See *Yearbook of the International Law Commission 1963*, vol. II, annex II, document A/CN.4/160.

¹²⁰ Some of these refer to the questions of the contracts and economic rights of aliens e.g., Mr. Elias (*Ibid.*, pp. 283-84); Mr. Rosenne (*ibid.*, pp. 285-290); Mr. Castrén (*ibid.*, pp. 290-93); Mr. Bartoš (*ibid.*, pp. 293-297) and, in one instance, to the work of the United Nations Commission on Permanent Sovereignty over Natural Resources (Mr. Rosenne *op. cit.*)

¹²¹ For example, "The succession of States in relation to general multilateral treaties of which the Secretary-General is the depositary" (*Yearbook of the International Law Commission 1962*, vol. II, document A/CN.4/150); "Digest of decisions of international tribunals relating to State succession" (*ibid.*, document A/CN.4/151).

IV. Status of permanent sovereignty over natural wealth and resources in Non-Self-Governing and Trust Territories

LEGISLATIVE AND FACTUAL INFORMATION

1. THE TRUST TERRITORY OF NAURU

Royalty payments to the indigenous population

245. A detailed review of royalty payments to the Nauruan people by the British Phosphate Commissioners in respect of phosphates extracted on Nauru is contained in the report of the United Nations Visiting Mission to the Trust Territories of Nauru and New Guinea, 1962.¹²⁵

246. Over-all payments made by the British Phosphate Commissioners include:¹²⁶ (1) all expenses of the

¹²⁵ United Nations Visiting Mission to the Trust Territories of Nauru and New Guinea, Report on Nauru, *Official Records of the Trusteeship Council, Twenty-ninth Session*, document T/1603, paras. 107-111.

¹²⁶ *Ibid.*, para. 13.

Administration; (2) payments to the Nauru Royalty Trust Fund, at the rate of 10d. per ton of phosphate exported;¹²⁷ (3) royalty paid to landowners at the rate of 1s. 1d. per ton of phosphate; (4) payments into the Nauruan Landowners Royalty Trust Fund at the rate of 8d. per ton;¹²⁸ (5) royalty at the rate of 1s. per ton of phosphate has been paid into the Nauruan Community Long-Term Investment Fund since 1958 (previous rates were 5d. and 2d.) for the purpose of meeting the future economic needs of the Nauruan people; and (6) lump sum payment to landowners for the lease of phosphate land. The rates are £120 per acre above the 30 ft. contour and £60 per acre below this contour. According to an agreement between the landowners and the Commissioners (1947), the Commissioners have the right to lease any phosphate-bearing land and to mine the phosphate thereon. The agreement, incorporated into a Land Ordinance, expires in July 1967.

¹²⁷ The fund is used for financing the activities of the Nauru Local Government Council and building new homes. At 30 June 1961, the Fund's credit balance was £23,176.

¹²⁸ The balance of the Fund at 30 June 1961 was £201,405.

Table IV-1

ROYALTY RATES PER TON OF EXPORTED PHOSPHATE SINCE 1947

Year	Royalty direct to landowners	Nauruan Royalty Trust Fund	Nauruan land-owners' Royalty Trust Fund	Nauruan community Long-Term Investment Fund	Total
1947/1948	6d.	3d.	2d.	2d.	1s.1d.
1948/1949	6d.	3d.	2d.	5d.	1s.4d.
1949/1950	6d.	3d.	2d.	5d.	1s.4d.
1950/1951	6d.	3d.	2d.	5d.	1s.4d.
1951/1952	6d.	3d.	2d.	5d.	1s.4d.
1952/1953	6d.	3d.	2d.	5d.	1s.4d.
1953/1954	6d.	3d.	2d.	5d.	1s.4d.
1954/1955	8d.	3d.	2d.	5d.	1s.6d.

1960/1961	1s.1d.	10d.	8d.	1s.	3s.7d.

Table IV-2

QUANTITY AND VALUE OF PHOSPHATE EXPORTS AND RELATED ROYALTY PAYMENTS

Year	Phosphate exports		Royalty payments	
	Tonnage	Value	Per ton	Total
1948/1949	680,746	£1,174,287	1s.1d.	£32,633
1949/1950	1,009,266	1,589,594	1s.1d.	47,544
1950/1951	950,744	1,378,579	1s.4d.	64,594
1951/1952	1,061,797	1,725,420	1s.4d.	67,546
1952/1953	1,227,103	1,994,045	1s.4d.	83,457
1953/1954	1,103,726	1,931,520	1s.4d.	75,643
1954/1955	1,237,236	2,165,163	1s.6d. ^a	100,893 ^b
				9,160
1955/1956	1,467,794	2,568,640	1s.6d.	114,872
1956/1957	1,278,176	2,236,808	1s.6d.	97,709
1957/1958	1,167,180	2,421,898	1s.7d.	90,746
1958/1959	1,201,138	2,492,361	2s.7d. ^a	155,147 ^b
				58,359
1959/1960	1,233,087	2,836,261	3s.2d.	179,054
1960/1961	1,338,681	2,945,098	3s.7d.	239,847

^a Royalty increase retroactive from preceding year.

^b Retroactive adjustment for preceding year.

Under an agreement concluded in March 1961, the latest total royalty rate of 3s.7d. per ton is to apply for a period of four years.

247. During the period under review, administration costs, contributed by the Commissioners have risen from £15,061 to £470,667, and total contributions, including royalties, have risen from 4 per cent of export value to 24 per cent.

2. BASUTOLAND

*Mining*¹²⁹

248. In September 1961 the Paramount Chief declared that the digging of diamonds at Letseng-la-Terai in the Mokhotlong District was open to Basuto concession holders. The Paramount Chief entered into an agreement in October 1961 with Colonel John Scott of Johannesburg to extend for a further two years the prospecting for diamonds which Colonel Scott started in 1955; the agreement provides for mining rights if an economic mine is discovered. A part of the original prospecting area has been set aside for Basuto diggers; over 100 diggers' licences were issued and diamonds worth about £30,000 were recovered in the last three months of 1961.

3. BECHUANALAND

(a) *Land*¹³⁰

249. In square miles, the area of the Territory comprises: Crown lands, 109,000;¹³¹ European blocks

¹²⁹ *Non-Self-Governing Territories, Summaries of information transmitted to the Secretary-General for 1961, ST/TRI/B.1962/1, p. 28.*

¹³⁰ *Ibid.*, pp. 43-44.

¹³¹ Another recent official source gave the total area of Crown lands in 1961 as 165,000 square miles.

(Gaberones, Lobatsi and Tuli blocks and Tati district), 4,000; and tribal reserves (Bakgatla, bakwena, Bamalete, Bamangwato, Bangwaketse, Barolong, Batawana and Batlokwa), 109,000 square miles. All Crown lands remain unalienated with the exception of 164 farms in the Ghanzi district, thirteen farms in the Molopo area and certain areas leased to the Colonial Development Corporation.

250. Three of the four European blocks (Gaberones, Lobatsi and Tuli blocks) were granted in perpetuity to the British South Africa Company with power to sell or lease the land. The blocks have been divided into farms and most of them sold with freehold titles. The Tati district is owned by the Tati Company, Limited, which has full power to sell or lease any portion except an area of some 320 square miles leased by the Government for the Tati Federated Tribes.

251. Land in each tribal reserve is vested in the chief and tribe and allocated by the chief in his discretion. Land does not pass automatically from father to son, nor can it be said to be owned by any one person. Land may not be alienated by a chief or tribe.

(b) *Mining*¹³²

252. No prospecting or mining either by individuals or mining concerns is allowed on Crown lands or in the Tribal Territories unless a Crown grant or a mineral concession has been negotiated. In 1961, ten Crown grants (seven in 1960) were being operated on in addition to a mineral concession over the whole of the Bamangwato Tribal Territory. Of these, seven conferred diamond prospecting rights, one rights to prospect for all minerals, one rights to mine manganese and prospect for all minerals and one rights to explore petroleum. Two other Crown grants for asbestos mining and manganese mining and prospecting rights were still valid.

¹³² *Op. cit.*, pp. 45-46.

(c) *Factual data on mineral production*¹³³

	PRODUCTION					
	Quantity			Value (thousand pounds)		
	1959	1960	1961	1959	1960	1961
Asbestos (short tons)	1,112	1,849	1,924	95.9	132.3	160.9 ^a
Manganese ore (short tons) . .	15,905	14,242	31,737	92.0	70.8	143.9 ^b
Gold (ounces)	198	203	261	2.4	2.5	3.2
Silver (ounces)	42	25	39	—	—	—

^a Refers to sales of 1,852 short tons.

^b Refers to sales of 24,833 short tons.

4. KENYA

*Land*¹³⁴

253. A new land policy, adopted by the Kenya Government in 1960 and now being implemented, is designed to

¹³³ *Ibid.*, p. 46.

¹³⁴ *Ibid.*, pp. 83-84.

achieve the progressive disappearance of racial barriers to land ownership and use, and to ensure that all land transactions will in future be judged on grounds of sound agricultural development and the economic use of the land, and not on grounds of race.

254. Under the Kenya (Land) Order in Council, 1960, which gives legal effect to this policy, all land in Kenya falls into three categories: (a) Crown lands; (b) trust lands; (c) private lands.

255. Crown lands include all leasehold land in the Colony, unalienated land, special reserves, temporary special reserves, special leasehold areas, special settlement areas communal reserves. All unalienated Crown land, whether within a municipality or a township, may be alienated to persons of any race, but, in municipalities and townships, the terms of the leases are still restricted to 999 years. Unalienated Crown land outside municipalities and townships may be alienated for agricultural purposes for an initial term corresponding to that required for development, with provision for the grant of freehold (on payment) on completion of the initial development.

256. Trust lands are lands, other than private lands, within the special areas, i.e., the areas of Native lands, the boundaries of which are set out in the Native Lands Trust Ordinance of 1938 (cap. 100). In the greater part of the special areas today, the occupation, control of use, inheritance and disposal of land is still governed by customary law. Provision was made in 1959, however, for the recognition, by registration, of rights of ownership under customary law as freehold. Individual title has already been registered over large areas of the Kikuyu Districts and parts of the Nandi, Elgeyo-Marakwet and Baringo Districts. In registered areas, except as regards inheritance, Native law and custom and the Native Lands Trust Ordinance have been superseded by the provisions of the Native Lands Registration Ordinance of 1959 and the ordinary land laws of Kenya. Under the Land Control (Special Areas) Regulations, 1961, control over land transactions is exercised by provincial and divisional boards, whose composition is predominantly African. It is the intention gradually to extend this system of registration and control to other parts of the special areas where the concept of individual ownership has emerged.

257. Private land includes all land held in fee simple under either the Land Titles Ordinance of 1908 (cap. 1959), the Crown Lands Ordinance of 1915 (cap. 155) or the Native Lands Registration Ordinance, 1959.

258. At the Kenya Constitutional Conference of 1962, it was agreed that the control of land transactions outside the Scheduled Areas (i.e., the former European areas) would be vested in the appropriate tribal authorities, and that with regard to land within the Scheduled Areas, a central land board would be established to formulate and implement settlement schemes.

5. NYASALAND

*Land*¹³⁵

259. During 1961, no change was made in the principles governing the ownership of land, or in the types of tenure on which land was held. Acreage figures for the various categories of land at the end of the year were approximately as follows: African trust land not the subject of leases, 20,067,363 acres; public land not the subject of

leases, 2,483,338 acres; freehold land, 623,281 acres; and African trust land and public land leased, 173,858 acres — a total of 23,347,840 acres.

6. SWAZILAND

(a) *Land*¹³⁶

260. About 2,241,000 acres of a total of 4,290,560 acres of the Territory are occupied by the Swazi people as Native Area, Native Land Settlement area or land owned by the Swazi nation and individual Swazis. The remaining 2,049,000 acres of European-owned and Crown land is devoted to ranching, irrigated crop production or forestry.

(b) *Mining*¹³⁷

261. In Swaziland mineral ownership is divided between the Crown and private persons, and, up to the present, the areas of differing ownership have been known as Crown mineral areas or mineral concessions. Before the promulgation of the Swaziland Mining Proclamation, about 48 per cent of the mineral rights were vested in the Crown and the remaining 51.6 per cent were held privately in the form of concessions. On the basis of a recent decision by the United Kingdom Government all rights to minerals on Crown mineral areas and lapsed and surrendered mineral concessions are to be vested in the Swazi nation. Discussions are proceeding between the Government and the Swazi National Council to implement this decision.

262. Asbestos, the most important mineral product, is mined by the Havelock Asbestos Mines, one of the largest producers in the world. Tin, diaspore, pyrophyllite and barytes are worked at present. Mining of the extensive anthracite coal deposits was started in 1959. There is a small-scale production of beryl and silver. Gold mining was recommenced on an appreciable scale for the first time since 1952. Deposits of iron ore, nickel and copper have been discovered recently.

(c) *Factual data on mineral production*¹³⁸

	MINERAL PRODUCTION		
	(Short tons)		
	1959	1960	1961
Chrysotile asbestos ..	24,807	32,026	30,792
Coal	1,594	12,846	1,079
Pyrophyllite	1,008	1,714	2,955
Barytes	461	200	453
Diaspore	428	827	491
Gold (fine ounces)	80,575	1,325
Metallic tin	6	707	612
Total value of mineral production (pounds)	2,100,848	2,830,383	2,580,380

V. Economic data pertaining to the status of sovereignty over natural wealth and resources in various countries

A. DATA RELATING TO THE INTERNATIONAL FLOW OF CAPITAL AND THE EXTENT OF FOREIGN INVESTMENT

1. INTERNATIONAL FLOW OF CAPITAL

263. The earlier study of the Secretariat on permanent sovereignty over natural wealth and resources¹³⁹ included substantial data on the international flow of capital, drawn largely from United Nations publications, in view of the fact that such full information was germane to a comprehensive review of the entire topic of permanent sovereignty.

264. Within the framework of the present supplementary report, however, it is believed to be sufficient to draw attention to the series of United Nations reports published under the titles of *International Flow of Long-term Capital and Official Donations*¹⁴⁰ and *The Promotion of the International Flow of Private Capital*.¹⁴¹

¹³⁹ See footnote 1 above.

¹⁴⁰ For the latest report published at the time of this writing and covering the years 1959-1961, see United Nations publication, Sales No.: 63.II.D.2; also Progress Report of the Secretary-General, *Official Records of the General Assembly, Eighteenth Session, Annexes*, agenda items 12-33-34-35-36-37-39-76, document A/5546.

¹⁴¹ For the latest report published at the time of this writing, see the third report by the Secretary-General in the series, *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes*, agenda item 6, document E/3665/Rev.1.

2. INDONESIA: DISTRIBUTION OF PETROLEUM PRODUCTION BETWEEN FOREIGN COMPANIES AND STATE ENTERPRISES¹⁴²

	<i>1960, production in tons</i>
Total production	20,606,121
Caltex Pacific Oil Co.	10,156,426
Shell Oil Co.	4,520,500
Standard Vacuum Oil Co.	3,860,685
TOTAL, foreign companies	18,537,612
Pertamin	1,444,654
Permina	589,192
Permigan	34,660
TOTAL, State-owned companies	2,068,509

3. PAKISTAN: GOVERNMENT PARTICIPATION IN PETROLEUM EXPLORATION COSTS¹⁴³

265. Total investment in oil exploration in Pakistan in 1960 amounted to 62.8 million rupees, of which the private companies provided Rs. 50.6 million and the Government the balance. Details of Government investment in each company are as follows:

¹⁴² *Mining Developments in Asia and the Far East, 1960*, Mineral Resources Development, Series No. 16, United Nations publication, Sales No.: 62.II.F.6. p. 46.

¹⁴³ *Ibid.*, p. 67.

<i>Name of company/project</i>	<i>Total investment to 1960</i>	<i>Government Investment to 1960</i>	<i>Investment 1960</i>	<i>Government Investment 1960</i>
<i>(Rupees)</i>

B. ACTIVITIES OF REGIONAL ECONOMIC ASSOCIATIONS

EUROPEAN COAL AND STEEL COMMUNITY: MINERAL EXPLORATION IN AFRICA

266. The study of the Secretariat on the Status of Permanent Sovereignty over Natural Wealth and Resources has made reference¹⁴⁴ to the exploration of new sources of iron ore by the European Coal and Steel Community (ECSC) in West Africa.

¹⁴⁴ United Nations publication, Sales No.: 62.V.6, chapter V, paras. 53-59.

267. More recent developments are reported by the Community as follows:¹⁴⁵

“ The work of prospecting for iron and manganese ore ... went ahead, within the terms of reference initially laid down, in Guinea and other African countries. In Guinea, a preliminary series of comparatively brief surveying operations confirmed the presence of extensive iron-ore deposit. The operations in question were carried out under a provisional contract which was to have been succeeded by an agreement with the Guinean Government: however, the negotiations fell through in consequence

¹⁴⁵ European Coal and Steel Community High Authority, *Tenth General Report on the Activities of the Community* (February 1, 1961-January 31, 1962), Luxembourg, 1962, pp. 269-270, para. 353.

of the desiderata put forward by the latter, particularly with regard to the terms on which the deposit was to be worked and the arrangements for transporting the ore to the coast. The High Authority-aided prospection programme was then suspended.

" ...

" In Gabon the operations effected during the period under review yielded encouraging results: aerial surveys showed several further deposits of low-grade ore to exist, the extent of which was then ascertained by ground-level investigation. One deposit was found to contain small quantities of high-grade ore.

" In the Congo (Brazzaville), a start has been made on aerial surveying."

268. Low-grade ore deposits were found in the Ivory Coast, but are too far from the sea to warrant present exploitation.

C. CONCESSIONS AND DEVELOPMENT AGREEMENTS WITH FOREIGN NATIONALS AND COMPANIES FOR THE DEVELOPMENT OF RESOURCES

1. AUSTRALIA: PÉCHINEY COMPANY *

269. Special mineral leases were issued on 11 March 1963 by the Commonwealth of Australia over bauxite deposits in the Gove Peninsula of Arnhem Land, Northern Territory, to the Gove Bauxite Corporation, Ltd., a company incorporated in the Northern Territory and associated with the Péchiney Company of France.

270. The leases provide that Gove Bauxite Corporation shall within three months of the grant of the leases, apply for their transfer to a company incorporated in Australia that is a subsidiary of the Péchiney Company.

271. The leases, which cover an area about 57 square miles and are for a period of 42 years, with a right of renewal, provide for a maximum cumulative tonnage of bauxite that may be exported. Thus, the working obligations set forth in the leases require, *inter alia*, that the lessee make an immediate start on the mining and export of bauxite and attain the following export targets within the periods stated, as follows:

Second year from date of grant:	Start of exports
Third year from date of grant:	250,000 metric tons
Fourth to seventh years:	1.2 million metric tons (total)
Each five-year period thereafter:	2.25 million metric tons (total)

to a maximum cumulative total of 10 million metric tons within 18 years of the grant of the leases.

272. The Government reserves certain discretionary powers as to the export price of bauxite and related products. Other working obligations stipulate the construction of an alumina plant with a minimum capacity

of 500,000 tons *per annum*, certain other minimum expenditures, the construction of a town site, harbour facilities and other infra-structural plant.

273. As the area over which the leases are granted falls within the Arnhem Land aboriginal reserve, the bauxite mineral will attract double the normal rate of royalty, the proceeds of which are to be paid into a trust fund for the general benefit of aborigines in the Northern Territory.

2. GABON: COMPAGNIE DES MINES D'URANIUM DE FRANCEVILLE

274. In June 1960, the Republic of Gabon approved a long-term concession agreement (*convention*) on the establishment and operation of the Compagnie des mines d'uranium de Franceville,¹⁴⁶ a corporation established with French capital, domiciled in Gabon.

275. The agreement in question is an example of a recent and highly integrated concession agreement concluded by a developing country; in addition, since the mineral substance concerned is uranium, the terms of the agreement are in certain technical respects governed by applicable regulations of the International Atomic Energy Agency (IAEA) and the European Atomic Energy Community (EURATOM).

276. Of special note are the agreement's preambular considerations and the framework of guarantees offered by the conceding State.

277. Negotiations on the subject of the present *convention* were begun prior to Gabon's accession to independent status and drafts of the agreement, as well as related measures on the applicable fiscal régime, were approved by the various legislative organs of the French Equatorial African Group of Territories. From a succession point of view, then, the draft convention passed through stages essentially analogous to those described in the Secretariat study on Permanent Sovereignty over Natural Wealth and Resources in connexion with the Compagnie minière de l'Ogooué (COMILOG) concessions¹⁴⁷ in Gabon and the Congo (Brazzaville). The present agreement, on the other hand, did not go beyond the draft stage prior to Gabon's accession to independence and thus constitutes an original agreement.

(a) Basic general economic considerations

278. The preambular considerations of the *convention* are of some interest in their generalized exposition of the basic rationale for the conclusion of the agreement. Thus:

" Considering that investments and especially industrial investments constitute one of the best means of encouraging economic growth and of improving the standard of living of a country's population;

¹⁴⁶ Law No. 19/16, 8 June 1960, Gabon, *Journal officiel*, 1 July 1960, pp. 396-401.

¹⁴⁷ United Nations publication, Sales No.: 62.V.6, chapter IV, paras. 17-24.

* Information provided by the Government.

"Considering the importance that the exploitation of its mineral resources, and especially of its uranium deposits — the purpose of the *Compagnie des mines d'uranium de Franceville* — represent for the economic and social development of Gabon;

"...

"Considering that the financing of [the company's] investments can only be carried out to the extent that the company is assured of stable economic, financial, fiscal, legal and social conditions, and given the fact that the company is in any event exposed to international commercial competition;"

279. The concluding *considerandum* then states that the agreement has been concluded in order to guarantee to the company stable conditions in the areas mentioned to the extent to which such stability is within the jurisdiction of the Republic of Gabon.

(b) *Domicile*

280. The company is domiciled at Libreville, Gabon, and undertakes not to remove its domicile from the country during the period of validity of the agreement without the prior consent of the Head of State of Gabon (preamble and article 2).

(c) *Guarantees provided by the grantor State*

i. *General guarantees and guarantees of non-discrimination*

281. Gabon undertakes to refrain from legislating or otherwise enacting any measures that might discriminate *de jure* or *de facto* against the company in relation to other industrial or commercial enterprises in the country (article 4). Guarantees are also provided in respect of the withdrawal, restriction or non-renewal of the Company's mining permits, and the maintenance of the long-term fiscal benefits agreed upon (article 5).

282. The present agreement is further guaranteed against any unilateral modifications (article 6).

ii. *Guarantees in respect of the effect of jurisdictional or institutional changes in the grantor State*

283. A general guarantee is provided that any jurisdictional or institutional changes that may intervene in Gabon shall not affect the provisions of the agreement (article 7).

iii. *Financial guarantees*

284. Gabon undertakes not to restrict the scope of legislation currently in force which guarantees free movement of capital and profits between Gabon, the other States members of the Equatorial Customs Union and France, in respect of the funds of the company, of its stockholders, creditors and personnel, as well as in respect of the repatriation of foreign capital and export of materials produced outside the franc currency area.

285. The company may utilize its foreign currency earnings from exports to pay for its own imports. Any future incentives that might be enacted to encourage the investment of profits in Gabon shall not interfere with the application of the provisions set forth above (article 8).

iv. *Economic guarantees*

286. Under this heading, the grantor State guarantees that no obstacles or discriminatory measures shall be taken against the company's requirements in imported materials and equipment, provided that the company accords preference to Gabonese products as well as to Gabonese industries and subcontractors, given equivalent prices and technical properties.

287. Also guaranteed are the free movement of goods and equipment, and the execution of the company's long-term and short-term sales contracts.

288. It is to be noted that the company, for its part, undertakes not to conclude such sales contracts at prices lower, on average, than those prevailing with respect to other producing countries (article 9).

v. *Juridical guarantees*

289. The grantor State guarantees to exempt the company from the effects of any measures in the fields of company, minerals and social legislation which would place the concession holder in a less favourable position than that which obtained under legislation previously in force or which would nullify the applicability of the present agreement, including its arbitration provisions (see paras. 293-296 below), unless the company specifically requests to be governed by such new legislation.

290. The conceding State also guarantees the company against any measures that might restrict the application of the company's statutes, which may not, however, contravene the provisions of the present agreement (article 19).

291. The conceding State, however, reserves the right to impose certain safety measures with respect to the mining and handling of radioactive materials, but such measures may not exceed the standards recommended by EURATOM or IAEA (article 21).

292. The company, for its part, waives any claim against Gabon developing from the technical hazards involved in the operations concerned or from general economic fluctuations (article 23).

(d) *Settlement of disputes*

293. The agreement provides (under title III) that any dispute arising between the Republic of Gabon and the company on the subject of the agreement, including its validity and interpretation, as well as any dispute with respect to the application of administrative decisions or with respect to any agreements or conventions concluded between the parties concerned, shall be submitted to definitive arbitration.

294. From a procedural point of view, provision is made for a system of notification and appointment of arbitrators; in the event that one of the parties fails to make such appointment, its arbitrator shall be appointed by the Vice-President of the French Council of State at the request of the party instituting the proceedings. The same procedure applies in the absence of agreement between the arbitrators appointed by the parties on the person of the third arbitrator.

295. The parties may, by common consent, designate an alternative personality to appoint the second or third arbitrators *ex officio*, either with respect to a specific dispute or in respect of a limited or unlimited period of time.

296. The final clause provides that

“The award [of the arbitral tribunal, whether composed of one, two or three arbitrators] shall be final and irrevocable, and the parties shall formally and without reservation waive, in advance, any right to upset, or fail by whatever means to execute, the terms of the award, or to seek to appeal from the award before any jurisdiction whatsoever.”

(e) *Duration of the agreement*

297. In the absence of denunciation of the agreement by the parties, acting in common consent, the agreement remains in force as long as the company is the holder of mining rights or concessions in respect of uranium in Gabon, including royalty, partnership or lease rights (article 25).

ANNEX I

Resolutions of the General Assembly and the Economic and Social Council bearing on the relationship between permanent sovereignty over natural wealth and resources and the need for international co-operation in the economic development of developing countries

A. GENERAL ASSEMBLY RESOLUTION 1803 (XVII)
OF 14 DECEMBER 1962

1803 (XVII). *Permanent sovereignty over natural resources*

The General Assembly,

Recalling its resolutions 523 (VI) of 12 January 1952 and 626 (VII) of 21 December 1952,

Bearing in mind its resolution 1314 (XIII) of 12 December 1958, by which it established the Commission on Permanent Sovereignty over Natural Resources and instructed it to conduct a full survey of the status of permanent sovereignty over natural wealth and resources as a basic constituent of the right to self-determination, with recommendations, where necessary, for its strengthening, and decided further that, in the conduct of the full survey of the status of the permanent sovereignty of peoples and nations over their natural wealth and resources, due regard should be paid to the rights and duties of States under international law and to the importance of encouraging international co-operation in the economic development of developing countries,

Bearing in mind its resolution 1515 (XV) of 15 December 1960, in which it recommended that the sovereign right of every State to dispose of its wealth and its natural resources should be respected,

Considering that any measure in this respect must be based on the recognition of the inalienable right of all States freely to dispose of their natural wealth and resources in accordance with their national interests, and on respect for the economic independence of States,

Considering that nothing in paragraph 4 below in any way prejudices the position of any Member State on any aspect of the question of the rights and obligations of successor States and Governments in respect of property acquired before the accession to complete sovereignty of countries formerly under colonial rule,

Noting that the subject of succession of States and Governments is being examined as a matter of priority by the International Law Commission,

Considering that it is desirable to promote international co-operation for the economic development of developing countries, and that economic and financial agreements between the developed and the developing countries must be based on the principles of equality and of the right of peoples and nations to self-determination,

Considering that the provision of economic and technical assistance, loans and increased foreign investment must not be subject to conditions which conflict with the interests of the recipient State,

Considering the benefits to be derived from exchanges of technical and scientific information likely to promote the development and use of such resources and wealth, and the important part which the United Nations and other international organizations are called upon to play in that connexion,

Attaching particular importance to the question of promoting the economic development of developing countries and securing their economic independence,

Noting that the creation and strengthening of the inalienable sovereignty of States over their natural wealth and resources reinforces their economic independence,

Desiring that there should be further consideration by the United Nations of the subject of permanent sovereignty over natural resources in the spirit of international co-operation in the field of economic development, particularly that of the developing countries,

I

Declares that:

1. The right of peoples and nations to permanent sovereignty over their natural wealth and resources must be exercised in the interest of their national development and of the well-being of the people of the State concerned.

2. The exploration, development and disposition of such resources, as well as the import of the foreign capital required for these purposes, should be in conformity with the rules and conditions which the peoples and nations freely consider to be necessary or desirable with regard to the authorization, restriction or prohibition of such activities.

3. In cases where authorization is granted, the capital imported and the earnings on that capital shall be governed by the terms thereof, by the national legislation in force, and by international law. The profits derived must be shared in the proportions freely agreed upon, in each case, between the investors and the recipient State, due care being taken to ensure that there is no impairment, for any reason, of that State's sovereignty over its natural wealth and resources.

4. Nationalization, expropriation or requisitioning shall be based on grounds or reasons of public utility, security or the national interest which are recognized as overriding purely individual or private interests, both domestic and foreign. In such cases the owner shall be paid appropriate compensation, in accordance with the rules in force in the State taking such measures in the exercise of its sovereignty and in accordance with international law. In any case where the question of compensation gives rise to a controversy, the national jurisdiction of the State taking such measures shall be exhausted. However, upon agreement by sovereign States and other parties concerned, settlement of the dispute should be made through arbitration or international adjudication.

5. The free and beneficial exercise of the sovereignty of peoples and nations over their natural resources must be furthered by the mutual respect of States based on their sovereign equality.

6. International co-operation for the economic development of developing countries, whether in the form of public or private capital investments, exchange of goods and services, technical assistance, or exchange of scientific information, shall be such as to further their independent national development and shall be based upon respect for their sovereignty over their natural wealth and resources.

7. Violation of the rights of peoples and nations to sovereignty over their natural wealth and resources is contrary to the spirit and principles of the Charter of the United Nations and hinders the development of international co-operation and the maintenance of peace.

8. Foreign investment agreements freely entered into by or between sovereign States shall be observed in good faith; States and international organizations shall strictly and conscientiously respect the sovereignty of peoples and nations over their natural wealth and resources in accordance with the Charter and the principles set forth in the present resolution.

II

Welcomes the decision of the International Law Commission to speed up its work on the codification of the topic of responsibility of States for the consideration of the General Assembly;

III

Requests the Secretary-General to continue the study of the various aspects of permanent sovereignty over natural resources, taking into account the desire of Member States to ensure the protection of their sovereign rights while encouraging international co-operation in the field of economic development, and to report to the Economic and Social Council and to the General Assembly, if possible at its eighteenth session.

As a convenient reference, the *Revised Compendium of Extracts from Resolutions of the General Assembly and the Economic and Social Council Involving Principles of International Economic Co-operation* (E/3714, 18 January 1963), may be consulted. B. AGREEMENTS AFFECTING THE RIGHT OF FOREIGN NATIONALS TO OWNERSHIP AND EXPLOITATION OF NATURAL RESOURCES

1. *Bilateral agreements*

Algeria

/France — Agreement on arbitration, 26 June 1963

Belgium

/United Kingdom — Convention with a view to facilitating Belgian traffic through the territories of East Africa, 15 March 1921

/Yugoslavia — Agreement for the settlement of certain financial claims, 15 April 1960

Cameroon

/United Kingdom — Agreement on Commercial and Economic Co-operation, 29 July 1963

France

/Algerian National Liberation Front — Declaration of Principles Concerning Economic and Financial Co-operation, 18 March 1962

—Declaration of Principles on Co-operation for the Exploitation of Saharan Subsoil Resources, 18 March 1962

—Declaration of Guarantees, 18 March 1962

/Provisional Executive of Algeria — Protocols, conventions and agreements, 29 August 1962

1. Protocol on the implementation of commitments entered into by the Organisation commune des régions sahariennes;

2. Convention on the application of paragraph 8 of Title I of the Declaration of Principles on Co-operation for the Exploitation of Saharan Subsoil Resources;

3. Convention concerning the technical organ for the exploitation of the Saharan Subsoil, in implementation of Title III of the Declaration of Principles on Co-operation for the Exploitation of Saharan Subsoil Resources;

4. Agreement regarding the application of the Saharan Petroleum Code and the transfer of related powers and functions.

/United States of America — Convention of establishment, 25 November 1959

Guinea

/Switzerland — Agreement on Commerce, Investment Protection and Technical Co-operation, 26 April 1962

Indonesia

/Netherlands — Agreement concerning West New Guinea (West Irian),

Japan

/Pakistan — Treaty of Friendship and Commerce, 18 December 1960

Luxembourg

/Yugoslavia — Agreement for the settlement of certain financial claims, 15 April 1960

Netherlands

/Federal Republic of Germany — Treaty concerning the mining of coal in the Netherlands-German frontier area west of Wegberg-Brüggen, 28 January 1958

Niger

/Switzerland — Agreement on Commerce, Investment Protection and Technical Co-operation, 28 March 1962

Pakistan

/Federal Republic of Germany — Treaty for the promotion and protection of investments, 25 November 1959

Poland

/United States of America — Agreement regarding the settlement of claims of United States nationals, 16 July 1960

Romania

/United States of America — Agreement relating to financial questions, 30 March 1960

United Kingdom

/Nigeria — Federation of Nigeria, International rights and obligations, Exchange of letters, 1 October 1960

United States of America

/Viet-Nam — Treaty of Amity and Economic Relations, 3 April 1961

2. *Multilateral agreements and draft agreements*

Protocol relating to certain concessions granted in the Ottoman Empire, Lausanne, 24 July 1923

European Economic Community — Convention of Association, 20 July 1963

Council of Europe — Draft recommendation on the protection of private foreign investments in developing countries, May 1962

C. POLICY STATEMENTS AND DECLARATIONS

The Cairo Declaration of Developing Countries, 1962

Tanganyika — Statement by the Prime Minister (Tanganyika National Assembly), 30 November 1961

— Note from the Prime Minister to the Secretary-General of the United Nations, 9 December 1961

D. INTERNATIONAL ADJUDICATIONS RELATING TO THE RESPONSIBILITY OF STATES IN REGARD TO THE PROPERTY AND CONTRACTS OF ALIENS

Lighthouses case between France and Greece, Permanent Court of International Justice, Series A/B, No. 62, Judgment of March 17, 1934

Dispute re Société Collas and Michel, French-Italian Conciliation Commission, Decision No. 146, 21 January 1953

Différend au sujet de diverses réclamations et contre-réclamations relatives à la concession des phares de l'Empire Ottoman (« Affaire des Phares »), Permanent Court of Arbitration, Award of 24 July 1956

E. CONCESSION AGREEMENTS

Australia

/Gove Bauxite Corporation, Ltd. (Péchiney Co.), mineral leases, 11 March 1963

Gabon

/Compagnie des Mines d'Uranium de Franceville (Law No. 19/16, 8 June 1960)

DOCUMENT E/3960**Report of the Economic Committee**

[Original text: English]
[3 August 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President of the Council, Mr. Akira Matsui (Japan), considered at its 347th and 348th meetings on 31 July and 3 August 1964 (E/AC.6/SR.347 and 348) item 15 of the Council's agenda which had been referred to it by the Council at its 1314th plenary meeting on 13 July 1964.

2. The Committee had before it the report of the Secretary General on this matter (E/3840) and decided to recommend to the Council to take note of it and to transmit it to the General Assembly, together with the comments which have been made in the Council (E/SR.1335-1337).

Agenda item 16: Questions relating to science and technology *

* For the discussion of this item, see *Official Records of the Economic and Social Council, Thirty-seventh Session*, 1351st meeting; see also the records of the 264th to 268th meetings of the Co-ordination Committee (E/AC.24/SR.264-268).

DOCUMENT E/3978
Report of the Co-ordination Committee

[Original text: English]
[13 August 1964]

1. The Co-ordination Committee, under the chairmanship of Mr. Daniel Cosío Villegas (Mexico), at its 264th to 268th meetings held on 10, 11 and 12 August 1964, considered item 16 of the Council's agenda (Questions relating to science and technology), which had been referred to the Committee by the Council at its 1314th meeting held on 13 July 1964.

2. The Committee had before it the following documents: report by the Advisory Committee on the Application of Science and Technology to Development on its first session (E/3866); twenty-ninth report of the Administrative Committee on Co-ordination (E/3886 and Corr.1 and Add.1).

3. At the 266th meeting, the representative of France introduced a draft resolution, sponsored also by Australia and Luxembourg (E/AC.24/L.248). During the course of discussion a number of amendments and suggestions were proposed to the text. At the 267th meeting, the representative of Australia introduced a revised text of the draft resolution (E/AC.24/L.248/Rev.1).

4. At the 268th meeting, the representative of Australia introduced a second revised text of the draft resolution (E/AC.24/L.248/Rev.2); Cameroon, Indonesia and Senegal had been added as sponsors, later joined also by Chile and Ecuador. With certain minor oral

revisions and corrections, the Committee unanimously adopted the revised draft resolution (E/AC.24/L.248/Rev.2).

5. At the 268th meeting, the representative of the Secretary-General made a statement on the financial implications of the draft resolution. He indicated that while the 1965 budget estimates included provision for a second session of the Committee, the proposed meetings of sub-groups would entail additional expenditures of the order of \$29,000 in 1965.

6. The Committee approved the following proposal made by the delegation of the United States of America:

"The Committee expressed the hope that the Council's Advisory Committee on the Application of Science and Technology to Development would serve, under conditions mutually acceptable to the Advisory Committee and to the United Nations Educational, Scientific and Cultural Organization (UNESCO), as the Advisory Committee on UNESCO programmes in this field."

7. The Committee therefore recommends the adoption by the Council of the following draft resolution:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1047 (XXXVII). Questions relating to science and technology*The Economic and Social Council,*

Recalling its resolution 980 A (XXXVI) of 1 August 1963 establishing an Advisory Committee on the Application of Science and Technology to Development,

Recalling further resolution 1944 (XVIII) of 11 December 1963 by which the General Assembly requested the Advisory Committee to examine, in collaboration with the Administrative Committee on Co-ordination, and in particular its Sub-Committee on Science and Technology, the possibility of establishing a programme of international co-operation in science and technology applied with a view to promoting the development of underdeveloped areas,

Noting with appreciation the great objectivity and the profound concern for accuracy displayed by the Committee, from its first session, in proposing a series of studies and measures to render the application of science and technology to development more effective and better co-ordinated,

1. Welcomes the report of the Advisory Committee (E/3866) on its first session;

2. Notes with satisfaction that, as a result of the Committee's work, the United Nations and its affiliated bodies will be in a better position than in the past to keep abreast with the progress achieved in the application of science and technology for the benefit of less developed areas and to improve the co-ordination of their scientific and technical programmes, in particular by establishing a more rational order of priorities and eliminating duplication;

3. Requests the Secretary-General of the United Nations and the executive heads of the specialized agencies and the International Atomic Energy Agency through the Administrative Committee on Co-ordination to inform the Council at its thirty-ninth session and the Advisory Committee at one of its forthcoming sessions of their views on the Advisory Committee's proposals and suggestions and the action, if any, which they have taken pursuant to those proposals and suggestions, particularly in relation to:

(a) The need for a more rational delimitation of responsibilities in the field of science and technology within the United Nations family, the convening of large international conferences covering fields in which several agencies are conducting programmes normally being the responsibility of the United Nations rather than of a single agency, except where an agreement to the contrary has been reached within the Administrative Committee on Co-ordination (*ibid.*, paras. 28 and 29);

(b) The inclusion in the periodic reports of the United Nations, the specialized and related agencies of a special section describing, for a limited number of topics, the new advances in science and technology of benefit to

the less developed areas, promising lines of uncompleted research, and important scientific and technical knowledge available, but not applied, in the developing countries; and the regular provision of publications to members of the Committee (*ibid.*, para.31);

(c) Improved clearing of scientific and technological information needed for development, in particular by the establishment or extension of regional and national information centres (*ibid.*, chap. V);

(d) The regular use of the method of affiliation between universities and research institutes in developed countries with their counterparts in developing countries, and the elaboration of a series of measures for systematically facilitating and encouraging the sojourn in developing countries of scientists, experts and technicians from industrialized countries (*ibid.*, para. 44);

(e) The Committee's recommendation that the views of organs of the United Nations family and of competent national and regional scientific organs be sought as to the choice of a limited number of especially important problems of research or application in which a "break-through" might be realized if a massive, worldwide attack on the problem were made (*ibid.*, chap. VIII);

4. Agrees with the views of the Advisory Committee:

(a) That the slow process of the preparation of a sufficient number of people at different levels of education and training is a matter for concern; that the study on a priority basis of new education and training methods for the developing countries should receive increased attention; and that the United Nations Educational, Scientific and Cultural Organization as well as other agencies should take action to plan for such development (*ibid.*, para. 68);

(b) That assistance from developed countries in the supply of modern equipment for training and research is absolutely essential to the development of training and research facilities in the developing countries (*ibid.*, para. 46);

(c) On the need to intensify the programmes of the Special Fund (in response to requests from Governments), the United Nations Educational, Scientific and Cultural Organization and other interested agencies, to reinforce local efforts where required (*ibid.*, para. 63);

5. Invites the Secretary-General in consultation with the executive heads of the specialized agencies and the International Atomic Energy Agency, the Managing Director of the Special Fund, and the Executive Chairman of the Technical Assistance Board, to keep the Council and the Advisory Committee informed of action taken in this connexion;

6. Requests the Secretary-General, in collaboration with the Managing Director of the Special Fund, the Executive Chairman of the Technical Assistance Board and the executive heads of the specialized agencies and the International Atomic Energy Agency to pay special attention, in their reports evaluating the effects

of technical assistance projects, to the progress achieved and the problems encountered in the application of science and technology to development;

7. *Further requests* the Secretary-General and the executive heads of the specialized agencies and the International Atomic Energy Agency to continue to provide the Advisory Committee with all the facilities necessary for the accomplishment of its mission;

8. *Requests* the Governments of States Members of the United Nations or members of the specialized agencies:

(a) To assist the Committee by every means in their power;

(b) To consider the possibility of increasing their contributions to the Special Fund and the Expanded Programme of Technical Assistance in view of the need for more adequate resources for the application of science and technology to development;

(c) To give due attention to the needs of developing countries in their bilateral assistance programmes for the effective application of science and technology to their development;

9. *Considers* that the Advisory Committee should hold its second session before the end of this calendar year, to be financed from saving, and that in the interests of continuity and in view of its heavy work programme the Advisory Committee should meet twice in 1965 with such meetings of its sub-groups as may be required (*ibid.*, paras. 15 and 83);

10. *Accepts* the advice of the Administrative Committee on Co-ordination (E/3886, paras. 83 and 84) that in view of changes in circumstances the formulation of the detailed observations contemplated in the Council's resolution 910 (XXXIV) of 2 August 1962 is no longer necessary;

11. *Agrees* with the Advisory Committee's recommendations on the need for a small secretariat to be established within the present resources of the United Nations Secretariat (E/3866, para. 81) and for focal points on science and technology within United Nations regional economic commissions by re-assigning existing staff or, if necessary, the creation of new posts (*ibid.*, para. 82).

*1351st plenary meeting,
15 August 1964.*

 French and Russian]*
 [26 June 1964]

1. At its twelfth session, held in 1963, the Committee on the Development of Trade of the Economic Commission for Europe (ECE) was able to note with satisfaction that in the field of reinsurance its *ad hoc* Working Party on Insurance Problems had reached unanimous agreement on the terms of a recommendation already transmitted by the Executive Secretary, in accordance with the decision taken by the Committee on the Development of Trade at its eleventh session, to Governments participating in the work of the Commission. The Committee felt, furthermore, that it would be useful if the Commission were to make a recommendation to the Economic and Social Council to request the other regional economic commissions to consider whether it would be possible to adopt similar recommendations for their respective regions (E/ECE/TRADE/68, para. 41).

2. At its nineteenth session, the Commission decided to submit to the Economic and Social Council the draft resolution on reinsurance problems contained in part IV of its report to the Council, together with all the other relevant material contained in the document which had been submitted to the Commission in that connexion

(E/ECE/509).¹ The material comprises the text of the recommendation mentioned above (annex I, below) and the relevant passages of the report of the *ad hoc* Working Party on Insurance Problems (annex II, below).

ANNEXES
Annex I
RECOMMENDATION ON THE FREEDOM OF REINSURANCE

The Economic Commission for Europe emphasizes that, in the interest of the economies of the various countries concerned and of the development of international trade, the widest possible spreading of insured risks by means of reinsurance should be permitted, and that it is consequently necessary to facilitate international reinsurance operations to the maximum possible extent by granting the widest freedom for their execution.

It considers that insurers and reinsurers should in particular be free

(a) to conclude reinsurance contracts, conventions and agreements with partners of their choice, and

¹ See *Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 7* (E/3887), para. 456 (c).

(b) to determine the content of such contracts, conventions and agreements as they see fit, in conformity with reinsurance usage, and that transfers made under reinsurance contracts, conventions and agreements should be unrestricted.

It further believes that reinsurance operations should not be subject to discrimination between national and foreign reinsurers, particularly in fiscal matters where, in addition, double taxation should be avoided.

These recommendations apply both to reinsurance and to retrocessions.

Annex II

RELEVANT PASSAGES OF THE REPORT OF THE *ad hoc* WORKING PARTY ON INSURANCE PROBLEMS ON ITS FOURTH SESSION (TRADE/149)

IV. Reinsurance problems

12. The *ad hoc* Working Party again examined the draft recommendation prepared by the Sub-Group on Reinsurance Problems (TRADE/WP.3/16, annex) and adopted the text without change.

13. The Working Party expressed the view that this recommendation did not interfere with partial compulsory cessions of reinsurance which existed in the legislation of some countries and which should be kept as limited as possible in order not to be regarded as restricting significantly the freedom of reinsurance.

14. The Working Party specified that the freedom of transfers under reinsurance contracts, conventions and agreements did not exclude any exchange controls which might be applied for the purpose of determining whether such transfers truly arose out of reinsurance operations, on the understanding that such control would be carried out as quickly as possible.

15. The Working Party further specified that the recommendation in no way concerned the duties of direct insurers in the fulfilment of their obligations under national legislation provided, however, that such legislation did not in effect frustrate the freedom of reinsurance. The delegation of Belgium stated that it construed this stipulation as meaning that Belgian law might provide that the direct insurer should possess, as full owner, and deposit in accordance with the statutory requirements, the whole of the assets representing the technical reserves, including the portion relating to reinsurance. The Working Party took cognizance of this statement.

16. In accordance with the decision taken by the Committee on the Development of Trade at its eleventh session (E/ECE/TRADE/60, para. 52), the Working Party instructed the Executive Secretary to transmit the recommendation and this report to Governments participating in the work of the Economic Commission for Europe.

17. The Working Party expressed its thanks to Professor Grossman (Switzerland), whose work had made it possible for the important recommendation on the freedom of reinsurance to be adopted unanimously.

DOCUMENT E/3937

Report of the meeting of the Executive Secretaries of the regional economic commissions

[Original text: English]
[11 July 1964]

Introduction

1. This report has been prepared in pursuance of General Assembly resolution 1823 (XVII) by which the assembly recommended that the Secretary-General should make available an annual report on the meeting of Executive Secretaries for consideration by the Economic and Social Council and the General Assembly. The meeting was presided at by the Under-Secretary for Economic and Social Affairs and attended by the Executive Secretaries of the regional economic commissions, the Director of the United Nations Economic and Social Office in Beirut and other senior officials of the Secretariat.

2. In accordance with Council resolution 955 (XXXVI) a brief progress report on decentralization of the economic and social activities of the United Nations and strengthening of the regional economic commissions appears in Part II of this report.

I. MAIN TOPICS EXAMINED AT THE MEETING

General review of the economic and social activities of the Organization

3. A general exchange of views among the participants took place on the current and prospective work

of the United Nations in the economic and social fields, both in the regions and from a global point of view.

4. The holding of the United Nations Conference on Trade and Development being a major event of the year under review, its significance as well as its impact on the future work of the Organization was appraised. Special attention was also paid to the implementation of General Assembly resolution 1940 (XVIII) on the holding of the international symposium on industrial development. As in the past the meeting devoted particular attention to questions related to United Nations activities in the field of technical assistance and other operational activities of the Organization.

5. There was recognition of the need for increasing co-operation in these fields between Headquarters and the regional secretariats, in order to enable the optimum use of all the resources at the disposal of the Organization and to achieve an integrated approach to the important tasks ahead. In reviewing these and other matters, the objectives of the United Nations Development Decade were kept in mind.

6. It was recognized that the intensification of work required of the United Nations to fulfil these tasks would require not only continued concerted action but also an adequate strengthening of the resources at the disposal both of Headquarters and the regions.

7. The following questions of common concern were the subject of more detailed discussion:

*The United Nations Conference
on Trade and Development*

8. It was recalled that the regional commissions and their secretariats had played a significant part in the overall United Nations effort in preparing for the Conference, both in the drawing up of papers and in the servicing of the Conference. The regional commissions had for a long time been active in the field of trade and had dealt with a number of topics considered at the Conference. It would accordingly be possible for them to intensify these activities and to add, as appropriate, new projects in order that they might play their part in implementing the decisions of the Conference. It was noted in this connexion that the Final Act of the Conference laid down that close and continued links should be established between the new machinery and the regional commissions and their Secretariats.

9. It was agreed that the additional work called for would place new emphasis on the work to be done by the trade divisions of the regional Secretariats and some extension of resources devoted to trade and development would be called for. It was recognized that there would clearly be scope for pooling of efforts and closer co-ordination of activities in certain areas, particularly on trade needs of developing countries, commodity surveys and projections. It was agreed that a special meeting of the Executive Secretaries should be convened at Headquarters towards the end of the year to review in further detail the arrangements required for following up the decisions of the Trade Conference.

Industrialization

10. In considering this matter, the meeting took note of the close co-operation between the Centre for Industrial Development at Headquarters and the regional economic commissions, co-operation which existed in respect of all projects of mutual concern in the field of industrial development. The existing practice of close and frequent consultation at the highest level on matters of policy and of direct contacts at a working level on individual projects was to be continued. It was felt that these arrangements might have to be broadened and adapted to the new requirements as the programme for industrial development had further expanded pursuant to the recommendations formulated at the fourth session of the Committee for Industrial Development and at the Conference.

11. The preparations for the International Regional Symposia on Industrialization in implementation of General Assembly resolution 1940 (XVIII) were considered to be among the most important undertakings in this field in the near future. The Secretary-General's report to the Economic and Social Council (E/3921 and addenda) gave an account of the actual position in respect of the various arrangements for setting in motion this operation, on which the Centre for Industrial Development was maintaining continuous contact

with the regional economic commissions. It was expected that upon final approval and allocation of the resources required, working contacts would be intensified so as to promote close consultation between the Centre for Industrial Development and the regional economic commissions for the full implementation of the decisions of the governing bodies. One aspect of the project which appeared to require particularly close relationships was the preparation of the country reports. In addition to their presentation at the regional symposia, the country reports might also serve as a first step in the direction of achieving some system of regular reporting on industrialization by the countries concerned and might be able to provide some of the basic material for the preparation of the World Industrialization Survey called for by the Committee for Industrial Development.

12. Under this item, the meeting also reviewed the steps already taken towards the preparation of a study on the world market for iron ore and prospective world steel demand which was included in the work programme of the ECE Steel Committee and which is to be carried out in co-operation with United Nations Headquarters and the other regional economic commissions. It was felt that the problems concerned with the existing and prospective situation of the world market for iron ore required urgent international review and study and that such a study would be of particular value to iron-ore exporting countries and to developing countries possessing iron ore resources capable of being exploited. The meeting agreed that every effort should be made to secure the financial resources needed for the early implementation of this project.

Science and technology

13. Under this item the meeting considered the role of the regional secretariats in United Nations activities in the field of science and technology and related co-operation between Headquarters and the regional economic commissions.

14. The meeting stressed the importance it attached to the establishment and intensification of appropriate links between the Advisory Committee on the Application of Science and Technology to Development and the regional economic commissions. It welcomed the setting up within the Advisory Committee of a number of regional groups and expressed the hope that effective contacts would be established between these groups and the regional economic commissions and that the relevant groups would visit regional offices in due course.

15. The meeting took note of the Advisory Committee's future plans in respect of its relations with agencies, inter-governmental bodies and non-governmental organizations, in particular as regards an adequate United Nations representation at regional meetings on science and technology. The Advisory Committee's preliminary ideas on a programme of studies and reports was also considered and the meeting expressed its interest in following closely further developments in this field. Special emphasis was placed on the questions related to the dissemination of technical information, in

particular in fields which were relevant to the acceleration of economic growth in the developing countries. It was also felt that encouragement should be given to specific research by developed countries on problems related to an increasingly diversified use of the resources of the developing countries. The need was also felt for arranging meetings at regional level geared to the most pressing problems arising out of the particular circumstances of the various regions.

16. While it was felt that it might be premature to try to formalize the relations between the Advisory Committee and the regional secretariats before the Advisory Committee had fully developed a programme, the appointment of correspondents in the regional secretariats was considered as a possibly useful means of maintaining contact with the relevant work at United Nations Headquarters.

Housing, building and planning

17. It was noted that the Council would be considering new institutional arrangements in the field of housing, building and planning. During the discussion it was recognized that activities in this area were of increasing importance in the development process, and, of course, a generator of additional employment. It was also emphasized that more stress should be laid on financing of housing from domestic sources which was essential in itself and as a device for a more effective mobilization of savings. The scope for increasing production of building materials and components in developing countries, and the need for more intensive research and training were noted. The meeting felt that the United Nations Special Fund should have an increasing part to play in this area. It was also felt that there was scope for better co-ordination between the Committee on Housing, Building and Planning at Headquarters and the corresponding committees in the regions and in this connexion it was suggested that members of the Committee coming from the regions should be fully aware of the activities of the regional bodies and keep their agreed programmes in mind when considering global action.

Technical assistance

18. The Meeting noted with satisfaction the results of the programming exercise for the biennium 1965-66 which for the first time involved the systematic participation of the regional secretariats. It suggested further steps to make this process more effective and comprehensive. Technical assistance programming should be considered as a continuous task and not be confined to an annual or a biennial exercise although it was recognized that full account would have to be taken of the formal programming period. Adequate travel funds were necessary for secretariat staff to be able to make a real contribution to programming, which, to be effective, had to be of a continuing character.

19. There was also need to provide for a more flexible use of the technical assistance funds available under country or regional programmes so as to maxi-

mize the use of savings. Furthermore, inevitably urgent new needs for both country and regional projects arose at short notice and required supplementary funds.

20. The meeting stressed once more the importance of technical assistance in the field of training, particularly training on the spot and on a regional or sub-regional basis. Taking note of the fact that funds available under bilateral programmes could be channelled in some regions into United Nations training activities, the meeting felt that, at times, United Nations technical assistance could be utilized to stimulate the bilateral contribution and to take fuller advantage of such training facilities. However, such use of United Nations technical assistance funds should be carefully considered on a case to case basis. The importance of development planning missions which were increasingly requested by various countries was stressed and attention was called to the importance of ensuring by every possible means, that maximum advantage was taken of the experience accumulated by the staff participating in these missions.

II. DECENTRALIZATION OF THE ECONOMIC AND SOCIAL ACTIVITIES OF THE UNITED NATIONS AND STRENGTHENING OF THE REGIONAL ECONOMIC COMMISSIONS

21. Further progress has been made with respect to decentralization of United Nations technical assistance operations since the Secretary-General reported to the Economic and Social Council on this subject a year ago.² The policy of decentralization of the economic and social activities of the United Nations and strengthening of the regional economic commissions expressed in General Assembly resolution 1823 (XVII) was reflected in the organizational arrangements and in the operational arrangements of both technical assistance regional projects and national programmes operated by the United Nations, including a further delegation of functions and authority at the substantive, financial and administrative levels.³

Organizational arrangements

22. With the establishment of the technical assistance co-ordinating unit in the secretariat of the Economic Commission for Asia and the Far East (ECAFE) in 1963, there is a technical assistance unit now at the seat of each of the four regional economic commissions, which can provide co-ordination of technical assistance through unified secretariat action at the regional level.

23. The United Nations Regional Social Affairs Office in Beirut, Lebanon, was strengthened in 1963 to include economic as well as social activities and was renamed as the United Nations Economic and Social Office in Beirut. In addition to its research work, this

² See *Ibid.*, *Thirty-sixth Session, Annexes*, agenda item 12(E/3786).

³ In compliance with General Assembly resolution 1823 (XVII) the Advisory Committee on Administrative and Budgetary Questions submitted to the General Assembly, at its 18th session, a report containing its recommendations on decentralization (A/5584).

Office has been assisting in the formulation and evaluation of technical assistance and Special Fund projects in the region and recently has served as the focal point for organizing a reconnaissance mission in development planning requested by several countries in the area. The findings of this mission will provide further bases for the development of United Nations activities in this region. The establishment of a technical assistance co-ordination unit in the Beirut Office, the creation of which was suggested by the Economic and Social Council in resolution 955 (XXXVI), and subsequently recommended by the General Assembly in resolution 1941 (XVIII), is under way.

Regional projects

24. Practically all the regional projects are by now administered by the secretariats of the regional economic commissions under authority delegated to them. The advantages inherent in this arrangement have been appreciated by the regional commissions and their member countries, since the majority of the regional projects, long-term and short-term, are designed to meet their needs collectively and economically. Their operation within a region facilitates participation by the countries of each region and by the regional secretariats in United Nations activities and brings closer participation of governments in the technical assistance projects. The number of regional projects in the United Nations regular programme has increased considerably during recent years as the following figures show:

	<i>(in thousands of US dollars)</i>
1962	1,490 (actual cost)
1963	1,749 (actual cost)
1964	2,036 (programmed)
1965	2,279 (proposed)

25. A revised and simplified operational procedure for regional projects was drawn up in close consultation with the regional secretariats. Under this procedure, the regional secretariats draw up programmes of regional projects for a biennium on the basis of the decisions of their respective regional economic commissions. The question as to which of the projects included in the programme for the biennium 1965-66 would be decentralized and which should be administered at Headquarters will be decided jointly between Headquarters and the regional secretariats before the beginning of the 1965 programme year. Upon approval of a project and its cost, Headquarters delegates its implementation to the regional commission's secretariats and issues the necessary instruments for the delegation of financial and administrative authority to the regional secretariat for execution of the project. Recruitment responsibility has also been decentralized in a considerable number of instances in the case of regional projects, including the authority to engage experts for a maximum of 12 months for posts within these projects.

Regional advisers

26. The trend toward greater decentralization is also reflected in the increase in the number of regional advisers

at the seats of regional commission secretariats who are able to participate in all phases of technical assistance projects. In fact, regional advisers have found a vital instrument in the policy of decentralization of technical assistance. The meeting noted that the demand by Governments for their services was constantly growing.

	<i>Number of posts</i>
1963	65
1964	77
1965	83 (proposed)

27. These advisers are attached to the regional commissions and are filling a long-felt need for high level personnel quickly available for short-term assignments at the request of Governments. They are in a position to serve a large number of countries. The difficulties of recruiting individual experts on short-term bases are minimized and this pool of expertise has proven to be economic and efficient.

28. It is proposed that the advisory services of the United Nations be expanded in 1965-66 through the establishment at Headquarters of a small nucleus of inter-regional advisers, moving from country to country and region to region according to programme requirements, with the view of fostering the transfer of knowledge and experience from one region to another. Some of these advisers are to be placed at the secretariat of ECE.

Country programmes

29. The principal measures of decentralization with respect to country programmes have been designed to take advantage of the knowledge acquired by the regional Secretariats of the problems of economic and social development of the countries in their respective regions.

30. The regional Secretariats have been able to participate on an increasing scale in assisting in the formulation of country programmes as stressed in paragraph 18 above. Joint programming missions of senior officers of the regional secretariats and senior officers from Headquarters, working closely with the Resident Representatives, were initiated for the first time in connexion with the 1965 regular programme and the 1965-66 Expanded Programme. These measures have contributed to the improvement in the quality of the programmes, in achieving co-ordination between regional and country programmes.

31. An increasing number of country experts are routed by Headquarters through the seats of the regional commissions before they take up their duties in the countries of their assignment.

32. An arrangement had been made by Headquarters under which country experts send copies of their reports to regional Secretariats.

33. In addition to its general responsibility in the field of technical assistance, ECE has assumed certain specific tasks such as substantive responsibility for country projects in the field of tourism. It includes also certain operational responsibilities with respect to the clearance and in some instances preparation of job-descriptions

for vacant posts in the field of travel and tourism and evaluation of candidates.

34. With respect to fellowships, while the regional secretariats now select fellows on all regional projects for which they are responsible, ECE has been made

responsible also for the implementation of some national fellowship programmes. Thus, Polish and Yugoslav fellowship programmes have been turned over to the ECE Secretariat which is responsible for the initial programming of these fellowships and assumes certain subsequent operational and financial responsibilities.

DOCUMENT E/3958

Report of the Economic Committee

[Original text: English]
[30 July 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President, Mr. Akira Matsui (Japan), considered at its 345th meeting on 29 July 1964 (E/AC.6/SR.345) a draft resolution on reinsurance submitted to the Council by the Economic Commission for Europe (document E/3887, Part IV, paragraph 1) and referred to the Committee by the Council at its 1319th Plenary meeting on 15 July 1964.

2. The Committee had before it the following documents: E/3939 and E/CONF.46/L.28, Annex A.IV.23. In addition to the draft resolution submitted by the Economic Commission for Europe, the Committee received a draft resolution on the same subject by Algeria, Chile, Colombia, Ecuador, Ghana, India, Indonesia, Iran, Iraq, Senegal and the United Arab Republic (E/AC.6/L.297). The delegation of Argentina subsequently joined the sponsors of this draft resolution.

3. The sponsors of the twelve-power draft resolution

agreed that the operative paragraph of their text should be changed to read as follows:

“Requests the Economic Commission for Europe to study further the problem of reinsurance in the light of the recommendation adopted at the United Nations Conference on Trade and Development on the same matter.”

4. The Committee considered that the twelve-power draft resolution replaced the draft resolution submitted by the Economic Commission for Europe and therefore took no action with regard to the latter text.

5. The Committee approved unanimously the twelve-power draft resolution (E/AC.6/L.297) as revised orally by the sponsors, and therefore recommends to the Council the adoption of the following draft resolution:

[Text adopted by the Council without change. See below, “Resolutions adopted by the Economic and Social Council”, resolution 1018 (XXXVII).]

DOCUMENT E/3963

The question of participation of Angola, Mozambique and South West Africa in the work of the Economic Commission for Africa: note by the Secretariat on certain legal aspects

[Original text: English]
[5 August 1964]

1. At the 1318th and 1319th meetings of the Economic and Social Council held on 15 July 1964, several representatives requested the Secretariat, in connexion with the consideration of the reports of regional economic commissions, to submit observations on the legal aspects of the question of participation by Angola, Mozambique and South West Africa in future sessions of the Economic Commission for Africa (ECA). The present note has been prepared in response to that request.

2. This question was the subject of resolution 94 (VI), adopted by GCA on 28 February 1964, by which the Commission, recalling the decision of the Economic and Social Council to expel Portugal from membership and to suspend the Republic of South Africa from participating in the work of the Commission, requested the Executive Secretary to make representations to the Council on the terms and conditions for inviting repre-

sentatives of the non-self-governing territories of Angola, Mozambique and South West Africa to attend future sessions of the Commission as associate members and to report to the Commission at its seventh session on measures taken in this regard. Since the three territories are already associate members of the Commission, the question before the Council is not one of their admission but of the participation by their representatives in the work of the Commission. In this sense, the first and foremost question is who should designate such representatives.

3. Under international law, external representation of dependent territories is the responsibility of the States administering those territories and responsible for their international relations. This principle is also recognized in the Charter and practice of the United Nations, and in a number of resolutions defining the participation of non-self-governing territories in the work of certain

United Nations organs or dealing with specific questions which affected non-self-governing territories.

4. Thus, in several resolutions [e.g. 566 (VI), 647 (VII), 1466 (XIV) and 1539 (XV)] adopted by the General Assembly, which have specifically sought to further the direct participation of representatives of the indigenous peoples of the non-self-governing territories in the work of various organs of the United Nations, the Assembly has invited or urged the Administering Members to take steps to provide for such participation. In other resolutions dealing with matters relating to non-self-governing territories, such as resolution 1695 (XVI) on dissemination of information on the United Nations in those territories and resolutions 1540 (XV), 1696 (XVI), 1849 (XVII) and 1974 (XVIII) on study and training facilities for inhabitants of the territories, the Assembly has invited Administering Members to take necessary measures to implement the provisions of these resolutions. In all of the resolutions mentioned, the Assembly recognized the legal position of the Administering Members as responsible for the conduct of the international relations of the territories in question.

5. It may be noted that in some cases a non-self-governing territory has designated its own representatives to United Nations bodies as, for example, where the territory is an associate member of a regional economic commission or where it has been invited to participate in a United Nations meeting. From the legal standpoint the naming of representatives by the territorial Government in such cases takes place pursuant to an implied or express authorization by the Government responsible for the foreign relations of that territory. Whether a request to appoint representatives may be made directly to the territorial Government by a United Nations organ depends on whether authorization

for such a direct approach has been granted (expressly or by implication) by the competent authorities of the State responsible for the international relations of the territory.

6. There have of course been a number of situations in the United Nations involving conflicting claims between groups claiming the right to be recognized as the Government of a territory. In a case of this kind a determination by a United Nations organ as to which group is entitled to appoint representatives for the territory in question involves a determination as to which is the Government of the area. This question, it will be recalled, has been considered as one appropriate for the General Assembly and not within the competence of a subsidiary organ [see, for example, General Assembly resolution 396 (V)].

7. Finally, it may be noted that a regional economic commission or any other body of the United Nations may seek information within the scope of its competence from sources other than the Government of that territory. Therefore, the Economic Commission for Africa would be free to hear individuals who come from the territories in question if the Commission considers them competent to inform the Commission of matters relevant to its activities. It is also pertinent to refer in this connexion to paragraphs 12 and 13 of the terms of reference of the Commission under which it may establish liaison with international organizations in Africa or make arrangements for consultation with non-governmental organizations granted consultative status by the Economic and Social Council. Such liaison and consultative arrangements may provide a further link with non-self-governing territories that are not otherwise represented.

DOCUMENT E/L.1053 *

Algeria, Argentina, Chile, Ecuador, India, Iraq, Senegal and Yugoslavia: draft resolution

[Original text: French]
[15 July 1964]

The Economic and Social Council,

Recognizing the important achievements of the regional economic commissions in developing co-operation among the countries of their respective regions,

Welcoming the co-operation among the regional economic commissions and their secretariats and between the commissions and the Secretariat of the United Nations at Headquarters,

Appreciating the substantial assistance given by the regional economic commissions and their secretariats in the preparations for the first United Nations Conference on Trade and Development and during the course of the Conference, and

Noting the recommendations of the Conference concerning the establishment of close links between the Trade and Development Board and the regional economic commissions,

Expresses the hope that the regional economic commissions will make a detailed study of the recommendations of the United Nations Conference on Trade and Development and will continue their active co-operation with a view to the application of these recommendations in the field of trade and development.

* Incorporating document E/L.1053/Corr.1.

DOCUMENT E/L.1064

Report of the Economic Commission for Africa — Algeria and Senegal: draft resolution

[Original text: French]
[11 August 1964]

The Economic and Social Council,

Recalling resolution 94 (VI) of the Economic Commission for Africa, in which the Executive Secretary of the Economic Commission for Africa is requested to make representations to the Economic and Social Council on the terms and conditions for inviting representatives of the non-self-governing territories of Angola, Mozambique and South West Africa to attend future sessions of the Commission as associate members,

Notes the communication of the Secretary-General in document E/3963 concerning certain legal aspects of resolution 94 (VI);

Decides to transmit this document to the Executive Secretary of the Economic Commission for Africa for any action that may be appropriate.

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1000 (XXXVII). Reports of the regional economic commissions

The Economic and Social Council,

Recognizing the important achievements of the regional economic commissions in developing co-operation among the countries of their respective regions,

Welcoming the co-operation among the regional economic commissions and the role played by their secretariats to this end,

Hoping that the regional economic commissions will grow in strength and effectiveness in response to the needs of their regions, particularly in the fields of trade, resources development and industrialization.

Appreciating the substantial assistance given by the regional economic commissions and their secretariats in the preparations for the first United Nations Conference on Trade and Development and during the course of the Conference,

Noting the recommendations of the Conference concerning the establishment of close links between the Trade and Development Board and the regional economic commissions,⁴

Expresses the hope that the regional economic commissions will, at the appropriate time, make a detailed study of the recommendations of the United Nations Conference on Trade and Development within the field of their competence and will continue their activities with a view

to the implementation of these recommendations in the field of trade and development.

1323rd plenary meeting,
20 July 1964.

1001 (XXXVII). Annual report of the Economic Commission for Europe

The Economic and Social Council

1. Takes note of the annual report of the Economic Commission for Europe for the period 5 May 1963 to 30 April 1964,⁵ of the views expressed during the discussion, and the resolutions adopted, during the nineteenth session of the Commission;

2. Endorses the programme of work and priorities contained in the report.

1319th plenary meeting,
15 July 1964.

1002 (XXXVII). Annual report of the Economic Commission for Asia and the Far East

The Economic and Social Council

Takes note of the annual report of the Economic Commission for Asia and the Far East⁶ for the period 19 March 1963 to 17 March 1964, and of the recommendations and resolutions contained in parts II and III of

⁴ E/CONF.46/139, Final Act of the Conference, Annex A.V.1, para. 19.

⁵ Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 7 (E/3887).

⁶ Ibid., (E/3876/Rev.1).

that report and endorses the programme of work and priorities contained in part V of the report.

*1319th plenary meeting,
15 July 1964.*

1003 (XXXVII). Annual report of the Economic Commission for Latin America

The Economic and Social Council

1. *Takes note* of the annual report of the Economic Commission for Latin America⁷ covering the period 18 May 1963 to 14 February 1964 and of the resolutions and recommendations included in the account of proceedings of the tenth session of the Committee of the Whole of the Commission;

2. *Endorses* the programme of work and priorities contained therein.

*1319th plenary meeting,
15 July 1964.*

1004 (XXXVII). Annual report of the Economic Commission for Africa

The Economic and Social Council

1. *Takes note* of the annual report of the Economic Commission for Africa⁸ for the period 3 March 1963 to 2 March 1964 and the recommendations and resolutions contained in parts II and III of that report;

2. *Endorses* the programme of work and priorities contained in the report.

*1319th plenary meeting,
15 July 1964.*

1018 (XXXVII). Reports of the regional economic commissions: Reinsurance

The Economic and Social Council,

Having considered the draft resolution submitted by the Economic Commission for Europe concerning reinsurance,⁹

⁹ *Ibid.*, *Supplement No. 7*, part IV.

Taking note of the recommendation adopted by the United Nations Conference on Trade and Development,¹⁰

Taking into account its resolution 1000 (XXXVII) of 20 July 1964, which expresses the hope that the regional economic commissions will, at the appropriate time, make a detailed study of the recommendations of the United Nations Conference on Trade and Development within the field of their competence and will continue their activities with a view to the implementation of these recommendations in the field of trade and development,

Requests the Economic Commission for Europe to study further the problem of reinsurance in the light of the recommendation adopted by the United Nations Conference on Trade and Development on the same matter.

*1342nd plenary meeting,
4 August 1964.*

1027 (XXXVII). Participation of representatives or delegations of Angola, Mozambique and South West Africa in the work of the Economic Commission for Africa

The Economic and Social Council,

Recalling resolution 94 (VI) of the Economic Commission for Africa,¹¹ in which the Executive Secretary of the Economic Commission for Africa is requested to make representations to the Economic and Social Council on the terms and conditions for inviting representatives of the non-self-governing territories of Angola, Mozambique and South West Africa to attend future sessions of the Commission as associate members,

1. *Notes* the communication of the Secretariat¹² concerning certain legal aspects of resolution 94 (VI);

2. *Decides* to transmit the above-mentioned communication to the Executive Secretary of the Economic Commission for Africa for any appropriate action having as its object the participation of representatives or delegations of Angola, Mozambique, and South West Africa in the work of the said Commission.

*1348th plenary meeting,
13 August 1964.*

DOCUMENT E/3849 **

Report of the Technical Assistance Committee on its meetings held in November-December 1963

[Original text: English]
[6 January 1964]

1. The Committee held seven meetings at Headquarters from 27 to 30 November and on 12 and 13 December (E/TAC/SR.308 — E/TAC/SR.314) under the Chairmanship of Mr. Poul Nyboe Andersen (Denmark). In the absence of Mr. Andersen, Mrs. Nonny Wright (Denmark) was elected Chairman for the last three meetings of the session.

2. The Committee had before it the following questions (E/TAC/L.313/Rev.1):

1. Expanded Programme of Technical Assistance

(a) Programme for 1963-1964. Document E/TAC/L.319 (see E/TAC/SR.308-311):

(i) Substantial programme changes as at 30 September 1963, including inter-agency transfers.

** Incorporating document E/3849/Corr.8.

Document E/TAC/L.317 (see E/TAC/SR.310).

(ii) Transfers of allocations during 1963. Document E/TAC/133 (see E/TAC/SR.310).

(iii) Review of contingency authorizations made in 1963. Document E/TAC/L.314, (see E/TAC/SR.310).

(iv) Revised Programme for Algeria. Document E/TAC/L.315 (see E/TAC/SR.310).

(v) Technical Assistance Board budget estimates for 1964. Documents E/TAC/131 and Add.1, A/5598, E/TAC/L.325 (see E/TAC/SR.311).

(vi) Allocations to the participating organizations toward their administrative and operational services costs for 1964. Document E/TAC/134 (see E/TAC/SR.311).

(vii) Authorization of allocation of funds for 1964. Document E/TAC/134 (see E/TAC/SR.311).

(b) Working Capital and Reserve Fund:

(i) Level of the Working Capital and Reserve Fund. Document E/TAC/L.316 (see E/TAC/SR.311).

(ii) Proposed amendment of the Expanded Programme of Technical Assistance legislation referring to the purpose of the Working Capital and Reserve Fund. Document E/TAC/132 (see E/TAC/SR.311).

(c) Progress report on the comparative study of emoluments of experts. Document E/TAC/135 and Add.1 (see E/TAC/SR.312).

(d) Development of information media. Documents E/TAC/136, E/3784 (see E/TAC/SR.312-313).

2. United Nations Programme of Technical Co-operation. Documents E/TAC/137, E/TAC/L.318 (see E/TAC/SR.313-314).

Date and place of next session.

General review of Expanded Programme activities

3. The Executive Chairman of the Technical Assistance Board (TAB), in his introductory statement to the Committee, reviewed the current position and touched upon further possible developments within the framework of the Expanded Programme of Technical Assistance (EPTA). Several members of the Committee commented on some of the matters which the Executive Chairman had included in his review. Other delegations, preferring to reserve their comments for those items which were specifically on the agenda of the Committee, requested that it be made clear that comments recorded in this introductory section do not represent the views of the Committee as a whole, but only of those members who had expressed them.

4. A number of members expressed concern at the possible impact of the provision of operational assistance under the Expanded Programme, under the reso-

lution of the Economic and Social Council 951 (XXXVI) now before the General Assembly. Some members explained that their reservations about the provision of operational experts under EPTA was due *inter alia* to the fact that such activities do not correspond to the basic principles under which the programme operates and sends experts to developing countries.

5. It was noted that operational experts would be available within the framework of normal country programming procedures and that recipient governments would be free to choose the extent to which they would avail themselves of this type of assistance in the same manner that they now decide the proportion of their country targets which they wish to devote to advisory experts, fellowships or equipment. Thus the availability of this type of assistance would in no way diminish the amount of aid provided to countries which do not require operational experts. It was also noted that agreements with governments and contracts with individual experts would be similar to the agreements and contracts under which operational experts are now provided under the regular programmes of the United Nations and certain specialized agencies. One member expressed concern at the continuation of the provision of operational, executive and administrative personnel under the regular programme of the United Nations (OPEX). He stressed that such assistance should emphasize the training of national personnel to fill posts for which operational personnel is now required, and that the OPEX programme should not be permanently institutionalized. In view of this emphasis on training aspects, he favoured the provision of operational personnel under the Expanded Programme rather than under the regular programme of the United Nations; the regular programme could thus use the resources made available for other activities designed to help developing countries.

6. It was also noted that the extent to which operational assistance would be required within the framework of EPTA cannot be fully determined until governments have formulated their requests for assistance in 1965-1966. The Executive Chairman doubted that such assistance would absorb more than a minor part of the resources or would be requested by more than a relatively small group of countries which were temporarily in need of operational personnel while their own cadres were being developed. He also explained that no information had been or would be sent to governments and no requests for operational assistance would be considered until the General Assembly had reached a decision on resolution 951 (XXXVI) of the Economic and Social Council now before it. He further stated that the TAB had unanimously stressed the importance of the training aspects of any operational assistance to be provided to recipient countries under EPTA.

7. It was noted by some members that while the introduction of project programming and two-year programming had resulted in such specific advantages as the better articulation of projects and improved recruitment and placement for experts and fellows, this might be outweighed by such disadvantages as

delays in execution and the tendency to fluctuations in the level of assistance requested and delivered between the two years of the biennial. It was, however, also noted that while the level of assistance requested tends to be higher in the first than in the second year of a biennial, delivery tends to be postponed so that a fairly steady flow of assistance may be expected on balance. In reply to a question by one member concerning the extent to which economies in the administration of the programme had resulted from project programming and two-year programming, the Executive Chairman stated that the main impact of the introduction of these procedures, which it was still too early to assess fully, could be expected more in qualitative improvements than in a reduction of the cost of operations.

8. The question of priorities between various fields of activity, such as industrialization, agriculture, education, etc., and various types of assistance, such as advisory or operational experts, fellowships or equipment, was the subject of comments by a number of members who pointed out the need to concentrate EPTA resources and efforts on sectors which are judged as the most important by developing countries and to avoid dispersion of efforts on unco-ordinated work in the less essential fields. Some members emphasized in particular the need for training national personnel and the provision of assistance in the field of industrialization. It was noted that the recent resolutions, 898 (XXXIV) and 949 (XXXVI), of the Economic and Social Council bearing on these points would be communicated to recipient governments in the letter in which the Executive Chairman will inform them of their targets for 1965-1966. Governments, however, remain free to establish their requests in accordance with their own priorities.

9. One member noted with concern the high cost of the services of experts and stated that they should be persons dedicated to their work and that one of their major qualifications should be willingness to share experience and knowledge with the personnel of the developing nations and to work for non-material as well as for material incentives. Another member considered that it might be timely to effect a general review of the types of assistance provided under EPTA, the present approach to such items as equipment and undergraduate fellowships being too restrictive. Another member, noting that the Executive Chairman had remarked that the cost of experts was increasing at a more rapid rate than the cost of living and thinking that this might be ascribed to a shortage of suitable staff, spoke of the desirability of increasing the supply of qualified personnel for expert assignments through the establishment of training programmes and, in particular, through the development of the associate expert scheme. Another member suggested that, since the end product of technical assistance is the elimination of the conditions which render such assistance necessary, the next report to TAC on evaluation of Expanded Programme activities should emphasize the impact of expert assistance on the training of counterparts.

10. Several members, while noting with satisfaction the increase in the volume of operations apparent from

a comparison between the programmes as implemented in 1961-1962, and as approved for 1963-1964, expressed concern at the reduction in the cost of equipment from \$7.9 million to \$2.4 million, particularly in view of the importance of the adequate provision of equipment in connexion with technical assistance projects. The Executive Chairman said that the priority between experts, fellowships and equipment is determined by the recipient governments themselves and that no new policy decision of the Technical Assistance Board was responsible for this reduction. There is, however, a tendency for programme savings to be used for the purchase of equipment, so that the cost of equipment actually delivered is often higher than the amount initially approved for this purpose.

11. One member drew attention to the fact that proposals for regional projects are frequently transmitted to the governments too late to be considered at the same time as the country programme is formulated, and requested the Executive Chairman to ensure that such submissions be made at the same time as the country programme proposals to enable the recipient governments to review the entire EPTA programme effectively. The Executive Chairman stated that the participating organizations had already been requested to present as many of such proposals as possible at the beginning of the biennial programming period.

12. A number of members noted with satisfaction the share of the programme and of the contingency allocations made by the Executive Chairman which went to Africa. It was emphasized by some members, however, that this should not continue at the expense of other parts of the world, such as Asia and the Far East, Latin America, and the Middle East, where the need for an increased level of assistance continued to be felt. One member further noted that the adoption of normal programming procedures, following the emergency action which had brought assistance to Africa to its present level, should not imply any lessening of the attention paid to the needs of that continent.

13. Several members expressed interest in the seminar on co-ordination which will be held in Addis Ababa in January 1964 for senior government officials responsible for the co-ordination of technical assistance in African countries. It was noted that the idea of holding this seminar had originated with the *Ad Hoc* Committee of Ten and had received general support from the Technical Assistance Committee in earlier discussions.¹ The Executive Chairman stated that, if time permits, a report on the seminar will be made available to the *Ad Hoc* Committee of Ten at its next meeting in February 1964. Some members commented on the contents of the agenda for the seminar, which was circulated informally to the Committee. It was noted that the meeting would be attended by senior officials responsible for the co-ordination of all sources of assistance and that discussions might range beyond

¹ See *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes*, agenda item 13, document E/3680, para. 116.

the question of the co-ordination of assistance from the United Nations family. Speakers at the seminar would be senior members of the Secretariat of the Board, including several Resident Representatives, and members of the staff of participating organizations, particularly of the Economic Commission for Africa. Some of the speakers have had experience in the co-ordination of technical assistance in their own countries before joining the international organizations. One member drew the attention of the Committee to the fact that the above seminar should not constitute a precedent contrary to the principle that the co-ordination of all types of external assistance was an exclusive right of the governments of the recipient countries.

DELAYED PAYMENTS OF VOLUNTARY CONTRIBUTIONS

14. The Committee noted the plea of the Executive Chairman to participating governments to review the time-tables being followed for payment of their voluntary contributions to the Expanded Programme, so that they may become available to meet the cash requirements of the programme early in the year for which they are pledged. In view of the slow rate observed this year in payments for 1963 pledges, and of the accumulated unpaid balance of prior years' pledges, the Committee endorsed the Executive Chairman's plea. The Committee called the particular attention of contributing governments to the importance to the sound financial administration of the Expanded Programme of having all contributions fully paid within the year to which they pertain. It also expressed the hope that all governments would take any action that might be required to carry out the recommendations of the Executive Chairman, beginning with contributions pledged for 1964.

Substantial programme changes as at 30 September 1963, including inter-agency transfers; transfers of allocations during 1963

15. The Executive Chairman stated that a number of modifications had been effected since the Category I programme for 1963-1964 had been approved by the Committee. In all cases these were made at the request of the government and after review by the participating organizations. Some of them were authorized by the Executive Chairman under the authority granted to him by the Committee to make such changes in the allocation of funds to the participating organizations as may be necessary to permit modification to country programmes requested by recipient governments and approved by him.² The extent to which changes had been authorized on this basis, as indicated in annexes I and II of document E/TAC/L.317, was noted with satisfaction by the Committee. The Committee also took note of the corresponding transfers of allocations (E/TAC/133) and requested that

² Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 14, document D-5 E/3704, annex I, para. 8.

in future the relation between changes in substance and financial changes be more clearly indicated. These transfers, as was pointed out by one member, had not resulted in any significant modification in the percentage shares of participating organizations in the EPTA programme, which remained almost at the same level as in the approved programme for 1963-1964 and in previous programmes. The same member stated that this showed that the decision of ECOSOC and TAC concerning the allocation of EPTA funds among developing countries was not being carried out in practice as it should be, because there was still a tendency to allocate these funds among participating organizations.

16. The Committee also took note of major changes in the programmes of certain countries as reported by the Executive Chairman (E/TAC/L.317, annex II). Several members requested that, in future, the financial implications of such major changes be clearly indicated in the tabulated statement. A number of members expressed concern at the large number of changes consisting of the addition or cancellation of expert and fellowship posts and equipment which had taken place during the first eight months of 1963. It was suggested that the relations between the present procedures based on biennial programming and project programming and the incidence of programme changes be the object of further study.

17. Another member suggested that, since some changes may have been due to the fact that the present financial rules do not provide for the carry-over of unutilized allocations approved for expert services from one biennial to the next, the necessary revisions should be made in the Programme procedures to enable such a carry-over to take place.

18. Several members suggested that it would be beneficial to the developing countries to have a merger of the EPTA programme with the regular programmes of the United Nations and the specialized agencies, based on the principles of the Expanded Programme.

Review of contingency authorizations made in 1963

19. The Committee reviewed the report on contingency authorizations made in 1963. The Executive Chairman stated that this was an interim report describing the allocations made during the period 1 May to 15 October 1963 and that a complete report outlining authorizations made during the period from 15 October to 31 December 1963, together with a statistical analysis of all allocations made in 1963, will be prepared for the summer 1964 session of the Committee. Several members suggested that reports on contingency authorizations submitted to the Committee should be rather fuller and should contain an analysis of the material presented. The Executive Chairman explained the difficulty of preparing such an analysis for periods of less than one year, but he stated that an annual analysis might be presented covering the distribution of allocations not only on a regional basis and by fields of activity; but also according to the general characteristics

of the situation under which each allocation had been made.

20. In view of the large proportion of contingency funds which, under two-year programming, must be devoted to the continued financing of projects until they can be absorbed in the Category I Programme, one member proposed that the next report to the Committee should highlight the impact of biennial programming, together with the use of contingency funds, and the extent to which requests for new allocations had to be rejected for lack of funds. Some members also questioned the appropriateness of the use of the contingency authority of the Executive Chairman to finance new programmes or to develop existing projects. The Executive Chairman answered that all allocations were made in response to requests which could not have been foreseen when the Category I Programme was approved by the Committee. Not all allocations were made, however, to meet such emergency situations as national disasters or change in government policies, but were in response to what might be called "opportunity situations" which would otherwise have to wait until the next programming exercise.

Revised Programme for Algeria

21. The Committee reviewed and approved a revised Category I Programme for Algeria based on the definitive request of the Government transmitted to the Resident Representative on 17 September 1963. It was noted that adjustments in the allocations to the participating organizations resulting from the revision of the programme for Algeria would be made through the normal procedure for inter-agency transfers.

Technical Assistance Board budget estimates for 1964

22. The Committee had before it the proposed budget estimates for the Technical Assistance Board Headquarters Secretariat and field offices for 1964 (E/TAC/131 and Add.1), and the report of the Advisory Committee on Administrative and Budgetary Questions thereon.³ The estimates envisaged a total cost to Expanded Programme funds of \$4,414,000, an increase of \$241,700 over the amount of \$4,172,300 approved for 1963. It was noted that this estimate represented 8 per cent of the total anticipated programme, which compares with a ratio of 7.5 per cent for 1963 and 7.9 per cent for 1962, and that some 78 per cent of the increase related to field office expenditures.

23. A number of representatives expressed concern at the increase in the budget estimates and in particular at the increased proportion of administrative costs as compared to the total costs of the programme. They felt that every effort should be made to achieve economies so that the highest possible proportion of resources could be allocated to the programme; they endorsed the Advisory Committee's suggestion

that the Executive Chairman endeavour to make savings of the order of \$100,000 in addition to those already provided for in his estimates. Other members, while agreeing on the desirability of achieving economies wherever possible, stressed that the principal concern of the Executive Chairman should be programme implementation and that if increases in the budget estimates led to better execution of the programme they would have no objection to them. They considered that since there had been only a small increase in the TAB Headquarters secretariat costs, and that the major share of the increase in the total budget was accounted for by fixed costs and by the strengthening of the field offices, the budget estimates appeared reasonable. One member thought that the budget estimates were too low and that certain offices needed strengthening. Another member, while supporting the budget estimates for 1964, pointed out the unfair distribution of administrative costs caused by the restricted contributions made by certain net donors. As a consequence too large a percentage of his government's contribution, which was fully convertible, was being used to defray administrative costs. A third member was of the view that it was difficult for the Technical Assistance Committee to make a thoroughly informed judgement on the Technical Assistance Board budget estimates without considering them in the broader context of their relation to other United Nations bodies. He felt that there was a need for the establishment of suitable machinery to make it possible for the TAC to make a more adequate appraisal of the Technical Assistance Board budget in the context of the over-all budget covering the TAB and the Special Fund.

24. Several members noted that the Executive Chairman's foreword to the portion of his budget estimates dealing with field offices revealed the continued existence of certain basic problems of co-ordination. They felt that the organizations participating in the work of the Technical Assistance Board were not using the Resident Representatives' offices sufficiently. This caused duplication of administrative work and was reflected in an uneven staffing pattern in the various Resident Representatives' offices. Several members expressed the view that there would be considerable scope for economies if the participating organizations used the facilities offered by the Resident Representatives' offices fully. Some members suggested that the Technical Assistance Committee make an appeal to the participating organizations in this connexion.

25. With regard to the institution of Resident Representative, some members felt that it should be maintained and strengthened. Others considered that plans should be made with a view to the future transfer of the functions of the Resident Representatives' offices to the national authorities, as this might reduce the administrative costs of the programme, and give the governments of the developing countries a better opportunity to determine, under less complicated procedures, for what purposes the programme funds should be allocated. One member stated that a first step in this direction could be the immediate appointment of Deputy Resident Representatives from among nationals

³ *Official Records of the General Assembly, Eighteenth Session, Annexes, agenda items 12-33-34-35-36-37-39-76, document A/5598.*

of the host country. These views were contested by other delegations. One member expressed concern that the technical assistance co-ordinating units in the regional economic commissions might duplicate the Resident Representatives' functions. The Executive Chairman stated, on the other hand, that far from duplicating, they reinforced each other.

26. The Committee invited the Technical Assistance Board to consider further the administrative improvements and economies which might be effected if the participating organizations made fuller use of the facilities offered by Resident Representatives' offices, and requested the Executive Chairman to present a report to the Committee in 1964 on progress made in improving co-ordination in the field and in particular on achieving a rationalization of field organization through the increased use of those offices by the participating organizations without, however, infringing on the constitutional autonomy of the latter organizations.

27. Two members requested that the TAC should be provided with detailed information concerning geographical distribution indicating the nationality and grade of personnel both at TAB Headquarters and the field, similar to the information given to the Fifth Committee on the geographical distribution of the United Nations staff.

28. The Executive Chairman stated that he shared the Committee's concern regarding the proposed increases in the budget, including the field establishment. However, the execution of the programme had to be adequate and many recipient countries as well as TAC and ECOSOC had repeatedly asked him to strengthen field offices and to provide the Resident Representative with sufficient assistance. He had tried to do this on as modest a basis as possible. In reply to questions raised, the Executive Chairman stated that he had no definite plans beyond 1964 for setting up new Resident Representatives' offices, since such plans would depend upon future developments within the programme. It was his feeling that the various regions were now reasonably well covered and that few if any new offices would be needed in 1965. As to strengthening existing offices, the proposals for 1964 constituted what he believed to be minimum requirements. Depending on the future development of the programme, the Executive Chairman would, if necessary, suggest further strengthening of the field offices and would of course justify any such increases before the Advisory Committee on Administrative and Budgetary Questions and the TAC itself. Generally speaking, existing offices had less staff than the patterns proposed by the consultant who had been engaged to carry out a recent field survey. A number of offices had been kept at lower strength where it was believed they could still do the job. As for regional offices, it was expected that there would be eleven in 1964, although many developing countries felt that regional representation was not sufficient to meet their needs for constant on-the-spot consultation and advice, and the Special Fund also felt that a local Director of Special Fund

Programmes (Resident Representative) was required in countries in which TAB alone might be adequately served on a regional basis. Although the Executive Chairman hoped that he could increase the use of regional offices, he had gone as far as he believed the present situation warranted in the 1964 budget estimates. On the question of control or even reduction of administrative costs, he reminded the Committee that the Advisory Committee had reviewed the 1964 estimates carefully and had recommended no reduction except for the possibility of saving \$100,000 through delayed recruitment, which the Executive Chairman assured the Committee that he would do his best to accomplish.

29. The Committee approved the TAB budget for 1964 as presented in E/TAC/131.

Allocations to the participating organizations toward their administrative and operational services costs for 1964

30. The Committee approved the requests of the World Meteorological Organization (WMO), the International Telecommunication Union (ITU) and the Universal Postal Union (UPU) for increases in the amounts approved last year for their administrative and operational services costs for 1964. With these revisions, the total lump sum allocations for administrative and operational services costs of the organizations will amount to \$4,590,333 in 1964.

Authorization of allocation of funds for 1964

31. At its 311th meeting, the Committee adopted the resolution reproduced in annex I of this report for authorization of allocations of funds in 1964 to cover (i) the costs of the Category I Programme and of the administrative and operational services costs of the organizations (ii) the balance of 1963-1964 contingency authorizations remaining unallocated at 31 December 1963, and (iii) the costs of the TAB Secretariat and joint field offices.

Treatment of estimated year-end uncommitted balances in the Special Account and of agencies' carry-overs

32. Several members commented on the estimate of the uncommitted balance of the Special Account on 1 January 1964, as reported in Table I of document E/TAC/134. One member felt that the estimate should also include the unobligated balances of 1963 earmarkings, which, in accordance with the Committee's authorization in the resolution that approved the allocations of funds for 1963, will be retained by the participating organizations for operations in 1964. It was also suggested that the surplus anticipated at the end of 1963, estimated at about \$5.7 million, might be utilized to finance new projects to be added to the approved Category I Programme of the current biennial for implementation in 1964.

33. The Executive Chairman explained that the agencies' anticipated carry-over at the end of 1963 had

not been included in the revised estimate of resources for 1963-1964 because it would not alter the financial position for the biennial as reported to the Committee in annex I to E/TAC/134. Under the two-year programming procedures, the agencies are allowed to retain, for operations in the second year, the balance of unobligated allocations of the first year's earmarkings; therefore, the Category I Programme costs for 1963 were recorded at the full amount of the allocations approved for the current year, with the remaining balance of the total approved biennial programme shown in 1964. Since the organizations expect to implement the programme in its entirety, any reduction of 1963 costs would be offset by a corresponding increase in anticipated 1964 costs. The Executive Chairman agreed, however, to include an explanatory footnote in the next comparable report, covering this point and giving an estimate of the unobligated amounts the participating organizations would retain at the end of 1965.

34. With regard to the suggestion that some of the 1963 surplus might be used to increase the level of the 1964 approved programme, the Executive Chairman explained the views of the TAB. He pointed out that the estimated surplus was based on all available resources — income from voluntary contributions and local costs assessments, uncommitted balances held in the Special Account and in the hands of the participating organizations at the end of the preceding biennial, etc. He also mentioned that the estimated surplus assumed the full payment of all past and present pledges and local costs payments, whereas in fact some \$3,000,000 of these amounts had not yet been paid. In order to plan the 1965-1966 biennial programme on a basis some 20 per cent above the level of the present biennial, the balances at the end of 1963 would need to be taken into account for this purpose. If a portion of this surplus were to be used in 1964, the target figures which are to be sent to the recipient governments early in December would have to be reduced accordingly. It was the judgement of the TAB that the better policy would be to go ahead on the basis already presented to the TAC, and count on the available resources of the programme being used for a well-planned programme for 1965 and 1966 within the levels suggested. He believed that it would not be wise to attempt a supplementary 1963-1964 programme at this stage. He stated, however, that he could review the matter again with the Board and report specifically on this point to the TAC at its summer 1964 session. Admittedly this would leave very little time for well-planned supplementary projects.

35. The Executive Chairman further pointed out that the preliminary estimate of 1965-1966 resources, on which the level of the next Programme would be based, has assumed that a number of governments will increase their contributions substantially in 1965 and that other governments will do so in 1966. He informed the Committee that, as a precaution, part of the planning reserves retained by him and by the organizations would not be assigned to country programmes unless there was some assurance on the part

of major contributors during 1964 of increased pledges for 1965. In the event that total contributions will fall short of programme costs, the earmarking device will be used to bring the level of implementation in 1965 and/or 1966 within available resources.

WORKING CAPITAL AND RESERVE FUND

36. The Committee considered the statement of the TAB (E/TAC/L.316) on the level of the Working Capital and Reserve Fund for 1964 and future years. It noted the Board's recommendation that with the increasing size of the programme, the level of the Working Capital and Reserve Fund should be raised toward a target level of \$15 million. The Committee agreed that for the year 1964 the level of the Fund should be increased by \$500,000 to \$12.5 million, as proposed by TAB.

37. The Committee also noted the amendment to the existing legislation relating to the purposes of the Working Capital and Reserve Fund, as proposed by the TAB in document E/TAC/132. The proposal of the TAB was accepted by the Committee which accordingly recommends to the Economic and Social Council the amendments to ECOSOC resolutions 521 A (XVIII) and 623 (XXXII), as set forth in annex II to this report.

PROGRESS REPORT ON THE COMPARATIVE STUDY OF EXPERTS' EMOLUMENTS

38. The Committee had before it document E/TAC/135 containing the progress report of the Executive Chairman on the comparative study of experts' emoluments which had been carried out at the request of TAC. It was pointed out that although much useful information had been received from those governments which had replied to the questionnaire sent out by the Executive Chairman, it was insufficient to permit the drawing of any conclusions of sufficient validity to warrant their submission to the Committee. A few governments had given rather complete information; some had provided much less detail; some had replied too late for their material to be taken into account; some governments had not yet sent replies.

39. The Executive Chairman expressed the view that a thorough and conclusive report on this subject would be of value to all concerned. He pointed out that there were differing views regarding the appropriateness of the present emoluments of technical assistance experts under the United Nations system. He felt, however, that more complete information would have to be received from more of the governments conducting bilateral aid programmes, and also that a process of follow-up, consultation and verification would probably be necessary in order to make accurate comparisons of the total conditions of service.

40. He further pointed out that experts' emoluments were only a part of the common salary system, fixed by the General Assembly on recommendations from the regular inter-agency machinery dealing with these matters; namely, the Administrative Committee on

Co-ordination (ACC) and its Consultative Committee on Administrative Questions (CCAQ), as well as the International Civil Service Advisory Board (ICSAB). It was further noted that the Fifth Committee had recommended enlarged terms of reference for the International Civil Service Advisory Board and the provision of a full-time Executive Secretary with appropriate supporting staff. The basic salaries under the common salary system would be reviewed by the appropriate inter-agency machinery.

41. In view of the above, the Executive Chairman pointed out that an alternative to continuing the study under the auspices of the TAB Secretariat would be to furnish the information already received to the inter-agency machinery referred to above, with the hope that any valid conclusions which could be reached on "comparability" would emanate from those bodies in due course.

42. A number of members emphasized the importance of having sufficient information from governments regarding the emoluments of bilateral experts in order to bring the study to a useful conclusion. They felt it would contribute to the efficiency of the programme to dispel any doubts as to how United Nations experts' emoluments compared with those of other comparable programmes. The Committee thus recorded its hope that governments which had not yet supplied sufficient detailed information regarding their own systems would do so in the near future.

43. The Committee decided to record its view that the study should be pursued, through the normal inter-agency machinery dealing with salary questions, and that the results, insofar as they related to comparative emoluments of technical assistance experts under the United Nations programme, should be made available at a future date to the TAC. Accordingly, it would request the Secretary-General and his colleagues on the ACC to undertake continuation of the study in the light of the above comments.

DEVELOPMENT OF INFORMATION MEDIA

44. At its last session the Committee had received a communication from UNESCO transmitting a resolution of the General Conference of UNESCO inviting its Director General to convey to the Technical Assistance Committee its appeal for a special allocation of funds for purposes of mass communication development in Africa, Asia and Latin America (E/3784). At the suggestion of the representative of UNESCO the Committee had agreed to defer the matter until its November session, by which time the Technical Assistance Board would have had an opportunity to study the matter further.

45. At its present session the Committee had before it a letter from the Director General of UNESCO to the Executive Chairman of TAB (E/TAC/136) which the Director General had requested be brought to the attention of the TAC. The letter gave further details regarding the form and scope of a possible enlarged

programme for mass communication development. The Committee also heard a statement by the representative of UNESCO in which he recapitulated the proposal and stated that the Director General of UNESCO intended to report to the next session of the Economic and Social Council on the present situation in respect of the proposal. Since the appeal of the General Conference of UNESCO was, in the first instance, directed to ECOSOC itself, and only subsequently to the Technical Assistance Committee, he suggested that the best procedure at the present session might be for the Committee to await the Council's assessment of the whole problem before engaging in any other action. Further guidance might thus be given for the enlightenment of the General Conference of UNESCO, which is to hold its next session in October 1964.

46. Several developing countries represented on the Committee expressed appreciation of UNESCO's initiative and appealed to the Committee to take the needs of emerging countries into consideration in studying the matter. Other members had reservations because they felt *inter alia* that it was not clear that the UNESCO proposal was based on a request from a government or governments as required by the basic legislation of the Expanded Programme. They also thought that approval of the proposal would amount to the laying down of priorities by the Committee, whereas it was up to the recipient countries themselves to indicate their priorities. Furthermore, at the request of the developing countries themselves, the Committee and other organs had already stressed the importance of high priority areas, such as industrialization, and it was felt that those areas should be concentrated on. They wished to know what the views of the Technical Assistance Board were on the proposal and its possible impact on the 1965-1966 programme.

47. Some members which supported the UNESCO proposal replied that most of the members of the Technical Assistance Committee were also members of UNESCO. It could therefore be said, in their view, that there had already been an indication of priority.

48. As requested, the Executive Chairman reported to the Committee the views of the Technical Assistance Board as expressed at its recent session. He pointed out that the general purposes of the proposal were viewed with sympathy by the Board, but that due to the state of the Expanded Programme resources in 1964, the fact that its estimated resources for the 1965-1966 biennial were already committed for programme purposes, and that the proposal would involve a deviation from the normal practice by allocating funds for a specific purpose, the Board could not support a special allocation. The view was expressed in the Board that other forms of financing of the proposed programme might be considered, *inter alia*:

(a) Governments might be invited to indicate the priority which they attached to projects in the field of development of information media by including them in their EPTA programme requests for 1965-1966;

(b) The UNESCO could be invited to consider the use of a portion of its EPTA regional programme for such projects;

(c) The possibility of UNESCO's using its programme planning reserves in supplementation of country target figures or regional allocations might be considered;

(d) Funds-in-trust arrangements with recipient Governments might be made;

(e) The Executive Chairman of the Technical Assistance Board could be requested to give due weight to all Government requests for technical assistance in the field of mass communications which meet the normal criteria of contingency allocations.

49. The Executive Chairman also pointed out that while there was no question in his mind of the value and usefulness of the UNESCO proposal, the Committee should not lose sight of the fact that its acceptance would reduce the amount available for other programming purposes (country and regional) in 1965-1966 by the amount required to implement the UNESCO proposal.

50. At its 313th meeting the representative of Senegal introduced the following draft resolution (E/TAC/L.323):

"The Technical Assistance Committee,

"Recalling resolution 1778 (XVII), in which the General Assembly invited the Technical Assistance Board to assist the less developed countries in developing and strengthening their national information media,

"Noting the appeal addressed to the Economic and Social Council and to the Technical Assistance Committee by the twelfth session of the General Conference of UNESCO in its resolution 5.122 for a special allocation to promote the training of mass information personnel in Asia, Africa and Latin America,

"Aware of the lack of essential means required for the training of cadres capable of activating national training programmes,

"Concerned at the delay which might occur in the execution of programmes for the development of information media in accordance with resolution 1313 A (XIII),

"Having considered the proposals transmitted by the Director-General of UNESCO, appearing in document E/TAC/136,

"Recommends the Executive Chairman of the Technical Assistance Board and UNESCO to seek means of utilizing to the utmost extent the resources available to them, in particular the Contingency Fund of the Technical Assistance Board, the planning reserves of UNESCO or any other sources, in order to meet the requests of Member Governments so as to enable them to carry out their national programmes for the training of information personnel."

51. In the ensuing discussion, several members expressed reservations about the use of the Executive

Chairman's contingency authority for the purposes envisaged in the resolution. One member thought that the required resources should be sought mainly from two of the sources mentioned in the Technical Assistance Board's discussion of the UNESCO proposal (see para. 48 above), i.e., inclusion in Expanded Programme requests for 1965-1966 by recipient countries, and funds-in-trust arrangements. On the other hand, one member stated his view that the contingency fund was an appropriate source of finance in this case.

52. Also at the same meeting the representative of India informally suggested the paragraph which follows for inclusion in the report of the Committee (E/TAC/L.322/:

"The Technical Assistance Committee considered the letter from UNESCO contained in document E/3784. It recognized the importance of developing information media as suggested therein.

"It invited the Technical Assistance Board to explore ways and means of financing, at the request of the individual countries concerned, or in response to regional requests, the establishment of institutes for the development of mass communications media."

53. In addition, the Executive Chairman of the Technical Assistance Board circulated to the Committee as document E/TAC/L.324 a note outlining the alternatives which had been suggested in the Technical Assistance Board for financing of the UNESCO proposal (see para. 48 above.)

54. The representative of Denmark proposed that the substance of the Indian proposal be included in the draft resolution submitted by the representative of Senegal and that reference also be made therein to the note which had been submitted by the Executive Chairman. The representatives of the Netherlands and of Nigeria proposed verbally that a third operative paragraph be added to the resolution to request the Executive Chairman of the Technical Assistance Board to submit a report to TAC in 1964 on the progress achieved in implementing the resolution. The sponsor agreed to the suggestions of the representatives of Denmark, the Netherlands and Nigeria and these suggestions, together with some other changes proposed verbally during the debate, were incorporated in a revised text (E/TAC/L.323/Rev.1) which was adopted unanimously by the Committee. The text of the resolution is reproduced as Annex III of the report.

United Nations Regular Programme of Technical Co-operation

RECENT DEVELOPMENTS

55. The Commissioner for Technical Assistance in his statement to the Committee (E/TAC/L.318) reviewed the current position and recent developments within the framework of the United Nations regular programme.

56. Funds obligated or expended as of 31 October 1963 amounted to \$5.3 million, an increase of approximately 13 per cent over the same period of 1962, in spite of the late approval of the programme.

57. There has been an increase in requests for short-term missions designed for examination of all relevant components of development plans. Such short missions are given top priority and their aims to advance practical plans for next steps by governments and international agencies. The regular programme is particularly well suited for organizing these missions in a very short time.

58. There has also been an increase in the use of regional advisers usually attached to the regional economic commissions. They fill a long-felt need for high level personnel quickly available for short-term assignments at the request of governments. The use of inter-regional advisers in the field of natural resources and industrial development has also been successful and it is the intention of the Secretary-General to expand the use of such advisers, as resources and circumstances permit, to other fields.

59. With respect to the 1964 regular programme, the Commissioner commented on the favourable effect of the earlier approval of the 1964 programme by the Committee and by the Council on the preparatory work for 1964. Under this new time-table, the Committee will receive the detailed regular programme proposals for 1965 at its 1964 summer session and will also have a comprehensive report on the implementation of the 1963 programme.

60. At the present session the Commissioner hoped that the Committee would establish the initial level for 1965 which the Secretary-General recommended should be at \$6.4 million (E/TAC/137).

61. The Commissioner also informed the Committee that the Secretary-General intends to advise the functional commissions and the regional economic commissions of the need for this Committee to review all proposals having financial implications for technical assistance funds under part V of the United Nations Budget. The review by this Committee at its last session of the proposals of the Commission on Human Rights and the Commission on Narcotic Drugs had set a useful precedent in this regard. He felt that such a review contributed to the rationalization of United Nations operational activities.

62. The comparability of the financial regulations and rules applicable to the regular programme and to EPTA is being reviewed by the Secretariat and the Secretary-General intends to submit a paper on this subject to the Advisory Committee on Administrative and Budgetary Questions for the purpose of achieving greater uniformity between these programmes. The Technical Assistance Committee will be kept informed of progress made in this direction.

63. As to decentralization, considerable advances have been made, according to the Commissioner, includ-

ing increased delegation of the authority for administering the projects of the United Nations technical assistance programmes to the Executive Secretaries of the regional economic commissions. A further step toward decentralization is being made by the organization of programming missions to more than 30 countries to be carried out by senior officers of the regional secretariats associated with senior officers from Headquarters whenever appropriate in connexion with the 1965 regular programme and the 1965-1966 Expanded Programme.

64. Members of the Committee noted the statement of the Commissioner with appreciation, some commenting favourably in particular on the programming missions, the new directions indicated and the new time-table of the Committee's work.

LEVEL OF REGULAR PROGRAMME IN 1965

65. While the Committee felt that the programme for 1965 should be drawn up on the basis that the appropriation available would be \$6.4 million, the amount proposed by the Secretary-General in his report (E/TAC/137), several members indicated that an approval of the level of \$6.4 million did not constitute an approval of the sectional breakdown contained in the report of the Secretary-General (para. 13 of the report).

PRIORITIES AND FLEXIBILITY IN ALLOCATING FUNDS

66. At its 313th meeting the Committee received a draft resolution on "United Nations Programmes of Technical Co-operation" (E/TAC/L.320) submitted by Afghanistan, Argentina, Brazil, Colombia, El Salvador, India, Indonesia, Jordan, Nigeria, Senegal, United Arab Republic, Uruguay and Yugoslavia. Under this draft resolution the Technical Assistance Committee,

"Considering the importance attached to industrial development as a major factor in accelerating the economic development of developing countries,

"Requests the Secretary-General to submit to the 1964 summer session of the Committee a plan for reallocating the funds available under Part V of the regular budget in such a way as to effect an increase in Section 13 (Economic Development) which will permit the provision under a separate chapter heading within that Section of a sum specifically for industrial development."

67. The Representative of the United Kingdom of Great Britain and Northern Ireland proposed (E/TAC/L.321) to add a new paragraph 1:

"Bearing in mind the need for the United Nations regular programme, like the Expanded Programme, to reflect the priorities for technical assistance determined by each developing country in the light of its own development plan,"

and to replace in paragraph 2 the words after "regular budget" with the following:

"for 1965, after consultation with the Governments of the developing countries and within a maximum of \$6.4 million, in such a way as more adequately to reflect the changing and various priorities of these countries, and to this end to consider either the provision of a separate chapter heading for industrial development or the abolition of some or all of the different chapter headings of Part V of the budget".

68. The representative of New Zealand proposed orally to add another paragraph at the end of the draft resolution as follows:

"Further requests the Secretary-General, as part of the plan referred to above, to review his proposals regarding the allocation of funds for human rights advisory services, and in this connexion to consider the possibility of making, in the first instance, savings by a reduction of the number of seminars currently programmed within this field."

69. At the 314th meeting of the Committee, the sponsors of the draft resolution presented orally a revised text of the draft resolution, which took account of the amendments proposed by the United Kingdom. It was indicated on behalf of the sponsors that it would be for the Secretary-General to prepare his plans with due attention to the budget ceiling of \$6.4 million. The representative of New Zealand, after some discussion and on the understanding that the proposed allocation for 1965 for human rights would be reviewed within the framework of the plan for reallocation proposed by sponsors, withdrew his amendment. The revised draft was adopted unanimously by the Committee and the resolution is reproduced in Annex IV under the title "United Nations Programmes of Technical Co-operation."

70. Upon the adoption of the resolution the Commissioner for Technical Assistance made a statement in which he outlined the manner in which he intended to proceed with the preparation of the report requested by the resolution.

71. In the exchange of views on the draft resolution and observations made after its adoption, several comments were made by the members of the Committee.

72. Some members stated that while supporting the idea of the resolution, because of its emphasis on the priority of industrialization, their position with respect to financing the regular programmes remained unchanged, namely, these programmes should not be financed under the regular United Nations budget, but by voluntary contributions under the Expanded Programme for Technical Assistance.

73. Several members felt that it would be to the benefit of the developing countries if the resources available under the regular programmes were not earmarked in advance for particular purposes, and if some or all of the different section headings under Part V

of the United Nations budget were abolished. Other views were to the effect that such a step would be premature.

74. Several members of the Committee, while supporting the need for flexibility in allocation of funds, emphasized the priority of industrial development for the developing countries. Some members, while agreeing, referred also to the importance of several other fields, among them various aspects of social development, human rights, and narcotics.

75. The Representative of Afghanistan, supported by the Representatives of Jordan, Nigeria and the United Arab Republic, felt that the teaching, study, dissemination and wider appreciation of international law were an important field in which the developing countries needed technical assistance. Pointing to the fact that this matter was being acted upon by the General Assembly in its current session, he hoped the Committee will give due consideration to this question at its summer session in 1964.

PLACE AND DATE OF THE 1964 SUMMER SESSION OF THE COMMITTEE

76. The Committee took note of the action of the Council accepting with appreciation the invitation of the Austrian Government for the Committee to meet in Vienna on 22 June 1964 for a period of two weeks and for a few days thereafter if necessary.

ANNEX I

The Technical Assistance Committee,

Recalling Economic and Social Council resolution 901 (XXXIV) on the financial arrangements for 1963-1964,

Recalling that it approved a technical assistance programme for 1963-1964 amounting to \$85,219,000 as contained in documents E/TAC/L.281 and Corr. 1 and Add. 1-2 and E/TAC/L.282,

Noting the substantial changes made in the 1963-1964 programme (E/TAC/L.317),

Noting further that the Technical Assistance Board estimates that the gross financial resources to be made available in 1964 will amount to \$59,673,000 and that, after setting aside (a) \$3 million as reimbursement of the Working Capital and Reserve Fund for contingency authorizations made in 1963, (b) \$500,000 to set the Working Capital and Reserve Fund at the level of \$12.5 million for 1964, and (c) \$4,414,000 to cover the estimated expenses of the TAB Secretariat, the financial resources will amount to \$51,759,000,

1. *Authorizes* the expenditure from the Expanded Programme resources of not more than \$4,414,000 for the TAB Secretariat and joint field offices in 1964;

2. *Decides* to set the level of the Working Capital and Reserve Fund for 1964 at the level of \$12.5 million;

3. *Confirms* that the Executive Chairman may authorize the participating organizations to enter into commitments to meet urgent needs in 1964 up to the total unallocated balance of the sum of \$9,575,000 approved by the Committee for those authorizations during the biennial period 1963-1964;

4. *Authorizes* the allocation of funds to each of the participating organizations from contributions, general resources, and local costs, as shown below:

<i>Participating organizations</i>	<i>Allocation (equivalent in United States dollars)</i>
United Nations	9,464,119
ILO	4,749,187
FAO	11,535,277
UNESCO	7,589,363
ICAO	2,034,424
WHO	7,988,760
ITU	929,823
WMO	1,028,020
IAEA	944,824
UPU	83,841
TOTAL	46,347,638

5. *Authorizes* the Executive Chairman to make such changes in these allocations as may be necessary to provide, as far as possible, for the full utilization of contributions to the Expanded Programme of Technical Assistance, and to permit modifications to country programmes requested by recipient governments and approved by him;

6. *Requests* the Executive Chairman to report any such changes to the Committee at the next session after they are made.

7. *Confirms* that the organizations are authorized to retain in 1964 the balances of funds allocated to them in 1963 which have not been obligated, or transferred to another agency under the provisions of paragraph 5 above, by the end of the year.

8. *Requests* the Secretary-General to transmit to the General Assembly the following draft resolution:

CONFIRMATION OF THE ALLOCATION OF FUNDS FOR THE EXPANDED PROGRAMME OF TECHNICAL ASSISTANCE IN 1964

The General Assembly,

Noting that the Technical Assistance Committee has reviewed and approved the Expanded Programme of Technical Assistance for the biennium 1963 and 1964,

1. *Confirms* the allocation of funds authorized by the Technical Assistance Committee to each of the organizations participating in the Expanded Programme of Technical Assistance from contributions, general resources and local costs assessments, as follows:

<i>Participating organization</i>	<i>Total allocations requested for 1964</i>
United Nations	9,464,119
ILO	4,749,187
FAO	11,535,277
UNESCO	7,589,363
ICAO	2,034,424
WHO	7,988,760
ITU	929,823
WMO	1,028,020
IAEA	944,824
UPU	83,841
TOTAL	45,347,638

2. *Concurs* in the Committee's authorization to the Executive Chairman to make changes in these allocations as may be necessary to provide, as far as possible, for the full utilization of contributions to the Expanded Programme of Technical Assistance, and to permit modifications to country programmes requested by recipient governments and approved by him;

3. *Requests* the Executive Chairman to report any such changes to the Committee at the next session after they are made;

4. *Concurs* in the Committee's authorization to the participating organizations to retain for operations in 1964 the balances of funds allocated to them in 1963 which have not been obligated, or transferred to another agency under the provisions of paragraph 2 above, by the end of the year.

ANNEX II

WORKING CAPITAL AND RESERVE FUND

The Technical Assistance Committee,

Having considered the proposals of the Technical Assistance Board concerning the purpose of the Working Capital and Reserve Fund,

Recommends that the Economic and Social Council amend Council resolution 521 A (XVII), as amended by Council resolution 623 B II (XXII), paragraph 1.A (a), by adopting the following draft resolution:

[*Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council", resolution 1021 (XXXVII).]*

ANNEX III

TECHNICAL ASSISTANCE IN THE DEVELOPMENT OF INFORMATION MEDIA

The Technical Assistance Committee,

Recalling resolution 1778 (XVII), in which the General Assembly invited the Technical Assistance Board to assist the less developed countries in developing and strengthening their national information media,

Noting the appeal addressed to the Economic and Social Council and to the Technical Assistance Committee by the twelfth session of the General Conference of UNESCO in its resolution 5.122 for a special allocation to promote the training of mass information personnel in Asia, Africa and Latin America,

Aware of the lack of essential means required for the training of cadres capable of activating national training programmes,

Concerned at the delay which might occur in the execution of programmes for the development of information media in accordance with resolution 1313 A (XIII),

Having considered the proposals transmitted by the Director-General of UNESCO, appearing in document E/TAC/136,

1. *Draws attention* to the note by the Executive Chairman of the Technical Assistance Board;^a

2. *Invites* the Technical Assistance Board to seek ways and means of financing, within the forms of financing outlined in the above-mentioned Note, the establishment of institutes and other appropriate activities for the development of mass communications media in order to meet the requests of Member Governments so as to enable them to carry out their national or regional programmes for the training of information personnel;

3. *Requests* the Executive Chairman to report to the Technical Assistance Committee in 1964 on results achieved on the above.

ANNEX IV

UNITED NATIONS PROGRAMMES OF TECHNICAL CO-OPERATION

The Technical Assistance Committee

Bearing in mind the need for the United Nations regular programme, like the Expanded Programme, to reflect the priorities

^a E/TAC/L.324.

for technical assistance determined by each developing country in the light of its own development plan,

Considering the importance attached to industrial development as a major factor in accelerating the economic development of developing countries,

1. *Requests* the Secretary-General, after appropriate consultation, to submit to the 1964 summer session of the Committee a plan for reallocating the funds available under part V of the regular budget for 1965 in such a way as to effect an increase in Section 13

(economic development) which will permit the provision under a separate chapter heading within that section of a sum specifically for industrial development.

2. *Requests* the Secretary-General, taking into account the views of the Committee, to consult with the governments of developing countries and to make recommendations to the 1964 summer session of the Technical Assistance Committee for introducing further flexibility so as to reflect the changing and various priorities of these countries.

DOCUMENT E/3850

Report of the Secretary-General under Council resolution 900 A (XXXIV): Part I. Expanded Programme of Technical Assistance and Special Fund

[Original text: English]
[9 January 1964]

Introduction

1. In its resolution 900 A (XXXIV) of 2 August 1962, the Economic and Social Council requested the Secretary-General in consultation with the executive heads of the specialized agencies and the International Atomic Energy Agency "to undertake the study recommended in paragraph 81 of the report (of the *Ad Hoc* Committee of Eight), including in the study the regular technical assistance programmes of the United Nations and the related agencies". In paragraph 81 of its report (E/3639), the *Ad Hoc* Committee had recommended that the Council request the Secretary-General "to study, in consultation, as appropriate, with the specialized agencies, the Executive Chairman of the Technical Assistance Board, and the Managing Director of the Special Fund the possible advantages and disadvantages of a partial or complete merger in due course, without running counter to the basic objectives of each programme, of some or all of the technical assistance programmes of the United Nations including that of the Regular Programmes, the Expanded Programme of Technical Assistance and the Special Fund".⁴

2. Part I of the present paper deals with the question of a possible merger of the Expanded Programme of Technical Assistance and the Special Fund. The question of a possible merger of "regular" and other programmes raises quite different issues and is consequently considered separately in Part II of the report (E/3851).

3. In undertaking the task entrusted to him, the Secretary-General has been guided by the single aim of serving most effectively the governments of the developing countries, at their request, in their efforts to promote the economic and social advancement of their peoples. He has taken full account not only of past experiences under EPTA and the Special Fund but also of the prospective responsibilities that may be entrusted to the United Nations family. While the

future range and scope of those responsibilities cannot be fully foreseen, several factors make it likely that they will tend to be substantially larger than at present.

4. The need for higher levels of pre-investment activities is evidenced by the inadequate rates of progress in many of the developing countries. They reflect, among other things, a shortage of sound projects and favourable technical conditions for increased investment. This is leading the developing countries to seek more technical and pre-investment assistance from external sources. The Special Fund alone is currently considering government requests for its help to finance projects calling for total expenditures of over \$500 million, to which the Fund would be expected to contribute \$200 million if all the projects were approved. Furthermore, all indications make it clear that governments urgently require and desire from the United Nations system substantially more assistance of the kinds provided under the expanded programme and the regular programmes of technical assistance, including OPEX.

5. There is moreover continuing pressure on the United Nations family to expand its operational activities in particular directions, and a spate of proposals have been put forward for the creation of new and semi-independent institutions, which would render still more complex the pattern of the aid programme of international organizations. In this connexion, the Secretary-General feels strongly that further dispersion through the creation of new agencies should not be decided upon without having thoroughly explored the potentialities of the existing organizations with their fund of experience, knowledge and technical skills, as well as the inter-agency co-ordinating mechanisms that have been built up over the years.

6. Not only are the developing countries seeking more technical and pre-investment assistance through the programmes of the United Nations family, but in the industrialized countries as a whole there is a parallel trend towards channelling more development assistance through the United Nations system. The proportion of such assistance so channelled has approximately

⁴ See *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes*, agenda item 13, document E/3639, para. 81.

doubled since the early 1950's and that proportion may be expected to continue to rise in the coming years. Meanwhile, there are important areas where increased assistance through the United Nations family is being pressed for. One of these is in bringing to the developing countries more of the benefits of the revolution in science and technology. New initiatives are also needed if the pace of industrialization is to be stepped up, while there is a continuing demand for more operational personnel and the establishment of training institutes, for example in public administration.

7. The United Nations system is thus confronted with the task of gearing itself to administer a larger proportion of an increased volume of needed assistance. To meet these responsibilities and embrace these opportunities — to enhance in breadth, volume, cohesion and effectiveness the services the United Nations system can and should provide in the years ahead — the Secretary-General has come to the conclusion that certain organizational rearrangements would offer obvious advantages and be entirely feasible. Rather than attempt to set out the possible advantages and disadvantages of the many different forms of rearrangement or merger that might be envisaged, he believes that it will be more useful that he should state clearly the conclusions to which his study has led him.

8. The establishment of the Expanded Programme of Technical Assistance in 1949 and of the Special Fund in 1958 reflected successive stages in the evolution of thinking as to the role of multilateral action in economic and social development.⁵ Each of these programmes has yielded good results and a large degree of co-ordination has been achieved between them. The Secretary-General believes that the complex pattern of the aid programmes of international organizations, coupled with the pressure for the expansion of the operational activities of the United Nations system in established and new directions referred to above, make it desirable that a further step should now be taken. He is not unmindful of the reasons which led to the Special Fund being separate from (though complementary to) the Expanded Programme of Technical Assistance, but he considers that those very reasons now favour a unification within a broader structure. While the suggestions that follow are made irrespective of the outcome of current discussions regarding the establishment of a United Nations Capital Development Fund,⁶ they are, he believes, such as to provide a more solid basis for the future growth and evolution of the action programmes of the United Nations system in this direction or in others.

9. In the course of drafting the present report, the Secretary-General has consulted with the executive

⁵ A note on the development and structure of the Expanded Programme of Technical Assistance and the Special Fund appears as an annex to the present document.

⁶ Under General Assembly resolution 1936 (XVIII) the Secretary-General has been asked "to prepare, in consultation with the appropriate organs of the United Nations and such other institutions as may be necessary, a study of the practical steps to transform the Special Fund into a capital development fund in such a way as to include both pre-investment and investment activities".

heads of the specialized agencies and the International Atomic Energy Agency, as well as the Managing Director of the Special Fund and the Executive Chairman of the Technical Assistance Board. While differences of view have been expressed by certain Directors-General on specific points, these consultations have revealed general agreement on the advantages of a merger at the inter-governmental, inter-agency and management levels. They have also revealed full agreement that no attempt at closer integration of the United Nations technical co-operation programmes would be fruitful unless it is done in such a way as to preserve what experience has proved to be the most valuable elements in the machinery and methods of work of both the TAB and the Special Fund and in a manner which respects the constitutional relationships among the participating organizations and the responsibility of each of them within its respective fields. In proposing certain improvements in machinery and methods, the Secretary-General is aiming not only at securing the most efficient implementation of the present programmes of EPTA and the Special Fund but also at placing the United Nations family in a better position to undertake such additional activities of an interagency character (without prejudice, that is, to the autonomous expansion of the work of the existing organizations under their respective constitutions) as the Member Governments may wish to assign to it. The proposals are couched in general terms. The Secretary-General expects to have further consultations with his colleagues in the Administrative Committee on Co-ordination before final details are worked out.

United Nations Development Programme

10. The Secretary-General considers that all countries contributing to and benefiting from United Nations technical co-operation programmes would best be served by bringing EPTA and the Special Fund together in a new United Nations Development Programme. This new Programme would operate under suitable governmental policy guidance, with the full participation of the specialized agencies and the IAEA, and afford an effective means of securing unification of effort. The changes contemplated aimed at simplifying in certain respects the channelling and consideration of government requests for assistance, and thus, it is hoped, would contribute towards meeting more effectively the needs of the developing countries.

11. There would be a single inter-governmental body, which might be known as the Inter-governmental Committee, to provide general policy guidance and direction for, as well as the necessary inter-governmental supervision over, the Programme as a whole. It would have final authority for the approval of assistance to be granted in response to requests by governments and recommended by the Head of the Programme after examination of the requests by the Inter-Agency Board provided for in paragraph 13. The Committee would review the administration and the execution of approved projects and programmes, and submit

reports and recommendations to the Economic and Social Council and the General Assembly. It would exercise the above functions without prejudice to the responsibilities exercised by the governing organs of the specialized agencies and IAEA in their respective fields, and with the full participation of representatives of those agencies in accordance with the Charter, the relationship agreements and the Rules of Procedure of the Economic and Social Council. The appropriate organs of the participating organizations would be expected to continue to review the technical aspects of the programmes for which the organizations assume responsibility.

12. While the rules affecting the composition of the Technical Assistance Committee and the Governing Council of the Special Fund differ slightly as regards geographical distribution and the representation of the economically more developed and less developed countries, it is believed that a unified body could be relatively easily established in such a way as to alter little the membership of the two existing bodies. Procedures appropriate to the different types and sizes of projects to be financed would have to be provided. For example, with respect to smaller projects, such as those now financed from EPTA, the practice of country programming, with needed flexibility provided by a contingency fund, should be maintained; for larger projects, such as those now financed from the Special Fund, procedures for approval such as those now applied by the Special Fund would seem most appropriate.

13. An Inter-Agency Board should be established to provide for the full participation in the process of decision and policy making of the Head of the Programme, the Secretary-General of the United Nations, the executive heads of the specialized agencies (including the President of the IBRD) and the IAEA, or their representatives. The Board, which would bring together the executive heads at regular intervals, would meet as often, and for such periods, as might be necessary to ensure that all aspects of the Programme, and other relevant activities of the United Nations family, were kept under continuous review. The Executive Directors of UNICEF and the World Food Programme would be invited to participate as appropriate in the Board's work.

14. The Programme would be managed by a Head of the Programme and a Co-Head.⁷ Their responsibility for the Programme as a whole would be exercised under the policy guidance and direction of the Inter-governmental Committee. Before recommending for approval general policies for the Programme as a whole or programmes and projects requested by governments, the Head of the Programme would consult with the Board and would express a consensus of its views to the fullest extent practicable and consistent with his responsibilities to the Programmes as a whole. The Board would similarly be fully consulted on the appointment of, and general policy relating to, field representatives. The Head would be assisted by a

single staff, having a status comparable to that of the present Technical Assistance Board and Special Fund secretariats, the structure and budget of which would be reviewed by the Advisory Committee on Administrative and Budgetary Questions and be considered by approval by the Inter-governmental Committee.

15. The Programme would rely, as EPTA and Special Fund do at present, on the offices of the Resident Representatives to maintain, in close co-operation with the country representatives and regional offices of the participating organizations, continuous and effective contact with governments and to assist those governments in programming the priority of their requests in such a way as to be best served by the total resources available. These offices, the number of which has grown from thirty-eight to seventy over the past five years, should be further strengthened and expanded as may be necessary to serve the countries concerned. Special emphasis should be placed on a policy of undertaking all necessary steps to help prepare governments to carry out their own planning and co-ordination of economic and social development in their own countries. The Programme staff and the staff of the participating organizations, who have the necessary competence in their respective fields, would work in closest association at all stages, from the conception and preparation of projects to their execution, follow-up and evaluation.

16. The resources for the Programme would be derived from voluntary contributions, notably those of governments at annual pledging conferences to be convened by the Secretary-General. Pledges would be receivable under existing rules governing contributions to the Special Fund and Expanded Programme respectively, or possibly under new rules governing supplementary contributions for special purposes.

* * *

17. The Secretary-General is convinced that a consolidation along the above lines, which seeks to maintain all that has proved most valuable to governments in the existing arrangements, is desirable in order to equip the United Nations system to meet more effectively its current and prospective responsibilities for the promotion of economic and social progress in the developing countries. He is prepared to indicate the changes that the implementation of these proposals would seem to require in the existing resolutions of the Economic and Social Council and the General Assembly. Legislative action may well also be required by the governing organs of the agencies concerned to authorize participation in the new arrangements. However, no major administrative or operational changes would seem to be involved.

18. The proposed Programme would be capable of expansion in any way required in the future, naturally without prejudice to the constitutional responsibilities of the existing agencies. By maintaining the best practices of the Expanded Programme of Technical Assistance and of the Special Fund it should help meet the fundamental desire of all, which is to enable assistance

⁷ The exact title to be determined after further consultation.

channelled through the United Nations system to produce maximum constructive effects. It should make a notable contribution towards simplifying administration, strengthening co-operation with the participating organizations, enabling the priority needs of the developing countries to be more adequately assessed, and ensuring that the resources available — in experience as well as in funds — are used most fruitfully. The Secretary-General trusts that by so gearing itself for more effective service, the United Nations system will be provided with the resources required to help make a success of the United Nations Development Decade.

ANNEX

Note on the Development and Structure of the Expanded Programme of Technical Assistance and the Special Fund

I. THE EXPANDED PROGRAMME OF TECHNICAL ASSISTANCE

1. The Expanded Programme of Technical Assistance, established by virtue of resolution 222 (IX) of the Economic and Social Council and resolution 304 (IV) of the General Assembly marked the opening of an important new phase in the growth of international co-operation in the economic and social development fields.

2. It represented a significant departure from the programmes of assistance to Member Governments that had previously been established by the United Nations and several of the specialized agencies — among them WHO, UNESCO, FAO and ILO. The Expanded Programme was to have an independent financial base — the voluntary contributions of Member Governments; it was to entail a systematized exchange of information by the participating organizations; and it was to have built-in co-ordinating and review machinery — i.e., the Technical Assistance Board at the Secretariat level and the Technical Assistance Committee at the government level.

3. The nature of the assistance to be given by the Expanded Programme did not vary basically from the work which several of the organizations had already begun: it included the provision of expert advice and assistance; the award of fellowships for training abroad; the sponsorship of international seminars, meetings of expert groups and training centres, and the provision of a limited amount of demonstration equipment. Although the size of individual projects was not specifically delineated, they have tended to involve an expenditure of from a few thousand dollars to a quarter of a million, with the majority falling between \$25,000 and \$50,000.

Structure

4. The Technical Assistance Board (TAB) consists of the Executive Heads, or their representatives, of the United Nations and the Agencies which participate in the Expanded Programme. According to the original resolution "the Secretary-General, or his representative", was to be Chairman of TAB, but this provision has been modified in favour of the arrangements described below.

5. The Board exercises its co-ordinating function in the areas of programme planning, financial management, the establishment of uniform administrative procedures and liaison with other programmes of assistance. It has the over-all responsibility for drawing up the programme of technical assistance and submitting this programme for the approval of the Technical Assistance Committee.

6. The Committee is responsible for the general supervision of the Expanded Programme and, particularly, for the review and

approval of the over-all programme submitted to it by TAB, as well as the authorization of funds with which to carry out this programme. In addition, the Committee — meeting twice a year — recommends new legislation for the Expanded Programme, interprets resolutions previously adopted and takes decisions on questions submitted to it by the TAB.

Strengthening of Expanded Programme machinery

7. The functions of both the TAB and the TAC, as well as the operating procedures of the Expanded Programme, reflect the provisions of subsequent Council and General Assembly resolutions which introduced important modifications or redefinitions of the arrangements set out in resolution 222 (IX). The aim of these changes was to improve headquarters and field co-ordination, to shift part of the responsibility for programme planning from the international organizations to the recipient governments, and to improve procedures for handling and approving requests.

8. In 1952, for example, the role of the Chairmanship of TAB was strengthened. The Council decided, in resolution 433 A (XIV), that the Board should have a full-time Executive Chairman, assisted by a Secretariat which would perform "under the supervision of the Executive Chairman, such functions as the efficient operation of the Board may require". The resolution also approved a set of functions for the Executive Chairman which provided, among other things, that he would examine programme proposals and make recommendations concerning them; that he would exercise continuous supervision over the Programme and appraise the effectiveness and the results of activities; that he would review the co-ordination of EPTA operations and keep informed, at the same time, of the activities of other multilateral or bilateral aid programmes; and that he would appoint, in agreement with the Board, Resident Technical Assistance Representatives, and determine their terms of reference.

9. The action of the Council endorsing the post of Resident Representative acknowledged a need for over-all co-ordination at the country level, which had already been expressed in the United Nations programme by the appointment of several Special Representatives of the Secretary-General. In subsequent Council resolutions, the increasing role of the Resident Representative was noted, and he was assigned additional responsibilities — particularly in connexion with programming.

Programming

10. Under the terms of resolution 222 (IX), 80 per cent of the financial resources of EPTA were divided among the participating organizations on the basis of fixed percentages. Each of the organizations received and considered government requests as they arrived, whether directly or through established agency machinery, during the course of the year. They assigned priorities to these requests and determined which ones could be accommodated within the funds available to them.

11. These arrangements were changed in 1954, on the basis of Council resolution 542 (XVIII). It provided that the funds of the Expanded Programme would no longer be allocated to the participating organizations on the basis of percentages fixed in advance. They would, instead, be distributed on the basis of requests submitted by governments and priorities established by them. In practice, the organizations continue to share in the Programme in roughly the same proportions as in former years.

12. From the beginning of 1955, programming became an annual exercise with a fixed time-table. Resident Representatives were assigned the responsibility for co-ordinating programming consultations between governments and participating organizations, while the role of Agency Field Representatives in rendering technical advice and guidance to governments was reaffirmed.

13. Resolution 542 (XVIII) also provided, so as to ensure flexibility, for the establishment of the Executive Chairman's contingency authority. Up to 5 per cent of the Programme's estimated global resources were set aside to finance those projects which might require urgent implementation between programming periods. The Executive Chairman considered the granting of these funds at the request of governments and on the basis of recommendations of participating organizations. The level of the Contingency Authority was first raised to 7-1/2 per cent when the system of two-year programming was introduced, and is currently at 10 per cent of total resources.

14. Two-year programming was initiated on an experimental basis by resolution 735 (XXVIII) of the Council in July 1959, and applied for the first time to the 1961-1962 period. It has since been extended through 1965-1966, and will be reviewed again in the light of further experience. Its fundamental intention is to allow governments more time in which to consider and develop their long-range needs and to give the participating organizations more time in which to prepare and execute the Programme.

15. The most recent major development in Expanded Programme procedures is the institution of project-programming, as from 1963. The significance of the new system (which is based largely on the experience of WHO) lies in the fact that a long-term project need be requested and approved only once (unless it will be in operation beyond four years), whereas formerly it had to be resubmitted for approval with each annual or biennial programme request. Funds, nevertheless, must still be allocated annually by action of the Technical Assistance Committee.

Other developments

16. The number of organizations participating in EPTA has increased from six to ten. The International Telecommunication Union and the World Meteorological Organization (1952), the International Atomic Energy Agency (1958) and the Universal Postal Union (1962) took their places on the Technical Assistance Board immediately upon joining the Programme. The Managing Director of the Special Fund has (as from 1958) a non-voting place on the Board. The Technical Assistance Committee, which had the same eighteen-member composition as the Economic and Social Council in 1950, was enlarged to twenty-four members in 1957, and to thirty in 1961.

II. THE SPECIAL FUND

17. Upon the recommendation of the Economic and Social Council, the United Nations Special Fund was established in 1958 by resolution 1240 (XIII) of the General Assembly, as a "constructive advance in United Nations assistance to the less developed countries". It reflected the desire of Governments to enlarge the scope of United Nations assistance for those countries, and to do so by assisting projects that "lead to early results and have the widest possible impact in advancing the economic, social or technical development of the country or countries concerned, in particular by facilitating new capital investment".

18. The basic resources of the Special Fund are derived from voluntary contributions of governments. According to resolution 1240 (XIII), contributions should be made in currency readily usable by the Special Fund, or should be transferable to the greatest possible extent into currency readily usable by the Fund.

Nature of the projects

19. Pursuant to resolution 1240 (XIII) and taking account of resources available, the Special Fund has provided assistance for projects in the following broad fields: surveys and feasibility studies; advanced education and technical training; applied research and development planning.

20. The Special Fund is enjoined to concentrate on "relatively large" projects. The projects it has thus far approved average \$2 million in cost (of which 42 per cent is provided by the Fund and 58 per cent by recipient governments) and average four years in duration. They are thus generally not only larger, but also longer term, than those of EPTA.

21. Special Fund project assistance is supplied in the form of international experts, equipment and supplies, fellowships and contractual services. The components of Special Fund assistance and their relative significance vary according to the nature of the individual project. The Special Fund has emphasized training through assistance to programmes in the developing countries, and denotes a much smaller proportion of its resources than EPTA to fellowships for study abroad. The equipment component, on the other hand, is considerably larger than that of EPTA projects and sometimes represents the major item in project costs.

22. The recipient countries undertake substantial obligations to match Special Fund assistance by furnishing counterpart personnel, buildings, equipment and other facilities. They also contribute to local costs of international experts.

23. The Special Fund assists regional as well as national projects.

24. Projects are designed to make permanent and continuing contributions to development with the complete responsibility being transferred to the assisted countries at the earliest possible moment.

Organization and management

25. Immediate inter-governmental control of Special Fund policies, operations and budget is exercised by a Governing Council composed (as of 1 January 1964) of twelve representatives of developing nations and twelve of industrialized nations. The Governing Council has final authority for the approval of projects and programmes recommended by the Managing Director.

26. The Managing Director is appointed for a term of four years by the United Nations Secretary-General after consultation with the Governing Council and following confirmation by the General Assembly. Under the policy guidance of the Governing Council, the Managing Director has over-all responsibility for the operations of the Fund and sole authority to recommend projects for approval by the Governing Council. He is assisted by a headquarters and field staff and advised in project selection by a Consultative Board.

27. The United Nations and its related agencies play a vital role in the preparation and evaluation of requests, as well as in the implementation of approved projects.

Preparation, evaluation and approval of requests

28. Requests for Special Fund assistance must originate from Governments and be transmitted through the local Director of Special Fund Programmes, who is also the Resident Representative of the Technical Assistance Board. In the preparation of requests, Governments as a rule seek and obtain the advice of the United Nations, the appropriate specialized agencies and the Director of Special Fund Programmes.

29. Requests are evaluated by the Managing Director of the Special Fund and his staff to make sure that they meet the various criteria specified by resolution 1240 (XIII) and the Governing Council. Besides being expected to make early and substantial contributions towards meeting the most "urgent needs" of the requesting countries, there must be evidence that the projects are integral parts of the national development plans and will be effectively co-ordinated with other external assistance programmes. Unlike EPTA, the Special Fund is specifically barred by its terms of reference from making any *a priori* allocation of funds among countries or basic fields of assistance.

30. In evaluating requests for assistance, the Managing Director obtains advice from the United Nations and its related agencies and frequently also from outside consultants. Finally, the Managing Director receives advice on requests from a Consultative Board which includes the Secretary-General of the United Nations, the President of the World Bank and the Executive Chairman of the Technical Assistance Board. This Board meets regularly at least twice a year.

31. Twice each year the Managing Director submits to the Governing Council projects he recommends for its approval. Projects are considered individually by the Governing Council. Expenditure is authorized to cover the full life of approved projects.

*Implementation follow-up and final evaluation
of approved projects*

32. Approved projects are entrusted for implementation to an Executing Agency which, in all cases to date, has been either the United Nations or one of its related agencies. The Executing Agencies are responsible for the recruitment of international experts, the international procurement of equipment, and — when relevant — the provision of contractual services, as well as of day-to-day supervision of project implementation. The agencies are reimbursed by the Special Fund for costs incurred in implementing projects.

33. The obligations of the Special Fund, the Executing Agency and the government or governments are spelled out in a contract known as the Plan of Operation. The Managing Director follows the progress of implementation through reports of the Executing

Agencies and of the Directors of Special Fund Programmes, as well as through visits by himself and his staff to project sites. He provides the Governing Council with information for its periodic review of administration and operations. The reports of the Governing Council are submitted to the Economic and Social Council which, in turn, transmits them, together with its comments and recommendations, to the General Assembly for review.

34. In connexion with the evaluation of project results, the Managing Director reports to the Governing Council on the follow-up of completed projects, e.g. investments made in pursuance of recommendations of a Special Fund assisted survey. On government request, the Special Fund, where appropriate and feasible, assists governments in contacting and negotiating with sources of finance for such follow-up investment.

Additional provisions

35. Resolution 1240 (XIII) authorizes the Governing Council to consider allocating, under certain conditions, part of the Fund's resources for assistance on a refundable basis. Resolution 1240 (XIII) also reaffirms the conditions set forth in section III of General Assembly resolution 1219 (XII). Under the latter the Assembly "Decides that as and when the resources prospectively available are considered by the General Assembly to be sufficient to enter into the field of capital development, principally the development of the economic and social infrastructure of the less developed countries, the Assembly shall review the scope and future activities of the Special Fund and take such action as it may deem appropriate."

DOCUMENT E/3851

Report of the Secretary-General under Council resolution 900 A (XXXIV): Part II. Regular Technical Assistance Programmes of the United Nations, the specialized agencies and the International Atomic Energy Agency *

*[Original text: English]
[31 January 1964]*

Introduction

1. Nearly all the activities which are carried out by the organizations of the United Nations system include, directly or indirectly, some element of technical assistance. However, for the purpose of the present study, the "regular programmes of technical assistance" can be defined as those operational activities of the United Nations, the specialized agencies and the IAEA which are organized into distinct programmes of assistance and which are financed by contributions to the individual organization concerned (as opposed to activities financed by the Expanded Programme of Technical Assistance and the Special Fund). These programmes are generally incorporated in regular budgets and, therefore, financed by assessed contributions, but some activities of some agencies — notably WHO and IAEA — are covered by voluntary contributions.

2. The regular programmes are all designed to further the aims of the individual organizations in their particular fields of competence, and are adapted to the specific requirements of the agency concerned.

* Part I, covering the Expanded Programme of Technical Assistance and the Special Fund, is contained in document E/3850.

Behind this similarity, however, lies a wide diversity: a diversity in size, in scope, in structure and in historical background. The relationship with activities financed by EPTA also shows considerable dissimilarities: in some agencies there is virtually no distinction of substance between projects in the regular programme and projects covered by EPTA, while in others the regular programme is used to a large extent to finance projects which do not come within the terms of reference of the Expanded Programme. The ratio between EPTA and regular programme activities also varies widely: in WHO, for instance, the regular programme is more than three times larger than the current allocation of EPTA funds, while in the case of FAO the regular programme is equivalent to only a very small fraction of the EPTA allocation. Other agencies again have no regular programme of their own and depend entirely on EPTA and the Special Fund for their technical co-operation activities.

3. The total expenditure of all agencies under their regular programmes at present amounts to less than one-third of the resources available to EPTA and the Special Fund. By far the largest programme (accounting by itself for almost three-quarters of all regular

programme expenditures) is that of WHO which has a specific constitutional mandate to provide technical assistance to Governments on request. All the other regular programmes together amount to less than 10 per cent of the combined EPTA/Special Fund resources.

4. In studying the advantages and disadvantages of merging the regular programmes with either the present Expanded Programme of Technical Assistance or the United Nations Development Programme indicated in Part I of this report (E/3850), the Secretary-General has borne in mind the interests of the developing countries and of the major contributing Governments; he has considered the practical problems that would face the individual organizations; and he has examined the constitutional and administrative issues that would arise.

5. The following section (paras. 6 to 33) describes the main features of the various regular programmes. An analysis is then made (paras. 34 to 44) of the administrative structure, policy control, role and scope of these programmes. The final section (paras. 45 to 47) summarizes the general conclusions reached by the Secretary-General as a result of his study.

THE REGULAR PROGRAMMES OF TECHNICAL ASSISTANCE OF THE VARIOUS ORGANIZATIONS OF THE UNITED NATIONS SYSTEM

6. Technical assistance activities have been included in the regular programmes of the various organizations as a result of decisions taken by the legislative organs concerned. For the greater part, they have been evolved as an answer to the pressing needs of developing countries.

United Nations

7. The United Nations regular programme of technical assistance,⁸ which for 1963 and 1964 amounts to \$6.4 million per year, has evolved more or less continuously since the first session of the General Assembly. In fact General Assembly action bearing on the regular programme has been taken at every session except two.⁹ This progressive development simply represents the recognition by Member Governments of changing needs, changing techniques and changing opportunities for useful international action. The regular programme makes it possible to provide priority assistance in fields which the international community regards as particularly important and in respect of which it considers that action through international organizations can be especially helpful at a given time. An abundance of examples could be cited which illustrate the capacity of the regular programme for adjusting quickly to needs for new international action. These responses are not so easily achieved under the other programmes of technical co-operation which

generally are composed of longer-run projects established for periods of two to five years.

8. This flexibility has been of special value during the periods when newly-emerging countries first realize their needs for technical assistance as they are confronted with problems arising from their newly-acquired independent status. The regular programme facilitates the provision of prompt advisory assistance in taking the first steps on projects which might ultimately become longer-range activities under EPTA or Special Fund financing.

9. In this context, as the regular programme is becoming more and more widely distinguished from other programmes, as the General Assembly has directed, the Secretary-General is suggesting that project proposals by Governments involving a number of years be considered in the first instance for the Expanded Programme, or, if the projects are already operative, that they be transferred to the Expanded Programme.

10. An important aspect of the flexible nature of the regular programme is the fact that there are no established country targets. This means that there is a certain mobility in the use of resources to meet special circumstances in a particular country for comparatively short periods of time. In a general sense, the regular programme is more or less continuously available for services to Governments as contrasted with the EPTA where two-year programming is the rule, except in the case of the contingency funds which may be used for unforeseen requirements at the discretion of the Executive Chairman of the Technical Assistance Board.

11. A further element of flexibility was discussed at the thirty-sixth session of the Technical Assistance Committee (late in 1963). This concerned flexibility between the sections¹⁰ of Part V of the regular budget which up to now have carried separate financial authorizations. The Committee decided, unanimously, to request the Secretary-General: first, to submit a plan for reallocating the funds available under Part V so as to affect an increase in Section 13 (Economic development) and thus permit a separate allocation within that Section for industrial development and secondly, to consult with the Governments of developing countries with a view to making recommendations for introducing further flexibility so as to reflect the various and changing priorities of these countries. The Secretary-General is to report to the Committee at the 1964 summer session.

12. Of special significance to the work programmes of the regional economic commissions is the absence from the regular programme of a statutory limitation on the portion of funds which can be devoted to regional projects, such as exists under the Expanded Programme. Some 35 to 40 per cent of the regular programme comprises regional projects while 15 per cent is the maximum permitted under EPTA. This flexibility has

⁸ The programme includes the broad fields of economic development, advisory social welfare services, public administration (including OPEX), human rights and narcotic drugs control.

⁹ See annex.

¹⁰ The sections are: Section 13, Economic development; Section 14, Social activities; Section 15, Human Rights advisory services; Section 16, Public administration (including OPEX); Section 17, Narcotic drugs control.

permitted the provision, on an increasing scale, of the regional adviser type of expert assignment which is contributing substantially to the decentralization of economic and social activities to the regional economic commissions. This has strengthened the regional economic commissions, as envisaged by the General Assembly, and has simultaneously made it possible to deal with Government requests without the need to recruit specialists on an *ad hoc* basis.

13. The absence of a limitation on the volume of regional and inter-regional activities enhances, too, the possibility of establishing a special operational staff of experts or specialists in certain strategic operational areas. Of special importance currently are development planning and programming, industrialization, housing and town planning, natural resources development, fiscal and financial questions and several aspects of public administration. These experts are at the disposal of Governments singly or in a group, for assignments of long or short duration to assist in diagnostic missions, project development and subsequent project inspection and evaluation. This is one of the features of the regular programme which makes it a virtually irreplaceable instrument within the present legislative framework. It creates the capacity to form teams of regional advisers and experts, who are based at Headquarters or in the regions, but who are essentially mobile, and who serve the United Nations for long periods in one technical assistance mission or another, in close contact with the competent departments of the Secretariat. Through these teams there is gradually accumulating in the United Nations a store of expertise and competence, which is the best guarantee of the quality of the service which the United Nations can give to Member Governments.

14. In formulating projects in consultation with recipient Governments and the regional economic commissions, the regular programmes are rationalized in relation to those of the Expanded Programme. For example, proposals for the 1965-1966 EPTA programme and the 1965 regular programme are being taken up simultaneously by the Resident Representatives with recipient Governments. The programmes are based on Government requests and the decisions and recommendations of the legislative bodies represented by the General Assembly and the ECOSOC including regional and functional commissions. No technical assistance is provided without specific requests from Governments.

15. In response to the comments made by the Advisory Committee on Administrative and Budgetary Questions concerning the need for an inter-governmental review of United Nations regular programme proposals, the Technical Assistance Committee has received annually, since 1959, the Secretary-General's planned programmes for its consideration and recommendation.

16. The foregoing account indicates a number of differences between the United Nations regular programme and EPTA. These differences increasingly distinguish the two programmes. The regular programme is more responsive to emergency demands

and new activities; it lacks the statutory restrictions which obtain as regards the EPTA programme. The programmes are co-ordinated and integrated in practice and complementary in concept. In the view of the Secretary-General the regular programme is an invaluable instrument in economic and social operational programmes for which there is no ready substitute.

International Labour Organisation

17. The ILO regular technical assistance programme consists of four separate sub-items for each of which funds are earmarked in the yearly budgets: labour and social assistance, workers' education programme, management development programme and rural development programme:

(a) The labour and social assistance programme appears for the first time in respect of the 1954 financial year although the ILO had occasion to undertake advisory missions from the 1920's onwards and Article 10 of its Constitution, as amended in 1946, provides that the International Labour Office shall "accord to governments at their request all appropriate assistance within its power in connexion with the framing of laws and regulations on the basis of the decisions of the Conference and the improvement of administrative practices and systems of inspection". In this field, account is specially taken of the directives given by the Governing Body and by the Conference, particularly those in the resolution concerning economic and technical assistance in the promotion of economic expansion and social progress in developing countries (June 1961). Account is also taken of the special responsibilities of the ILO in certain fields, as established by its Constitution and further enhanced by resolutions of the Conference. To give an example, the Conference in 1958 adopted a resolution concerning labour management relations and recommended an expansion of the organization of "technical assistance and educational programmes to aid both management and labour in developing a proper and useful understanding of their relationship to one another, upon which much of the success of their efforts depends; and to explore with interested countries their particular problems and needs". The resolution also recommended that the ILO "encourage and foster the establishment of national, regional and international institutes and centres for systematic training and study in labour-management relations".

(b) The workers' education programme which started in 1956 is based on principles found both in the Preamble of the ILO Constitution and in the Declaration of Philadelphia, which is annexed to the Constitution. It is guided by resolutions adopted by the International Labour Conference at its 1950, 1957 and 1961 sessions, and on the decisions taken by the Governing Body to give effect to these resolutions.

(c) The management development programme is carried out under a resolution concerning management development adopted by the Conference at its 1958

session, and which sets out the essential requirements for management development and the action required to attain efficient management of all types of undertakings.

(d) The Rural Development Programme arises from the ILO's concern with problems of the rural sector, where the ILO is called upon to deal with the welfare of every category of worker, whether wage-paid, semi-independent or self-employed. At its June 1960 session in particular, the Conference re-emphasized this mandate by adopting a resolution drawing attention to the urgency of expanded action aimed at improving conditions of life and work in rural communities; it recommended that a special long-term programme of research and operational activities should be established by the ILO to raise incomes and living conditions in rural communities in developing countries in the fields of concern to the ILO.

18. Expenditure under the regular programmes was \$640,558 in 1962 and approximately \$1,278,000 in 1963; as compared with \$4,786,000 in 1962 and \$4,325,000 in 1963, for the ILO share of EPTA. The 1964 budget makes provision for a total of \$1,398,000 for the ILO operational activities under the regular budget, i.e. \$500,000 for labour and social assistance, \$278,000 for the workers' education programme, \$120,000 for the management development programme and \$500,000 for the rural development programme, as compared with some \$5,200,000 for 1964 for the ILO's participation in the Expanded Programme.

19. The regular programme of ILO similarly covers a wider field than EPTA, and reflects the basic responsibilities of the ILO under its Constitution and the relevant decisions of the International Labour Conference and the Governing Body, in which employers' and workers' representatives enjoy equal status with those of Governments, and therefore also reflects the concerns of employers and workers as much as those of Governments. The criteria applied by the ILO for providing assistance in the labour and social fields under its regular programme include the requirement that one or more of the following conditions be met:

(a) The project is requested by a State, such as a newly-independent country, which has not been in a position to apply for assistance under EPTA because of the procedures in force;

(b) The project is requested in an ILO field of work which does not enjoy sufficiently high priority under the Expanded Programme or the Special Fund, such as projects relating to the application of international labour conventions and recommendations, and projects of a social character relating to social security, labour management relations, conditions of work, occupational safety and health, labour inspection, etc. — such projects have hitherto accounted for almost 70 per cent of the ILO regular programme as against less than 15 per cent of the Expanded Programme;

(c) The project is requested by a developed country;

(d) The project requested takes the form of an exploratory or preparatory mission or of a follow-up mission;

(e) The project is requested by a regional or other inter-governmental organization outside the framework of the United Nations.

20. As regards other operational activities under the regular programme, such as workers' education and rural development, basic criteria and guide-lines have been laid down in the resolutions adopted by the Conference.

Food and Agriculture Organization

21. The regular technical assistance programme of FAO amounted to \$400,000 for 1962-1963 and the same amount will be available for 1964-1965. While this programme has an experimental character, it is already apparent that it gives considerable flexibility to the Organization to fill essential gaps in assisting member countries in agricultural development planning and programming, thus enhancing the effectiveness of all FAO Technical Assistance activities. The present programming procedure under EPTA is such that all the needs which might crop up from time to time cannot be anticipated and planned in advance. Even where such planning has taken place, events have shown that, in the course of implementation of a scheme, new needs arise. The FAO regular programme of technical assistance offers a flexible means of meeting some of the more urgent of these needs as well as of a number of regional training activities which could not be financed under EPTA. In view of the shortage of funds, the special provision for technical assistance in FAO's regular budget is for the time being confined to short-term assistance in agricultural development planning, including the training of country personnel for such work. A set of guide-lines has been worked out specifying the main types of assistance which would qualify for financing under the regular programme.

22. The advisory work is carried out chiefly with the help of a small task force of senior agricultural planning economists who spend the greater part of their time in the field, especially in Africa where the requests for short-term advice are perhaps most urgent. An agricultural planning economist has been outposted at the Cairo regional office to meet requests from Member Governments in the Near East and a similar arrangement is now under consideration for the Latin American regional office. The FAO was able to participate, with the Inter-American Development Bank, in organizing at short notice training courses in agrarian reform for the Latin American countries, while some thirty-five fellows from Africa and the Near East were given an intensive short course in agricultural development planning in 1963.

United Nations Educational, Scientific and Cultural Organization

23. Since 1957, the regular technical assistance programme of UNESCO has been entitled "Programme of

Participation in the Activities of Member States". Its purpose is to place the services of the organization at the disposal of Member States in order to help them, at their own initiative and within their own national plans, to advance education, science and culture within the programmes approved by the General Conference. It brings the organization's work more closely into line with practical needs, resources and methods of Member States and, at the same time, provides a means whereby a part of the UNESCO programme is executed by Member States themselves. It was conceived on the one hand as a complement to activities initiated by the organization and on the other as a stimulus to national endeavour through international assistance. It forms an integrated part of UNESCO's regular activities flowing from the wider purposes set forth in the UNESCO Constitution. The amount of the regular technical assistance programme of UNESCO has been \$1,625,000 for 1961-1962 and \$1,862,000 for 1963-1964, while its share in the Expanded Programme has been set at \$13,969,000 for 1963-1964.

24. In the case of UNESCO, differentiation between activities financed by EPTA and activities under the regular programme has been more clearly marked since the redefinition of the Participation Programme by the UNESCO General Conference at its 1962 session. The long-term objectives of the redefinition are to restrict generally the eligibility for assistance under the Participation Programme to those fields within UNESCO's competence which are not eligible for assistance under EPTA, or are covered in a very limited manner, and to make special provision for assistance to countries which are not eligible for assistance under EPTA with a view to achieving a well-balanced development within UNESCO operations.

25. For 1963-1964 the UNESCO General Conference has stipulated that Member States may request assistance under the regular programme in fields outside the scope of EPTA, such as:

Equality of opportunity for education and prevention of discrimination;

Education for international understanding;

Adult education and youth activities, particularly for promoting international understanding among adults and youth;

Application of social science to problems of international relations and peaceful co-operation;

Research in humanistic studies;

Study, preservation and presentation of African cultures;

Artistic education and cultural development of the community;

Preservation of the cultural heritage of mankind;

Development of museums;

Promotion of mutual appreciation of Eastern and Western cultural views;

Promotion of professional organizations in mass communication;

Use of mass communication techniques in education.

At its 66th Session (September-October 1963) the Executive Board of UNESCO reaffirmed its view "that the regular programme of UNESCO, which serves wider purposes enjoined on UNESCO, should be kept distinct from the Expanded Programme of Technical Assistance and the Special Fund while aiding all efforts for co-ordination at the national level".

World Health Organization

26. The programme of direct technical assistance to Governments provided by WHO from sources other than the Expanded Programme of Technical Assistance and the Special Fund is the largest among the organizations of the United Nations system. It amounted to \$25,316,000 in 1962 and \$28,988,000 in 1963, as compared with \$7,334,000 from EPTA in 1962 and \$7,530,000 in 1963. The amount of assistance financed from the Special Fund was negligible in both 1962 and 1963, as compared with the regular and expanded programmes.

27. Among the constitutional functions of the WHO are "to assist Governments, on request, in strengthening health services" and "to furnish appropriate technical assistance and, in emergencies, necessary aid upon the request or acceptance of Governments". In accordance with this mandate, a programme of technical assistance to Governments, on their request, has been provided by WHO, beginning in January 1947 during the time of the Interim Commission. Thus, for WHO, the creation of the Expanded Programme meant only an expansion and enlargement of that part of the regular programme of the organization which provides direct technical assistance to Governments on request. The only difference between the technical assistance programmes financed from Expanded Programme funds and those financed from other funds available to the organization is that the latter are available to all Members of the Organization, while the former are restricted to the "developing countries". In addition to direct technical assistance to Members, WHO provides many technical services of a general international character.

International Atomic Energy Agency

28. The regular technical assistance programme of IAEA is financed from voluntary contributions from Member States. These resources may be in the form of money, services, equipment or facilities given to the Agency to enable it to furnish technical assistance to its Member States or a group of Member States.¹¹ The regular technical assistance programme of the IAEA is based on Article III A.1 of the Statute under which the Agency is authorized "to encourage and assist research on, and development and practical application of, atomic energy for peaceful uses throughout the world" and on Article III B.3 under which the

¹¹ An amendment to the Agency's Statute pursuant to which the Agency's regular technical assistance programme would in the future be financed from the Agency's budget has been recommended by the Board of Governors and is pending before the General Conference.

Agency is required to "allocate its resources . . . bearing in mind the special needs of the under-developed areas of the world". Assistance to its members is a statutory objective of the Agency and all members of the Agency are eligible for that assistance whatever their degree of economic development. The Agency has in fact granted various forms of technical assistance from its own resources to Member States that were under-developed in the realm of atomic energy although not necessarily economically under-developed. In view of the large equipment component in most nuclear science projects and the fact that such equipment is usually unobtainable locally, it is customary under the Agency's regular programme to follow a somewhat more liberal policy than under EPTA with regard to requests for equipment. In 1962, the Agency provided on its own resources a total value of technical assistance of \$1,703,700 out of which monetary contributions amounted to \$1,003,700 and resources in kind approximately to a further \$700,000. The main component of technical assistance derived from resources in kind is fellowships offered free of cost by the host country, but there are also significant contributions by Member States in the form of experts' services and equipment donated for the Agency's regular programme.

World Meteorological Organization, International Telecommunication Union, International Civil Aviation Organization and Universal Postal Union

29. The World Meteorological Organization, the International Telecommunication Union, the International Civil Aviation Organization and the Universal Postal Union have no regular technical assistance programme, as until now the governing bodies have not considered it indispensable to establish such programmes.

30. As regards WMO, the Fourth World Meteorological Congress in April, 1963 approved for the financial period 1964-1967 the establishment of a Development Fund for purposes partly of a technical assistance nature. One of the basic ideas for the establishment of the new Development Fund was to make provision for projects which, due to their nature, are at present excluded from EPTA and Special Fund assistance. For example, the relevance to economic development of some projects which are of great importance to international meteorology and to the work of WMO may not be direct or evident and they may not therefore qualify for assistance under EPTA or the Special Fund. It is also intended to create the possibility of providing assistance as necessary to countries which would not be considered as "developing" in the sense of EPTA and the Special Fund. For example, the implementation of WMO recommendations which would be of benefit not only to the recipient country but also to other neighbouring countries might be, in some cases, difficult to justify as a charge on a purely national budget.

31. The ITU does not have a regular technical assistance programme as such, financed or carried out by the Union. From time to time, however, requests are

received with little notice from member countries for short-term experts. Most of them are for urgent purposes which could not have been anticipated when EPTA requests were prepared. Nor are they of a nature that can be postponed until the next programme period. By their nature and the quantum of assistance required such requests cannot qualify for a contingency allocation under the EPTA legislation. It is felt that the most effective way of handling such requests would be to have some sort of regular programme under which experts would be available to the Union and could be deployed at short notice to meet these urgent requests. At present, the Union has no regular programme to meet such demands with flexibility and speed. The Plenipotentiary Conference is the only body which can authorize such a programme. The next Conference in 1965 may consider proposals for the institution of such a programme as a charge to the regular budget of the Union.

32. The ICAO does not have any regular technical assistance programme as such. A certain amount of its work, particularly that connected with the implementation of ICAO regional plans for the provision of integrated systems, facilities, services and procedures within various regions to serve international civil aviation, is in some ways complementary to that carried out by the Organization under EPTA. While it is becoming increasingly clear that many Governments, particularly those in the less developed areas, require both financial and technical aid to implement the ICAO regional plans, so far the assistance provided by ICAO Regional Offices and the Implementation Teams has been limited to technical advice related to the improvement of the systems, facilities and services described in the Regional Plans.

33. Although UPU does not have a regular programme of technical assistance of its own, it does promote mutual assistance between postal administrations.

ADMINISTRATIVE STRUCTURE, POLICY CONTROL, ROLE AND SCOPE OF THE REGULAR PROGRAMMES OF TECHNICAL ASSISTANCE

34. While the content and substance of the regular technical assistance programmes reflect the diversity of the aims and activities of the organizations in the United Nations system, the administrative structure of these programmes is rather similar in the various agencies. Generally speaking, the administration of these programmes and of EPTA and the Special Fund projects is handled by the same staff. In that respect very little or no saving in terms of eliminating duplication of services and machinery could be obtained through a merger. It can be said, with few qualifications, that in all agencies which run a technical assistance programme on their regular budget, the same units and the same personnel are dealing with the programming, budgeting, accounting, evaluation and external liaison for projects under the regular programme and EPTA at Headquarters, and that in the field, the regional and field officers handle the regular programme

projects in the same way as they handle EPTA and Special Fund projects except that the criteria and procedures require in some respects different arrangements. This pattern applies fully to the United Nations, UNESCO and WHO. In ILO, a number of accounting processes for the regular budget programme are separate from those for EPTA; it is intended to integrate these to the extent possible during the course of 1964. Apart from this, the integration has been fully achieved. In FAO also, the administration of the regular programme and of EPTA is basically handled by the same units while certain staff within those units are assigned specialized duties. In IAEA, the same technical personnel advises in all field projects, whether financed from regular, EPTA or Special Fund resources; the Agency has no regional or field offices.

35. In all agencies, there is also, broadly speaking, a machinery for policy control and review of the regular programmes along similar or the same lines as for the Expanded Programme. This permits of obtaining unity in the technical assistance programmes. While some improvements may be called for in a few cases, they could be realized without basically changing the present structure. In the current system, means for review and orientation already exist and are generally applied. This has already been explained for the United Nations.

36. As regards the specialized agencies, policy directives with respect to their regular technical assistance operations and to their operations under EPTA are formulated or reviewed by the same inter-governmental authorities, irrespective of the sources of financing.

37. In the ILO for instance, the Governing Body has established an Operational Programmes Committee which, at each autumn session, determines in the light of the results achieved the advisable magnitude and balance of the regular programme of technical assistance in order that its views may be taken into account in preparing the budget proposal.¹² The Financial and Administrative Committee reviews in some detail the budgeting and expenditure of technical assistance programmes financed under the regular budget and is called upon to submit to the Governing Body financial proposals on each of the sub-items of operational activities so financed. Programmes financed from EPTA and the Special Fund derive their funds from sources external to the ILO and the content of these programmes is determined or reviewed by legislative bodies outside the ILO. Nevertheless, the Financial and Administrative Committee retains general supervisory responsibility as the organ charged with ensuring appropriate control over funds entrusted to the ILO from whatever source they derive.

¹² Its terms of reference are the following: "the care under continuous review of aspects of the ILO's operational activities, in whatever technical field or fields they might be carried out and wherever they might be financed; to assist in the development of a vigorous and balanced operational programme; to co-ordinate work done under the various operational programmes; to consider problems arising in the operational field; to examine priorities and to review and evaluate results achieved".

38. In UNESCO, the budget estimates for EPTA and Special Fund projects are prepared and submitted to the Executive Board and General Conference in the same way as those for the regular programme. However, in view of the fact that these two programmes are financed by resources external to the Organization, the General Conference, upon recommendation of the Executive Board, usually adopts somewhat different resolutions taking into account the differences in the origin of funds. Financial reports for EPTA and the Special Fund are submitted for examination by the External Auditor of the Organization, and to the Executive Board and General Conference in the same manner as for the regular programme.

39. In WHO, there is no essential difference in character between the programme financed under the Expanded Programme of Technical Assistance and that part of the Organization's regular programme devoted to projects of direct assistance, which is also provided only at the request of Governments: all technical assistance activities are developed with the Governments as a co-ordinated whole.

40. The Executive Board of WHO has called to the attention of Governments the need, in planning the health activities to be included in their co-ordinated country programmes under the Expanded Programme of Technical Assistance, for taking into consideration the total health needs of their countries and for co-ordinating activities in the health field financed under the Expanded Programme with those financed from the Organization's regular budget, with those financed from other sources of outside assistance and with those to be financed from the Governments' own resources.

41. Whatever the source of funds from which projects are to be financed, they are developed in detail with the Government concerned, and are presented in detail to the governing organs of WHO. The Regional Committee, the Executive Board's Standing Committee on Administration and Finance, the Executive Board itself and the World Health Assembly examine the technical aspects of the projects which compose the programme to be financed from all sources of funds in the same way and at the same time as that part of the regular programme providing for technical assistance to requesting Governments.

42. Detailed plans of operation are negotiated with the Governments concerned for all projects, setting forth the objectives of the project, its area, the methods to be used and a plan of action. The plan of action describes in detail the respective undertakings of the Government and of WHO (if a third party such as UNICEF is involved, the plan of operations includes the commitments of that agency). It includes a target time schedule, assignment of responsibility, provision for reports from the Government, for continuation of the project after international assistance has been completed, and for evaluation.

43. The Executive Board of the WHO, in its resolution EB 32.R29 of 28 May 1962 circulated at the thirty-sixth session of the Council as document E/3792, has expressed its views on the possibility of merging

the regular programme of technical assistance of the WHO with the Expanded Programme of Technical Assistance. The information concerning WHO which appears in this document is presented subject to the provisions of the resolution of the WHO Executive Board.

44. In FAO also, the regular programme of technical assistance is subject to the review of the Council and the Conference. In the IAEA, the Agency's regular programme is approved, subject to availability of voluntary contributions, by the Board of Governors within the framework of the operational budget approved annually by the Board and by the General Conference.

Conclusions

45. If the regular programmes were to be merged with the Expanded Programme of Technical Assistance or with the United Nations Development Programme suggested in Part I of this study (E/3850) the question naturally arises whether the Expanded Programme of Technical Assistance — or the United Nations Development Programme — would be endowed with the additional resources required to finance all the activities at present carried out under regular programmes. This is a question which can only be answered by Governments and not by the Secretary-General. He feels, however, that such a merger would deprive the action programmes of the United Nations family of a vital element, since the regular programmes of the United Nations and the related agencies act as a spearhead for the initiation of new types of assistance and, thanks to their flexible procedures and wide terms of reference, form a natural complement to the Expanded Programme or the United Nations Development Programme.

46. Generally speaking, the regular programmes are already handled by the same staff as activities financed by EPTA and the Special Fund. A merger could, therefore, hardly be expected to produce any significant saving in administrative costs. The executive heads of certain agencies feel, indeed, that a merger would lead not to simplification but to greater complexity, and could result in increased rather than diminished administrative expenditure. Any proposal for merger of regular programmes with EPTA or UNDP would, furthermore, go beyond the question of the most convenient administrative arrangements for handling technical assistance and would raise fundamental questions concerning the structure of the United Nations system.

47. In Part I of this report (E/3850) the Secretary-General reached the conclusion that a consolidation of the Expanded Programme of Technical Assistance and the Special Fund into a single United Nations Development Programme would be in the best interests of the United Nations system and the Governments that belong to it. After studying the position of the regular programmes, he feels that their merger, either with the present Expanded Programme of Technical Assistance or with the proposed United Nations Development Programme, would raise more problems than it would resolve, and that the disadvantages would

outweigh any possible advantage. He is of the opinion that a central United Nations Development Programme complemented by the regular programmes of the various agencies with their own distant characteristics and procedures represents the most effective means for the United Nations system as a whole to fulfil its diverse responsibilities towards its Member States.

ANNEX

RESOLUTIONS OF THE GENERAL ASSEMBLY CONCERNING THE REGULAR ASSISTANCE PROGRAMME

Number	Title
52 (I)	Provision of expert advice by the United Nations to Member States.
58 (I)	Transfer to the United Nations of the advisory social welfare functions of UNRRA (United Nations Relief and Rehabilitation Administration).
200 (III)	Technical assistance for economic development
246 (III)	International facilities for the promotion of training in public administration.
305 (IV)	Technical assistance for economic development under General Assembly resolution 200 (III).
316 (IV)	Advisory social welfare services.
399 (V)	Technical assistance activities under General Assembly resolution 200 (III).
418 (V)	Advisory social welfare services.
518 (VI)	Technical assistance activities under General Assembly resolutions 200 (III), 246 (III) and 418 (V).
723 (VIII)	Technical assistance in public administration.
729 (VIII)	Technical assistance in promoting and safeguarding the rights of women.
730 (VIII)	Technical assistance in the fields of prevention of discrimination and protection of minorities.
839 (IX)	Technical assistance in freedom of information.
921 (X)	Programmes of technical assistance.
926 (X)	Advisory services in the field of human rights.
1023 (XI)	Implementation and expansion of the programmes of technical assistance.
1024 (XI)	Technical assistance in public administration.
1163 (XII)	Seminars on the status of women.
1189 (XII)	Freedom of information.
1215 (XII)	United Nations technical assistance programmes.
1255 (XIII)	United Nations programmes of technical assistance.
1256 (XIII)	United Nations technical assistance in public administration.
1261 (XIII)	Advisory services in the field of human rights.
1384 (XIV)	United Nations regular programmes of technical assistance.
1385 (XIV)	United Nations assistance in public administration.
1395 (XIV)	Technical assistance in narcotics control.
1530 (XV)	United Nations assistance in public administration: provision of operational, executive and administrative personnel.
1532 (XV)	United Nations programmes of technical assistance: arrangements to facilitate the prompt supply of technical assistance personnel.
1679 (XVI)	Human rights fellowships.
1777 (XVII)	United Nations assistance for the advancement of women in developing countries.
1768 (XVII)	Programmes of technical assistance under the regular budget of the United Nations.
1988 (XVIII)	Programmes of technical assistance under the regular budget of the United Nations.

DOCUMENT E/3862

Report of the *Ad Hoc* Committee established under Council resolution 851 (XXXII) on co-ordination of technical assistance activities

[Original text: English]
[10 March 1964]

1. The *Ad Hoc* Committee of Eight¹³ was established by the Council at its thirty-second session under resolution 851 (XXXII) with the following terms of reference:

“... 1. *Decides* to establish an *ad hoc* committee of representatives of eight Member States appointed by the President of the Council on as wide a geographical basis as possible, from among the members of the Technical Assistance Committee and the Governing Council of the Special Fund, to undertake with the assistance of the Executive Chairman of the Technical Assistance Board and the Managing Director of the Special Fund, a study of the further steps which may be needed to:

“(a) Organize the technical co-operation activities of the United Nations, the specialized agencies, the International Atomic Energy Agency and the Special Fund so as to provide greater aid to Member States, on their request, in the preparation of country development programmes, it being understood that the preparation of such national programmes, their implementation and co-ordination are the prerogative of the Governments concerned;

“(b) Bring about a closer co-ordination, whenever possible, of the technical co-operation and pre-investment activities of the United Nations, the specialized agencies, the International Atomic Energy Agency and the Special Fund, with the object of advancing the achievement of country development objectives;

“(c) Assist Member States by providing technical co-operation services which will be most conducive to their national development;

“2. *Requests* the *ad hoc* committee to explore ways and means of bringing about in developing countries a closer relationship within the United Nations system of agencies, giving special attention to the potential role of the resident representatives, so as to provide more concerted advice to countries that request it on the technical preparation and implementation of country programmes and on the technical aspects of individual parts of such programmes;

“3. *Invites* the United Nations, the specialized agencies, the International Atomic Energy Agency and the Special Fund to transmit to the *ad hoc* committee, prior to 31 December 1961, any comments they may deem appropriate;

“4. *Requests* the *ad hoc* committee to submit its report and recommendations to the Governing Council of the Special Fund and to the Technical Assistance Committee, and further requests that any comments of the latter two bodies, together with the report of the *ad hoc* committee, be submitted to the thirty-fourth session of the Council.”

2. The following countries were designated by the President of the Council as members of the Committee: Brazil, Ethiopia, France, Japan, Union of Soviet Socialist Republics, United Arab Republic, United Kingdom of Great Britain and Northern Ireland and the United States of America.

3. The *Ad Hoc* Committee of Eight convened its first session in 1962, holding four meetings from 16 to 23 January 1962 and ten meetings from 23 April to 18 May under the Chairmanship of Mr. Eurico Penteado (Brazil) with Mr. Kifle Wodajo as Vice-Chairman.

4. The records of the first session are contained in documents E/AC.49/SR.1 to 14. The report of the Committee¹⁴ was submitted to the thirty-fourth session of the Council. In connexion with this report the Council adopted resolution 900 A (XXXIV) as follows:

“*The Economic and Social Council,*

“*Having considered* the report of the *ad hoc* Committee of Eight established under Council resolution 851 (XXXII) of 4 August 1961,

“1. *Commends* the *ad hoc* Committee on its work in producing the report;

“2. *Takes note with appreciation* of the recommendations in part II of the report;

“3. *Invites* Governments of Member States to take such steps as they may consider desirable to implement the recommendations falling within their competence;

“4. *Requests* the Administrative Committee on Co-ordination:

“(a) To consider the report:

“(b) To arrange for the immediate implementation of those recommendations falling within its purview which, in its view, can be implemented;

“(c) To report its views to the Council at its resumed thirty-fourth session on the recommendations and on the action taken;

¹³ The membership of the Committee was later increased to ten, see para. 5.

¹⁴ *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes, agenda item 13, document E/3639.*

"5. Requests the *ad hoc* Committee to continue its work undertaken under resolution 851 (XXXII), and to submit a progress report to the thirty-sixth session, and its final report to the thirty-eighth session of the Council;

"6. Requests the President of the Council to appoint two additional members to the *ad hoc* Committee to ensure adequate representation of countries concerned with the United Nations technical co-operation programmes;

"7. In furtherance of the work of the *ad hoc* Committee:

"(a) Requests the Secretary-General in consultation with the executive heads of the specialized agencies and the International Atomic Energy Agency to undertake the study recommended in paragraph 81 of the report, including in the study the regular technical assistance programmes of the United Nations and related agencies;

"(b) Invites the General Assembly to authorize the Advisory Committee on Administrative and Budgetary Questions to bring up to date the studies which it made in response to General Assembly resolution 722 (VIII) of 23 October 1953, in the light of the developments which have occurred since the earlier studies were made, giving particular attention to the question of financial procedures and overhead costs of the programmes of technical co-operation, as referred to in paragraph 79 of the report;

"8. Recommends that in the course of these studies and also in the course of the work of the *ad hoc* Committee, during its continued mandate, account be taken of the debate on the *ad hoc* Committee's report in the Technical Assistance Committee and the Council."

5. At its resumed thirty-fourth session the President of the Council designated Indonesia and Jordan as the two additional members of the *Ad Hoc* Committee.

6. The Committee convened for its second session in March 1963 and held fourteen meetings from 11 to 23 March 1963, under the Chairmanship of Mr. J. B. P. Maramis (Indonesia) with Mr. A. Ghorbal (United Arab Republic) as Vice-Chairman.

7. The records of the second session are contained in documents E/AC.49/SR.15 to 29. The report of the Committee¹⁵ was submitted to the thirty-sixth session of the Council. In connexion with this report, the Council adopted resolution 954 (XXXVI) in which it requested the Secretary-General:

"... (a) To transmit the interim report of the *ad hoc* Committee on Co-ordination of Technical Assistance Activities, as well as the records of the debates in the Technical Assistance Committee and the Economic and Social Council on this subject, to the States Members of the United Nations, or members of the specialized agencies or the Inter-

national Atomic Energy Agency and to invite their comments and observations on the issues raised in this report; and

"(b) To prepare an analysis of the views received in time for consideration by the *ad hoc* Committee early in 1964 to assist the Economic and Social Council and the General Assembly in their consideration of the final report of the *ad hoc* Committee."

8. The *Ad Hoc* Committee convened its final session from 17 February to 6 March 1964 holding fifteen meetings under the chairmanship of Mr. J. B. P. Maramis (Indonesia) with Mr. M. Tell (Jordan) as Vice-Chairman and Rapporteur. The records of the meetings are contained in documents E/AC.49/SR.30 to 44.

Introduction

9. In considering the adoption of the agenda the question as to whether the Committee should proceed to a final report at this time was raised.

10. Those who felt the Committee should not proceed now based their stand on the fact that Council resolution 900 A (XXXIV) had asked the Committee to report to its thirty-eighth session. Further, that since decisions would undoubtedly be taken by the forthcoming United Nations Conference on Trade and Development on questions which would bear on matters before the Committee, especially on the possible transformation of the Special Fund into a capital development fund, it was feared that if the Committee made final recommendations these might prejudice such a transformation.

11. Others pointed out that the Spring 1964 session of the Council had been cancelled and that the Council, at its resumed thirty-sixth session in December 1963, had included the report of the Committee on the agenda of its thirty-seventh session. They also pointed out that the Council would have before it the reports of both the Committee and the Conference. Further, they maintained that the question of a merger of EPTA and the Special Fund and that of the transformation of the Special Fund were separate questions, and any recommendations the Committee might reach would not prejudice the latter. The representative of the Secretary-General drew attention to the following passage in his report:

"While the suggestions that follow are made irrespective of the outcome of current discussions regarding the establishment of a United Nations Capital Development Fund, they are, he believes, such as to provide a more solid basis for the future growth and evolution of the action programmes of the United Nations system in this direction or in others." [E/3850, para. 8]

12. The Committee had before it the reports of the Secretary-General (E/3850) and (E/3851) and the comments and observations of Governments on the note sent them under Council resolution 954 (XXXVI). The organizations participating in the EPTA and the

¹⁵ *Ibid.*, Thirty-sixth Session, Annexes, agenda item 4, document E/3750.

Special Fund had reached complete agreement on the Secretary-General's report, document E/3850. They were able to do so within the policies and guide-lines laid down by their own legislative bodies and constitutions. It will naturally be for the legislative organs of each agency to consider any changes which may emerge from the Council and the General Assembly. A number of delegations expressed their appreciation to the Secretary-General for the way he had carried out his difficult task. They considered the two papers submitted by the Secretary-General provided a useful basis for the Committee's discussions. As to the replies from Governments (E/AC.49/8 and Add.1 to 4), twenty Governments had submitted comments and only eleven of them within the prescribed six weeks. While some doubted whether these constituted a sufficient basis for a meaningful analysis, others criticized the Secretariat for not analysing the comments as had been requested in the above-mentioned resolution and called upon it to do so. In addition, they felt that in his reports the Secretary-General had set forth only his conclusions, rather than presenting a study of the "possible advantages and disadvantages of a partial or complete merger . . . of some or all of the technical assistance programmes of the United Nations"¹⁶ as had been requested by the Council. At the thirty-fifth meeting of the Committee, the representative of the Secretary-General made an oral statement replying to these points. This reply was considered by some to be incomplete and inadequate.

13. The Committee decided to proceed to prepare a final report to the Council at its thirty-seventh session.

14. Many members felt that insufficient emphasis had been given in the reports of the Secretary-General to the role of the regional economic commissions. The words "regional offices" used in the report were considered to be equivocal and usually applied to the regional offices of the specialized agencies. They stressed the positive effects of the decentralization policy established by the General Assembly and the Economic and Social Council and pursued by the Secretary-General. They referred especially to General Assembly resolutions 1709 (XVI) and 1941 (XVIII). They wanted to ensure that in the suggested United Nations Development Programme the regional commissions and the United Nations Office in Beirut should have a clearly defined and increasing role.

The question of the merger of the Expanded Programme of Technical Assistance and the Special Fund

15. Those members favouring the proposal of the Secretary-General providing for the bringing together of EPTA and the Special Fund in a United Nations Development Programme felt that it could help to eliminate duplication and make the programme more adaptable to meeting new requests in such fields as industrialization, resource surveys, feasibility studies

and the early application of new methods in science and technology. It was essential that planning be made possible at all levels. This was important because of the growing tendency of recipient countries to ask for, and of some donor countries to grant, multilateral assistance. A merger would correct any tendency leading to the dispersion of available resources and would assist Governments in determining priorities, and in making a co-ordinated attack on all of their development problems.

16. Some of them referred to the agreement which had been reached between the Secretary-General and the other members of the Administrative Committee on Co-ordination concerning the proposals in document E/3850. They felt that the merger would probably result in an increase in funds available and also in a more efficient use of these funds. The Managing Director of the Special Fund supporting this view stated: "if this merger takes place, and quickly, I am certain that further increases will be forthcoming. If it does not take place, we are going to have difficulty in holding our own." (E/AC.49/L.16.)

17. Some delegations said they were sceptical about the merger of EPTA and the Special Fund (notably the programmes and management) having all the advantages claimed for it. They believed that the two programmes were, by and large, functioning satisfactorily and that most of the improvements required could be achieved by closer co-ordination between the two programmes and the participating agencies in the field. They doubted whether the merger would have much bearing one way or the other on the funds made available by a number of Governments.

18. Delegations opposing a merger of EPTA and the Special Fund pointed out that at recent meetings of the Technical Assistance Committee and the Governing Council, general satisfaction had been expressed with the present structure of the programmes and that therefore no radical action was required. The chief problems were ones of co-ordination which would not be solved by amalgamation. Decentralization was much to be desired and would improve the effectiveness of both programmes. The establishment of a single inter-governmental body would reduce the number of countries participating in deciding on policy, with no reduction in the probable workload. It appeared that the same amount of staff would be required and that no financial advantage would accrue. The two programmes had already worked out a satisfactory arrangement of joint administration and representation. Fear was expressed that a merger would mean the absorption of EPTA by the Special Fund or *vice versa* and the slowness of the latter could be to the detriment of rapid industrialization. Some of those delegations further expressed the view that the contradictory comments so far received from Governments of developing countries made it impossible to undertake any merger of EPTA and the Special Fund which would lead to a satisfactory arrangement.

19. In the view of a number of delegations, any combination of the programmes of EPTA and the Special

¹⁶ *Ibid.*, Thirty-fourth Session, Annexes, agenda item 13, document E/3639, para. 81.

Fund should retain the special qualities and characteristics of each of the programmes while making it easier for requesting Governments to find just the assistance required without the present confusion as well as without the danger of duplication and overlapping, and to follow through on development plans. They emphasized the fact that from the studies so far made such a step would result in a more efficient use and an eventual growth of the two funds.

20. A majority of the Committee favoured the creation of one inter-governmental body and of some inter-agency advisory body for both programmes.

21. On questions relating to a merger at the management level there was considerable disagreement. Some favoured one centralized management while others felt that dual management alone could retain for each programme the special and desirable qualities which each had developed in the course of its operations. Although a suggestion for the creation of one fund was made it was decided that two funds would be maintained, as well as most EPTA procedures, especially country targets and country programming.

22. At the thirty-ninth meeting the representative of the United States presented a draft resolution (document E/AC.49/L.17) which reads as follows:

"The Ad Hoc Committee of Ten,

"Having considered the proposals made by the Secretary-General, in his report (E/3850), for bringing together the Special Fund and the Expanded Programme of Technical Assistance (EPTA), in a new Development Programme (UNDP), and the report of the Secretary-General (E/3851),

"Being convinced that such a consolidation would go a long way in streamlining the activities carried on separately and jointly by EPTA and the Special Fund, simplify organizational arrangements and procedures, facilitate over-all planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness,

"Recognizing that requests for assistance on the part of the developing countries are steadily increasing in volume and in scope,

"Believing that a reorganization is necessary to provide a more solid basis for the future growth and evolution of the technical assistance programmes of the United Nations system of organizations financed from voluntary contributions,

"1. Recommends that the Economic and Social Council take the necessary steps to combine the United Nations Expanded Programme of Technical Assistance and the Special Fund in a programme to be known as the United Nations Development Programme (UNDP), it being understood that the special characteristics and operations of the two programmes will be maintained, and that contributions may be pledged to the two programmes

separately; and the principles, procedures and provisions governing EPTA and the Special Fund not inconsistent with this resolution be reaffirmed;

"2. Recommends, to this end, that the Council, subject to the approval of the General Assembly as necessary:

"(a) Establish a single intergovernmental committee of members, to be known as the Governing Council for the United Nations Development Programme, to perform the functions previously exercised by the Governing Council of the Special Fund and the Technical Assistance Committee; in addition it should provide general policy guidance and direction for the United Nations Development Programme as a whole, as well as for the United Nations regular programmes of technical assistance and submit reports and recommendations thereon to the Economic and Social Council; decisions of the Governing Council on important questions, including questions of policy, the approval of projects and programmes and the allocation of funds, should be made by a two-thirds majority of the members present and voting;

"(b) Elect the members of the Governing Council from among States Members of the United Nations or members of the specialized agencies or of the International Atomic Energy Agency for a term of three years, provided however, that of the members elected at the first election, the terms of [] members shall expire at the end of one year, and the terms of [] other members at the end of two years. Retiring members should be eligible for re-election; there should be equal representation of the economically more developed countries and of the developing countries. The first election should take place at the first meeting of the Council, after the General Assembly has given its endorsement;

"(c) Establish, in the place of the Technical Assistance Board and the Consultative Committee of the Special Fund, an advisory committee to be known as the Inter-Agency Consultative Board for the UNDP; it should be composed of the Secretary-General, the Executive Heads of the specialized agencies and of the IAEA. The Executive Directors of UNICEF and the World Food Programme should be invited to participate as appropriate; it should (i) advise the management on the programmes and projects submitted by Governments, through the Resident Representative, prior to their submission to the Governing Council for approval, taking into account the programme of technical assistance being carried out under the regular programmes of the agencies members of the Consultative Board with a view to ensuring more effective co-ordination; (ii) be consulted in the selection of agencies for the execution of specific projects as appropriate; and (iii) be consulted on the appointment of the Resident Representatives and review annual reports submitted by them;

"(d) Give consideration to the best ways and means of providing unified management of the United Nations Development Programme while main-

taining those special characteristics and procedures of EPTA and the Special Fund which have proved effective;

“3. *Requests* the Secretary-General (i) to give further study to the question of management and submit a report thereon to the thirty-seventh session of the Economic and Social Council and (ii) to prepare for consideration by the Council a draft resolution for the Council and the General Assembly required to implement the above-mentioned proposals.”

23. The representative of Jordan presented the following amendment to the above resolution (document E/AC.49/L.18):

“Substitute the following for the second and third paragraph of E/AC.49/L.17:

“2. (d) Provide for the appointment of joint Managing Directors of the Programme, responsible for the Special Fund and the Expanded Programme of Technical Assistance respectively, who shall make common administrative arrangements which will ensure effective over-all co-ordination;

“3. *Requests* the Secretary-General to prepare for consideration by the Council the draft resolution required to implement the above recommendations.”

24. Subsequently the representative of Jordan presented a revision of this amendment (E/AC.49/L.18/Rev.1) as follows:

“Substitute the following for paragraphs 2 (d) and 3 of E/AC.49/L.17:

“2. (d) Provide that, pending a further review of arrangements at the management level within a period of two years, the Managing Director of the Special Fund and the Executive Chairman of the Technical Assistance Board (to be known in the future as the Executive Director of EPTA) act as joint heads of the Programme, responsible for the Special Fund and the Expanded Programme of Technical Assistance respectively, and requests them to make common administrative arrangements to ensure over-all planning and co-ordination and maximum efficiency.”

25. The representative of Jordan presented a further revision of this amendment (E/AC.49/L.18/Rev.2) adding the following paragraph:

“3. *Requests* the Secretary-General to prepare for consideration by the Council at its thirty-seventh session a draft resolution required to implement the above recommendations.”

26. The representative of Indonesia proposed the omission of the word “technical” from the fourth preambular paragraph of the draft resolution (E/AC.49/L.17).

27. The representative of the United Arab Republic was opposed to and the representative of the United Kingdom had reservations about the requirement of

a two-thirds majority of members present and voting contained in operative paragraph 2 (a).

28. The representative of Ethiopia proposed two additional preambular paragraphs which were accepted by the sponsor (see text of E/AC.49/L.17/Rev.1 below). He also proposed (E/AC.49/L.25) to substitute the words “should be responsible to the head of the Programme” for the words “act as joint heads of the Programme” in the Jordanian revised amendment E/AC.49/L.18/Rev.1.

29. The representative of the United States presented a revision of his draft resolution incorporating some of the oral amendments made during the discussions (E/AC.49/L.17/Rev.1) as follows:

“*The Ad Hoc Committee of Ten,*

“*Having considered* the proposals made by the Secretary-General, in his report (E/3850), for bringing together the Special Fund and the Expanded Programme of Technical Assistance (EPTA), in a new Development Programme (UNDP),

“*Being convinced* that such a consolidation would go a long way in streamlining the activities carried on separately and jointly by EPTA and the Special Fund, simplify organizational arrangements and procedures, facilitate over-all planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness,

“*Recognizing* that requests for assistance on the part of the developing countries are steadily increasing in volume and in scope,

“*Believing* that a reorganization is necessary to provide a more solid basis for the future growth and evolution of the technical assistance programmes of the United Nations system of organizations financed from voluntary contributions,

“*Recalling and reaffirming* Part III of General Assembly resolution 1219 (XII) and Part C of General Assembly resolution 1240 (XIII) concerning the decision and the conditions ‘under which the Assembly shall review the scope and future activities of the Special Fund and take such action as it may deem appropriate’,

“*Without prejudice* to the study requested from the Secretary-General by the General Assembly in resolution 1936 (XVIII) ‘of the practical steps to transform the Special Fund into a capital development fund in such a way as to include both pre-investment and investment activities’ or the recommendation of the Council and General Assembly thereon,

“1. *Recommends* that the Economic and Social Council take the necessary steps to combine the United Nations Expanded Programme of Technical Assistance and the Special Fund in a programme to be known as the United Nations Development Programme (UNDP), it being understood that the special characteristics and operations of the two programmes as well as two separate funds will be

maintained, and that contributions may be pledged to the two programmes separately as hitherto; and the principles, procedures and provisions governing EPTA and the Special Fund not inconsistent with this resolution be reaffirmed;

"2. *Recommends*, to this end, that the Council, subject to the approval of the General Assembly as necessary:

"(a) Establish a single inter-governmental committee of [] members, to be known as the Governing Council for the United Nations Development Programme, to perform the functions previously exercised by the Governing Council of the Special Fund and the Technical Assistance Committee including the approval of projects and programmes and the allocation of funds; in addition it should provide general policy guidance and direction for the United Nations Development Programme as a whole, as well as for the United Nations regular programmes of technical assistance and submit reports and recommendations thereon to the Economic and Social Council;

"(b) Elect the members of the Governing Council from among States Members of the United Nations or members of the specialized agencies or of the International Atomic Energy Agency for a term of three years, provided however, that of the members elected at the first election, the terms of [] members shall expire at the end of one year, and the terms of [] other members at the end of two years. Retiring members should be eligible for re-election; there should be equal representation of the economically more developed countries and of the developing countries. The first election should take place at the first meeting of the Council, after the General Assembly has given its endorsement;

"(c) Establish, in the place of the Technical Assistance Board and the Consultative Board of the Special Fund, an advisory committee to be known as the Inter-Agency Consultative Board for the UNDP; it should be composed of the Secretary-General, the Executive Heads of the specialized agencies and of the IAEA. The Executive Directors of UNICEF and the World Food Programme should be invited to participate as appropriate; it should (i) advise the management on the programmes and projects submitted by Governments, through the Resident Representative, prior to their submission to the Governing Council for approval, taking into account the programmes of technical assistance being carried out under the regular programmes of the agencies members of the Consultative Board with a view to ensuring more effective co-ordination; (ii) be consulted in the selection of agencies for the execution of specific projects as appropriate; and (iii) be consulted on the appointment of the Resident Representatives and review annual reports submitted by them;

"(d) Give consideration to the best ways and means of providing unified management of the United Nations Development Programme while main-

taining those special characteristics and procedures of EPTA and Special Fund which have proved effective;

"3. *Requests* the Secretary-General (i) to give further study to the question of management and submit a report thereon to the thirty-seventh session of the Economic and Social Council and (ii) to prepare for consideration by the Council a draft resolution for the Council and the General Assembly required to implement the above mentioned proposals."

30. The representative of Ethiopia introduced two amendments to the above revised draft resolution. The first called for the addition, at the end of the first preambular paragraph of the draft resolution, of the words: "paragraph 9, in particular, to the effect that consultations have revealed general agreement on the advantages of a merger at the inter-governmental, inter-agency and management levels". Secondly, in operative paragraph 1 of the draft resolution, he proposed the insertion of the words "as hitherto continue to be" after the words "contributions may" and the deletion of the words "as well as two separate funds" and of the words "as hitherto; and the principles procedures and provisions governing EPTA and the Special Fund not inconsistent with this resolution be reaffirmed".

31. The representative of the United Arab Republic proposed first, that the words "such a consolidation" in the second preambular paragraph should be replaced by "a better co-ordination than the existing one". Secondly, the deletion of the word "technical" from the fourth preambular paragraph. Thirdly, that the words "in a programme to be known as the United Nations Development Programme (UNDP)" in operative paragraph 1 should be replaced by: "on the inter-governmental level as well as on the inter-agency consultative level".

32. The representative of Ethiopia withdrew his sub-amendment (contained in E/AC.49/L.25) to the Jordanian amendment.

33. Subsequently, the representative of Ethiopia presented the following redraft of his proposed amendment: "paragraph 9, in particular, to the effect that consultations between the Secretary-General, the heads of the specialized agencies, the Managing Director of the Special Fund and the Executive Chairman of the TAB have revealed general agreement among them on the advantages of a merger at the inter-governmental, inter-agency and management levels".

34. The Ethiopian amendment to the first preambular paragraph was rejected by 7 votes to 1 with 2 abstentions on a roll-call vote:

In favour: Ethiopia.

Against: Jordan, Union of Soviet Socialist Republics, United Arab Republic, United Kingdom of Great Britain and Northern Ireland, Brazil, France, Japan.

Abstaining: United States of America, Indonesia.

35. The United Arab Republic amendment to the second preambular paragraph was rejected by 3 votes

to 2 with 4 abstentions. The amendment to the fourth preambular paragraph was adopted by 4 votes to 3 with 3 abstentions.

36. The amendment of the United Arab Republic to operative paragraph 1 was not adopted, 3 votes being cast in favour, 3 against with 4 abstentions on a roll-call vote.

In favour: Brazil, United Arab Republic, Union of Soviet Socialist Republics.

Against: Ethiopia, United States of America, United Kingdom of Great Britain and Northern Ireland.

Abstaining: Japan, France, Indonesia, Jordan.

37. The Ethiopian amendment to operative paragraph 1 was rejected by 7 votes to 1 with 2 abstentions by roll-call vote.

In favour: Ethiopia.

Against: Jordan, Union of Soviet Socialist Republics, United Arab Republic, United Kingdom of Great Britain and Northern Ireland, Brazil, France, Japan.

Abstaining: United States of America, Indonesia.

38. During the Committee's consideration of the Jordanian amendments (E/AC.49/L.18/Rev.1 and 2) the representative of the Soviet Union proposed the deletion of the words "Within a period of two years" in paragraph 2 (d). This proposal was rejected by 4 votes to 2 with 3 abstentions on a roll-call vote.

In favour: Brazil, Union of Soviet Socialist Republics.

Against: Japan, United States of America, United Kingdom of Great Britain and Northern Ireland, Jordan.

Abstaining: France, Indonesia, United Arab Republic.

The representative of Ethiopia announced that he would not participate in the vote. The Jordanian amendment was adopted by 6 votes to 3 with 1 abstention.

39. The United States draft resolution as amended (see text below) was adopted by 6 votes to 3 with 1 abstention on a roll-call vote.

In favour: Jordan, United Kingdom of Great Britain and Northern Ireland, United States of America, Indonesia, France, Japan.

Against: Union of Soviet Socialist Republics, United Arab Republic, Brazil.

Abstaining: Ethiopia.

"The Ad Hoc Committee of Ten,

"Having considered the proposals made by the Secretary-General, in his report (E/3850), for bringing together the Special Fund and the Expanded Programme of Technical Assistance, in a new Development Programme (UNDP),

"Being convinced that such a consolidation would go a long way in streamlining the activities carried on separately and jointly by EPTA and the Special

Fund, simplify organizational arrangements and procedures, facilitate over-all planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness,

"Recognizing that requests for assistance on the part of the developing countries are steadily increasing in volume and in scope.

"Believing that a reorganization is necessary to provide a more solid basis for the future growth and evolution of the assistance programmes of the United Nations system of organizations financed from voluntary contributions,

"Recalling and reaffirming Part III of General Assembly resolution 1219 (XII) and Part C of General Assembly resolution 1240 (XIII) concerning the decision and the conditions 'under which the Assembly shall review the scope and future activities of the Special Fund and take such action as it may deem appropriate',

"Without prejudice to the study requested from the Secretary-General by the General Assembly in resolution 1936 (XVIII) 'of the practical steps to transform the Special Fund into a capital development fund in such a way as to include both pre-investment and investment activities' or the recommendation of the Council and General Assembly thereon,

"1. Recommends that the Economic and Social Council take the necessary steps to combine the United Nations Expanded Programme of Technical Assistance and the Special Fund in a programme to be known as the United Nations Development Programme (UNDP), it being understood that the special characteristics and operations of the two programmes as well as two separate funds will be maintained, and that contributions may be pledged to the two programmes separately as hitherto; and the principles, procedures and provisions governing EPTA and the Special Fund not inconsistent with this resolution be reaffirmed;

"2. Recommends, to this end, that the Council, subject to the approval of the General Assembly as necessary:

"(a) Establish a single inter-governmental committee of [] members, to be known as the Governing Council for the United Nations Development Programme, to perform the functions previously exercised by the Governing Council to the Special Fund and the Technical Assistance Committee including the approval of projects and programmes and the allocation of funds; in addition it should provide general policy guidance and direction for the United Nations development programme as a whole, as well as for the United Nations regular programmes of technical assistance and submit reports and recommendations thereon to the Economic and Social Council;

(b) Elect the members of the Governing Council from among States Members of the United Nations or members of the specialized agencies or of the International Atomic Energy Agency for a term of three years, provided however, that of the members elected at the first election, the terms of [] members shall expire at the end of one year, and the terms of [] other members at the end of two years; retiring members should be eligible for re-election; there should be equal representation of the economically more developed countries and of the developing countries; the first election should take place at the first meeting of the Council, after the General Assembly has given its endorsement;

(c) Establish, in the place of the Technical Assistance Board and the Consultative Board of the Special Fund, an advisory committee to be known as the Inter-Agency Consultative Board for the UNDP to be composed of the Secretary-General, the Executive Heads of the specialised agencies and of the IAEA; the Executive Directors of UNICEF and the World Food Programme should be invited to participate as appropriate; it should: (i) advise the management on the programmes and projects submitted by Governments, through the Resident Representative, prior to their submission to the Governing Council for approval, taking into account the programmes of technical assistance being carried out under the regular programmes of the agencies, members of the Consultative Board, with a view to ensuring more effective co-ordination; (ii) be consulted in the selection of agencies for the execution of specific projects as appropriate; and (iii) be consulted on the appointment of the Resident Representatives and review annual reports submitted by them;

(d) Provide that, pending a further review of arrangements at the management level within a period of two years, the Managing Director of the Special Fund and the Executive Chairman of the Technical Assistance Board (to be known in the future as the Executive Director of EPTA) act as joint heads of the Programme, responsible for the Special Fund and the Expanded Programme of Technical Assistance respectively and requests them to make common administrative arrangements to ensure over-all planning and co-ordination and maximum efficiency;

3. *Requests* the Secretary-General to prepare for consideration by the Council at its thirty-seventh session a draft resolution required to implement the above recommendations."

40. The Brazilian delegation voted against the draft resolution and dissociates itself from the recommendations therein for the following reasons:

(a) At this stage, any decision on institutional changes affecting the Special Fund would necessarily prejudice the consideration of the problem of the transformation of that fund into a Capital Development Fund, object of General Assembly resolution 1936 (XVIII);

(b) An eventual consolidation of the Expanded Programme of Technical Assistance and the Special Fund

should not be considered before the United Nations Conference on Trade and Development and the Economic and Social Council will have reached a decision on the question of the transformation of the Special Fund into a Capital Development Fund;

(c) It does not believe that for the time being a "reorganization is necessary to provide a more solid basis for the future growth and evolution of the assistance programmes of United Nations system of organizations financed from voluntary contributions".

41. The representatives of the United Kingdom and France explained that, although they were not yet convinced that a merger of the Special Fund and the Expanded Programme would have all the advantages claimed for it, they had voted for the draft resolution since it outlined a satisfactory form of organization which would preserve the separateness of the two programmes under the supervision of a combined governing body and with the advice of an inter-agency consultative body, and because it appeared to be the feeling of the majority that merger on the latter levels would be desirable.

42. The representative of the Union of Soviet Socialist Republics, on voting against the draft resolution, stated that the idea underlying it was that the Expanded Programme should be absorbed by the United Nations Special Fund and that Special Fund procedures and principles of organization should be imposed unilaterally on the United Nations technical assistance programmes — a step which would reduce the effectiveness of those programmes. The course mapped out in the draft resolution ran counter to the opinion of a number of Governments, including the Governments of some developing countries, which in their replies to the questionnaire from the Secretary-General had expressed opposition to the merger of the Special Fund and the Expanded Programme and whose position in that matter had the Soviet Union's support. When the draft resolution had been adopted by a majority of the Committee, the United Nations Secretariat had not submitted documents analysing the possible advantages and disadvantages of a merger of those two programmes, together with the replies of Governments to the Secretary-General's questionnaire, in accordance with Economic and Social Council resolutions 900 A (XXXIV) and 954 (XXXVI). The adoption of the draft resolutions made it more difficult to resolve the question of transforming the Special Fund into a United Nations capital development fund. For those reasons the Soviet delegation did not consider itself bound by that resolution.

43. The representative of Ethiopia, in explanation of his vote, said that his delegation was compelled to abstain for reasons fully outlined in his previous statements on the same subject. The Ethiopian delegation endorses that part of the Secretary-General's report (E/3850) dealing with the question of a possible merger of the Expanded Programme of Technical Assistance and the Special Fund, on the understanding that the proposal will in no way prejudice the study requested from the Secretary-General by the General Assembly

in resolution 1936 (XVIII). Secondly, the representative of Ethiopia, in explaining his vote, stated that the resolution just adopted did not take full account of the suggestions set forth by the Secretary-General in consultation with the Executive Heads of the specialized agencies and the International Atomic Energy Agency, as well as the Managing Director of the Special Fund and the Executive Chairman of the Technical Assistance Board, namely, that the merger would result in a more effective and efficient use of the funds.

44. The Ethiopian delegation had noted with appreciation the fact that, "In undertaking the task entrusted to him, the Secretary-General has been guided by the single aim of serving more effectively the Governments of the developing countries, at their request, in their efforts to promote the economic and social advancement of their peoples". (E/3850, para. 3)

Regular programmes

45. The Committee considered in the light of the Secretary-General's report (E/3851) those technical co-operation activities of the United Nations and the specialized agencies, related to the social and economic development of the developing countries, which are financed from their own resources — the "regular programmes".

46. The representative of the United Kingdom submitted a note on "Programmes of technical co-operation financed from the regular budgets of the United Nations and the specialized agencies" (E/AC.49/L.15) in order to stimulate discussion of the principles on which its regular programmes should be run.

47. Some members considered that it would advance the achievement of country development objectives if these programmes should be merged with EPTA on the basis of EPTA principles. Some delegations had suggested that the United Nations Regular Programmes should be merged with EPTA under certain conditions. In this connexion it was pointed out that it would be illogical to leave the programmes of the specialized agencies untouched and at the same time to deprive the United Nations of its own regular programme.

48. The prevailing view was that, in order to bring about a closer co-ordination of the technical co-operation activities of the United Nations and the specialized agencies and the IAEA with the object of advancing the achievement of country development objectives, the following considerations should be borne in mind in the drawing up of all regular programmes and that the Economic and Social Council should so request the specialized agencies concerned and the IAEA:

(a) Activities which could equally well be carried out under the Expanded Programme should as far as feasible be left to that Programme.

(b) The regular programmes should therefore be concentrated upon those types of assistance which are not suitable for Expanded Programme procedures, in particular:

(i) Continuing research programmes at Headquarters or in the field concerned with operational activities, which cannot be related to specific country requests.

(ii) Advisory assignments of a regional or inter-regional character which can most efficiently be undertaken by experts or teams of experts retained on a long-term basis at Headquarters or in the regions instead of being recruited for specified assignments.

(c) There should be maximum flexibility in drawing up the programmes to permit response to the needs expressed by individual developing countries.

(d) The specialized agencies, like the United Nations, should make use of the Resident Representatives for the negotiation with the Governments of the developing countries of country technical assistance programmes which will take account, in a co-ordinated manner, of assistance available under the regular programmes, EPTA and the Special Fund.

49. The prevailing feeling in the Committee was that if the specialized agencies, as well as the United Nations, were to observe these principles, it would be an important step towards providing to Member States those technical co-operation services which would be most conducive to their national development. The agencies should follow these considerations in so far as they are compatible with their respective constitutions, and taking into account the relationship between their general activities and the technical assistance they provide to the developing countries.

50. With reference to point (c) above, one representative urged that any specific measure designed to provide greater flexibility among the programmes should take account of the intrinsic importance of such programmes as the Advisory Social Welfare Services and the Advisory Services in the Field of Human Rights as reflected in the actions of the General Assembly establishing and maintaining these programmes. He also felt that point (b), while sound in intent, was too sweeping and did not take sufficient account of the differences in volume and character of the regular programmes carried on by the United Nations, the specialized agencies and the International Atomic Energy Agency.

51. One representative stated that the regular budgets of the United Nations and the specialized agencies are not designed for the financing of technical assistance activities all of which should be financed by voluntary contributions from Governments.

52. Another representative indicated that, according to him, the technical assistance activities should, in principle, depend on voluntary contributions from Governments.

53. Others pointed out that the stabilization of the size of the regular programmes would, on the contrary, mean that increases in the total volume of assistance could be channelled through the voluntary programmes, whose procedures permit the available resources to be distributed between the various fields of activity in accordance with the priorities established by the Governments of individual developing countries.

54. One delegation felt that, irrespective of the considerations in (a) to (d) above, the following suggestions for treatment of the United Nations and specialized agencies regular programme appropriations should be considered:

- (a) Set aside a percentage for regional programmes;
- (b) Assign a percentage to continuing research projects as set out in (b) (i) above;
- (c) Retain a percentage as a contingency fund to meet newly emerging needs during the course of the operational period;
- (d) The remaining balance should be distributed among recipient Governments in the form of country targets. These targets to be communicated to Governments at the same time as those of the Expanded Programme to permit maximum co-ordination within country programming.

55. Some members stated that they were unable to support the principles because, in their view, the adoption of either set of principles was likely to lead to a reduction or stabilization of the overall volume of technical assistance provided for the developing countries.

COMMENTS BY THE WORLD HEALTH ORGANIZATION ON THE ABOVE CHAPTER OF THE REPORT

56. The representative of the World Health Organization indicated that his Organization assumed that no recommendations would be made which would be inconsistent with, or in conflict with, the Charter of the United Nations or the constitutions of the specialized agencies. He also drew particular attention to resolution EB32.R29 of the Executive Board of the World Health Organization. The Executive Board, *inter alia*, considering "that the Charter of the United Nations provides, in Article 17, paragraph 3, that the General Assembly of the United Nations shall examine the administrative budgets of the specialized agencies with a view to making recommendations to the agencies concerned", "believes that the programmes financed from funds appropriated by the World Health Assembly must continue to be governed solely by the World Health Organization"; and "underlines that the scope of the study to be carried

out by the Secretary-General under the terms of Economic and Social Council resolution 900 A (XXXIV) paragraph 7 (a), as far as WHO is concerned, be guided by the principle established in the Charter of the United Nations, Article 17, paragraph 3, referred to above".

57. The representative of the World Health Organization recalled that his Organization had always considered the Expanded Programme of Technical Assistance as an expansion of its previously existing programme. It had been considered that the Expanded Programme was to supplement, not to supplant, the regular programme of technical assistance. He also recalled that projects assisted by WHO, financed from funds of the Expanded Programme, and the co-ordination of those projects, could only be carried out with due regard to the Constitution of WHO and to the relations established between WHO and the other organizations participating in the United Nations system.

58. For all these reasons, the suggested principles contained in document E/AC.49/L.15 were not applicable to the World Health Organization.

NOTE

59. A number of members noted that they had supported the proposals and recommendations submitted to the Economic and Social Council by the Committee because they had been those which commanded the largest majority obtainable in the Committee. They nevertheless reserved the right of their Governments to suggest changes in or additions to those proposals and recommendations when they came before the Economic and Social Council or the General Assembly, as the case might be.

SITE OF HEADQUARTERS OF THE TECHNICAL ASSISTANCE BOARD AND SPECIAL FUND

60. Two delegations indicated that the Secretariat should submit to the Council through the Administrative Committee on Co-ordination, a thorough study of the advantages and disadvantages of the possible transfer of the headquarters of the Technical Assistance Board and the Special Fund to Geneva.

Analysis of major trends in technical co-operation activities in 1963

A. MAIN DEVELOPMENTS IN THE FIELD OF TECHNICAL CO-OPERATION IN 1963

1. This report presents in some detail the developments in the technical co-operation activities undertaken by the United Nations during 1963 in compliance with the requests from developing countries and work programmes approved by the legislative bodies of the Organization, both at Headquarters and in the regional economic commissions. In this review attention is focussed upon the growing role of the United Nations in the implementation of different types of technical assistance programmes. Factual information is given on the implementation of Special Fund projects for which the United Nations has been designated as the Executing Agency and on the progress made in developing the World Food Programme in the substantive fields serviced by the United Nations. The progress made under the regular and expanded programmes is presented in more detail since these programmes are of greater direct concern to the Technical Assistance Committee. The main trends under the regular and expanded programmes are indicated in terms of financial value, both by geographical region and field of activity, and the types of projects undertaken in the main substantive fields are described. Following the pattern established in last year's report¹⁷, statistics on the trends in technical assistance operations have been included.

Implementation of Special Fund projects

2. The disbursements for Special Fund projects increased from \$1.7 million in 1961 to nearly \$4.1 million in 1962 and to roughly \$6.7 million in 1963. As of 1 January 1963, there were thirty-seven projects

assisted by the Special Fund for which the United Nations served as the Executing Agency. The Governing Council of the Special Fund approved an additional nine projects at its session in January 1963, and eight at its session in June 1963. By 31 December 1963 the United Nations was the Executing Agency for a total of fifty-four projects, which are classified under the following broad categories:

(a) Mines and minerals	25 projects (includes 5 which relate also to ground-water)
(b) Water and power	16
(c) Industries	7
(d) Economic surveys	3
(e) Other	3

3. In addition to two projects completed in previous years, two projects were completed in 1963. At the end of the year there were, therefore, fifty projects, of which sixteen were under negotiation with the Governments and the Special Fund; one had been suspended; and thirty-three were at various stages of execution.

4. The total amount approved by the Governing Council of the Special Fund for the fifty-four projects was \$46,733,000, and recipient Governments had agreed to contribute \$10,774,000 in cash, making a total of \$57,507,000. In addition, the recipient Governments were making available an estimated \$26,374,000 in services, supplies and equipment, and a further \$2,047,000 in cash. The total estimated amount contributed by the Governments and the Special Fund towards the fifty-four projects was \$86,545,000. The total expenditure for 1962 and prior years for all projects was \$6,713,000 (project costs of \$6,186,000 plus agency overhead costs of \$527,000), and for 1963 it was \$6,657,000 (project costs of \$6,217,000 plus agency overhead costs of \$440,000). The total expenditures from the inception of all projects to 31 December 1963 was \$13,374,000 (project costs of \$12,407,000 plus agency overhead costs of \$967,000).

¹⁷ *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 14, document E/3757 and Add.1.*

*Aid for economic and social development
under the World Food Programme*

5. The multilateral principle was extended into the field of food aid for economic and social development when the joint United Nations/FAO World Food Programme began operations on 1 January 1963 under General Assembly resolution 1714(XVI). This programme has been administered by a joint administrative unit located at Rome, to which the United Nations has seconded officers. This has functioned in close liaison with the United Nations, which has created a small section for the purpose of assuring co-ordination of food aid with United Nations technical assistance and Special Fund operations and with United Nations substantive activities. The World Food Programme has thus permitted a marked increase in United Nations support of governmental development programmes in a considerable range of substantive fields. The number and food value of requests submitted, projects approved and agreements signed in these fields, up to the middle of April 1964, is presented in Table 1-A. It will be seen therein that requests received in the fields serviced by the United Nations amounted to \$22.3 million. Of this, requests amounting to a total value of \$8.1 million were approved and agreements have already been entered into for \$3.8 million. No figures on the implementation of the projects are as yet available.

6. The effectiveness of food aid for development projects depends largely on the technical value of the project, especially when the project is associated with technical assistance, in order that the technical adviser can help the Government in the preparation, implementation and appraisal of the request for food aid.

While technical assistance has thus strengthened food aid, the World Food Programme has also reinforced technical assistance by enabling Governments to obtain material aid for the implementation of the advice given by experts and particularly for the initiation of pilot projects. One quarter of the requests received and about one half of the projects approved and agreements signed in fields of United Nations activities are associated with the work of United Nations technical assistance experts, and it is the projects with which experts are associated that advance most rapidly.

7. The way in which food aid has been used to support labour-intensive projects has varied from field to field. In community development, it has taken the form of awards of incentive premiums to local groups to encourage them to invest their labour in some undertaking of local interest on which they would not otherwise have worked. In housing, building and planning, it has sometimes taken this form, especially for self-help housing and neighbourhood improvement, but it has also served for part payment of wages in kind, while a few experiments are being made in the local sale of part of the food in order to use the proceeds to pay the wages of construction workers who in turn will buy the food. In transport and other public works, food aid has served mainly as a means of meeting part of the wage bill in kind, thus making possible additional work beyond that provided for in the budget.

*Growth of technical assistance operations (excluding
Special Fund projects and the World Food Programme)*

8. The technical assistance programmes implemented by the United Nations, excluding operations undertaken

TABLE 1-A. NATURE AND STATUS OF WORLD FOOD PROGRAMME PROJECTS OF INTEREST TO THE UNITED NATIONS

Field	Requests received		Requests approved		Agreements signed	
	Number	Food value (\$000,000)	Number	Food value (\$000,000)	Number	Food value (\$000,000)

Youth welfare	4	1.1	—	—	—	—
<i>All fields</i>	131	51.8	39	20.3	23	14.4

Note: Figures in parentheses in columns (2), (4) and (6) indicate projects linked with United Nations technical assistance (Bureau of Technical Assistance Operations).

Some projects cover a number of substantive fields; the allocation shown indicates that at least one of the fields covered is in an area of United Nations activity.

All the projects in United Nations fields are labour-intensive, except for some involving youth training.

for Special Fund projects,¹⁸ have shown a growth, as indicated in Table 1-B. The index of 100.0 in 1960 rose to 160.8 in 1962. In 1963 there was only a very slight increase, since 1963 was the first year in the biennial programming for the Expanded Programme and not all of the projects proposed were operative for the full year; the balance of resources was carried over to 1964. The imbalance between the two years of the biennial is expected to be overcome in 1964 and it is anticipated that the index will rise to an estimated 229.8 this year.

9. A summary of the programme expenditures in 1962 incurred by the United Nations by major areas of assistance is presented in table 1-C. A breakdown of the regional distribution of expenditures under the different programmes is given in Table 4 of the statistical annex.

10. The rate of increase in expenditures in Africa of roughly 100 per cent from 1961 to 1962 declined somewhat with a rise of only approximately 50 per cent from 1962 to 1963. The increase for other regions

¹⁸ If the implementation of Special Fund projects is also taken into account, the total expenditure incurred under all programmes of technical co-operation was of the order of \$23.2 million in 1963 as compared with \$19.8 million in 1962 and \$12.1 million in 1961. Expenditures by field of activity in dollar values are presented (in some detail) in Table 3 for the years 1961, 1962 and 1963.

is roughly 14 per cent for the Middle East, 15 per cent for Asia and the Far East and 17 per cent to 18 per cent for the Americas. There was a slight decline in expenditures in Europe. There was an increase in the proportion of inter-regional projects. In absolute terms, the total dollar expenditures rose in all regions except Europe.

11. The regional distribution of total expenditures, excluding expenditures for Special Fund projects for 1960 to 1964 (Table 1-D), shows that the percentage increase in Africa, which was roughly three times higher in 1960 than in 1963, is expected to be substantially maintained in 1964. The decrease in expenditure for the Americas is expected to be made up somewhat in 1964. The proportion of regional and inter-regional projects increased from 19.8 per cent in 1962 to 26.2 per cent in 1963, with an anticipated increase of 28 per cent in 1964.

12. The distribution of resources between the regional and inter-regional programmes and country programmes is shown in Table 1-E. The increase is due partly to the priority given to regional and interregional projects by the regional economic commissions and other legislative bodies of the United Nations. A little less than 39 per cent of the regular programme in 1964 will be for regional projects as compared with

TABLE 1-B. GROWTH OF TECHNICAL ASSISTANCE OPERATIONS, 1959-1964

	Volume of technical assistance projects ^a	Funds-in-trust	Total	Index 1960=100
(Figures in millions of dollars)				
1959	8.6	.5	9.1	93.8
1960	9.1	.6	9.7	100.0
1961	9.6	.7	10.3	106.1
1962	14.8	.8	15.6	160.8
1963	14.5 ^b	1.2	15.7	161.8
1964 (estimated)	18.1 ^c	4.2 ^d	22.3	229.8

^a Excludes Special Fund.

^b Excludes \$9 million special programmes for Burundi and Rwanda.

^c As programmed.

^d Includes \$2.99 million funds-in-trust programmes for Congo (Leopoldville) involving 246 posts.

TABLE 1-C. SUMMARY OF 1963 PROGRAMME EXPENDITURES^a

Major areas	Regular budget	EPTA	Special Fund	Funds-in-trust	Total
Economic development	2,092,381	5,983,596	6,430,846	716,623	15,223,446
Social activities	2,101,571	1,204,050	90,752	410,159	3,806,532

Source: "Decentralization of the economic and social activities of the United Nations and strengthening of the regional economic commissions: report of the Secretary-General" (E/3786).

31.6 per cent in 1962 and 35.3 per cent in 1963. The growth of regional activities under the regular programme has also been partly due to the appointment by the United Nations of a growing number of regional advisers. This has enabled the regional secretariats to respond quickly to the requests for technical assistance from member countries in the respective geo-

graphical areas. Table 1-F presents the number of regional adviser posts established in 1963, by field and principal geographical region. In keeping with the requests from the regional economic commissions, the provision made for 1963 at the time of programming has increased by more than half. There was a considerable increase in the number of regional advi-

ser posts established in 1963 as compared with the preceding year. The project statistical data presented in tables 11 to 20 give information on inter-regional projects, which have also increased sharply since 1962.

13. The expenditures by field of activity in dollar value and per cent for 1960 to 1963 and the anticipated programme value in 1964 are presented in Table 1-G. In terms of actual performance in the principal fields in which the programmes exceeded \$1 million a year, there was an impressive growth from 1960 to 1963 in the fields of statistics, economic surveys, pro-

gramming and projections, social activities, natural resources development and public administration, in that order. Technical assistance activities in industrial development and other fields increased in absolute value from 1960 to 1963, but at different rates. Indications are that in 1964 activities in all the main fields will show further substantial increases.

14. The total number of experts increased from 924 in 1960 to 1,540 in 1963 and is expected to be 1,645 in 1964, as is shown in table 1-H. These figures do not take into account experts working on Special Fund

TABLE 1-G. TRENDS OF PROGRAMME COMPONENTS BY PROGRAMME VALUES AND PER CENT 1960-1964 ^a

^b Includes 64 posts under the European Social Welfare Exchange Programme not reported in prior years.

Note: The figures on experts reported in this table and in the tables annexed to this document, include short-term experts and consultants for seminars and training activities. They also include United Nations staff members who are detailed to country or regional projects.

projects. Nor are the 246 posts for technical assistance services in the Congo transferred in 1964 included. The rate of increase in the number of experts in each of the fields has varied.

15. The number of fellowships awarded decreased from 1,843 in 1962 to 1,652 in 1963. As shown in table 1-I, the number of fellowships under the regular programme in 1963 was only slightly less than in 1962, whereas the number of fellowships under the Expanded Programme decreased from 997 in 1962 to 788 in 1963, owing to the fact that under the Expanded Programme there is an imbalance between the two years in the biennial programme period and, for purposes of comparison, it is more appropriate to take the figures for 1961 and 1963, the first years of the Expanded Programme. The number of fellowships under the Expanded Programme increased from 506 in 1961 to 788 in 1963. The number of fellowships under the regular programme increased sharply from 363 in 1960 to 815 in 1963. A considerable part of this increase is to be attributed to the large number of participants attending conferences, seminars and study tours. There has been an increase since 1960, mainly because of the increased number of regional projects carried out under the auspices of the regional economic commissions.

16. It is difficult to forecast the number of fellowships that will be awarded in 1964, since the number includes participants in the various conferences, seminars and other meetings. Experience has shown that Governments do not decide on nominations for fellowships for this type of activity until just before the meeting. Sometimes it is not possible for them to make a definite commitment to take part in these projects and, if so, to state how many persons will be nominated. Because of this element of uncertainty, it is impossible to establish fellowship posts at an early date.

17. Of the 1,652 fellowships awarded in 1963, 815 (or 49.4 per cent) were implemented with funds provided in the regular programmes, 788 (47.7 per cent) were financed under the Expanded Programmes and 49 (or 2.9 per cent) through extra-budgetary operations programmes.

18. Both in absolute numbers and in percentage share, a larger number of awards were made to fellows from the Americas and Asia and the Far East; these were, however, offset by some decrease for Africa and Europe. There was also a substantial decrease in the number of fellowships awarded to countries of the Middle East in 1963 as compared with 1962, because of the larger group projects undertaken in that region in 1962.

^a Does not include 19 awards in the special education programmes for South West Africa.

Note: As the fellowships awarded in a given year may be tenable the following year, the figures of awards in a given year do not correspond with the number of persons studying in that year.

19. During 1963, 506 fellows, or 30.6 per cent of the total, undertook studies in the field of social activities as compared with 355 or 19.3 per cent in the preceding year. The number of fellows in the field of public administration also increased from 251 in 1962 to 281 in 1963, representing an increase from 13.6 per cent to 17 per cent. In 1963, 109 fellows or 6.7 per cent of the total undertook studies in the field of statistics; 205 or 12.4 per cent in the field of industrial development, 159 or 9.6 per cent in the field of natural resources development; and 107 or 6.5 per cent in the field of economic surveys, and economic programming and projections.

20. In addition to the award of individual fellowships, the United Nations has developed other techniques for the provision of training. Higher priority has been given to the building of institutions at the country and regional levels, since many Governments have welcomed the establishment of these permanent training facilities. As Governments also find it increasingly difficult to release personnel for any length of time and find it advantageous to draw on institutions which are near at hand, a wide network of training facilities of this nature has been set up. This has also made it possible to effect greater economies and make training available to a larger number of persons. At the regional level, economic development institutes have been set up in Africa and Asia and the Institute for Economic and Social Planning has been founded in Latin America. The Advanced School of Public Administration (ESAPAC) has played a notable part in

Latin America. The Institute for the Prevention of Crime and the Treatment of Offenders set up in Asia and the Far East has met some urgent needs of the countries in the region in this field. Much progress has been made in the establishment of regional and national training centres in the statistical field in Africa, which have trained personnel needed at various levels. The training of primary and intermediate statisticians in Asia has been a recent development. The Demographic Training and Research Centres in India, Chile and the United Arab Republic, the physical planning institutes in Ghana and Indonesia, and the Lahore Signalling Training Centre are all examples of this trend in the development of institutions. More information about some of these institutions is given in the succeeding sections.

21. When justified by a sufficient demand on a regional or inter-regional, if not on a national, basis, courses in group training of a less permanent character have proved to be economical and highly efficient. Many courses have been fitted to the requirements of the participants who, in addition, have benefited as a group from the exchange of their experiences. In this category, some of the group training programmes that have been organized include the training programme in techniques and procedures of technical assistance, the training programme in development financing for Africa, the United Nations foreign service training course, held in Geneva and New York, and the foreign service training course organized for Caribbean countries, namely, Barbados, British Guiana,

Jamaica, and Trinidad and Tobago. The training programme in central banking techniques and operations given under the auspices of the Banque de France, the in-service training courses on tariff and trade policies organized by GATT, and the in-service training courses organized by the regional economic commissions have also met important needs. Reference is made to some of these programmes in the following sections, which present developments in technical assistance in the substantive fields.

22. The inclusion of training in the duties of experts appointed at the country level has also proved useful. This on-the-spot training has often been for the training of counterparts.

23. The following sections present in detail the developments in technical co-operation programmes in the various substantive fields during 1963.

B. ECONOMIC PLANNING, PROGRAMMING AND SURVEYS

24. United Nations technical assistance activities in economic planning have increased rapidly in the first few years of the United Nations Development Decade, the number of experts and fellows in 1963 having more than doubled since the late 1950's. The increase has been especially notable in the African region, which now accounts for about half the total programme, and where there were twice as many countries receiving assistance in 1963 as in 1962.

25. Country programmes have included general surveys preliminary to the undertaking of economic planning, and the use of expert advisers in the preparation and implementation of comprehensive economic plans. Under the regular programme in Nyasaland, where the Government has decided to introduce a system of five-year development plans, a three-month survey mission, undertaken in collaboration with the Food and Agriculture Organization of the United Nations (FAO) and including experts in industrial and agricultural development and in general planning, advised the Government with regard to the establishment of priorities with a view to making the most efficient use of human and material resources. Late in 1963, also under the regular programme, a survey mission was appointed, in collaboration with FAO, to advise the Government of Northern Rhodesia with regard to economic planning. In addition to a general economist serving as chief, the mission included specialists in the fields of industrial, fiscal and balance-of-payments problems, and agriculture.

26. The following are examples of countries which received assistance in 1963 in the course of their planning efforts. In Cyprus, two experts in economic planning continued to advise the Government regarding current economic policies, including the implementation of the present five-year economic development plan. They also assisted in preparing background information for the formulation of the next plan. In Togo, two experts assisted the Government's planning office in the evaluation and promotion of key economic development projects. In Peru, where a tripartite ECLA/

OAS/IDB advisory group in economic planning was assisting the Government in its planning efforts, the group's general programmer assisted the National Planning Institute in its work, and shared in the work of the advisory group concerned with the preparation of a detailed analysis of the Peruvian economy and the evaluation of investment projects, and with the organization of the Government's planning machinery. In Ceylon, where the Government has been receiving continuous assistance since 1956 in the formulation and implementation of its development plans, the scale of assistance has been reduced in recent years; in 1963, two economists assisted in adjusting existing plans in the light of changing circumstances, in the elaboration of short-term planning models, and in the development of perspective planning. The experts have devoted attention to the training of their counterparts in these various country projects, in accordance with one of the general objectives of technical assistance activities.

27. In several instances, technical assistance has been provided to a group of countries seeking to promote economic co-operation among themselves. At the request of the Governments of Kenya, Tanganyika and Uganda, an economic adviser was appointed under the regular programme to help the East African Common Services Organization (EACSO) with various economic problems affecting the region as a whole. The expert also assisted the Governments, at their request, in discussions concerning closer economic relations. At the request of the Governments of the Gambia and Senegal, a three-man mission was appointed under the regular programme late in 1963 to assemble economic and political information on which decisions could be based with respect to the form which the future relationships of the Governments should take. The team included a general economist whose task was to consider problems and prospects of economic development in the two countries, with special reference to possible forms of co-operation or association that might be adopted by the two countries. In Burundi and Rwanda, an expert was provided to service the Council of Economic Union, which is composed of the Prime Ministers and Finance Ministers of the two Governments. An economist was provided to assist the Advanced School of Public Administration for Central America with regard to the economic integration.

28. The provision of regional advisory services in various aspects of economic planning was strengthened in 1963 by the appointment of additional advisers in Africa. Plans have also been made for appointing inter-regional advisers under the regular programme with a view to improving the United Nations ability to respond quickly to urgent requests for short-term assistance in planning and evaluating needs for long-term assistance in economic planning.

29. In the field of training in economic planning, the United Nations ability to meet government requests for assistance was strengthened by the operations of the Latin American Institute for Economic and Social

Planning and by decisions to establish Economic Development Institutes in Africa and Asia. Economic planning fellowships for in-service training in the regional economic commissions and for study at educational institutions throughout the world continued to be granted as in former years, and the number of awards in 1963 was more than 100.

C. FISCAL AND FINANCIAL MATTERS

30. During 1963, there was a growing demand for United Nations technical assistance in the fiscal and financial field. Government requests for technical assistance in the fields of budget, tax and finance (banking, credit facilities, capital markets, insurance) reflected their efforts in promoting economic growth within their countries, as well as the efforts in a number of regions towards economic integration. Advice in budgeting, taxation and finance was given to more than thirty countries and territories by some forty experts from more than twenty different countries, as well as by regional advisers assigned to the regional economic commissions in Africa and Latin America.

31. In September 1963, a workshop on problems of budget reclassification and management was held in San José, Costa Rica, at the seat of the Advanced School for Public Administration (ESAPAC), for the countries of Central America.¹⁹ This workshop continued the series of regional budget workshops initiated in 1953 to deal with the classification of government transactions along economic and functional lines and with the techniques of programme and performance budgeting. The meeting at San José was attended by twenty-one persons designated by the Governments of Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua and Panama. Emphasis was on the analysis of the changes in concepts and procedures needed in the budget systems of the area in order to make the process of budget presentation and execution more responsive to the need of economic development planning. Much of the discussion centred on the practical means of assisting the Governments in carrying out the basic reforms that the introduction of a new system would require.

32. The working documents submitted by the Secretariat included a draft *Manual for Programme and Performance Budgeting* (E/CN.12/BRW.3/L.4) and several other studies dealing with the relationship of economic development programming and government budgeting. In reviewing developments since 1953, the workshop expressed satisfaction with the progress made in introducing economic and functional classifications of government transactions. It reaffirmed the recommendations by the first workshop held in the region that the *Manual for Economic and Functional Classification of Government Transactions*²⁰ should serve as a guide for governments in reclassifying their budgets. The workshop further recommended that the governments of the region adopt a standard classification of government transactions for common

use throughout the region. Such classifications, accompanied by item-by-item definitions, are included in the workshop report together with a uniform system of object classification for Central American countries.

33. The workshop attached great importance to such classifications which should facilitate the development of an integrated system that would serve the needs of both economic development planning and government budgeting. In view of the continuing efforts towards regional economic integration in the area, special emphasis was placed on the establishment of such classifications on a uniform basis. The importance of training programmes in the field of accounting and budgeting was stressed, particularly with regard to the significant role that ESAPAC itself should play in such an undertaking. In the light of the recommendations of the workshop, steps have already been taken to secure the services of a regional budget adviser to assist the Governments of the Central American isthmus in these endeavours.

34. The urgent need for basic budget and accounting reforms in order to make the budget a more effective instrument for the execution of fiscal policies was reflected in a number of country requests for expert assistance in this field. In response to the request of the Government of Argentina, a short-term mission by a budget expert was undertaken at the end of 1963 to assist in the development of a comprehensive programme of budgetary and accounting reforms. This mission is expected to be followed up by the appointment of experts in the fiscal policy, budgetary and accounting fields. The appointment of a regional budget adviser for Africa facilitated response to the requests of the Governments of Ethiopia and the Sudan for an evaluation of their needs in the fields of economic development, budgeting and government accounting. On the basis of short-term missions to these countries, programmes have been formulated and recruitment for expert posts is already under way. Also in 1963, a complete survey of the structure and composition of the public sector was undertaken in Senegal by a regional adviser, using as a basis the United Nations *Manual for Economic and Functional Classification of Government Transactions*. A similar survey is at present under way in Morocco. In South America, important progress has been made with the help of United Nations experts in Colombia, Ecuador and Peru. In all these countries, particular emphasis has been placed on basic improvements of accounting processes.

35. In response to urgent requests from Governments and the regional economic commissions, work was also initiated on a manual for government accounting.²¹ The applicability of the model schemes developed in this manual will be tested at forthcoming regional workshops.

36. Technical assistance in the field of taxation was provided to some twenty countries and covered assistance in tax policy, administration and legislation.

¹⁹ For the report of the workshop see ST/TAO/Ser.C/66.

²⁰ United Nations publication, Sales No.: 58.XVI.2.

²¹ In preparation.

A noteworthy development during 1963 was the growing demand for assistance in the harmonization of national tax systems and policies in connexion with regional economic integration schemes and political federations. In 1962, the five member countries of the Central American Common Market adopted an agreement unifying their national legislation on tax incentives for the promotion of industrial development which had been prepared by a United Nations Technical Assistance expert.²² These Governments have now requested assistance in a major study of their national tax systems with a view to their possible harmonization.

37. The tax and fiscal implications of federal arrangements were examined by a UNTA expert during the year at the request of the Governments of Kenya, Tanganyika and Uganda in East Africa. At the request of the Governments of Senegal and the Gambia in West Africa, a UNTA expert similarly studied, as a member of a technical assistance mission, the tax and fiscal implications of a possible political association between these countries.

38. The progress achieved in land tax valuation and administration through long-term UNTA projects in Jamaica, Ghana and Trinidad and Tobago has attracted the interests of other Governments and a request for similar assistance was received during the year from the Government of Nepal. In this connexion, a manual for land tax valuation and administration is being prepared for the guidance of governments and technical assistance experts.

39. The expansion of technical assistance activities in the field of development financing during 1963 reflects the growing interest on the part of the developing countries in introducing or strengthening their financial institutions, policies and programmes. These measures are directed towards a more effective mobilization of domestic and external financial resources available to developing countries for investment projects in the public and private sectors as envisaged in their national economic plans. During the period under review, technical assistance in the above field covered a growing number of projects for advisory services and showed a marked increase over the previous year in the number of fellowships awarded for training under the new and continuing group programmes. Many experts serving Governments also undertook the training of their counterparts and officials in their fields of specialization.

40. Advisory services in the establishment of new financial institutions and in the techniques of financial planning and operation were provided to an increased number of countries. In Pakistan, an expert served as an adviser on loan utilization to the Industrial Development Bank of Pakistan and assisted the bank in the establishment of improved systems and procedures for project appraisal, credit agreement and examination of financial statements of loan recipients. In Thailand, an expert advised the Government Savings Bank on improvement of organization and methods

related to promotion of savings functions in Thailand. He also organized a programme of training for the bank personnel in the techniques of savings bank services. Assistance was also provided in central banking operations and policies to Burundi, Cyprus, Nepal and Rwanda.

41. Technical assistance was also increased in the field of monetary policy and financial planning. In Somalia, an expert advised the Government on the preparation of international payments accounts and undertook periodic surveys on the financial and monetary conditions of that country. The Government of Uganda received advisory assistance on financial planning and foreign exchange regulations; the Government of Cambodia on monetary and financial statistics; and the Government of Ghana on balance of payments and foreign exchange policies. In Indonesia, the expert assigned to the Insurance Supervision Department advised the Government on insurance legislation and, as a new means to improve insurance management, control and supervision, organized a programme for the training of actuaries.

42. In 1963, 105 candidates received training in the fiscal and financial field, including fifty-five from Africa, twenty-two from Asia, sixteen from Latin America and twelve from Europe and the Middle East.

43. Nineteen candidates from seventeen African countries attended a special programme on the financing of development offered at Headquarters. The purpose of the programme, which was instituted in September 1963 and covered a period of four months, was to provide officials concerned with development financing with a knowledge of the structure and operations of public and private agencies and institutions engaged in the provision of financial assistance or investment capital to developing countries. The curriculum centred on the study of development policies and planning, domestic sources and their most economic utilization, and the foreign sources of capital, both public and private, bilateral and multilateral. Part of the tutorship was entrusted to loan officers from national financial agencies in two of the countries which provide capital. The programme also included the many aspects of international aid, among others, the activities and related functions of the United Nations and of its agencies specialized in this field.

44. The central banking programme organized by the Banque de France at the request of the United Nations was attended by twenty-three candidates from ten African countries, and a similar group programme offered for Latin American countries at the *Centro de Estudios Monetarios para Latinoamérica* (CEMLA) was attended by nine fellows from five countries. Two received fellowships for participation in the semi-annual in-service training course on tariffs and trade policies at GATT. In the field of taxation, seven United Nations fellows were enabled to participate in the annual training courses for government officials offered in the United States by the Harvard University Law School International Program in Taxation, and three fellows participated in a programme in the

²² Central American Agreement on Tax Incentives to Industrial Development, 31 July 1962, document E/CN.12/657.

United Kingdom provided by the British Council. The other fellows received training according to individual programmes arranged in the various fields of development financing, financial and credit management and insurance.

D. INDUSTRIAL DEVELOPMENT

45. Both the volume and the support of operational activities in industry improved during 1963. This was related to several factors: an increased demand for technical assistance from the newly emerging countries, particularly those in Africa; a consistent effort towards re-orientation of technical assistance in industry towards integrated "multi-expert" missions; and an increased use by countries of the Special Fund for more institutionalized forms of assistance, such as the establishment of technological institutes and industrial estates. The greater scope and depth of support were made possible by some strengthening of the advisory staff of the Centre for Industrial Development.

46. During the past year, technical assistance projects in industry covered such fields as industrial planning and programming; general policies of industrial development; project evaluation; marketing and trade promotion; establishment of new industries; and technical and engineering advice in specific industrial and manufacturing plants for textiles, leather, cement, ceramics, glass, iron and steel, metals, chemicals and petrochemicals, fertilizers, insecticides, pharmaceuticals, pulp and paper and food processing. During this period, there were some 150 experts in the field serving on various industrial development projects for periods ranging from one to twelve months.

47. A major feature of technical assistance activities in the field of industry has been the strengthening of the team approach by means of the organization of integrated survey missions. The Industrial Survey Mission for Burma, which began its work in November 1962, concluded the major part of its work during the year. The Survey covered textiles, fertilizers and chemicals, food processing, metals and engineering, and river-boat building and repair; an investigation into the establishment of industrial zones will be completed in 1964. It is expected that the Mission's recommendations will serve as a basis for the formulation of government policies for the development of these industrial branches, particularly fertilizers and textiles. Another industrial mission consisting of a team of experts in various industries, such as food processing, metals, and chemicals, began work in Iran in January 1964. The team will focus its attention on identifying specific industrial projects to be developed, and assist the Plan Organization in the evaluation and preparation of "bankable" projects in the areas thus selected. The mission will also make recommendations for further United Nations assistance making use, if necessary, of the facilities available under the Special Fund operations.

48. In Malaysia, assistance continued to be provided to the Economic Development Board of Singapore, which was set up in 1961 as a result of the previous

industrial survey mission. Included among the United Nations experts provided to assist the Board in preparing and evaluating industrial projects for the development programme of Singapore are the following: a senior industrial economist, a chief of technical consultant services, a chemical engineer, a mechanical engineer, an industrial designer, an industrial engineer and an industrial cost accountant.

49. The Centre for Industrial Development has also been engaged to an increasing extent in organizing short-term exploratory missions to assess the potentialities for industrial development and elaborate proposals for longer-term assistance, or evaluation missions to review the results of expert assistance already extended, to provide on-the-spot guidance and to advise Governments on future action. Such missions have been carried out either by staff members and technical advisers seconded from Headquarters or by outside consultants.

50. Thus, at the request of the Government of Turkey, one of the Centre's senior industrial advisers visited that country for the purpose of consultation on the Government's programme for the development of industry under the Five-Year Plan. Following these consultations, the Government requested United Nations assistance in establishing a body within the Ministry of Industry which would be charged with preparing surveys of industrial potentialities, evaluating priorities, and formulating "bankable" projects; and recommending a number of experts in various industrial fields who would serve on this body and train counterpart personnel. An expert consultant was recently sent to Iraq at the Government's request to evaluate the present technical assistance programme in industry and examine possibilities for rendering increased and more effective aid.

51. In addition, at the request of the Governments, the Centre's technical adviser on small-scale industries and industrial estates visited Trinidad and Venezuela to ascertain the role which industrial estates might play in the industrial development of these countries, with a view to making preliminary proposals regarding suitable types of estates as well as recommendations on future assistance by the United Nations.

52. An industrial adviser was provided to the Government of Surinam to assist in the elaboration of a long-term industrial development plan, on measures for implementation and on the methodology for appraisal of individual projects and allotment of priorities. The same expert was also sent on a short-term mission to Barbados to advise on problems relating to industrial development planning in that country.

53. The services of two industrial development experts were provided under the Central American Economic Integration Programme. One of the experts gave advice in connexion with the preparation of general surveys concerning the development of the manufacturing sector and of studies which would facilitate the identification of branches of industry suitable for Central America and capable of contributing effectively to an increase in productive activity and in the

use of regional resources. The other expert concentrated his work on studies relating to the specialization and expansion of the textile industry.

54. United Nations aid to India continued to be provided in a variety of fields. Further assistance was given in the substitution of the indigenous raw materials for imported raw materials in industry; specifically, expert advice was provided on the substitution of various imported metals in the manufacture of utensils. Two successful assignments in the field of standards were completed: one relating to the promotion of machine tool standardization, and the other to the establishment of internal and company standards departments. In addition, advice was provided by a pulp and paper technologist in the manufacture of sack-kraft paper from bamboo. A two-man team conducted an intensive survey and made detailed recommendations for the improvement of fountain-pen manufacture. A mechanical engineer was recently assigned to the National Council for Applied Economic Research to assist in assessing the potential demand for major industrial products and studying their cost-price structure. Another mechanical engineer has been advising on the design and production of tools, dies, jigs and fixtures at Guindy Industrial Estates, Madras.

55. As mentioned above, a significant development during the past year was the increase in the provision of technical assistance to the newly independent countries of Africa in the form of advice on specific problems of industrial programming, the establishment or expansion of industrial plants, or the carrying out of industrial surveys and feasibility studies. For example, in Liberia, an expert has been advising the Government on economic aspects of industrial development generally, as well as on the economic feasibility of specific industrial projects. An industrial economist served as a member of a three-man team assigned to assist the Government of Nyasaland in its planning for economic development. It was the task of this expert to undertake an industrial survey of the territory with a view to identifying the areas suitable for growth, to establish priorities in the selection of industrial projects and to advise on their integration in a rational development programme.

56. In Tunisia, assistance has been provided by specialists in different branches of industry. Specifically, a chemical engineer has given the Government advice on various fertilizer projects; an adviser in mercury metallurgy has made proposals for the organization of a mercury plant, including the design of installation and equipment; and another consultant has been advising on projects in the mechanical and metallurgical industries.

57. A senior officer of the Centre visited Algeria at the invitation of the Government for consultations on their programme for the development of industry. Following these consultations, one expert was provided to assist the Government on problems of industrial planning, and another to carry out a petrochemical survey concerning possibilities of producing items based on natural gas. In addition, a Headquarters

technical adviser was sent on a short-term mission to explore the possibility of increasing the country's steel production and to recommend measures for further development of the industry.

58. An industrial consultant was also provided at the request of the Government of Guinea to carry out a preliminary survey of industrial development possibilities. The Government has now requested an industrial development adviser to assist in the formulation of industrial policies, to carry out feasibility studies and to evaluate industrial projects within the framework of the general economic development plan of the country.

59. During the period under review the diversity of training is reflected in the fields of study undertaken by the fellows, which included textile machinery, rubber technology, organization of industrial production, metal foundries, steel rolling, machine tools, ceramics technology, small-scale industries, manufacture of dyestuffs, agricultural machinery, plastics industry, fertilizers and insecticides.

60. Projects in the field of industry assisted by the Special Fund in which the Centre is directly involved fall into two main categories: technological research institutes and industrial estates. To date, the United Nations has been designated Executing Agency for eight institutes and for one feasibility study for the establishment of an industrial estate. Some of these projects were the direct result of earlier technical assistance projects under the Expanded Programme (such as the Central American Research Institute for Industry (ICAITI) and the projects in Paraguay and Thailand); others were formulated with the assistance of Headquarters staff members and technical advisers (Bolivia and Colombia).

61. Thus, as a result of a survey and recommendations made by a United Nations expert concerning facilities for applied scientific research in Thailand, the Government requested further assistance by the same expert in the formulation of a Special Fund project for the establishment of a technological research institute. The institute will carry out investigations for the improved commercialization and utilization of the country's resources, including agricultural produce and other raw materials, wood products, local ores, building materials, and fibres. At the request of the Government, the Director of the Research and Evaluation Division visited Israel in order to aid in the reformulation of a request to the Special Fund for the establishment of an industrial research institute. The objective of the project is to develop applied technical and economic research in areas which are potentially suitable for the establishment of export industries such as plastics and polymers, fibres and textiles, and food, and to carry out investigations of new or improved processes or products. Both of the foregoing projects were approved by the Governing Council of the Special Fund at its eleventh session held in January 1964.

62. An industrial estates project in Iran was also approved by the Special Fund during the period under

review. A preliminary team of two experts completed the initial phase of the project, which consisted of a feasibility study to determine the cost and location of the estate in connexion with the finalization of the plan of operation. A report has been submitted to the Government and the next phase of implementation is under way, which includes the recruitment of the team of technical experts provided under the plan of operation.

63. A Headquarters technical adviser visited the Sudan for consultations with local authorities concerning the plan of operation for the Sudan Industrial Research Institute, which was approved by the Special Fund in June 1963. A project manager was recently appointed who will also act as director of the Institute until this function can be taken over by a national.

64. In Bolivia, the project manager is assisting in the negotiation of the plan of operation and expenditure for the Technological Research Institute, and is also advising on the recruitment of experts, and on problems of implementation.

65. A mission was organized by the Centre for Industrial Development during 1963 to review the activities of ICAITI and make recommendations for the future development of its programme. The report, which has been transmitted to the Board of Directors of ICAITI, contains a proposal that Special Fund assistance be continued beyond 1964 to enable the newly appointed Director of the Institute to carry out the work programme recommended by the mission.

66. As in the past, seminars and research dealing with practical problems and needs of industrial development continue to play a significant role in stimulating broader interest and promoting a fuller interchange of information and experience in this field between countries and regions.

67. A Seminar on Industrial Development Programming for the Latin American Region sponsored by the Centre for Industrial Development and ECLA, was held in Sao Paulo, Brazil in March 1963.

68. Another important contribution to the interchange of technological information and experience needed for industrial development was the inter-regional symposium on the application of modern technical practices in the iron and steel industry to the developing countries which was held at Prague and Geneva in November 1963. This meeting, organized jointly with all the regional economic commissions, brought together 126 experts and technicians from fifty of the industrially advanced and developing countries. In addition to providing a forum for the exchange of views among the participants on the role that new technical advances in steel-making would play in developing this sector of production, arrangements were made for inspection tours of steel industry facilities in six European countries.

E. RESOURCES AND TRANSPORT

69. As in 1962, the demand from developing countries for technical assistance in the fields of resources

and transport continued to increase. Within this general trend, however, two situations emerged. First, the number of internationally recruited experts in the field on Special Fund projects almost doubled during 1963, and secondly, the number of experts in the field under United Nations technical assistance programmes decreased slightly during the same period.

70. The substantive servicing of their activities was an important phase of the work of the Resources and Transport Branch. In addition, the substantive and operational servicing of Special Fund projects, and research and assistance involved in the preparation and formulation of new projects in response to requests from Governments, made increasing demands on the time of the staff and technical advisers at Headquarters. By the end of 1963 no less than forty-two approved projects in the fields of natural resources had been assigned to the United Nations as executing agency.

71. Technical assistance activities in the fields of natural resources and transport covered all phases of exploration and development in 1963, owing partly to the wider recognition of the underlying importance of these fields in the economic development of a country. It was also the result of the fact that a number of projects which had been initiated earlier had reached the operational stage.

72. Natural resources surveys on a regional or national level continued to be an important area of action. It has become increasingly evident that the multi-purpose integrated development of river basins and energy resources is a highly efficient approach to development in many areas of the world. This approach is reflected in the projects of the Mekong basin, the Wu and Cho-Shui basins, the Karnali basin, the Senegal basin, the Niger basin, the Chiriqui basin and the Mono basin, some of which are being executed in conjunction with the Special Fund. Broad provision is being made to meet the increased requirements that are anticipated. For example, proposals have been made for increased training for higher government officials in river basin development techniques in the 1965-1966 Expanded Programme. General resources advisers were provided to help Governments with their day-to-day problems and in the planning and execution of resources development. Lastly, a number of technical advisers have been added to the staff at Headquarters in the last two years, all of whom have had practical experience in developing countries. They serve not only as a pool of expert opinion to be drawn upon for short periods by individual countries, but also as members of teams set up at Headquarters to study and advise on multi-purpose projects.

73. An important feature of the technical assistance programme in 1963 was the number of long-term projects which reached the stage at which specific schemes could be implemented, even though the planning and surveying of a whole programme had not been completed. For instance, in Cyprus and China, expert assistance was given to the Governments to assist in the design and construction of dams and other hydraulic works within the long-term programme of

water resources development. Marked progress was made in 1963 in the Lower Mekong scheme, and it is expected that this project will shortly move into the new and more dynamic phase of implementation. In Afghanistan, the geological survey project is now moving into a more advanced stage of implementation. The provision of expert services by the United Nations will be continued in the future to assist the Government in planning and executing specific mineral and ground-water development projects on the basis of information collected systematically over recent years.

74. Another feature of technical assistance in 1963 was the growing number of requests for expert assistance in improving production methods in the fields of mining, water and energy. New or continuing requests for experts to advise on the mining and utilization of coal in the Philippines and Venezuela, mica mining in the Sudan, ilmenite production in the United Arab Republic, gold and diamond prospecting in West African countries and the exploitation of non-metallic materials in Tunisia, semi-precious and ornamental stones in Madagascar, and phosphate in Jordan were all examples of this trend in the field of mineral resources.

75. During 1963, technical assistance funds were used to finance a number of exploratory missions connected with the preparation and formulation of Special Fund requests. These included for example, missions to Dahomey and Togo in connexion with a joint power supply request; to Panama, the countries of the Senegal and Niger river basins, Togo and Dahomey in connexion with water resources requests; to Pakistan in connexion with a cartography request; to a number of countries including Argentina, Bechuanaland, Ecuador, Nicaragua, the Philippines and Senegal, in connexion with potential mineral resources projects; and to Kenya and Tanganyika in connexion with transport requests.

76. Other types of technical assistance provided in 1963 included help to Governments in organizing and developing technical departments or services, geological and mining institutes and similar institutions of lasting value to the countries concerned. Thus, in the field of cartography, many projects were designed to provide self-sufficient technical agencies capable of carrying out regular standard mapping programmes and specific surveying projects. Extensive assistance was provided, as a continuation of earlier programmes or in response to new requests, to Afghanistan, Cambodia, Cameroon, the Congo (Brazzaville), Laos, Mali, the Philippines, the Republic of Viet-Nam, Somalia and the Sudan in connexion with the organization of cartographic services, the preparation of maps, the implementation of topographic, cadastral and other surveys, and the training of technicians. Equipment was provided in some instances and fellowships were awarded for training in cartography, photogrammetry, map reproduction and other mapping and surveying techniques.

77. In the energy field, assistance was given, among others, to the Governments of China, Indonesia, Morocco, Trinidad and Tobago, and Turkey, on petro-

leum and natural gas problems; hydro-electric power experts were sent to Argentina, Ceylon and Panama; advice and assistance in other electric supply problems were given to the Governments of British Guiana, Burma, El Salvador, Iran, Nepal, Syria and the United Arab Republic; and a mission was sent to Costa Rica to explore the geothermal potential of the country. As noted above, missions were also sent to Dahomey and Togo, under the United Nations regular programme of technical assistance, to assist in the preparation of an electrification plan for the two countries to be implemented with the help of the Special Fund.

78. The Central American Electrification Mission, which is a project under the Central American Economic Integration Programme, prepared a number of studies on the possibilities of linking up the electrical systems of various Central American countries and on the combined development of their resources. One of these projects has been accepted by the countries concerned, and pre-investment studies are being carried out. This project would mean savings of some \$24 million, and studies are continuing on another project which would save the two participating countries \$30 million in developing their systems. The mission also gave advice on the formulation of national electrification policies and plans, and on such matters as supplies, tariffs and accounting systems. Lastly, the mission has given assistance in the preparation of a joint request to the United Nations Special Fund for the establishment of a regional network of hydro-meteorological stations and an evaluation of Central America's water resources.

79. Geology and mining continued to be an important sector of activity in 1963. Thus, in addition to continued support for the Israel Technical Advisory Board and the Regional Geological Institute in Bolivia, continuing assistance in the form of teams of experts was provided to Afghanistan, Bolivia, Chile, Madagascar and other countries known to have mineral deposits. Senior mining advisers were sent to Burma, the Congo (Leopoldville), Madagascar, Mali, Panama, Rwanda, Somalia, Tunisia and the Upper Volta. Finally, there was a marked increase in assistance to meet *ad hoc* needs in projects of limited scope. Thus, the Governments of Ethiopia, Guatemala, Nicaragua and the Upper Volta were assisted in drafting mining legislation; a fuel efficiency expert continued his work in Argentina; a laboratory chief and a mineral analyst were stationed in the Ivory Coast; and alluvial gold geologists were recruited for Madagascar. Many of these projects also provided for fellowships for training.

80. In the field of water resources, a number of important advances were made in multi-purpose river basin development schemes. For example, the comprehensive reconnaissance survey report on the Naktong Basin in the Republic of Korea was completed and it is expected that this work will lead to a Special Fund project. Similarly, in the Sittang Valley in Burma, a mission followed up the work of the preliminary planning mission by undertaking detailed studies during the latter

half of 1963; a comprehensive report is in preparation. In the Lower Mekong scheme, progress towards the detailed design and implementation of specific projects was continued with funds made available through United Nations technical assistance, the Special Fund and various bilateral aid programmes. The team which was organized to help the riparian Governments of the Senegal River completed its mission early in 1963. The work was followed by the establishment of an Inter-State Commission representing the four riparian Governments, the drafting of a treaty, and further studies expected to lead to Special Fund projects. The United Nations also played an important part in the preparation of the Niger River Treaty of February 1963, which followed studies made possible through United Nations technical assistance. Assistance was also provided to Cameroon for river basin development, which may lead to a Special Fund project. Lastly, preparatory work in Togo and Dahomey undertaken through United Nations technical assistance led to the Mono River Special Fund project.

81. Other forms of technical assistance by the United Nations in the field of water resources included the provision of experts to the Governments of Barbados, Cameroon, Dahomey, Guinea, Iran, Mali, the Niger, Nigeria, Peru, the Upper Volta and Western Samoa to assist in surface or ground-water exploration and development. Assistance was also given for projects of a more specific nature, including tidal land reclamation in China, drainage and sewerage engineering in Kuwait and the demineralization of sea and brackish water in Argentina and Tunisia.

82. One feature of the 1963 technical assistance programme in the field of transport has been the wider use of regional advisers. For example, two regional transport advisers—a transport economist and an engineer—provided assistance to countries in Africa. In Asia and the Far East, a regional railway research adviser was appointed, in addition to the inland transport adviser, to work on the technological problems of railways in countries in the area. Provision was made for one adviser on surface transport and another on shipping and ports to assist the countries of Central America.

83. Another trend of the transport programme was the emphasis on group training. The Inter-Regional Ports and Shipping Training Seminar held its third session in Copenhagen in June. The number of applicants greatly exceeded the available facilities. At Lahore, the Railway Signalling Training Centre, now being operated by the Government of Pakistan, continued to receive assistance from the United Nations through the provision of lecturers. The South Pacific Regional Training Course in Boatbuilding held two sessions—the second English-language session in Auki, British Solomon Islands, and the first French-language session in Nouville, New Caledonia.

84. Other assistance provided in the transport field included help in transport surveys, programming, co-ordination, policy formulation, finance, engineering and management. During the year, there were

some sixty experts in a considerable number of countries advising on economic aspects, engineering, administration, finance and the like. Road construction received the widest attention. Countries receiving assistance in the ports and shipping field included Chile, the Congo (Brazzaville), Indonesia, Malta, Malaysia (Singapore), Saudi Arabia and the United Arab Republic. Experts in railway construction and maintenance, railway accounting, river navigation and public works provided assistance in British Honduras, Burma, Cameroon, Cyprus, Saudi Arabia, Syria, Togo, the United Arab Republic, Venezuela and Western Samoa, and a mission surveyed the Senegal River.

F. TRADE PROMOTION AND TRADE RELATIONS

85. Increased concern with the trade needs of developing countries, which was illustrated by the decision taken in 1963 to convene the United Nations Conference on Trade and Development in the spring of 1964, has also been reflected in an increase in the number of expert advisers and fellows appointed in this field in 1963 as compared with 1962; the number of experts increased from seventeen to thirty-eight and the number of fellows was maintained at about sixty. Additional impetus in this field has been afforded by the efforts of groups of developing countries to increase economic co-operation among themselves, and to evolve new policies governing their trade relations with economic groupings among the developed countries.

86. At the country level, technical assistance activity in trade promotion has been particularly marked in Latin America and Africa. The Government of Mexico, for example, obtained the services of an economic adviser in foreign trade development, to make recommendations for promoting trade in the Latin American Free-Trade Association and for improving the commercial methods of Mexican exporters. An adviser in foreign trade promotion serving with the Advisory Group in Paraguay completed his assignment, in the course of which he made an extensive study of ways and means of taking greater advantage of opportunities to increase the number of experts. The Government requested a continuation of his services, and he returned there in 1964. In southern Europe, United Nations technical assistance to Malta included the services of a trade expert, who assisted in setting up a trade relations section in the Maltese Government and provided advice regarding trade policies.

87. An example of the provision of assistance in trade matters to a group of countries is provided in Central America, where an expert has been advising the Central American Economic Integration Committee and its member Governments on ways and means of setting up a customs union in accordance with the General Treaty on Central American Economic Integration.

88. In the African region, in addition to country programmes, expert services are also available to Governments on a flexible, short-term basis. A regional adviser

in trade and commerce has been appointed under the regular programme to enable the United Nations to respond promptly to requests for short-term advisory services.

89. The Trade Committee of the Economic Commission for Asia and the Far East recommended that a study be undertaken to determine the possibility of establishing a permanent training centre in trade promotion, and the Standing Committee on Trade of the Economic Commission for Africa lent its support to plans for expanding programmes of trade promotion in Africa, including the establishment of an in-service training programme in the Trade Section of ECA. Requests for training in trade promotion and in the trade problems of regional economic co-operation are increasing, and United Nations training programmes in these fields are under study with a view to ascertaining the best ways of meeting the increased demand.

90. The United Nations Conference on International Travel and Tourism, held from 21 August to 5 September 1963, expressed the view that the volume of domestic and external resources being devoted to the promotion of tourism in the developing countries is inadequate, and recommended, *inter alia*, that the Governments of these countries take more initiative in seeking external assistance, and that agencies, including organs of the United Nations, should give high priority to such requests.²³ These recommendations illustrate an increasing concern with tourism promotion which is expected to result in increased activity in the future.

G. STATISTICS

91. During the year under review, efforts to promote statistical development in all regions continued to receive support from the programmes of technical assistance. An intensive programme of training constitutes an important feature of the efforts made to promote statistical development. In Africa, the urgency of the programme arose from the need to replace departing expatriate staff with local personnel in newly independent countries, the general shortage of middle-level assistants in most African countries and the new requirements for meeting the rapid expansion of statistical organization. On the basis of recommendations of the Conference of African Statisticians, and with the help of technical assistance funds, regional and national training centres have been operating in Africa since the end of 1961.

92. These centres entered their third year of operation in October 1963. The four middle-level centres at Addis Ababa, Achimota, Yaoundé and Abidjan, which accommodated a total of 178 trainees from twenty-five countries during their first two years of operation, enrolled 127 trainees from twenty-five countries for the semester beginning November 1963. The statistical training centre in Rabat, offering a two-year course at the professional level, accommodated about seventy-five trainees from six countries during the same period

and enrolled thirty-four trainees from seven countries for the course beginning in November 1963.

93. In order to co-ordinate statistical training activities throughout the region, the objectives of which were common standards of training and courses of instruction properly adapted to African conditions, two sub-regional meetings of heads of statistical offices were convened in 1962, one for West Africa and the other for North and East Africa. In addition, a meeting of all directors of the centres for consultations on the same topic was held at Addis Ababa in April 1963. The results of these meetings were submitted to the Third Conference of African Statisticians, which agreed that uniformity of curricula and examinations in the principal subjects should remain the goal of centres operating on an international basis. While it is generally agreed that considerable progress has been made towards the training of statistical personnel, both the Economic Commission for Africa at its fifth session and the Conference of African Statisticians at its third session stressed the need to expand existing facilities and provide new ones in order to meet present as well as future needs.

94. In Asia, too, much emphasis has been given to the need for the training of primary and intermediate statisticians and, following recommendations of the Conference of Asian Statisticians on the subject, the following steps were taken to provide guidance to the countries of the region: a Working Group on Training of Statisticians was convened in 1960 to give attention to the practical aspects of organizing and conducting training centres; on the basis of a syllabus drawn up by the Working Group, a training manual was prepared by the ECAFE secretariat; a regional statistical training centre for the organizers of national training centres is now being organized and is scheduled to meet from 14 July to 4 September 1964. The centre will bring together from countries of the region officials responsible for training statistical personnel on a national basis, with a view to discussing organizational and other training problems and exchanging views at seminars. Existing national programmes for training statistical personnel will be reviewed and ways and means will be evolved whereby the recommendations of the 1960 Working Group on Training of Statisticians can be incorporated into such programmes. Lastly, the centre will provide participants with experience in organizing and imparting training along the lines recommended by the Working Group. Provision was made in the technical assistance programme for the organization of seminars in 1963 to promote the exchange of technical information between countries. A seminar on Housing Statistics and Programmes for Asia and the Far East was held at Rolighed near Copenhagen, Denmark, from 25 August to 14 September 1963. The Seminar was organized to provide an opportunity for statisticians engaged in the collection and analysis of housing data and representatives of housing agencies responsible for planning programmes to meet and study methods of formulating and implementing housing programmes within the context of over-all plans of economic and

²³ For the final report of the Conference, see E/3839.

social development and to become familiar with the statistical tools which could usefully be employed for this purpose. Emphasis was placed on the methods of collection and the types of analysis which could be most usefully applied in the ECAFE region.

95. For countries of Europe, a Regional Statistical Seminar on Sampling Methods in Current Statistics was held in Budapest, Hungary, from 16 to 27 September 1963. The topics discussed at the seminar were general methodology of sampling in current statistics, control and estimation of sampling bias and methods of de-biasing, costs and economic efficiency of sample surveys, application of sampling in statistics of industry and commerce, labour statistics and agricultural statistics, sampling in Soviet statistics (including applications in the compilation of index numbers), integration of sample surveys and experience of general-purpose sample inquiries and the history of sampling in official statistics.

96. As in the past, advisory and operational services were provided in 1963, at both the country and the regional level, in order to meet requests for direct assistance in formulating and implementing long-range programmes of statistical development and in building up statistical services. In 1963 the number of statistical experts was ninety-nine.

97. The United Nations continued to award individual fellowships to qualified persons for advanced training in statistics; in 1963, thirty-four fellows from twenty-one countries took up their awards. This figure does not include fellowships granted for participation in training centres or seminars mentioned earlier.

H. SOCIAL DEVELOPMENT AND WELFARE

Social policy

98. In accordance with Economic and Social Council resolution 903 B (XXXIV), regional meetings on social planning in the context of balanced economic and social development were given increased attention during the year under review. A meeting of experts on planning in individual social sectors in relation to economic development was held at Bangkok, Thailand, from 9 to 18 April 1963; it was attended by more than fifty participants, mostly from countries in the region served by the Economic Commission for Asia and the Far East (ECAFE). A working group of experts on the integration of social development plans with over-all development planning met at Addis Ababa, Ethiopia, from 9 to 18 October 1963 and was attended by more than thirty consultants and experts from different areas of planning in African countries. A European meeting on the problems and methods of social planning met at Dubrovnik, Yugoslavia, from 4 to 11 November 1963 and was attended by more than twenty participants drawn from among officials in the planning bureaux of various European countries, academic specialists in planning and experts appointed by the United Nations.

99. In the field of social research, assistance is being given, within the framework of the Central American Integration Programme, through the provision of the services of advisers in equalization of social changes and in socio-economic aspects of income distribution. In addition, a social policy adviser has been assigned to assist the Government of Somalia in the formulation and supervision of its programmes on the social aspects of economic development. The expert will be particularly concerned with policy decisions on the allocation of resources for social projects.

Demography

100. Technical assistance in the demographic field during the period under review was concentrated in the areas of training, advisory services and research projects related to the development needs of Governments. Continuing support was provided to the regional Demographic Training and Research Centres for Asia and the Far East at Chembur (India), and for Latin America at Santiago (Chile). A third centre, designed to meet the needs of North African countries (Algeria, Libya, Morocco, Tunisia, the Sudan and the United Arab Republic), was established at Cairo in March 1963 and initiated training classes in November with a group of twenty fellows. The possibilities were explored of establishing other sub-regional demographic training and research centres in Africa, Central America and Asia.

101. The post of a regional demographic adviser for the African region was established, whose duties consisted of providing advice and assistance in demographic studies to countries of the region, and assisting in the training of personnel at a sub-regional demographic centre. The demographer assigned to the Mexico Office of ECLA to carry out a programme of demographic studies for the Central American countries carried forward, among other studies, the analysis of results of a demographic and socio-economic survey of the metropolitan area of San Salvador.

102. The regional demographic adviser attached to the ECAFE secretariat, in addition to rendering advisory services to Governments to promote the fuller utilization and analysis of data from recent censuses and related materials, undertook as a major responsibility the planning and organizational arrangements for the Asian Population Conference, which was held at New Delhi from 10 to 20 December 1963.

103. All government members and associate members of ECAFE were invited to the Conference, the first of its kind at the regional level, and it was attended by 100 participants (government officials, experts and United Nations officials). The Conference made recommendations with regard to the formulation and implementation of national population policies, modes of international co-operation in promoting research, training and the exchange of information in this field; questions of economic and social policy and planning relevant to population problems; and the development of demographic statistics.

104. As anticipated, there was an increase during the year under review in the number of requests for technical assistance at the national level for developing demographic research, for institutionalizing such research and for training research personnel. Such assistance was rendered during 1963 in Iran, Morocco and Peru; steps were also taken towards fulfilling requests of the Governments of Venezuela and the United Arab Republic for advisory services in demography.

105. A study on social and economic aspects of the growth of the metropolitan area of San Salvador was completed, and a study was initiated of sparsely populated areas as compared with heavily populated areas, with a view to determining the causes of the differences in population behaviour in Central America and its effects on the economic and social development of the countries of the area.

Community development

106. In the field of community development, there has been a greater tendency recently for advisers to be assigned to national planning agencies. While assisting Governments to assess and make provision for personnel, services and material and financial aid for community activities, the advisers have helped to stimulate interest in national development activities and participation through various organizational and institutional devices. A measure of the success of this approach has been the willingness on the part of Governments, such as Afghanistan, Colombia and Nigeria, to divert more resources for the establishment of pilot projects over and above the targets annually set out in their development.

107. During 1963, evaluation teams visited Venezuela and Ghana, and indications are that such teams will be a continuing feature of technical assistance in the field of community development.

108. The community development aspects of land reform have continued to gain the attention of Governments. Algeria has set up a joint United Nations and Food and Agriculture Organization project for land reform and community development, which is being assisted by a community development adviser in addition to the advisers from FAO. Laos has requested an adviser in this field to assist in the resettlement of displaced persons and demobilized personnel. In Bolivia and Ecuador, the advisers continue to assist in the community development aspects of colonization schemes. In British Guiana, the Government has requested an adviser to assist in the resettlement of small farmers on land settlement schemes assisted by the World Food Programme and other programmes. At the request of the Government of Iran, technical assistance was provided for a study of the land reform programme with a view to the formulation of a request to the Special Fund. In order to provide advisory services with regard to the introduction and improvement of community development aspects of land reform and settlement, a regional adviser has been appointed to the Asian area. In the report of the *ad hoc* Group of Experts

in Community Development, which met in February-March 1963, emphasis was placed on the contribution that community development could make to land reform which is certain to create more awareness of this aspect of community development.²⁴

109. Technical assistance is constantly being requested in the field of training for community development. Training advisers have been assigned to Afghanistan, Algeria, Panama and Saudi Arabia, and other similar requests have been received. The Economic Commission for Africa organized a training course in community development in the East African region. A seminar was also organized by the Arab States Training Centre for Education for Community Development (ASPEC), the theme of which was "Training for community development in the Arab countries". As a result of the advisory services of the regional training adviser in ECAFE, many countries in that area are promoting national workshops to determine the training needs in relation to rural and urban community development.

110. The economic aspects of community development are being given more and more emphasis in programme development. In Latin American countries which have drawn up economic development plans, community development is being utilized to implement programmes at the local level. Paraguay and Ecuador have requested the services of an economist to strengthen the economic aspects of community development in their national plans. In Nigeria communal settlement of young people on tribal land is being undertaken through community development as a method of combating rural unemployment. The community development adviser in the Sudan is directing attention, in the pilot project outside Khartoum, to the promotion of market gardening, while in Afghanistan the community development programme has been instrumental in promoting co-operatives, and this has led to the enactment of a co-operative law.

Social services

111. During 1963 there was increased evidence that the developing countries desired assistance in the social services. Algeria, Cyprus and Senegal requested general social welfare advisers to assist in planning and organizing more comprehensive programmes of national social services. In Nigeria and Uganda, in addition to general social welfare advisers, the Governments requested social welfare research advisers to assist in undertaking practical research which would enable the countries to determine needs and provide services on a more scientific basis. Although Ethiopia and Nigeria requested advisory services particularly related to urban areas, it is evident that the Governments wish advice on the establishment of national programmes. Family and child welfare advisers were requested by China and Pakistan, primarily to assist in the development of social services for children. As evidenced by the requests from the Ivory Coast and

²⁴ *Community Development and National Development* (United Nations publication, Sales No.: 64.IV.2).

Nyasaland, training for social services still remains a high priority in the developing countries. There is a growing interest in the establishment of regional training programmes, and the School of Social Work in the Ivory Coast has accepted students from neighbouring countries. Participants in the African Seminar on Social Work Training held at Lusaka, Rhodesia, urged the Economic Commission for Africa to consider the establishment of a regional training centre for senior personnel and training officers. The Government of Chile has requested assistance in establishing an advanced training programme. The Economic Commission for Asia and the Far East has continued to give high priority to training for social services in its programme for 1964, which includes a Working Group on Development of Training Materials, the preparatory work for which was begun in 1963.

112. During 1963, the following meetings were held under the European Social Welfare Programme: Expert Group on Rural Social Welfare Services; Study Group on the Contribution of Social Security to the Development of Family Welfare Services; Study Group on Rural Social Development; Seminar on the Relationship of Social Security and the Social Services; Seminar on Training Senior Personnel for the Social Services and Expert Group on the Problems and Methods of Social Planning.

113. The number of advisers in the field of social services has stimulated the development of co-operative projects of aid to Governments, in which technical assistance from the United Nations and material aid provided by the United Nations Children's Fund (UNICEF) have together helped Governments to implement certain social goals. The policies, broadened in 1961, now make it possible, for example, for UNICEF to finance new posts for a specified period in a Government's social welfare or related programme, thus helping to benefit children by strengthening the infrastructure in a ministry or department responsible for social welfare. In a few instances in, for example, China, Indonesia, Mexico and Pakistan, a United Nations adviser has been assigned to assist in the implementation of the project. In some countries where the United Nations and UNICEF have been assisting in the development of family and child welfare services, Governments are now moving towards the development of more comprehensive social welfare programmes and have sought assistance from United Nations and UNICEF in making assessments of their national needs and resources as a basis for national planning in the social sector. Many jointly-assisted projects were first initiated to foster the training of social welfare personnel, usually beginning with direct service staff. In several such countries, these training programmes have been extended and now provide also for advanced training of senior administrative and advisory personnel.

Rehabilitation of the handicapped

114. There was a marked increase in 1963 in technical assistance in rehabilitation of the disabled, both

with respect to the assignment of advisers and the training of personnel through the granting of fellowships. In the assignment of advisers, the trend was towards greater use of experts of a general character to evaluate and co-ordinate the various existing services for the disabled and to relate these services to other social and economic programmes in the country. The major projects begun in 1963 include the organization of a rehabilitation centre and other services for the disabled in Malaysia, a prosthetics workshop and training programme in Iran, and the introduction of rehabilitation elements into the institutional care of crippled children in the Philippines.

Social defence

115. Training activities in the field of the prevention of crime and the treatment of offenders continued during 1963 and remained the primary preoccupation of the Asia and Far East Institute for the Prevention of Crime and the Treatment of Offenders, which was established in 1962 at Fuchu, Japan, under the auspices of the United Nations, with the co-operation of the Government of Japan. The Institute is the first regional institute to be set up to train personnel and carry out research in the field, provide consultative or advisory services to Governments in the region and serve as a clearing-house and documentation centre for the collection of data and the dissemination of information and training materials. During 1963, three international training courses, lasting one month, six months and three months respectively, were held for trainees, largely senior correctional personnel, from eighteen countries in Asia and the Far East. At the request of the Governments of Malaysia and Thailand, training and advisory services were undertaken by senior officials of the Institute and a visiting expert. The Institute's teaching faculty was strengthened during the period under review; six visiting experts participated in the training courses, and a research programme covering five projects was planned and set in motion.

116. In order to stimulate action in the social defence field in the various geographical areas, the United Nations planned a series of regional meetings. The first of these meetings, for Latin America, was held at La Guaira, Venezuela, from 9 to 18 September 1963.²⁵ It was attended by participants from eleven Latin American countries (Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Ecuador, Mexico, Peru, Uruguay and Venezuela), as well as an expert from Sweden and observers from the specialized agencies, the Organization of American States and certain other Governments and national organizations. Attention was focussed on problems of delinquency and crime in relation to rapid social change in Latin America. Recommendations were formulated on the prevention of juvenile delinquency, training of personnel, probation and related measures and the institutional treatment of adults and juveniles which, if implemented, should aid in the development of social defence programmes in the region and in the prevention

²⁵ For the report of the meeting, see ST/TAO/Ser.C/68.

of criminality resulting from social change accompanying economic development.

Housing

117. A major feature of technical assistance in the field of housing, building and planning during the period under review was the further strengthening of a regional approach and of the pilot project programme, and increased co-ordination with United Nations Headquarters. A regional housing programming adviser was added to the staff of ECLA, which also had one adviser assigned to Central America. A housing finance adviser was also recently recruited. The Economic Commission for Africa now has a regional adviser on self-help housing and one on low-cost housing financed from technical assistance funds.

118. Four pilot projects in housing were in progress or were initiated during the year, and five others were in the active planning stage. Experience with these projects has led to the evolution of a more formal set of administrative procedures for implementation than now exists.

119. The policy of conducting seminars on selected aspects of housing in all regions of the world on a basis of rotation was extended. Following a Seminar on Housing Statistics and Programmes for Latin America in 1962, a similar seminar was held for Asia and the Far East in 1963, and one will be held in Africa in the near future. This approach provides an opportunity for a world-wide discussion of important subjects, and results in a comprehensive set of co-ordinated recommendations. Similar series have been planned for other aspects of housing: the social aspects of housing, beginning in 1963 with the inter-regional Meeting of Group of Experts on Housing Management and Tenant Education in New Zealand,²⁶ and the financing of housing, which began in 1963 with the Seminar on Financing of Housing for the Arab States.

120. In all these activities, emphasis is put on the importance of training local personnel and developing the building materials industry and mobilizing local resources for housing through self-help and other methods. Nevertheless, there is a continuing and increasing tendency to approach external sources with requests for technical assistance in the form of funds, materials and experts to supplement United Nations assistance. Thus, in Ethiopia and Somalia, the American Friends Society has contributed funds; in Ethiopia, Somalia and the Philippines, associate experts have been provided by the Government of Sweden. For the pilot housing project in Guinea, the Government of Israel has pledged \$70,000 to supplement the United Nations contribution of a project co-ordinator, and Poland and Yugoslavia have discussed additional contributions in materials and equipment. Similar approaches are being made on all pilot projects. With respect to the holding of seminars, Denmark has

financed two conferences, and Romania has discussed the possibility of a similar contribution.

Physical planning and urbanization

121. A significant trend in physical planning was the demand from some of the smaller countries for advice on the establishment of a national physical planning framework for the country. Thus in Ghana, a team of three United Nations technical assistance experts helped the Government in the preparation of a national physical development plan and draft legislation for its implementation. In Trinidad and Tobago, a team of three United Nations experts is advising on a similar project. Requests for this kind of assistance have also been received from Barbados and Malta.

122. Another trend in the physical planning field seems to be the lengthening of the duration of the assignment. This is understandable in view of the complexity of the problems involved, the shortage of trained personnel in the developing countries and a lack of readily available data. In this connexion, the services of associate experts have been most useful to Governments and senior technical assistance advisers, especially in the collection of basic data and research for planning.

123. The training of personnel continues to have the same importance as in past years. In addition to the assistance already provided for the development of the physical planning institutes in Ghana and Indonesia, an expert has been provided to the Government of Nigeria to advise on the curriculum for a town planning course at the Technical College in Ibadan. Assistance is also being provided to the Government of Ceylon for the establishment of a course of training for architects and town planners.

124. An important new trend is the growing use of technical assistance funds by Governments to assist them in formulating requests to the Special Fund. The experts so requested are usually able to complete their assignments in two to four weeks. The first request for such assistance was made by the Government of Venezuela to assist the Centro de Estudios del Desarrollo Universidad Central de Venezuela (CENDES) to establish a programme of studies in urbanization. This request is now under consideration by the Special Fund. Two expert assignments of this nature have been undertaken in Skoplje, Yugoslavia, and Lagos, Nigeria. The former request, which is for assistance in the replanning of Skoplje after the disastrous earthquake of July 1963, was considered by the Consultative Board at its meeting in early March 1964. The possibility of further action of this nature is envisaged in other countries, such as Algeria, Afghanistan and Singapore.

125. Technical assistance for the reconstruction of areas devastated by natural disasters has increased and has become an important activity of the United Nations during the past years owing to the frequent recurrence of such disasters. During the past year, assistance in this field was provided to Libya, Trinidad and Tobago, and Yugoslavia, in addition to Iran, where

²⁶ For the report of the meeting, see ST/TAO/Ser.C/61.

assistance was continued for the reconstruction of the Ghazvin area, which was destroyed by an earthquake in 1962.

Building

126. In the field of building, increasing interest was taken by Governments in the development of local building materials and construction industries. Technical assistance experts were provided to the Governments of Cambodia, Iraq, Togo and the United Arab Republic to advise on the use of inexpensive local building materials for the construction of houses. Fifty building technologists from Asian, African, Middle Eastern and Latin American countries also participated in the Study Tour to the Union of Soviet Socialist Republics which was concerned with problems relating to the development of the building materials and construction industries.²⁷ The participants made several recommendations relating to standardization of building components, industrialized techniques in housing construction and mass production of building materials which are applicable to the developing countries.

I. PUBLIC ADMINISTRATION

127. Pursuant to resolution 907 (XXXIV) of the Economic and Social Council, a Survey of Public Administration Programmes and Provision of Operational, Executive and Administrative Personnel in the United Nations and the Specialized Agencies was prepared for the Administrative Committee on Co-ordination. As a result of the increasing recognition on the part of the Governments that effective public administration is a prerequisite of national development, United Nations activities in the field of public administration have shown a substantial increase over the previous years.

128. The clearest evidence of this is the increase during the period under review of the number of technical assistance requests received from Member States in the field of public administration. In 1963 there were 201 experts, as compared with 150 in 1962, 130 in 1961 and 112 in 1960. During the same period there were 281 fellowships awarded as compared with 251 in 1962, 193 in 1961 and 181 in 1960. Regional and inter-regional efforts have also been stepped up to support the work of experts in the field and to suggest alternative solutions based on a comparative study for the administrative problems faced by developing countries.

129. In addition to the increase in expert posts, activities in public administration show a broadening in scope through new types of assistance. An example of the first type was the mission requested by the Governments of Senegal and the Gambia with a view to gathering economic and political data on which decisions could be taken as to the form that the future relationship of the two countries might take.

130. In accordance with its new plan of activities, the Advanced School of Public Administration for Central America (ESAPAC) carried out a wide range

of activities during 1963. A seminar was held on administration for development, the purposes of which were to make a systematic study of the functions of key public agencies in development policy and strategy and of relations and interactions between political, administrative and technical bodies, with a view to ensuring consistency between policies and action. A Seminar on Customs Administration was held, during which the administrative aspects of the application of the Central American Uniform Customs Code were analysed and uniform tariff legislation was studied. A regional course was given on administration for development, the purpose of which was to train operational-level government personnel in Central America who are performing, or may be called on to perform, duties related to the introduction or operation of administrative systems or agencies intimately involved in the formulation, execution and supervision of plans, programmes, projects and activities for development and economic integration.

131. National courses were given on customs technology with a view to standardizing the application of national tariffs based on the Standard Central American Tariff Nomenclature (NAUCA). These courses were held in Nicaragua for sixty-two participants, in Honduras for fifty-two, in El Salvador for ninety, in Guatemala for fifty-five, in Costa Rica for sixty, and in Panama for sixty. An ESAPAC publication of 900 pages on the classification of goods and methods of applying the nomenclature has been widely distributed in all countries.

132. Other meetings at ESAPAC during 1963 included the workshop on Budgetary Classification and Management in Central America and Panama²⁸ and the First Central American Course on Programming Techniques.

133. Activities in this field have also been broadened by means of joint projects with specialized agencies, and a senior consultant was appointed in Europe to develop this phase of the activities in the field of public administration. The United Nations, the Special Fund, the International Labour Organization (ILO) and the United Nations Educational Scientific and Cultural Organization (UNESCO) sponsored a joint mission to the Niger with a view to examining in broad terms the needs of the country of various types of technical and administrative training. The visit resulted in a government request to the Special Fund for long-term assistance in establishing a school of public administration. The establishment of such a school is designed to serve the dual purpose of meeting urgent training needs of middle management officials of the Government and providing for accelerated vocational and professional education to meet longer-term needs in both the public and the private sectors of a new developing State.

134. Joint efforts between the United Nations and specialized agencies during the period under review included workshops and seminars. A Workshop on Administrative Problems of Rapid Urban Growth in

²⁷ Report of the Study Tour of Building Technologists from Latin America, Africa and the Middle East to the Union of Soviet Socialist Republics (3 to 31 July 1963) (ST/TAO/Ser.C/65).

²⁸ For the report of the workshop, see ST/TAO/Ser.C/66.

the Arab States was held in March 1963, under the auspices of the Bureau of Social Affairs, WHO and UNESCO.²⁹ A Seminar on Central Services to Local Authorities was held in collaboration with the Eastern Regional Organization for Public Administration (EROPA), ECAFE, FAO, UNESCO and WHO, and the United Nations Inter-Municipal Technical Assistance Programme (UNITAP) in collaboration with the International Union of Local Authorities of The Hague.

135. Following a request by ECA at its fifth session, a working party was convened in Paris from 14 to 17 May 1963 to discuss regional and sub-regional support of national efforts to improve public administration and to develop training activities in this field in Africa. The meeting included participants from the United Nations, UNESCO, the ILO and ECA, as well as from those bilateral agencies with extensive training programmes in Africa. The purpose of the meeting was to identify possible regional approaches to training problems and to discuss technical matters of survey methodology and resources available for surveys and training programmes in the sub-regions.

136. In response to the demands of the regional economic commissions and developing countries, the trend in the public administration programme is now towards research and assistance in three main fields, all of which are directed towards the building of institutions for development. In the first place, urgent measures are required for the development of competent civil service and personnel systems and for the building of institutions. This calls for the development of comprehensive and long-term training schemes at all levels. Secondly, special emphasis is being given to the requirements of development planning and to the need to relate every form of assistance to the development goals of the country. Thirdly, materials are being assembled and assistance provided in methods of improving regional and local administration. In accordance with the first requirement, the largest number of experts in public administration are advisers on personnel and training and, in most cases, their efforts are directed towards the establishment of training institutes. Public administration institutes in Central America, Colombia, Ethiopia, Ghana, Libya, the Sudan and the United Arab Republic received expert assistance, while exploratory steps are being taken to establish similar institutes in the Niger and Somalia.

137. In some developing countries, the established educational system has not yet evolved to a point where it can produce, on a regular and continuing basis, all the trained vocational and professional personnel that an expanding government demands. Therefore, in addition to the long-term planning of such education by UNESCO and the ILO, the United Nations supplements these efforts by providing short-term training and a type of accelerated instruction of a practical nature that meets urgent needs on an interim basis. Such programmes, however, from the outset provide

for the in-service training of all technical and professional cadres on a continuing basis. Normal attrition within the civil service along with rapid changes in science and technology make such training essential. National institutions and programmes of training are not only more economical, but more closely connected with the work. This important dual purpose was accomplished through the concerted action of the United Nations and the specialized agencies.

138. To meet the second requirement, assistance has been given to countries engaged in long-term development planning by providing experts on the administrative aspects involved. To support this type of assistance, studies and training activities are being carried out on a regional and inter-regional basis in Africa, Asia, the Far East and Latin America in collaboration with the specialized agencies and the regional economic commissions. Special attention is being given to the machinery and procedures for planning and plan implementation suited to the circumstances and stages of development of the respective countries.

139. Closely related to these efforts are the research and training projects developed by the Division for Public Administration, which include management of public enterprises, government purchasing and supply and mechanized data processing in government operations.

140. Assistance is also being given in decentralization, including regional and local administration as well as local government. For example, an expert made a comprehensive study of relationships between the central government and the local government units in Jamaica. Another assisted the Government of the Niger in preparing a basic statute for regional and local administration. Another assisted the Government of Morocco in developing a new system of local government.

141. The number of experts in local government and administration has increased greatly owing in part to the inter-regional and regional projects in this field financed from regular funds. Through such projects, guides have been developed on alternative approaches to decentralization for rural development, on the administration of new towns, and on methods of organizing at the national level for rational decentralization of powers and functions and for the improvement of local government.³⁰ Studies under way and programmed in 1964-1966 will fill important gaps in information on comparative experience in dealing with common administrative problems at the local level, including a study of the administrative aspects of urbanization, which was approved by the Economic and Social Council resolution 830 B (XXXII),

³⁰ See *Public Administration Aspects of Community Development Programmes* (United Nations publication, Sales No.: 59.II.H.2); *Public Administration Problems of New and Rapidly Growing Towns in Asia* (United Nations publication, Sales No.: 62.II.H.1); *Decentralization for National and Local Development* (United Nations publication, Sales No.: 62.II.H.2); *Local Government in Selected Countries* (United Nations publication, Sales No.: 63.II.H.1), part of a study on Central Services for local Authorities carried out by the International Union of Local Authorities for the United Nations.

²⁹ For the report of the workshop, see United Nations publication, Sales No.: 64.II.H.1.

a study of unified personnel systems for local authorities, and a study of credit institutions for local authorities. The inter-regional meetings that are held to review the drafts of studies provide an opportunity for useful contact by senior officials of ministries of local government and related fields. Similarly, regional meetings, such as those held in Beirut and New Delhi, facilitate similar contacts on a regional basis, produce regional materials which are useful as guides for training purposes,³¹ and place responsible national officials in contact with United Nations officials, who can advise them on technical possibilities.

J. PROVISION OF OPERATIONAL, EXECUTIVE AND ADMINISTRATIVE PERSONNEL

142. The level of the present annual appropriation of \$850,000 for the provision of OPEX personnel has been considered sufficient to provide for the support of a maximum of some seventy posts for a full year. Since this level of appropriation was established by the General Assembly at its fifteenth session, the number of posts filled for all or part of each succeeding year has risen from thirty-seven in 1961 to sixty-eight in 1962 and to seventy-eight in 1963.

143. Although OPEX assistance in 1963 was provided to twenty-nine countries and territories in addition to the East African Common Services Organization (Kenya, Tanganyika and Uganda), the requests of Governments for this form of technical assistance exceeded the amount of funds available. By the end of 1963, a total of fifty Governments had signed OPEX agreements with the United Nations, and there were approximately 200 unfilled requests.

144. Since the provisions of General Assembly resolution 1256 (XIII) did not limit this form of assistance under the United Nations regular budget to fields of activity wholly within the competence of the United Nations, OPEX assistance in 1963 continued to cover a substantial number of posts (approximately one-third) exclusively within the substantive competence of specialized agencies. In addition, there were a number of posts filled for which a specialized agency shared substantive interest with the United Nations.

145. The following figures indicate the number of posts filled in 1963 within the competence of the respective organizations:

United Nations	52 ^{a b}	UPU	2
FAO	6	WHO	1
ICAO	3	WMO	8
ILO	2		
ITU	4	Total	78

^a Of these posts 7 were of joint concern to the United Nations and a specialized agency; 4 concerned the FAO and 3 the IMF.

^b One post was vacated in 1963 and refilled before the end of the year.

146. An analysis of the posts filled in fields of activity within the competence of the United Nations shows

³¹ See *Administrative Problems on Rapid Urban Growth in the Arab States, 1963* (United Nations publication, Sales No.: 64.II.H.1); United Nations-EROPA Seminar on Central Services to Local Authorities, 21 October to 6 November 1963.

that the interest of Governments in securing OPEX assistance ranged broadly over the areas of economic development, social welfare and public administration. The following is a breakdown of the fields of activity covered:

Posts by main United Nations fields of activity

Public administration	8
Public finance	5
Statistics	8
Financial institutions	3 ^a
Economic surveys	3
Economic planning and programming	1
Natural resources development and power	7 ^b
Industrial development and productivity	7
Housing, physical planning and building	6
Public works	1
Land tenure	1 ^b
Trade promotion	2
	—
	52

^a Three posts jointly with the IMF.

^b Four posts jointly with the FAO.

147. In the Secretary-General's report to the Council last year³², reference was made to the then impending review by the Technical Assistance Committee of the financial requirements for this form of technical assistance, in the light of the demonstrated interest of Governments in the OPEX programme and of the limitations imposed by the annual level of the appropriation under the regular budget of the United Nations. The Council approved the recommendations of TAC and by resolution 951 (XXXVI) authorized, subject to approval by the General Assembly and on an experimental basis from 1964-1966, the use of funds for the provision of operational posts from the Special Account of the Expanded Programme of Technical Assistance. The General Assembly endorsed these proposals at its eighteenth session (resolution 1946 (XVIII)), and requested the Secretary-General to report on the results of the experiment at the twenty-first session.

148. Since the country programmes of Governments have already been approved for 1964, the action of the General Assembly will have a limited effect during the current year. Operational posts will either have to be provided within the procedures for programme changes or the use of programme savings or by recourse to contingency financing under the Working Capital and Reserve Fund of the Technical Assistance Board. The full effect, however, will be felt in 1965-1966. In putting forward their programme proposals for the next biennial, Governments will now be in a position to indicate their needs for expert assistance under the Expanded Programme of both the advisory and the operational kind, subject to the general principles laid down in the original OPEX programme by the General Assembly and to the additional criteria approved

³² *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 14, document E/3757 and Add.1.*

by the Economic and Social Council in recommending the use of funds from the Expanded Programme.

149. The OPEX programme under the United Nations regular budget will continue to be available for the provision of assistance pursuant to General Assembly resolution 1256 (XIII), but the bulk of the funds will be available for financing posts either exclusively in fields of activity within the competence of the United Nations or for posts in which the United Nations shares a joint interest, substantively, with one or more of the specialized agencies. Agreement has already been reached with all the specialized agencies for which posts within their substantive competence appear in the current OPEX programme, whereby an orderly transfer of administrative and financial responsibility for these posts to the specialized agencies will be effected. At the same time, the OPEX programme under the United Nations regular budget will also be available for meeting requests for certain key posts in the fields of the specialized agencies, in agreement with the respective organizations.

150. In the Secretary-General's report to the Council last year, attention was drawn to the long-term nature of the bulk of the OPEX assignments and to the factors which contribute to this characteristic of these assignments. Experience during 1963 has continued to bear out the fact that achievement of the desirable goal of all OPEX appointments, namely the development of self-sufficiency in trained nationals to take over the responsibilities temporarily assumed by the international experts, requires a high degree of co-operation between the participating organizations, recipient Governments and OPEX officers. During 1963, the turnover in personnel was higher than in 1962, since some twenty-four posts were vacated.

151. The Economic and Social Council's resolution 951 (XXXVI), subsequently endorsed by the General Assembly, introduced additional criteria for the provision of operational personnel, stressing the importance of the requirement that each request demonstrate that a definite and important element of training of national counterpart personnel would form part of each project, and that priority should be accorded to requests related to long-term planning assistance provided by participating organizations while, at the same time, giving consideration to the special situation in the newly independent countries. These criteria will provide a basis for improving procedures, including the development of an operational plan for each appointment and for the co-ordination of OPEX assistance with all other technical assistance, from both the United Nations and specialized agencies.

K. HUMAN RIGHTS

152. During 1963, the emphasis in the programme of advisory services in the field of human rights reflected the growing interest of Governments in human rights fellowships. Close to 100 applications were reviewed during the year, and it was possible to award approx-

imately forty fellowships following the concurrence of the Advisory Committee on Administrative and Budgetary Questions in the transfer of \$40,000 from another section of part V of the 1963 budget appropriations.

153. In line with the request made in General Assembly resolution 1782 (XVII), the number of 1963 fellowship awards was thus approximately double the 1962 total, not including participants in seminars. The principal criterion in selecting human rights fellows is the practical applicability of the experience in the home country. As the fellowship programme has developed, it has become the practice not to make awards either for academic instruction or for research projects. Areas of study in which awards were made for the first time in 1963 include:

(a) Problems of human rights in the formulation of government legislation, decrees and regulations;

(b) Protection of human rights in a multi-national society;

(c) Protection of human rights of juvenile delinquents in the administration of justice in children's courts;

(d) Role of the police in the protection of human rights;

(e) Legal aid systems and treatment of offenders;

(f) Protection of human rights in the rehabilitation of discharged prisoners;

(g) Drafting and implementation of legislation related to the protection of the rights of the child and of the family;

(h) Equal employment opportunities for women;

(i) Legal aid and assistance, with particular reference to the application of these techniques to the improvement of the status of women;

(j) Problems of ensuring freedom of information through laws, regulations and press codes.

154. In 1963, three regional seminars were held under the advisory services programme. The seminar on the role of the police in the protection of human rights held at Canberra, Australia, from 29 April to 13 May 1963, was the first to be organized on this topic, and aroused wide interest in the Asia and Far East area. In accordance with a request made by the seminar (ST/TAO/HR/16, para. 209), the question of an international code of police ethics was included on the agenda of the twentieth session of the Commission on Human Rights. Another result of the seminar is that requests have been received for fellowships in this field. Similarly, the 1963 seminar on the rights of the child, held at Warsaw, Poland, from 6 to 19 August 1963 (ST/TAO/HR/17), was the first to be held on this topic. It led to an increased number of government requests for fellowships dealing with protection of the rights of the child.

155. The seminar on the status of women in family law, held at Bogotá, Colombia, from 3 to 16 December

1963, was the third in a series of seminars on this topic; the previous ones were held in 1961 in Bucharest and in 1962 in Tokyo, and the fourth in the series will be held in 1964 at Lomé, Togo.

L. NARCOTICS CONTROL

156. In 1963, technical co-operation in the field of narcotics control continued to be financed partly under the Expanded Programme of Technical Assistance and partly under General Assembly resolution 1395 (XIV).

157. Under the continuing programme established by resolution 1395 (XIV), one inter-country and one regional project were undertaken:

(a) The second part of a visiting mission of experts to Governments in the Middle East and North Africa was carried out during the period from 4 September to 12 October 1963.³³ The experts visited and consulted with government officials in Algeria, Cyprus, Iran, Israel, Lebanon, Syria, Tunisia and Turkey;

(b) A seminar on narcotics problems in developing countries in Africa was held at Addis Ababa, Ethiopia,

from 11 to 22 November 1963. The participants were from Cameroon, the Congo (Brazzaville), Dahomey, Ethiopia, French Somaliland, Ghana, the Ivory Coast, Kenya, Liberia, Madagascar, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, the Sudan and Uganda.

158. Fellowships in narcotics control were completed by nationals of the following countries: three from Thailand, one from Mexico and one from the United Arab Republic. A fellowship for the study of *cannabis sativa* was awarded to Greece and will be completed in 1964. Of the continuing fellowships, one was awarded to Iran for the study of the determination of opium origin, and the work was completed during the year. One fellowship was awarded to Turkey for the study of opium origin and analysis, which was continued and extended to 1964. Finally, three fellowships in narcotics control were awarded in 1963 to China, Nigeria and Thailand.

159. Under the Expanded Programme of Technical Assistance, the services of an expert in narcotics made available to the Government of Iran continued throughout 1963.

160. During the year under review, additions were made to the collection of films and slides on narcotics control and loans to Governments and institutions were continued.

³³ For the report of the visiting mission, see TAO/ME/2.

TABLE 2. EXPENDITURE BY SOURCE OF FUNDS

(Amounts in United States dollars)

	1961		1962		1963	
	Appropriation	Expenditures	Appropriation	Expenditures	Appropriation	Expenditures

Regular programme of Technical Assistance: the 1965 programme

1. The Technical Assistance Committee at its last session held in November-December 1963 suggested that the regular programme for 1965 should be drawn up on the basis that the appropriation available would be \$6.4 million, the amount proposed by the Secretary-General.³⁴

2. Under the new time-table introduced by the Committee in 1963 at its autumn session, the Committee establishes the level of regular programme activities for the year after the next, and at its summer session that follows it receives for study the detailed regular programme proposals for that year. The Committee presents in this report the detailed programme proposals for 1965.

3. These detailed programme proposals enable the Committee to review for the Economic and Social Council its initial position on the total size of the regular programme and, under each of the sections forming part V of the regular budget of the United Nations, as well

as under each of the three major fields of activities, that is; economic development (including industrial development); social welfare; and public administration, the proposed distribution of this amount among country programmes and regional and inter-regional projects. The Committee makes this review in the light of the recommendations made by various legislative bodies, among them the regional economic commissions the functional commissions and committees of the Economic and Social Council.

4. In his presentation of the 1964 budget estimates, the Secretary-General described³⁵ his conception of the regular programme as that of an instrument the flexibility of which makes it particularly well suited to meet new and urgent needs that can be less easily accommodated under the Expanded Programme for Technical Assistance. He indicated his intention to take increasing advantage of the distinctive features of the regular programme for responding quickly to such requirements, for promoting decentralization and for fostering increased activity in the "impact areas" singled out by the legislative bodies of the Organization.

³⁴ E/3849, para. 65, and E/TAC/137.

³⁵ *Official Records of the General Assembly, Eighteenth Session, Supplement No. 5 (A/5505)*, pp. 102 and 103.

5. The spirit in which the Secretary-General prepared his detailed project proposals is that of a limited reconversion initiated in 1963 and continued in 1964. Account was also taken of the directives and recommendations of the Technical Assistance Committee and the *Ad Hoc* Committee on the Co-ordination of Technical Assistance Activities established under Economic and Social Council resolution 851 (XXXII).

6. The attention of the Committee is called to the prevailing view held in this *Ad Hoc* Committee on the considerations which should be borne in mind in the drawing up of all regular programmes.³⁶ The relevant considerations are the following:

“(a) Activities which could equally well be carried out under the Expanded Programme should as far as feasible be left to that Programme.

“(b) The regular programmes should therefore be concentrated upon those types of assistance which are not suitable for Expanded Programme procedures, in particular:

“(i) Continuing research programmes at Headquarters or in the field concerned with operational activities, which cannot be related to specific country requests.

“(ii) Advisory assignments of a regional or inter-regional character which can most efficiently be undertaken by experts or teams of experts retained on a long-term basis at Headquarters or in the regions instead of being recruited for specified assignments.

(c) There should be maximum flexibility in drawing up the programmes to permit response to the needs expressed by individual developing countries.”

7. The subsequent sections of this report refer to the preparation of the 1965 country programmes and to the topics considered to be of strategic importance which have been before the Committee during the last year, including the question of possible transfer of continuing country projects to the Expanded Programme, the question of priorities, and technical assistance for industrial development and for other “impact areas”.

8. Pending the outcome of the study by this Committee, the initial budget estimates for part V of the regular budget for 1965, as submitted to the Advisory Committee on Administrative and Budgetary Questions, for reasons stated in paragraph 12 below made no attempt to provide a sectional distribution of the total anticipated availability, with the exception of section 15 (human rights) and section 17 (control of narcotic drugs), for which the Secretary-General proposed the amounts of \$180,000 and \$75,000 respectively. These estimates will be revised in the light of recommendations of this Committee as to the level and content and submitted to the General Assembly at its nineteenth session.

A. PREPARATION OF COUNTRY PROGRAMMES

9. In drawing up the proposed 1965 programme, the Secretary-General continued to take into account the concern of the Committee that the contents of this programme, while complementing the Expanded Programme, should also be distinguished from it in particular respects. The Governments were requested in submitting their requests for 1965 to bear in mind that the regular programme funds should also be available to meet emergency and special requirements, including the needs of the newly-independent countries, and that these funds should not be committed to too many long-term projects; they were also requested to transfer as far as possible continuing commitments arising out of the 1963-1964 regular programme to their 1965-1966 requests under the Expanded Programme. At the same time, it was indicated to Governments that the resources under the regular programme were unlikely to be sufficient to meet all requests and that no individual country targets could be established.

10. Programming for the 1965 regular programme and the 1965-1966 Expanded Programme was carried out simultaneously. Consultations with government officials were held in many developing countries during the programming visits which, in a number of cases, were made by senior officers from both Headquarters and the regional economic commission secretariats. The experience gained through these visits was very valuable. Through direct contact with United Nations officials, government officials were able to obtain a better understanding of the manner in which United Nations technical assistance programmes operate and thus be in a better position to plan for utilization of the available services; United Nations officials were in a position to learn in greater detail both the content of the requests and how they fit into national development plans and thus better serve the requesting Governments.

B. PRIORITIES AND TECHNICAL ASSISTANCE FOR INDUSTRIAL DEVELOPMENT

11. The question of the need for the regular programme to be more responsive to the priority requirements of the requesting Governments was examined by the Technical Assistance Committee at its summer session in 1963. Its recommendations were adopted by the General Assembly in resolution 1988 (XVIII) of 17 December 1963, according to which the Secretary-General was authorized to make adjustments in the sectional provisions of the budget for section 13 (economic development), section 14 (social welfare), and chapter I of section 16 (public administration) to a maximum adjustment of 5 per cent in any one of these sections so as to increase one or more of the sections under part V.

12. At its subsequent session in 1963, the Technical Assistance Committee continued to study the question of priorities and addressed itself specifically to the need of an increase in technical assistance for indus-

³⁶ E/3862, para. 48.

trial development. While it had before it a submission by the Secretary-General³⁷ on a tentative initial distribution of \$6.4 million among the several sections in part V of the budget, several members indicated that the recommendation of the level of \$6.4 million for 1965 did not constitute an approval of that sectional breakdown.³⁸ The Committee felt that the regular programme needed to reflect the priorities for technical assistance determined by each developing country in the light of its own development plan and emphasized the importance attached to industrial development as a major factor in accelerating their economic development. It requested the Secretary-General, "... after appropriate consultations, to submit to the 1964 summer session of the Committee a plan for reallocating the funds available under part V of the regular budget for 1965 in such a way as to effect an increase in section 13 (economic development), which will permit the provision under a separate chapter heading within that section of a sum specifically for industrial development".³⁹ The Committee at the same time requested the Secretary-General to consult with the Governments of developing countries and to make recommendations for further flexibility designed to reflect the changing and varied priorities of those countries.

13. The Commissioner for Technical Assistance sub-

³⁷ E/TAC/137, para. 13.

³⁸ E/3849, para. 65.

³⁹ E/3849, annex IV.

sequently addressed himself through the Resident Representatives to the Governments of the developing countries on this subject. The Governments were asked to present their requests for 1965 under the regular programme in two ways. The first of these called for the submission, as in prior years, of project proposals in accordance with the existing sectional distribution in part V of the budget. The second method called for the submission of requests in a strict descending priority order without regard to the sectional breakdown. The Governments were also asked to indicate their preference for either plan.

C. PROPOSED 1965 REGULAR PROGRAMME

14. On the basis of the requests received from the Governments of developing countries, the Secretary-General submits for the consideration of the Economic and Social Council and its Technical Assistance Committee detailed project proposals for country programmes and regional and inter-regional programmes for 1965 in the fields of economic development, social welfare and public administration, including OPEX. These proposals are given in annex I. On the left-hand side of the tables in this annex the projects for 1965 are presented in accordance with existing sectional distribution in part V of the budget, under General Assembly resolution 200 (III) (economic development), resolution 418 (V) (social welfare), resolution 723 (VIII) (public administration), and resolution 1256 (XIII) (OPEX), and are summarized in table A below:

TABLE A. PROPOSED 1965 REGULAR PROGRAMME BASED ON EXISTING SECTIONAL DISTRIBUTION^a

(In United States dollars)

	Resolution 200 (III) Section 13	Resolution 418 (V) Section 14	Resolution 723 (VIII) Section 16 chapter 1	Resolution 1256 (XIII) Section 16 chapter 2	Total
Africa	877,000	746,900	565,000	457,500	2,646,400
Asia and the Far East	489,600	605,700	133,700	202,500	1,431,500
Europe	3,200	110,300	15,900	22,000	151,400
Latin America	400,200	381,500	101,300	127,500	1,010,500
Middle East	60,000	140,600	24,100	40,500	265,200
Inter-regional	420,000	80,000	140,000	—	640,000
TOTAL	2,250,000	2,065,000	980,000	850,000	6,145,000

^a Not including human rights advisory services (section 15) and narcotics control (section 17).

15. On the right-hand side of the tables in annex I the proposed 1965 projects are presented in accordance with the priorities assigned by the requesting Governments, a summary of which appears in table B below.

16. The proposed 1965 regular programme (table B) based on priorities indicated by Governments is also shown by main fields of activities in table C below.

17. Table C indicates that 52.5 per cent of the 1965 regular programme funds are proposed for the country programmes, 47.5 per cent to be allocated for

financing regional and inter-regional projects. Priorities established by individual Governments will not affect regional and inter-regional projects, since they are governed by other considerations, especially decisions by regional economic commissions and functional commissions.

D. NARCOTICS CONTROL AND HUMAN RIGHTS

18. While the provision for section 17 (narcotics control) proposed for 1965 remains the same as it was

TABLE B. PROPOSED 1965 REGULAR PROGRAMME BASED ON GOVERNMENT PRIORITIES ^a

(In United States dollars)

	<i>Economic development</i>	<i>Social welfare</i>	<i>Public administration</i>	<i>Total</i>
Africa	1,240,500	697,900	707,900	2,646,300
Asia and the Far East ..	711,000	572,900	150,600	1,434,500
Europe	31,200	75,200	41,700	148,100
Latin America	484,200	372,900	153,800	1,010,900
Middle East	100,500	140,600	24,100	265,200
Inter-regional	420,000	80,000	140,000	640,000
TOTAL	2,987,400 ^b	1,939,500 ^c	1,218,100 ^d	6,145,000

^a Not including human rights advisory services and narcotics control.
^b Including over \$5 million for OPEX posts and almost \$1.5 million in regional and inter-regional projects.
^c Including one OPEX post (\$13,500) and 787,100 regional and inter-regional projects.
^d Including \$646,900 for regional and inter-regional projects, \$119,300 for OPEX posts in the field of public administration, and \$70,400 for OPEX posts in fields of competence of the specialized agencies.

TABLE C. PROPOSED 1965 REGULAR PROGRAMMES BASED ON GOVERNMENT PRIORITIES: COUNTRY, REGIONAL AND INTER-REGIONAL PROJECTS BY MAIN FIELDS OF ACTIVITIES ^a

(In thousands of United States dollars)

<i>Main fields of activities</i>	<i>Country projects</i>	<i>Regional and inter-regional projects</i>	<i>Total</i>
Economic surveys, planning and programming ^b	362.3	173.0	535.3
Fiscal and financial	154.5	168.0	322.5
Industrial development and productivity	279.3	473.0	752.3
Natural resources development ^c	469.0	298.0	767.0

Miscellaneous ^e	97.4	12.8	227.2
TOTAL	3,226.2	2,918.8	6,145.0

^a Excluding the fields of human rights and narcotic drugs control.
^b Including trade.
^c Including transport.
^d Excluding OPEX posts (costing \$70,400) in fields of competence of specialized agencies.
^e Including OPEX posts (costing \$70,400) in fields of competence of specialized agencies.

in 1964, namely \$75,000, it is proposed to increase the provision for section 15 (human rights) from \$140,000 in 1964 to \$180,000 in 1965. These two sections, together with the programme of \$6,145,000 proposed in the fields of economic development, social welfare and public administration, come to a total of \$6.4 million. Details of the narcotics control and human rights programmes proposed for 1965 are shown in annexes II and III.

E. PROGRAMME BASED ON EXISTING SECTIONAL DISTRIBUTION

19. Should the Committee decide to recommend the 1965 regular programme on the basis of existing sectional distribution, the following distribution is proposed:

TABLE D. PROPOSED 1965 REGULAR PROGRAMMES BASED ON EXISTING SECTIONAL DISTRIBUTION

<i>Sections of part V of the United Nations budget and relevant General Assembly resolutions</i>	<i>In thousands of United States dollars</i>
Section 13	
General Assembly resolution 200 (III) (Economic development, of which industrial development accounts for \$750,000)	2,250
Section 14	
General Assembly resolution 418 (V) (Social welfare)	2,065
Section 16, chapter I	
General Assembly resolution 723 (VIII) (Public administration)	980
Section 16, chapter II	
General Assembly resolution 1256 (XIII) (OPEX)	850
SUB-TOTAL	6,145
Section 15	
General Assembly resolution 926 (X) (Human rights)	180
Section 17	
General Assembly resolution 1395 (XIV) (Control of narcotic drugs)	75
GRAND TOTAL	6,400

F. PROGRAMME BASED ON PRIORITIES BY REQUESTING GOVERNMENTS

20. Sixty-two Governments have replied to the Commissioner for Technical Assistance indicating their preference between a regular programme based on existing sectional distribution in part V of the budget and a regular programme based on priorities requested by the recipient Governments. Forty-six of the sixty-two Governments (74 per cent) indicate their preference for a programme based on priorities indicated by them. Eight Governments prefer existing sectional distribution. The remaining eight indicate no preference.

21. Should the Committee adopt the priorities approach, one possible way of distributing the 1965 regular programme may be as follows (see table B):

	<i>Dollars</i>
(a) Economic development	2,987,400
(b) Social welfare	1,939,500
(c) Public administration	1,218,100
SUB-TOTAL	6,145,000
(d) Human rights	180,000
(e) Narcotics control	75,000
TOTAL	6,400,000

22. Should the Committee adopt the distribution above, the Secretary-General would propose that \$752,300 of \$2,987,400, shown under economic development, be earmarked in 1965 for industrial development. This figure consists of the amount assigned to industrial development on a priority basis by the requesting Governments in country programmes combined with the amount proposed on a priority basis for industrial development in regional and inter-regional projects.

23. The recommendation given in paragraphs 21 and 22 above may be summarized in round numbers in the following table:

TABLE E. PROPOSED 1965 REGULAR PROGRAMME BASED ON GOVERNMENT PRIORITIES ^a

<i>Fields of activities</i>	<i>In United States dollars</i>
Economic development:	
I. Industrial development ...	750,000
II. Other economic fields	2,250,000
	3,000,000
Social welfare	2,000,000
Public administration	1,145,000
SUB-TOTAL	6,145,000
Human rights	180,000
Narcotics control	75,000
TOTAL	6,400,000

^a Since OPEX posts will be financed in 1965-1966 on an increasing scale under the Expanded Programme, the OPEX posts under the regular programme are not shown separately for 1965 in this table. OPEX posts within the competence of the specialized agencies (\$70,400) are included under public administration.

G. "IMPACT AREAS"

24. The General Assembly, in resolution 1797 (XVII) of 11 December 1962, recognized that "... the objectives of the United Nations Development Decade require the maximum concentration of efforts and resources in selected areas where there are the greatest needs and opportunities for United Nations action". The question of re-orientation of the regular programme towards such areas of strategic importance to economic and social development and so identified by the legislative bodies representing the General Assembly and the Economic and Social Council, in particular the regional economic commissions and the functional commissions, was discussed by this Committee at its last summer session in 1963. The areas specifically identified by the Committee and referred to as "impact areas", include economic surveys, planning and programming, industrial development, public administration, urbanization and housing.

25. The extent to which the "impact areas" were emphasized in the regional and inter-regional project in the course of recent years, as well as the 1965 proposals for such areas, are shown in table F.

H. REGIONAL AND INTER-REGIONAL PROJECTS

26. Regional and inter-regional projects are of particular value within the context of the regular programme. Whether these projects take the form of advisory services by teams of experts, regional or inter-regional training centres, seminars, demonstration projects or study tours, they bring about a transfer and adaptation of methods and techniques, and facilitate the exchange of knowledge and experience, including that which the Secretariat can develop and place at the disposal of the Government concerned. The development of regional and inter-regional projects is a basic feature of the regular programme.

27. The Secretary-General, in submitting the proposals for regional and inter-regional projects in 1965, continued to be guided by collective requests from groups of interested countries, by the frequency of demand made by requesting Governments for regional and inter-regional advisory services, as well as by priorities attached to these types of projects by the organs concerned. These projects had been given increased emphasis in the 1963 and 1964 programmes and are further emphasized in the proposals for the 1965 programme.

28. The regional projects are also ideally suited for execution by the secretariats of the regional economic commissions, since they provide a means for giving quick recognition to the regional requirements for technical assistance as envisaged by the regional economic commissions at their annual sessions. The projects may involve all or several countries of the region or sub-region, such as the case of river valley development and trade. The delegation of authority to the regional economic commission secretariats for the implementation of such projects makes it possible

TABLE F. REGULAR PROGRAMMES: REGIONAL AND INTER-REGIONAL PROJECTS
BY MAJOR FIELDS OF ACTIVITY, 1962-1965

(In thousands of United States dollars)

Main fields of activity	1962	1963	1964 Programme	1965 Proposals
Economic surveys, planning and programming	71	170	121	173
Industrial development and productivity	26	275	385	473
Natural resources development	182	46	129	298
Housing, planning and building	82	78	152	244
Public administration	447	670	691	647
Statistics	352	151	311	243
Fiscal, financial and trade activities	29	48	106	168
All others	600	678	628	673
TOTAL	1,789	2,116	2,523	2,919

to put into effect decentralization in a rapid and effective way in response to General Assembly resolution 1709 (XVI) of 19 December 1961.

I. REGIONAL AND INTER-REGIONAL ADVISERS

29. Further development of the use of regional and inter-regional advisers is proposed in 1965 under the regular programme. One of the main characteristics of these services is the priority given to the areas of activity identified by the legislative bodies as "impact areas" requiring intense action by the United Nations, and to advisory service requirements which had not been anticipated by countries at the time of the programming exercises.

30. The scheme of regional advisers assigned to, and under supervision of, the respective Executive Secretaries has expanded in the recent years: the number of regional advisers' posts rose from sixty-five in 1963 to seventy-seven in 1964, and it is proposed to include eighty-three advisers in the 1965 programme.

TABLE G. REGIONAL ADVISERS' POSTS

Region	1963 Programme	1964 Programme	1965 Proposals
Africa	34	39	36
Americas	20	20	22
Asia and the Far East	11	18	22
Europe	0	0	0
Middle East	0	0	3
TOTAL	65	77	83

31. This arrangement strengthens the regional economic commissions in enabling them to meet requests from Governments more promptly and in greater number. Experience has shown that with this scheme of having high-level experts assigned to the regional economic commissions on a standing basis, it is possible to undertake short-term assignments at the request of Governments without resorting in each instance to the time-consuming process of recruiting experts on an *ad hoc* basis.

32. Similarly, at the world level, special importance attaches to the advisory services which can be provided through the scheme of inter-regional advisers. This scheme, which was started in 1963 on a modest scale in the areas of resources development, industrial development and public administration, has proved successful as a means of overcoming, by way of central pooling, the scarcity of high-level experts and, as a means of fostering, by way of a global approach, the transfer of knowledge and experience from one region to another. Inter-regional advisers, who are attached to Headquarters and detailed to countries or regions according to programme requirements are utilized for the purpose of meeting a mounting number of government requests for prompt assistance in the initial tasks involved in the preparation of integrated development activities. It is proposed to broaden the use of such advisers in the areas of economic planning, fiscal, financial and trade activities, industrial development, resources development, housing and physical planning and public administration. The number of such advisers increased from seven in 1963 to sixteen in 1964, and twenty-five are proposed for 1965.

DOCUMENT E/3899

Draft resolution submitted by the Secretary-General in response to paragraph 3 of the resolution adopted by the *Ad Hoc* Committee on co-ordination of Technical Assistance Activities

[Original text: English]

[8 June 1964]

1. The Economic and Social Council will have before it the report of the *Ad Hoc* Committee of Ten (E/3862) the reports of the Secretary-General (E/3850 and E/3851) and the report of the Administrative Committee on Co-ordination (E/3886, paras. 29 to 33).

2. Attached hereto are two draft resolutions prepared in response to paragraph 3 of the resolution adopted by the *Ad Hoc* Committee of Ten (E/3862) on the question of bringing together the Special Fund and the Expanded Programme of Technical Assistance in a United Nations Development Programme. One of the draft resolutions is intended for adoption by the Economic and Social Council and the other by the General Assembly. However, the General Assembly resolution would initially constitute an annex to the Economic and Social Council resolution.

3. The draft Assembly resolution incorporates the recommendations of the *Ad Hoc* Committee on the above subject and its provisions, including the paragraphs in its preamble, are similar to the resolution adopted by the *Ad Hoc* Committee. Provisions which did not form part of the *Ad Hoc* Committee's resolution are indicated by underscoring. Foot-notes indicate the sources of passages which either were not in the original *Ad Hoc* Committee resolution or appeared in that resolution in a different form.

4. The draft Council resolution has not been taken from any previous one (except for the second paragraph of its preamble, which is substantially similar to paragraph 2 of the preamble of the resolution of the *Ad Hoc* Committee of Ten). The alternative text for paragraph 6 of the Assembly resolution is intended to give effect to a recommendation of the Administrative Committee on Co-ordination and the Secretary-General (E/3886, para. 32).

Draft resolution submitted for consideration by the Economic and Social Council

The Economic and Social Council,

Having considered the proposals made by the Secretary-General in his report (E/3850) for bringing together the Special Fund and the Expanded Programme of Technical Assistance in a United Nations Development Programme (UNDP), together with the report of the *Ad Hoc* Committee of Ten (E/3862) and the views expressed thereon by the Administrative Committee on Co-ordination (E/3886, paras. 29 to 33),

Concurring in the view that such a consolidation would go a long way in streamlining the activities

carried on separately and jointly by EPTA and the Special Fund, simplify organizational arrangements and procedures, facilitate over-all planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness,

1. *Endorses* the resolution annexed hereto and recommends it for adoption by the General Assembly;

2. *Decides* that the resolutions of the Economic and Social Council concerning the Special Fund and the Expanded Programme of Technical Assistance shall, upon adoption by the General Assembly of the resolution annexed hereto, be deemed to have been amended or superseded to the extent necessary to give effect to that General Assembly resolution.

ANNEX

Draft resolution submitted for recommendation by the Economic and Social Council to the General Assembly

The General Assembly,

Having considered the recommendation of the Economic and Social Council to combine the Special Fund and the Expanded Programme of Technical Assistance in a United Nations Development Programme (UNDP),

Being convinced that such a consolidation would go a long way in streamlining the activities carried on separately and jointly by EPTA and the Special Fund, simplify organizational arrangements and procedures, facilitate over-all planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness,

Recognizing that requests for assistance on the part of the developing countries are steadily increasing in volume and in scope,

Believing that a reorganization is necessary to provide a more solid basis for the future growth and evolution of the assistance programmes of the United Nations system of organizations financed from voluntary contributions,

Recalling and reaffirming Part III of General Assembly resolution 1219 (XII) and Part C of General Assembly resolution 1240 (XIII) concerning the decision and the conditions "under which the Assembly shall review the scope and future activities of the Special Fund and take such action as it may deem appropriate",

Reaffirming that the consolidation proposed would be without prejudice to consideration of the study requested from the Secretary-General by the General Assembly in resolution 1936 (XVIII) "of the practical steps to transform the Special Fund into a capital development fund in such a way as to include both pre-investment and investment activities" or the recommendation of the Council and General Assembly thereon,

Recognizing that the effective working of a United Nations Development Programme depends on the full and active participation and technical contribution of all the organizations concerned,

1. *Decides* to combine the United Nations Expanded Programme of Technical Assistance and the Special Fund in a programme to be known as the United Nations Development Programme (UNDP), it being understood that the special characteristics and operations of the two programmes as well as two separate funds will be maintained, and that contributions may be pledged to the two programmes separately as hitherto;

2. *Reaffirms the principles, procedures and provisions governing the Expanded Programme of Technical Assistance and the Special Fund not inconsistent with this resolution^a and declares that they shall continue to apply to relevant activities within the UNDP;*

3. *Resolves* that a single inter-governmental committee of [] members, to be known as the Governing Council for the United Nations Development Programme, shall be established to perform the functions previously exercised by the Governing Council of the Special Fund and the Technical Assistance Committee, including the approval of projects and programmes and the allocation of funds. In addition, it shall provide general policy guidance and direction for the United Nations Development Programme as a whole, as well as for the United Nations regular programmes of technical assistance, and submit reports and recommendations thereon to the Economic and Social Council. *It shall perform its functions without prejudice to the responsibilities exercised by the governing organs of the specialized agencies and the IAEA in their respective fields and with the full participation of representatives of those agencies in accordance with their relationship agreements with the United Nations. The appropriate organs of the participating organizations would be expected to continue to review the technical aspects of the programmes for which the organizations assume responsibilities.^b Decisions of the Governing Council on important questions, including questions of policy, the approval of projects and programmes and the allocation of funds, shall be made by a two-thirds majority of the members present and voting. Decisions on other questions shall be made by a majority of the members present and voting;*^c

4. *Requests* the Economic and Social Council to elect the members of the Governing Council from among States Members of the United Nations or members of the specialized agencies or of the International Atomic Energy Agency for a term of three years, provided, however, that of the members elected at the first election, the terms of [] members shall expire at the end of one year, and the terms of [] other members at the end of two years; retiring members shall be eligible for re-election; there shall be equal representation of the economically more developed countries and of the developing countries; the first election shall take place at the first meeting of the Council after the adoption of the present resolution;

5. *Decides* to establish, in place of the Technical Assistance Board and the Consultative Board of the Special Fund, an advisory committee to be known as the Inter-Agency Consultative [Advisory]^d Board for the UNDP to meet under the chairmanship of one of the joint heads of the Programme [The Administrator or Co-Administrator] and to include the Secretary-General and the Executive Heads of the specialized agencies and of the IAEA or their representatives; the Executive Directors of UNICEF and the

World Food Programme should be invited to participate as appropriate. *In order that the participating organizations be provided with the opportunity to take part fully in the process of decision and policy making,^e the Inter-Agency Consultative [Advisory]^d Board shall be consulted on all significant aspects of the programmes and their implementation and in particular it shall:*

- (i) Advise [the management]^f on the programmes and projects submitted by Governments, through the Resident Representative, prior to their submission to the Governing Council for approval, taking into account the programmes of technical assistance being carried out under the regular programmes of the organizations represented on the Consultative [Advisory]^d Board, with a view to ensuring more effective co-ordination. *The views of the Consultative [Advisory]^d Board when it so requests shall be conveyed by the Administrator (referred to in paragraph 6 below) to the Governing Council together with any comments he may wish to make, when recommending for approval general policies for the Programme as a whole or programmes and projects requested by Governments;*^g
- (ii) Be consulted in the selection of agencies for the execution of specific projects as appropriate, and
- (iii) Be consulted on the appointment of, and general policy relating to,^h the Resident Representatives and review annual reports submitted by them;

*The Inter-Agency Consultative [Advisory]^d Board shall meet as often and for such periods as may be necessary for the performance of the foregoing functions and to ensure that all aspects of the Programme and other relevant activities of the United Nations family are kept under continuous review;*ⁱ

6. *Decides*, pending a further review of arrangements at the management level within a period of two years, the Managing Director of the Special Fund and the Executive Chairman of the Technical Assistance Board (to be known in the future as the Executive Director of EPTA) shall act as joint heads of the Programme, responsible for the Special Fund and the Expanded Programme of Technical Assistance respectively, and requests them to make common administrative arrangements to ensure over-all planning and co-ordination and maximum efficiency.

ALTERNATIVE TEXT FOR PARAGRAPH 6 RECOMMENDED BY
THE SECRETARY-GENERAL AND THE ACC

6. *Decides that the UNDP shall be directed by an Administrator to be appointed by the Secretary-General after consultation with the Governing Council and subject to confirmation by the General Assembly, provided that as a transitional measure on adoption of this resolution the present Managing Director of the Special Fund shall become the Administrator of the UNDP and the present Executive Chairman of the Technical Assistance Board shall become the Co-Administrator of the UNDP, each to serve until 31 December 1966 or such later date as may be determined by the Secretary-General after consultation with the Governing Council.*

^a Last provision of paragraph 1 of the resolution of the *Ad Hoc* Committee of Ten.

^b Report of the Administrative Committee on Co-ordination, document E/3886, paragraph 31 (a).

DOCUMENT E/3913

Note by the Secretary-General

[Original text: English]
[11 June 1964]

The Secretary-General has received a communication from the Director-General of the World Health Organization, requesting that the following resolution, adopted by the Executive Board of the World Health Organization on 29 May 1964, be transmitted to the Economic and Social Council:

Ad Hoc Committee of Ten established by resolutions 851 (XXXII) and 900 (XXXIV) of the Economic and Social Council

“ The Executive Board,

“ Having considered the report by the Director-General on the *Ad Hoc* Committee of Ten established under resolutions 851 (XXXII) and 900 (XXXIV) of the Economic and Social Council;

“ Having also considered the report on the subject by the Administrative Committee on Co-ordination at its session in April 1964;

“ Recalling the agreement between the World Health Organization and the United Nations in which the World Health Organization, ‘ having regard to the function and power of ECOSOC under Article 62 of the Charter ’, *inver alia*, ‘ affirms its intention of co-operating in whatever further measures may be necessary to make co-ordination of the activities of the specialized agencies and those of the United Nations more fully effective ’;

“ Considering the responsibilities of the World Health Organization to assist Governments, on request, in strengthening health services and, also on request, to provide appropriate technical assistance;

“ Reiterating the need for the World Health Organization to preserve its own channels of communications with Governments on matters within its competence, in order properly to carry out its constitutional responsibilities; and

“ Considering that details of the proposed consolidation of the programmes of the Special Fund and the Expanded Programme of Technical Assistance have not yet been sufficiently defined,

“ 1. *Reaffirms* the position of the World Health Organization as expressed on behalf of the organization at the February 1964 session of the *Ad Hoc* Committee;

“ 2. *Believes* that special emphasis should be placed on a policy of undertaking all necessary steps to help Governments to prepare and carry out their own planning and co-ordination of economic and social development in their countries;

“ 3. *Calls* attention to the importance, to economic and social development, of the technical

responsibilities carried out by the organizations participating in the United Nations system;

“ 4. *Considers* that, in order to ensure that the organization carries out its responsibilities, the Director-General, or his representative, should participate fully in the process of decision- and policy-making by whatever inter-agency board may be established;

“ 5. *Expresses* the hope that the Economic and Social Council will adopt the recommendations contained in the report by the ACC on the report of the *Ad Hoc* Committee of Ten;

“ 6. *Expresses* the further hope that, consistent with the recommendations of the ACC, the Economic and Social Council and the General Assembly of the United Nations will, at their 1964 sessions, take decisions to accomplish the following:

“ (a) Establish a single inter-governmental committee to perform functions previously exercised by the Governing Council of the Special Fund and the Technical Assistance Committee;

“ (b) Establish a single inter-agency advisory board to perform functions previously carried out by the Technical Assistance Board and the Consultative Board of the Special Fund;

“ (c) Decide that, pending development of definitive new legislation, the existing legislation should be followed in so far as it is consistent with (a) and (b) above; the inter-governmental committee and the inter-agency advisory board would exercise, in respect of each programme, functions originally assigned to the organs established for the two programmes;

“ 7. *Requests* the Secretary-General of the United Nations, with his colleagues in the Administrative Committee on Co-ordination, to prepare, for presentation to the Economic and Social Council and the General Assembly as soon as possible, appropriate legislation, indicating which provisions of resolutions of the Economic and Social Council and of the General Assembly concerning the Special Fund and the Expanded Programme of Technical Assistance remain operative;

“ 8. *Reiterates* the provisions of resolution EB32. R29 concerning the programme of technical assistance financed from the regular budget of the World Health Organization; and

“ 9. *Requests* the Director-General to transmit this resolution to the Secretary-General of the United Nations with the request that he submit it to the appropriate organs of the United Nations.”

DOCUMENT E/3914

Participation of the Inter-Governmental Maritime Consultative Organization in the Expanded Programme of Technical Assistance

[Original text: English]
[11 June 1964]

The Secretary-General has received the following communication from the Secretary-General of the Inter-Governmental Maritime Consultative Organization (IMCO) dated 3 June 1964, transmitting resolution Council XI/Res.5 adopted by the Council of IMCO on 28 May 1964. The Secretary-General was requested to bring this resolution to the attention of the Economic and Social Council:

“ At its eleventh Session, the Council of the Inter-Governmental Maritime Consultative Organization decided that IMCO should seek to be made a member of the United Nations Technical Assistance Board.

“ May I ask you please to be so kind as to transmit IMCO's request to the President of the Economic and Social Council.

“ I understand that, in the normal course of events, IMCO's request may be considered by the Technical Assistance Committee of the Economic and Social Council which meets at Vienna beginning June 22, 1964.

“ As you will note from the attached copy of the resolution, the Council (1) accepted, as a basis for discussion with the United Nations, the division of technical assistance responsibilities in the maritime field between IMCO and the United Nations as suggested by the latter (see the annex to the Council's resolution) and (2) requested me, in the event that IMCO is accepted to membership on the United Nations Technical Assistance Board, to seek arrangements whereby for the time being the United Nations will administer on behalf of the Organization such technical assistance projects as are assigned to IMCO by the Board.”

DOCUMENT E/3922

Note by the Secretary-General

[Original text: English and French]
[18 June 1964]

The Secretary-General has received a communication from the Director-General of the United Nations Educational, Scientific and Cultural Organization, (UNESCO) requesting that the following resolution, adopted by the Executive Board of UNESCO at its recent sixty-seventh session, be brought to the attention of the Economic and Social Council:

“ *The Executive Board,*

“ *Being informed* of the new developments concerning the co-ordination of the technical co-operation programmes of the United Nations (document 67 EX/14, Add.2),

“ *Having examined,* in particular, the resolution approved at the February-March 1964 session of the *Ad Hoc* Committee of Ten established by the Economic and Social Council to study this matter, as well as the extract on this subject from the report

addressed to the Economic and Social Council by the Administrative Committee on Co-ordination of the United Nations at its thirty-seventh session (Paris, 28 to 30 April 1964),

“ *Recalling* the decision, taken at its sixty-sixth session (66 EX/Decisions 4.6.1),

“ *Believes* that the Administrative Committee on Co-ordination, in its report mentioned above, clearly defines the conditions which will make it possible for the merger of the Expanded Programme of Technical Assistance and of the Special Fund to fulfil its objectives in the best manner,

“ *Requests* the Director-General to continue to co-operate, in the spirit defined in the above-mentioned report, in the discussions on these new developments and to report the results to the Executive Board at its sixty-eighth session.”

DOCUMENT E/3933

Report of the Technical Assistance Committee on its meetings held in June-July 1964

[Original text: English]
[8 July 1964]

1. The Committee held 17 meetings in Vienna from 22 June to 3 July 1964 under the chairmanship of Mr. Friedrich A. Kolb (Austria).

2. The Committee had before it the following questions (E/TAC/L.327/Rev.1):

- (1.) Election of Chairman;
 - (2.) (a) Annual report of the Technical Assistance Board to the Technical Assistance Committee for 1963: interim report on implementation of the 1963-1964 Programme (E/3871 and Add.1, E/TAC/L.331 and Add.1) (E/TAC/SR.315 to 320);
 - (b) Expanded Programme activities, including:
 - (i) Review of contingency authorizations made in 1963 and interim report on 1964 contingency authorizations (E/TAC/L.329, E/TAC/L.330) (E/TAC/SR.321);
 - (ii) Programme changes as at 1 April 1964 (E/TAC/L.328 and Add.1, E/TAC/141 and Add.1) (E/TAC/SR.321);
 - (iii) Local cost assessments for regional projects (E/TAC/139) (E/TAC/SR.321, 322 and 329);
 - (iv) Housing for experts (E/TAC/142) (E/TAC/SR.321 and 328);
 - (c) Report on the use of experts from developing countries (E/TAC/140/Rev.1) (E/TAC/SR.322);
 - (d) Technical assistance to promote the teaching, study, dissemination and wider appreciation of international law (E/TAC/138, E/TAC/143) (E/TAC/SR.322 and 329);
- (3.) Report of the Secretary-General on technical assistance activities of the United Nations (E/3870 and Add.1, E/TAC/144, E/TAC/145, E/TAC/L.332 and Add.1, and E/TAC/L.333) (E/TAC/SR.323 to 325, 327 to 329);
 - (4.) Final report of the *Ad Hoc* Committee on the co-ordination of technical assistance activities (E/3862, E/3886, paras. 29 to 33, E/3899, E/3913, E/3922) (E/TAC/SR.324 to 328);
 - (5.) Other questions: Application of the Inter-Governmental Maritime Consultative Organization for membership in Technical Assistance Board (E/3914) (E/TAC/SR.325).

Introduction

3. Mr. Bruno Kreisky, Minister for Foreign Affairs of Austria, welcomed the Committee to Vienna on behalf of the Austrian Government. He stated that his Government considered that the Technical Assis-

tance Committee was performing a key function in the field of world economic co-operation, a field which offered new promise as a result of the recently concluded United Nations Conference on Trade and Development. On behalf of the Government of Austria, Mr. Kreisky wished the Committee success in its deliberations, which, if even modestly effective, could produce results in geometric progression.

4. Mr. Sigvard Eklund, Director General of the International Atomic Energy Agency, welcomed the Committee to the headquarters of the Agency. As head of one of the organizations participating in the work of the Expanded Programme of Technical Assistance, he was in a good position to measure the significance of the Committee's endeavours. The further progress of technical assistance institutions could be ensured only by fostering the forces which would work to uphold them, and Mr. Eklund wished the Committee great success in this endeavour.

5. The Executive Chairman of the Technical Assistance Board and the members of the Committee expressed their warm appreciation to the Austrian Government for its invitation to hold the present session in Vienna, and thanked both the Austrian Government and the International Atomic Energy Agency for the cordial hospitality with which they had been received.

Agenda item 2 (a)

Annual report of the Technical Assistance Board to the Technical Assistance Committee

6. Members of the Committee generally expressed satisfaction with the form and content of the annual report of the Technical Assistance Board (E/3871). The Executive Chairman's suggestion that the report on the 1963-1964 biennial should include a survey of the whole life of the programme in commemoration of its fifteenth anniversary was also generally supported by the Committee. Several members wished however to see a greater emphasis placed on evaluation and recommendations, as it was difficult for the Committee to reach conclusions based primarily on descriptive material. The hope was expressed that the Executive Chairman would develop procedures and pilot projects which would be useful to the Economic and Social Council in its efforts to develop an adequate system of evaluation of the over-all impact of programmes of the United Nations system of organizations on the economic and social development of those countries. It was hoped that the next report placed before the Committee would emphasize evaluation particularly with regard to regional and inter-regional projects.

7. The Executive Chairman informed the Committee that in view of the general feeling that evaluation should be a prominent part of the work of the TAB secretariat, it was intended that the annual report covering the 1963-1964 biennial should contain a study of the functioning of the programme in six selected countries.

8. While some members emphasized the importance of providing the Committee with an interim report on the first year of the biennial, one member suggested that a biennial programme required only a biennial report. The Executive Chairman pointed out that the intermediate year report had already been considerably reduced and that this policy might be taken further. He supposed, however, that the Committee would probably continue to require some indication of the work done and the funds disbursed in the first year of the biennial. The question of the format of the interim report would be carefully reviewed. Happily the matter was not urgent as the next report would, as usual, cover the entire biennial.

9. Other suggestions made by members of the Committee included the establishment of a working group to study the operation of the programme as a whole, with particular emphasis on the work of experts.

GENERAL REVIEW OF ACTIVITIES — PROGRAMME IMPLEMENTATION AND PROGRAMMING PROCEDURES

10. Members of the Committee generally expressed satisfaction with the growth of the Programme in 1963 and with its operation under the resolutions governing two-year programming and project programming. It was noted that, although this was not generally foreseen when biennial programming procedures were adopted, requesting governments tended to place the emphasis on the first year in developing their programmes, while the desire of the Participating Organizations to execute the Programme in the best possible manner tended to cause the weight of implementation to shift to the second year. These fluctuations were generally considered by the Committee as a natural consequence of two-year programming. Some members, however, expressed concern at the uneven rate of delivery of the Programme and suggested that a review of current procedures be made at the conclusion of the biennial. They noted particularly that the establishment of long-term projects would appear to provide the necessary perspective for developing satisfactory programmes, thus obviating the need for two-year programming. Other possible solutions were mentioned, including assistance to recipient governments in the preparation of requests, greater efforts at early recruitment of experts and placement of fellows on the part of the Participating Organizations, better arrangements for the provision of counterpart personnel and possibly the stockpiling of standard items of equipment. One member recalled the suggestion regarding the possibility of establishing two-year programming on an annual basis, thus making it possible to adjust the Programme in the light of the current rate of implementation, while another member

foresaw the possible extension of programming arrangements to periods longer than two years if sufficient assurance as to future pledges could be obtained.

11. The Executive Chairman assured the Committee that the secretariat would give thought to the matter and take another look, for instance, at the procedures applied by WHO, which had considerable experience in long-term programming.

12. Several members of the Committee emphasized the possibilities for closer integration between the Expanded Programme and the development plans of individual governments offered by the long-term programming arrangements approved by the Committee and expressed concern at the apparent misunderstandings on the part of certain governments as to the nature of the commitments into which they would enter by requesting assistance on a long-term basis. Some members suggested that special efforts be made to encourage governments to develop long-term projects integrated with their national development plan.

Types of assistance

13. Several members expressed concern at the decline in the number of fellowships awarded and the cost of equipment purchased between 1962 and 1963. The importance of providing facilities for the training of national personnel, which had been the object of an earlier resolution of the Committee (E/3783, annex II) was emphasized and the urgent need for equipment in countries at the earlier stages of economic development was also stressed. The Executive Chairman remarked, however, that in the case of fellowships the decline was to be understood as an effect of biennial programming (fellowship placements tending to be concentrated at the end of the biennial). In the case of equipment no specific reason could be ascribed to year by year variations. Equipment was provided exclusively in connexion with expert assistance and the incidence of projects requiring a sizeable amount of equipment for training and demonstration purposes had not shown a discernible trend. Although the Board was fully aware of the immense needs of developing countries for all types of equipment, to deviate from the basic policies under which the Programme operated and to provide equipment by itself would be to risk a radical change in the whole character of the programme.

Regional distribution

14. Members of the Committee noted the continued increase in the share of the programme going to Africa and generally considered this justified in view of the special development needs of the region. Concern was, however, expressed by some members at the continued decrease in the percentage of funds allocated to other regions. The hope was expressed that with the phasing out of emergency assistance to Africa, and a continued increase in the over-all resources of the Programme, the proportion of assistance available to regions other than Africa would be adjusted appropriately.

15. Several members emphasized that the Programme had special responsibilities with regard to

newly independent countries, and expressed the hope that special arrangements would be made to assist both Malawi and Zambia, which would achieve independence in the course of the year.

16. The Committee endorsed the arrangement made by the Executive Chairman that in the case of the Congo (Leopoldville) the increased local cost contribution of the Government should be considered as funds-in-trust, outside the scope of local costs arrangements and that only the foreign currency component of the programme should be charged against the country target. The Committee took note of the revised Congo programme for 1963-1964 (E/TAC/L.328/Add.1), which had been prepared on this basis and agreed to the application of the same formula to the 1965-1966 biennial.

Relations between Expanded Programme and Special Fund projects

17. Reference was made to the number and proportion of Expanded Programme projects which had led to Special Fund projects. The Executive Chairman recalled that illustrations of ways in which the Expanded Programme and Special Fund reinforced each other were usually given in the report presented to the Committee at the end of each biennial. He hoped to be able to include much more information on this subject in the next report, though the varied character of the subject matter did not lend itself to statistical analysis.

Regional and inter-regional projects

18. The Committee took note with interest of the special study of regional projects included in the interim report on 1963. Members were generally of the opinion that regional and inter-regional projects are of special value to the Programme. They are frequently the most efficient and economical device for adding to the "know-how" of developing countries, particularly in those cases where the countries of a region are faced with problems of a similar nature. Regional projects actively foster personal contact and the exchange of views and experience between nationals of neighbouring countries and thus also serve the broader purpose of encouraging international understanding.

19. The Committee generally felt that the present percentage of the resources available to the field programme devoted to regional and inter-regional projects which had been set at 16 per cent by the Committee was adequate, although one member suggested that it be raised to 20 per cent.

20. It was noted that the present procedure for the organization of regional projects does not give sufficient assurance that these actually reflect the wishes of recipient governments, particularly as they are not a charge against the target and the financial obligations of governments are often minimal with regard to such projects. Several members expressed the wish to see governments participate more actively in the selection of regional projects and suggested in particular that, when appropriate, the regional commissions should

play an increasing role in this process since, in the view of those members, the commissions were in a better position than the participating organizations to assess the wishes of the governments.

21. The Executive Chairman assured the Committee that he himself had devoted much time to personal contacts with the Executive Secretaries and senior staff of the regional commissions and that meetings of resident representatives with the staff of the commissions had been very useful. These discussions and exchanges of views had been taken into account in framing country and regional programmes. The Economic Commission for Africa had co-operated most usefully in the seminar on national co-ordination of technical assistance held at Addis Ababa in January 1964. Several members expressed satisfaction at the benefits derived from the seminar and suggested that arrangements be made to hold similar seminars in other regions.

22. One member expressed the opinion that too many regional projects were regional in form rather than in content and expressed the wish to see more of them reflect a truly regional approach to a common problem as in the case, for instance, of the assistance provided under the Central American Integration Scheme. Regret was also expressed at the fact that projects initiated on a regional basis frequently revert to national status on the termination of international assistance and it was suggested that in such cases the trend to maintaining regional projects in the Programme longer than country projects should not be discouraged.

23. The request was also made that recipient governments should be consulted before invitations to individuals to participate in regional seminars or study tours are issued and that host governments should be closely consulted on all arrangements concerning the organization and scheduling of regional projects.

Fields of activity

24. The Committee had an exchange of views on the fields of activity in which the Expanded Programme should concentrate its efforts. It was generally felt that the decisions of the Conference on Trade and Development would have an impact on all United Nations activities related to the economic development of developing countries and in particular on the Expanded Programme. The emphasis placed by the conference on the need for industrialization should, some members felt, give a new impetus to the provision of technical assistance in this field as in the field of science and technology. It was also noted that the Expanded Programme offered a particularly convenient means of providing assistance in matters of trade promotion.

25. Several members, however, expressed concern at the drop in the percentage of funds expended on assistance to industrial production (5.5 per cent in 1963 and only 3.8 per cent in the case of regional projects). It was, however, noted that if a broader

definition of assistance related to industrial development were used, a different picture could be seen, showing an increase of 1 per cent to 24.1 per cent in 1963.

26. Various views were expressed about the adequacy of the definitions used in arriving at these figures. The Executive Chairman informed the Committee that it had been hoped that the definition of industrial development established by the Committee for Industrial Development could have been used for the preparation of the report. He explained that this definition would have to be carefully elaborated before it could be applied to the classification of technical assistance activities, and that a working definition would be developed for use in the next report to be presented to the Committee.

27. One member, while recognizing that the final decision on the content of the Programme rested with individual governments, considered that the low percentage of assistance in the field of industrialization was due to the lack of promotional activities on the part of the participating organizations concerned. The Executive Chairman expressed the belief that, with the expansion of the Centre for Industrial Development and the impact of the Conference on Trade and Development, the Programme would, in the years to come, show an increase in the extent to which funds are used to develop the industrial potential of the developing countries and assured the Committee that the subject would be dealt with again in the next report.

Developments in the field and administrative costs

28. The statements made by the Executive Chairman concerning the growth in size and responsibilities of the joint Technical Assistance Board/Special Fund field establishment were generally welcomed, and the importance of strengthening the role of the resident representatives in the future was stressed by many members. Some members, however, expressed concern at the apparent trend of growth in the level of administrative and operational services costs in the Programme and wondered whether the proportion which those costs bore to the total level of the Programme was likely to continue to increase. The Executive Chairman explained that the relative increase in administrative and operational services costs of the participating organizations resulted from the action taken by the Committee in 1963 to liberalize somewhat the formula by which such costs were calculated — under which the costs of administering projects financed from the Executive Chairman's contingency authority were covered for the first time. The Executive Chairman observed that the costs of the TAB field establishment had been increasing as the establishment expanded in response to the needs of the Programme, especially in Africa, and that these offices besides performing their administrative duties also provided valuable technical assistance to host governments. However, the Executive Chairman did not believe that the proportion of the TAB secretariat administrative and operational costs relative to the total Programme would continue to increase. Assuming

that anticipated increases in pledges for EPTA would materialize, he knew of no reason why the level of administrative and operational services costs relative to the level of the Programme as a whole should increase in the future.

Associate experts and volunteers

29. The Committee generally welcomed the information provided by the Executive Chairman concerning the important role played by associate experts and volunteers in the field programme and in TAB field offices. Some members indicated that their governments were considering increasing their sponsorship of associate experts and volunteers. One member asked for more information on the additional opportunities for volunteers in TAB field offices which the Executive Chairman had mentioned in his opening statement (E/TAC/L.331). The secretariat would supply such information to any interested members. Information was also requested as to the proportion of associate experts who ultimately became fully-fledged technical assistance experts, and representatives of some governments who sponsored associate experts indicated that an important percentage of the associates did in fact become fully-fledged experts in due course.

Contributions

30. The Committee supported the Executive Chairman's appeal for early payment of contributions, while recognizing that contributing governments required parliamentary action before payments could be made. It was understood that the alternative to timely payment of pledges was a significant increase in the level of the Working Capital and Reserve Fund. One member inquired as to the possibility of the Expanded Programme borrowing the required working capital from the Special Fund pending receipt of cash payments from pledging governments. The Executive Chairman indicated that, as the two programmes were separate financial entities and the costs of interest payments on such borrowings were likely to arise, it would in his view be inadvisable if the Expanded Programme had to rely on the possibility of loans, though emergency recourse to such possibilities could not be excluded. All members of the Committee welcomed the statement by one representative that his Government intended to announce at the next Pledging Conference, and that of another representative that her Government was contemplating an increase in their contributions to the Expanded Programme and the Special Fund for 1965. The Committee heard with interest indications from other governments concerning the possibilities of increased pledges, and many members voiced appeals for increased pledges to all governments who were in a position to make them.

31. Members of the Committee noted with appreciation the information in the Annual Report that certain improvements had been made in 1963 with respect to the convertibility of contributions. Some members supported the Executive Chairman's appeal

for more liberal convertibility arrangements for the pledges of governments who were not donors to the Programme with a view to facilitating planning and operations and safeguarding the multilateral character of the Programme. The Board's report that further progress had been made in its efforts to enhance the utilization of the currencies available to the Programme was welcomed by the Committee.

Experts — administrative questions

32. Some improvements in the pattern of the geographical representation among experts were noted, and the need for further improvements was stressed by three members of the Committee with special reference to experts from socialist countries. One member mentioned the need for improving the geographical distribution pattern of the TAB secretariat.

33. Several members observed that there was room for improvement in the preparation of job descriptions for technical assistance experts. One member repeated his observation of a year ago that there was a tendency to define too narrowly the technical qualifications required of experts, and a second member supported this view. The Commissioner for Technical Assistance, in his opening statement to the Committee (E/TAC/L.332 and Add.1), pointed out, however, that most countries recently polled on the subject had, on the contrary, requested more detailed job descriptions. Other members felt that the tendency of some recipient governments to request only top-level experts should be discouraged in view of the increasing difficulties of recruiting senior experts of the highest calibre. One member suggested that the standard cost figure for experts was too generous and that it could be reduced by cutting salaries paid to experts by an amount of \$500 annually. The Executive Chairman pointed out that salary was only a part of the standard cost figure; he doubted whether a general salary reduction would be in the interest of recipient countries, since it would tend to make the already difficult recruitment problem even more difficult.

Approval of the Annual Report of the Technical Assistance Board to the Technical Assistance Committee for 1963

34. The Committee approved unanimously the draft resolution reproduced in Annex 1, under which the Council takes note with appreciation of the Annual Report of the Technical Assistance Board to the Technical Assistance Committee for 1963.

Agenda item 2 (b)

Expanded Programme Activities and Procedures

(i) REVIEW OF CONTINGENCY AUTHORIZATIONS MADE IN 1963 AND INTERIM REPORT ON 1964 CONTINGENCY AUTHORIZATIONS

35. The Committee considered the report of the Executive Chairman on contingency allocations made in 1963 (E/TAC/L.329) and an interim report on con-

tingency allocations made during the period 1 January to 30 April 1964 (E/TAC/L.330). It was noted that during 1963, 242 allocations were made by the Executive Chairman for a total amount of \$3,578,503 but that as a result of delays in recruitment and other causes, final authorizations amounted to \$1,908,863 as against a ceiling of \$9,575,000 established by the Committee for the 1963-1964 biennial. It was also noted that the level of 1964 authorizations may be expected to exceed considerably the amount authorized in 1963 as the continuing costs of contingency projects initiated in 1963, currently estimated at \$3 million, will have to be met in addition to the cost of new requests arising in 1964.

36. The Committee generally expressed satisfaction at the conservative manner in which the Executive Chairman had exercised his contingency authority in 1963. Nevertheless, some members thought that some of the projects described indicated a rather liberal interpretation of the criteria under which the Executive Chairman exercises his contingency authority. Other members considered that the Executive Chairman should retain maximum flexibility in his use of this authority. The Executive Chairman pointed out that technical assistance was most effective where its flexibility met changing situations. These included not only natural disasters but all kinds of unforeseeable changes in the political and economic situation of a country giving rise to new opportunities for constructive effort.

37. Some members were concerned at the fact that the amount allocated to newly independent countries in the field of industrialization, and to the Universal Postal Union, was not more substantial in view of the fact that the level of the Chairman's authority had been specifically increased to provide additional assistance of this nature.

38. While regretting the fact that natural disasters had occurred, which resulted in calls for additional assistance to meet resulting emergency conditions, several members were gratified to note that the Executive Chairman had been able to make allocations amounting to 14 per cent of the total to meet such situations in 1963.

39. Several members expressed satisfaction at the additional information made available concerning the grounds on which allocations had been made. One member suggested that in addition to the statistical information already available future reports might present contingency allocations as a percentage of the country programme.

(ii) PROGRAMME CHANGES

40. The Committee took note of document E/TAC/L.328 and Add.1 on programme changes during the period 1 October 1963 to 30 April 1964, and E/TAC/141 and Add.1 on the transfers of allocations in 1963 and 1964.

41. One member expressed concern at the fact that some 30 per cent of the approved Programme had

undergone changes of one kind or another and that, together with the use of the contingency authority, this resulted in considerable differences between the Programme originally adopted by the Committee and the delivered Programme. He suggested that the Board, participating organizations and requesting governments should look more closely at their procedures to avoid the necessity for so many changes. He also suggested that detailed information be made available to the Committee, not only on changes which resulted in inter-agency transfers and other major changes, but on all changes approved or noted by the Executive Chairman.

(iii) LOCAL COSTS ASSESSMENTS FOR
REGIONAL PROJECTS

42. The Committee considered the report of the Technical Assistance Board on this subject (E/TAC/139) together with additional information supplied by the secretariat in the course of the debate. The Committee noted that the Technical Assistance Board had encountered practical difficulties in the application of the provisions of operative paragraph 4 of Council resolution 787 (XXX) in computing assessments of particular governments for the local living costs of regional experts who make *ad hoc* visits for as short periods as a very few days to many countries in the region. In the opinion of the Technical Assistance Board the overhead costs which would be entailed in connexion with the computation of such costs would in certain cases offset the theoretical local costs income which would be received in respect of such experts. The Committee understood that recipient governments were already required, under agreements with the Board, to provide local transportation, secretarial and clerical facilities, postal and telegraph expenses and other locally available administrative support and that these obligations, which were frequently costly, would not be affected by the proposal of TAB.

43. The Committee believed that the principle that recipient governments should pay as much as possible of the local costs of projects was of fundamental importance. It recognized that in the case of regional experts certain practical difficulties would sometimes arise, and on the understanding that host governments would continue to provide appropriate local administrative support for such experts, the Committee decided to recommend to the Economic and Social Council that it authorize the Executive Chairman of the Technical Assistance Board, in joint agreement with the governments participating in regional projects, to apply the provisions of paragraph 4 of Council resolution 787 (XXX) with a degree of flexibility imposed by practical considerations, provided that the principle of reasonable financial participation of recipient governments in the costs of such projects, including local living costs of experts, was maintained.

(iv) HOUSING FOR EXPERTS

44. The Committee considered the report of the Technical Assistance Board on this subject (E/TAC/15

142) and the additional information supplied by the TAB secretariat in the course of the discussion. The Committee understood that in the overwhelming majority of countries suitable housing was obtained either by normal means on the commercial market, or from the government. However, in the case of six or seven countries in certain areas, principally in West and Central Africa, the impossibility of obtaining suitable housing by these normal means was threatening to inhibit the progress of project operations. In close co-operation with the governments concerned, TAB would be able to arrange for suitable housing in such countries if the Board could guarantee long-term leases to builders or landlords, or, in exceptional instances, participate in the financing of construction costs by making recoverable advances to host governments. The costs of the accommodations would in any case be met by the experts in the form of rent. Arrangements had been made with the Special Fund under which a trust account could be established by the Fund for administration by TAB in the rare instances where financing of construction costs was involved. All such arrangements would be negotiated with host governments who would participate in the administration of the housing, and in the case of construction, provide the land at nominal rental, together with access and utilities. Such exceptional arrangements would be confined to population centres where a continuing need for expert housing was foreseen and would be limited quantitatively to a level well within the total estimated requirement.

45. The TAB secretariat did not foresee any financial implications for the Expanded Programme as in all cases it was proposed that the full costs of the housing would be met by the occupants in the form of rental payments. Nevertheless, there was the remote possibility that for unforeseen reasons, such as a sudden termination of EPTA activities, certain residual costs might emerge. To guard against such cases, TAB would attempt to arrange for host governments to assume or at least participate in such costs.

46. The Committee was informed that the Legal Counsel of the United Nations held the view that, inasmuch as the remote possibility of residual liquidating charges accruing to EPTA could not be entirely ruled out, the authorization of the Technical Assistance Committee and the Economic and Social Council was required before TAB could enter into any long-term leases or arrangements for financing construction costs.

47. In the discussion it was generally recognized that the absence of suitable housing could adversely affect the recruitment of experts and thus impair the normal progress of project operations. On the other hand it was stressed that experts should expect to live in accommodations of a standard commensurate with conditions in the duty country. Members of the Committee felt that the intervention of TAB in the arrangements for the housing of experts should be strictly limited to cases where no other solution was available, and that to the extent possible the recipient governments should be associated with any special arrangements

made by TAB. Two members suggested that the use of prefabricated housing should be considered in connexion with any construction plans.

48. The Committee felt that guarantees of long-term leases should suffice to meet most of the difficult cases, given the full co-operation of host governments, and that participation by TAB in the financing of construction costs should only be used as a last resort, when no other solution could be applied. The TAB should regularly report to the TAC on the use of the proposed authority. In particular, any direct charges to the Expanded Programme emerging from such arrangements should be reported by TAB to TAC at the earliest possibility.

49. On the basis of the considerations described above, the Committee recommended that the Council adopt the draft resolution reproduced in Annex II.

Agenda item 2 (c)

Report on the use of experts from developing countries

50. The Committee had before it a report by the Technical Assistance Board on the use of experts from developing countries (E/TAC/140/Rev.1).

51. The Committee generally noted with satisfaction that the use of experts from such countries had continued to increase both in number (from 1,133 to 1,333) and as a percentage of the total number of experts (from 29.3 to 30.8 per cent).

52. Some members, placing the emphasis on the advantages accruing from the recruitment of such experts, such as better understanding of local conditions and the benefit the experts themselves would derive from the additional experience, were of the opinion that the increased employment of these experts should be encouraged. Others, concerned at the adverse effect on developing countries of the loss of scarce personnel, considered that such recruitment should take account of all the factors involved, and that what one member called "a code of good behaviour" should be observed by all concerned in order to ensure that developing countries are not deprived of the services of essential personnel.

53. The Executive Chairman stated his view that the overriding consideration in the recruitment of experts was to give the best possible service to the countries seeking assistance. When searching for the most suitable experts for particular tasks the participating agencies would continue to give proper weight to the special background and experience of candidates from developing countries. Naturally the consent of the government concerned would be sought in the case of candidates in the public service.

Agenda item 2 (d)

Technical assistance to promote the teaching, study, dissemination and wider appreciation of international law

54. The Committee had before it a note by the Technical Assistance Board (E/TAC/138) on the subject of technical assistance in the field of international

law. It also considered resolution 1968 (XVIII) of the General Assembly which referred to the report of the Secretary-General⁴⁰ containing certain practical suggestions relating to the proclamation of a United Nations Decade of International Law and an initial programme of assistance and exchange in the field of international law. The Committee noted that, by its resolution 1968 (XVIII), the General Assembly had, *inter alia*, requested the Technical Assistance Committee to consider the report of the Secretary-General referred to above and to advise the Special Committee of the Assembly which had been established to consider the question of technical assistance in international law, and the General Assembly itself on "the extent to which technical assistance programmes for the purpose of strengthening the practical application of international law could be implemented within the Expanded Programme of Technical Assistance, with particular attention to the kinds of technical assistance which would be acceptable under the existing objects and principles of the Expanded Programme".

55. In the note of the Technical Assistance Board it was pointed out, *inter alia*, that no technical assistance had been given in international law as a general subject under the Expanded Programme. Although assistance had been given in specific fields of international law by some of the organizations participating in the Expanded Programme, it was doubtful whether it would be permissible to provide assistance in the field of international law in general in view of the terms of Economic and Social Council resolution 222 A (IX). It seemed clear to TAB that it would be something of a departure from the accepted concepts of the Programme if assistance were given in the field of general international law which, important as it was, was not as closely related to the economic and social development of developing countries as other priority fields. For this reason TAB considered that the present rules of the Expanded Programme would not permit its funds to be used for this purpose and that an amendment to existing legislation would have to be passed before TAB could accept proposals for projects of this kind. There were instances, however, in which technical assistance in international law might be considered as having a direct bearing on economic, social and administrative development even under present EPTA legislation; for example, the legal problems connected with international transactions, commercial arbitration, air law and the legal régime of waterways. Programmes of assistance in such fields could include fellowships, advisory services in matters such as drafting national legislation or bilateral and multilateral conventions, regional training and refresher courses, seminars and some other forms of assistance.

56. Several members of the Committee stressed the importance of international law and emphasized the keen interest that was felt in the problem among a number of developing countries. They expressed the hope that the Technical Assistance Committee

⁴⁰ Official Records of the General Assembly, Eighteenth Session, Annexes, agenda item 72, document A/5585.

would come to a decision in principle on the question of including international law within Expanded Programme activities. Most members, however, while recognizing the importance of spreading a knowledge of international law, felt that amendment of the basic legislation of the Expanded Programme for this purpose would constitute an undesirable precedent. They considered it preferable to limit technical assistance in international law to cases where it could be shown that such assistance would serve the needs of economic, social or administrative development, as required by present EPTA legislation. Other members suggested that the question of technical assistance in international law be postponed to a later session of the Technical Assistance Committee so as to give time for further study.

57. The consensus of the Committee was that the basic EPTA legislation should not be amended to permit consideration of requests for assistance in the general field of international law, but that the Executive Chairman should be prepared as before to consider requests in specific fields of international law if they were related to economic, social or administrative development and included in country programmes in the normal way.

58. As regards the Regular Programme, the Committee considered document E/TAC/143 which contained an invitation to the Committee for its views on the question of the possible provision of funds under Part V of the United Nations budget for programmes of technical assistance in the field of international law. The report of the Secretary-General suggested that:

“On the assumption that the priority programme basis was to be adopted by this Committee for application to the 1965 regular programme and future regular programmes, the Committee may wish to consider one of the two following approaches:

“(a) Should the Technical Assistance Committee decide to support the establishment of a programme in the field of international law with a specific sum of money earmarked for that purpose, the appropriation should be proposed outside of Part V of the regular budget;

“(b) Should this Committee favour a programme in the field of international law financed from the United Nations regular programme funds, but without the earmarking of a specific sum, such a programme would be reflected under Part V of the budget to the extent to which the governments assign the degree of priority to their requirements in this field within their over-all programme proposals. Thus, such a programme would be formulated on the priority approach described in the report of the Secretary-General on the 1965 programme (E/3870/Add.1).”

59. The Technical Assistance Committee agreed that there should not be a special earmarking for this purpose, but that governments are free to continue to include in their requests, on the basis of the priority approach described in the report of the Secretary-General on the 1965 Programme, proposals for assistance with respect to any international legal aspects

involved in development projects, and under the human rights advisory services programme, they may request assistance relating to the field of international law.

60. The Committee requests that the Secretary-General transmit these conclusions to the Special Committee and the General Assembly in response to Part B of General Assembly resolution 1968 (XVIII).

Agenda item 3 United Nations Regular Programme of Technical Assistance

INTRODUCTION

61. In its review of the United Nations Regular Programme of technical assistance, the Technical Assistance Committee had before it the annual report of the Secretary-General (E/3870) which reviewed developments in 1963 of the technical assistance programmes administered by the United Nations, and document E/3870/Add.1 which contained the detailed proposals of the Secretary-General for the 1965 Regular Programme. In addition to the proposal for technical assistance to promote the teaching, study, dissemination and wider appreciation of international law (see paras. 54 to 60 above), the Committee also had for consideration a proposal for further technical co-operation in narcotics control (E/TAC/144). Additionally, the Committee was asked to consider document E/TAC/145 referring to questions arising under General Assembly resolution 1768 (XVII) and various suggested changes in the financial regulations governing the regular programme activities which had been made to the Advisory Committee on Administrative and Budgetary Questions. Resolution 1768 (XVII) requested the Technical Assistance Committee to prepare a study of the relationship between the various United Nations programmes of technical assistance and the Regular Programme with a view to their rationalization and in order to avoid duplication in future fiscal years. The Committee also considered, in its discussion of the Regular Programme, that part of document E/3862, which referred to that Programme.

1963 and current activities

62. The Secretary-General's report on activities in 1963, supplemented by a statement of the Commissioner for Technical Assistance, (E/TAC/L.332 and Add.1), summarized the main developments in the programmes by major fields of activity and by regions with retrospective data. Total expenditures under the Expanded Programme, the Regular Programme and funds-in-trust in 1963 were \$15.7 million, slightly higher than in 1962, but considerably higher than expenditures in 1960 (\$9.7 million) and 1961 (\$10.3 million). A projection for 1964, which included nearly \$3 million for the Congo (Leopoldville), financed by funds-in-trust, and the normally higher expenditure in the second year of the Expanded Programme biennial, suggests a total programme of about \$22 million in 1964.

63. The report showed a continuing emphasis in 1963 on projects in the fields of economic programming and projections, industrial development, social activities (including housing), public administration and trade promotion. Programmes planned for 1964 show important increases in fiscal and financial subjects, industrial and natural resource development, statistics and social activities. Those increases generally reflect the special attention being given by national administrations and commissions and committees of the United Nations to the basic prerequisites for systematic economic and social development.

64. The Secretary-General's report drew special attention to the increased use being made of regional and inter-regional advisers in the strategic fields of development. This arrangement contributes to the possibilities for decentralization of operational activities to the regional economic commission secretariats. It provides a number of highly qualified experts who are available, at the request of governments, for short-term operational missions and for assisting in the preparation of plans for longer range and more sustained assistance. These would include, for example, advice on the preparation of Special Fund requests, requests for assistance under the World Food Programme and for comprehensive survey missions often involving one or more of the specialized agencies.

65. The Commissioner for Technical Assistance noted with appreciation the increased availability of associate experts provided to the United Nations and the other participating organizations on a funds-in-trust basis by several governments. The associate experts contribute important supplementary services to the programmes by enlarging the capacity of the more senior experts, to which they are normally attached. Such supporting assistance may be especially important in the training aspects of technical assistance operations. The training of counterparts and related personnel still remains one of the most important features of technical assistance activities and one to which the United Nations is giving increased attention.

Programme proposals for 1965

66. At its session in November-December 1963, the Technical Assistance Committee considered the initial estimates of \$6.4 million proposed by the Secretary-General for part V of the United Nations budget (E/TAC/137). The proposals included a distribution of the \$6.4 million among existing sections of Part V.⁴¹ The Committee, while agreeing that the programme for 1965 should be drawn on the basis of an appropriation of \$6.4 million, did not agree with the

⁴¹ Section		Dollars
13	Economic development	2,250,000
14	Social activities	2,105,000
15	Human Rights Advisory Services ...	140,000
16	Chap. I. Public Administration ...	980,000
	Chap. II. Operational, executive and administrative personnel	850,000
17	Narcotic drugs control	75,000

sectional distribution as proposed by the Secretary-General. In its resolution⁴² the Committee referred to the need for the United Nations Regular Programme to reflect the priorities for technical assistance as determined by each developing country in the light of its own development plan. Accordingly, it requested the Secretary-General to submit to the 1964 summer session of the Committee a plan to allocate funds available in part V in such a way as to show an increase in Section 13 (Economic development) which would permit the provision of a separate chapter heading specifically for industrial development. Additionally it requested the Secretary-General, taking account of the views of the Committee, to consult with the governments of developing countries and to make recommendations to the 1964 summer session of the Committee for introducing further flexibility so as to reflect the changing and various priorities of developing countries.

67. In response to this last recommendation, the Commissioner for Technical Assistance informed the Committee that he would request recipient countries to present their 1965 requests in two ways: on the usual sectional distribution (see footnote below) and on a straight priority basis without regard to the sectional distribution. Document E/3870/Add.1 gives the outcome of this request with the detailed project proposals for 1965 shown country-by-country in parallel columns in the statistical annex. As regards industrialization, a proposed allocation of \$750,000 was presented to the Committee, this figure being based on the total of government requests on a priority basis together with regional and inter-regional projects accorded high priority by the regional commissions and the Committee for Industrial Development. Sixty-two governments in response to a letter from the Commissioner for Technical Assistance indicated their views as to which system was preferable. Of these, forty-six indicated a preference for the priority system, eight preferred the sectional arrangement and eight had no preference.

68. The report of the Secretary-General summarized the detailed proposals in Table D and Table E of E/3870/Add.1 on a sectional basis and a priority basis respectively.

69. The Committee in its discussion on alternative methods of programming noted the fact that 46 of the 54 governments which had indicated a preference in replying to the Commissioner's letter had supported the priority approach. Taking this preference into account, the Committee decided to support this method of programming which had the advantage of offering to recipient governments the maximum flexibility in obtaining those types of assistance which would satisfy their most urgent requirements. The Committee decided to adopt the priority approach as from 1965.

70. It confirmed its previous recommendation of \$6.4 million as the appropriate level for part V of the regular United Nations budget for 1965. It approved

⁴² E/3849, annex IV.

the initial distribution of resources among the main fields of activity shown in Table E of E/3870/Add.1, as follows:

INITIAL 1965 REGULAR PROGRAMME BASED ON PRIORITIES

(In United States dollars)

<i>Fields of activities</i>	
Economic development	
I. Industrial development	750,000
II. Other economic fields	2,250,000
	3,000,000
Social welfare	2,000,000
Public administration	1,145,000
	6,145,000
SUB-TOTAL	
	6,145,000
Human rights	180,000
Narcotics control	75,000
	255,000
TOTAL	6,400,000

71. As the programme henceforth was to be established in accordance with priorities, it could be assumed that section 13 (economic development), section 14 (social activities) and section 16 (public administration) would be administered as a whole so that programme changes arising during the operational year might be more easily accommodated than heretofore.

72. The Committee recommended the adoption by the Economic and Social Council of the draft resolution proposed by the nineteenth session of the Commission on Narcotic Drugs concerning a survey of economic and social requirements of opium-producing regions in Thailand. The resolution of the Committee reads as follows:

"The Technical Assistance Committee,

"Having considered the report of the Secretary-General (E/TAC/144) transmitting a resolution adopted by the nineteenth session of the Commission on Narcotic Drugs concerning a survey of economic and social requirements of opium-producing regions in Thailand,

"Recommends that the Council adopt the resolution as proposed by the Commission."

73. The Committee's observations concerning Part B of General Assembly resolution 1968 (XVIII) on technical assistance to promote the teaching, study, dissemination and wider appreciation of international law are set out in paragraphs 54 to 60 above.

Programme level for future years

74. It was agreed that for working purposes a provisional level of \$6.4 million should be used as a guide for 1966 to enable the Secretary-General to begin the

programme planning exercise with governments for that year late in 1964.

75. As regards the level of the regular budget in future years, several delegations indicated that any increase in the resources available for United Nations technical assistance purposes should be achieved through voluntary contributions to the Expanded Programme. Certain delegations expressed the opinion that the budget of the United Nations was not intended to finance activity in the field of technical assistance. A few countries expressed the view that the Regular Programme of the United Nations should be merged with the Expanded Programme.

*Draft resolutions recommended for adoption
by the Council*

76. The Committee recommended that the Council adopt the draft resolutions set out in annexes III and IV. The draft resolution in annex III, recommended unanimously, notes with appreciation the report by the Secretary-General on the United Nations Regular Programmes. The draft resolution in annex IV, recommended by 27 votes in favour, none against and two abstentions, transmits to the Council for its adoption a draft resolution which would implement the decisions recorded in paragraphs 69 to 71 and 74 above.

*Questions arising under General Assembly
resolution 1768 (XVII)*

77. The Technical Assistance Committee returned to its discussion of the matters dealt with in General Assembly resolution 1768 (XVII) in order to conclude the assignment which was given to it under that resolution.

78. The assignment given to TAC by General Assembly resolution 1768 (XVII) was to prepare a study on the relationship between the various United Nations programmes of technical assistance and the Regular Programme with a view to their rationalization and in order to avoid duplication in future fiscal years. The Advisory Committee was requested to review this study and to report its findings to the Secretary-General and the General Assembly in order to assist them in arriving at the appropriation to be included in part V. Due to the pressure of time, the immediate response from TAC was an interim report of December 1962 (E/3704, para. 82). The Technical Assistance Committee deferred its observations on the longer range aspects of the United Nations Programme pending the availability to it of the report of the *Ad Hoc* Committee, since the same subject fell within that Committee's terms of reference under Council resolution 851 (XXXII).

79. On the occasion of its first discussion of General Assembly resolution 1768 (XVII) in November 1962, TAC had reached certain interim conclusions on the United Nations Regular Programmes. After

further consideration, a substantial majority of TAC now confirmed its conclusions as follows:

- (a) The United Nations Regular Programmes have made a contribution towards the development of developing countries and fulfil a definite purpose;
- (b) As a consequence of the integrated administration of technical assistance projects by the United Nations, there is no duplication in the use of funds as between the resources the United Nations receives from the Expanded Programme and its own budgetary sources;
- (c) The Regular Programme is an invaluable instrument in the economic and social operational programmes for which there is no ready substitute.

80. At its session from 17 to 29 June 1963, TAC had accepted the view of the Fifth Committee of the General Assembly and the Advisory Committee that a careful review of all United Nations technical assistance activities, with special reference to the Regular Programme, should be primarily exercised by TAC (See E/3783, para. 57).

81. Additionally, an improvement in the procedures for submission to the Council of new proposals having financial implications for United Nations technical assistance resources has taken place. This improvement in procedures was based on the precedent followed in 1963 when proposals from the Commission on Human Rights and from the Commission on Narcotic Drugs were referred to TAC for observation before being considered by the Council. It is being applied this year to proposals emanating from the General Assembly and from the Commission on Narcotic Drugs described earlier in this report.

82. In connexion with its review of the United Nations Regular Programme for 1965, to which, as described above, flexibility in the use of funds is to be applied on a priority basis, TAC requested that the Secretary-General should continue to report to the Commissions and Committees of the Council on the programmes delivered and planned in the fields of their particular substantive interest.

83. As to the level of the regular budget for a particular financial year, this appears best determined on a year-to-year basis.

84. The Technical Assistance Committee wishes to take the occasion of its present report to confirm the belief stated at its session in November-December 1963, that there is a need for greater comparability between the financial regulations and rules applicable to part V and those adopted for EPTA. The TAC endorsed the proposals to this effect which the Secretary-General is making to the nineteenth session of the General Assembly.

85. The Committee adopted unanimously the resolution set out below which transmits to the Advisory Committee the statement contained in paragraphs 77

to 84 above as constituting the study requested of TAC in General Assembly resolution 1768 (XVII):

"The Technical Assistance Committee,

"Having considered the report (E/3862) of the Ad Hoc Committee of Ten under ECOSOC resolution 851 (XXXII) and, in particular, that part of the report dealing with the regular programmes,

"Recalling its interim observations in response to operative paragraph 2 of General Assembly resolution 1768 (XVII) on relationships of the regular programme of the United Nations to other funds available to the United Nations for its technical assistance activities (E/3704) and recalling also other actions which it has taken and which were set out in the Secretary-General's report (E/TAC/145),

"Decides to transmit to the Advisory Committee on Administrative and Budgetary Questions the statement contained in paragraphs 77 to 84 of E/3933, as constituting the study requested of the Technical Assistance Committee in General Assembly resolution 1768 (XVII)"

Other matters

86. In discussing the nature of the United Nations Programme of technical assistance, several members of the Committee commented favourably upon the increasing emphasis being given to training activities in national and regional training centres, in group training activities on an inter-regional basis and in other ways. Experts serving under the United Nations Programme are requested to pay particular attention to training needs.

87. In this connexion, a few members commented upon an apparent decrease in the number of fellowships from 1962 to 1963. The Commissioner for Technical Assistance, in reply, indicated that a comparison of fellowships awarded between two years only was not necessarily indicative of a trend. The nature of the fellowship programmes and arrangements for placement with host governments could be expected to result in somewhat erratic fluctuations in the statistics.

88. Several members welcomed the increase in regional and inter-regional projects, including advisers, study groups and seminars. In particular, the comparatively rapid response to government requests made possible by the adviser system contributed greatly to the ability of the Programme to deal promptly and effectively with a wide variety of problems.

89. The Committee noted with interest the further expansion of the use of associate experts, who are made available through the participating organizations without cost to recipient governments by several donor governments. Interest was expressed in receiving further information about this aspect of technical assistance including what happened when the associate expert completed his assignment, that is, whether he returned to his home country or became attached to the Programme as an expert. In commenting on this point,

the Commissioner agreed to supply particulars in his report to the Committee in 1965.

90. One member questioned the advisability of the new United Nations policy of levying a 12 per cent administrative charge on donor countries for associate experts supplied to the Programme. The Commissioner replied that this practice had been adopted recently because of the growth in the volume of funds-in-trust arrangements of all kinds and was applicable to governmental trust accounts generally. The choice of 12 per cent followed a TAB recommendation that in cases where an organization decided to apply a fee for the administration of trust funds, a 12 per cent figure should be used in the interests of standardization.

91. In further comments concerning the adoption of a priority system of programming in place of programming by sections of the United Nations technical assistance budget, interest was expressed in receiving in future years statistical tables showing implementation of programme by major fields of activity, appropriately sub-divided, for a series of years. This would permit the Committee to evaluate the results of the new system. The Commissioner agreed to supply the information requested.

92. The Committee agreed that the new timetable for its consideration and review of the proposed programme offered a number of advantages in that it gave governments of developing countries and the secretariat additional time to prepare carefully integrated programmes. As previously mentioned, the Committee agreed that the Secretary-General could consider \$6.4 million as the initial level of the regular budget for 1966 for planning purposes. This would allow earlier programming activities than otherwise would be possible.

93. Some members of the Committee drew attention to the relatively low level of increased resources being devoted to countries of Asia and the Far East and Latin America. While recognizing the urgent needs of the many newly emerging countries elsewhere they expressed the hope that this trend would not go too far or continue much longer.

94. During the discussion on the report on the activity of the United Nations Regular Programme of technical assistance, some members of the Committee made critical comments in connexion with the fact that under the Regular Programme the opportunities which they were ready to offer were utilized in a very unsatisfactory manner. In particular, it was emphasized that too few specialists from those countries were sent to the developing countries as United Nations experts.

95. One member requested explanations of the fact that, according to the information in table 9 of document E/3870, a considerable number of fellowships had been awarded in 1963 to nationals of highly developed countries, whereas very few fellowships, or sometimes none at all, had been awarded to certain developing countries. The Commissioner replied that there was nothing to preclude developed countries from request-

ing assistance under the resolutions governing the Regular Programme. It was also pointed out that many of the fellows came from developing areas under the administration of such developed countries. As for the lack of fellowships awards to certain developing countries, the Commissioner stated that the answer can only be that none were requested.

Agenda item 4

Final report of the *Ad Hoc* Committee on the co-ordination of technical assistance activities

96. The Committee had before it the final report of the *Ad Hoc* Committee on Co-ordination of Technical Assistance Activities (E/3862) together with the relevant parts of the latest report of the Administrative Committee on Co-ordination (ACC) (E/3886). Also available to it, for information, were the Secretary-General's Report (E/3850) to the Council and the *Ad Hoc* Committee under Council Resolution 900 A (XXXIV), the draft resolutions submitted to the Economic and Social Council by the Secretary-General in response to paragraph 3 of the resolution adopted by the *Ad Hoc* Committee (E/3899), the resolution on the Gradual Transformation of the Special Fund adopted by the United Nations Conference on Trade and Development, and an excerpt from the report of the twelfth session of the Governing Council of the Special Fund summarizing the Governing Council's discussion of the *Ad Hoc* Committee's proposals (E/3889).

97. The Chairman explained that the Committee was not called upon to take any specific action in regard to the proposals contained in documents E/3862 and E/3886 for combining the Expanded Programme and the Special Fund in a new United Nations Development Programme. It had been asked by the Council to comment on the *Ad Hoc* Committee's report. To learn the views of the members of the Committee on this matter with which they were so closely concerned would no doubt be helpful to the Council. Such an expression of views would naturally be without prejudice to the position that might ultimately be taken by the governments concerned at the Economic and Social Council or the General Assembly.

98. The Committee heard a statement by the Under-Secretary for Economic and Social Affairs. (E/TAC/L.333) The Under-Secretary stressed the timeliness of a consolidation such as that proposed pointing out the importance and urgency, in the light of the enhanced role assigned to the United Nations in the promotion of economic development of maximizing the United Nations effectiveness and authority in that field. He transmitted to the Committee a message from the Secretary-General of the United Nations, in which the Secretary-General underlined the great importance he attached to the establishment of a new United Nations Development Programme which would not only include the best elements of the Expanded Programme and the Special Fund but have an added strength of its own. The Secretary-General further stated his conviction that the creation of the new Programme, besides

improving the services the United Nations family could provide, was essential if the larger resources required to meet the urgent needs of the developing countries were to be mobilized. The full text of this message is reproduced in annex VI.

99. The Executive Chairman of the Technical Assistance Board and the Associate Managing Director of the Special Fund told the Committee that they considered, on the basis of their experience, that the time was ripe for a further step in the rationalization of the United Nations technical co-operation work. They expressed strong support for the proposals, as elaborated by the Secretary-General and the ACC.

100. The representatives of the ILO, FAO, UNESCO, WHO, ITU, UPU, WMO and IAEA expressed full support of the proposals as amplified in the report of ACC, underlining particular features, notably the importance of ensuring full agency participation in the Programme through the proposed inter-agency body. In the case of certain of these agencies, the statements made reflected positions already taken by their governing organs in the matter.

101. A considerable majority of the members of the Committee expressed their firm support of, or general concurrence in, the *Ad Hoc* Committee's proposal, it being understood that the separate identity and characteristics of the EPTA and the Special Fund would be preserved within the United Nations Development Programme. Some of these members reserved their position as to details or expressed doubts in regard to specific aspects of the proposal, while agreeing that the consultations held during the past two years had greatly extended the areas of agreement. Other members stated that their governments were unable to accept the proposal at this time, or wished to reserve their attitude toward it pending the discussion at the Economic and Social Council or the General Assembly.

102. Among those favouring the proposal for consolidation, many, while approving the proposals for the establishment of a single inter-governmental governing council and a single inter-agency consultative board, were opposed or reserved their position, as to a unification at the management level at the present stage and supported the recommendation of the *Ad Hoc* Committee. The others expressed their support of the Secretary-General's position, endorsed by the ACC, that there should be a unified management. One member stated that the only merger he could contemplate at the moment was that of the TAC and the Governing Council of the Special Fund. Another member stated that, in his view, the alternative paragraph 6 of the resolution recommended for adoption by the General Assembly in document E/3899 did not reflect the position of the Secretary-General on the question of the unification of the management as expressed in document E/3850, paragraph 14, and E/3886, paragraph 32. The representative of the Secretary-General explained that the final proposals were the result of a long process of consultation and that, where full agreement had not been reached, the Secretary-General took final responsibility for these proposals.

103. A point emphasized by many speakers was the essential importance of ensuring that the proposed re-organization would be without prejudice to any action aimed at the establishment of a United Nations Capital Development Fund. Most delegations maintained that there would be no such prejudice. Frequent reference was made to the recommendation of the United Nations Conference on Trade and Development on the transformation of the Special Fund into a United Nations Capital Development Fund — a recommendation based on a report submitted to the Conference by the Secretary-General under General Assembly resolution 1936 (XVIII). The Secretary-General's positive statement to the Committee that "Far from limiting the possibilities of a United Nations Capital Investment Programme, the proposals should enhance those possibilities" was noted with satisfaction by some of the speakers concerned, while one member expressed the view that the assurances should come from the policy-making organs of the United Nations, namely the Economic and Social Council and the General Assembly, when taking a decision on the question of the merger (see annex VI).

104. Among other points to which attention was drawn in the course of the discussion were the continued need for the techniques of both the Special Fund and the EPTA, and the desirability that the Programme should pay appropriate attention to the work of the United Nations on the application of science and technology to development, on industrial development, on the development of natural resources, and on the promotion of trade. A number of members underlined the importance of equal representation of developing and developed countries on the Governing Council of the UNDP, while one member expressed his desire for full representation of the developing countries in that Council, in accordance with the pattern recommended by the United Nations Conference on Trade and Development for the proposed Trade and Development Board. Several members felt that the role of the resident representatives in the developing countries should be strengthened and that the relations between the regional economic commissions and the organs and staff of the UNDP should be as close as possible.

105. Among those members who opposed, or who expressed doubts or reservations regarding the proposals for a merger, some felt that an expression of the views of a larger number of developing countries would be needed before a definite position could be taken. They also felt that the advantages and disadvantages of a possible merger had not been sufficiently explored by the *Ad Hoc* Committee or the Secretary-General. Some members considered that the emphasis should be on closer co-ordination rather than on structural change and further that a merger would have little justification unless it were combined with practical steps for the international financing of development.

106. Among the members not favouring a merger, three also expressed the view that such a step needed

to be considered in relation both to the future of the Regular Programme and to the possibilities of establishing a United Nations Capital Development Fund. They considered that the proposed merger would lead in fact to the absorption of the Expanded Programme into the Special Fund, as a result of which the positive experience and procedures of the Expanded Programme, which are beneficial to the developing countries, might be lost. One step which they considered immediately desirable was the merger of the Regular Programme with the Expanded Programme of Technical Assistance.

107. The members favouring the proposal for consolidation shared the view that it should result in improving the services the United Nations could provide to the developing countries, in enlarging the scope and enhancing the effectiveness and authority of those programmes and in helping to provide the larger resources required. While paying tribute to the outstanding record of achievement of each of the existing technical co-operation programmes of the United Nations, they were convinced of the importance of a further step being taken to adapt the United Nations machinery to the new and enlarged possibilities for international action that now offered themselves.

Agenda item 5

Request of the Inter-Governmental Maritime Consultative Organization for participation in the Expanded Programme of Technical Assistance

108. The Committee considered a note by the Secretary-General of the United Nations (E/3914) in which he transmitted a communication dated 3 June 1964 from the Inter-Governmental Maritime Consultative Organization requesting membership in the Technical Assistance Board and resolution COUNCIL XI/Res.5 adopted by the Council of IMCO on 28 May 1964. The Secretary-General was requested to bring the resolution to the attention of the Economic and Social Council.

109. In introducing the request, the Secretary-General of IMCO explained how technical assistance activities in the maritime field had up to that date been handled in accordance with an agreement between IMCO and the United Nations. He pointed out that in its resolution COUNCIL XI/Res.5 the Council of IMCO had accepted as a basis for discussion with the United Nations a new division of technical assistance responsibilities in the maritime field between IMCO and the United Nations which had been suggested by the latter. He hoped that the Technical Assistance Committee would endorse IMCO's application, which would enable it to extend technical assistance directly and thus to play its full role as a participating specialized agency.

110. The Committee welcomed the application of IMCO for participation in the Expanded Programme. The Chairman proposed that the Committee recommend to the Council that it approve the participation of IMCO in the Expanded Programme of Technical

Assistance and that it amend Council resolution 222 (IX) accordingly.

111. At its 325th meeting the Committee recommended unanimously the adoption by the Council of the draft resolution reproduced in annex V.

ANNEX I

[Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council", resolution 1005 (XXXVII).]

ANNEX II

[Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council", resolution 1006 (XXXVII).]

ANNEX III

[Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council", resolution 1007 (XXXVII).]

ANNEX IV

[Text adopted by the Council as amended orally at the 1325th meeting. See below, "Resolutions adopted by the Economic and Social Council", resolution 1008 (XXXVII).]

ANNEX V

[Text adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council", resolution 1009 (XXXVII).]

ANNEX VI

Text of message from the Secretary-General

"I should like the Committee to know that I attach the greatest importance to the consolidation and effective co-ordination of all United Nations pre-investment assistance. That is why I have so earnestly sought the establishment of a new United Nations Development Programme which will not only include the best elements of the Expanded Programme of Technical Assistance and the Special Fund, but have an added strength of its own. Besides improving the services our United Nations family can provide, the creation of this new programme, I am convinced, is essential if we are to mobilize the larger resources required by the urgent needs of the developing countries. Far from limiting the possibilities of a United Nations capital investment programme, the proposals should enhance those possibilities.

"I am glad to report that as a result of extensive consultation with the executive heads of the specialized agencies and the International Atomic Energy Agency, we are all now agreed on the proposals which are recommended by me in the draft resolution which has been prepared for the Economic and Social Council and which reflects agreements recorded in the ACC report. These proposals contain only one modification of substance from the recommendations of the Committee of Ten, and that is in the Secretary-General's view on management, in which members of the Administrative Committee on Co-ordination concur. A unified management is proposed for the new Programme, with the present Managing Director of the Special Fund serving as Administrator, and the present Executive Chairman of the Technical Assistance Board serving as Co-Administrator until 31 December 1966."

DOCUMENT E/3966

Co-ordination of technical assistance activities: report of the Co-ordination Committee

[Original text: English]
[6 August 1964]

1. The Co-ordination Committee, under the chairmanship of Mr. Daniel Cosío Villegas (Mexico), considered, at its 251st, 252nd, 253rd, 254th, 255th, 256th and 257th meetings held on 28, 29, 30 and 31 July 1964,⁴³ item 19(c) of the agenda: "Co-ordination of technical assistance activities". This item had been referred to the Committee by the Council at its 1314th plenary meeting held on 13 July 1964.

2. The Committee had before it the following documents:

Report of the Secretary-General under Council resolution 900 A (XXXIV), Part I and Part II. Documents E/3850 and E/3851;

Report of the *Ad Hoc* Committee established under Council resolution 851 (XXXII). Document E/3862;

Report of the Administrative Committee on Co-ordination of Technical assistance activities. Document E/3886, paragraphs 29 to 33;

Draft resolution submitted by the Secretary-General in response to paragraph 3 of the resolution adopted by the *Ad Hoc* Committee on Co-ordination of Technical Assistance Activities. Document E/3899;

Note by the Secretary-General. Document E/3913;

Note by the Secretary-General. Document E/3922;

Report of the Technical Assistance Committee on its meetings held in June-July 1964. Document E/3933, paragraphs 96 to 107;

Report of the Governing Council of the Special Fund on its twelfth session. Document E/3889, paragraphs 101 to 112.

3. During consideration of the item in the Committee, the following written amendments to the draft resolutions submitted by the Secretary-General were introduced:

Amendments proposed by the delegation of Italy. Document E/AC.24/L.234;

An amendment proposed by the delegation of France. Document E/AC.24/L.235;

Amendments sponsored by the delegations of Algeria, Argentina, Cameroon, Chile, Ecuador, Ghana, India, Indonesia, Iran, Iraq, Mexico, Senegal, United Republic of Tanganyika and Zanzibar, and Yugoslavia. Document E/AC.24/L.236;

An amendment initially sponsored by the delegations of Japan and the United Kingdom of Great Britain and Northern Ireland and later also by the delegation of Austria. Document E/AC.24/L.237.

4. After a general discussion in which most of its members took part, the Committee proceeded to consider and vote on the draft resolutions submitted by the Secretary-General (E/3899) together with the above amendments paragraph by paragraph.

5. At the 255th meeting of the Committee, the Under-Secretary for Economic and Social Affairs made the following statement based on his consultations with the representatives of the agencies, the Managing Director of the Special Fund, and the Executive Chairman of the Technical Assistance Board:

"We have carefully studied the amendments proposed to the draft resolutions submitted by the Secretary-General for consideration by the Economic and Social Council, to the extent that they relate to the participation of the Specialized Agencies and the IAEA in the proposed United Nations Development Programme.

"We believe that these amendments are aimed at clarifying the text and we do not think that they alter the basic understanding arrived at in the Administrative Committee on Co-ordination.

"In particular, as far as the proposed amendment to paragraph 3 of the draft resolution is concerned, we have taken note of the explanatory statement of the representative of Chile on behalf of the sponsoring governments, that the deletion of the two sentences in that paragraph has been proposed on the understanding that they are, strictly speaking, unnecessary. It is of course taken for granted that the agencies will continue to exercise their responsibilities under their constitutional authority and that the relationship agreements will be applicable to participation in the new organ.

"As far as paragraph 5 is concerned, we understand that the language proposed has created some doubts and misunderstandings. We would like to stress that it has not been the intention of the Administrative Committee on Co-ordination that the proposed inter-agency Consultative Board would have decision-making powers. The power of decision-making rests with the Governing Council on matters of policy and with the Administrator and Co-Administrator on matters of management, it being understood that there are certain types of decisions with which governing bodies of the participating organizations would have to be associated. At the same time, it is in the nature of the programme that the process leading up to the formation of decisions necessarily involves consultations with the participating organizations at various stages.

⁴³ See provisional summary records E/AC.24/SR.251 to 257.

“ Finally, as far as sub-paragraph (iii) of the same paragraph 5 (iii) is concerned, we understand that the deletion of the words ‘ and general policy relating to ’ would not affect the consultations which now take place, as appropriate, with the participating organizations concerning the general arrangements and the terms of reference applicable to the Resident Representatives.

“ We would be grateful if these observations could be reflected in the report of the Committee as this would be helpful to the governing bodies of participating organizations, particularly those which have already expressed themselves on the matter.”

6. The Committee adopted without objection the entire preambular part of the draft resolution submitted for recommendation by the Council to the General Assembly (E/3899 annex), together with the first amendment in Part II of document E/AC.24/L.236, and the second amendment after oral modification to conform with the text of the message annexed to E/3933.

7. The first operative paragraph of the Assembly resolution was approved by 20 votes in favour, 3 against and 1 abstention.

8. After the sponsors had withdrawn the third amendment in Part II of E/AC.24/L.236, the second operative paragraph was approved without a vote.

9. The first part of amendment 4 in document E/AC.24/L.236 was approved by 25 votes in favour, none against and 1 abstention. The second part was approved by 15 votes in favour, none against and 5 abstentions.

10. The three amendments to operative paragraph 3 submitted by Italy in document E/AC.24/L.234, were approved without objection.

11. Amendment 5 in document E/AC.24/L.236, containing two alternative texts on the question of representation on the Governing Council, after an oral revision to add the words “ and IAEA ” at the end of the text, was approved by 14 votes in favour, 6 against and 6 abstentions. The sixth and seventh amendments in the same document were approved without objection. The amendment submitted by Austria, Japan and the United Kingdom in document E/AC.24/L.237 was rejected by a vote of 7 in favour, 9 against and 8 abstentions. Amendment 8 in document E/AC.24/L.236 was approved by a vote of 22 in favour, none against and 4 abstentions. The ninth and tenth amendments were approved without a vote. The amendment submitted by France in document E/AC.24/L.235 was withdrawn.

12. Amendment 11 (II) of the fourteen Powers was adopted by 22 votes in favour, none against and 4 abstentions after an oral revision to read as follows:

“ 6. *Decides*, as a transitional measure on adoption of this resolution, that the present Managing Director of the Special Fund shall become the Administrator of the UNDP and the present Executive Chairman of the Technical Assistance Board shall become the Co-Administrator of the UNDP, each to serve until 31 December 1966, or, pending a further review of arrangements at the management level, such later date as may be determined by the Secretary-General after consultation with the Governing Council.”

13. The draft resolution for recommendation to the General Assembly as a whole and as amended was adopted by a vote of 20 in favour, 3 against and 1 abstention.

14. The Committee approved the first and second preambular paragraphs of the draft resolution submitted for consideration by the Economic and Social Council (E/3899) without objection. The first fourteen-power amendment in Part I of document E/AC.24/L.236, and the second amendment after oral modification to conform with the text of the message annexed to E/3933, were also approved without objection. The first operative paragraph of the Council draft resolution was adopted by a roll call vote of 21 in favour and 4 against, as follows:

In favour Austria, Cameroon, Colombia, Ecuador, United States of America, Ghana, India, Indonesia, Iraq, Iran, Italy, Japan, Luxembourg, Mexico, United Kingdom of Great Britain and Northern Ireland, United Republic of Tanganyika and Zanzibar, Senegal, Yugoslavia, Algeria, Argentina, Australia.

Against France, United Arab Republic, Czechoslovakia, Union of Soviet Socialist Republics.

The second operative paragraph was approved without a vote. The draft Council resolution as a whole was adopted by a vote of 21 in favour, 3 against and 1 abstention.

15. The Committee recommends to the Council the following draft resolution for adoption and for recommendation to the General Assembly:

[*Text adopted by the Council without change. See below, “ Resolutions adopted by the Economic and Social Council ”, resolution 1020 (XXXVII).]*

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1005 (XXXVII). Annual Report of the Technical Assistance Board to the Technical Assistance Committee

The Economic and Social Council

Takes note with appreciation of the report of the Technical Assistance Board to the Technical Assistance Committee for 1963. (E/3871/Rev.1)

*1325th plenary meeting,
21 July 1964.*

1006 (XXXVII). Housing for experts

The Economic and Social Council,

Having noted the report of the Executive Chairman of the Technical Assistance Board concerning housing for experts in the field (E/TAC/142),

Recognizing the importance of adequate housing for experts in the field,

Considering that growing shortages of housing for project personnel threaten, in some cases, to inhibit the normal progress of project operations,

Noting that the overwhelming majority of such housing problems are being met by normal means and with the full co-operation and financial participation of the recipient Governments concerned,

Considering, however, that a hard core of cases remains which could, as remote possibilities, require extraordinary solutions involving residual contingency charges against the Expanded Programme,

1. *Decides* to authorize the Technical Assistance Board, as an exceptional measure when no other practical remedies are available, to adopt such solutions which might involve underwriting the costs of providing experts with housing, recognizing that such solutions could exceptionally give rise to contingent costs to the Expanded Programme when no other source of funds was available;

2. *Requests* that the use of this authority should regularly be reported to the Technical Assistance Committee and, in particular, that it be provided with full details of any costs at the first opportunity.

*1325th plenary session,
21 July 1964.*

1007 (XXXVII). Report by the Secretary-General on the United Nations programmes of technical assistance

The Economic and Social Council

Takes note with appreciation of the report by the Secretary-General on the United Nations programmes of technical assistance (E/3870 and Add.1).

*1325th plenary session,
21 July 1964.*

1008 (XXXVII). United Nations programmes of technical assistance

The Economic and Social Council,

Having considered the report of the Secretary-General on the United Nations programmes of technical assistance (E/3870 and Add.1) and the report of the Technical Assistance Committee (E/3933),

1. *Endorses* \$6.4 million as the level of appropriations for Part V of the regular United Nations budget in 1965, and endorses in principle the programme proposals outlined in the report of the Secretary-General;

2. *Approves*, in keeping with the preferences expressed by the developing countries, the establishment of the 1965 programme under the regular budget on the priority basis outlined in paragraph 23 of the Secretary-General's report (E/3870/Add.1);

3. *Decides* that future programmes under the regular budget should be drawn up on the basis of similar priority procedures;

4. *Requests* the Secretary-General:

(a) During a programming period to inform recipient Governments of the services available to them under General Assembly and Economic and Social Council resolutions in the fields of economic development, social welfare, public administration, human rights and narcotic drugs control;

(b) To continue to report to the commissions and committees of the Council on the programmes delivered and planned in the fields of their particular substantive interests;

5. *Requests* the Secretary-General to continue to make provision in his annual appropriation requests under the regular budget for Technical programmes and suggests that, for working purposes, the tentative budget estimates for Technical programmes for 1966 should be at the level approved for 1964;

6. *Decides* that the level of the Secretary-General's annual budget submissions for Technical programmes and the programmes thereunder should continue to be subject to the advice, guidance and review of the Technical Assistance Committee, and that proposals emanating from the functional commissions and committees of the Council which could affect the technical assistance resources of the United Nations should be transmitted to the Council through the Technical Assistance Committee.

*1325th plenary meeting,
21 July 1964.*

1009 (XXXVII). Participation of the Inter-Governmental Maritime Consultative Organization in the Expanded Programme of Technical Assistance

The Economic and Social Council,

Having considered the request of the Inter-Governmental Maritime Consultative Organization for par-

ticipation in the Expanded Programme of Technical Assistance (E/3914),

1. *Approves* the participation of the Inter-Governmental Maritime Consultative Organization in the Expanded Programme of Technical Assistance;

2. *Decides* to amend its resolution 222 (IX) of 14 and 15 August 1949 accordingly.

*1325th plenary session,
21 July 1964.*

1020 (XXXVII). Consolidation of the Special Fund and the Expanded Programme of Technical Assistance in a United Nations Development Programme

The Economic and Social Council,

Having considered the proposals made by the Secretary-General in his report (E/3850) for bringing together the Special Fund and the Expanded Programme of Technical Assistance in a United Nations Development Programme, together with the report of the *ad hoc* Committee of Ten (E/3862) and the views expressed thereon by the Administrative Committee on Co-ordination (E/3886, paras. 29 to 33),

Concurring in the view that such a consolidation would go a long way in streamlining the activities carried on separately and jointly by the Expanded Programme of Technical Assistance and the Special Fund, simplify organizational arrangements and procedures, facilitate over-all planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness,

Reaffirming that the consolidation proposed would be without prejudice to consideration of the study requested from the Secretary-General by the General Assembly in its resolution 1936 (XVIII) of 11 December 1963, "of the practical steps to transform the Special Fund into a Capital Development Fund in such a way as to include both pre-investment and investment activities" and without prejudice to the recommendation of the United Nations Conference on Trade and Development on the gradual transformation of the Special Fund, so as to include not only pre-investment but also investment proper (E/CONF.46/139, annex (A.IV.8).

Taking note of the Secretary-General's message (E/3933, annex VI), in which he states, *inter alia*, "far from limiting the possibilities of a United Nations capital investment programme, the proposals should enhance those possibilities",

1. *Endorses* the draft resolution annexed hereto and recommends it for adoption by the General Assembly;

2. *Decides* that the resolutions of the Economic and Social Council concerning the Special Fund and the Expanded Programme of Technical Assistance shall, upon adoption by the General Assembly of the draft resolution annexed hereto, be deemed to have

been amended or superseded to the extent necessary to give effect to that General Assembly resolution.

*1344th plenary meeting,
11 August 1964.*

ANNEX

The General Assembly,

Having considered the recommendation of the Economic and Social Council to combine the Special Fund and the Expanded Programme of Technical Assistance in a United Nations Development Programme,

Being convinced that such a consolidation would go a long way in streamlining the activities carried on separately and jointly by the Expanded Programme of Technical Assistance and the Special Fund, simplify organizational arrangements and procedures, facilitate over-all planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness,

Recognizing that requests for assistance on the part of the developing countries are steadily increasing in volume and in scope,

Believing that a reorganization is necessary to provide a more solid basis for the future growth and evolution of the assistance programmes of the United Nations system of organizations financed from voluntary contributions,

Recalling and reaffirming part III of its resolution 1219 (XII) of 14 December 1957 and part C of its resolution 1240 (XIII) of 14 October 1958 concerning the decision and the conditions "under which the Assembly shall review the scope and future activities of the Special Fund and take such action as it may deem appropriate",

Reaffirming that the consolidation proposed would be without prejudice to consideration of the study requested from the Secretary-General by the General Assembly in its resolution 1936 (XVIII) of 11 December 1963 "of the practical steps to transform the Special Fund into a capital development fund in such a way as to include both pre-investment and investment activities", and without prejudice to the recommendation of the United Nations Conference on Trade and Development on the gradual transformation of the Special Fund, so as to include not only pre-investment but also investment proper, or the recommendation of the Council and General Assembly thereon,

Taking note of the Secretary-General's message in which he states *inter alia* "far from limiting the possibilities of a United Nations capital investment programme, the proposals should enhance those possibilities",

Recognizing that the effective working of a United Nations Development Programme depends on the full and active participation and technical contribution of all the organizations concerned,

1. *Decides* to combine the United Nations Expanded Programme of Technical Assistance and the Special Fund in a programme to be known as the United Nations Development Programme, it being understood that the special characteristics and operations of the two programmes as well as two separate funds will be maintained, and that contributions may be pledged to the two programmes separately as hitherto;

2. *Reaffirms* the principles, procedures and provisions governing the Expanded Programme of Technical Assistance and the Special Fund not inconsistent with this resolution; and declares that they shall continue to apply to relevant activities within the United Nations Development Programme;

3. *Resolves* that a single inter-governmental committee of [. . .] members, to be known as the Governing Council for the United Nations Development Programme, shall be established to perform

the functions previously exercised by the Governing Council of the Special Fund and the Technical Assistance Committee, including the consideration and approval of projects and programmes and the allocation of funds. In addition, it shall provide general policy guidance and direction for the United Nations Development Programme as a whole, as well as for the United Nations regular programmes of technical assistance, shall meet twice a year, and shall submit reports and recommendations thereon to the Economic and Social Council for consideration by the Council at its summer session. Decisions of the Governing Council shall be made by a majority of the members present and voting;

4. *Requests* the Economic and Social Council to elect the members of the Governing Council from among States Members of the United Nations or members of the specialized agencies or of the International Atomic Energy Agency for a term of three years, provided, however, that of the members elected at the first election the terms of [...] members shall expire at the end of one year and the terms of [...] other members at the end of two years; retiring members shall be eligible for re-election; [there shall be equal representation of the economically more developed countries, on the one hand, having due regard to their contribution to the United Nations Development Programme, and of the developing countries, on the other hand, taking into account the need for equitable geographical distribution among the latter members;] [there shall be equitable geographical representation of all States Members of the United Nations and members of the specialized agencies and the International Atomic Energy Agency;] the first election shall take place at the first meeting of the Council after the adoption of the present resolution;

5. *Decides* to establish, in place of the Technical Assistance Board and the Consultative Board of the Special Fund, an advisory committee to be known as the Inter-Agency Consultative Board for the United Nations Development Programme to meet under the chairmanship of the Administrator or Co-Administrator and to include the Secretary-General and the Executive Heads of the specialized agencies and of the International Atomic Energy Agency or their representatives; the Executive Directors of United Nations Children's Fund and the World Food Programme should be invited to participate as appropriate. In order that the participating organizations be provided with the opportunity to take part fully in the process of decision- and policy-making in a consultative capacity, the Inter-Agency Consultative Board shall be consulted on all significant aspects of the United Nations Development Programme and in particular it shall:

(a) Advise the management on the programmes and projects submitted by Governments, through the resident representative, prior to their submission to the Governing Council for approval, taking into account the programmes of technical assistance being carried out under the regular programmes of the organizations

represented on the Consultative Board, with a view to ensuring more effective co-ordination. The views of the Consultative Board when it so requests shall be conveyed by the Administrator (referred to in paragraph 6 below) to the Governing Council together with any comments he may wish to make, when recommending for approval general policies for the Programme as a whole or programmes and projects requested by Governments;

(b) Be consulted in the selection of agencies for the execution of specific projects as appropriate;

(c) Be consulted on the appointment of the resident representatives and review annual reports submitted by them;

The Inter-Agency Consultative Board shall meet as often and for such periods as may be necessary for the performance of the foregoing functions;

6. *Decides*, as a transitional measure on adoption of this resolution, that the present Managing Director of the Special Fund shall become the Administrator of the United Nations Development Programme and the present Executive Chairman of the Technical Assistance Board shall become the Co-Administrator of the United Nations Development Programme, each to serve until 31 December 1966, or, pending a further review of arrangements at the management level, such later date as may be determined by the Secretary-General after consultation with the Governing Council.

1021 (XXXVII). Working Capital and Reserve Fund

The Economic and Social Council,

Having noted the report of the Technical Assistance Committee (E/3849),

1. *Decides* to amend its resolutions 521 A (XVII) of 5 April 1954 and 623 B II (XXII) of 9 August 1956, as follows:

In sub-paragraph I.A (a) (V) of resolution 623 B II (XXII), delete the phrase reading: "... each participating organization shall limit its forward contractual commitments and residual liquidating liabilities to its *pro rata* share of the Fund, based on the allocations authorized for the current year; "

2. *Recommends* to the General Assembly that it give its approval to the above amendment.

*1344th plenary meeting,
11 August 1964.*

CHECK LIST OF DOCUMENTS

NOTE. This check list includes the documents pertaining to agenda item 19 which are not reproduced in the present fascicle.

<i>Document No.</i>	<i>Title</i>	<i>Observations and references</i>
E/3871/Add.1	Addendum (Statistical data relating to all projects which were in operation in 1963 under the Expanded Programme of Technical Assistance)	Mimeographed

DOCUMENT E/3949

Second annual report of the United Nations/FAO Inter-Governmental Committee on the World Food Programme

[Original text: English]
[17 July 1964]

A. INTRODUCTION

Fourth session

1. The present report is the second annual report of the Inter-Governmental Committee on the World Food Programme. It is submitted in pursuance of General Regulation 11 of the World Food Programme and covers the period between 18 May 1963 and 30 June 1964.

2. This period has been a crucial one for the development of the Programme. In the 14 months that elapsed between May 1963 and June 1964 it has moved from the stage of preparation and determination of main policies and procedures to that of initiating and operating projects, for which the flow of requests has been steadily increasing. Now, halfway through the experimental period, the Programme is firmly established, its shape and characteristics are well defined, most of its resources have been committed or earmarked, and the conditions have been created for the orderly fulfilment of its operational tasks, namely the shipping of its commodities and its supervisory functions in the execution of projects, and for the necessary appraisal of its activities.

**B. MAJOR DECISIONS TAKEN BY
THE INTER-GOVERNMENTAL COMMITTEE**

3. During the period under review the Committee held two regular sessions: the fourth session took place in Rome from 4 to 9 November 1963, and the fifth in Geneva from 6 to 10 July 1964.

4. At its fourth session, the Committee took a number of decisions dealing with substantive aspects of the Programme and its operations:

(a) It extended to the end of 1964 the Executive Director's delegation of authority to approve projects in which the cost of the food or feed component did not exceed \$500,000.

(b) It agreed that the 25% of the Programme's annual resources in commodities, together with the necessary services, or approximately \$7 million, previously authorized for use in emergency relief operations in 1963, should be earmarked in each of the years 1964 and 1965.

(c) It authorized the Executive Director to carry forward to 1964 and 1965 respectively any unused balance not exceeding \$7 million remaining from the resources allocated for emergencies in 1963 and 1964, and also to draw in advance late in 1963 and 1964 up to \$2 million on the amounts earmarked for the same purpose for the following year.

(d) It instituted a procedure under which summaries of projects requiring the approval of the Inter-Governmental Committee could be transmitted to the Committee Members, who would be asked to inform the Executive Director within 45 days from the date of dispatch whether they approved them or not. If, on the expiration of this period, no negative reply had been received, the Executive Director would have authority to proceed with the project,

as having obtained the approval of the Committee by correspondence. Any negative reply would make it necessary for the project to be submitted to the Committee at its next session.

(e) Subject to certain modifications, it approved the outlines and procedures proposed by the Executive Director for developing and presenting five studies to aid in the consideration of the future development of multilateral food aid programmes, as specified in the General Regulations.

(f) It reviewed and discussed the projects approved by the Executive Director since its third session and adopted nine projects that had been submitted for its approval.

(g) It endorsed the policy on commodity sales as laid down by the Executive Director in his letter of 11 March 1963 to the Resident Representative of the Technical Assistance Board (TAB); the text of this letter is reproduced in annex I to this report. It considered that each such exception to the general practice of direct distribution in kind would be examined on its merits, and that particular attention should be paid to (i) the Government's assurance that no displacement of commercial market supplies would result; (ii) systematic observation by the World Food Programme staff of the sales operations; and (iii) frequent surveys of consumption patterns in the project areas.

Fifth session

5. At its fifth session, the Committee took the following decisions dealing with operational and policy matters:

(a) It reviewed and discussed the 39 projects approved by the Executive Director since its fourth session.

(b) It approved six projects submitted by the Executive Director, together with the extension of a seventh project already approved by it at its third session. This approval was, in three cases, made subject to the completion of further necessary consultations and investigations.

(c) It took note of the fact that three projects submitted to Committee members individually for approval by correspondence had given rise to no objections and were therefore deemed to have been approved by the Committee as a whole.

(d) It extended the procedure for approving projects by correspondence until its sixth session, when the matter would again be reviewed.

(e) It endorsed the suggestion by the Executive Director that, at the present stage of the Programme's development, larger projects, calling for commodities to the value of at least \$200,000 were to be preferred over small projects. It agreed, however, that this need not constitute an inflexible rule.

(f) It agreed that steps could appropriately be taken to encourage contributions from Governments and non-governmental organizations to cover the non-food costs of World Food Programme projects.

(g) It invited Governments whose contributions were affected by problems arising from high international price levels to examine with the Executive Director means of arriving at an acceptable solution in accordance with the General Regulations, which require that the value of contributions of commodities be computed on the basis of prevailing world market prices.

(h) On the basis of the report by an *an hoc* committee set up to study the procedures for arranging transport, superintendence and insurance of World Food Programme commodities, the Committee authorized the Executive Director to continue to apply the procedures hitherto followed by him and to implement his proposals regarding insurance in the light of the observations made by the *hoc ad* committee.

(i) It recommended to the Economic and Social Council and the Council of the Food and Agriculture Organization of the United Nations (FAO) amendment of two passages in the General Regulations and approved the amendment of two articles of the Provisional Financial Procedures.¹

C. RESOURCES OF THE PROGRAMME

6. By 17 May 1963, the actual date to which the statistics included in the first annual report of the Intergovernmental Committee refer, the total contributions pledged for the three-year duration of the Programme had reached a total (in round figures) of \$89.8 million. Since that date, primarily as a result of the appeals made by the Economic and Social Council at its 36th session and by the Conference of the FAO at its twelfth session, which were embodied in resolutions 971 (XXXVI) and 3/63 respectively, 17 additional countries have made pledges to the Programme, bringing the total number of contributing countries to 67. Of this number, over two-thirds are developing countries. The latter have together pledged about 3.9% of the total, which by 30 June 1964 amounted to \$91.1 million. Two countries which had previously made pledges have increased them, and several countries have agreed to the conversion of all or a portion of their services pledge to commodities or cash, or of a portion of their commodities pledge to cash. The net result of new pledges, augmented pledges and converted pledges is as follows: the commodity total has remained practically unchanged; the services total has decreased by \$0.3 million through the conversion of certain pledges to cash; and cash has increased by \$1.7 million. The position on 30 June 1964 is shown in Table I.

7. The pledged commodities consist primarily of those in surplus, such as cereals, certain types of dairy product and vegetable oils. Of the \$45.4 million worth of commodities already delivered or committed for future delivery to projects by 30 June 1964, almost 81% consisted of these three groups (cereals, 48%; dairy products, 28%; vegetable oils, 5%.) and only slightly over 19% of all other commodities (fish, 7.9%; meat, 5.8%; pulses, 3.3%; fruit 1.4%; tea and coffee, 0.6%).

¹ See also paragraphs 30 and 31 below.

TABLE I

	<i>Value (million US\$)</i>
Commodities	65.8
Services (shipping and insurance)	5.5
Cash	19.8
	91.1

8. Almost the entire pledged amounts of the latter categories of commodities have now been either delivered or committed, so that for practical purposes only cereals and cereal products, dairy products (excluding cheese and canned milk) and vegetable oil now remain available for commitment to projects yet to be approved or for emergency use. No oil cake or mill offals have been available for livestock projects at any time, and pledged quantities of rice, pulses and sugar have been very small in relation to needs.

9. The increased cash pledges have brought the proportion of cash pledges to total pledges up to 21.6% as compared with about 20% a year ago; the cash component is thus still well below the target figure of one-third. If the cash and services pledges are taken together, they account for 27.6% of the total, as compared with 26.6% a year ago.

10. In addition to resources available from pledges, over \$136,000 of miscellaneous income had been received by 31 December 1963, primarily in the form of interest earned on time deposits. It is estimated that by 31 December 1965 total miscellaneous income will amount to at least \$250,000, bringing total resources, without any allowance for future pledges, to over \$91.3 million and cash resources to over \$20 million.

11. It now appears that cash and shipping pledges may not be sufficient to move all the commodities pledged. Since a reserve in the commodity pledges is maintained to cover possible price increases this insufficiency will be reduced accordingly.

D. EMERGENCY AID

12. Twenty-five per cent of the commodities pledged to the Programme have continued to be earmarked for use in emergency feeding operations.

13. Of the seven emergency feeding operations initiated by 17 May 1963, which were described in the Committee's first report,² four had been substantially completed at that time, i.e. the operations in Thailand, Algeria, Tanganyika and Morocco. In the case of the other three, additional supplies have been furnished or existing commitments fulfilled. These are as follows:

(a) *Iran*. In addition to the tea and sugar supplied after the 1962 earthquake, 1,500 metric tons of wheat have now been supplied to replace national food stocks diverted to seeding in the earthquake area.

(b) *Indonesia*. In addition to the 3,600 tons of maize, 900 tons of dried or canned fish, 360 tons of dried skim milk and 90 tons of vegetable oil committed for emergency relief in Bali, four additional instalments of food aid have subsequently been committed for the same purpose at approximately quarterly intervals. These four subsequent instalments have involved in total the following quantities of commodities: maize, 14,250 tons; dried skim milk, 1,326 tons; dried fish, 450 tons; and vegetable oil, 297 tons. This emergency aid is expected to be concluded by 1 September 1964, when a rehabilitation project on Bali will come into operation.

(c) *Sarawak*. The quantities of foodstuffs actually supplied to flood victims in discharge of the commitment already reported have been: rice, 441 tons; condensed milk, 92 tons; canned fish, 88 tons; canned meat, 88 tons; vegetable oil, 63 tons; salt, 33 tons; and sugar, 30 tons.

14. World Food Programme supplies for emergency operations have, since the date of the first report, been committed to five additional countries, four of which suffered from natural disasters, while the fifth faced a sudden influx of repatriates. The five operations were as follows:

(a) *Pakistan* (East). Following a severe cyclone which struck near Chittagong on 30 May 1963, drowning over 10,000 people and leaving hundreds of thousands destitute, the Programme supplied 250 tons of dried whole milk for pregnant and nursing women and small children and 500 tons of dried fish. Rice and wheat were available from Government stocks.

(b) *Syria*. Severe floods and hailstorms in the Gezira area destroyed grain crops and farm lands. In response to the Government's request, the Programme supplied 3,115 tons of wheat flour to relieve the need of the inhabitants the most severely affected.

(c) *Trinidad and Tobago*. After Hurricane Flora had devastated the island of Tobago, a request for aid was received to which the Programme responded by supplying 949 tons of wheat flour; 200 tons of oats; 150 tons of dried whole milk; 107 tons of canned meat; 70 tons of dried fish; 60 tons of canned fish; 50 tons of maize; 45.3 tons of dried skim milk; 45 tons of vegetable oil; 30 tons of cheese; 28.5 tons of condensed milk; 4 tons of tea; and 3.9 tons of butter.

(d) *Cuba*. The same storm battered the eastern parts of the island of Cuba. This led to a request for assistance which was met by the supply of 1,000 tons of dried skim milk; 300 tons of dried whole milk; 150 tons of butter oil; 30 tons of beans; and the allocation of 1,750 tons of maize not yet delivered.

(e) *Dahomey*. A request was received for assistance in feeding an influx of 7,500 persons who had returned destitute to Dahomey in connexion with a border dispute. Food available from other sources was supplemented by World Food Programme supplies of 45 tons of beans and 27 tons of vegetable oil.

15. The cost to the Programme of all emergency operations undertaken between the beginning of the Programme and 30 June 1964 is shown in Table II.

² See document E/3791, para. 28.

TABLE II

Country	Cause of emergency	Value of food only (US\$)	Total value (US\$)
Thailand	Hurricane	70,126	76,216
Iran	Earthquake	179,115 *	250,434 *
Algeria	War refugees	666,667	715,460
Morocco	Flooding	2,250,540	2,532,997

Pakistan	Cyclone	339,635	418,382
Syria	Flooding	311,500	330,254
Tobago	Hurricane	440,916 *	516,047 *
Cuba	Hurricane	657,861 *	923,000 *
Dahomey	F.ugees	19,060 *	22,061 *
TOTALS		7,028,506	9,066,443

* Estimated values.

16. The commodities committed to emergency operations by 30 June 1964 are listed in Table III.

TABLE III

Commodity	Quantity (metric tons)	Value (000 US\$)
Cereals	58,820	3,886
Dairy products	3,745	1,265
Other protein foods ...	12,098	1,600
Other foods	898	277
TOTALS	75,561	7,028

17. During the Committee's fifth session,³ the Government of the Philippines addressed a request to the Executive Director for emergency relief for the victims of a typhoon which had struck the country on 29 June 1964. At the same time, the Government of British Guiana submitted a request for emergency food assistance to political refugees.

E. ECONOMIC AND SOCIAL DEVELOPMENT PROJECTS, INCLUDING FEEDING

18. Considerable progress was made during the year towards the development of a comprehensive programme of economic and social projects and of feeding projects. In May 1963, at the beginning of the period covered by this report, a total of 26 requests for such projects had been submitted, of which six only had been approved, involving a total WFP cost of \$8.56 million. By 30 June 1964, the Executive Director had received 169 official requests, of which 72 had matured by 10 July into approved projects, and 63 were under active consideration.

³ This figure includes an extension to an already existing project and two projects conditionally approved subject to further clearances.

19. An analysis by type and time of approval of the 73 approved projects,³ which require a total outlay of \$46,279,270, is given in Table IV.

20. The breakdown of these projects by type of activity shows that while most of the Programme's activities remain centred on rural development, the efforts made to increase its demonstration value in developing a wider range of projects have been very successful. The breakdown by category is given in Table V below.

21. In spite of the efforts made by the Executive Director to expedite the signature of agreements by recipient governments, including *ad hoc* visits by members of the World Food Programme staff, agreements had been signed for only 33 of the 72 approved projects by 10 July 1964. The delays encountered between approval of projects and conclusions of the relevant agreements with Governments continue therefore to be a cause for concern.

22. Of the projects for which agreements had been signed, 32, involving a total budgeted cost to the Programme of \$22,544,300 and a food or feed cost of \$16,640,000, had become operational by 30 June 1964. The commodities committed to the projects which were operational at that date are listed in Table VI.

23. In order to ensure as far as possible that all commodities contributed by the World Food Programme to projects are properly utilized, the occasional supervision exercised by officers from Programme headquarters is supplemented, where this appears necessary to both the Executive Director and the contracting Government, by the assignment of a project officer, whose functions include that of advising the Government on all Programme food distribution matters, assisting the Government with its reporting and appraisal work, and serving as a staff assistant to the TAB Resident or Regional Representative on all matters affecting the Programme. Seven project officers had been appointed by 30 June 1964, one of whom is stationed in each of six countries: Bolivia, British Guiana (cover-

ing also Surinam), Chad, Ghana, Honduras and the United Arab Republic; and a seventh is to be assigned to an African country. Others are to be recruited for assignment to other countries where projects are to commence.

F. EVALUATION AND APPRAISAL OF PROJECTS

24. In accordance with Regulation D.20 (c) of the General Regulations, reports analysing and appraising the results of each completed World Food Programme project are to be submitted to the Inter-Governmental Committee. In a report submitted at the fourth session of the Committee, the Executive Director outlined comprehensive proposals for the evaluation and appraisal of projects. These arrangements contemplated three stages in the evaluation process, namely:

(a) The evaluation of official requests, which is carried out with the assistance of the United Nations, FAO and other interested specialized agencies upon receipt of the official request.

(b) The evaluation of the execution of projects, which extends throughout the operational life of a project and is mainly concerned with the verification that Programme supplies are handled, distributed, utilized and accounted for in the manner stipulated in the agreement; and the extent to which purposes of the project are observed and achieved.

(c) The final evaluation of projects, which is to cover all points outlined in the annex appended to each project agreement, and the results of which are embodied in the final report required under General Regulation D.20 (c).

25. As most of the information to be included in the final reports will not be available by the time when Member States are called upon to decide about the future of the Programme, the Executive Director will

prepare an interim report evaluating the experience gained up to that time through the operations of the Programme. In preparing this report, the Executive Director will, in suitable cases, avail himself of the help of the organizations of the United Nations family participating in the Programme, as well as of a limited number of outside consultants who will assess the various aspects of selected projects during the next few months. The report will be completed early in 1965 and will be submitted to the members to the Inter-Governmental Committee together with the comments of the Secretary-General of the United Nations and the Director-General of FAO for consideration at the Seventh session of the Inter-Governmental Committee.

G. WORLD FOOD PROGRAMME STUDIES

26. At its fourth session, the Committee approved, with some modifications, the outlines of the five studies dealing with various aspects of multilateral food-aid programmes proposed by the Executive Director, in accordance with General Regulation F.29. The Executive Director appointed a number of consultants to conduct the five studies. These consultants held a preliminary meeting at the end of February 1964 to establish a common understanding on the basic concepts to be used in the studies and to consider problems arising from the need for their synchronization and co-ordination in substance. The first drafts of the studies will be submitted by the middle of August 1964 and the consultants will then meet at the end of August or the beginning of September to discuss them and to arrange for any necessary revisions. Arrangements will also be made at this meeting to obtain comments on the drafts from the secretariats of the United Nations, FAO and the other specialized agencies concerned. It is expected that the five studies will be ready for issue in printed form early in 1965. In connexion with the studies, a selected annotated bibliography on food aid has been prepared and will be available in printed form before the end of 1964.

H. BUDGET, FINANCE AND ADMINISTRATION

27. The approved budget for 1963 in respect of the World Food Programme secretariat and the technical advisory, administrative and servicing costs of the United Nations, the United Nations Technical Assistance Board, FAO and other specialized agencies was \$1,592,200. However, because of the delays which occurred in launching the programme of studies and in recruiting the staff of the Joint Administrative Unit, and also as a result of the savings made in the technical advisory, administrative and general operating services provided to the Programme, less than \$970,000 was actually spent.

28. Of the \$7 million earmarked for emergency use in 1963, the actual amount committed was \$7,095,282. In accordance with the decision of the Inter-Governmental Committee at its fourth session, the \$95,282 committed in excess of the \$7 million authorized for 1963 was borrowed from the sum authorized for 1964, thus reducing the 1964 allocation from \$7 million to

\$6,904,718. A sum of \$1,024,212, or only about one-quarter of the estimated expenditure of \$4,810,090, was actually spent in 1963 on feeding and economic and social development projects.

29. At its fourth session, the Inter-Governmental Committee approved a budget of \$37,600,770 for 1964. The budget comprised \$1,583,300 for technical advisory, administrative and servicing costs, \$7 million (revised to \$6,904,718 for the reasons given in the preceding paragraph) for emergency operations, and \$29,017,470 for development projects, including special feeding.

30. As already indicated in paragraph 5 (i) of this report, several amendments to the General Regulations and the Provisional Financial Procedures of the Programme were considered by the Committee at its fifth session. The Committee agreed to recommend to the Economic and Social Council and the FAO Council (a) the amendment of General Regulation C.7 (a) in view of the election of four additional members to serve on the Committee; and (b) the amendment of General Regulation E.27 to give effect to the suggestion of the Advisory Committee on Administrative and Budgetary Questions that it should not be mandatory on that body to comment on the Programme's financial reports.

31. The texts of the recommended amendments, together with the texts in their present form, are reproduced in annex II to this report.

32. The Committee approved the amendment of articles V and X.2 (a) of the Provisional Financial Procedures to make clear that voluntary contributions from non-governmental sources may be accepted by the Programme for the purpose of financing the non-food cost of World Food Programme projects, and to make it possible for the Executive Director to employ superintendents at the time of loading and discharging Programme commodities.

33. The Committee was informed that the annual accounts for 1963 had been audited and would be submitted to it at its sixth session.

34. The Committee was also informed that no changes had been made in the organization or basic structure of the Joint Administrative Unit. The size of the Unit had been kept small and reliance had been placed, as in the previous year, on the technical advisory and administrative services and facilities of the United Nations, FAO, ILO, WHO and UNESCO. The total number of professional posts had been kept at 28, and there had been an increase of four posts (from 30 to 34) in the General Service category.

35. The United Nations Resident Representatives continued to be the official representatives of the World Food Programme in their countries of assignment.

36. The Executive Secretaries of the four United Nations regional economic commissions addressed the fifth session. The Committee expressed the wish that co-operation between the Programme and the regional economic commissions might be strengthened, and that whenever possible the Executive Secretaries of the latter might attend future sessions of the Committee.

ANNEXES

Annex I

CIRCULAR LETTER ON SALES POLICY BY THE EXECUTIVE DIRECTOR

There have been several occasions lately when questions have been raised about the policy we should follow regarding the sale of commodities provided under the World Food Programme to a country by the recipient Government within that country. These questions have been raised not only by Governments requesting our assistance but sometimes by our own representatives and staff members of UN organizations who are involved in this Programme. The purpose of the present communication is to make clear the policy of the World Food Programme in this matter and briefly set forth the reasons on which this policy is based.

The Regulations governing our Programme lay down that our operations must be conducted in accordance with the FAO Principles of Surplus Disposal. In particular it is enjoined that commercial markets and normal and developing trade are neither interfered with nor disrupted and that the agricultural economy in recipient countries is adequately safeguarded with respect both to its domestic markets and the effective development of food production. These conditions are best satisfied when the food supplies brought in under the Programme are moved directly into additional consumption over and above what is taking place through current commercial transactions. This is the reason why our first preference is for the distribution of the commodities supplied by us in kind to people engaged in new undertakings. Under these circumstances it is also easier to verify that the commodities provided under the Programme do not displace existing supplies on the market but result in net increase in consumption. The provision of our supplies on the basis of specific projects rather than in bulk for general support to a government's development programme furthers the same objective, although this is not the only reason for this approach.

Thus, the ideal plan would be to distribute Programme supplies in kind in an approved project. We recognize, however, that there may be serious difficulties in enforcing this condition strictly in certain circumstances. From the point of view of administrative and operational convenience, as well as to meet some specific internal requirements of a project, it may be expedient in certain cases to sell the commodities provided under the Programme and then use the sale proceeds for carrying out an approved project.

Such cases should, however, be regarded as exceptions to the general rule of direct distribution of supplies in kind. Moreover, each such proposal for sale of Programme supplies will need to be examined on its merits. The principal consideration will be to guard against the proposed sale depressing the market price of the commodity in question or a related commodity to any serious extent over an appreciable period of time. We may assume that this will be satisfied if the proceeds of sale are directed to purchases of the commodities supplied with as short an interval as possible after the sale. For instance, the supplies may be sold at the port of entry and the receipts disbursed as wages to labour engaged in a project which is located in the interior. This will be permissible provided the circumstances indicate that most of the new income generated will be used in buying up the same types and quantities

of food and that private trade may be expected to move the supplies to the site of the project to take advantage of the new demand created there.

There may also be need in a project for relatively simple tools and equipment which may be fabricated in a short time with available material and idle local labour. If a small proportion of supplies received under the Programme be sold to raise funds for purchase of such tools and equipment, it is possible that the income accruing to the local craftsmen will be mostly spent in picking up the Programme supplies again.

Sales of Programme supplies may be justified in these and similar circumstances and will need to be approved in each case. It should be clear, however, that the proceeds of sale should be spent in implementing the specific project which is approved and should not go to meet the costs of other projects or to augment the general budgetary resources of the Government. Further, the disbursement of the sale proceeds must go to the benefit of people in the lowest income brackets, because only such people may be expected to spend most of their earnings on food.

I trust these explanations will make clear that while most Programme projects should contemplate direct distribution of the food supplies, we shall be prepared to consider proposals for initial sale and then re-purchase of our supplies provided the particular circumstances indicate that there will be no long-run harmful effect on the market.

(Signed) A. H. BOERMA
Executive Director

Annex II

AMENDMENTS TO THE GENERAL REGULATIONS SUBMITTED TO THE ECONOMIC AND SOCIAL COUNCIL AND THE FAO COUNCIL FOR THEIR APPROVAL^a*Regulation C.7 (a)*

" 7. The organs of the World Food Programme shall be:

" (a) a United Nations/FAO Inter-Governmental Committee of [20] 24 Member States of the United Nations or Member Nations of FAO;"

Regulation E.27

" 27. The [financial reports and the] annual budget of WFP shall be reviewed by the FAO Finance Committee and the Advisory Committee on Administrative and Budgetary Questions, and submitted together with their reports to the Inter-Governmental Committee for approval. [The advance review by one or both committees may, however, be dispensed with in regard to the first budget of the WFP, should this be found impracticable for reasons of timing.] *The financial reports of the WFP shall be submitted to the FAO Finance Committee and to the Advisory Committee on Administrative and Budgetary Questions. After review by the FAO Finance Committee and by the ACABQ they shall be submitted with any comments which these Committees might wish to make to the Inter-Governmental Committee for approval.*"

^a Deletions are shown within square brackets; additions are shown in italic.

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1019 (XXXVII). World Food Programme

A

The Economic and Social Council,

Having considered the second annual report of the United Nations/FAO Inter-Governmental Committee of the World Food Programme,

Noting that the Programme has passed the mid-way point in its three-year experimental period and has moved from the stages of preparation and determination of main policies and procedures to that of initiating and operating projects, that its shape and characteristics are well defined, that most of its resources are committed and earmarked and that the conditions have been created for the fulfilment of its operational tasks and the necessary appraisal of its activities,

Noting that in response to the appeal made to States Members of the United Nations or of the specialized agencies in Council resolution 971 (XXXVI) of 31 July 1963 a number of additional pledges have been made to the Programme and the proportion of pledges in cash has been increased but that the pledges to the Programme are still \$9 million short of the \$100 million goal and that cash pledges remain far short of the desired minimum target of one third of total contributions,

Noting the recommendations on the World Food Programme in the Final Act of the United Nations Conference on Trade and Development⁴ and in the report of Committee I contained in the Report of the Conference,

1. Takes note of the second annual report of the United Nations/FAO Inter-Governmental Committee;

2. Expresses satisfaction with the progress achieved by the Programme;

3. Renews the appeal made in its resolution 971 (XXXVI) to States Members of the United Nations or members of the specialized agencies who have not yet pledged contributions to the Programme to make such pledges, preferably as contributions in cash in order to reach the original goal of \$100 million;

⁴ Document E/CONF.46/139, Final Act of the Conference, annex A.II.6. And Report of the Conference.

4. Appeals to all States participating in the Programme to consider the possibility of converting pledges already made in commodities to pledges in cash;

5. Calls the attention of appropriate United Nations' bodies to annex II.6 of the Final Act of the United Nations Conference on Trade and Development and to the Report of Committee I contained in the Report of the Conference when the present experimental United Nations/FAO World Food Programme is reviewed in 1965.

1343rd plenary meeting,
6 August 1964.

B

The Economic and Social Council,

Approves the amendments proposed by the United Nations/FAO Inter-Governmental Committee of the World Food Programme to Regulations C.7 (a) and E.27 of the General Regulations of the World Food Programme which, as amended, would read as follows:

Regulation C.7 (a)

"7. The organs of the World Food Programme shall be:

"(a) A United Nations/FAO Inter-Governmental Committee of 24 Member States of the United Nations or Member Nations of FAO;"

Regulation E.27

"27. The annual budget of WFP shall be reviewed by the FAO Finance Committee and the Advisory Committee on Administrative and Budgetary Questions, and submitted together with their reports to the Inter-Governmental Committee for approval. The financial reports of the WFP shall be submitted to the FAO Finance Committee and to the Advisory Committee on Administrative and Budgetary Questions. After review by the FAO Finance Committee and by the Advisory Committee on Administrative and Budgetary Questions they shall be submitted with any comments which these committees might wish to make to the Inter-Governmental Committee for approval."

1343rd plenary meeting,
6 August 1964.

Professor Kurt Back and Dr. Halliman Winsborough of the Duke University Population Studies Program prepared initial drafts of parts of this report.

I. Introduction

A. BACKGROUND

1. The General Assembly at its seventeenth session adopted resolution 1838 (XVII) on "Population growth and economic development", in which, *inter alia*, the Secretary-General was requested "to conduct an inquiry among the Governments of States Members of the United Nations and members of the specialized agencies concerning the particular problems confronting them as a result of the reciprocal action of economic development and population changes". In the same resolution, the Assembly recommended that the Economic and Social Council, taking into account the results of this inquiry, "should intensify its studies and research on the interrelationship of population growth and economic and social development, with particular reference to the needs of the developing countries for investment in health and educational facilities within the framework of their general development programmes". Further, the Assembly recommended that the Council "should report on its findings to the General Assembly not later than at its nineteenth session".

2. The inquiry requested by the General Assembly was discussed by the Population Commission at its twelfth session¹ and by the Economic and Social Council

at its thirty-fifth session.² The Population Commission "welcomed the recommendation for such an inquiry, the importance of which could not be over-emphasized in the light of the need for intensification of research of interrelationships between population changes and economic development as an aid to the Development Decade programme".³ In the course of the debates, members of the Commission and the Council expressed diverse views with regard to the scope of the inquiry and the method of conducting it, but neither body made any recommendations to the Secretary-General on these points.

3. Taking account of the views expressed in the debates of the Population Commission and the Economic and Social Council, the Secretary-General prepared an outline of the inquiry listing examples of aspects of the problems covered by the General Assembly's resolution which might be important in various countries. This outline and a copy of the Assembly's resolution were sent to the Government of each State Member of the United Nations or of the specialized agencies with a note dated 28 June 1963, inviting the Government to submit a statement "covering those points in the outline which the Government considers pertinent and appropriate in the circumstances of its country".

¹ See *Official Records of the Economic and Social Council, Thirty-fifth Session, Supplement No. 2 (E/3723/Rev.1)*, paras. 21-24 and documents E/CN.9/SR.163, 176 and 177.

² See *Official Records of the General Assembly, Eighteenth Session, Supplement No. 3 (A/5503)*, paras. 403-405, and *Official Records of the Economic and Social Council, Thirty-fifth Session*, 1244th, 1246th and 1248th meetings.

³ See E/3723/Rev.1, para. 22.

Each Government was also invited to give information on any additional points which, in its view, should be taken into account in a comprehensive statement on the problems to which the resolution of the General Assembly referred. Copies of the Secretary-General's note and the materials transmitted with it are to be found in appendix A, B and C to the present document.

4. A report on the responses received from Governments up to 23 June 1964 (E/3895 and Add.1) was presented by the Secretary-General to the Economic and Social Council at its thirty-seventh session. The Council, in its resolution 1048 (XXXVII) of 15 August 1964, invited "the General Assembly, the regional economic commissions and the Population Commission to examine the replies of the Governments to the inquiry and to make recommendations with a view to intensifying the work of the United Nations in assisting the Governments of the interested developing countries to deal with the population problems confronting them". The Council also requested the Secretary-General, in this resolution, "to circulate the findings of the inquiry to the World Population Conference and to the specialized agencies concerned, in particular the International Labour Organisation, the Food and Agriculture Organization, the United Nations Educational, Scientific and Cultural Organization and the World Health Organization, with the suggestion that they take the findings into account, as appropriate, in formulating their programmes". Further, the Council requested the Secretary-General "to undertake in the future, at appropriate intervals, similar inquiries on problems resulting from the relationship between economic development and population changes".

5. The Secretary-General has therefore prepared the present revised and consolidated report on the responses of Governments to the inquiry, in order to provide a unified document for consideration by the bodies mentioned in the Council's resolution, incorporating a summary of the replies of four Governments which were received after 23 June 1964.

B. NUMBER AND SCOPE OF RESPONSES RECEIVED FROM GOVERNMENTS

6. Responses were received from the 53 Governments listed below: Australia, Austria, Bolivia, Bulgaria, Byelorussian Soviet Socialist Republic, Cameroon, Canada, Chile, Ceylon, China, Colombia, Cyprus, Czechoslovakia, Denmark, Federal Republic of Germany, Finland, France, Ghana, Greece, Guatemala, Holy See, Hungary, India, Iran, Ireland, Italy, Jamaica, Japan, Jordan, Kuwait, Lebanon, Liberia, Malaysia, Morocco, Netherlands, New Zealand, Norway, Pakistan, Panama, Philippines, Republic of Korea, Sierra Leone, Sudan, Sweden, Tunisia, Turkey, Union of Soviet Socialist Republics, United Arab Republic, United Kingdom, United States of America, Venezuela, Western Samoa, Yugoslavia.

7. Although many of these responses are of great value, in the Secretary-General's view, in elucidating

the problems and issues that confront Governments and the United Nations, limitations of time and resources preclude translation and reproduction of the full texts. It is regretted that the present summary report cannot do full justice to the important contents of all the responses. A limited number of copies of the full texts are available for consultation in the offices of the Secretariat.

8. There is a great diversity in the responses as regards the aspects of problems arising from the interaction of economic development and population changes that are considered, the kinds of pertinent information provided, the degree of detail and points of view from which the problems are analysed. The statements submitted vary in length from one page to 495 pages. Some Governments submitted, in addition to or in lieu of specially prepared statements, copies of pertinent documents prepared for other purposes, such as national development plans, reports on population projections, and demographic and economic studies. The Governments of the Philippines and the Republic of China submitted copies of national statements prepared for the Asian Population Conference,⁴ which contain much material pertinent to the inquiry. Some Governments responded with a systematic comment on all major aspects of problems mentioned in the Secretary-General's outline so far as they were considered pertinent in the circumstances of the country; others treated one or more but not all major headings of this outline, while still others were concerned primarily with matters not specifically mentioned in the outline. Some of the responses are strictly factual, giving statistics or other data on demographic, economic and social conditions with little or no indication of the Government's view of any problems arising from their interaction. Where problems are stated to exist, in some cases the lines of action being taken by the Government are indicated while in other cases there is no mention of the Government's policy or actions being taken to cope with the problem. The comments of some Governments are not limited to their own problems but refer to those of countries in different circumstances or to policy questions facing the United Nations.

9. As a result of this diversity, the comparability of the responses is limited. It would be hazardous, for instance, to infer from the absence of comment on a given problem in the response of one Government and the presence of such a comment in the response of another Government, that the two Governments differ in their views of the importance of the given problem. It is also doubtful to what extent the views of the responding Governments are representative of the views of Governments in general on the questions covered by the inquiry. These limitations should be kept clearly in view in interpreting the present summary of responses.

⁴ "The Population and Other Demographic Facts of the Philippines" (Government of the Philippines), and "Country Statement for the Asian Population Conference" (Republic of China). The United Nations Asian Population Conference was held in New Delhi, India, 10-20 December 1963 (ECAFE/104).

C. SCOPE AND ORGANIZATION OF THE REPORT

10. The present report is focussed primarily on the views stated in the responses with regard to problems facing the Governments, as this was the focus of the General Assembly's request for the inquiry. It has not been possible to include much of the factual and statistical material relating to demographic, economic, and social conditions and trends contained in the responses, although much of this material is pertinent and valuable. As a general factual background for the summary of responses with regard to problems, a brief over-view of salient features of the demographic situation and trends in various parts of the world, based mainly on studies carried out by the Secretariat, is presented as part II of the report. General views of the responding Governments with regard to the nature and importance of problems arising from the interaction of economic development and population changes are summarized in part III, while part IV deals with views of more particular problems. Information and views found in the responses with regard to availability of statistical data and development of research pertinent to these problems, action being taken by the Governments to deal with the problems, and external assistance in these matters are summarized briefly in parts V and VI.

II. Demographic conditions and trends

A. MORTALITY

11. Progress in reducing mortality rates in the world has been outstanding in the period since the Second World War. A survey recently carried out by the Secretariat⁵ showed especially impressive gains in this respect in many of the developing countries where mortality

⁵ *Population Bulletin of the United Nations*, No. 6—1962. (United Nations publication, Sales No. 62.XIII.2). The present summary is based mainly on the results of this survey, with supplementary information drawn from the responses to the inquiry.

rates were previously high. Some of these countries have surpassed all previous records of achievements in the more developed countries as measured by the magnitude of gains in expectation of life within a corresponding period of time. For example, the expectation of life of new-born infants increased in Ceylon from 46 years in 1945-47 to 60 years in 1954, in Panama from 52 years in 1941-43 to 62 years in 1952-54, in China (Taiwan) from 43 years in 1936-41 to 64 years in 1959-60. Although less spectacular successes have been achieved so far in some of the developing countries where the obstacles are greater, substantial progress has been made almost everywhere. In India, for example, the expectation of life at birth is estimated to have risen from only 27 years in 1921-30 to 32 years in 1941-50 and 45 years in 1961.

12. Estimates of the changes in death rates in different regions of the world between 1937 and 1954-58, and estimated regional averages of expectation of life in 1955-59, are shown in table 1. It should be stressed that the estimates for certain regions are only rough approximations.

13. A process of reduction of death rates which has been fairly typical of many developing countries is described as follows in Ceylon's response to the inquiry:

Though after 1923, there was a gradual decline in the death rates, it was between 1946 and 1947 that Ceylon experienced a revolutionary decline in her mortality rates. From a level of about 20 in 1946, the death rates declined to 14.3 in 1947 or by nearly 30 per cent. This sharp and unprecedented decline in the mortality rate has been the result of the intensive island-wide D.D.T. campaign to combat malaria, a disease which until 1946 was the chief cause of morbidity and mortality in the country. Of course, the expansion in the medical and sanitary services and the wide-spread use of drugs and antibiotics have also been responsible for this sharp fall in the death rates. The death rates have since continued to decline and in 1961 was only 8 per thousand of the population.

14. As a result of the differences in the progress of mortality reduction achieved to date, there is now a wide variation in death rates and expectation of life

TABLE 1
Estimated crude death rates and expectation of life at birth for regions of the world

^c Canada, Greenland, St. Pierre and Miquelon, and the United States of America.

^d Including all America except the four areas listed under Northern America.

among the developing countries. In the great majority of such countries, the present levels of expectation of life range from about 30 to 60 years. The developing countries which have scored the greatest gains in this respect are now not far behind the most advanced countries of Europe, Northern America and Oceania so far as expectation of life is concerned, though they generally lag much farther behind in other components of the level of living. The crude death rates (annual number of deaths per 1,000 population) in some of the developing countries at present are even below the average level of the more developed countries, because a relatively large proportion of the population in the developing countries consists of young people, in ages at which mortality risks are relatively low.

15. In most countries of Europe and in Northern America, Australia and New Zealand, mortality rates were already low before World War II and the further reductions since that time have generally been smaller than those recorded in Asian, African and Latin American countries. A great gain was achieved in the Soviet Union, where the pre-war expectation of life was considerably lower than the European average (44 years for the USSR in 1926, which was raised by 1958-59 to 69 years, approximately the same as the average for Europe). A gain of similar magnitude was recorded in Bulgaria. It is estimated that in a majority of the more developed countries in the world at present, expectation of life is in the range of 67 to 72 years.

16. The study of trends of mortality and factors influencing it in various parts of the world makes it appear probable that the general trend of increasing expectation of life will continue in the future. The largest and most rapid increases in expectation of life are to be expected, on the whole, in countries where the expectation is relatively low at present, while further gains in countries where it is highest are likely to be comparatively small. Thus the outlook is for a narrowing of the present wide range of variation in expectation of life throughout most of the world.

B. FERTILITY

17. A world-wide survey of conditions and trends of fertility, carried out by the Secretariat,⁶ shows that while mortality rates have been greatly reduced, birth rates throughout most of the world have changed relatively little since the Second World War. Exceptions are the Soviet Union and Japan, where birth rates were much higher in the 1930's than they are at present. In parts of Europe, Northern America, Australia and New Zealand, birth rates have recovered from a record low in the depression of the 1930's. A pattern of relatively low birth rates in more developed countries and much higher rates in less developed countries was already established in the pre-War period as a result of an earlier long-term trend of declining birth rates in the more developed countries, and the changes that have

Oceania	24	1.8
USSR	25	1.4

Source: Population Commission, Report of the Twelfth Session (4-15 February 1963). E/3723/Rev.1, table 1. Estimates for certain regions have been slightly revised in view of new data and results of further analysis.

^a Estimates are of a relatively low order of reliability. For countries having about 40 per cent of the total population of the developing regions, there are no satisfactory data; but for some of these countries, available data of low or unknown reliability were used in calculating the regional averages.

occurred in some countries since the War have only accentuated this world-wide picture.

18. Estimated average birth rates (annual births per 1,000 population) and gross reproduction rates for different regions of the world, according to the latest available data, are shown in table 2. The gross reproduction rate is a refined measure of fertility which is free of influence from the age-sex composition of the population; it is defined as the average number of daughters that would be born per woman under the existing conditions of fertility of women at each age, provided that none of the women should die prior to the end of the potentially reproductive period of life. Again it should be emphasized that the estimates for some of the regions are rough approximations.

19. As these estimates indicate, fertility is roughly twice as high, on the average, in the less developed regions as it is in the more developed regions of the world. The Secretariat's survey has revealed that no other index makes so clear-cut a distinction between more developed and less developed countries as does the measure of fertility.⁷ With very few exceptions, the developing countries now have birth rates above 30 per 1,000 population and gross reproduction rates above 2.0, while the more developed countries have rates below these limits. Yet there are wide variations in the particular levels of fertility within both groups of countries. In some of the developing countries, the estimated birth rate exceeds 50 and the gross reproduction rate exceeds 3.5. On the other hand, in some of the developed countries, the birth rate is below 20 and the gross reproduction rate is in the vicinity of 1.0 or little higher. Little consistent correlation can be found between the variations of fertility among either the developing or the more developed countries, and such indicators of

⁷ *Ibid.*, chapter IX.

economic and social development as income per head, degree of industrialization and urbanization, literacy rate, expectation of life, newspaper circulation, etc.⁸

20. Until about a decade ago, the countries of the world could be classified under three demographic types: those with high fertility and high mortality; those with low fertility and low mortality; and countries in a transitional state of decline in mortality and fertility. At the present time, though mortality in a large number of countries has fallen drastically, few countries of hitherto high fertility show any evidence of a transition to low fertility being in progress. Fertility has been decreasing slowly in Puerto Rico but it has not yet reached a low level, and a more rapid decrease has occurred in the fertility of the Asian minority in the Republic of South Africa. Most recently, decreases in the birth rate have been recorded for several consecutive years in China (Taiwan), Singapore and, on a smaller scale, in the Federation of Malaya and Hong Kong. Rises in an already high level of fertility have been noted in Jamaica, Trinidad and Tobago, British Guiana, Mauritius and Réunion and are suggested also by recent data for Costa Rica and Venezuela. For other countries of high fertility, present evidence does not suggest any significant change of fertility in recent years.

21. Argentina, Australia, Canada, New Zealand, the United States, and some Western European countries experienced a gradual slight rise during the 1950's in their low or moderate fertility levels as measured by the gross reproduction rate. In some countries of Eastern Europe, fertility decreased during the 1950's from a moderate to a somewhat lower level. Mortality in these countries being low, the rate of population growth responds mainly to fluctuations in fertility, even if these fluctuations are not very large.

22. The large decreases in fertility which occurred in the more or less distant past in countries with presently low or moderate fertility have been associated with a number of closely interrelated factors including urbanization, industrialization, improved education, improved health, diversification in the roles of women, development of media of communication, and the increased facility of transport. These and other changes in the social and economic environment have been accompanied by changes in attitudes, personal aspirations, and patterns of behaviour pertaining to marriage and the birth of children. It is possible but as yet uncertain that similar social and economic changes in the developing countries in the future may likewise entail a decline of fertility.

C. NATURAL INCREASE

23. It is estimated that the world population increased during 1958-62 at an average annual rate of about 20 per 1,000, whereas the average rate for the decade of the 1930's is estimated at 11 per 1,000. Estimated annual rates of natural increase (excess of births over deaths

per 1,000 population) for major areas of the world in these two periods are as follows:⁹

	Decade of the 1930's	1958-1962
Latin America	19	28
Africa	12	23
Asia	12	23
Soviet Union	9	17
Oceania	10	16
Northern America	8	15
Europe	7	9

The acceleration of natural increase rates in some of the more developed regions since the 1930's has been due partly to an increase in birth rates, where they had fallen to very low levels at that time. The sharp rises in rates of increase in Latin America, Africa, Asia, and the Soviet Union have been brought about by falling death rates.

24. Rates of natural increase in recent years have risen above 30 per 1,000 in a number of the developing countries where the death rates have fallen relatively low while the birth rates are high. In some cases, rates exceeding 35 per 1,000 have been recorded; examples are Aden, Brunei, British Honduras, Costa Rica and El Salvador. At the other extreme, natural increase rates below 5 per 1,000 have recently been recorded for some of the more developed countries where birth rates are lowest, namely Belgium, Eastern Germany, Hungary, Luxembourg and Sweden.¹⁰ The less developed countries where natural increase rates are no higher than 15 per 1,000 are mostly those where mortality has not yet been brought down to a low level; Congo (Brazzaville), Gabon, Nepal and Zanzibar are examples, and other developing countries which lack satisfactory measures of vital rates may still be in this category.

25. Growing continuously at an annual rate of 30 per 1,000, a population doubles within twenty-three years. During the same period of time, a population growing at an annual rate of 10 per 1,000 increases by 25 per cent, while one growing at only 5 per 1,000 increases by only 12 per cent.

26. The rates of natural increase result from the interplay of fertility, mortality, and age composition of the population. In a country where mortality and fertility are both high and a large proportion of the population is young, improved conditions of health can bring a sharp reduction of the crude death rate and a quick acceleration of natural increase. Hence the tendency of accelerating population growth in the developing countries may persist for some time in the future, especially in those countries where the death rates at present are still comparatively high. In more developed countries where fertility had been reduced for some time, the proportion of persons at advanced ages is rising, and this change in age composition of the population tends to check any further decline in

⁹ The rates for 1958-62 are from the *Demographic Yearbook 1963* (United Nations publication, Sales No.: 64.XIII.1), table 2; those for the decade of the 1930's are approximate estimates made by the Secretariat for the purpose of this comparison.

¹⁰ *Demographic Yearbook, 1963*, table 3.

⁸ *Ibid.*, chapter IX.

their crude death rates. In those countries, there is not much reason for expecting the rates of population growth to accelerate in the future, and there is a possibility of the rates of growth in some of the more developed countries falling lower in the future, as a result of further decreases in their crude birth rates.

D. INTERNATIONAL MIGRATION

27. With some exceptions, international migration has affected population growth less in recent years than it did earlier in the century. During the economic depression of the 1930's and during World War II and ensuing years when means of transport were limited, migratory balances between Europe and countries of European settlement overseas were small, and the previous large-scale movements of Chinese, Indians and Pakistanis to Southeast Asia also came to a standstill. After 1946, European overseas migration was resumed on a comparatively large scale and during a number of years many migrants moved to America, Australia and New Zealand, but the intensity of the movement has diminished recently and migration has become increasingly confined to certain categories of workers with skills particularly desired in the receiving countries.

28. International migration nevertheless has continued to be of considerable demographic importance in a few countries. During 1948-1952, the population of Israel doubled, mostly as a result of immigration. Despite an appreciable excess of births over deaths, emigration has continued to cause a slow decrease in the population of Ireland. In Argentina, Australia and Canada, the rates of immigration during a few years in recent times have been high in proportion to the rates of natural increase in these countries. Although the magnitude of immigration into the United States has been considerable in the post-war period, averaging 300,000 per year for the decade 1950-1960, the proportionate effect on the growth of population in that country was not so large, since the natural increase in the United States during the decade averaged about 2.5 million yearly. Migration between countries in Europe has been intensified recently, considerable numbers of workers being attracted to France, Germany and Switzerland, though many of those migrants may eventually return to their countries of origin. There has been some emigration from countries of the Caribbean region and some movement between countries in Latin America. Migration between certain African countries is believed to be large but the balances have not been accurately measured.

E. INTERNAL MIGRATION

29. Migration within countries has been much more important, on the whole, than international migration in recent times. Movements between rural and urban areas have been taking place on a large scale in a great many countries, both developed and developing. Rural-urban migration is of great importance in its relation to industrialization and the development of secondary and tertiary employments, and problems connected

with such migration are stressed in the responses of many Governments to the Secretary-General's inquiry. The rapid growth of population in the capitals and other principal cities is to an increasing extent preoccupying the attention of the Governments of many developing countries. This trend and its implications are treated in some detail in the responses received from several countries.

F. AGE COMPOSITION OF THE POPULATION

30. Developed and developing countries typically differ markedly in the age structure of their population, as a result of the generally higher birth rates of the developing countries. In the majority of developing countries, the proportion of children under 15 years of age exceeds 40 per cent of the population and it is as high as 45 per cent in a few cases, while the corresponding proportion in the developed countries varies generally in the range of 24 to 32 per cent. The economic implications of the high proportion of children in the developing countries, and particularly the implications for the problems of education, are stressed in the responses to the inquiry from a number of these countries.

31. On the other hand, the proportion of persons aged 65 years and over generally varies between 3 and 4 per cent in the developing countries, while it is usually in the range of 8 to 13 per cent in the more developed countries. This difference likewise is due mainly to the difference in levels of the birth rate. The proportion of elderly persons in many of the developed countries is rising, reflecting the downward trend of their birth rates over a long period in the past.

32. Adults in the age range from 15 to 65 years constitute between 50 and 55 per cent of the population in most countries. The proportion is higher in some developed countries, exceeding 60 per cent in some cases, as a result of past decreases in the birth rate having reduced the proportion of children in the population and not yet having registered its full effect in increasing the proportion of aged persons. On the other hand, the proportion of adults in the age group 15 to 65 years has been depressed somewhat in some developing countries where the birth rate is high and the rates of mortality have been decreasing. The reason for this is that the mortality rates for the population in the age group 15-64 usually tend to diminish more slowly than the rates for young children. On the whole, though, the variations of mortality rates have relatively little effect on the age composition of the population, which depends much more on the level of the birth rate.

33. In addition to the economic and social effects of variations in the age composition of the population their effects on the levels and trends of crude birth and death rates need to be taken into account in international demographic comparisons. The effect of age composition on the crude death rate is especially important; countries where conditions of mortality are very different may have nearly the same crude death rates if the age structure of their population differs considerably.

For example, a crude death rate in the vicinity of 12 per 1,000 population may be found both in a country with 70 years expectation of life and a high average age of population (due to a low birth rate), and in one with only 55 years expectation of life and a large proportion of children in the population (due to a high birth rate). It is because of their youthful age structure of population that many of the developing countries now have crude death rates as low as, or lower than, those of much more developed countries. This circumstance is an important factor contributing to the rapid rate of population increase in the developing countries.

III. General views

34. It is appropriate to summarize separately the general views stated in the responses of Governments of developing countries and those of more developed countries, since the trends of population as well as the economic conditions are generally quite different in the two groups of countries.

A. VIEWS OF GOVERNMENTS OF DEVELOPING COUNTRIES

35. Many of the responses received from Governments of developing countries manifest more or less serious concern with the high rate at which the population of their countries is increasing, considering this as an important handicap to economic and social development. Among the problems commonly mentioned as being magnified and made more difficult to solve as a result of rapid population growth, are those of insufficient food supply and poor nutrition, low levels of average production per head, shortage of capital for investments in the development of agriculture and industry, unemployment and under-employment, inadequate educational and health facilities, deficiencies of housing, and problems of urban development.

36. The Governments of some developing countries are doubtful of the feasibility of making satisfactory progress in economic and social development in the near future if the present high rate of population increase continues. Ceylon states:

The Government of Ceylon is aware that population trends and economic development are closely interrelated and that each is a determinant and consequence of the other. There is full appreciation of the impact of the rapid increase in population on the economy of the country. . . .

The Ten Year Plan stated "... unless there is some prospect of a slowing down in the rate of population growth and relative stability in at least the long run, it is difficult to envisage substantial benefits from planning and development. It is not so much the size of the population in an absolute sense; but rather the rate of increase that tends to frustrate attempts to step up the rate of investment and to increase income per head. Apart from the difficult process of cutting present levels of consumption, the source for increasing the volume of investment is the 'ploughing back' of portions of future increases in incomes. This task is handicapped if these increases have instead to be devoted each year to sustaining a larger population."

The Short Term Implementation Programme stated "Population Growth has obviously an impact on the magnitude of

the economic, social and financial problems which we have to solve. For instance, the Government's current expenditure on food subsidies, education and health is now considerably higher than it would have been if our population had increased at a slower rate. The same applies to our import requirements and the scarcity of foreign exchange. . . ."

It is clear that Ceylon has to embark on a vigorous policy of industrial development and agricultural expansion in order to provide avenues of employment for the increasing work force and to attain self-sufficiency in food and other consumption goods. The investments on industry and agriculture will have to be much larger than on education, health and housing. But the problem facing Ceylon, like other under-developed countries, is the acute shortage of capital ... The accelerated increase in population imposes a serious strain on the limited resources of the country and prevents any substantial expansion in the economy.

37. Views somewhat similar to those of Ceylon were expressed with varying degrees of emphasis in the responses of the Republic of China, India, Iran, Jamaica, Jordan, Republic of Korea, Lebanon, Pakistan, Panama, Philippines, Tunisia, Turkey and the United Arab Republic. Some of these views are briefly summarized below.

38. India reports that:

... in common with other under-developed countries, the level of national income and per capita income in India are very low, and over decades, the Indian economy was almost stagnant developing at a rate barely exceeding the growth of population. Over the last decade, however, India's net national income has advanced at an average rate of 4 per cent per annum — the increase in aggregate national income being about 42 per cent ... As population has been increasing during the last decade at about 2 per cent per annum, the increase in per capita income over this period has been only 17 per cent. This low rate of economic development would have to be substantially stepped up and special efforts made to reduce the rate at which the population is increasing if the level of living of the bulk of the country's population has to be significantly raised.

39. Turkey submits statistics on the trends of population and national income since 1927 and observes that although income has grown substantially during this period, the increase in average income per head has been slight because of rapid growth of the population. The target of the Five Year Plan (1963-67) is a 7 per cent annual increase in national income, but if, as expected, the population increases at 3 per cent a year, income per head will rise at an annual rate of only 4 per cent, which would not be sufficient to overtake the lead of the Western countries for a very long time to come. Among the social problems mentioned by the Government as being closely connected with the excessive rate of increase of the population are large-scale under employment in agriculture and unemployment in the cities, a high illiteracy rate, a high rate of infant mortality, high incidence of tuberculosis, lack of sufficient medical services, substandard housing for large numbers of families in the cities, lack of drinking water in a majority of rural villages and small towns, and lack of electricity in the majority of Turkish homes.

40. In Jamaica, the Government reports that the future progress of economic development will depend

on the degree to which compensations can be made for several difficulties and limitations, not the least of which is rapid growth of the population:

The island is small with very limited natural resources, a serious deficiency in the amount of good arable land available and a fairly high population density as well as a high rate of natural increase of population. There is a shortage of local capital for development, and inadequacies in the levels of education and skill limit the employment prospects and efficiency of a large portion of the labour force.

In the face of the rapidly rising expectations of the people, the country must cope with the problem of achieving a balance between a satisfactory rate of economic growth and the provision, at the same time, of services and amenities for the increasing population. The Jamaican situation is a demonstration of the race between development and population growth.

The rate of natural increase of the population has risen considerably. However, population pressure has been relieved significantly by the heavy emigration to the United Kingdom which has occurred over the past ten years.

But population growth threatens to nullify the gains from development. The situation has become more serious with the sharp decline in emigration to the United Kingdom which has occurred since the imposition in 1962 of restrictions by way of the Commonwealth Immigrants Act.

41. Lebanon states :

In Lebanon the population is increasing at the rate of 2.3 per cent a year. It is a relatively young population, more than 50 per cent of the inhabitants being under twenty years of age. With this population pressure, the annual rate of growth of the national product is 4.40 per cent, while the rate of net investments is 14 per cent of the national income. These few economic indicators show that while population pressure in Lebanon may not hamper economic development, it is at least retarding it.

42. Pakistan describes a "fundamental" conflict between development and a large and rapidly growing population" in that country. While the increase of the population creates an urgent need for large investments, it restricts the possibilities of savings; and the larger the population, the greater is the imbalance between investment needs and savings potential. Overpopulation in Pakistan is considered to be so extreme that an early reduction of the present high rate of natural increase of the population is indispensable.

43. Tunisia states :

In addition to the social burdens which it imposes on the country, the continuation of the rate of population growth at the current level necessitates a considerable increase in production, not only in the agricultural sector but in all the sectors producing the goods required for a modern, even if modest, way of living. It is useless to increase agricultural output if manufactured goods are lacking and have to be imported in their entirety. Such a situation would imperil monetary stability, necessitate the imposition of price controls and, in general, make it difficult even to maintain the level of living.

It should be remembered that the population is increasing at a rate of 2.2 per cent per year, which means 80,000 new mouths to feed. If this increase is not accompanied by a proportionate increase in production, the national revenue which is distributed among the members of a constantly growing family will automatically decrease.

Thus it can be said that the success or failure of the will to some extent depend on the population problema in Tunisia.

44. Iran's Third Plan (1962-68), of which the Government submitted a copy as a part of its response to the inquiry, contains data showing that the gross national product increased during the Second Plan period (1955-59) at an annual average rate of 6 per cent, thus considerably exceeding the rate of population growth. However, it is noted that "with abundant unskilled labour, a lower population growth rate will bring about faster increase in per capita income", and slower population growth is regarded as one of the indispensable conditions of success in achieving the objective of a level of per capita income, within twenty-five years' time, equal to the level now prevailing in advanced western countries.

45. In Panama, although the rate of expansion of the economy in recent years "seems to indicate a promising trend toward progress and prosperity", the Government expresses concern with the economic implications of the population trend:

As a result of the declining death-rate and high fertility, the rate of population growth has increased unaccompanied by economic changes capable of producing a sufficient increase in per capita income. The rapid growth of population combines with an economically unfavourable age structure, a shortage of capital, and other factors too well known to require mention, to challenge the effort we Panamanians must make in order to raise our level of living.

46. Colombia and Guatemala, though not expressing fear of development efforts being defeated if population continues growing at the present rate, observe that the recent pace of economic development has been too slow in view of the rapid rate of population growth. Colombia's gross domestic income increased at an annual average rate of about 3.6 per cent during 1951-59 and only 1.9 per cent during 1956-59, whereas population growth was estimated to have reached the rate of about 2.8 per cent in 1961. Among the problems stressed in Colombia's response as being made more difficult by the speed of population increase are those of unemployment, under-employment, education, housing and health services. In Guatemala, where the rising rate of natural increase of the population reached the high level of 3.2 per cent in 1960 according to the recorded vital statistics (though it receded to 3.0 per cent in 1962), the Government observes:

Even where they show increases, the basic economic indices have not kept pace with the steady growth of population, and consequently they represent a deficit from the point of view of a solution of population problems. . . . The spontaneous growth of the country's economic development has not been sufficient to meet the needs arising from the natural increase in population, and . . . must be given even greater impetus if it is to correspond to those needs.

47. Malaysia's view is somewhat different; while the Government considers that excessively rapid population growth is creating immediate difficulties in economic development, it sees the smallness of the country's

population as a hindrance to industrial development in the long run. Malaysia states:

The Federation, despite a fast growing population, has no "Malthusian problems" — no fears of population pressure bringing rapidly diminishing returns to land. Indeed, just the opposite; a larger population should ultimately bring substantial external economies. But in the short run the rapidly growing population will make it more difficult to increase per capita income; for a high proportion of Capital Formation will be needed for 'capital widening' rather than 'capital deepening.' During the next few years, owing to the prospective worsening of the terms of trade, per capita incomes are expected to remain constant. However, after 1965 per capita, real income should start increasing again, perhaps by about 2 1/2 per cent a year.

48. Morocco sees three primary problems related to population trends in that country: (a) the accelerated growth of the urban population, which poses problems for industrial development, (b) the very rapid growth of the labour force, creates serious difficulties in view of the existing problem of under-employment and (c) the growth of the population of school age, which poses substantial problems in the field of education.

49. Chile is another developing country where the Government sees important economic and social difficulties related to the growth of population, although the Chilean response does not indicate whether the population trend is considered, in general, as a major obstacle to achievement of development goals. Intensified problems of under-employment and unemployment, due to demand for labour in the most dynamic sectors of the developing economy not having kept pace with the growth of the labour force during recent years, are featured in Chile's response, along with increasing problems of congestion in principal urban centres. On the other hand, Chile has succeeded in expanding educational facilities and school enrolments at a rate exceeding the increase of the population and the proportion of illiterates has decreased.

50. Some of the responding Governments, while stressing economic difficulties which they see arising from the rapid growth of population, make no mention in their responses of any action being taken or contemplated for the purpose of modifying the population trend. In this group are certain Governments which, like Ceylon, doubt the possibility of achieving satisfactory progress in economic and social development in the face of current population trends. Lebanon states that means other than family planning will be utilized to reduce the adverse effect of population growth on economic development: increasing the productivity of labour and maximum utilization of human and natural resources are among the measures envisaged by the Government for dealing with the problem.

51. On the other hand, the responses of India, Iran, Jamaica, the Republic of Korea, Pakistan, Tunisia, Turkey, and the United Arab Republic refer to efforts which they have been making or are contemplating with the aim of moderating the growth of population. India states:

It is the considered view of the Government of India that the problems of economic development and population changes

should be simultaneously tackled. In view of this, action has been initiated and is being accelerated on both of these fronts as will be evident from the steps taken by the Government of India during the three plan periods starting from 1951. Efforts are being made to accelerate the economic and social development of the country by introducing changes in the primary, secondary and tertiary sectors of the economy as also by emphasizing the importance of family limitation through the various Family Planning programmes.

52. Pakistan takes the view that, "over-population being so extreme", the high fertility rates in that country "cannot be allowed to decline as slowly as in other developing countries in the past". The Government is therefore giving increasing attention to the promotion of family planning.

53. In Turkey, prior to the period of the present Five-Year Plan, it was the policy of the Government to encourage population increase at the highest possible rate. This policy has now been reversed and provisions are included in the Plan for promotion of family planning as well as emigration.

54. The policy of the United Arab Republic is stated as follows:

The National Charter, promulgated by the President of the United Arab Republic in May 1962, brought out the gravity of the population problem, as one of the greatest difficulties facing the people in its initial efforts to increase national production. The charter also stated that family planning was one way of mitigating the severity of the problem, although it confirmed the fact that — regardless of the possible consequences of the experiment in family planning — the country must embark on increasing national production as rapidly and as efficiently as possible, so that the resulting increase in national income should be at the rates required to cope with the increase in population and, at the same time, to raise the standard of living.

That is for the short term. For the long term, however, we must refer to the cultural consequences of a constant high standard of living in restricting population growth through a decline in the birth rate. This relationship between standard of living and family size revealed by the historic economic development of many West European countries is the kind of relationship we expect to emerge in the development of our national economy.

55. The Government of the United Arab Republic goes on to say, "One of the most serious problems ever met by the national economy of the U.A.R. has been that of population increase during the years just precedent to the 23rd July 1952 Revolution, at a rate greater than national income." The relation of economic development to population increase has been much better in more recent years. Between 1959/60 and 1962/63, while the population grew at an average rate of 2.8 per cent annually, the national income increased at an average of 6.4 per cent annually. The national plans envisage doubling of the national income in ten years' time.

56. Iran places family planning, as "a major welfare programme", among the three principal "strategies" of two strategies being to raise the rate of domestic saving and to promote institutional, administrative and

organizational improvements so as to enhance the efficiency of utilization of investment resources.

57. Tunisia foresees that strenuous efforts in the economic sphere alone will not suffice to attain the objectives of the national plan and to realize the projected developments beyond 1971; it will be necessary also to act on the rate of population growth; "in a word, to try to slacken it". A birth control policy is under study and a campaign in favour of birth control has been launched.

58. The Government of Jamaica appears to be mainly preoccupied with emigration as a means of relieving the pressures generated by rapid population increase, and notes some difficulties encountered in the effort to find suitable outlets for emigration:

This movement [of emigration] has relieved population pressure considerably. The natural increase of population from 1951 to 1962 amounted to 521,000. Net migration, including a small movement to countries other than the United Kingdom, amounted to 191,000 or about 37 per cent of the natural increase.

But in July 1962, the United Kingdom Government introduced legislation designed to control immigration into that country from British Commonwealth countries. The effect of these restrictions, which include the use of work permits as a means of control, has already been felt. In the first 6 months of 1962 about 19,000 Jamaicans migrated to the United Kingdom. Between July when the restrictions came into effect, and December, emigration dropped to 4,000.

Apart from the United Kingdom, no developed country has shown any signs of willingness to accept migrants in significant numbers from countries like Jamaica. The possibilities of obtaining more generous immigration quotas from the United States and Canada have been under examination for some time. Having gained independence, Jamaica is seeking to be placed on the non-quota basis in so far as migration to the United States is concerned. British Commonwealth countries which encourage immigration have not yet come around to accepting Jamaicans in any numbers. Some thought has been given to the possibilities of outlets in other areas such as Africa, British Guiana, British Honduras and Brazil, but so far the difficulties involved have proven to be insuperable.

59. Not all the responding Governments of developing countries take the view that population growth is greatly hampering the economic and social development of their countries. Some (Bolivia, Ghana, Kuwait, and Western Samoa) are non-committal on this question. Others (Sudan, Sierra Leone) note some problems connected with the population trend but do not appear to be gravely concerned with the difficulty of achieving satisfactory progress in development in spite of such problems. Venezuela, while recognizing some such problems, views population growth, on the whole, as a positive factor in the development of the economy. Cameroon appears to be satisfied with the present rate of increase of the population, Cyprus sees no problem on this score, while Liberia fears that the population may be too small.

60. Kuwait discusses demographic trends and economic conditions and problems without expressing views as to the ways in which the former may be related to the latter. Bolivia draws the following conclusion from a review of the country's conditions and problems:

In order to ascertain the reciprocal action of economic development and population changes in Bolivia, a genuine plan for economic and social development must first be imposed and human and natural resources must be allocated in accordance with this plan. The spontaneous development which Bolivia has experienced so far does not produce important changes but on the contrary leads to economic stagnation and rigid social stratification.

61. The Sudan refers to the country's large reserve of cultivatable land as a factor easing the problem of meeting the targets of the development plan in spite of population increase at the high rate of 2.8 per cent per annum. Sierra Leone sees no problem of population pressure as the density of population is low, but reports difficulties in making food production keep pace with population growth.

62. The report of a study on the demography of Eastern Cameroon, submitted by the Cameroon Government in response to the Secretary-General's inquiry, concludes that the rate of increase of the population is in the neighbourhood of 2 per cent per annum, and comments:

This rate, which is relatively moderate for an African country, appears to be a factor favouring the country's development. A higher rate would have made it difficult to increase per capita income, while if the rate had been lower there would not have been sufficient population pressure to encourage urbanization, which is an essential factor in the economic development of the country.

63. Venezuela's National Plan (1963-1966), submitted in response to the Secretary-General's inquiry, takes generally a positive view of the interactions of population growth and economic development. It is noted that human resources are the most valuable asset, especially of a nation which possesses such ample natural resources as Venezuela's, and that the country could support several tens of millions of inhabitants. Nevertheless, the very high rate of population growth (natural increase in recent years exceeding an annual rate of 3 per cent) is recognized as having a tendency to magnify the problems of unemployment and under-employment which are of great concern to the Government, and in this context a recent slight reduction in the rate of natural increase is mentioned as a "favourable factor". Unbalanced distribution of population within the country is also regarded as a major problem and the excessive proportion of the national population concentrated in the region of the capital is particularly emphasized.

64. Cyprus is not faced with important population problems, in the Government's view. The Government reports, "Indeed the rate of growth of population in Cyprus is not such as to present us with any particular problems which would make the consideration of such a problem and the study of a policy on 'effective means for checking the population growth' a justified priority". In recent years, with the birth rate officially reported at about 25 per 1,000 and the death rate about 10 or a little lower, the natural increase of population in Cyprus has been at the relatively moderate rate of about 1 1/2 per cent per year.

65. Liberia, far from regarding population growth as a menace to the success of developmental efforts, expresses concern lest the smallness of the country's population prove to be a major obstacle to development. The Government fears that the reserves of population on the land may be insufficient to supply manpower requirements of expanding industrial centres. "There is ample land of a fertile character". Liberia reports, "still to be exploited in the interior, which insures sufficient nutrition; and the only fear in this is that the rural economy may largely be drained of its workers". Malaysia, as already mentioned, is also apprehensive of shortage of population as an impediment to industrial development in the long run, though in this case immediate difficulties resulting from the rapidity of population growth are also stressed.

66. Ghana's response is concerned mainly with the problems of developing accurate statistics which would provide a basis for the study of these matters; these problems are also stressed in the responses of Bolivia, Guatemala, Liberia and Sierra Leone. Western Samoa affirms its recognition of the importance of the questions raised in the inquiry but does not find it possible in the circumstances to submit a detailed response.

B. VIEWS OF GOVERNMENTS OF MORE DEVELOPED COUNTRIES

67. The majority of responses from Governments of more developed countries express less concern with economic and other problems resulting from population growth within their territories, than is apparent in the responses from many developing countries.

68. Several responding Governments of more developed countries either state that they see no important problems in this sphere or report a generally satisfactory relationship between population changes and economic development. Such are the responses of Austria, Bulgaria, Byelorussia, Denmark, Greece, Sweden and the USSR, although Bulgaria, Byelorussia and the USSR refer to serious population problems that existed in the past. France and the United Kingdom also respond in a way which does not imply that population trends are thought to be creating important economic problems.

69. Denmark reports that "during a long period the population has grown by a rather constant rate and the population growth has not created major problems in relation to the economic development of Denmark". Austria is of the opinion that the net reproduction rate, which is slightly above the replacement level in that country, "represents a satisfactory situation." The Austrian Government goes on to say:

Thus, Austria exhibits none of the problems connected with possible over-population, and competent Austrian agencies have therefore not paid any particular attention to the question of the reciprocal action of population growth and economic development ... consequently there are no special Austrian problems to describe.

70. Sweden considers that the people of that country are fortunate in having succeeded in bringing their birth

rate down to a near balance with the death rate thus maintaining a moderate rate of population increase. Various ways in which this moderation is believed to have aided the economic and social development of Sweden are noted in the Government's response. Among other things, the Government observes that rationalization of agriculture has been facilitated by closing down small units of cultivation, and this has been made easier by the reduction in number of large families within the agricultural sphere; with smaller families, migration and adjustments to life in urban areas are not so difficult. Recognizing the existence of a labour shortage, the Swedish Government comments:

This shortage has given the employee organizations a strong position for negotiations about wages and social benefits. At the negotiating table, the workers have been able to secure for themselves a reasonable part of the gains in productivity. In this way the variations in income of different social levels have become less and less. The democratization process has been more rapid.

71. The French response contains an analysis of factors relating to the optimal rate of population growth — the rate which would be conducive to greatest progress in raising national production per head — and concludes tentatively that this optimal rate of population increase for the industrialized countries of Europe may be in the order of 1 per cent per year in present circumstances. The actual rate of natural increase in France as recorded for the year 1963 was 0.65 per cent and the estimated average for all Europe in 1960-62 was 0.9 per cent.¹¹ The United Kingdom refers to a ten-year projection of future growth of the labour force in that country, which indicates a much slower rate of growth for the latter half than for the first half of the projection period, and comments that this trend is probably an unfavourable one, but it is likely to be outweighed by other factors and in any case may be only temporary.

72. The response of the Greek Government contains an analysis of population and economic trends from which the conclusion is drawn that "the population increase in Greece has little or negligible effect on the formation of the per capita income level of the Greek people". Although the rate of natural increase in recent times has varied between 1 and 2 per cent annually, a large part of this increase has been offset by emigration, so that the population has grown only at a slow rate. Projections for the period 1960-1980 also indicate only moderate rates of population growth, and the influence of this growth on the economic development of the country is expected to be rather limited and not unfavourable, because "either it will be absorbed through the increasing employment opportunities or it will be directed to migration abroad".

73. The Government of the Soviet Union reports that this country "does not have any problems connected with a failure of economic growth to keep pace with growth of population", and sums up the relationship

¹¹ *Ibid.*, tables 2 and 3.

between population and economic development in the Soviet Union with this statement:

Soviet society develops on the basis of a socialist law of population, whose main requirement is the full and rational utilization of labour resources in constantly expanding social production. Its purpose is to ensure a high level of prosperity for the entire population. The history of the development of the Soviet Republics is a history of a rate of growth of the economy constantly greater than the rate of growth of the population, under conditions of a high birth rate and low mortality rate.

The population policy of the Soviet Union is stated as follows:

The Soviet Government is interested in increasing the total population of the country, since it goes on the principle that under Socialist economic conditions, population increase represents one of the most important factors in the constant growth of social wealth and prosperity of all members of society.

74. Serious population problems which confronted the Soviet Union in the early years of its existence are recalled in the Government's response. The Soviet Union at that time:

... was on the same economic level as many of today's developing countries ... there was still considerable unemployment resulting from the enormous agrarian over-population and the inadequate level of development of the country's productive forces carried over from Tsarist Russia ... The country lacked sufficient food and fuel, transport functioned badly and many of the small number of existing factories were idle. The literacy rate was extremely low and there was accordingly a great shortage of trained personnel.

75. The Government of the Soviet Union relates how these problems were solved and the rate of growth of the economy was made to outstrip considerably that of the population, by a policy aimed at industrialization of the country, collectivization of agriculture, achievement of a cultural revolution, and training of personnel. Between 1913 and 1963, while the population of the USSR increased by 41 per cent, national income increased more than 27 times and income per head, 19 times. The major accomplishments in economic and social development of the country during this period, reviewed in the Government's response, were achieved without any appreciable slackening of population increase. A great decrease of the death rate was offset by an approximately equal decrease of the birth rate so that the rate of natural increase followed an almost level long-range trend, with some temporary ups and downs. During 1949-1961, the annual rate of natural increase fluctuated between 16 and 18.6 per 1,000 population: roughly the same as the rate in Russia before the First World War.

76. Byelorussia likewise reports on the success achieved in solving the problems of population that existed in that country before the revolution. Byelorussia was a relatively under-developed and densely populated part of Russia under the Czarist régime. The summary of conditions at that time, contained in the Byelorussian response to the inquiry, indicates that the people suffered in extreme degree many of the same kinds of

economic and social handicaps under which the peoples of the developing countries are labouring today. "An alarming problem was raised by the disastrous growth of surplus agrarian population." After the revolution, "Socialist reform became the primary means of solving the relative over-population problem and its dire social and economic consequences". With "rapid and steady growth in output and planned use of labour resources it was possible even in the first years of socialist construction to eliminate unemployment and rural over-population in Byelorussia". The high density of population is believed to have been helpful in this connexion. In present circumstances, the Government places a positive value on growth of the population, considering it as a mark of healthy development of the economy and satisfactory conditions of life among the people. The conditions created by the socialist development of the country are held to favour population increase as they give "the workers confidence in a happy tomorrow".

77. Bulgaria reports a similar experience of serious problems of agrarian over-population and a low level of living, inherited from the capitalist past, which were overcome by the development of the country along socialist lines after World War II. The rudimentary development of industry under the capitalist régime is emphasized as a primary cause of Bulgaria's former economic and demographic ills; as late as 1934, almost 80 per cent of the labour force were engaged in agriculture. After the war, with rapid industrial development and other social and economic reforms, the demographic conditions of the country were transformed: the proportion of the working population employed in agriculture was reduced to 50.1 per cent by 1962, the proportion of urban population was increased from 24.7 per cent in 1946 to 39.8 per cent in 1962, and thus the problems of agrarian over-population and "hidden unemployment" in the villages were solved. Expectation of life increased in Bulgaria by 25 years between 1921-26 and 1962, reaching almost 68 years for males and over 71 years for females at the latter date. "This index", the Bulgarian Government states, "clearly illustrates the influence of economic factors on the population and a continuous improvement in it is an indication that the reciprocal action of economic development and population changes is proceeding in the right direction." With the drop in mortality rates more than offsetting a gradual downward trend of the birth rate, the rate of natural increase in Bulgaria's population "has remained at a sufficiently high level to meet the society's requirements of manpower and rapid economic growth".

78. Other Governments of more developed countries responding with a generally favourable view of the interactions of population trends with economic development (although they express concern with certain particular problems) include those of Canada, the Federal Republic of Germany, the United States of America and Yugoslavia.

79. Yugoslavia reports that the demographic situation in that country during the post-war period has not been unfavourable to economic and social development as the rates of economic growth and development of

social services have been high and they have reacted "favourably" upon the trends of population. It is considered possible in Yugoslavia to improve the demographic situation "by indirect, economico-social and other measures and not through measures which would directly affect its natality". However, contraceptive advice is given as a part of the work of the public health services.

80. Canada comments as follows on the economic effects of accelerated increase of population in that country since World War II:

Although Canada was better prepared in the late 1940's than most countries to meet the requirements of a rapidly growing population, it was a period of excessive demand which was accentuated by postponements of spending during the war. The boom in primary industries which continued into the 1950's together with the expansion of secondary industries during the war and immediate post-war years provided a broad base for meeting the needs for social capital including housing and education of the rapidly expanding population. It is important to note, however, that in the first decade after the war the continued expansion of primary and secondary industries made heavy claims on available capital ...

It is expected in future years that requirements in the fields of university education, highways and urban services (e.g., roads, urban transit and urban renewal) will be particularly demanding. The university-age population and the proportion attending university is rising rapidly ... The expenditures on highways and urban services will be required not only in response to the demands of a rapidly growing and increasingly urbanized population, but in response to factors which are a function of rising per capita incomes as well as population growth (e.g., the rapidly increasing number of motor vehicles).

81. In the United States of America, the doubling of population between 1910 and 1963 has not prevented a great rise in the level of living, as the gross national product increased nearly five-fold. The Government takes an optimistic view of prospects for continuing improvement in the capacity of the economy to cope with substantial increases of population in the future. Even on the highest estimates of the population increase expected by the year 2000, no over-population is foreseen, nor any shortages of labour or other resources that would limit growth. The main problems in economic development now posed by population growth in this country, as the Government sees them, are problems of adaptation and structure. The chief emphasis is placed on problems arising out of the growing concentration of population in metropolitan areas. These problems have been accentuated by the growth of the country's total population during recent decades, and their magnitude is expected to increase during the remainder of the century.

82. In regard to the effect of population increase on the trend of per capita income in the United States during the last half-century, the Government makes the following remarks:

It is still not clear whether population growth speeded or retarded the growth of per capita income. While increasing population placed added pressure on the Nation's natural resources, thereby tending to bring diminishing returns (had other things remained equal), increasing population also permitted

the United States to take advantage of economies of large scale production and distribution which cause unit costs to fall and standards of living to rise. The separate effects of these forces are not known. In any event, the rate of economic growth in the United States is influenced largely by forces other than population size — increases in the stock of physical capital, improvements in the quality of human resources, and advances in technology.

The exact role of population growth in stimulating aggregate demand and hence the full employment of resources remains clouded. On the one hand, population growth raises consumer needs and thus adds to consumer demand, thereby increasing pressures on productivity capacity. On the other hand, by raising consumption expenditures it tends to reduce the ratio of saving to income, thereby limiting the resources available, for the expansion of productive capacity. In view of these constraints, population growth cannot be considered a major cause of increase in the level of living.

83. In the response of the Federal Republic of Germany, like that of the United States, the current problems stressed most heavily are those of imbalance in distribution of population and economic opportunities within the country. Problems that were involved in assimilating the influx of expellees and refugees into the country after the Second World War are also mentioned. The number of expellees, including their natural increase after entering the country, amounted to nearly 10 million in 1960, or 25 per cent of the total population. A vast amount of public funds was spent on aid for the subsistence and integration of the expellees and refugees; but the Government observes that their addition to the population "made a decisive contribution to the acceleration of economic growth in Germany; the increase in the evaluation of labour, running parallel for economic reasons, has facilitated the process of the absorption of immigrants".

84. The Federal Republic of Germany outlines the German experience of successive phases in the interactions of economic and demographic development during the course of the country's industrial evolution since the early nineteenth century, suggesting that this experience may be pertinent to present problems in developing countries. Four phases of these interactions are outlined, corresponding to the well-known theory of the "demographic transition". In the first phase, that of the pre-industrial agrarian economy which existed in Germany at the beginning of the nineteenth century, birth and death rates were high and nearly balanced so that population increase was slow. Next, in the phase of early industrial development, which continued in Germany until the end of the nineteenth century, the death rate fell while the birth rate remained high, so that population increase accelerated, matching or exceeding the increase in national income. During this phase, there was considerable emigration from Germany. During the third phase, which occurred in Germany during the first three decades of the twentieth century, the birth rate gradually adjusted itself to the lower mortality rate so that the rate of population increase was moderated. The Federal Republic now finds itself in the fourth phase,

... in which technological development has basically been concluded [and] the mortality and the birth rates are low as a result

of the progress achieved on the health sector and in family planning without the population growth being lower than during the first phase. This is the reason why the population figure increases at a slower rate than national income and why the average standard of living rises.

85. A few of the responding Governments of more developed countries are gravely concerned with problems of depopulation (Ireland) or population increase at a rate considered to be too low, either being experienced at present (Czechoslovakia) or apprehended for the future (Italy).

86. In Czechoslovakia, where the birth rate has fallen quite low (less than 16 per 1,000 for 1960-62, though it rose to 16.9 in 1963 according to provisional data), the Government has adopted a policy aimed at encouraging a higher birth rate and rate of population growth. The Czechoslovakian response states:

It is the aim of the Government of the Czechoslovak Socialist Republic — as it has been proved by the constitution of the State Population Commission and a number of concrete measures in favour of large families — to pursue a pro-natality and pro-population policy.

In following this purpose, the State Population Commission proceeds from the premise that in principle, the population policy is one of long-term perspectives and that measures undertaken in its support must not be in any way one-sided.

For the time being, the situation in the Czechoslovak Socialist Republic is such that, in the general rise of the living standards of the population, there still exist differences in level of the living standards of childless families, or those with a small number of children and large families.

Therefore it is one of the serious tasks of the State Population Commission to follow up and consider carefully all measures from the point of view of raising the living standards of families with children in such a way as to give more favourable treatment to families with a large number of children.

87. Italy's problem, as analysed in the Government's response, is one of population distribution and migration between the industrialized north of the country, where the birth rate is low and there is a chronic labour shortage, and the economically much less developed south, which has a higher birth rate and a vigorous natural increase. Migration from the south to the north plays an essential role in the economic and social development of the country. As measures are taken to promote the development of the south, it is foreseen that the birth rate and natural increase in that part of the country may diminish in the future, with the result that the flow of migration to the north would also be reduced. The Government is apprehensive of the possible consequences of such a course of events for the future development of industries both in the north and in the south.

88. The Government of Ireland considers the country to be under-populated and sees its problem as one of checking the decrease of population which has been proceeding almost continuously in that country for more than a century as a result of heavy emigration over-balancing natural increase:

Irish circumstances, and especially the predominant role played by emigration, make the study of the relationship be-

tween population trends and economic growth particularly difficult. However, it is reasonable to suppose that for any particular country, with given natural resources and a given level of scientific knowledge as to how to exploit them, there exists an "optimum" population level. This optimum population would be such as to ensure for the individual citizen and the highest possible "standard of living", not measured exclusively in terms of income per head, but taking into account also such factors as cultural activities, living space, family life, health and life expectancy. If this is the case then it appears that the population of Ireland falls below this optimum level. Failure of the population to increase is an impediment to economic growth which is in turn an obstacle to a population increase. The breaking of this vicious circle is the main task facing the Irish Government.

89. In analysing the effects of emigration, the Irish Government stresses its influence on the age structure of the population:

By international standards the proportion of the Irish population is remarkably low in the "young adult" age group while it is high in the proportion in the "dependent" age groups. Of this situation the Commission on Emigration said "Moreover, it was suggested to the Commission that where the proportion of older people in the community is large, their conservative attitude of mind tends to prevent the progressive outlook of the younger section from finding practical and effective expression. While in the nature of the case it is not possible to obtain evidence on this important aspect of our problem we accept this suggestion as self-evident especially in its application to rural areas". It is undoubted that the effect of emigration on the age distribution of the population has had its bearing on the climate of opinion in regard to economic development and in addition it has meant that, relatively, the burden of provision for children and for the old is much heavier in Ireland than in other countries.

90. The Government of Greece also is concerned with the adverse effect of emigration on the age structure of the population:

... Owing to migration abroad ..., Greece's net population increase per year approaches zero, while a deep change in its composition is taking place, because the Greek migrants — mainly to West Germany — are of young age, skilled industrial or handicraft workers, as a result of which the most productive age groups are leaving the country. This fact is of serious concern to the Greek Government, since it forms an obstacle to the country's industrialization effort; difficulties are already noticed in finding skilled labor for industry.

91. The Governments of Australia and New Zealand view their population problems mainly with regard to immigration, considering this as an important positive factor in their economic development. Australia states:

Since the war, the Australian economy has undergone a transformation. A whole range of entirely new industries such as aluminium, petro-chemicals, plastics, motor-vehicle construction, carbon-black, electronics and oil refining has been established; the production of steel, power, minerals and primary produce has increased enormously and the number of factories has doubled. Many great developmental projects have been undertaken.

Expansion on this scale has only been made possible by a continuous inflow of migrant workers, who constitute on arrival a highly mobile workforce which can be deployed to meet the changing needs of a rapidly developing economy. These workers

and their families in addition, go to swell the domestic markets on which Australia's expanding export industries are based.

A rapidly increasing population through immigration is seen as an essential condition for maintaining the momentum of economic development. It is a premise upon which much forward planning has come to be based. By such devices as varying the proportion of workers in the intake to offset fluctuations in labour supply and demand, immigration can, and has been, used to supplement the more orthodox methods of economic control.

92. The Government of the Netherlands explains its views on immigration and emigration as follows:

By way of supplementary action to its industrialization policy, the Government has offered information and financial support to prospective emigrants in order to relieve the population pressure. The significance of the policy with regard to emigration has diminished because — contrary to earlier expectations — during the last ten years the country had a shortage of workers rather than a surplus. Especially during the last three years the shortage of workers has been painful.

In view of the labour shortage, the Government has concluded agreements with a few other European countries for the recruitment of labour. Those agreements are implemented by the Employment Service in co-operation with pertinent employer associations. The action with regard to emigration is not strong. The Government maintains such action out of fear of rising unemployment at some future time.

93. The Government of Japan reports that the population problem of that country prior to World War II was centred in the pressure generated by rapidly increasing population in an already crowded country with limited natural resources. The situation in the post-war period has been transformed by a great reduction in the birth rate together with progress in industrial development. The Government is concerned with the means that the people have used to limit births, largely by induced abortion, and endeavours to promote the use of contraception instead. As the rate of population growth is now moderate, the focus of population policy has shifted to the need for improving the quality of the population through education and other social programmes, and to improve the regional balance of population and economic development.

94. Problems of unbalanced distribution of population within the country are also stressed in the response from several other more developed countries. This aspect of the problem in Italy has already been mentioned. Other Governments which place their main emphasis on problems of population distribution include: the Federal Republic of Germany, Finland, Netherlands, Norway, the United States of America and Yugoslavia (see paras. 221 to 226).

95. Some of the responses from Governments of more developed countries state general views, not specifically related to conditions in their countries, concerning the interactions of population trends with economic development and issues of population policy. Some also state views on the special problems of developing countries.

96. The response from the Government of the United Kingdom contains the following general observations:

There is nothing either in experience or in economic theory to indicate that a rapidly growing population makes it easier or more difficult to keep the rate of growth of the national product ahead of that of population. Such empirical evidence as there is, based on international comparisons, seems to show that there is no pronounced relationship between the rate of productivity growth and the annual increase in the supply of labour. Whether the rate of growth of national product keeps ahead of that of population depends largely on the balance of other factors.

97. The United Kingdom Government goes on to mention some possible positive and negative effects of population growth on economic development. On the positive side, it may help to raise productivity by facilitating reallocation of labour among industries, division of labour and achievement of economies of scale; it may also be helpful in achieving full utilization of resources and evoking investment outlays that will stimulate economic growth. On the negative side, there is the danger of population growth outstripping production of food and other goods and services; this is most important in under-developed countries. In addition, the growing labour force must be furnished with capital equipment and productive resources have to be used for this purpose which might otherwise be devoted to raising output per worker, although in countries where there is a shortage of capital, a growing labour force may facilitate the use of less capital-intensive processes in some industries.

98. The Government of France, commenting generally on the interactions of population growth and economic development in industrial countries, observes:

Not only have the industrial countries adapted themselves much more satisfactorily than might have been expected to the increase in the active population, particularly from the standpoint of employment, but they have also found in this increase a means of combatting the inflation which so often results from excess demand.

99. The French Government supports this view with an analysis of the comparative rates of increase in employed labour force, production per worker and price level in several industrial countries during 1952-1962. The Government then goes on to analyse the question of the optimal rate of population growth from an economic point of view, considering, on the one hand, the advantage of a growing labour force for flexibility in adapting the occupational and industrial structure to changing needs and opportunities, and on the other hand, the heavy load of investments in housing, hospitals, schools, etc., which an excessively rapid rate of population growth would entail.

100. The United States Government observes:

Some relationships are more important at certain stages of a country's development than at others. For example, a high rate of population growth may stultify early national economic development, the gains being eroded by a stream of people growing even more rapidly than the output of the economy. On the other hand, rapid population growth can actually stimulate economic development where an ample base of natural and man-made capital resources exist.

101. The Government of the Soviet Union states the following views:

The economically developing countries face vast and extremely complicated problems in ensuring a high rate of economic development, overcoming mass hunger and poverty, providing work for tens of millions of people, and wiping out the illiteracy which prevails almost universally. The problems confronting these countries are socio-economic problems, and a solution to them should not be sought in population changes but rather in terms of the social and economic conditions in which their populations live and the manner in which those conditions contribute to a solution of the developing countries' main problem, which is to ensure a rapid and substantial growth of their productive resources.

In order to ensure intensive accumulation of funds for national economic development, an increase in national income and the conquest of hunger and poverty in the developing countries, what is primarily needed is not artificial curtailment of the birth rate but action to ensure the fastest possible rate of economic development together with full and efficient utilization of those countries' manpower and material resources.

Soviet thinking on the problem of population is based on the view that any type of Malthusian approach, including the modernized or camouflaged versions (e.g. the theory of optimum population growth), is fundamentally unacceptable. It is, in the final analysis, through human labour that all material and spiritual blessings are created. Viewed in that light, the worker, the producer can never be "superfluous". Sometimes, however, temporary (or local) quantitative imbalances may arise between the available manpower and the means of effectively utilizing it (the available productive apparatus, the volume of natural resources already under exploitation, etc.). The more rapidly the economy develops, the greater the degree of planning employed in its development and the more powerful and flexible the machinery of general and vocational education created for the purpose of training labour cadres along any desired lines, the more rapidly such imbalances are eliminated.

Although in some cases the rapid growth of population in the less developed countries may create temporary difficulties, according to Soviet thinking there are no grounds for pessimism on the whole. The fact is that as economic and cultural progress is gradually achieved in these countries a gradual decline in the rate of natural increase is to be expected, which will make it increasingly easy to strike the above-mentioned balance between demographic and economic indices (with ever improving economic indices).

It must be emphasized that, today, for countries that have acceded to independence and have embarked on autonomous political and economic development it is much easier, provided that they carry out democratic social reforms, than it was for the Soviet Union to overcome their age-old backwardness, since the present level of science and technology makes it possible to achieve this in a shorter time. Unlike the USSR, these countries can also count on outside assistance.

102. The response from the Byelorussian Soviet Socialist Republic contains the following statement with regard to the interaction of population trends and economic development in socialist States:

The high birth rate, low death rate and high rate of natural increase of the population under conditions of full employment and stable social and economic development characteristic of socialism completely disproves the views widely held in Western countries concerning the alleged "disproportion" between a rapid rate of natural increase and a slow growth of the means of subsistence, and concerning the decisive impact of demographic changes on economic development.

103. In the same vein, the Bulgarian Government states:

The experience of the People's Republic of Bulgaria shows that it was only under socialism that the country was able to achieve the most harmonious progress of the reciprocal action of economic development and population changes. The changes which occurred in Bulgaria when a people's Government took over confirm the accuracy of the theory that purely demographic problems can be solved only when rapid economic, social and cultural progress makes it possible to strike a balance between demographic and economic indices and achieve a continuous and rapid improvement in the latter.

104. Italy, commenting on population problems and questions of population policy in general, recognizes a close interrelationship between demographic and economic factors and observes that in countries where there is a surplus of labour in relation to other resources, conservation of manpower might be considered in economic terms as a poor investment. The case is different in developing countries where economic growth equals or exceeds the rate of population growth and domestic manpower resources are insufficient to ensure development of the economy. In those circumstances, a country could benefit from maintaining or increasing the rate of population growth with the help of immigration if the birth rate is insufficient.

105. In the opinion of the Government of Italy, it is contrary to the interests of a majority of States Members of the United Nations to accept, as a general principle, the view that future declines in mortality necessitate concern for the balance between population and means of subsistence. In Italy's view, the interrelationships between population and economic phenomena are intricate and the relevant theories highly controversial. Present policy should provide for an adjustment of economic conditions to the demographic situation rather than to adapt population to economic conditions.

106. Austria's view is rather similar. The Austrian Government points out that problems of housing shortage, unemployment, under-employment, ill health, etc., exist in many countries that are far from being overpopulated, some of these countries even being short of population. Austria takes the view that instead of regarding these as population problems, it would be more correct to consider them as "general phenomena of under-development and to try to solve them not by acting on the basis of population policy but by bringing about more equitable social conditions, tapping unused natural resources, especially agricultural resources".

107. The Government of Ireland, though concerned itself with the opposite problem of depopulation, is "keenly and sympathetically aware of the difficulties of countries faced with the problems arising from increasing population and inadequate economic resources". Ireland is opposed, however, to "remedial policies based on artificial methods of population limitation" and recommends:

High priority should be given to (i) the fuller development of the human and economic resources of the countries concerned and (ii) research into and dissemination of information on methods of family planning which do not involve the use of artificial means.

108. Sweden's position is quite different; the Government offers four general views on the question of population policy, based on Sweden's own experience:

That the population trend is a most important factor in the economic development of a country; that over-population in relation to the actual means of supply in a country counteracts and delays — the more the greater the over-population is — an increase in the average standard of living; that difficulties owing to under-population seem to be easier to master by means of importation of labour and through technical development such as automation, etc.; and that of the two chief means against over-population — emigration and family planning — family planning is to be preferred.

109. In the statement submitted by the Holy See, the importance of due attention to moral as well as economic aspects of the question of population policy is stressed.

110. A few Governments included in their responses some remarks about the inquiry itself and the manner in which it was conducted. Hungary expressed the opinion that the inquiry should have been formulated differently for more developed and less developed countries and for those with and without centrally planned economies; the Government considered the inquiry in the form presented to be largely inapplicable to Hungary's conditions. Austria and Italy commented on the possibility that some sections of the Secretary-General's outline, especially where population was represented as a problem and possibilities of action were suggested, could prejudice the outcome. In Italy's view, the sections of the outline referring to action programmes and external assistance went beyond the limits of the inquiry requested by the General Assembly; Austria expressed the same view on the section relating to external assistance and the Netherlands questioned whether this section should have been included if it could be interpreted as referring to an international programme with "an outlined population policy". The Holy See felt that a very narrow meaning, confined strictly to the purposes of the inquiry, should be given to the sections of the outline referring to action programmes and external assistance. Sweden expressed the view that the inquiry gave an opportunity for countries facing population problems to benefit from the experience of other countries which had dealt with similar problems before.

IV. Views on particular problems

A. AGRICULTURAL DEVELOPMENT AND FOOD SUPPLY

111. The response of the Government of Austria denies that the problem of food supply for developing nations is associated with problems in the population sphere, citing "the finding made at the World Food Congress, namely that the world's reserves in food suffice for the normal nutrition of all people and that existing food shortages are a result of maldistribution of existing food". A similar view is expressed by the Government of Ireland.

112. The Government of the Soviet Union also takes an optimistic view of the present relationships between

population growth and expansion of food production in the world as a whole and in the developing countries in general:

Data to be found in the official statistics of various countries and data prepared by FAO show that the world production of foodstuffs is appreciably outstripping population growth. With the exception of certain years, there is a considerable rise in per capita production of foodstuffs even in most under-developed countries. It has been calculated that food production in the under-developed countries is rising at an average rate of 3 per cent, but as the population is increasing at a rate of 2 per cent, the rise in food production per capita amounts to about 1 per cent. The problem of inadequate food production will become increasingly less important, as steps are taken to implement the resolution adopted by the General Assembly 1710 (XVI) in December 1961 concerning the attainment by the under-developed countries of an annual rate of economic growth of 5 per cent by 1970.

113. The Soviet view of long-range prospects for success in meeting the food requirements of the world's growing population is also optimistic. The Soviet Government quotes opinions of certain experts that a great expansion of the area of cultivated land in the world is possible along with great increases in yields per unit of land under cultivation, and thus food can be produced for many times the present number of the earth's inhabitants. In this connexion, the possibilities of hydroponic food production (i.e., soilless agriculture) are also stressed.

114. Many of the responses received from Governments of developing countries, on the other hand, reveal a painful preoccupation with problems of expanding food production to keep pace with population growth. Thus, the Republic of China reports:

The demand for food resulting from the upsurge of population is one of the many knotty problems in the development of Taiwan's economy. Fortunately, the rate of increase of aggregate agricultural production up to 1962 is still ahead of the rate of population increase. By 1970, however, there will be no excess food left on the Island with a projected population of 15 million people at that year. From that time on, the farm production will be progressively insufficient to meet the needs of a growing population.

115. The Government of Ceylon reports, "The high rate of population growth in Ceylon has a serious impact on our food requirements". The Government of Jordan reports, "Although about one-half of all employed Jordanians were working in agriculture, Jordan was not able to produce enough food to feed itself. With the population increase of 3 per cent per year, the output of Jordanian agriculture must experience a similar increase in order to prevent an even greater deficit in food". Concern about balance in the diet as well as the level of per capita calorie intake is expressed by several Governments. The Republic of China mentions a low intake of protein. The Republic of the Philippines mentions a deficiency in certain vitamins, calcium, and fats.

116. The report of the Philippines discusses the problem thus:

Total food production of the Philippines in 1960 was 7.6 million metric tons. Under alternative trends of fertility and mor-

tality, food requirements will reach a level of from 19.6 to 21.2 million tons in 1980. This requires an annual increase in food production of 4.8 per cent to 5.2 per cent from the 1960 level.

Increases in food crop production during the period 1951-1960 averaged 6.2 per cent. The maintenance of this rate of annual increase in the production of food crops will ensure that the population of the Philippines will be fed at standard levels from domestic production alone. This 6 per cent rate of increase, however, would probably be hard to maintain in the coming decades. It has been pointed out that Philippine food production increased 6 per cent yearly during the past decade only because it took place during a period of rehabilitation and reconstruction.

117. India's response includes statistical tabulations showing that production of foodgrains increased substantially during the early years of the 1950's but has grown more slowly since 1954. The trend in amount of foodgrains available per head of the population (including imports, which have been substantial) was as follows:

Year	Ounces per day	Year	Ounces per day
1951	13.5	1957	15.2
1952	13.2	1958	13.9
1953	14.0	1959	16.2
1954	15.5	1960	15.7
1955	15.1	1961	16.2
1956	14.7	1962	15.8

118. Panama observes that production in agriculture has failed to keep pace with population growth and underlines the importance of this by noting the preponderant role of agriculture in Panama's economy. Colombia also reports difficulties in expanding food production at a sufficiently rapid rate. Tunisia recognizes the existence of a food deficit at present and expects population increase to magnify this deficit in the future. Sierra Leone reports that agricultural production has not kept up with population growth and that large quantities of food are imported; efforts are being made to extend the area of cultivation, but such efforts encounter difficulties related to topography, rainfall and drainage conditions.

119. Pakistan reports difficulties in agricultural development, related to pressure of population on agricultural land, insufficiency of capital investment and inadequate farming techniques. The average area of cultivated land per agricultural worker is 4.3 acres in West Pakistan and only 1.3 acres in East Pakistan. Prior to 1960, agricultural production was stagnant, but it has now become possible to increase this production at more than 3 per cent per annum, "given normal weather".

120. In Guatemala, the increase in production of basic food crops during 1952-62 lagged considerably behind the growth of population, in spite of technological advances in agriculture which brought some increase in crop yields per hectare. In spite of varying amounts of food imports, the level of food consumption per inhabitant was grossly deficient. According to an estimate quoted in the Guatemalan response to the Inquiry, the consumption of foodstuffs other than those

derived from maize and sugar cane is not sufficient to cover even 50 per cent of minimal requirements for a basic diet.

121. The Republic of Korea has had to rely on heavy imports of food during the postwar period as a result of the increase of population outpacing the production of food. Food production increased between 1955 and 1960 at an average annual rate of only 1.2 per cent, while population was growing at more than twice this rate. A projection to 1980 indicates that if the birth rate were not reduced, the magnitude of the food shortage would be more than doubled by that time; domestic production would then suffice to supply less than 65 per cent of food demand.

122. Governments of developing countries that face the necessity to import food deplore this use of scarce foreign exchange resources. Ceylon discusses it as follows:

It is estimated that between 1954 and 1961 Ceylon has been spending on the average Rs.250 million annually on the imports of rice. This means that since a substantial portion of the country's limited foreign exchange resources is spent on feeding the people, Ceylon has not been in a position to accumulate badly needed savings for the capital requirements of development. Ceylon cannot continue to do this and it is very important that this drain on scarce resources be reduced, if not completely eliminated, if the country is to achieve speedy economic development.

123. The United Arab Republic reports that considerable emphasis is being placed on agricultural development in the framework of the national plans for economic and social development. Investments in agriculture under the First Five-Year Development Plan (1960/61-1964/65) are calculated to increase agricultural production by 28 per cent during this period. This would be approximately double the rate of increase in the population. It is expected that the completion of the Aswan High Dam will allow a higher rate of increase in agricultural production under the second five-year plan, starting in 1965.

124. Other Governments reporting difficulties in expanding food production rapidly enough in view of the rate of population growth include those of Iran and Jamaica. On the other hand, Liberia, with its large area of little used forest land, sees no problem of this kind, nor does the Government of Malaysia see any difficulty in expanding food production. Kuwait states that the country has little scope for agriculture, but relates the problem to technical rather than demographic questions.

B. MANPOWER AND EMPLOYMENT

125. Many Governments report problems of manpower and employment arising from the interaction of economic development and population change. Governments, both of developed and developing countries express concern about the provision of jobs for those wanting them. In developed countries, the experience of the great depressions of the 1930's seems to have left a lasting mark on attitudes and policies, even though they now have full employment or labour shortages.

It is in the responses from developing countries, though, that expressions of most serious concern with unemployment and under-employment are found.

126. Ceylon states:

An immediate effect of the rapid growth in population is the increase in the workforce of the country. An important objective of planned economic development is the creation of opportunities for full employment. But the present annual rate of population increase worsens the employment or rather the unemployment situation by increasing the number of entrants to the labour force. It is estimated that the workforce of the country which was about 3.4 million in 1956 will increase to 7.1 million by 1981. Apart from this addition to the workforce, there is a sizeable backlog of unemployed and under-employed for whom jobs have to be found. Unless all the proposed targets outlined in our development plans are achieved in time, it is unlikely that Ceylon's economy will create a sufficient number of jobs to absorb the existing backlog of unemployed and the annual additions to the workforce.

127. In Pakistan, it is estimated that 26 per cent of the labour force is unemployed or under-employed, and this is attributed to pressure of population. In agriculture, even with double and triple cropping, intensified cultivation, and land reclamation, it is not expected that much more labour than already exists can be employed by 1985.

128. The report of the Philippines contains a detailed discussion of the problem of under-employment:

Employment data obtained by the Philippines Statistical Survey of Households in its current surveys of Philippine manpower and economic activities indicate that about 8 per cent of the country's labour force is unemployed.

In addition, one-fourth of the employed population in the Philippines are *unpaid* family workers, most of whom, it would be expected, would be actively seeking more satisfying types of employment should these be available.

It is not only agricultural workers who suffer from low incomes due to insufficient work. If forty hours a week were considered the normal work-week, the results of the current labour force surveys show that, on the average, about one out of every eight employed persons was working less than the normal number of hours a week and, as the surveys reported, was seeking additional work or more hours of employment.

Not included in the above proportions are the "invisibly under-employed". Because of inadequate earning and under-utilization of skills in occupations and enterprise of low productivity, an average of almost 7 per cent of the employed labour force desire additional work although these workers are already working the full number of hours.

129. In Venezuela, unemployment has increased considerably during the last decade and it is estimated that in 1962, 14 per cent of the labour force was unemployed and 36 per cent under-employed. The analysis of the factors of unemployment and under-employment makes it appear that the rapid growth of the labour force is an important hindrance to efforts to solve these problems. Although expansion of employment is one of the principal objectives of the national development plan, and the unemployment rate is expected to be cut in half by 1966, no reduction in the under-employment rate is expected to be achieved by that date. Even in

1975, according to the Government's projections, 20 per cent of the labour force is still expected to be under-employed.

130. Colombia also reports a large surplus of labour and a major problem of under-employment both in the glutted urban labour market and in rural areas. Employment forecasts for 1963 indicated that 190,000 new workers would be added to the national labour force in that year; 70 per cent of those finding jobs in the primary-production sector were expected to be under-employed, 60 to 65 per cent in the secondary sector, and 50 to 60 per cent in the tertiary sector.

131. Chile reports that the demand for labour in manufacturing industries and other developing sectors of the economy has not been sufficient in recent years to absorb as much of the increase in the labour force as it should have done, and consequently the problems of under-employment and unemployment have been intensified. During 1952-60, for example, the number of workers in manufacturing industries increased at an average annual rate of only 0.6 per cent while the labour force was growing at 1.8 per cent annually.

132. Guatemala's response shows concern with problems of unemployment and under-employment but emphasizes that measures of them are lacking in Guatemala.

133. Elimination of unemployment and under-employment is stated by the Government of Malaysia to be one of the most important problems of that country. Since unemployment is mainly structural, it is attributed primarily to a discrepancy between the rate of growth of the labour force and rate of growth of productive capacity, which has not been sufficient to absorb the additional workers.

134. The response of Jamaica lays special stress on unemployment and under-employment among the problems arising in that country out of the interaction of population growth and economic development:

Unemployment is clearly the major social and economic problem in Jamaica. The levels of unemployment and under-employment are high and are in part a result of the rapid growth of population.

A surplus of unskilled workers exists alongside a serious shortage of skilled workers. Paradoxically, in many farming areas the supply of labour offering itself for work is well below the demand. This is probably due to the strong reluctance on the part of many persons to undertake agricultural work at low wage levels and with no continuity of employment, in conditions which are hardly an inducement.

In the absence of a sufficient amount of employment opportunities at adequate wage levels, large numbers of persons engage in own-account work on uneconomic farm holdings, or in petty trading. Output in agriculture and trade would not be reduced if the labour force so employed were decreased.

Basic to these problems are the inability of the agricultural sector, with its limited supply of arable land, to absorb the growing population, and the shortage of capital in the island.

135. Jordan anticipates intensified problems of under-employment in the future:

The preponderance of young people in the Jordan population implies a rapid increase in labour force in the future and the

need to provide a great number of additional employment opportunities.

In the Seven Year Programme of Economic Development for the period 1 April 1964 to 31 March 1971 currently being prepared by the Jordan Development Board and the various ministries and authorities, it is assumed that population will continue to increase at the rate of 3 per cent per year and the labour force will increase at approximately 4 per cent per year. Projections of Gross National Product over this period indicate that a 5.8 per cent per year increase should be attained. Considering growth in labour force of 4 per cent per year, and some limited improvement in productivity, it is reasonable to assume that there will continue to be an element of unemployment throughout the period.

136. Iran states:

An over-abundance of labour, accompanied by a severe shortage of skilled workers will constitute the major manpower problem of the Third Plan (1962-68). Population growth, a decrease in disabling diseases among potential workers, and an increase in the number of women in the labour force will bring about a net addition of slightly more than 1 million in the labour force. To this should be added the backlog of unemployed as of the beginning of the plan.

137. Turkey also reports a serious problem of under-employment in agriculture and attributes it to the rapid increase of population outpacing the expansion of employment opportunities.

138. Policy and planning problems associated with a growing labour force concomitant with mechanization to increase productivity are discussed by the Republic of China as follows:

... mechanization of farm production and automation of industrial equipment, which are urged in many quarters and are on the way to realization, will replace a great deal of human labour at the same time as there is an increasingly large surplus labour force resulting from population growth. It would be rather difficult to map out a policy that can bring about further mechanization and at the same time reduce unemployment. As primitive methods of production can employ relatively more workers, it is often for this reason such methods are still being used in many types of production.

139. Tunisia, in a similar view, reports that, in view of the size of the agricultural labour force, full employment in this sector cannot be achieved in the near future and that mechanization threatens to make the employment situation worse.

140. The Governments of some developing countries, however, are concerned with general labour shortages. Sierra Leone sees evidence of a manpower shortage in the fact that "the labour force is estimated to be about 734,000, some 80 per cent at least of which are engaged in agriculture; this leaves only 146,000 or even less for non-agricultural employment".

141. In many developing countries, acute shortages of skilled and technical, managerial, and professional manpower exist, even though there may be a general surplus of manpower and widespread unemployment or under-employment. The Government of the Sudan, in its response to the Inquiry, is mainly preoccupied with the requirements of various categories of technically qualified manpower for fulfilment of the targets of the

national plan. In Pakistan, though the number of persons with a technical education is increasing, it is still inadequate. "The education system in the past was geared to produce civil servants, teachers and possibly a leisure class. The impact of development, particularly of industrialization, has been to change completely the required structure of education".

142. In Korea, the lack of skilled labour is considered by the Government to be as serious a problem as the lack of capital. Because the labour force consists mainly of unskilled workers, the Government sees a need for positive action in the development of manpower resources and has established a technical development plan with the view to improving the ratio of certain professional, technical and other skilled workers to unskilled workers.

143. The report from Malaysia notes an increased demand for skilled technicians following success in capital formation which had to be satisfied by the use of outside personnel:

The increase in Gross Capital Formation under the Second Five-Year Plan caused, not unexpectedly, a shortage of professionals and technicians, particularly of engineers, draughtsmen and architects. These shortages were circumvented by contracting-out projects to foreign firms; using standard designs for buildings such as schools, so as to economize on architects' services; and recruiting foreign technicians.

144. As noted in the section on problems of education, improvement of the level of training of workers requires capital expenditures which may not have an influence on economic growth for some years. The Governments of a number of developing countries express concern over the allocation of capital to this end as compared with the more immediately productive allocation to increasing mechanization.

145. Neither the problems of unemployment and under-employment nor those of shortage of skills are limited to developing countries; such problems are mentioned in the responses from some more developed countries as well. On the other hand, some of the Governments of more developed countries also mention problems of general labour shortage.

146. The response from Ireland mentions surplus of labour and under-employment in agriculture as an important problem. A comparison of the number of males engaged in agriculture in 1960 with estimated requirements of labour force on agricultural holdings of various sizes indicated a surplus of actual over required numbers amounting to 61 per cent, though the Government cautions that this estimate of the surplus might be somewhat overstated. The actual number of workers as a percentage of estimated requirements varied with size of holdings as follows:

Size of holding (in acres)	Percentage	Size of holding (in acres)	Percentage
1/4-1	115	50-100	142
1-5	256	100-150	120
5-10	278	150-200	111
10-15	270	200-300	105
15-30	226	Above 300	115
30-50	183	All farms	161

147. The United States is among the more developed countries in which problems of unemployment related to the trends of population are mentioned in the responses to the Inquiry. The Government sees a threat of increasing unemployment in the sharply rising numbers of young people entering the labour force in recent years, which results from the up-turn of the birth rate in the late 1940's. Although full employment is not considered to be unattainable, "the task of providing employment opportunities and, as a part of that task, educational opportunities for the rapidly growing younger labour force groups will be a challenging one in the years immediately ahead".

148. Byelorussia recalls a growing surplus of agrarian manpower as one of the greatest problems that formerly existed in that country, before the revolution. "From estimates based on the official agricultural statistics of czarist Russia, the manpower surplus in 1892 in the rural areas of the Minsk, Vitebsk and Mogilev *guberniyas* amounted to more than 700,000 persons, or over 40 per cent of the total manpower." This problem was solved, however, within a few years after the socialist revolution.

149. In the Soviet Union, the Government reports, there were still 1,526,000 unemployed workers at the beginning of 1928, but "by the end of 1930, the industrialization of the country and the collectivization of agriculture had already made it possible to do away with unemployment and rural over-population completely" and there are no unemployed at present. The following information about the utilization of labour resources is reported:

Utilization of labour resources is measured by the ratio of the number of persons employed in social production and other forms of socially useful activity to total labour resources. In the USSR the proportion of persons having such employment (including members of the armed forces) amounts to approximately 78 per cent or, if the families of collective farmers, and of manual and non-manual workers engaged in personal supplementary agricultural work are included, to more than 85 per cent. In addition, since 5.8 million persons 16 years of age or older were attending educational institutions full-time, utilization of labour resources really amounts to almost 90 per cent — 97.5 per cent in the case of men and 84 per cent in the case of women.

The high proportion of women in the labour force of the Soviet Union is emphasized in the Government's response. The Soviet Union recommends harmonious expansion of industry and agriculture to the developing countries as the only possible means of eliminating rural over-population and achieving full employment.

150. Czechoslovakia reports a general shortage of manpower and measures being taken to relieve it:

As regards the development of employment, the plan of labour force at the present time and in the near future is rather strained as a result of an unfavourable development of population in the period of the world economic crisis between 1929-1936. ... In view of the fact that a prolonged period of the preparation for employment is expected, measures are adopted to forestall further shrinkage in the volume of manpower through the departure of old workers into retirement. Special attention is devoted to agricultural labour where the average age is too high and to

manpower in some other branches such as transport, communications and some industries where in the next few years, there will be a mass exodus of workers into retirement.

In this connexion — as regards long-term trends — is strongly felt the need for mobilization of further labour reserves in the years to come.

151. In Japan also a shortage of labour has developed since World War II. The Government observes that while modern large-scale industry is developing in Japan, pre-modern, small-scale family enterprises are still quite numerous and they employ substantial numbers of unskilled young workers at low wages. As the large-scale industries expand, increasing their demand for young workers, the small- and medium-scale enterprises face an increasing difficulty of labour shortage, which is further accentuated by the rising percentage of young people who, upon graduation from middle school, go on to high school instead of joining the labour force.

152. Norway reports a shortage of skilled manpower in some branches of industry since the Second World War.

C. EDUCATION

153. Raising the level of education of the population is accorded high priority by Governments of developing countries for two reasons. On the one hand, education is viewed in and of itself as a major aim of social policy. At the same time, the importance of education in increasing labour productivity is stressed heavily. Thus the report of the Republic of China states: "In the long run, our most productive investment is in the education and development of people." The Republic of Korea puts the same idea in these terms: "It is generally recognized that the cost of education and training should be considered as an investment in human resources, as effective education, in the long run, will result in raising labour productivity".

154. Pakistan points out that education has a dual role in economic development: to provide the skills needed for industrialization, and to create an atmosphere favourable to the changes in social institutions and behaviour patterns that accompany industrialization. The Government notes that only 40 per cent of Pakistani children between the ages of six and eleven years are enrolled in schools, and that the target for 1970 is 70 per cent.

155. Achievement of the desired advances in education in developing countries is made more difficult by rapid increases in the numbers of school-age children, magnifying the investments in facilities needed if all are to be educated; and the difficulty is made all the greater by the fact that the ratio of the child population to the adult population in productive ages is high in the developing countries, as a result of their generally high birth rates.

156. The response of the Philippines contains a calculation which illustrates the growing magnitude of this problem. Assuming a constant rate of school attendance at the current level for children in ages 7-13 and that universal elementary education is to be achieved by

1980, with an anticipated doubling of the population in this age group between 1960 and 1980, it is estimated that for the five-year period, 1960-1965, new schools will be required to accommodate about 205,000 additional children each year. These annual net additions will increase considerably during each successive five-year period and will reach nearly 480,000 per year by 1975-1980.

157. Similar calculations are included in the response of Tunisia and the Government strongly emphasizes the difficulty of meeting the educational needs in view of the rapidly increasing number of children.

158. Jamaica states:

In spite of a considerable effort on the part of the Government over the years to provide adequate educational facilities for Jamaica, large gaps remain. The country's limited resources and rapid population growth have made the task very difficult.

159. Where the population is increasing rapidly, even though efforts to expand educational facilities may succeed in increasing the percentage of school-age children who attend school, the absolute number not attending school may nevertheless increase. This is the trend reported by the Government of Colombia for the rural areas in that country. Likewise an increase in the number of illiterates is reported in spite of some progress in reducing the proportion of illiterates in the population. Chile reports success during the 1950's in making provisions for increasing school enrolments at a higher rate than the increase of the school-age population and in reducing the illiteracy rate. Between 1952 and 1960, the proportion of illiterates in the population of school-age dropped from 9.6 to 5.1 per cent, and in the population past school-age, from 14.6 to 12.5 per cent. Nevertheless, the Government observes, the absolute number of illiterates did not decrease during this period.

160. The costs of meeting increased educational demands, due both to increased school age population and attempts to increase the proportion receiving education, are mentioned with some frequency in the responses from developing countries. The report from Jordan comments:

In Jordan's Seven Year Programme (1964-1970) considerable emphasis has been placed on education, and it is anticipated that almost one-half of the increase in central government recurring expenditures will be devoted to education. But the heavy preponderance of young people noted above makes the expanded programme for education a heavy one for a country of limited resources.

161. The problem of maintaining an equitable balance between educational investment and investment in other sectors is stressed by the Republic of Korea:

If the cost of education grows faster than that of the total economy, some of the money invested in education will be wasted, as sufficient places for employment will not be found due to a proportional decrease in industrial investment.

The Republic of Korea adds that the national economy is considered unable to afford the full cost of providing elementary educational facilities for the rapidly growing population of school age. It is hoped that, with the

success of family planning, the school population will stop increasing by 1975. The resulting savings in classroom construction and teachers' salaries could then be used for other purposes, such as improving the quality of education.

162. Turkey likewise observes that if the birth rate could be reduced to the extent hoped for by 1985, the number of children under fifteen years of age in the population at that date would be 7 million less than the number expected on the basis of fertility continuing at the present level, whereas the size of the adult population in working ages would be unaffected by the decline of the birth rate up to that time. The result would be to free for productive investments, capital resources that would otherwise have to be spent on provision of educational and other facilities for the additional children. In addition, the reduction in the average number of dependent children per family should increase the propensity of families to save, thus further improving the balance between capital resources and investment needs.

163. In developing countries, educational problems arise also with respect to the adult population who have passed through the school years during a period in which educational facilities were less available and educational requirements for participation in the labour force were not as high, but who have many potentially productive life years remaining. Several Governments report programmes in efforts to reduce adult illiteracy. Others report good experience with on-the-job training programmes.

164. Promotion of education is also stressed in the responses from several more developed countries as an essential means of achieving harmonious interaction of economic development and population trends. In Bulgaria, for example, "measures giving the people greatly increased access to education of all kinds and at all levels" were found to be an urgent necessity in the industrial development of the country and the shift of population from rural areas to the cities.

165. The high ratio of children to adults, due to the high birth rates in the developing countries, has an especially important bearing on the problems of economic development, since a heavy burden of child dependency tends to depress income per head and make it more difficult to save and invest a large share of the national income. This aspect of the problem is mentioned in the responses of Colombia, Jamaica, Jordan, Republic of Korea, Philippines, Tunisia and the United Arab Republic. The United Arab Republic observes that the economic burden is being increased by a rising trend in the proportion of children under age fifteen in the population; this proportion increased from 38.0 per cent at the census of 1947 to 42.8 per cent at the 1960 census.

166. In some of the more developed countries, the instability of the birth rate and consequent variation of requirements for educational facilities is an important aspect of the educational problem. On this matter, Sweden states:

Experience has shown that for a rational planning of school buildings, teacher training and institutional care for the coming

generation a balanced birth rate is of great importance. The difficulties are just as great when the schools are bulging as when premises and teachers are not made full use of because of a temporary decline in the number of children in a specific age-group.

167. New Zealand offers a somewhat different view:

One of the first felt consequences of this concentrated age distribution is a large number of children of school age requiring an extensive school building programme. This problem is, however, essentially of medium term only. Experience in some of the longer established housing areas is that the initial flood passes and in later years school rolls commence to decline leaving unused schoolrooms. As a result of this experience school building policy has been changed to provision of a permanent core structure to such schools with temporary additional classrooms to cope with peak demands for accommodation.

168. A similar problem in Finland, resulting from the high rise of the birth rate in 1946-1950 and its subsequent decline, is stated in the Government's response as one of the two main features of Finland's population problems. Finland reports that the resulting increase in the number of elementary school children some years later was proportionately greatest in the northern and eastern parts of the country, which have always been relatively less developed than the rest of the country; and this feature has made the consequent economic difficulty all the greater.

169. In the United States also strains on the educational system have been felt as a result of the wartime and post-war "baby boom" and the subsequent swelling of cohorts of children coming of school-age. The pressure of sharply rising enrolments, which was felt first at the elementary and later at the secondary school level, is now causing major problems for the colleges and universities in the United States, as the number of new entrants to these institutions more than doubled between 1953 and 1963.

170. The United States response treats at some length the broader question of economic and social effects of changes in the proportions of different age groups in the population. The increasing number of people over the age of 65 years is one of the trends noted. This entails an increase in the amount of resources devoted to the support of retired workers and adjustments in the economy so as to provide arrangements for the care of the aged and increased production of types of goods and services which they require.

D. HOUSING

171. The problem of supplying sufficient and adequate housing for the population is mentioned by many of the responding Governments, both of developing and developed countries. In general, housing problems are seen as derivative from three factors: Population changes, including rural-to-urban migration as well as population growth, war destruction or pent-up demand during war time, and the problem of allocating the limited productive capacity of the construction industry to residences in the face of industrial demand.

172. All these factors have been operative in Korea and the Government remarks:

In general, there was a shortage of housing even before the Liberation in 1945, but it was not conspicuous until the entrance of the mass of refugees from north Korea, and those repatriated from various foreign countries at the conclusion of World War II. An abrupt increase by about 2.5 million people for these reasons has broken the balance of supply and demand of housing completely. To make matters worse, the Korean War devastated 18 per cent of the total housing of 3,378,000 which had then existed.

173. At the census of 1960, the housing shortage in Korea was estimated at 1,037,000 units, or 23.6 per cent of the estimated need, and the Government quotes projections which indicate that the shortage will increase progressively in the future if population growth is not checked.

174. Jordan stresses the implication of the present age composition of the population for future housing needs. As 24 per cent of Jordan's inhabitants are between 10 and 20 years of age, an extremely heavy demand for housing is foreseen for the next decade.

175. The response from Guatemala indicates that a large number of middle and low-income families in urban areas of that country are ill-housed and that the magnitude of the housing deficit is increasing as a result of the natural growth of the population and the influx of migrants from rural areas. The figures quoted in the Government's response on housing needs and current investments in housing programmes illustrate the difficulties involved in making rapid progress towards solution of the housing problem in rapidly growing cities in a little developed country. According to estimates made in 1958 by the Pan-American Union 75,000 housing units needed to be constructed in the urban areas of Guatemala to replace substandard units occupied by low and middle-income families, and 70,000 additional units would be required for such families to keep up with expected population growth during the next ten years. Thus the ten-year need for construction was estimated at a total of 145,000 urban housing units, and the Government estimated the cost at 259 million quetzals, or 26 million quetzals annually. The Government's response to the Inquiry gives data on several current public housing programmes in urban areas, being supported with considerable amounts of foreign aid; yet it appears that the total annual volume of both public and private investment in urban housing construction is no more than half of the annual requirement indicated by the estimates above. After reviewing the situation and programmes in rural as well as urban areas of the country, the Government concludes: "... it must be admitted that despite the housing boom all the programmes put together still represent only a minimal percentage of the country's housing needs".

176. The response of Bolivia also contains an analysis of the housing problem in quantitative terms which shows the importance of the factor of population growth. Bolivia's housing problem seems to be generally similar to that of Guatemala.

177. The response of Jamaica also emphasizes the problems of urban housing deficiency resulting from large immigration from rural areas:

... the serious inadequacy of housing in the Kingston Metropolitan Area has been accentuated by the rapid growth of population, resulting largely from the influx of people from the rural areas in search of work. In rural areas poor housing conditions contribute to the unattractiveness of farm life and can be considered a contributing factor in the drift of people to the city.

178. Fairly similar statements are made by the Republic of China, Colombia, Pakistan and Panama. The problem of relatively low productive capacity in the construction industry is detailed in the report of Colombia, and the Government reports that the result of this together with the vast influx of migrants into the cities has been a deterioration of quality of urban housing as well as an increasing quantitative deficit of housing units.

179. A problem of balance in the allocation of limited construction capacity between the building of residences and of industrial buildings exists in many developing countries.

180. Some of the Governments of more developed countries mention the problem of replacing housing devastated during the Second World War or satisfying the pent-up demand generated during the War when residential construction was curtailed. In some developed countries this factor has interacted with the increase in family formation following the War in such a way as to leave the problem still unresolved.

181. Yugoslavia sums up the problem in that country as follows:

A rapid increase in number of households outpacing the increase of population during the whole post-war period led to a permanent high demand for dwellings. In spite of the fact that, beginning with the year 1957, the number of new dwellings increased constantly (in the year 1955, 30,000 dwellings were built; in 1958, 62,000; in 1961, 100,000 and in 1962, 104,000), the shortage in modern dwelling space is constant. Thus the forthcoming Seven-Year Plan envisages a further increase of the number of new dwellings paralleled with the increase in public utility construction.

182. In Bulgaria, "to solve the housing problems resulting from the mass movement of the population towards the urban areas, preparations were made for large-scale State co-operative and individual housing construction. A total of 642,666 new dwellings were built between 1945 and 1962. The rapid rate of housing construction is to continue throughout the entire period covered by the general long-term development plan ... which will end in 1980".

183. In the Federal Republic of Germany, although the great deficit of housing which resulted from wartime destruction and the post-war influx of refugees and expellees has now been largely made up, the Government reports that almost five million housing units in the towns and villages still require rebuilding: that is, nearly one third of the total number in 1961. Emphasis in the national programmes of aid to housing construction is now shifting toward the objective of reducing

inequalities of housing conditions in different regions and types of communities as a part of the effort to achieve better balance in the geographical distribution of the population.

184. The Netherlands states:

War damages and a building stop imposed by the Nazi Occupator turned the pre-war housing surplus into a severe shortage. Notwithstanding the high level of post-war building activities, that shortage still exists. The latest estimates range from 179,000 to 259,000 dwelling units (the total number of existing dwelling units is three million). The reasons why such a situation could develop are:

(1) The accelerated growth of the number of families looking for homes — the acceleration being caused by the fact that the average size of families has been dropping (4.82 persons in 1909; 3.80 persons in 1962);

(2) One half of the total productive capacity only is used for building homes...; the other half of the building capacity has to be used for the construction of factories (essential to the industrialization programme!), offices, schools, etc.

The number of new dwellings annually built just about covers the annual increase in demand resulting from the growth of the number of families plus the number of obsolete dwellings to be replaced annually and leaves no room for reducing the backlog.

185. The level and changes of the birth rate and consequent variations of age structure of the population also are factors in the problems of housing. Sweden comments on this aspect:

The demand for housing represents a consumption which is greatly influenced by the population structure, not least in respect of the number of children involved. Families with children require more space than other families. ... The requirement of families with children for housing subsidies has brought into being a system of governmental rent-reductions. Out of the families with children in cities and other urban areas about one half (275,000) now enjoy such subsidies which are means-tested and adjusted to the number of children. The supply of housing is still not sufficient; it has not been possible to keep building operations in pace with increased purchasing power and growing demand. This affects the formation of new families. It happens that the space of the flat is a motive for limiting the number of children. To make the housing subsidies more helpful is part of the current policy in Sweden. For a good planning of the building activity a balanced population development is regarded to be of great importance.

E. HEALTH

186. A common theme running through most of the responses to the inquiry on problems related to health is one of considerable improvement in the recent past. Problems facing the nations in the future vary considerably, and here again, the rapid increase of population in developing countries adds to the difficulty of making sufficient investments for the development of health facilities and services. Sierra Leone comments:

Although it is probable that infant mortality rate has reduced and the death rate of adults has also reduced owing to increased health facilities yet the infant mortality rate and adult death rate are still comparatively high by modern standards; it is estimated that of every 1,000 children born at least 120 die annually. In Freetown the capital where alone birth and death registra-

tion is compulsory it is recalled that although mortality rate was reduced considerably from 148.4 per thousand in 1950 to 125 per thousand in 1955, yet, probably owing to the pressure of an increased birth rate and less than comparative increase in medical and health facilities, the mortality rate has reduced less rapidly since 1955 to 121.6 per thousand in 1960. The absence of population data in the intervening years since 1948 and the obvious absence of pressure on the land have led in the past to an inadequate recognition of the gravity of the health problem of the country. In addition there has been a general absence of vital statistics in many areas and this obscured the urgency of the problem.

187. The Republic of China reports a problem in maintaining the present level of health services in the face of the increasing population:

By 1970, our population will exceed 15 million or 3.5 million more than the present total. Thus we have to prepare 2,500 more (hospital) beds for the added population even at the present standards of requirements. As industrialization and economic development are raised to a higher level, the need for better health protection will follow. The financial burden for providing this service will be tremendous. But this is a harsh fact that we will have to face in the next decade.

188. Jordan also comments on the financial burden of providing health service, associating the problem with the need to orient the social welfare and health programmes toward the needs of the heavy preponderance of young people. Pakistan gives statistics which show very low ratios of doctors and hospital beds per inhabitant: 1:7000 and 1:3000, respectively, and states that ratios of nurses, mid-wives and other personnel to relevant segments of the population are even lower.

189. The Guatemalan response provides another illustration of the difficulties in expanding health services and facilities, as well as housing, at a rate sufficient to provide for the needs of a rapidly growing population in a little developed country. The Government cites statistics on the numbers of beds in State hospitals, showing an increase from 7,352 to 10,250 in the ten-year period 1953 to 1963. This amounts to an increase of nearly 40 per cent, yet it is scarcely more than the increase of the population, estimated at 35 per cent for the ten years 1951 to 1961. As the Government observes, the ratio of hospital beds to the population was still very low in 1963, especially in the rural areas.

190. Colombia, discussing the problem of insufficiency of hospital beds and other health facilities, comments:

There is unquestionably a marked disproportion between the magnitude of these problems and the resources available for their solution, a disproportion which is daily aggravated by the progressive population increase.

191. Colombia goes on to comment at length on the disparity between health facilities in urban and rural areas. Jamaica and Pakistan also note this problem. The Republic of Korea has also faced this problem and made progress towards its solution by a plan whereby physicians are assigned to rural areas for two years in lieu of military service.

192. Of the more developed countries, Sweden specifically notes changes in health services necessary for an

aging population: "The great shift toward older age-groups is reflected in the adjustment of hospital treatment to the requirements of the care of chronic invalids, etc."

F. THE DEVELOPMENT OF CAPITAL AND INVESTMENTS

193. The development of capital is seen in many developing countries as a major problem in achieving the desired level of living. The connexion between this problem and the growth of population receives attention in the reports of a number of Governments.

194. Discussing the relationships between population growth, capital growth and growth in national product, the Republic of Korea notes that from 1953 to 1962 average savings amounted to only 13.5 per cent of the gross national product. Moreover, only 3.8 per cent of accumulated capital came from domestic savings, the remainder being provided by other countries. Although the situation was due to many unfavourable influences, the rapid increase of population was the most important factor. The rapid increase of population within the dependent age groups and the requirements of this segment for education, social welfare, etc., represent an added burden upon the national economy.

195. Ceylon presents the problem in the following terms:

The implication of population growth for capital requirement is well illustrated quantitatively. Before 1947 our population increased, on average, by about 1.7 per cent a year. In order to arrive at a 2 per cent increase in the gross domestic product per head, as envisaged in the present programme, we would have to achieve a rate of economic growth of 3.7 per cent a year. On the basis of a gross domestic product of about R^s.6,340 million in 1961-62 and a capital output ratio of 3.5, the required amount for investment in 1961-62 would be 3.5×3.7 or 12.95 per cent of R^s.6,340 million, i.e., about R^s.820 million.

At our present rate of population growth of 2.8 per cent per annum a 2 per cent increase in the gross domestic product per head would require an investment of R^s.1,065 million. In other words, in 1961-62 we have to invest R^s.245 million (R^s.1,065 million - R^s.820 million) more because our population is growing not at 1.7 per cent, but at 2.8 per cent a year. We are thus involved in a race between economic growth and population growth.

196. The response from the Sudan brings out the point that implications of population growth for investment needs are not the same in the "modern" and "traditional" sectors of the economy. The Sudan's development plan envisages doubling of income per head in a period of twenty-five to thirty years, and the Government observes that the high rate of population growth (2.8 per cent per annum) directly affects the amount of increase in total national income and the volume of investments required to achieve this objective. However, an important qualification is noted in this respect:

About half of Sudan's national income is still produced in the traditional way. Such production consists for the larger part of the output of shifting rainland cultivation where only simple and home-made tools are used, of the production of nomads, of the catch of river fishing in the southern part of Sudan, of

forestry products (especially firewood), of crafts like pot-making and of personal services like water carrying.

In extrapolating the output of this traditional part of the economy over the plan period it has been assumed that it would grow approximately *pari passu* with the population without needing modern investment goods (mostly consisting of imported equipment, European-type building and large civil engineering works). Such an assumption seems justified on the basis of the mode of production and in view of the fact that Sudan has large areas where the cultivatable lands are by no means fully used up.

197. The response of Malaysia focusses on the relationship between capital formation and the creation of jobs:

Despite Gross Domestic Product (at constant prices) increasing since 1955 at an average of 4 per cent a year, structural unemployment exists. It is not of course sufficient, to avoid unemployment, for Gross Domestic Product to increase at the same rate as the labour force; it has to increase faster to allow for the increase in productivity per worker. If additions to the labour force are to be fully absorbed, productive capacity (and Gross Domestic Product) must increase at a rate that equals the combined rate of increase in productivity and the labour force. At least this will be so on the basis of rather rigid assumptions.

In recent years productivity per worker must certainly have been increasing. The spread of education, technological developments, external economies must all have had an important influence. Perhaps productivity per worker has been increasing at, say, 1-1/2 per cent a year; that, although merely a guess, would not be implausible. If so, with the labour force increasing at about 3-1/2 per cent a year, productive capacity (and Gross Domestic Product) would have had to increase at about 5 per cent a year to forestall an increase in unemployment. It has not in fact expanded as fast as this. Hence the structural unemployment.

The main remedy for the existing unemployment appears to be, on this argument, a faster rate of increase in productive capacity. To achieve this, Gross Capital Formation, particularly by the private sector, will need to be increased. A shift in relative factor prices, so inducing more labour-intensive methods of production, would also be helpful.

198. Somewhat similar problems are reported by the Republic of China and Pakistan. On the other hand, Kuwait envisages no such difficulties, in view of its high level of consumption and a savings rate of 50 per cent of the national income.

G. THE DEVELOPMENT OF INDUSTRY AND CHANGING STRUCTURE OF THE LABOUR FORCE

199. Promotion of industrial development occupies a central position in the economic policies and plans of the Governments of most developing countries. This is regarded as an essential means of achieving a high level of income per head in the long run. Moreover, it is considered indispensable as an outlet for employment of surplus labour in the agricultural sector, particularly in developing countries which have a severe shortage of land and a rapidly growing agricultural population.

200. The Republic of Korea envisages that between 1960 and 1980 its labour force will increase by 7.4 million and that about 60 per cent of the increment will accrue during the 1970's. The Government considers

that changes over the first decade in the industrial composition of the economically active population will be such that the number in secondary and tertiary activities will be about 20 and 35 per cent, respectively, of the total working force. If unemployment remains at the level recorded in 1962 (8.4 per cent), the numbers actually engaged in secondary activities will be twice as large in 1970 as in 1960, 1.449 and .749 million, respectively.

201. The United Arab Republic states:

The industrial sector receives a great deal of care and attention for many reasons. Firstly, industrial development... is essential in order to absorb the excess farm population in Egypt's rural areas—an excess that constitutes a disguised unemployment problem. Secondly, industrial development opens up job opportunities for much of the manpower entering the labour market as a result of the constant annual increase in population, averaging some 2.8 per cent at the present time... Accordingly, it may be said that the widest possible promotion of industrialization will solve the population problem in both its static aspect (disguised unemployment) and its dynamic aspect (constant population growth). Thirdly, industrial development is essential to support agricultural development, since the large-scale expansion of agricultural production requires the creation of outlets for agricultural products, whether in the form of raw materials for industry or in the form of foodstuffs.

202. Ceylon also emphasizes the necessity of creating a large industrial sector "in order to make a sufficient impact on the employment situation in the background of a rising work force", but points out that it is not necessary for industry alone to absorb the whole surplus of agricultural labour supply, as some of it may be used in expanding transportation, trade, distribution, etc.

203. Panama submits a discouraging report on the effectiveness of industrialization in expanding employment opportunities for the growing labour force in that country up to the present time:

Industrialization has not been effective in Panama so far as the absorption of labour is concerned. The industrial sector employed some 7.5 per cent of the working labour force in 1950 and 7.4 per cent in 1960. Panama's population has a natural growth rate of about 3 per cent per year. Rural living conditions and the attractions of the town... encourage emigration to the urban areas, producing a further increase in their rate of population growth. These people must be employed in some useful way, since otherwise they will overcrowd the less productive sectors or join the mass of the unemployed, creating widespread social and economic friction and considerably reducing the share of those sectors in the rising level of living. What branches of economic activity can employ this manpower? A careful study of the prospects in the various branches leads to the conclusion that what is needed to solve the unemployment problem is vigorous growth in the industrial sector. Since output per person employed in industry will tend to increase, particularly if the trend for the establishment of undertakings continues, and since relatively few people are employed in industry, at present, really striking rates of industrial growth will be required.

204. Panama is also disappointed by the smallness of expansion in industrial output up to the present time:

Despite the increase in industrial investment, the share of the industrial sector in the gross domestic product has remained

almost unchanged. This may be because industrial investment needs several years in which to mature before the capacity installed begins to yield normal returns.

205. Jamaica finds that increasing investment in the manufacturing sector has done more to increase domestic gross product than to relieve the problems of unemployment and under-employment:

The manufacturing sector has become the largest contributor to gross domestic product at factor cost among the island's productive sectors. Since 1960 the sector's contribution to total product has exceeded that of agriculture. In 1962 the gross domestic product from manufacturing amounted to £33.7 million or about 13.7 per cent of total gross domestic product.

This growth has been accompanied by a diversification of the sector and a widening of the range of products made in the island. Prior to the 1960's the sector was based mainly on the processing of local agricultural products and the production of a limited range of consumer goods for local consumption and export, such as sugar, rum, cigars and cigarettes, non-alcoholic beverages, and a range of food products.

Many new industries have come into operation in recent years, some aiming primarily at the local market and others for export. Many of these industries are based on imported raw materials.

The development which has taken place up to the present time is very encouraging, but further and more rapid development is essential if the manufacturing sector is to provide the employment opportunities necessitated by the fast growing labour force. Employment in the sector has been growing but is still comparatively low and is growing rather slowly.

206. Tunisia pins her hope for eventual solution of her population problem mainly on industrialization, but the Government does not expect the rate of industrial expansion considered as feasible to be sufficient to solve the problem of unemployment and under-employment in the near future.

207. Pakistan comments that increases in the size of the agricultural labour force will only result in more widespread unemployment and under-employment. A shift in the industrial structure of the labour force is considered indispensable to the well-being of the population dependent upon agriculture.

208. The statements of Governments of some of the more developed countries also refer to actual or potential excesses of labour supply in areas of primary production and the need to transfer workers to manufacturing and other secondary or tertiary activities. The following statement from New Zealand provides an example of a well-developed economy concerned with a transition from extractive activities to manufacturing activities:

Historically, New Zealand's high living standards have been based upon pastoral production—mainly for export. Land resources are, however, finite, and in recent years with increasing labour productivity the number employed in agriculture has declined slightly. Also because of fluctuating terms of trade for primary products and because of uncertainties as to future developments in world markets emphasis has been placed on industrial development. Inevitably an increasing proportion of the total labour force will, in future years, be employed in the manufacturing and supporting service sectors. This will require changes in present institutional and social structures and increasing investment in industrial and related fields.

209. Norway comments on a somewhat similar problem:

The structural improvement which has occurred within the primary industries since the Second World War is not concluded. The reduction of the working population in agriculture has contributed to a better relation between the natural resources of the industry and the population developing them. Small far-flung or other unprofitable holdings have been discontinued or combined with other holdings to become larger operational units. Different methods of co-operation in usage of capital equipment are being taken up in several districts both in agriculture, forestry, and fishing. It can therefore be reckoned that there still is a considerable surplus population in the primary industries which can benefit other industries with higher productivity and a partial lack of manpower, without reduced production in the primary industries.

210. France analyses from a theoretical point of view the changes in occupational structure of manpower required in the process of economic development, and the role of an increasing labour force in facilitating such adjustments:

At any given time, the sum total of consumption and investments determines a certain occupational structure, which might be called the "required population" and which is generally not identical with the actual active population.

Under the influence of technical progress and the resulting changes in consumption, the "required" occupational structure is constantly changing. The traditional migration from primary to secondary and tertiary activities is supplemented by variations within each of these sectors.

In such circumstances the actual occupational structure must keep pace with this movement. If it does not, or if it changes too slowly, economic progress is retarded and the very application of technical advances is hampered. It is therefore essential that the structure of the active population should change. There are two methods of bringing this about:

(a) Change of occupation during active life (often called reconversion);

(b) A greater influx of young people into expanding occupations.

The first method is more difficult to apply because it imposes hardships on the worker who is driven out of his occupation and entails loss of capital for undertakings (artisans are a case in point).

The second is easier to apply but it has its limitations, for the active population renews itself slowly.

In an industrial population with a low mortality rate (life expectancy at birth: seventy years), the active population is renewed at the rate of 2.2 per cent a year (replacement of old by young workers). Even if all of these young people were to enter occupations where there is a labour shortage, that would not suffice to meet all needs. When an occupation is doomed by changing techniques to disappear, the process will require a maximum of forty-seven years if it is accomplished simply by the death of the persons engaged in that occupation.

If the population increases by 1 per cent a year the rate of renewal rises from 2.2 to 2.8 per cent, which represents an increase of 27 per cent. But as the mobility of young people is only partial, the increase in the renewal capacity is much greater, perhaps even double.

Thus population growth makes it possible to modify the occupational structure and reap the benefits of progress. The more rapid the latter, the more essential it is that the population should increase. If, on the other hand, the occupational structure does

not adapt itself as desired, as is the case where a population is stagnant, this resistance in turn hampers economic progress.

Where there are immigrants the flexibility is still greater, particularly if they are admitted with a work card for employment in occupations in which there is a labour shortage. By widening the bottle-necks they not only increase production in their own sector but also, by their consumption and their activity, they increase employment and production in other sectors.

H. URBANIZATION AND POPULATION DISTRIBUTION

211. Many of the Governments of developing countries mention problems resulting from an accelerated flow of migration from the countryside into the principal cities, and several of the responses attribute this movement partly to the rapid growth of population in rural communities and the difficulty in making a proportionate expansion of employment opportunities there. Turkey mentions these problems and they are stressed very strongly in the report from Panama:

... the problems resulting from the reciprocal action of population changes and economic development in Panama may be summed up as arising from a process of urbanization which does not seem to be accompanied by a parallel process of industrialization. The high rural fertility-rate (the urban rate is also high), the wide circulation of reports about the attractions — often illusory — of the city, and the precarious living conditions prevailing in the country are some of the factors in the so-called rural exodus. This phenomenon, which is the cause of urbanization in Panama and which seems, moreover, to be characteristic of the capitals of other Latin American countries, is the key to the country's main problems of industrial development, development of transport, services and communications, labour, employment, unemployment and under-employment, training, education, housing and health.

212. Colombia also places great emphasis on the "vertiginous pace" of urbanization, observing that "the urban centres are saturated with rural migrants". At the same time, Colombia stresses the maldistribution of rural population in relation to land resources as a primary factor in its population problem. An improved balance of population distribution is seen as an imperative necessity against the background of rapid increase in size of the population. On this aspect of the matter, the Colombian response states:

... in 1951 Colombia was in a favourable position owing to its relatively low average population density, but it was confronted with population pressures resulting from the uneven territorial distribution of the population. By 1971 the average density will have increased by 137 per cent over the figure for 1951, making it necessary to formulate a policy of distributing the population in accordance with economic development goals.

213. In Venezuela's National Plan, the exodus from the countryside to the cities is cited as one of the major maladjustments that have hindered progress toward the goal of a healthy economy and satisfactory conditions of life for the whole nation. Venezuela is described as a "macrocephalic" country with an excessive proportion of its population concentrated in the region of the capital. A better balance between the distribution of population and resources, in regional as well as urban-rural terms, is one of the principal objectives of

the national plan. The relatively crowded condition of the agricultural population in the region of the Andean highlands is contrasted with the extremely low density of population in the Guyana region.

214. Bolivia has a problem of unbalanced population distribution not unlike that of Colombia and Venezuela. At the 1950 census of Bolivia, 84 per cent of the population was found in the regions of the Andean Plateau and the Valleys, which constitutes only 33 per cent of the country's area, while the population density on the lowland *Llanos* was exceedingly low. Although spontaneous and Government-assisted migration to the *Llanos* has been important in the economic development of that region, it has not been large enough to have a significant effect on the growth of population in the Plateau and Valley regions. The Bolivian response expresses concern with the adverse effects of deforestation and erosion on the productive capacity of land resources in the latter regions.

215. Migration to the cities has created complex problems of urban concentration and congestion in Chile. The large investments required for massive construction of housing, street pavement, and development of public utilities in the growing cities are noted as a major problem. The Government expresses the opinion that the trend of concentration of population in large cities may have been accentuated by insufficient allocations of developmental investments to the regions of the country from which migration to these cities has been flowing.

216. The conditions that have resulted from the mushroom growth of cities in Guatemala are described as follows in the Government's response:

The spontaneous growth of population has meant that in the capital in particular there are new districts of badly built houses which do not fulfil any of the required standards and merely constitute accumulations of humanity living in wretched conditions. These districts have involved the destruction of many green areas and they are at the same time a danger to the health not only of the inhabitants but of the rest of the population on account of the breeding-grounds of disease whose formation they provoke.

With the aim of correcting these conditions and checking their proliferation, the Guatemalan Government is co-operating with municipal authorities and with the citizens concerned, in establishing new urban settlement areas in accordance with acceptable standards for housing, land use, and public services. Some of the programmes being promoted along these lines are described in the Government's response.

217. The movement to the cities presents a dilemma to the Governments of developing countries. On the one hand, so far as it corresponds to a shift of labour supply from agriculture to industry and related activities, it may be a necessary part of the transition to a highly developed economy with a high level of income per head. On the other hand, it involves the necessity of heavy investments in housing, schools, utilities, and employment-providing industries in the urban sector, which may be a severe strain on the economy. This dilemma is particularly evident in the response of Pak-

istan. While the Government finds a movement out of agriculture indispensable to the well being of the agricultural population, it sees great difficulties in meeting the costs of accelerated urbanization. Estimating an increase in urban population of 25 per cent in East and 39 per cent in West Pakistan by 1985, the Government observes: "The cost of this urbanization in building and extending towns and cities is almost prohibitive. It may even absorb half the country's development effort over the period."

218. Difficult problems of adjustment and integration of migrants into the urban community also arise, and social disorganization, delinquency and crime may be among the consequences. The cause of the migration, as Pakistan and Tunisia note, may not be so much the lure of employment opportunities or other attractions in the city, but mainly the pressures built up by increasing population on the land and restricted possibilities for utilizing additional labour to increase production in agriculture.

219. In the view of the Soviet Union, the "temporary difficulties" in developing countries which may be created by rapid growth of population are likely to be most marked in the urban areas. The increase of the urban population in such countries is "often disproportionate to the development in them of industrial enterprises cultural institutions, transport facilities, etc." The Government of the Soviet Union sees a failure to solve problems in the agrarian hinterland as a major reason for this urban "hypertrophy"; inadequate agrarian reform, use of old-fashioned farming methods, soil erosion, etc. are held largely to blame.

220. Concern with problems of population redistribution and urbanization in some of the more developed countries is also apparent in the responses to the Inquiry. Japan reports that the increasing concentration in large cities, especially of the young adult population is causing various, ill-effects such as shortages of housing and water supply, congestion of traffic, etc. On the other hand, this city-ward movement hinders the modernization of agriculture as it unbalances the age structure of the agricultural population.

221. Finland considers regional redistribution of the population as one of two paramount problems created by the reciprocal action of economic development and population changes (the other problem being the temporary inflation in the number of births during 1946-50 and consequent difficulties, particularly in the provision of school facilities in the economically less developed parts of the country). On the problem of population distribution, Finland reports an estimate that, by present trends, the population in the region of the capital, Helsinki, would more than double in the next three decades, and comments:

It is apparent that the difficulties encountered even now in connexion with planning for the general development of the Helsinki region by no means will be diminished if this population growth actually takes place. On the other hand, the prospect of a continued concentration of almost half of the population increase in the capital and its surrounding region obviously does not meet the aspirations for future development entertained by other regions of the country.

The problems connected with redistribution of the population in regions losing inhabitants are principally derived from the fact that migration particularly taxes the population of best working age. The number of old people becomes disproportionately large, while the new generations tend to become smaller as the number of young families decreases. This situation tends to paralyse development and local initiative in the areas concerned. Balanced progress in line with the general development of the whole country becomes impossible, and the development lag tends to become more and more noticeable. From the national point of view such a development gives cause for concern, when the areas affected by incipient desolation have a good potential for development in view of their soil or other natural resources.

222. Norway's response refers to a somewhat similar problem of internal distribution of the population, as substantial surpluses of labour are believed to exist in areas of primary production. Yugoslavia likewise stresses the shift of population from agricultural regions to industrial centres as an indispensable factor in the economic development of the country.

223. The Netherlands also reports on a problem of uneven distribution of population:

The urbanization is fostered by industrialization. Population and economic activity are not evenly spread over the whole territory; more than proportional parts of both are concentrated in the western regions where the two sea ports and the seat of the government are located. The population density in that area has grown to 800 inhabitants per square kilometre which has created congestion and recreation problems. Internal migration toward those regions because of lack of employment opportunities elsewhere used to contribute to the uneven geographical distribution of the population.

224. A major part of the United States response is devoted to the consequences of geographical redistribution of population within the country. "For the United States, these consequences constitute the principal population problems for the coming decades." The outstanding feature of population redistribution trends in this country is the increasing concentration in metropolitan areas, though the Government's response also mentions problems of depopulation and economic contraction in some areas.

225. One of the difficulties resulting from the growth of population in the metropolitan areas of the United States is the sharp rise in costs of providing public services and facilities, which entails fiscal and tax problems. Increasing congestion often generates an increase in costs that is disproportionate to the increase in the number of people requiring services and facilities; this is particularly evident in the case of road construction. Other problems that are accentuated by the growing trend of metropolitan concentration include difficulties in waste disposal, air and water pollution, criminality, illegitimacy, and the complex problems of safeguarding the public interests in land use and construction activities. On the other hand, some important benefits also flow from this trend:

Concentration of population also brings important economies by facilitating communication and transportation among economic units, by reducing costs of distribution of public as well as private goods and services, and by permitting development of both large-scale and highly specialized commercial enterprises.

Growing concentrations of population permit the birth and survival of facilities and programmes that, because they cater to specialized interests, have not been economically viable in the past. Thus, the fabric of society has been altered already in innumerable ways, and more alterations are to be expected as urbanization continues.

226. The problems of unbalanced population distribution in the Federal Republic of Germany are summed up as follows in the Government's response:

Areas with sparse population, little industry and therefore weak economic and tax power exist side by side with overcrowded areas on which the economic and financial efficiency of the Federal Republic of Germany is mainly concentrated.

In the areas lagging behind the general development which are mainly agricultural, there is a population of only 8 million inhabitants, i.e. 15 per cent of the total population, on an area of 40 per cent of the territory of the Federal Republic of Germany, whereas in the overcrowded densely populated areas more than 23 million inhabitants, i.e. 43 per cent of the total population, are concentrated on only 13 per cent of the territory of the Federal Republic of Germany. In these overcrowded areas the density of population increased from 579 per km² in 1950 to 716 inhabitants/km² in 1961. Of the entire population growth in the total area of the Federal Republic of Germany amounting to 5.3 million from 1950 to 1961, 4.3 million alone were concentrated on the overcrowded areas. Further overcrowding of certain areas would be met with objections for economic, social, health and other reasons. A progressive increase in social costs, difficulties and high costs in short-distance traffic, noise, air pollution, excessively high estate prices are only a few of the typical detriments and shortcomings.

The reasons for structural problems in the areas lagging behind the general stage of development are inherent in the fact that there are no sufficient economic bases and especially there is a lack of non-agricultural jobs in the immediate neighbourhood of residences. These structural difficulties are intensified by the progressive changes in agriculture, in particular in as far as the European Economic Community is concerned, in that a great number of agricultural workers become redundant. On the other hand, the "industrial problem areas" are characterized by a unilateral economic structure which is especially sensitive to crises.

227. The Government of the Soviet Union reports that the urban population of that country increased from 18 per cent of the total in 1913-26 to 52 per cent in 1963, as "a direct consequence of the socialist industrialization of the country and of the collectivization, and resulting wide mechanization, of agricultural production". No problems connected with the process of urbanization in the Soviet Union are mentioned in the Government's response to the Inquiry. Another feature of population redistribution within the Soviet Union is the increasing proportion of the country's total population found in the Republics of Central Asia and Kazakhstan. Between 1913 and 1963, the combined population of these republics increased from 12.9 million to 27.6 million, or an increase of 115 per cent, while the population of the USSR as a whole increased by 41.2 per cent during these fifty years. In spite of the rapid growth of population in the Central Asian Republics and Kazakhstan, and in spite of the fact that they were initially regions of relatively retarded development, great achievements have been made in development of both

agricultural and industrial sectors of their economy; these achievements are documented with statistics quoted in the response of the Soviet Union to the Inquiry.

V. Sources of information

228. The importance of adequate statistical data and analytical studies as means of assessing the trends in population and their interactions with economic development is recognized in the responses received from many Governments. Austria particularly emphasizes this:

The interrelations and reciprocal action of population growth and economic development are exceedingly complex and, to be completely understood, require not only thorough study but also, and above all, accurate statistical data and other basic scientific information. Such information may be found today in only a relatively small number of highly developed States while it is precisely those States which show a high birth rate and whose economic development is beset with difficulties that have either no such information at all or only incomplete records with many gaps — a fact, by the way, that has been expressly noted in the report on the world social situation prepared by the Secretary-General for the thirty-sixth session of the Economic and Social Council.

229. The need for such information has only lately come to be sufficiently appreciated in many countries. Few Governments can say, as Sweden does, that it possesses reliable statistics going back 100 years. The realization of need for economic planning and for understanding of demographic factors in this connexion has furnished an important stimulus in recent years to the collection of basic demographic statistics and the development of research on population trends and their economic and social determinants and consequences. Yet in some countries (notably Lebanon, Liberia and Sierra Leone among those from which responses were received) the facilities for collecting adequate population statistics are not present yet, and in many countries there is much room for improving their scope and accuracy.

230. Practically all the reporting Governments have had a census of population since 1957 and plan to have continuing censuses in intervals of five or ten years. The Governments which report no completely published recent censuses report a definite need for more adequate statistics. These include Sierra Leone and Liberia, from whose first censuses (1962 and 1963) only preliminary results are yet available, and Bolivia, which has no census data more recent than those of 1950. Morocco reports that the principal demographic facts with regard to that country are not well known, as the first modern census covering the whole territory was taken only in 1960 and the tabulation of results has not yet been completed, while registration of vital statistics is not yet organized throughout the country. Lebanon depends for its basic population statistics mainly on surveys made as by-products of international activities, and the responses from all these countries deplore the lack of sufficient statistics.

231. Current data on vital rates are mainly collected through registration, and clearly show great variation between countries. Although most countries have seen

the value of and found the means to make a periodic effort to collect complete population data in the census, a continuous registration system is a different matter. Even in some of the countries, current publications of national vital statistics and the establishment of central statistical offices to collect them are comparatively recent. Yugoslavia reports that before World War II these data were only collected in church registers. Many of the developing countries are instituting this kind of endeavour as part of their development effort, but no long statistical time series can be computed.

232. In many African countries where it has not yet been possible either to carry out a comprehensive census of the population or to establish registers of vital statistics, demographic sample surveys have been used as a means of obtaining some of the most essential demographic measures. Reports of such surveys in different parts of Cameroon were submitted as a part of the response to the inquiry by the Cameroon Government.

233. Problems of unsatisfactory quality as well as restricted scope of demographic statistics are emphasized in the responses from several developing countries. In the majority of such countries, the quality of vital statistics registration in particular is poor. One of the problems that many developing countries face in this connexion is mentioned in the response from Tunisia. It has been the practice in that country for registration of births and deaths to be done anywhere and not necessarily in the locality where they occur, and thus accurate vital rates for various areas cannot be derived from the registration data. Panama reports a lack of registration facilities and the fact that only one out of four deaths is reported through official channels. The Korean response also includes some discussion of errors in registration, including different age reckonings by the Chinese and Western customs. The response of Iran examines in detail the accuracy of census and vital statistics for Iran. Kuwait reports that demographic statistics at present are not reliable, but steps are being taken to improve their quality. In India's response, shortcomings of census and vital statistics are discussed at some length and actions designed to improve their quality are outlined in some detail. Pakistan reports that the census statistics for that country are affected by considerable under-enumeration and faulty reporting of ages, and that vital statistics are deficient in coverage and quality; special demographic sample surveys are therefore being undertaken to establish more substantial bases for population estimates and projections.

234. The economic data are again partly by-products of the execution of some policies and partly collected especially for information to suit policy-making purposes. In the first category fall import and export data, labour force data through the use of government employment facilities, and the detailed data of countries with centrally planned economies. In some countries, special efforts are made in the census to collect economic data, as in Malaysia, where an employment census was taken in 1962. In general, there may be more difficulty resulting from defective quality and inadequate scope of the statistics than from the lack of them. It is clear for

economic data even more than for demographic data that the meaning depends on the purposes for which they are collected, and the extent of coverage and definitions will depend on the stage and organization of the economy. Thus, data on such a question as distribution of investments will be defined according to the particular interests of the Governments.

235. Various kinds of social data are also mentioned in the responses received from Governments, especially data on health and education. The coverage of the responses varies from country to country in such a way that failure to mention a particular type of data cannot be taken to mean that such data are necessarily lacking.

236. As demographic statistics are seldom collected primarily with a view to their use in studying interactions of population trends with social and economic factors, and the same is true in even greater degree of social and economic statistics, there is a need to provide material for such studies by conducting specially designed surveys, which can generally be carried out most economically and efficaciously on a sample basis. Sample surveys conducted recently for the purpose of obtaining such materials are mentioned in the responses of some of the Governments. Panama mentions a sample survey being conducted in Panama City for the purpose of obtaining information on fertility and its determinants. Czechoslovakia reports on a programme of sample surveys on marriage, fertility family planning, abortion, and other demographic, economic and social questions. A recent sample survey on family planning attitudes and practices is also mentioned in the response from Sweden. India mentions the demographic and other data obtained in national sample surveys sponsored by the office of the Registrar-General and the Indian Statistical Institute. Morocco is planning a survey of internal migratory movements. Bolivia mentions a sample survey of population, agriculture and housing carried out in the whole country in 1963, as the principal source of up-to-date information on these matters pending the execution of a new census.

237. Several Governments comment appreciatively on the utility of technical assistance in the collection and evaluation of demographic statistics. Panama refers particularly to the need for assistance in the improvement of vital statistics registration procedures. In this context, the report of Ghana points to problems involved in intermittent external assistance:

One important thing which is worth emphasizing is that in order to derive maximum benefit from the various forms of external assistance there should be qualified local personnel to take over from the technical experts when they leave. This is related to the problem of training of local experts. It is desirable that more provisions for fellowships are made available to local personnel to enable them to acquire the necessary skills, so that they can cope with projects on their own and take over efficiently from where the technical experts leave off. This will ensure that the work of the experts is not to be lost to the country on their departure.

238. Jordan mentions that external financial and technical help was obtained in carrying out the housing survey of 1953 and the population census taken in 1961.

A United Nations expert had the major responsibility for the census operations.

239. The collection of suitable statistics is, of course, only a first step toward an understanding of the interaction of population trends and economic and social development, and of the problems arising out of this interaction. Adequate understanding of these matters requires an on-going programme of analytical research based on such statistics. The majority of the responses received from Governments contain rather little if any information on such research activities. Some of the responding Governments, however, lay considerable emphasis on research projects that have been undertaken or carried out and steps which have been taken to organize and promote the development of research in demography and population problems.

240. Czechoslovakia, Japan and Yugoslavia mention that they have special Government-supported institutions for demographic research; Czechoslovakia and Hungary report that technical journals in demography are published with Government support. Jamaica and the Philippines refer to programmes of research in demographic and other social and economic fields carried out in the universities as well as by Government agencies. Sweden refers to demographic research being conducted in statistical and sociological institutes in the universities. India reports as follows on the Government's sponsorship of demographic research and training activities:

In India, population problems began to receive attention in the 1930's. At the advent of the First Five-Year Plan demographic studies were conducted mostly in a localized way by a few scholars and individual experts, interested in the field. Official attention was confined to broad assessment of the dimensions of the problem. A number of important recommendations were made by Bhore Committee in 1946. It is only since the beginning of the First Five-Year Plan in 1951 that the lack of data and trained personnel to study the interrelationship of population factors with social and economic factors was keenly felt in official circles and the need for intensive training and research in demography fully recognized. The first plan emphasized the need for demographic research especially in fields of family planning and manpower research. The subsequent Five-Year Plans have given increasing attention to demographic studies in the various fields of economic and social planning. A major step taken by the Government of India to develop training and research in demography was the establishment of five demographic centres in different parts of India, Demographic Training and Research Centre, Bombay, 1956 and Demographic Research Centres at Calcutta, 1957, Delhi, 1957, Trivandrum, 1958 and Dharwar, 1961 under the general direction of the Demographic Advisory Committee set up in 1959.

In 1962, an Institute of Applied Manpower Research was started in Delhi to conduct research in problems of manpower planning. More recently a Family Planning Communication Action Research Committee has been set up primarily with the object of initiating studies relating to motivations in family planning. Apart from these developments, the Gokhale Institute of Politics and Economics, Poona the All India Institute of Hygiene and Public Health, Calcutta and the Indian Institute of Population Studies, Madras have continued their interest in demographic studies. Another development worth mentioning in this regard is the setting up of the National Council of Population in 1960 to co-ordinate work in the fields of popula-

tion, vital and health statistics, and to advise on demographic studies that could be undertaken from time to time.

241. Australia's response, largely concerned with immigration problems, mentions that a wide range of inquiries into economic and social consequences of immigration is conducted by the Government. Canada cites analytical studies of the interrelationships of economic, social and demographic indicators in the report and special studies of the Royal Commission on Canada's Economic Prospects and the report of the Canadian Senate's Special Committee on Manpower and Employment.

242. The responses from some of the developing countries express dissatisfaction with the extent of research on population questions carried out up to this time and speak of the lack of trained personnel and lack of a satisfactory institutional basis for such research. Jordan reports that no analytical studies of the country's demography have been undertaken. Panama states that "analytical studies have been few so far, largely owing to the lack of trained personnel", however, a systematic plan has been drawn up for a series of analytical studies on the results of the 1960 census. The Moroccan response also outlines a series of research reports on fundamental aspects of the demography of Morocco, to be carried out on the basis of the 1960 census results. The Chilean Government is sponsoring a programme of research on demographic and other factors in the development of human resources of the country, as a basis for planning the use of these resources. An outline of this programme was submitted as a part of the Chilean response to the Inquiry. The Government of the Republic of Korea feels an urgent need for demographic studies as an aid to policy-making and planning. Though the Korean response lists several demographic research reports that have recently been completed and some other studies now under way, the resources for such work are considered insufficient and it is noted that non-Governmental institutions that could undertake research in this field do not yet exist in Korea.

243. Although demographic research, especially in the universities, has been done on a relatively extensive scale in some of the more developed countries, the Governments of some such countries feel that it has been insufficiently emphasized. Finland's response states,

Demographic research is done by the National Planning Office, which employs one demographer, as well as by the private Population Research Institute, which receives a yearly subsidy from the state. These institutions maintain a close collaboration in making population projections, studying the migratory movements, etc. Some research in this field is also done by university institutions.

Unfortunately, the relation between economic growth and population changes has only seldom been studied in connexion with demographic and economic research in Finland. Another shortcoming is the lack of university teaching in the field of demography.

244. The United States Government notes major gaps in knowledge of the interactions of economic and

demographic factors in that country and a need for further research on these questions:

The economic demographic interactions discussed here have an undeniable relevance to a proper understanding of national social and economic evolution. Yet there is a regrettable lack of apt quantitative measures of interactions of this kind, compelling resort to *ad hoc* measures whose suitability for the task may be debatable. Consequently, some important questions cannot now be answered. While it can be said with assurance, for example, that the United States has had a most impressive long-term record of economic growth, it is far from clear that either a faster or slower rate of population growth than has actually occurred would have altered this record, and, if so, in what directions and to what extent. In view of the importance of these interactions to this and future generations, further research and discussion are essential as guides to appropriate policy.

245. Examples of the results of extensive demographic data collection and research in the Federal Republic of Germany are furnished in more than 50 publications annexed to the Government's response to the Inquiry. Among these are official reports of Government agencies and unofficial scientific and technical publications dealing with many aspects of the trends of population growth, structure, and distribution, mortality, fertility, and the interactions of these demographic variables with economic and social variables in Germany. It is not possible in the present report to summarize the varied contents of these publications.

246. Population projections are recognized as an essential tool for policy-making and planning of action programmes in various economic and social fields, as well as a basis for population policy decisions. Some of the responses received, notably those from Bolivia, Cameroon, Colombia, Czechoslovakia, Greece, Iran, Korea, Malaysia, the Philippines, Turkey and Venezuela, include more or less detailed population projections. In New Zealand, the main emphasis in development of demographic information is placed on projections; in addition to projections of the national population and the labour force, regional population projections, and projections of school population and family formation have been undertaken. Liberia finds it difficult to make trustworthy projections in the circumstances existing in that country.

247. Panama and the Philippines mention that aid to development of demographic research in their countries which has been given by training of their nationals at the regional centres for demographic training and research operated under the United Nations technical assistance programmes in Santiago, Chile, and Chembur (Bombay), India.¹² Morocco hopes to benefit from the United Nations regional demographic training centre projects for training Moroccan demographers to take part in the programme of studies of the census results. Jordan states that in undertaking studies of the inter-relationships of demographic, economic and social factors, based on results of the 1961 census, it intends to "draw upon" the resources of the United Nations and

its specialized agencies and to obtain bilateral foreign assistance. Bolivia cites results of studies on various aspects of Bolivian demography carried out at the demographic training and research centre in Santiago.

248. The responses from Czechoslovakia, Ghana, Kuwait, Sweden and Yugoslavia include expressions of appreciation of the value of the demographic work of the United Nations Secretariat and of the research reports, statistical compilations, and methodological publications issued by the United Nations in this field.¹³ Ghana welcomes particularly the work of the United Nations in collecting and disseminating demographic information on a world-wide scale and would appreciate the expansion of this activity so that more information from studies carried out by the United Nations or in member countries would be internationally available. Czechoslovakia wishes that some of the United Nations research reports and technical publications on population questions could be released "in such form as to make them accessible both in content and price to the widest international public". Yugoslavia offers the opinion that the methodological studies carried out by the United Nations would be improved by taking more account of the experience gained in various countries, and then an exhaustive information service on current demographic publications throughout the world would be useful.

249. The United States Government stresses the need for more knowledge of the demographic situation and problems of developing countries and favours a major role for the United Nations in helping to increase such knowledge "both through its own programs of demographic research and analysis and through technical assistance in programs of demographic research and analysis and through technical assistance in programs of research and analysis undertaken by developing countries". In the United States view, the resources hitherto devoted to these activities have been modest and should be expanded in the future. Specifically, it is suggested in the United States response that "the United Nations should be prepared to extend technical assistance to member countries which desire to undertake surveys of the attitudes of their people toward marriage, child-rearing and family size". While supporting expansion of United Nations activities along these lines, the United States Government stands ready to give bilateral assistance in this field to countries which desire it.

VI. Action programmes

250. All Governments have programmes of economic and social action which affect the interactions between population changes and economic development, not only by their direct bearing on the growth of the economy but also indirectly by the consequent influences on population trends. The demographic effects may sometimes be among the considerations of Government policy for actions in the economic and social spheres, and in such

¹² A third regional demographic research and training centre, for North African countries, has also been established under United Nations auspices, in Cairo. See appendix C, page 41.

¹³ The scope and purposes of some of these works are briefly outlined in appendix C.

cases the economic and social actions can be considered in part as measures of population policy. Economic and social action programmes are outlined in varying degrees of detail in the responses of most of the Governments and some of the points mentioned have been summarized in the preceding chapters. As such programmes have been reported in other surveys, the present summary is confined to actions aimed specifically at modifying population trends by influencing either the birth rate or the currents of international or internal migration, as reported in the Governments' responses to the inquiry. Also included are references to stated views of the Governments with regard to the need or advisability of such actions.

A. ACTIONS AIMED AT INFLUENCING THE BIRTH RATE

251. As has been indicated previously, a great number of the responses from Governments of developing countries express concern with the high rate of natural increase and some of them report action programmes aimed at moderating this increase by lowering the birth rate. The most detailed reports on such programmes come from India and the Republic of Korea.

252. India's programme of action for promoting the practice of family planning is summarized as follows:

The First Five-Year Plan stressed that the measures aimed at reducing fertility should form part of the public health programme. In pursuance of this population policy, the programme to moderate fertility was expanded especially in the Second Plan. The major activities in the Second Plan programme were (a) education about family Planning through use of mass media; (b) provision of clinical referral services integrated with health services in urban and rural areas; (c) training of personnel; (d) provision of supplies; and (e) research.

The third Five-Year Plan which began in 1961 stated that the great stress has to be placed on the programme of family planning, and the objective of stabilizing the growth of population over a reasonable period must be at the very centre of planned development. In pursuance of this policy, a plan of Rs.270 million has been made (with programme ceiling of Rs.500 million) for the Third Plan period. The programme has now been extended by greatly strengthening its organizational structure, by emphasizing community-level educational techniques, by liberalizing the flow of contraceptive supplies, by developing statistical indicators of programme impact, by strengthening facilities for training of personnel, and by extending research activities on communications, demographic and reproductive physiology aspects of the programme. A basic organizational structure at the centre and in the States has been set up and over 9,000 centres (including over 7,000 in rural areas) have been established for contraceptive distribution.

Thus the Government of India is firmly committed to a policy of implementing specific programmes to accelerate the acceptance of family planning as a way of life by the people in order to achieve economic strength and social welfare.

253. India also mentions an expected contribution of \$700,000 from the Ford Foundation of New York that is to be utilized in the implementation of the Third Five-Year Plan.

254. The Government of the Republic of Korea in 1961 adopted a policy of promoting the practice of family planning. The programme includes the establish-

ment of a number of family planning centres, hiring of family planning workers, and free distribution of contraceptives. In 1963 there were 366 family planning workers employed in 190 centres, who distributed more than 115,000 free contraceptives. Also 22,000 vasectomies were performed within a period of three months and a programme of education was conducted for 2 1/2 million people in rural areas. The programme is aimed to bring the rate of population growth down from nearly 3 per cent to 2 1/2 per cent per annum by 1966.

255. In Tunisia, a policy of regulation of births is under study and a family planning campaign has been launched. Family planning is considered to be within the sphere of health and education of women and linked with the public health services. Family planning information and assistance are given to women visiting maternal and child health centres, and meanwhile various "birth control" devices are being tested. The popularization of family planning in this country is regarded by the Government as a long-range undertaking.

256. In the Third Plan of Iran, it is stated that: "Thus, for both economic and general welfare consideration, in the next decade or two, family planning should be greatly popularized and it should constitute an important welfare programme in our future plans."

257. In Pakistan's view, "To check a deterioration in the capital-labour ratio, family planning has to be initiated by the Government instead of being left to the forces generated by education and economic development". Increasing importance is thus being given to the family planning programme. The financial allocation in the Third Plan is tentatively fixed at 150 million rupees, compared with an allotment of 30 million in the Second Plan. Steps have also been taken to ensure that the funds will be more efficiently utilized in the Third Plan period.

258. In Turkey, where the practice of family planning has hitherto been prohibited, a proposal is now before the Parliament to make it legal. The five-Year Plan for 1963-67 includes provisions for the instruction of health service personnel in family planning matters, giving of information on these matters to parents upon their request, and distribution of free materials to low-income families. The Government recognizes, however, that it will not be easy to reduce the level of the birth rate appreciably within a short time.

259. As mentioned in chapter III, the National Charter of the United Arab Republic promulgated in 1962 states that family planning is "one way of mitigating the severity of the [population] problem" in that country, though industrialization is also emphasized.

260. In some countries, family planning programmes are being conducted by private organizations with Government support. An example of such a programme is reported by the Republic of China. Family-planning activities in that country are sponsored by a Government-chartered, non-profit organization, the Family Planning Association of China. In addition to family planning activities and education for child spacing, the organization provides child placement and assists couples who want to adopt children.

261. Malaysia mentions the existence of family planning clinics in the country and observes that if the idea of family planning should "catch on", population growth would be slowed considerably, but the Government sees little likelihood at the moment of this occurring.

262. Among the more developed countries where the birth rate is now at a relatively low level, Japan reports on a programme of action aimed at encouraging the use of contraception instead of induced abortion as a means of regulating births. As the practice of illegal induced abortion has become rather prevalent in Japan, the Diet in 1948 established a Eugenic Protection Law whereby inducement of abortions was legalized under prescribed conditions and certain provisions were made for promoting the use of contraception. The reported number of legal abortions increased from 0.5 million in 1950 to 1.2 million in 1955, but since then it has decreased gradually as contraception gained ground; in 1962, the number of legal abortions fell below 1 million. It is the policy of the Government so far as possible to encourage the use of contraception instead of abortion as a means of limiting the size of families. Local public bodies and private organizations are also making efforts to disseminate information on family planning and give proper guidance in this field.

263. Japan has a Population Problems Inquiry Council which advises the Government on population policy questions. This Council has submitted recommendations in the past on quantitative control of population, capacity of the country to support population, etc., and in 1962 it adopted a resolution on "measures for the promotion of human quality".

264. Yugoslavia provides contraceptive services in the framework of national health services, with family welfare as well as health objectives. The Government reports:

In 563 dispensaries and consultation centres for women, there are also consultative services on uses of contraceptive means. However, the number of these consultation centres is too low especially in the districts with high infant mortality and high natality.

265. Sweden's policy is indicated by the following statement:

This change in the population trend (reduction of the rate of natural increase through decline of the birth rate since the late nineteenth century) was brought about by an economic and social evolution, side by side with an ever more common practice of family planning. The birth rate, which in 1860 amounted to 34 per thousand, has declined until in 1960 it was at the level of 13.85 per thousand. The family planning ideas found their way to the people through the popular educational organizations and through the labour movement... Leading personalities in the labour movement, which had its break-through around the turn of the century, vigorously advocated birth control as a means to attain balance between supply and demand for labour. Without such balance — or some degree of it — it would never be possible to get the employers to share their profit; the classless society could only be achieved with an approximate balance between these factors, it was said. As a result this balance was attained gradually.

In the safe conviction... [that children will survive to adulthood] the parents dare to plan a lower number of children also in view

of the future and their own old age. ... The safe and secure background to family planning in Sweden is the excellent health services.

The Swedish Government has on several occasions initiated official studies of population issues: in the 1930's in a parliamentary Population Commission, including experts, and in the 1940's in a commission of a corresponding composition. The intention was then to study whether the low and, on both the two occasions, declining number of children had had any social and economic causes, which reasonably should be noticed by the community and lead to counter-measures. However, the intention has never been that the community should take part in a propaganda or any pressure whatsoever upon the individuals to have more children or — vice versa — to have less children in cases where illness or weakness can be expected in the off-spring. Instead, the positive approach is a system of family support, made up of general child and study allowances, free school meals, free medical care, etc. Together with these social benefits, which are not subject to means tests, there are also some means-tested benefits such as the above-mentioned family rent allowances. This family subsidy is just intended to be an incentive to family formation: it wants to reduce the economic and social difficulties, preventing families from having otherwise welcome children or giving their only child a longed-for brother or sister. The family supporting policy is supplemented with an abortion legislation and with sterilizing regulations which are carefully safeguarded against abuse. In this section of family policy the emphasis is laid on preventive measures.

266. The Swedish response also refers to assistance which Sweden has given to family planning projects in Ceylon and Pakistan. In Sweden's view, the technical assistance given by the United Nations to Member States upon their request might include assistance in developing information and teaching material pertinent to population questions as well as the services of medical experts for teaching family planning methods suitable in various cultural and religious settings.

267. In Czechoslovakia, where the birth rate has fallen very low in recent years, the Government is engaged actively in a policy of encouraging a rise in the birth rate. As already mentioned, the response of Czechoslovakia states: "It is the aim of the Government of the Czechoslovak Socialist Republic to pursue a pro-natality and pro-population policy." As childless families still have a higher standard of living than families with many children can reach, the policy of the Government is to raise the standard for families with numerous children. Czechoslovakia has a State Population Commission composed of experts in demography, medicine, education, economics, and other fields, which arranges for research and makes recommendations to the Government for policy and action.

268. The Government of the Soviet Union states that "there is no propaganda of any kind in the USSR promoting the use of contraceptives" and that "abortions are permitted only to protect the health and life of women".

269. Although the response of the United States makes no mention of any actions taken or contemplated by the Government for the purpose of influencing the trend of the birth rate or the practice of family planning in that country, it is stated that methods of

family limitation "are within the reach of a sizable fraction of the population" in the United States at present. The use of such methods, the Government observes, helps families to satisfy their growing desires "to improve the quality of life and to enhance future opportunities for each child".

270. Views of the United States Government with regard to the issues of population policy facing other Governments and the role of the United Nations and other international organizations in this field are represented by quotations of recent statements of some officials of the Government, included in the response to the Inquiry. These statements indicate that the United States would oppose any "dogmatic prescription of specific population policies for specific societies" and "any effort to dictate to any country the means to be employed in dealing with its population problem". In the United States view, "obstacles should not be placed in the way of other governments which, in the light of their own economic needs and cultural and religious values, seek solutions to their population problems". The United States "can help other countries, upon request, to find potential sources of information and assistance on ways and means of dealing with population problems", and "believes that member countries should be able to obtain from the United Nations and its agencies such assistance as they may need and request in connexion with their efforts to deal with their population problems". The development of "a blueprint for international co-operation" in national programmes in this sphere is advocated, based on the principle of free choice of participating countries. It is recommended that the United Nations and other international agencies should give advice, upon the request of Governments, on problems of communicating family planning information, and assistance in building effective health and social services which could play important roles in family planning work in countries where this is desired. Internationally sponsored research on human reproduction and means of controlling it is also advocated in the United States response. The Government reports that it is providing substantial support for scientific research in this field in the United States at present and expects to increase this support in the future: and the United States Government pledged \$500,000 to the World Health Organization in May 1963 to initiate research on human reproduction.

271. The Federal Republic of Germany states the following views on "family policy":

In a pluralistic social order it is the task of the Government to safeguard and enhance the family which is the smallest and most intimate social community of the members of the society. The basic idea is that everybody may choose the form of life which corresponds to his will and sense of responsibility. The most elementary community relations exist in the family.

Family policy shall guarantee that the tasks can be fulfilled which the family faces. Therefore such measures have to be taken as are likely to compensate the burdens arising in particular in this respect. Such measures are mainly economic measures aiming at an improvement of income, e.g. (a) children's allowance; (b) tax relief for families consisting of

several members; (c) preferential treatment to be given to such families in the field of publicly assisted housing projects; (d) continued wage payment for maternity cases; (e) reduced rates for public institutions; (f) grants and loans.

Besides these social economic tasks non-material assistance should not be underestimated. For instance, the creation of an atmosphere in which more respect is paid to the family-minded will have the effect that material burdens lose weight, psychologically speaking, and self-responsibility will be strengthened.

272. Greece states the following opinion on the question of population policy:

Any conscious effort on the part of the authorities concerned with economic policy tending towards raising the per capita income, should be followed by a suitable demographic policy, in order to achieve the objectives set up.

Increasing the per capita income involves the joint action of two different movements, namely, an increase and a delay. The increase refers to the actual national income of the country and the delay to the net annual increase of its population. A simultaneous control over the movements of both these aggregates should be the main target of any effort to raise the living standard of the people in any country. Taking into consideration that the characteristic feature of under-developed countries nowadays, is the high rate of their annual net population increase and the existence therefore of powerful demographic pressures, preventing such countries from overcoming economic stagnation, the taking of necessary measures by them for harnessing their level of yearly birth rate is an imperative duty, which should precede any other activity for speeding up economic progress.

273. The Governments of Italy and the Netherlands state that they take no action for the purpose of influencing the birth rate and the Government of Austria goes further, saying that there is no justification for the State to attempt to influence the choices of parents with regard to the number of their children by propagating certain trends or postulates. Although Italy's report takes note of a widespread practice of family planning in the North of the country and expresses apprehension that a labour shortage in the future may result from the spread of family planning in the South, the Government feels that the problem is too complex for any attempt to be made to interfere with the trend. Italy states:

Democratic governments can do little to prevent the spread of birth-control practices in the economically developed countries, because there the financial and psychological cost of bringing up children is so high as to constitute the most effective obstacle to procreation.

274. Italy also offers an opinion on the basis for population policy decisions in other countries:

Despite its reservations — based on the present state of knowledge about the relationship between population growth and economic development — regarding the suitability of such a means of contributing towards the process of economic development, and despite its dislike of anything which tends to influence the will of the people in matters affecting the most intimate human rights and to force them to agree to experiments which might cause irreparable damage to their present or future health, this Government considers that each country's population policy is a strictly internal matter which should be settled by that

country alone in accordance with its collective individual and moral principles.

275. Ireland offers a somewhat different opinion on this score. While sympathetically aware of difficulties of many countries arising from the reciprocal action of economic development and population changes, the Irish Government is opposed to artificial methods of population control. The Government feels that solution to these difficulties can be found in the fuller development of the human and economic resources and research into and dissemination of information on non-artificial methods of family planning.

276. The Holy See is of the opinion that moral and spiritual judgements must not be ignored in any measures taken in regard to the population problem and that the "decisive part to be played by the conscience of spouses in the ultimate decisions in this connexion" cannot be underestimated.

B. PROGRAMMES AIMED AT INFLUENCING INTERNAL MIGRATION AND POPULATION DISTRIBUTION

277. As already mentioned, several Governments, both of developed and developing countries, report actions taken for the purpose of influencing internal migratory movements, particularly from rural to urban areas, and to achieve a better distribution of population within the country. Czechoslovakia, the Federal Republic of Germany, India, Jamaica, Japan, Liberia, the Netherlands, Norway, Tunisia, Venezuela and Yugoslavia report specific actions being taken or planned with this aim, though such actions are not always described in much detail in their responses.

278. The United States Government states that it has generally refrained from formulating national policies relating to the distribution of population and taking measures aimed at slowing down population growth in already congested areas or stimulating growth in less populous areas. In particular, it is the policy of the Government to leave decisions as to the location of industrial establishments to their private managements.

279. The Federal Republic of Germany has a different policy, aimed at achieving "a sounder distribution of the population over the entire territory of the Federal Republic of Germany by applying a judicious combination of various measures". The principal measures are aids to housing construction and to the creation of industries in regions in need of development, and particularly in the villages, so as to bring about a balance in standards of living and check migration to the overcrowded areas of the country. Some of the principles that have been adopted for the execution of this policy are indicated by the following excerpts from the Government's response:

For this purpose special consideration will be given to those areas of the Federal territory which for decades have been emigration areas. Special attention will be paid to the fact that the construction of housing units is linked with the creation of new jobs. Increased promotion of the construction of family houses with priority in these areas will render a decisive contribution to make people settle down, which is the desired aim.

Besides giving priority to the promotion of the so-called distressed areas it is the intention to create new communities also in the surroundings of the congested areas and to promote especially the development of suitable small and medium-size towns important as community centres.

The most important aims of town and village replanning are: re-arrangement of and routing traffic through the big cities; creation of town units on a humanly conceivable scale; Reduction of density of buildings in the town centres; effective solution of problems of moving and stationary traffic; restoration of harmony between built-up areas and open landscape; proper division of municipal area into areas for housing, work and recreation.

The prerequisite and the basis of the future development of communities is an effective country planning. Without consideration being given to the aims of country planning, reasonable town construction planning, including the rebuilding of towns and villages, is inconceivable.

280. The Government of the Netherlands had adopted a policy of decentralization of industry as a means of effecting a more equal distribution of population within the country. The Government states:

To counteract the growing congestion in the western regions of the country, the Government has been fostering an even geographical spread of manufacturing industry by paying grants to enterprises which build a new plant in one of the regions stipulated by the Government where local employment opportunities used to be poor; smaller grants are paid to enterprises extending their plants in those areas. This policy has induced many enterprises to move from the west to one of those regions or to build a new plant there instead of extending their old one in the west. Moreover, the policy has reduced the urge among workers in other regions to move to the west where employment opportunities used to be better. Contrary to policies in the United Kingdom and France, the Government places no obstacles in the way of enterprises which prefer to settle or expand in the congested region.

281. In Norway, diversified economic development in certain rural areas is promoted for the purpose of stemming the outflow of population from such areas. The Norwegian Government comments:

A richer milieu and a wider field and variation in industry in districts which otherwise are dominated by agriculture, forestry and fishing, are a necessary provision for continued settlement in such districts and thereby production in the primary industries. To reach this goal an attempt is being made to lead a greater part of new industrial investments to suitable chosen central places in these districts, places situated in a manner that also as many as possible of the primary industry population can have contact with this town-like milieu. It is also calculated that such a milieu can be created by investments in the tourist industry which will have rich possibilities for development in Norway.

282. India has taken as one of the main objectives of her economic and population policies to moderate the flow of migration into a few very large metropolitan conglomerations. The means adopted for this purpose include rural development programmes aimed at improving amenities such as electricity, water supply, roads, educational and health facilities in the villages and thus reducing the rural-urban disparity in conditions of life. It is recognized that such measures alone will not be enough to stem the tide of migration to the cities unless rural employment opportunities are also

expanded. Accordingly, it is the policy to promote growth of small-scale industries in small towns and villages, to encourage the development of cottage industries, and to provide additional employment for surplus labour in rural areas through land reclamation, soil conservation, afforestation, irrigation works, road construction, and other such programmes. Moreover, the Government reports:

Deliberate attempt is made in the planning of large-scale industries to locate them away from already congested areas, wherever the nature of the industry is such as to give a choice in the matter of its location No. ... Finally, in community development projects or other special development areas, the planning of activities is such as to strengthen the economic interdependence between towns and the surrounding rural areas.

283. In Tunisia, while it is recognized that the attractions of cities will continue, an effort is made to channel migration toward developing urban areas and to minimize its volume so as to diminish the pressure of growing population in the urban sector. Jamaica states, "One important task is that of locating industries in other parts of the island in order to spread the benefits of industrialization and to reduce the flow of job-seekers to the Kingston area." Venezuela's National Plan provides for substantial investments in the development of satellite cities as a means of relieving the pressure of population in the principal metropolitan areas, and especially in the region of Caracas.

284. In Liberia, an effort is made to divert migration from the capital city by creating new urban settlements. Panama's Economic and Social Development Programme includes provisions for reform and development of the country's metropolitan region, designed in part to solve the problems resulting from unregulated movement of migrants into the towns; land reform is also regarded as a means of slowing down this migration. In Czechoslovakia, Japan and Yugoslavia, centrally planned policies of economic development in different areas have as one of their aims to achieve a rationally balanced distribution of population between the urban and rural sectors and among regions of the country.

285. The Government of the USSR offers the following opinion with regard to the most effective policy for dealing with some of the problems attendant upon rapid urbanization in the developing countries:

... the best way of dealing with the accumulation in the towns of vast numbers of unemployed or semi-employed persons having difficulty in acquiring urban trades or professions would be to accelerate industrialization and general and vocational training; at the same time, measures should be rapidly introduced in the rural areas to halt the exodus to the towns. It would be most useful if, at both poles of this migratory current, which is still very strong, the developing countries could count on the aid of the developed countries in the form of the construction of industrial enterprises, the creation of scholastic, medical and cultural institutions, the supply of technical equipment, the dispatch of the necessary specialized instructors, etc.

C. IMMIGRATION AND EMIGRATION PROGRAMMES

286. Among the Governments of developing countries which express concern over the economic difficul-

ties arising from growth of the population, Jamaica stresses the efforts being made to reduce these difficulties by promoting emigration, though the results of the Government's recent efforts in this direction appear to have been disappointing.

287. The Government of Turkey has also adopted the policy of encouraging emigration to Western countries, in addition to family planning, as a means of moderating the rate of population growth and relieving unemployment and under-employment. It is emphasized that only unskilled labour is to be exported, as there is a shortage of skilled workers in Turkey.

288. With these exceptions, it appears to be the Governments of more developed countries that report actions designed to influence international migration as measures of population policy.

289. Ireland's policy is to check emigration and simultaneously to reduce the labour surpluses and under-employment on the smaller farms by a land settlement programme aimed at securing "the establishment on the land available of the maximum number of families in economic security". Both creation of new holdings and enlargement of existing small farms are promoted with this aim in view. New legislative proposals envisage the following measures for implementing this policy:

(a) An extension of the Land Commission's powers of acquisition in relation to lands which have been let and not properly worked or left vacant;

(b) Inducements for elderly or incapacitated landowners to sell their lands to the Land Commission on a cash or life annuity basis, on the understanding that they would be left in rent-free occupation of their dwelling-houses for their lifetime; and

(c) The provision of loans, in suitable cases, to enable farmers who are willing to sell their small holdings to the Land Commission to purchase economic holdings in another district.

290. It is also the policy of Greece to foster creation of "necessary conditions for checking the flow of emigration and ensuring repatriation of the Greek workers from abroad". This is expected to be accomplished by "a many-sided economic development of the country... resulting in the supply of increased employment opportunities mainly in the industrial sector".

291. The Netherlands simultaneously takes action for encouraging immigration as a means of relieving present shortages of labour in various industries, and aiding emigration in view of the possibility that labour surpluses, which have occurred in the past, may recur in the future.

292. Australia and New Zealand give some information in their responses about their policies of promoting immigration on a selective basis as an aid to economic growth. Australia, which at the end of World War II considered itself under-populated, has obtained 43 per cent of its increases since that time by immigration. A directed policy of recruiting skilled workers and technicians has been followed with the aim of ensuring that immigrants will be quickly integrated into the social and economic life of the country and make positive contributions to industrial and economic develop-

ment. Even some of the problems created by the large influx of migrants, such as shortage of housing, could be met with the manpower and skills which the immigrants brought.

293. The emigration policy of the United Kingdom is stated as follows in the Governments response:

The United Kingdom Government's policy on emigration is based on the fact that it recognizes the value to the Commonwealth connexion of a steady flow of emigrants to other Commonwealth countries. It continues to be Government policy to encourage migration from this country to other parts of the Commonwealth. However, the level of migration from the United Kingdom to other Commonwealth countries is in the last resort dependent on the voluntary decisions of individuals. These are influenced in large measure by economic circumstances and by arrangements made by the Governments of receiving countries to attract migrants. The formulation of plans for maintaining the flow of migrants from the United Kingdom is thus primarily a matter for those Governments, but the United Kingdom Government are very glad to collaborate with those Governments to this end, with some reservations in the case of certain types of skilled and professional manpower of which there are acute shortages in this country.

294. The response of the United Kingdom also contains some more general remarks about demographic considerations in national policies with regard to immigration and emigration:

An increase in population because of immigration will usually increase the proportion of young and active workers, who in general contribute more to national product than they consume. Immigrants are usually relatively mobile workers. The history of immigration shows wide variations in the skills of immigrants and skilled immigrants will make a bigger contribution to national product than unskilled ones. Even over-populated, under-developed countries which would lose rather than gain from unskilled immigration may gain from skilled immigration. Most countries will lose by emigration as it is usually the young and active who leave. Even an over-populated country cannot expect to gain very much from emigration, although the example of Ireland in the 19th century should warn us against hasty generalizations.

It is not desirable to consider immigration and emigration solely from the viewpoint of individual countries. The economic welfare of the world may be improved by some redistribution of workers even though individual countries may lose. Also individuals may gain by emigrating and it would be wrong to look only at the total economic situation of the losing country. Finally, social and political factors must of course be taken into account as well as economic ones. Immigration can, for example, play a part in maintaining traditional links between the exporting and importing countries.

APPENDICES

Appendix A

SECRETARY-GENERAL'S NOTE OF 28 JUNE 1963 TO STATES MEMBERS OF THE UNITED NATIONS AND MEMBERS OF THE SPECIALIZED AGENCIES

The Secretary-General of the United Nations presents his compliments to and has the honour to refer to resolution 1388 (XVII) of the General Assembly, in which, among other things, the Secretary-General

was requested "to conduct an inquiry among the Governments of States Members of the United Nations and members of the specialized agencies concerning the particular problems confronting them as a result of the reciprocal action of economic development and population changes".

The General Assembly recommended, in the same resolution, that the results of this inquiry be taken into account by the Economic and Social Council in intensifying its "studies and research on the interrelationship of population growth and economic and social development, with particular reference to the needs of the developing countries for investment in health and educational facilities within the framework of their general development programmes" and that "the Economic and Social Council should report on its findings to the General Assembly not later than at its nineteenth session". A copy of the resolution is transmitted herewith; the records of the pertinent debates in the General Assembly and the Second Committee are published in documents A/C.2/SR.866 to 869, 874-5, 878 and A/PV.1197.

The Secretary-General recognizes his obligation to formulate this inquiry objectively, so as to obtain meaningful information on the questions of interest to the General Assembly and to permit comparative analysis of the Governments' responses. With these considerations in view, the Secretary-General has prepared an outline of the inquiry, of which three copies are transmitted herewith. The items in this outline are presented as examples of aspects of the problems covered by the General Assembly's resolution which may be important in various countries. Each Government is invited to submit a statement covering those points in the outline which the Government considers pertinent and appropriate in the circumstances of its country. Each Government is invited also to give information on any additional points which, in the view of the Government, should be taken into account in a comprehensive statement on the problems to which the resolution of the General Assembly refers.

As the above-mentioned resolution calls for a report by the Economic and Social Council to be submitted to the General Assembly at its nineteenth session, the Secretary-General intends to prepare a report on the results of this inquiry for consideration by the Economic and Social Council at its thirty-eighth session. In order to allow sufficient time for the analysis of responses and preparation of the report, it is requested that the statement of His Excellency's Government be transmitted to the Secretariat by 30 November 1963 at the latest.

Appendix B

OUTLINE OF INQUIRY ON PROBLEMS RESULTING FROM RECIPROCAL ACTION OF ECONOMIC DEVELOPMENT AND POPULATION CHANGES (Pursuant to resolution 1838 (XVII) of the General Assembly)

I. General view

A brief statement of salient facts and views of the Government with regard to the reciprocal action of economic development and population changes may be presented. This may be supported by a brief analytical summary of recent levels and trends of the basic demographic indicators on the one hand and economic and social indicators on the other, and may include the Government's views on the importance of their interrelations for economic and social development of the country.

II. Definition of problems

Any problems resulting from the reciprocal action of economic development and population changes, which the Government considers important and relevant, may be stated with reference,

inter alia, to the following aspects, so far as they are considered to be pertinent and appropriate in the circumstances:^a

1. *Fields of development to which such problems relate*

Some illustrative examples are: agricultural development and food supply; industrial development; development of transportation and communication facilities; manpower, employment, unemployment, and under-employment; distribution of manpower among sectors of the economy; training; literacy and education; housing; urban development; social welfare; health.

2. *Scope of the problems*

For example, they may be: of national scope limited to certain regions of the country; limited to certain types of communities (e.g., urban or rural communities); limited to certain groups of the population (e.g., social, cultural and ethnic groups).

3. *Time reference of the problems*

They may be: existing at the present time; foreseen in the future (with time period specified).

4. *Main demographic factors involved and areas and directions of their impact*

For example, one or more of the following factors may be pertinent: size, density and geographical distribution of population; rate of population growth; age structure and other aspects of population composition; fertility; mortality and morbidity; international migration; internal migration and urbanization.

5. *Major economic and other factors involved*

Such factors may include, for example: Capital requirements, sources of capital, and investment patterns; natural resources and factors affecting their development; technology and factors affecting its development; availability of personnel with special training and skills; factors affecting productivity of labour; conditions of international trade and balance of payments; social, institutional and cultural factors; external assistance.

III. *Availability of information*

Main types of information available to the Government on the reciprocal action of economic development and demographic factors and on any resulting problems mentioned in Section II may be outlined, so far as they are considered pertinent, with reference to statistical information and analytical studies.

A. *Statistics:*

1. Types of pertinent statistical data available (other than basic statistical series reported routinely to the Statistical Office of the United Nations and specialized agencies) may be specified.
2. Any major gaps and deficiencies observed in these statistics may be mentioned.
3. Degree of reliability of the statistics may be indicated.

B. *Analytical studies:*

1. References may be given to reports of principal relevant studies.
2. Topics and scope of major projects of relevant research under way or being planned may be stated.

^a It is not intended that responses under this heading of the outline should necessarily follow this order of listing of the points. The Government is invited to present a statement in the form found most convenient and effective for defining the problems, if any.

3. Organizational arrangements for such research may be outlined with reference to the Government agencies having responsibilities for such research, if any; non-Governmental institutions engaged in such research; and arrangements for the use of findings of such research by policy-making, planning, and action bodies.

4. Any major present gaps in pertinent information derived from such research may be noted, and difficulties in overcoming such deficiencies may be indicated.

C. *Steps, if any, being planned or contemplated for obtaining information now lacking, pertinent to problems of the types outlined in section II, through development of statistics and analytical studies.*

IV. *Problems of action*

Information may be given on any types of action which the Government may have sponsored or supported, or action contemplated or planned, relevant to any problems mentioned under Section II, so far as such information is considered appropriate and pertinent to this inquiry.

A. *Types of action:* 1. Objectives of such action. 2. Whether aimed directly to influence demographic factors, non-demographic factors, or their interrelations. 3. Specific forms and organization of action. 4. Whether of national, regional, or local scope. 5. Whether of long-term or short-term design. 6. Whether incorporated in broad economic and social development programmes and plans or devised specifically to deal with particular problems. 7. Budgetary provisions for such action.

B. *Assessment of the effectiveness of action taken up to the present time.*

V. *External assistance*

The response may include any comment which the Government may wish to make on the utility of demographic and other activities of the United Nations, as well as other external assistance, relevant to problems such as those outlined under sections II, III, and IV.

A. *United Nations activities:*

The annex outlines the present demographic activities of the United Nations (other than statistical activities). Comments may be made, if the Government wishes, on the utility of these activities and suggestions for their development or modification to enhance their effectiveness.

B. *Other external assistance or co-operation.*

VI. *Other remarks and suggestions (if any) considered by the Government to be pertinent to the subject of the inquiry*

Appendix C

OUTLINE OF PRESENT DEMOGRAPHIC ACTIVITIES OF THE UNITED NATIONS

(Not including statistical activities)

A. *Studies aimed at improving information on the trends of population, their interrelations with economic and social factors, and resulting problems. Among the topics of such studies carried out by the Secretariat at Headquarters, secretaries of the regional economic commissions, and the staff of regional demographic research and training centres provided under the Technical Assistance programmes, are:*

1. Population estimates and projections. Projections for the world, regions, and countries of total population, sex and age

groups, economically active population, urban rural and population, school population, households, etc.;

2. World and regional surveys of major aspects of the demographic situation, such as growth and distribution of population, conditions and trends of fertility, mortality, international and internal migration, urbanization, population structure, demographic aspects of manpower and dependency, etc.;

3. Studies of interrelations of population trends with factors of economic and social development, such as:

(a) Survey of existing knowledge of determining factors and economic and social consequences of population trends as shown by findings of existing studies in various parts of the world;

(b) Studies of relationships of population growth and structure to manpower supplies;

(c) Studies of implications of population trends for needs for investments in educational and health facilities and other aspects of economic and social development;

(d) Studies of factors affecting fertility in various cultural and economic settings, in co-operation with national or local agencies and institutions;

(e) Studies of demographic aspects of rural-urban migration and urbanization in various areas, in co-operation with national or local agencies and institutions.

B. *Technical publications on methods of demographic analysis and projections, aimed at assisting Government agencies and non-governmental research institutions in carrying out national and local demographic studies pertinent to problems of developmental planning and policy-making, such as:*

1. Manuals on methods of projecting population by sex and age groups, urban and rural population, school population, economically active population, households, etc.;

2. Manuals on methods of analysing and evaluating results of population censuses as aids to development planning and policy-making;

3. Statements of general principles and guidelines for national programmes of population projections and analyses of population census results.

C. *Technical assistance, upon the request of Governments of developing countries, for national and local studies of population trends, their interrelations with economic and social factors, and resulting problems of developmental planning and policy-making, through:*

1. Services of regional demographic advisers available upon request to Governments of countries in Asia and the Far East and similar services planned to be provided in the future in other regions;

2. Services of demographic experts provided upon the request of Governments under country programmes of technical assistance.

D. *Training in methods of demographic research for personnel from developing countries, through:*

1. Regional demographic training and research centres established in Asia and the Far East, Latin America, and North Africa, and similar centres being planned for Tropical Africa and Central America;

2. Fellowships for advanced training in demography at institutions in other regions of the world.

E. *Scientific and technical conferences and seminars on problems of population and related questions of research, such as:*

1. World Population Conference to be held in 1965;

2. Asian Population Conference to be held in India in December 1963;

3. Seminar on Population Problems in Africa held in Cairo in 1962, and similar regional seminars held previously in Asia and the Far East, Latin America, and Southern Europe.

DOCUMENT E/3986

Report of the Economic Committee

[Original text: English]
[13 August 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President of the Council, Mr. Akira Matsui (Japan), considered at its 355th through its 358th meetings on 11, 12 and 13 August 1964 (E/AC.6/SR.335, 356, 357 and 358) item 21 of the Council's agenda which had been referred to it by the Council at its 1314th plenary meeting on 13 July 1964 (E/SR.1314).

2. The Committee had before it the following documents: E/3895 and Add.1.

3. The Committee also received a draft resolution submitted by the delegations of India, Iran, Japan, Mexico and Yugoslavia (E/AC.6/L.309 and L.309/Rev.1).

4. During the discussion of the draft resolution (E/AC.6/L.309/Rev.1), the sponsors accepted the following changes in the text:

(i) the word "Endorses" at the beginning of operative paragraph 4 was replaced by the words "Draws the attention of the General Assembly to";

(ii) the words "as well as the economic trends connected with them" were inserted in operative paragraph 5 after the words "to study the population trends";

(iii) operative paragraph 7 was deleted.

5. The Committee thereupon approved the revised draft resolution (E/AC.6/L.309/Rev.1), with the foregoing changes, by a vote of 24 to none, with no abstentions, and therefore recommends to the Council the adoption of the following draft resolution:

[Text adopted by the Council without change. See "Resolution adopted by the Economic and Social Council" below.]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1048 (XXXVII). Population growth and economic and social development

The Economic and Social Council,

Recalling General Assembly resolution 1838 (XVII) of 18 December 1962 on population growth and economic development and Council resolutions 933 B (XXXV) of 5 April 1963 on the World Population Conference to be held in Belgrade, Yugoslavia, in 1965 and 933 C (XXXV) of 5 April 1963 concerning the intensification of demographic studies, research and training.

Having considered with appreciation the inquiry conducted by the Secretary-General as requested by the General Assembly among Governments of States Members of the United Nations or members of the specialized agencies concerning the particular problems confronting them as a result of the reciprocal action of economic development and population changes (E/3895 and Add.1),

Having noted in particular the serious concern expressed in reply to the inquiry by many Governments of developing countries about the slow rate of economic growth of their countries in relation to the high rate of their population growth,

Having further noted the high priority given by the Advisory Committee on the Application of Science and Technology, *inter alia*, to "the objective of a more complete understanding of population problems" (E/3866, para. 77),

Commending the Economic Commission for Asia and the Far East for organizing the Asian Population Conference held in 1963,

1. *Invites* the General Assembly, the regional economic commissions and the Population Commission to examine the replies of the Governments to the inquiry and to make recommendations with a view to intensifying the work of the United Nations in assisting the Governments of the interested developing countries to deal with the population problems confronting them;

2. *Requests* the Secretary-General to circulate the findings of the inquiry to the World Population Conference and to the specialized agencies concerned, in particular the International Labour Organisation, the Food and Agricultural Organization, the United Nations Educational, Scientific and Cultural Organization and the World Health Organization, with the suggestion that they take the findings into account, as appropriate, in formulating their programmes;

3. *Requests* the Secretary-General to undertake in the future, at appropriate intervals, similar inquiries on problems resulting from the relationship between economic development and population changes;

4. *Draws the attention* of the General Assembly to resolution 54 (XX) unanimously adopted by the Economic Commission for Asia and the Far East on 17 March 1964 which invites "the United Nations and the specialized agencies to expand the scope of the technical assistance they are prepared to give, upon the request of Governments, in the development of statistics, research experimentation and action programmes related to population" (E/3876/Rev.1);

5. *Recommends* that the Economic Commission for Latin America and the Economic Commission for Africa organize regional conferences, study the population trends as well as the economic trends connected with them and their implications for economic and social development in the regions concerned, and to communicate their findings to the Council and to the Population Commission for appropriate action;

6. *Urges* the Secretary-General and the specialized agencies concerned to explore ways and means of strengthening and expanding their work in the field of population, including the possibilities of obtaining voluntary contributions.

*1351st plenary meeting,
15 August 1964.*

CHECK LIST OF DOCUMENTS

NOTE. — This check list includes the documents pertaining to agenda item 21 which are not reproduced in the present fascicle.

<i>Document No.</i>	<i>Title</i>	<i>Observations and references</i>

* For the discussion of this item, see *Official Records of the Economic and Social Council, Thirty-seventh Session, 1345th meeting*; see also the records of the 503rd and 504th meetings of the Social Committee (E/AC.7/SR.503 and 504) and the record of the 202nd meeting of the Council Committee on Non-governmental Organizations (E/C.2/SR.202).

DOCUMENT E/3915
Note by the Secretary-General

[Original text: English]
[12 June 1964]

1. General Assembly resolution 1916 (XVIII) of 5 December 1963 on the world social situation, *inter alia*, requests the Economic and Social Council to review its resolution 496 (XVI) of 31 July 1953 on concerted practical action in the social field of the United Nations and the specialized agencies; invites the Council to consider effective means of translating the social objectives of the United Nations Development Decade into concrete realities; requests the Secretary-General to prepare in so far as feasible, for submission to the Council in 1965, a draft programme of social development for the second half of the Decade; and also requests the Economic and Social Council and the Secretary-General to report to the General Assembly at its nineteenth session on steps taken to implement the present resolution.

2. In consultation with the specialized agencies concerned and other interested bodies, the Secretary-General is circulating a questionnaire to Governments of developing countries calling their attention to resolution 1916 (XVIII) and asking for information on their social objectives and social targets during the second half of the Development Decade, and also for

their views on international priorities in the social field in this connexion.

3. The plan of work of the report called for in paragraph 5 of resolution 1916 (XVIII) has been briefly considered by the Preparatory Committee of the Administrative Committee on Co-ordination (ACC) and, together with the questionnaire, will be finalized during July in inter-agency meetings and inter-Secretariat consultations. Efforts to advance the preparation of this report have been impeded to date by a shortage of qualified staff.

4. The Secretary-General will inform the Council orally of developments resulting from current and forthcoming consultations.

5. The Secretary-General would propose that the Council schedule its review of resolution 496 (XVI) at its thirty-ninth session, and take account, *inter alia*, of the views put forward by the Social Commission and the contents of the above-mentioned report, including that part of the report containing Government views on priorities in the social field (as revealed in responses to the Secretary-General's questionnaire).

DOCUMENT E/3945

Assessment of arrangements for carrying out United Nations responsibilities in the field of prevention of crime and the treatment of offenders

Note by the Secretary-General

[Original text: English]
[17 July 1964]

1. At its thirty-sixth session, the Economic and Social Council authorized the Secretary-General to send the report on the assessment of arrangements for carrying out United Nations responsibilities in the field of prevention of crime and the treatment of offenders, together with proposals for the reorganization of the social defence programmes to the members of the Social Commission and to present a report direct to the Council in 1964, with the written comments of the members of the Commission.¹

2. Accordingly, on 28 April 1964, the Secretary-General transmitted to the members of the Social Commission the report² prepared by Mr. Torsten Eriksson, the consultant whom he had appointed for this purpose, in accordance with work programme project 39.1 of the Social Commission, adopted at its fifteenth session.³

3. In transmitting the consultant's report, the Secretary-General endorsed Mr. Eriksson's findings that the organizational arrangements brought into being in September 1960 had not been wholly satisfactory and found considerable merit in the solution proposed by the consultant, since it would make possible the development of a programme of the scope and intensity required for the United Nations to exercise its role of leadership in the field of the prevention of crime and the treatment of offenders. At that time, the Secretary-General also stated that he hoped to be in a position to give the Economic and Social Council, when it took up this item at the thirty-seventh session, some preliminary indication of the availability of the supplementary funds envisaged.

4. As of 7 July 1964 the Secretary-General has received the comments of the Social Commission members from Argentina, Canada, Denmark, Iraq, the Union of Soviet Socialist Republics and the United States of America.

5. The comments received from these six members of the Social Commission reflect a large measure of agreement on the importance of the work of the United

Nations in the field of the prevention of crime and the treatment of offenders and the advisability of strengthening the capacity for carrying this work forward. In this connexion, Commission members pointed out the urgency of developing effective measures to counteract delinquency associated with social change, particularly in newly emerging countries. Most of the members indicated the awareness of their government of the need for intensifying the United Nations activities in the field of prevention of crime and treatment of offenders, including especially increased technical assistance to developing countries.

6. A consensus, however, was not reached on the method by which the United Nations might best advance its work in this field. Some members indicated that further study of Mr. Eriksson's proposals was desirable and that, in this connexion, some elaboration of certain aspects of his proposal would be useful. Other members conveyed general support of the consultant's proposal. Still others, while seeking suitable means of strengthening United Nations work in this field, expressed misgivings about the creation of the special advisory and budgetary machinery envisaged by the consultant. While some members foresaw the feasibility of a system of extra-budgetary financing, to be administered by the Secretary-General and designed to provide the means for expanding activities in this field, one member expressed disapproval of such an arrangement.

7. Therefore, in view of several factors including the limited number of comments received from Social Commission members, the absence of a consensus concerning the machinery needed, and the absence, at this date, of an adequate indication of the level of supplementary funds which might be made available for the purposes described in the consultant's report, the Council may prefer, at this stage, to limit its action to affirming the importance of strengthening the capacity of the United Nations to carry forward its role of leadership in the field of the prevention of crime and the treatment of offenders. Should the Council so wish, the Secretary-General would be glad to explore further the possible avenues for achieving the goal of strengthening this work, including the availability of supplementary funds for this purpose, and to submit a report to the Social Commission at its sixteenth session in the spring of 1965.

DOCUMENT E/3964

Report of the Social Committee

[Original text: English]
[7 August 1964]

1. The Social Committee, under the chairmanship of Mr. Abdelkader Chanderli (Algeria), second Vice-President of the Council, at its 503rd and 504th meetings held on 3 and 4 August 1964, considered item 22 of the Council's agenda (Social development) which had been referred to the Committee by the Council at its 1314th meeting held on 13 July 1964.

2. The Committee had before it the following documents: note by the Secretary-General on General Assembly resolution 1916 (XVIII) on the world social situation (E/3915); note by the Secretary-General on the report on methods of determining social allocations (E/3920); note by the Secretary-General transmitting the consultant's report on the assessment of arrangements for carrying out United Nations responsibilities in the field of the prevention of crime and the treatment of offenders (E/CN.5/383); note by the Secretary-General on the same subject (E/3945) transmitting the comments of the members of the Social Commission on the consultant's report.

3. The Committee held two separate discussions on this item. During the first, held at the 503rd and 504th meetings, the Committee examined the Secretary-General's notes on General Assembly resolution 1916 (XVIII) on the world social situation and on the report on methods of determining social allocations. The question of social defence was discussed subsequently at the 504th meeting.

4. Following its consideration of documents E/3915 and E/3920, the Committee adopted the following recommendation proposed by the Chairman:

"The Social Committee recommends that the Economic and Social Council decide to postpone consideration of the questions dealt with on the notes by the Secretary-General on General Assembly resolution 1916 (XVIII) of 5 December 1963 on the

world social situation and on the methods of determining social allocations (E/3915 and E/3920), until after their consideration by the Social Commission at its sixteenth session."

5. Following its consideration of documents E/3945 and E/CN.5/383 on the question of social defence, the Social Committee adopted the following recommendation proposed by the Chairman:

"The Social Committee recommends that the Economic and Social Council decide to postpone consideration of the questions dealt with in the notes by the Secretary-General on the assessment of arrangements for carrying out United Nations responsibilities in the field of prevention of crime and the treatment of offenders (E/3945 and E/CN.5/383), until after their consideration by the Social Commission at its sixteenth session."

6. The Social Committee, therefore, recommends the adoption by the Council of the following recommendations:

A

WORLD SOCIAL SITUATION AND REPORT
ON SOCIAL ALLOCATIONS

[Text adopted by the Council without change. See below, "Decisions taken by the Economic and Social Council".]

B

SOCIAL DEFENCE

[Text adopted by the Council without change. See below, "Decisions taken by the Economic and Social Council".]

DECISIONS TAKEN BY THE ECONOMIC AND SOCIAL COUNCIL

World social situation and report on social allocations

At its 1345th meeting on 11 August 1964, the Council decided to postpone consideration of the questions dealt with in the notes by the Secretary-General on General Assembly resolution 1916 (XVIII) of 5 December 1963 on the world social situation and on the methods of determining social allocations (E/3915 and E/3920), until after their consideration by the Social Commission at its sixteenth session.

Social defence

At its 1345th meeting on 11 August 1964, the Council decided to postpone consideration of the questions dealt with in the notes by the Secretary-General on the assessment of arrangements for carrying out United Nations' responsibilities in the field of the prevention of crime and the treatment of offenders (E/3945 and E/CN.5/383) until after their consideration by the Social Commission at its sixteenth session.

DOCUMENT E/3912

Note by the Secretary-General

[Original text: English]
[10 June 1964]

1. In accordance with procedure established by the Economic and Social Council when creating the Committee on Housing, Building and Planning (resolution 903 C (XXXIV) the Secretary-General submits herewith a summary of comments made on the report of the Committee on its second session which was held at United Nations Headquarters, New York, from 22 January to 4 February 1964. The Committee's report (E/3858) is being circulated separately.

2. The Council decided at its thirty-sixth session (1297th meeting) that the Social Commission would meet in 1965 instead of 1964 and that the report of the Committee on Housing, Building and Planning should, therefore, be submitted directly to the Council at its thirty-seventh session.

3. The Committee for Industrial Development considered the report of the Committee on Housing, Building and Planning at its fourth session from 2 to 19 March 1964.¹ It noted that the Committee on Housing, Building and Planning has accorded high priority to the industrialization of building and that the increasing interest in this area of development at the international level reflected the growing need throughout the world for a faster rate of construction in order to cope with

problems of rapid urbanization and industrialization. Similarly, the growing building volume underlined the need for applying industrial methods and for more building capacity.

4. It was also noted that among the conclusions of the Committee on Housing, Building and Planning were the following: the industrialization of the building sector should be planned in relation to general industrial development; the developing countries should develop their construction and building materials industries with a view to reducing foreign currency requirements for imported materials and components; standardization of building types, designs and materials would contribute to integrating the different phases of the building process. Furthermore, reference was made to the importance which the Committee on Housing, Building and Planning had attached to (a) the transfer of technology and the adaptation of the results of building research in regard to social and economic conditions in the developing countries and their cultural setting, and (b) the role of pilot projects and practical demonstrations as suitable means by which to develop new approaches that were less demanding on funds, time and technical and administrative skills.

5. Finally, the Committee for Industrial Development noted that the Committee on Housing, Building and Planning had considered the administration and

¹ *Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 6*, paras. 86-88.

organization of the United Nations programme in housing, building and planning and had recommended the establishment of a separate Centre for Housing, Building and Planning within the Department of Economic and Social Affairs which would co-operate closely with the Industrial Development Centre and other units of the United Nations Secretariat, both at Headquarters and in the regional economic commissions.

6. The report of the Committee on Housing, Building and Planning on its second session was also transmitted by their Executive Secretaries to the Economic Commission for Africa (sixth session, 19 February to 2 March 1964), the Economic Commission for Asia and the Far East (twentieth session, 2 to 17 March 1964), and to the Committee on Housing, Building and Planning of the Economic Commission for Europe (twenty-fifth session, 2 to 5 June 1964). It was not possible to transmit the Committee's report to the Economic Commission for Latin America since the tenth session of its Committee of the Whole was held from 12 to 14 February 1964, when the report had not yet become available.

7. The Economic Commission for Africa took note of the report of the Committee on Housing, Building and Planning and of a covering note by the United Nations Bureau of Social Affairs which highlighted the main points of interest to the Commission.²

8. At the nineteenth session of the Economic Commission for Europe (13 April to 1 May 1964), many delegations underlined the importance of co-operation with

² *Ibid.*, supplement No. 10, para. 162.

the Economic and Social Council's Committee on Housing, Building and Planning. The Commission's Committee on Housing, Building and Planning, which met subsequently and had before it the report of the Council's Committee on its second session, noted the concerted programme in this field which was carried out by the United Nations family for the benefit of the developing countries. Particular attention was given to work pertaining to regional physical planning and the development of the building industry as areas for useful co-operation between the two Committees. Stress was also laid on a proposal made by the Commission's Seminar on Changes in the Structure of the Building Industry which met in Prague from 19 to 30 April 1964 to consider the usefulness of organizing an inter-regional seminar on the same subject with the participation of all economic commissions of the United Nations.

9. It was also recalled that the Committee on Housing, Building and Planning of ECE had affirmed on several occasions its willingness to co-operate closely with the Council's Committee and thus to assist the developing countries in the solution of their housing, building and physical planning problems. "It was pointed out that the kind of activity and co-operation envisaged has been steadily developing as far as ECE is concerned. Some caution was expressed, however, concerning the possibility of intensifying these activities in the light of the limited Secretariat resources available. It was understood, as approved by the sixteenth session of the ECE, that the existing practice whereby such co-operation is normally established and maintained by contacts between the Secretariats of the bodies concerned would be continued in the future."

DOCUMENT E/3918

Co-ordination and organization of existing programmes in housing, building and planning: report of the Secretary-General *

[Original text: English]
[16 June 1964]

Background

1. The Committee on Housing, Building and Planning considered at its first session the question of co-ordination and organization of existing and increased international assistance to housing, building and planning.³ The Committee expressed the view that there was some danger of a dispersal of international and regional efforts in this field, especially now that the international agencies concerned were planning to intensify their activities in this respect. It was considered that the time was opportune for a fuller examination of the existing international programme in housing, building, physical planning and urban and regional development and of the machinery

* Pursuant to resolution 5 (II) of the Committee on Housing, Building and Planning.

³ See *Official Records of the Economic and Social Council, Thirty-sixth Session, Supplement No. 13*, chapter VII.

for their co-ordination with a view to improving existing arrangements under the leadership of the United Nations.⁴

2. The Committee incorporated these views in a draft resolution⁵ which was then adopted unanimously by the Economic and Social Council as resolution 976 G (XXXVI). The Council not only endorsed the Committee's view that the activities of the United Nations, the regional economic commissions and the specialized agencies in the field of housing and urban development represented a sector of high priority in the United Nations Development Decade, but recognized at the same time that the Committee's work could be effective only if these activities were "efficiently organized and well co-ordinated". The Council suggested, therefore, that "the Secretary-General might consider the advisability

⁴ *Ibid.*, para. 129.

⁵ *Ibid.*, chapter XI, draft resolution VIII.

of obtaining on an *ex gratia* basis relevant independent expert advice on questions of management, organization and procedures to ensure efficient and effective organization and administration of the growing international operational programmes in housing, building and planning" and report his findings to the second session of the Committee on Housing, Building and Planning. The Council, in the same resolution, also requested the Secretary-General "to consult with the members of the Administrative Committee on Co-ordination on the administrative arrangements for an expanded and intensified programme of concerted action in this field and on how existing and future resources for international action in this field might be used most effectively".

3. The Secretary-General obtained the services of Mr. George F. Davidson (Canada), Deputy Head of the Bureau of Government Organization, Privy Council Office, Ottawa, and former President of the Economic and Social Council, to prepare a survey report on organizational arrangements in the field of housing, building and planning based on consultations with the agencies concerned, including the specialized agencies and several other inter-governmental bodies. Concurrently, consultations took place through the mechanism of the working groups on housing and related community facilities and on urbanization of the Administrative Committee on Co-ordination. The Secretary-General transmitted the report of Mr. Davidson (E/C.6/24) for information to the second session of the Committee on Housing, Building and Planning.

*Report on organizational arrangements in the field of housing, building and planning: action taken by the Committee on Housing, Building and Planning at its second session*⁶

4. The Committee at its second session commended the report on the organizational arrangements in the field of housing, building and planning for its "comprehensiveness, completeness and penetration". It noted that many institutions were presently engaged in housing, building and planning activities which in itself was indicative "of the submerged importance of housing in widely varied fields concerned with social and economic progress". At the same time, however, the Committee recognized "that the aggregate of current efforts in the field does not constitute an organized programme or mount the massive housing effort needed in the United Nations Development Decade".⁷

5. In discussing these proposals and findings, the Committee accorded special importance and endorsement to the following:

(a) More active and co-ordinated participation by the regional economic commissions in guidance of basic and essential co-ordination and organization at national levels;

(b) A closer relationship of housing, building and planning activities to economic and industrial development;

(c) The establishment of a separate and self-contained housing, building and planning centre within the United Nations Secretariat reporting directly to the Under-Secretary for Economic and Social Affairs;⁸

(d) The inadequacy of existing organization at regional and international levels; and

(e) The relative paucity of resources and inadequacy of co-ordination on administrative guidance at the international level.⁹

6. The debate and conclusions of the Committee on Housing, Building and Planning are recorded in its report of the second session.¹⁰ After thorough discussion of a wide range of solutions and close votes on draft resolutions recommending the establishment of a specialized agency for housing, building and planning or a centre within the framework of the United Nations, the Committee unanimously adopted a resolution which reads as follows:

"The Committee on Housing, Building and Planning

Recommends that the Economic and Social Council urge the Secretary-General, in the work programme of the Secretariat for the next year, to give priority to the establishment of the Centre for Housing, Building and Planning recommended by the Committee on Housing, Building and Planning within the limits of the present budget of the United Nations."¹¹

7. In adopting this draft resolution, "the Committee reiterated its overwhelming view that the work programme adopted by it could be realized only if United Nations activities in the field of housing, building and planning received a proper share of the total United Nations funds which were available to it every financial year. It was also stressed that such a share should truly reflect the importance of this sector in the total activity for human betterment which the Organization is called upon to undertake".¹²

Lines of future action pursuant to operative paragraph 2 of draft resolution 5 (II) of the Committee on Housing, Building and Planning

8. The Secretary-General has given careful consideration to the survey report of Mr. Davidson and to the views expressed by the Committee on Housing, Building and Planning at its second session regarding the proposed reorganization of "existing working facilities... as a first step forward in the development of an integrated and comprehensive United Nations unit in the field of housing, building and planning".¹³

⁸ *Ibid.*, para. 180 (i).

⁹ *Ibid.*, para. 180 (iii).

¹⁰ *Ibid.*, chapter VII, paras. 178 to 207 and chapter VIII, paras. 216 to 217.

¹¹ *Ibid.*, chapter VIII, para. 216, resolution 6 (II).

¹² *Ibid.*, para. 217.

¹³ *Ibid.*, chapter VII, para. 207, resolution 5 (II), and chapter XI, draft resolution III.

⁶ *Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 12.*

⁷ *Ibid.*, chapter VII, paras. 178 to 179.

9. In the nature of the case, the Secretary-General, with the help of his Administrative Management staff, has had to examine these proposals in relation to other organizational proposals which have been made or are under consideration by the Social Commission, the Committee for Industrial Development as well as the United Nations Conference on Trade and Development. At the same time he was charged with making an overall survey of the organization and management of the Department of Economic and Social Affairs, the regional economic commissions and other administrative aspects related to the United Nations activities in the economic and social field. The Secretary-General is inclined to support the establishment of a Centre for Housing, Building and Planning within the Department for Economic and Social Affairs headed by a Director at the D-2 level for the reasons given in the expert's report.¹⁴

10. Proposals are before the Advisory Committee on Administrative and Budgetary Questions which contain suggestions for an improvement in the existing organizational arrangement for the top management of the Department of Economic and Social Affairs. These suggestions include the establishment of a post

¹⁴ See para. 3 above.

of Commissioner for Social Development and Housing at the Under-Secretary level.

11. While it is expected that these arrangements would meet the preoccupations of the Committee in respect of raising the status of the Secretariat for housing, building and planning, and providing a better base for co-ordination of regional and specialized agency work in these fields, the impact of the change will certainly be negligible if Governments on their part are not ready to provide greater resources for housing, building and planning at all levels of operation.

12. In conformity with his statement of financial implications covering the work requested by the Committee on Housing, Building and Planning at its first session, and approved by the Council at its thirty-sixth session, the Secretary-General provided in the budget for 1964 two new Professional and two General Service posts for this field of activity. He has also included in the budget proposals for 1965 four new Professional and three General Service posts. In light of decisions taken by the Council at its thirty-seventh session, the Secretary-General would submit to the Council, as necessary, a statement on any further financial implications for 1965 involved in the proposal to establish the Centre for Housing, Building and Planning, together with a plan for the Centre's further development over the next few years.

DOCUMENT E/3962

Report of the Social Committee

[Original text: English]
[6 August 1964]

1. The Social Committee, under the chairmanship of Mr. Abdelkader Chanderli (Algeria), Second Vice-President of the Council, considered, at its 502nd and 503rd meetings held on 3 August 1964, item 23 of the agenda entitled: "Report of the Committee on Housing, Building and Planning". This item was referred to the Social Committee following its consideration at the 1337th and 1339th plenary meetings of the Council, in line with the decision taken by the Council at its 1314th plenary meeting held on 13 July 1964.

2. The Committee had before it the following documentation in the consideration of this item: the report of second session of the Committee on Housing, Building and Planning, 22 January 4 February 1964 (E/3858); a note by the Secretary-General transmitting the comments of the regional economic commissions and of the Committee on Industrial Development on the Report of the Committee on Housing, Building and Planning (E/3912); a report by the Secretary-General on the co-ordination and organization of existing programmes in housing, building and planning, prepared pursuant to resolution 5 (II) of the Committee on Housing, Building and Planning (E/3918); the twenty-ninth report of the Administrative Committee on Co-ordination (E/

3886, paras. 99 103);¹⁵ amendments to draft resolution I (E/3858, chapter XI) submitted by the United States of America (E/AC.7/L.441); amendments to draft resolution I (E/3858, chapter XI) submitted by the United Kingdom of Great Britain and Northern Ireland (E/AC.7/L.444); an amendment to draft resolution II (E/3858, chapter XI) submitted by the United States of America (E/AC.7/L.442); and an amendment to draft resolution III (E/3858, chapter XI) submitted by the United States of America (E/AC.7/L.443).

3. The Committee's consideration of the amendments submitted to the three draft resolutions, as well as oral amendments submitted during the discussion, are given below.

DRAFT RESOLUTION I

Third preambular paragraph

4. The Committee adopted by 12 votes to 10 with 3 abstentions the amendment to this paragraph submitted

¹⁵ See *Official Records of the Economic and Social Council, Thirty-seventh Session, Annexes*, agenda item 6.

by the representative of the United Kingdom (E/AC.7/L.444, amendment No. 1) to substitute this paragraph by the following:

“*Recognizing further* that social reforms aimed at accelerating social and economic development have an important part to play in the successful solution of housing problems.”

Operative paragraph 1(c)

5. The United States of America submitted an amendment to operative sub-paragraph 1(c) (E/AC.7/L.441, amendment No. 1) to substitute this sub-paragraph by the following:

“(c) Take all necessary measures to develop a building material industry utilizing local raw materials to the maximum and to promote or establish as appropriate building design and construction organizations which will improve efficiency, lower costs and will establish designs and standards that are appropriate to relevant cultural, social and economic requirements;”

6. The representative of Ghana orally proposed the addition to operative paragraph 1(c) of the words “or other” between the words “large State” and “building”.

7. The representative of Argentina orally proposed the replacement of the word “State” by “national” in operative paragraph 1(c).

8. The United States amendment was adopted by 14 votes to 10 with one abstention. In consequence, the amendments proposed by Ghana and Argentina did not apply.

Operative paragraph 1(e)

9. The representative of the United Kingdom submitted the following amendment (E/AC.7/L.444, amendment No. 2):

“for the words ‘Bring about basic reforms’ substitute the words ‘Bring about, by basic reforms if necessary, conditions’”.

10. The representative of the Union of Soviet Socialist Republics proposed an oral sub-amendment to the amendment submitted by the United Kingdom, to replace the words “if necessary” by “where they have not been implemented”.

11. The representative of the United Kingdom orally revised his amendment as follows:

“to replace the words ‘Bring about basic reforms in the sphere of land ownership and land use’ by the words ‘Bring about conditions in the spheres of land ownership and land use by basic reforms, if such conditions have not already been achieved.’”

12. This amendment was adopted by the Committee by 13 votes to 8 with three abstentions.

13. The Committee then adopted operative paragraph 1(e), as amended, as a whole by 16 votes to none with 9 abstentions.

Operative paragraph 2

14. The representative of the United States of America submitted an amendment to this paragraph (E/AC.7/L.441, amendment No. 2) which read as follows:

“2. *Recommends* that international assistance to developing countries in the field of housing, building and planning, whether multilateral or bilateral, be directed toward the establishment or improvement of housing finance institutions, the development of an appropriate building materials industry, the promotion of building design and construction organizations, the training of necessary technical, managerial and skilled personnel, the development of local, regional and national planning, and the planning and execution of pilot projects contributing to the earliest possible solution of the housing problem;”

15. The representative of Ghana orally proposed the addition to operative paragraph 2 of the words “or other” following the word “State”, i.e., between the words “of State” and “building design”. The amendment was subsequently withdrawn.

16. The representative of Argentina orally proposed the following changes in this paragraph:

(i) To replace the words “State and/or national” by the words “national or, if necessary, State”; and

(ii) To replace the word “State” between the words “industry and of” and “building design” by the words “national or, if necessary, State”.

17. The United States amendment (E/AC.7/L.441, amendment No. 2) was rejected by the Committee by 11 votes to 11 with 3 abstentions.

18. The oral proposal of Argentina mentioned in paragraph 16 (i) and (ii) above were adopted by the Committee by 15 votes to one with 9 abstentions.

19. Operative paragraph 2 of draft resolution I (E/3858, Chapter XI), as amended by the oral proposal of Argentina, was adopted as a whole by the Committee by 23 votes to none with one abstention.

Operative paragraph 3

20. The United States proposed the deletion of this paragraph (E/AC.7/L.441, amendment No. 3).

21. The representatives of Cameroon and Argentina orally proposed the following amendments to operative paragraph 3:

(i) To replace the word “*Requests*” by the word “*Invites*”; and

(ii) To replace the word “implementation” by the word “application”.

22. The amendment submitted by the United States to delete this paragraph was adopted by the Committee

by 12 votes to 10 with 3 abstentions. In consequence, the Cameroon and Argentine oral amendments did not apply.

23. As a result of the adoption of the United States amendment, operative paragraphs 4 and 5 of draft resolution I were renumbered 3 and 4.

Operative paragraph 4

24. An amendment to replace this paragraph was submitted by the United States of America (E/AC.7/L.441, amendment No. 4). This amendment was subsequently orally revised by the representative of the United States to read as follows:

“ 3. *Suggests* that the Secretary-General prepare biennial progress reports on the application of this resolution in close co-operation with the Executive Secretaries of the regional economic commissions ”.

25. The amendment submitted by the United States, as orally revised, was adopted by the Committee by 16 votes to 4 with 5 abstentions.

26. *Draft* resolution I (E/3858, chapter XI), as amended, as a whole was adopted unanimously by the Committee. The text of this resolution recommended by the Social Committee for adoption by the Council is given in paragraph 33 below (see draft resolution A).

DRAFT RESOLUTION II

27. The representative of the United States of America proposed the addition after operative paragraph 1 of a new paragraph (E/AC.7/L.442). This amendment was subsequently orally revised to read as follows:

“ 2. *Further requests* the Secretary-General in taking the steps called for in paragraph 1(a) to make necessary efforts to the end that maximum use is made of studies, information, experience and facilities as may already be available, including those developed by the Economic Commission for Europe and its Committee on Housing, Building and Planning, and that work in this field be concentrated on those aspects which remain unexplored or are profitable for further development.”.

28. The amendment submitted by the United States, as orally revised, was adopted unanimously by the Committee. In consequence, operative paragraph 2 of draft resolution II was renumbered as operative paragraph 3.

29. *Draft* resolution II (E/3858, chapter XI), as amended, as a whole was adopted unanimously by the Committee. The text of this resolution recommended by the Social Committee for adoption by the Council is given in paragraph 33 below (see draft resolution B).

DRAFT RESOLUTION III

30. Several amendments were submitted to operative paragraph 2 of draft resolution III (E/3858, chapter XI) by the Committee, and the action taken with respect to them is given below:

(i) An oral amendment proposed by the representative of the Union of Soviet Socialist Republics to delete this paragraph was rejected by 2 votes to 16 with 6 abstentions.

(ii) An oral amendment submitted by the United States of America to delete the words “ which reports to the Under-Secretary for Economic and Social Affairs ” was adopted by 11 votes to 5 with 9 abstentions.

(iii) An amendment was submitted by the United States of America (E/AC.7/L.443) to replace the last clause of operative paragraph 2, which read “ this Centre to be considered as a first step forward in the development of an integrated and comprehensive United Nations unit in the field of housing, building and planning; ” by

“ this Centre to be considered an important step forward in the development of an integrated and comprehensive United Nations programme in the field of housing, building and planning; ”

This amendment was adopted by 15 votes to one with 9 abstentions.

31. The Committee adopted operative paragraph 2, as amended, as a whole by 21 votes to 2 with 2 abstentions.

32. *Draft* resolution III (E/3858, chapter XI) as amended, as a whole was adopted by the Committee by 23 votes to none with 2 abstentions. The text of this resolution recommended by the Social Committee for adoption by the Council is given in paragraph 33 below (see draft resolution C).

33. The Committee therefore recommends the adoption by the Council of the following draft resolutions:

[*Texts adopted by the Council without change. See below, “ Resolutions adopted by the Economic and Social Council ”.*]

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1024 (XXXVII). Report of the Committee on Housing, Building and Planning

A

HOUSING, BUILDING AND PLANNING
IN THE UNITED NATIONS DEVELOPMENT DECADE*The Economic and Social Council*

Recommends to the General Assembly at its nineteenth session the adoption of the following draft resolution:

"The General Assembly,

"Noting that in countries throughout the world the housing problem is one of the most important problems calling for solution without delay,

"Recognizing that the housing problem can be successfully solved only by mobilizing the efforts and resources of the nations,

"Recognizing further that social reforms aimed at accelerating social and economic development have an important part to play in the successful solution of housing problems,

"1. Recommends that Member States should:

"(a) Assume a major role in the solution of the housing problem in every country and to this end make provision in their national development planning for the necessary activities and resources;

"(b) Establish for this purpose central and other organizations or bodies in charge of housing and town and country planning, and sufficiently empowered with the necessary authority;

"(c) Take all necessary measures to develop a building material industry utilizing local raw materials to the maximum and to promote or establish as appropriate building design and construction organizations which will improve efficiency, lower costs and will establish designs and standards that are appropriate to relevant cultural, social and economic requirements;

"(d) Prepare and implement programmes for training architects, and construction engineers and workers in sufficient numbers to carry out national development programmes;

"(e) Bring about conditions in the spheres of land ownership and land use, by basic reforms if such conditions have not already been achieved, that will ensure a speedy and national solution of housing and industrial construction problems, harmonious town and rural development, the elimination of speculation in plots of land, and a more equitable use of housing resources in the interests of the whole population;

"2. Recommends that international assistance to developing countries in the field of housing, building and planning, whether multilateral or bilateral, be directed

towards the financing of housing, the establishment of a national or, if necessary, state building materials and components industry and of national or, if necessary, State building design, construction and financing organizations, the training of national cadres of architects and construction engineers and workers, the establishment of national bodies in charge of housing construction and town-building, and the planning and execution of pilot projects contributing to the earliest possible solution of the housing problem;

"3. Suggests that the Secretary-General prepare biennial progress reports on the application of this resolution in close co-operation with the executive secretaries of the regional economic commissions;

"4. Invites the Committee on Housing, Building and Planning, on the basis of those reports, to work out additional practical and effective measures for the implementation of the above recommendations and the solution of the housing problem."

*1345th plenary meeting,
11 August 1964.*

B

THE INDUSTRIALIZATION OF BUILDING

The Economic and Social Council

1. Requests the Secretary-General to initiate:

(a) The elaboration of a study on achievements, possibilities and existing programmes in the field of industrialization of housing in the developing countries in keeping with the stages of economic and technical development;

(b) An extensive international exchange of experience in this field, through the proposed Housing, Building and Planning Centre and the regional economic commissions and other international bodies;

2. Further requests the Secretary-General in taking the steps called for in paragraph 1(a) to make necessary efforts to the end that maximum use is made of studies, information, experience and facilities as may already be available, including those developed by the Economic Commission for Europe and its Committee on Housing, Building and Planning, and that work in this field be concentrated on those aspects which remain unexplored or are profitable for further development;

3. Further requests the Secretary-General to report to the United Nations Committee on Housing, Building and Planning at its third session on the progress made in the implementation of the present resolution.

*1345th plenary meeting,
11 August 1954.*

C

CO-ORDINATION AND ORGANIZATION OF EXISTING PROGRAMMES IN HOUSING, BUILDING AND PLANNING

The Economic and Social Council,

Recognizing the contribution which international assistance for housing, building and planning could make to the most effective use of international and domestic resources directed towards economic and social development,

Believing that the contribution of the United Nations in this field requires the most effective arrangements for conducting housing, building and planning activities within the United Nations Secretariat and for co-ordinating these activities with the work of other agencies bent to the common task of increasing world productivity and living standards,

Acknowledging the report on organizational arrangements in the field of housing, building and planning, (E/L.6/24).

Having considered the report of the Secretary-General on the early implementation and possible methods of effecting the organizational changes requested by the Committee on Housing, Building and Planning (E/3918),

1. *Recognizes* that housing, building and planning represent an important element of economic development whose full potential in raising productivity and assisting economic growth warrants greater emphasis;

2. *Approves* the proposals contained in the report on organizational arrangements in the field of housing, building and planning, communicated by the Secretary-General to the Committee on Housing, Building and

Planning, concerning the reorganization of the Housing, Building and Planning Branch through the establishment, within the limits of the present United Nations budget, of a Centre for Housing, Building and Planning in the Department of Economic and Social Affairs; this Centre to be considered an important step forward in the development of an integrated and comprehensive United Nations programme in the field of housing, building and planning;

3. *Urges* that:

(a) Housing, building and planning efforts receive the proper share of the total United Nations funds which are available every financial year, a share which will reflect the relative importance of this sector of human action to the others;

(b) The Secretary-General provide within the limits of the present budget of the United Nations the additional posts and resources which he has estimated would be required to implement the recommendations of the Committee on Housing, Building and Planning;

(c) The Secretary-General make the necessary reorganization of existing work and facilities to implement these recommendations;

(d) The Secretary-General provide for specialist teams in housing, building and planning to assist developing nations, at their request, in the establishment of basic housing, building and planning programmes and housing industries, drawing as appropriate on the resources of the United Nations programme of technical assistance;

(e) The regional economic commissions activate their work in housing, building and planning.

*1345th plenary meeting,
11 August 1964.*

CHECK LIST OF DOCUMENTS

NOTE. This check list includes the documents pertaining to agenda item 23 which are not reproduced in the present fascicle.

<i>Document No.</i>	<i>Title</i>	<i>Observations and references</i>
E/3858	Report of the Committee on Housing, Building and Planning on its second session	<i>Official Records of the Economic and Social Council Thirty-seventh Session, Supplement No. 12</i>

DOCUMENT E/3906 *

**Report of the Secretary-General on the first United Nations
Regional Cartographic Conference for Africa**

[Original text: English]
[29 May 1964]

1. The Executive Secretary of the Economic Commission for Africa consulted with Governments of States members and associate members of the Economic Commission for Africa, on the convening of a Regional Cartographic Conference for Africa, in pursuance of resolution 761 B (XXIX) adopted by the Economic and Social Council on 21 April 1960.

2. A summary on the replies¹ received from Governments was reported by the Secretary-General to the Economic and Social Council at its thirty-first session. On 27 April 1961 the Council adopted resolution 816 (XXXI) requesting that a United Nations Regional Cartographic Conference for Africa be convened during the latter part of 1962.

3. The Government of Kenya offered to be the host country for the Conference and asked that the Conference be held in 1963 rather than in the latter part of 1962 to give more time for the necessary preparations. The Economic and Social Council considered this request at its thirty-second session and agreed that this conference should take place during the second quarter of 1963.

4. The conference was convened in Nairobi, Kenya, from 1 to 12 July 1963.

5. The main objective and general organization of the Conference conformed with the previous cartographic conferences held in Asia and the Far East in Mussoorie, India in 1955, in Tokyo, Japan in 1958 and in Bangkok, Thailand in 1961, while the actual arrangements for the participation of Governments followed the pattern of the meetings of the Economic Commission for Africa.

6. Twenty-six members and associate members of the Economic Commission for Africa sent representatives and observers. Nine other States Members of the United Nations and the specialized agencies sent observers. Observers were also present from four specialised agencies, two inter-governmental organizations and one international non-governmental scientific organization.

7. The official records of the Conference are being published in two volumes. Volume 1² contains the report of the Conference and has already been issued, in English and in French, while Volume 2, which will contain the proceedings of the Conference and technical papers, is now in preparation.

8. The agenda of the Conference included the following item: review of cartographic activities in Africa; development of cartographic services, training of personnel, technical assistance, matters relating to regional projects and to surveying and mapping.

* Incorporating E/3906/Corr.1.

¹ *Official Records of the Economic and Social Council, Thirty-first Session, Annexes*, agenda item 8, documents E/3465 and Add.1.

² *United Nations Regional Cartographic Conference for Africa Vol. 1 — Report of the Conference*. United Nations publication, Sales No: 64.I.2.

9. Four committees were established by the Conference: the first was on Geodesy and Hydrology; the second on Photogrammetry; the third on Special Mapping and the fourth on the Preparation and Reproduction of Maps.

10. Twenty-two resolutions were adopted by the Conference.

11. The Conference recommended that a second United Nations Regional Cartographic Conference; for Africa should be convened not later than 1966; that sub-regional conferences should be organized with the assistance of the Economic Commission for Africa; that the Economic Commission for Africa and the Commission for Technical Co-operation in Africa should consult with each other on questions relating to cartography; that the question of organizing a Cartographic Committee within the Economic Commission for Africa should be deferred until the Second Regional Cartographic Conference; that dissemination of information regarding technical assistance be ensured as well as the implementation of requests for such assistance; that preparatory work and study for the setting up of Regional Training Centres should be initiated; that a survey of

training facilities already in existence in the region should be undertaken; that Governments should be consulted on the establishment of joint centres for specialized services in cartography on a regional or sub-regional basis; that cartographic information among countries of the region should be exchanged; that necessary steps should be taken to ensure the connexion of geodetic networks between countries, as well as the agreement to work towards the establishment of a common geodetic datum; that co-operation should take place between specialists in, and producers of, topical maps; that the countries of the region should take necessary steps to complete and revise aeronautical charts; that the African countries should take account of the name specifications for the International Map of the World on the Millionth Scale and take the steps recommended in the report of the Group of Experts in standardizing written forms of their own geographical names, and that the African countries indicate their intention to participate in the international conference on the standardization of geographical names now under consideration by the Economic and Social Council. The Conference also made recommendations regarding the organization of national cartographic services within the region.

DOCUMENT E/3907

International co-operation in the standardization of geographical names: report of the Secretary-General

[Original text: English]
[3 June 1964]

1. Pursuant to Economic and Social Council resolution 929 (XXXV) of 3 April 1963, the Secretary-General of the United Nations sent a note to all Governments of States Members of the United Nations and Members of the specialized agencies, as well as to the specialized agencies concerned, on the desirability of convening an international conference on international co-operation in the standardization of geographical names, and on the date, place and tentative agenda of such a conference. The note was accompanied by a tentative agenda [Annex I] and by a paper on the nature and scope of the proposed international conference on the standardization of geographical names prepared with the assistance of a consultant,³ in accordance with the same Council resolution.

2. Forty-three countries had replied to the Secretary-General by 12 May 1964.

3. Thirty-seven of the Governments expressed themselves in favour of convening an international conference on the standardization of geographical names. While several Governments had no comments to offer, the majority qualified their reply.

4. Portugal considered it important that preliminary studies in regional conferences be undertaken before

convening an international conference. The United States of America considers such a conference will prove practicable at a later time. Belgium wondered whether it would not be better to carry the preparatory work a stage further before taking a final decision. The Republic of Korea suggested that Governments should be notified about the Conference at least one year before it is convened. Japan and the Philippines commented that this Conference should be held after the forthcoming fourth United Nations Regional Cartographic Conference for Asia and the Far East, while India suggested that it should be held prior to the Regional Cartographic Conference.

5. Austria, the Federal Republic of Germany, Morocco and Portugal consider it very important that countries having common alphabets, similar writing systems, and linguistic background hold regional meetings prior to an international conference on geographical names.

6. More than half of the countries answering concurred with the tentative agenda as prepared by the Secretary-General. The Federal Republic of Germany suggested that the following item be added to the agenda, "The establishment at United Nations Headquarters of a permanent committee of experts which, after the Conference, could evaluate the results and press on with systematic work on this very extensive and complicated subject". Israel suggested as an item for the agenda

³ Mr. M. F. Burrill, Chairman of the Group of Experts on Geographical Names.

"The desirability of including simple rules of pronunciation in map magazines and the standardization of treatment of generic terms and of generic contents". Several Governments stated that they would suggest additional items to the agenda at a later date.

7. Guatemala, the Netherlands, and Thailand suggested that the venue of the Conference should be the United States. The preferred venue of Belgium, the Byelorussian Soviet Socialist Republic, Chile, Iran, the Ukrainian Soviet Socialist Republic, the Union of Soviet Socialist Republics and the United Kingdom, was Geneva. Lebanon suggested Paris, while Yugoslavia favoured that the Conference be held somewhere in Europe. Brazil emphasized the importance of choosing a location which had good conference facilities and where there was easy access to material pertaining to geographical names.

8. With respect to the timing of the Conference, the suggestions received were for some time between mid-1964 to the end of 1965.

9. In the light of the replies, the Secretary-General considers that, while the desirability of convening a United Nations Conference on the Standardization of Geographical Names is confirmed, this project, which requires considerable preparatory work is not one of immediate urgency and could advantageously be preceded by discussions at the regional level. Accordingly, the Secretary-General would propose to place the question of standardization of geographical names on the agenda of the fourth United Nations Regional Cartographic Conference for Asia and the Far East and of the proposed second United Nations Regional Cartographic Conference for Africa. Thereafter, with the benefit of the progress made on the subject at the two regional conferences in question, definite plans for a world-wide conference might be drawn up and specific proposals made for its scheduling and financing.

10. If the Council agrees with this approach, the Secretary-General would suggest that a decision to hold a

world-wide United Nations Conference on the Standardization of Geographical Names be further deferred until 1967, with the understanding that the Secretary-General will then submit specific proposals to the Council on the basis of the progress made meanwhile in the consideration of the question.

ANNEX I

Tentative agenda

1. Opening of the Conference.
2. Adoption of the rules of procedure.
3. Election of officers.
4. Report on credentials.
5. Adoption of the agenda.
6. Organization of work.
7. Reports by Governments on the progress made in their standardization of geographical names:
 - (a) National authorities on names;
 - (b) National map publishing agencies.
8. Review of methods and techniques used by various countries in the standardization of geographical names.
9. Exchange of experience on problems identified in the report of the group of experts.^a
10. Correlation of national and international standardization.
11. Broad consideration in the transliteration of names.
12. Regional meetings among Governments having similar systems of writing.
13. Evaluation of techniques in the light of the Conference discussions.
14. Needs for, and sources of, technical assistance.
15. Machinery for international exchange of information.
16. Report of the Conference.

DOCUMENT E/3883

Report by the Secretary-General on the desirability of further action to revise or replace the Convention on Road Traffic and the Protocol on Road Signs and Signals (Geneva, 19 September 1949)

[Original text: French]
[28 April 1964]

1. This report has been prepared pursuant to paragraph 3 of Economic and Social Council resolution 967 (XXXVI).

2. The proposed amendments to the Convention and Protocol drawn up by the Inland Transport Committee of the Economic Commission for Europe, which were submitted in October 1962 by Austria and again in late January 1964 by France, represent changes of only minor importance in the 1949 texts — a better concordance of the English and French texts, drafting improvements, and modifications in some technical provisions on which, it would appear, agreement could easily be reached by correspondence. The fate of these proposed amendments will not be known until the four months allowed to the Contracting States for their reply have elapsed, or in other words, until the opening date of the thirty-seventh session of the Council.

3. Even if the proposed amendments are adopted, the question raised in the Council, namely, whether the Convention and Protocol should be revised more radically or be superseded by new instruments, will remain unresolved. This report will consider one by one the following points: possible amendments to the Convention on Road Traffic; possible amendments to the Protocol on Road Signs and Signals; the procedure for studying such amendments and reaching a decision.

AMENDMENTS TO THE CONVENTION
ON ROAD TRAFFIC

4. The two principal objects of the Convention, as envisaged at the time of its drafting, were:

(a) to establish simplified and uniform world-wide regulations concerning road vehicles in international traffic;

(b) to constitute a common basis for the drafting of national laws and regulations on road traffic.

The Convention superseded the earlier conventions on the same subject, the first of which dated back to 1909. It was envisaged that the Convention would be kept up to date in line with technical advances, and a revision clause, which it was thought would be easy to apply, was included.

5. Apart from a brief chapter on road signs and signals, the Convention may be broken down into four parts, as follows:

(a) Rules of the road. These rules need to be re-examined from a number of standpoints:

(i) Some of them have become outmoded as a result of the increase in traffic and the technical advances in traffic control; for instance, article 11 does not envisage

traffic moving in parallel lines, and article 12, paragraph 4 (*d*), is in conflict with certain modern methods of channelling traffic at intersections;

(ii) Statutory rules of the road in every country are more detailed than those set out in the Convention; while it would perhaps be Utopian to hope that a complete and uniform world-wide code of traffic rules could be drawn up, the Convention might nevertheless be supplemented in certain respects;

(iii) A further effort might be made to standardize the rules concerning the direction of traffic (on the right or left of the road); such standardization is difficult, of course, but it will become more so as time goes by, owing to the fact that the change-over becomes more costly and troublesome with every increase in motor traffic; annex I attached shows the direction of traffic continent by continent.

(b) Minimum specifications for equipment and documentation which, if applied to a motor vehicle registered by one of the Contracting Parties, oblige the other Contracting Parties to allow the vehicle in question to use its roads. The technical specifications concerning equipment could with advantage be subjected to a more radical revision than would result from the minor amendments mentioned in paragraph 2 above. Consideration might also be given to the question of requiring the Contracting Parties to apply these technical specifications to all the motor vehicles they register, since in the absence of such a requirement States have no way of knowing whether or not foreign motor vehicles, duly registered by a Contracting State, which seek to cross their frontiers meet these technical specifications. With respect to the registration certificate which must accompany the vehicle, it might be considered desirable to standardize the numbering of the obligatory headings in the certificates with a view to facilitating the more widespread abolition of any requirement for customs documents in which these headings were repeated and numbered in order to avoid language difficulties.

(c) Rules concerning driving permits required in international traffic. Many countries, including some which are not Parties to the Convention, are at present more liberal in this connexion than is required under the terms of the Convention, and an attempt might be made to liberalize the latter. It would appear futile, however, to continue the efforts that were made, pursuant to Economic and Social Council resolution 379 B (XIII), to define the minimum examination requirements for national driving permits in an annex to the Convention; practically speaking, adequate results have already been achieved in most regions; nevertheless, the African countries appear to favour supplementing the Convention on this point.

(d) Rules relating to cycles in international traffic. Although these rules are of minor practical importance, they should be revised, since they conflict with the requirement imposed by many Contracting Parties whereby cycles must be equipped in the rear with a red light, and not simply a red reflector.

6. In addition, it would be advantageous to amend certain clauses of the Convention which are open to

misinterpretation, including in particular the following:

(a) Article 1, paragraph 1, the present text of which might be interpreted as restricting the traffic rules laid down in the Convention to international traffic, whereas it is obviously impossible to apply different regulations, at any one place, according to the country in which a vehicle is registered;

(b) Article 1, paragraph 2, which, contrary to the intention of the authors, would appear to require any Contracting State to allow any vehicle registered abroad to use its roads for a period of one year, even if the vehicle in question belongs to persons resident in its territory;

(c) Article 23, the second sentence of which is not clear and, in any event, is not applied.

If the Convention is revised, the opportunity should, of course, be taken to amend article 31 concerning revision, which has proved very difficult to apply.

7. On some of the above points, the Inland Transport Committee of the Economic Commission for Europe has already drafted proposed new texts.

8. Chapter III of the Convention, which deals with road signs and signals, merely enunciates a few very broad principles applicable to any system of signs and signals. The Protocol on Road Signs and Signals, signed on the same date as the Convention, was drafted and accepted by only a small number of countries, most of which are in Europe, and the Conference, as stated in paragraph 7 (*h*) of its Final Act, "took into account the fact that it was not possible to reach an agreement . . . on a world-wide uniform system of road signs and signals" and "was of the opinion that it would be desirable for the Economic and Social Council to entrust the Transport and Communications Commission (since abolished) with the task of reviewing the matter further with the assistance of such experts as might be needed".

9. Following the 1949 Conference, and in accordance with Council resolution 272 (X), six experts designated by the Secretary-General prepared a draft convention on a uniform system of road signs and signals (E/CN.2/119). The draft convention specified the elements of uniformity which should be incorporated, gradually if necessary, in the various national or regional systems of road signs and signals. Thus, it was more concise than the 1949 Protocol, but fuller than the Convention. It was communicated to Governments in accordance with Council resolution 468 D (XV), and the replies from Governments were analysed in a report by the Secretary-General to the Transport and Communications Commission (E/CN.2/151 and Add.1). Owing to the divergence of views expressed, the Council decided against the conclusion of a convention and confined itself, as proposed by the Commission, to recommending to Governments, in its resolution 567 B (XIX), that they should consider the provisions of the draft convention as recommended practices when revising their systems of road signs and signals either unilaterally or bilaterally, or in regional agreements. In 1957, the Transport and Communications Commission took note of the replies from Governments (E/CN.2/174) to an

inquiry by the Secretary-General concerning the action taken on Council resolution 567 B (XIX) and, while not denying the desirability of unification, noted the continued existence of considerable obstacles to the establishment in all countries of a uniform system of road signs and signals.

10. Apart from some regional standardization, especially in Europe, there continue to be radical differences between national systems of road signs and signals. It is true that all systems distinguish between three broad classes of signs — danger signs, signs giving instructions (prohibitory, restrictive and mandatory), and informative signs — but neither the shapes nor the colours of these three classes of signs are identical; moreover, the American system and various other national systems make very wide use of inscriptions in signs, whereas in principle the system laid down in the 1949 Protocol uses only symbols, in order to avoid difficulties due to the diversity of languages.

11. The regional Economic Commissions, however, have been concerned to bring about or to maintain uniformity of signs and signals in their regions, as follows:

(a) In Europe, where except in Cyprus, Ireland, Turkey and the United Kingdom signs and signals are almost entirely in conformity with the rules laid down in the 1949 Protocol, the Economic Commission for Europe, in the interest of preserving uniformity, has adopted certain additional symbols to meet new needs not covered by the Protocol and a series of recommendations to supplement or interpret the Protocol;

(b) In Africa, where the French-speaking countries use, or at least take as their basis, the system laid down in the Protocol, while the English-speaking countries base themselves rather on the British system, which is itself similar to the American system, a proposal for a uniform system of signs and signals, based on the 1952 draft convention and showing an inclination towards the solutions set forth in the Protocol, was submitted by the secretariat of the Economic Commission for Africa to the West African Transport Conference (E/CN.14/114/Add.1) and the East African Transport Conference (E/CN.14/TRANS.5);

(c) The countries of Central America concluded at Tegucigalpa, on 10 October 1958, an Agreement on Uniform Road Signs and Signals, which has come into force, likewise based on the 1952 draft convention and providing generally for both an inscription, as under the American system, and a symbol, as under the Protocol, on one and the same sign;

(d) In Asia, where road signs and signals are very heterogeneous, the Economic Commission for Asia and the Far East has recommended a system of signs and signals based on the 1952 draft convention and on many provisions of the 1949 Protocol, and also on some of the recommendations of the Economic Commission for Europe.

12. Annex 2 compares the principal systems of road signs and signals; a complete comparison of national systems would disclose a number of other differences.

13. The question of road markings was not mentioned in the 1949 Convention, but a very high degree of uniformity has already been attained on the basis of the proposals contained in the 1952 draft convention. The Economic Commission for Europe drafted a European Agreement on Road Markings (Geneva, 13 December 1957) and has produced a detailed recommendation which incorporates, in an expanded form, the clauses of the 1952 draft.

14. Owing to the fact that millions of road signs are already in existence and would be very costly to replace, it is very difficult to standardize road signs on a world-wide basis. It would, however, be most desirable to attempt a limited standardization which, in its legal form, would consist of expanding the chapter of the Convention dealing with signs and signals and would cover road markings, the essential principles of road signs, and those signs whose present diversity can have very dangerous consequences (e.g., the meaning of a red intermittent light, or the shape and colour of the stop signal at an intersection).

15. The revision of chapter III of the Convention, dealing with signs and signals, should be accompanied by a revision of the Protocol, in order to bring the latter into harmony with the new provisions which would be inserted in the Convention and also to incorporate in it the supplementary or interpretative clauses adopted by the Economic Commission for Europe in the course of its work; the activities of ECE have, in any event, already disclosed the need to make a number of changes in the Protocol, not all of which are covered by the minor amendments mentioned in paragraph 2 above.

Procedure

16. Article 31 of the Convention and article 60 of the Protocol provide for two possible revision procedures:

(a) By correspondence. This is the method used in the case of the minor amendments mentioned in paragraph 2 above, and the difficulties encountered on this occasion make it clear that the procedure is unworkable in the case of more radical, and therefore more controversial, amendments;

(b) By the convening of a conference for revision. Before this can be done, either one-quarter or one-third of the Contracting Parties must, within four months of the date on which the amendment is transmitted to them, indicate their support for the convening of a conference, and there is no certainty that such proportions could be easily obtained; moreover, it appears from the terms of paragraph 2 of articles 31 and 60 respectively that a conference convened in this manner might have no authority to do more than to consider the proposed amendment which was the reason for its being convened, and any such restriction would be unfortunate, bearing in mind the fact that representatives of some 120 countries would be invited to the conference;

(c) Decisions taken by the conference could not enter into force until they had been expressly accepted by

two-thirds of the Contracting States, and that might cause very considerable delay.

17. In short — and this was the conclusion reached by the Sub-Committee on Road Transport of the Economic Commission for Europe at its November 1963 session (TRANS/279, paras. 64-65) — it appears that neither of the procedures for revision stipulated in the Convention and the Protocol can be used in the case of important amendments; the only procedure to be recommended would appear to be the convening of a United Nations conference to draft new instruments superseding those of 1949, as was done in 1949 in order to substitute the Convention and Protocol for the International Convention relating to Road Traffic (Paris, 24 April 1926), the Convention on the Regulation of Inter-American Automotive Traffic (Washington, 15 December 1943), and the Convention on the Unification of Road Signals (Geneva, 30 March 1931).

18. There remains the question of the desirability of convening such a conference in the very near future. In this connexion, the Sub-Committee on Road Transport of the Economic Commission for Europe took the view, in November 1963, that it should not recommend such a conference "at the present time"; "the most widely held view" was "that it would be better to defer the convening of a diplomatic conference for several years, even if the amendment proposals submitted earlier by Austria and re-submitted by France were not adopted", and the Sub-Committee decided to draft a European agreement supplementing the 1949 Convention and Protocol and replacing the short supplementary agreement concluded on 16 September 1950 (TRANS/279, paras. 66-67).

19. In the view of the Secretariat, a world conference should not be convened until *travaux préparatoires* have been carried out in the regional economic commissions. If the Economic and Social Council is in favour of a conference to draft new instruments superseding those of 1949, it might at the same time decide to defer the convening of the conference for several years and might, for instance, postpone setting the date until one of its sessions in 1968. At the present stage, however, it might ask:

(a) The United Nations Secretariat to prepare draft standard rules for road traffic, and technical specifications for motor vehicles and their equipment; this draft would be intended to constitute the basis for national regulations and would be transmitted to the regional economic commissions for study and recommendations;

(b) The regional economic commissions, not only to study this draft, but also to consider what could be done to bring the systems of road signs and signals in use in the countries of their regions closer to the 1952 draft convention and the 1949 Protocol;

(c) The regional Economic Commissions, and in particular the Economic Commission for Africa, to study the possibility of making it the general rule in their regions, or on some parts of their regions, that traffic should keep to the right of the road;

(d) The secretariat of the Economic Commission for Europe to transmit to the secretariats of the other regional Economic Commissions, for consideration by the Commissions, the European agreement supplementing the 1949 Convention and Protocol as soon as it has been drafted;

(e) The United Nations Secretariat to ensure close co-ordination of the work of the regional Economic Commissions referred to above and to submit to the Economic and Social Council in 1968 a further report and, possibly, a complete new draft convention and draft protocol;

(f) The international organizations, governmental and non-governmental, competent in this field to co-operate with the United Nations Secretariat and the secretariats of the regional Economic Commissions with respect to the above-mentioned tasks.

Annex 2

COMPARISON OF THE PRINCIPAL SYSTEMS OF ROAD SIGNS AND SIGNALS

I. The sign " Priority road, yield right of way " to be erected at an intersection

1949 Protocol:	An equilateral triangle with one point downwards, white or light yellow ground, wide red border
United States of America:	Same shape as under the Protocol, yellow ground bordered by a thin black line, inscription "YIELD" in black
Economic Commission for Africa (ECA) recommendation and Central American Agreement:	As under the Protocol
Economic Commission for Asia and the Far East (ECAFE) recommendation:	Does not mention this sign; sign II (" Stop at Intersection ") below should therefore be placed at such intersections

II. The sign " Stop at intersection "

1949 Protocol:	A circle with white or light yellow ground and wide red border, bearing within it an equilateral triangle with one point downwards (signal I above) and within the triangle the inscription "STOP" in black
United States of America:	A red octagon bearing the inscription "STOP" in white
Economic Commission for Africa recommendation:	As in the United States
Central American Agreement:	As in the United States, but "STOP" is replaced by "ALTO"
Economic Commission for Asia and the Far East recommendation:	Two possibilities: <ul style="list-style-type: none"> (a) A white or yellow circle with red border, bearing the word "STOP" or its equivalent in the national language in red (b) A yellow octagon bearing at the centre the symbol for an intersection (a broad horizontal black band and a shorter narrow vertical black bar), with the word "STOP" or its equivalent in the national language appearing in yellow on this symbol

III. *Advance danger signs*(a) *General Principles*

1949 Protocol:	An equilateral triangle with one point upwards, white or light yellow ground, wide red border, black or dark symbol representing the hazard
United States of America:	A square with the diagonal vertical, yellow ground, bordered with a thin black line; in some cases a symbol (bend, intersection, road narrows), in others an inscription, but a change-over to symbols is recommended; symbols and inscriptions are in black
Economic Commission for Africa recommendation:	As in the Protocol, but the red border is optional
Central American Agreement:	As in the United States, but symbols instead of inscriptions
Economic Commission for Asia and the Far East recommendation:	As in the Protocol, but also permitted is a square with the diagonal vertical, alone or placed below the triangle and bearing the symbol (if the triangle is superimposed on the square, the triangle bears no symbol)

(b) *Advance level-crossing signs*

In the United States:	A yellow disk with diagonal black lines and the letter R in the left and right quadrants thus formed
Protocol, Economic Commission for Africa recommendation, Central American Agreement and Economic Commission for Asia and the Far East recommendation:	The sign laid down under the general principles of the system with a symbol as follows: for level-crossings with gates: a gate; for other level crossings: under the Protocol, a steam locomotive; under the other systems: a Saint Andrew's cross broken at the centre to display the symbol of a railway, consisting of a horizontal bar crossed by short vertical lines

(c) *Advance signs for an intersection at which the road user will encounter sign I ("Yield right of way") or sign II ("Stop at intersection")*

1949 Protocol:	Sign I ("Yield right of way"), supplemented by a plate below the sign indicating the distance from the intersection
United States:	The ordinary danger sign with a suitable inscription
Economic Commission for Africa recommendation, Central American Agreement, Economic Commission for Asia and the Far East recommendation:	The ordinary danger sign with the symbol for an intersection (a thick horizontal black line with a shorter and thinner vertical line)

(d) *Miscellaneous remarks*

- (i) Under the Protocol, the advance danger sign for intersections where the normal rules of priority apply is conventional, consisting of a Saint Andrew's cross; under the other systems, it consists of the pattern of the intersection, which of course varies.
- (ii) To indicate bends, countries which are Parties to the Protocol may either adopt throughout their territory a conventional symbol consisting of an inclined Z or use the pattern of the individual bend as a symbol; under the other systems, only the latter method is used and the pattern of the bend ends in an arrow.
- (iii) As an outgrowth of the Protocol, the countries of Europe have adopted a number of expressive symbols which are not used elsewhere (danger, flying stones; roundabout; danger, wild animals crossing; danger, landslides; embankment ahead, etc.)

IV. *Signs giving instructions*

(a) These signs may be:

Prohibitory:	No entry for all vehicles, no entry for certain classes of road users or vehicles, turning to the right (or to the left) prohibited, overtaking prohibited, waiting or stopping prohibited, etc.
Restrictive:	Speed-limit, restrictions on the height, width, length or weight of vehicles, restricted stopping, etc.
Mandatory:	Direction to be followed, compulsory cycle track, etc.

- (b) Under the system laid down in the Protocol, prohibitory and restrictive signs are circular, white or yellow, with a wide red border; the prohibition or restriction is represented by a symbol in black; the few mandatory signs stipulated are circular and have a blue ground with a symbol in white; some prohibitory signs also have a red diagonal bar across the symbol.

In the United States of America, inscriptions only are used on all signs; the sign is a rectangle with the longer side vertical; the ground is white and the inscription is in black (the colours are reversed in the case of large signs and signs indicating a speed-limit only after dark); on signs regulating waiting, however, the inscription is in red where waiting is totally prohibited and in green where it is restricted. Under the Economic Commission for Africa and Economic Commission for Asia and the Far East systems, prohibitory and restrictive signs are the same as under the Protocol, except that all prohibitory signs have a red diagonal bar across the symbol; the only mandatory sign laid down (direction to be followed) is circular, with white or yellow ground, red border and a symbol in black.

The Central American Agreement combines the American and the ECA-ECAFE systems; the signs consist of a rectangle showing the ECA-ECAFE sign above and an inscription below.

- (c) Whereas the Economic Commission for Africa and Economic Commission for Asia and the Far East recommendations and the Central American Agreement prescribe only one sign to indicate "no entry for all vehicles" (a white disk with red border, showing a vertical black arrow pointing upwards and crossed by a red diagonal bar), the Protocol makes provision for two different signs, both of which are purely conventional; one indicates that the road is closed to all vehicles in both directions (a white disk with red border, but with neither symbol nor diagonal bar), and the other that the road is closed to traffic only in the direction in which vehicles approaching the sign are proceeding (a red disk with a broad white horizontal bar).

Whereas the ECA and ECAFE systems have two different signs for restrictions on waiting — one indicating that waiting is prohibited (a white disk with red border bearing the letter P in black crossed by a red diagonal bar) and one indicating a time-limit on waiting (the same signal, but without the red diagonal bar), the Central American Agreement prescribes only one sign (a white or yellow disk with red border showing the letter E); the Protocol also lays down only one sign (a blue disk with red border and a diagonal red bar or, by way of a concession, the ECA-ECAFE "waiting prohibited" sign) with an additional plate below the sign in cases where waiting is restricted but not prohibited. The European countries applying the Protocol are considering reopening the question; they would like to make a distinction between a prohibition of stopping and a prohibition of or restriction on waiting, and a further distinction in the case of an alternate-side-of-the-street prohibition on waiting.

The ECAFE recommendation stipulates that the end of a prohibition shall be indicated by the same sign as the beginning of a prohibition, accompanied by a suitable inscription; the ECA recommendation and the Central American Agreement specify the same sign, but with a black border and a suitable inscription; the Protocol, as supplemented by the European countries, provides that the end of a prohibition shall be indicated by a white or light yellow disk showing the symbol for the prohibition in grey and crossed by a diagonal bar consisting of fine parallel black lines, the absence of any symbol on the sign meaning "End of all prohibitions in force".

V. *Indication signs*

These may be divided into: advance signs; direction signs; route identification signs; and signs giving other information.

The systems laid down by the Protocol, ECA, ECAFE, and the Central American Agreement are all similar — a rectangular sign with one side horizontal, a prohibition in principle of the use of the colour red, and the use in some cases of the same expressive symbols.

The United States system is almost the same, but it should be noted that no symbols are used and there is no special shape for route identification signs.

VI. *Light signals*

There is no difference between the various systems in the meaning of the lights, except as concerns the meaning of a single red intermittent light; under the system laid down in the Protocol, this kind of light means "Come to a complete stop", since it may be used at level-crossings to indicate the approach of a train (although a supplement to the Protocol has been recommended, with a view to stipulating that for this purpose two red lights flashing alternately should be used, as under the other systems); in the other systems, a single red intermittent light has the same meaning — i.e., "Stop, then proceed with caution" — as sign II ("Stop at intersection") described above.

DOCUMENT E/3977

Report of the Economic Committee

[Original text: English]
[13 August 1964]

1. The Economic Committee, under the chairmanship of the first Vice-President of the Council, Mr. Akira Matsui (Japan), considered at its 355th and 356th meetings on 11 and 12 August 1964 item 25 of the Council's agenda which had been referred to it by the Council at its 1314th plenary meeting on 13 July 1964.

2. The Committee had before it documents E/3883 and E/L.1058.

3. The Committee also received a draft resolution by the delegations of Austria, Czechoslovakia, France and the United Kingdom of Great Britain and Northern Ireland (E/AC.6/L.306) in connexion with its consideration of this item.

4. The sponsors of the draft resolution accepted the following changes in their text;

(i) In the sixth preambular paragraph, the word "effectively" was inserted after the words "that the 1949 Convention cannot be", and the words "and that this Conference should take place as soon as feasible" were added at the end of this paragraph;

(ii) The last part of operative paragraph 1 was re-drafted to read as follows: "and to communicate them to Member Governments and to the regional economic commissions for consideration;"

(iii) The words "with a small group of experts" in operative paragraph 2 were replaced by the words "with such experts as he may consider appropriate";

(iv) The words "not only to study these drafts but also" were deleted from operative paragraph 3 (a);

(v) Operative paragraph 3 (b) was deleted;

(vi) The last part of operative paragraph 3 (d) [now paragraph 3 (c)] was reworded to read as follows: "...and to submit to the Council at its thirty-ninth session, a report on progress achieved which should include the draft instruments and any comments then received, with a view to a Conference being convened as soon thereafter as may be feasible so as to minimize the delay in bringing new world-wide instruments into force."

5. The delegations of Australia and Italy joined the co-sponsors of the draft resolution.

6. The Committee then approved the six-power draft resolution (E/AC.6/L.306), as revised by the sponsors, by twenty-four votes to none, with no abstentions, and therefore recommends to the Council the adoption of the following draft resolutions:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1034 (XXXVII). Question of Procedures for the Revision of the Convention on Road Traffic and of the Protocol on Road Signs and Signals, done at Geneva, 19 September 1949

The Economic and Social Council,

Recalling its resolution 967 (XXXVI) of 25 July 1963 on the revision of the Convention on Road Traffic and of the Protocol on Road Signs and Signals done at Geneva, 19 September 1949,

Having noted that the procedure for revision of the aforesaid two instruments has been instituted again in accordance with that resolution, pursuant to a proposal by France, and that:

So far as concerns the Convention the procedure has failed;

So far as concerns the Protocol, two-thirds of the Contracting Parties have informed the Secretary-General that they are of the opinion that the amend-

ments should be adopted without a conference being convened, with the result that the proposed amendments will shortly enter into force in conformity with article 60, paragraph 5 of the Protocol, save with respect to such Contracting Parties as may notify the Secretary-General that they object thereto,

Having noted the report (E/3883) submitted by the Secretary-General in accordance with its resolution 967 (XXXVI),

Considering that the 1949 Convention on Road Traffic should be amended in order to bring about greater uniformity of national regulations governing road traffic and national regulations on the equipment of motor vehicles and any other road vehicles, to facilitate international traffic and to develop an optimum system of road signs and signals and road markings,

Considering further that, in order to take account of the new needs which have arisen through the increase in road traffic, the 1949 Protocol on Road Signs and Signals

should be amended much more radically than it would be through the adoption of the amendments now under consideration, and that these amendments should be included in a new effort, to be undertaken when the Convention is revised, to reconcile the several systems of road signs and signals, to achieve a better and as uniform as possible system of road signs and signals,

Being of the opinion, in the light of the unsuccessful attempts recently made to amend the Convention without the convening of a conference, that the 1949 Convention cannot be effectively amended or replaced otherwise than through the convening of a conference, and that this conference should take place as soon as feasible,

Taking the view, however, that the convening of such a conference should be preceded by detailed technical studies, in particular at the regional level,

1. *Requests* the Secretary-General to prepare on the basis of the 1949 Convention and the draft supplementary European Convention, the draft of a revised Convention on standard rules for road traffic and draft standard technical specifications for vehicles and their equipment, and to communicate them to Member Governments and to the regional economic commissions for consideration;

2. *Further requests* the Secretary-General to prepare, in consultation with such experts as he may consider appropriate, taking into account the 1952 draft Convention and the various systems of signs and signals at present

in existence, the draft of a new instrument on road signs and signals and on road marking; this text, which would be designed to replace finally the existing Protocol should lay down an optimum system based on symbolic signs; it might in addition be prefaced by certain principles to be universally applied;

3. *Invites* :

(a) The regional economic commissions to consider what could be done to bring the systems of road signs and signals in use in the countries of their regions closer to the 1952 draft convention and the 1949 Protocol;

(b) The Secretary-General and the Executive Secretaries of the regional economic commissions to secure, for the purpose of the aforesaid tasks, the co-operation of the international organizations, governmental and non-governmental, which are competent in this field;

(c) The Secretary-General to ensure close co-ordination of the work of the regional economic commissions referred to above and to submit to the Council at its thirty-ninth session, a report on progress achieved which should include the draft instruments and any comments then received, with a view to a conference being convened as soon thereafter as may be feasible so as to minimize the delay in bringing new world-wide instruments into force.

*1350th plenary meeting,
14 August 1964.*

CHECK LIST OF DOCUMENTS

NOTE. This check list includes the documents pertaining to agenda item 25 which are not reproduced in the present fascicle.

<i>Document No.</i>	<i>Title</i>	<i>Observations and references</i>

DOCUMENT E/3879

Memorandum from Senegal

[Original text: French]
[20 April 1964]

By resolution 1907 (XVIII), the General Assembly designated 1965 as International Co-operation Year.

The fourth and fifth preambular paragraphs of that resolution describe the General Assembly as

“ *Considering it essential* that Member States should endeavour to promote measures aimed at the elimination of international tension”, and as

“ *Convinced* that increased public awareness of the extent and significance of existing everyday co-operation would lead to a better appreciation of the true nature of the world community and of the common interests of mankind”.

Accordingly, operative paragraph 4 of the resolution calls upon all Member States, the specialized agencies, the International Atomic Energy Agency and the non-governmental organizations, *inter alia*:

“(b) To publicize to the widest extent feasible the activities of international co-operation in which they have been and are at present engaged and their efforts to strengthen and expand these activities;

“(c) To formulate such plans and programmes as seem to them appropriate to promote the purposes of the International Co-operation Year”.

It is within the context of sub-paragraph (c) and in keeping with the fifth preambular paragraph of the resolution that the Government of Senegal has asked for the inclusion of the item “Town twinning: means of international co-operation” in the agenda of the thirty-seventh session of the Economic and Social Council.

Through its Minister for Foreign Affairs and its Permanent Representative to the United Nations, Senegal has already emphasized the importance it attaches to town twinning as a means of international co-operation. In a message addressed to the Foreign Ministers of all countries, Mr. Doudou Thiam, Minister of State for Foreign Affairs, Relations with the Assemblies, and the Vice-Presidency of the Republic, and President of the United Towns Organization stated:

“The reason why many Africans have accepted positions of responsibility on the Executive Board of the United Towns Organization is that this organization is dedicated to co-operation in the form of tangible action, such as the training of personnel, assistance to developing countries, and international civic education for young people through direct personal contacts between towns in modern countries and towns in under-equipped countries.

“Yet that is not the only benefit; for this international exchange is not only decentralized and personal but also free from politics. Any twinning worthy of the name is not an instrument of propaganda for a country or a bloc; otherwise, it would no longer be co-operation but merely a new disguise for colonialism. In twinning, the ordinary citizen is not used by the authorities for some political purpose, he becomes part of a communal act of solidarity in which there is no implication of an ‘alignment’ of partners and no commitment in terms of traditional policy. If there is any hope of genuine East-West collaboration in assistance to the ‘third world’ without ulterior

motives of domination, rivalry and bargaining, then 'triangular' twinings can certainly help to bring about that collaboration, so widely favoured by the world's great men".

It was Mr. Léopold Sédar Senghor, President of the Republic of Senegal, who, speaking about the International Co-operation Year, said:

"Let us hope that, with the help of the United Towns Organization and of the United Nations, the Year will be marked by many twinings throughout the world, weaving by this device of direct democracy a network of solidarity and friendship from country to country, and from people to people".

It should also be noted that the idea of town twinning has been generally accepted by the Social, Humanitarian and Cultural Committee of the United Nations in the draft declaration on the promotion among youth of the ideals of peace, mutual respect and understanding between peoples. This draft has been transmitted to Member States for study [See, General Assembly resolution 1965 (XVIII)].

It is therefore necessary that there should be a large

number of twinings, 100 for example, to mark the International Co-operation Year of 1965 (at least one twinning per Member State) under the auspices of the United Nations and the United Towns Organization. With regard to this self-evident method of international co-operation Abbé Pierre has said:

"Because it helps people to know each other at the primary level of man's social co-operation (immediately after the level of the family circle), the twinning of towns across any and every frontier may, if it can remain sufficiently free and clear of every kind of State pressure, carry great weight with the public conscience whenever the intoxication of hate threatens to submerge it".

It is to be hoped that 1965 will be the year of the human community, by providing an opportunity for men to come to know, to understand and to love one another, and for the East, the West and the "third-world" to co-operate honestly, loyally and without discrimination or partisan feeling, for the well-being of all mankind. Town twinning will fit these objectives perfectly.

13 April 1964

DOCUMENT E/3969

Report of the Social Committee

[Original text: English]
[11 August 1964]

1. The Social Committee, under the chairmanship of Mr. Adbelkader Chanderli, Second Vice-President of the Council, considered, at its 505th to 507th meetings, held on 6 and 7 August 1964, item 26 of the Council's agenda: "Town twinning: means of international co-operation". This item had been referred to the Social Committee for its consideration during the 1314th plenary meeting held on 13 July 1964.

2. The Committee had before it the following documentation in connexion with the consideration of this item: a memorandum on the subject from the delegation of Senegal (E/3879); a communication to the President from the Head of the delegation of the Czechoslovak Socialist Republic to the thirty-seventh session of the Economic and Social Council (E/L.1058); a draft resolution submitted by Algeria, Cameroon, Chile, Ghana, Iraq, Senegal and Yugoslavia (E/AC.7/L.445); amendment by the United Kingdom of Great Britain and Northern Ireland to the seven-power draft resolution (E/AC.7/L.446); amendments by the United States of America to the seven-power draft resolution (E/AC.7/L.447); amendments by Senegal to the United Kingdom amendment contained in document E/AC.7/L.446 (E/AC.7/L.448); and a revised draft resolution submitted by Algeria, Cameroon, Chile, Ghana, Iraq, Senegal and Yugoslavia (E/AC.7/L.445/Rev.1).

3. The Committee's consideration and action on the various amendments and oral proposals and suggestions

made during the discussion of this item are given below, paragraph by paragraph.

Preambular paragraph 1

4. The United States of America submitted an amendment to preambular paragraph 1 (amendment No. 1 of E/AC.7/L.447) which would *omit* the word "when" and *replace* the phrase "without discrimination of any kind" by the phrase "between Members of the United Nations and specialized agencies in the spirit of mutual understanding and assistance, and particularly among countries of different stages of development".

5. The representative of Argentina suggested that the United States amendment could usefully be added at the end of this paragraph following "and especially...". The representative of the United States suggested that the English version might be amended to delete the word "when" and to replace the words "discrimination of any kind" by "any discrimination, and especially between Members of the United Nations".

6. The representative of Senegal, on behalf of the co-sponsors, thereupon orally revised this paragraph to include the United States and Argentine oral suggestions and to read as follows:

"*Considering* that experience in recent years has shown the great value of town-twinning practised

without any discrimination, and especially between States Members of the United Nations.”

7. The representative of the United States withdrew his amendment to this paragraph and the paragraph, as orally revised, was adopted unanimously.

Preambular paragraph 2

8. The representative of the United Kingdom proposed the following amendment (amendment No. 1 of E/AC.7/L.446):

“insert after ‘United Towns Organization’ the words ‘the International Union of Local Authorities and other organizations’”.

9. The representative of Senegal introduced a sub-amendment (amendment No. 1 of E/AC.7/L.448) to the United Kingdom, which read as follows:

“replace the words ‘the International Union of Local Authorities and other organizations’ by the words ‘and other similar organizations’”.

10. The representative of India proposed that the word “town-twinning” should be used throughout the resolution instead of “twinning” as found in some paragraphs of E/AC.7/L.445/Rev.1. (Following general acceptance of this proposal, the adopted paragraphs given below incorporate this change).

11. The United Kingdom amendment was withdrawn following the deletion of the words “in a majority of cases” and the revision of this paragraph by the representative of Senegal, on behalf of the co-sponsors. The revised paragraph read as follows:

“*Considering* that many town-twinning arrangements under the auspices of the United Towns Organization and other similar organizations promote the realization of the lofty ideals enshrined in the United Nations Charter, the constitution of UNESCO and the resolutions of the great international conferences,”.

12. Preambular paragraph 2, as orally revised, was adopted by 21 votes to none with 2 abstentions.

Preambular paragraph 3

13. Two amendments were submitted to this paragraph by the representative of the United States (amendments Nos. 2 and 3 of E/AC.7/L.447) which read as follows:

- (i) “In the third preambular paragraph after the word ‘makes’ in the first line, *add* the words ‘important contribution to’”;
- (ii) “In the same third preambular paragraph, *replace* the word *feasible* by the word *permits*”.

14. The third preambular paragraph contained in E/AC.7/L.445/Rev.1 was subsequently orally revised by the representative of Senegal, on behalf of the co-sponsors, by replacing the words “making feasible” by the word “permitting”.

15. The United States amendments having been withdrawn, the third preambular paragraph, as orally revised, was adopted unanimously and read as follows:

“*Considering* that the first African Conference of World-Wide Inter-community Co-operation, meeting at Dakar on 1, 2 and 3 April 1964 and attended by 148 participants from 41 countries, laid special emphasis on “town-twinning co-operation” as a means of establishing positive mutual assistance between equal partners, permitting vocational and domestic training, the training of key municipal administrative personnel and skilled workers, and adapting vocational and domestic training to local needs through appropriate periods of instruction”.

Preambular paragraph 4

16. No amendments were submitted to this paragraph, and it was adopted unanimously. The text of the paragraph (E/AC.7/L.445/Rev.1) read as follows:

“*Considering* that the General Assembly of the United Nations decided, by resolution 1907 (XVIII), dated 21 November 1963, to designate 1965 as International Co-operation Year,”.

Preambular paragraph 5

17. An amendment to this paragraph submitted by the representative of the United States (amendment No. 4 of E/AC.7/L.447) to delete this paragraph was withdrawn. The Committee adopted this paragraph unanimously, subject to its alignment, in all languages, to the French original text. The text of this paragraph, as adopted by the Committee, read as follows:

“*Considering* therefore that it is desirable that such a direct form of co-operation as town-twinning should be put into practice,”.

Operative paragraph 1

18. No amendments were submitted to this paragraph. However, in the course of the discussion the words “particularly as a part of” were replaced by “both in connexion with” and “as well as” by “and”. The paragraph, as orally revised, was adopted unanimously, and read as follows:

“1. *Considers* town-twinning as one of the means of co-operation that should be encouraged by the international Organization both in connexion with International Co-operation Year and on a permanent basis,”.

Operative paragraph 2

19. The representative of the United Kingdom submitted an amendment (amendment No. 2 of E/AC.7/L.446) to this paragraph, which read as follows:

“add after the words ‘United Towns Organization’ the words ‘the International Union of Local Authorities,’”.

20. The representative of the United States submitted an amendment to this paragraph (amendment No. 5 of E/AC.7/L.447) which would replace it by the following:

“ 2. *Transmits* this resolution to the Committee for the International Co-operation Year established by General Assembly resolution 1907 (XVIII) for appropriate action designed to encourage town-twinning as a means of achieving the objectives of International Co-operation Year.”

21. The representative of Senegal introduced a sub-amendment (amendment No. 2 of E/AC.7/L.448) to the United Kingdom amendment which read as follows:

“ In amendment 2, replace the words ‘ the International Union of Local Authorities ’ by the words ‘ and other organizations having the same objectives, ’ ”.

22. The representative of Senegal revised his text by inserting the word “ competent ” before “ non-governmental organizations ” and by deleting the phrase at the end “ and, in particular, the United Towns Organization and other similar organizations ”. Taking into account statements by the representatives of the Secretary-General and UNESCO, it was agreed to include the words “ within the limits of their resources ” following the words “ encourage during 1965 ”. As a consequence of the revision of this paragraph, the United Kingdom amendment did not apply. The representative of the United States withdrew his amendment to this paragraph.

23. Operative paragraph 2, as orally revised by the co-sponsors, was adopted by 20 votes to none with 2 abstentions. The text of the adopted paragraph read as follows:

“ 2. *Recommends* the United Nations and UNESCO to encourage during 1965, within the limits of their resources, the largest possible number of town-twinning with the collaboration of competent non-governmental organizations; ”.

Operative paragraph 3

24. The representative of the United States introduced an amendment (amendment No. 6 of E/AC.7/447) to this paragraph which read as follows:

“ 3. *Refers* to the Non-Governmental Organizations Committee the request to accord the United Towns Organization status in category A for action in 1965 in keeping with paragraph 35 (a) and other applicable

rules set forth in Council resolution 288 (X) on Review of Consultative Arrangements with Non-Governmental Organizations; ”.

25. The representative of Austria suggested revision of this paragraph by the deletion of the phrase “ in order to strengthen the effectiveness of the United Towns Organization as an extension of international action on the non-governmental plane ” and the replacement of the words “ to consider favourably ” by “ to give all due consideration to ”.

26. Following oral revision of this paragraph by the representative of Senegal, on behalf of the co-sponsors, along the lines of the suggestions of the representative of Austria, the representative of the United States withdrew his amendment.

27. Operative paragraph 3, as orally revised, was adopted by 20 votes to none with 3 abstentions. The text of this paragraph as adopted read as follows:

“ 3. *Invites* the Council Committee on Non-Governmental Organizations to give all due consideration, as soon as possible and in accordance with established procedures, to the request that the United Towns Organization should be given category A consultative status; ”.

Operative paragraph 4

28. No amendments were submitted to this paragraph and it was adopted unanimously by the Committee.

29. The draft resolution contained in document E/AC.7/L.445/Rev.1, as orally revised by the sponsors during the discussion, was adopted by roll-call by 20 votes to none with 3 abstentions. The voting was as follows:

In favour: Algeria, Argentina, Australia, Austria, Cameroon, Chile, Colombia, Czechoslovakia, Ghana, India, Indonesia, Iran, Iraq, Italy, Senegal, Union of Soviet Socialist Republics, United Arab Republic, United Kingdom of Great Britain and Northern Ireland, United States of America and Yugoslavia.

Against: None.

Abstentions: France, Japan and Luxembourg.

30. The Committee therefore recommends the adoption by the Council of the following draft resolution:

[*Text adopted by the Council without change. See below, “ Resolution adopted by the Economic and Social Council ”.*]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1028 (XXXVII). Town twinning: means of international co-operation

The Economic and Social Council,

Considering that experience in recent years has shown the great value of town-twinning practised without any discrimination and especially between States Members of the United Nations,

Considering that many town-twinning arrangements under the auspices of the United Towns Organization and other similar organizations promote the realization of the lofty ideals enshrined in the United Nations Charter, the constitution of the United Nations Educational, Scientific and Cultural Organization and the resolutions of the great international conferences,

Considering that the first African Conference of World-Wide Inter-community Co-operation, meeting at Dakar on 1, 2 and 3 April 1964 and attended by 148 participants from 41 countries, laid special emphasis on "town-twinning co-operation" as a means of establishing positive mutual assistance between equal partners, permitting vocational and domestic training, the training of key municipal administrative personnel and skilled workers and adapting vocational and domestic training to local needs through appropriate periods of instruction,

Considering that the General Assembly decided in its

resolution 1907 (XVIII), dated 21 November 1963, to designate 1965 as International Co-operation Year,

Considering therefore that it is desirable that such a direct form of co-operation as town-twinning should be put into practice,

1. *Considers* town-twinning as one of the means of co-operation that should be encouraged by the International Organization both in connexion with International Co-operation Year and on a permanent basis;

2. *Recommends* the United Nations and the United Nations Educational, Scientific and Cultural Organization to encourage during 1965, within the limits of their resources, the largest possible number of town-twinning arrangements with the collaboration of competent non-governmental organizations;

3. *Invites* the Council Committee on Non-Governmental Organizations to give all due consideration, as soon as possible and in accordance with established procedures, to the request that the United Towns Organization should be given category A consultative status;

4. *Requests* the Secretary-General to transmit this resolution to the General Assembly committee responsible for the preparation of International Co-operation Year.

*1348th plenary meeting,
13 August 1964.*

DOCUMENT E/3952 **

Report of the Social Committee

[Original text: English]
[24 July 1964]

1. The Social Committee, under the chairmanship of Mr. Abdelkader Chanderli (Algeria), second Vice-President of the Council, at its 490th to 497th meetings held from 16 to 22nd July 1964, considered item 27 of the Council's agenda: (Report of the Commission on Human Rights), which had been referred to the Committee by the Council at its 1314th meeting held on 13 July 1964. In referring this item the Council also decided that the Social Committee should be asked to consider the draft declaration on the elimination of all forms of religious intolerance with a view to its completion and subsequent transmission to the General Assembly at its nineteenth session.

2. The Committee had before it the following documents: report of the Commission on Human Rights on its twentieth session (E/3873); note by the Secretary-General (E/3925 and Corr.1 and Add.1) transmitting the comments received from Governments on the preliminary draft declaration on the elimination of all forms of religious intolerance prepared by the Sub-Commission on Prevention of Discrimination and Protection of Minorities (E/3873, para. 294) and on the report of a working group of the Commission (*ibid.*, para. 296).

3. At its 490th meeting, the Committee decided, on the proposal of the representative of Argentina, to follow its general debate on this item by considering the report chapter by chapter and to consider the draft resolutions submitted by the Commission (*ibid.*, chap. XI

at the same time as the chapters to which they referred. The Committee held its general debate during the 490th to 492nd meetings and considered the chapters and the draft resolutions and actions required in connexion with them at the 493rd to 497th meetings.

4. The Committee considered chapters I, IV, VI, VIII, IX and X and did not recommend any action in connexion with these chapters. Several draft resolutions were submitted in connexion with the Committee's consideration of the remaining chapters of the report. The Committee's action with reference to those chapters was as follows.

Chapter II. Draft International Convention on the Elimination of All Forms of Racial Discrimination

5. The Committee considered the draft resolution submitted by the Commission on Human Rights (E/3873, chap. XI, draft resolution I) and adopted it unanimously (see para. 17, draft resolution I below).

Chapter III. Draft Declaration and Draft Convention on the Elimination of All Forms of Religious Intolerance

6. During the consideration of this chapter, the representative of Mexico, on behalf also of Cameroon, Ghana, India, Indonesia, Iraq, Senegal, the United Arab Republic and the United Republic of Tanganyika and Zanzibar, introduced a draft resolution (E/AC.7/L.437).

7. The representative of the United Kingdom made an oral proposal to the effect that it be decided whether

** Incorporating document E/3952/Corr.1.

or not the Social Committee, without detriment to the time and items allocated to it, make an attempt to continue work on the draft declaration, and, if possible, complete it.

8. The Committee had before it a note prepared by the Secretariat on the financial implications of various courses of action under discussion (E/AC.7/L.436).

9. The Committee decided by 14 votes to 7, with 4 abstentions to give priority to the consideration of the nine-Power draft resolution (E/AC.7/L.437).

10. The representative of the United States of America introduced an amendment (E/AC.7/L.438) whereby the following paragraph would be added to the nine-Power draft resolution:

“Requests the General Assembly to give high priority to completing a draft declaration with a view to its adoption at the nineteenth session of the General Assembly”.

This amendment was subsequently revised orally so that it would replace operative paragraph 3 of the nine-Power draft resolution.

11. The amendment of the United States (E/AC.7/L.438 as orally revised) was not adopted by the Committee by 13 votes to 13, with no abstentions.¹

12. The Committee adopted draft resolution E/AC.7/L.437 by 16 votes to none, with 10 abstentions (see para. 17, draft resolution 2, below).

Chapter V. Prevention of Discrimination and Protection of Minorities

13. The Committee considered the draft resolution on the study of discrimination in respect of the right of everyone to leave any country, including his own, and to return to his country, which had been submitted to Council by the Commission on Human Rights (E/3873, chap. XI, draft resolution II). The Committee adopted the draft resolution by 18 votes to none, with 5 abstentions (see para. 17, draft resolution III, below).

Chapter VII. Designation of 1968 as International Year for Human Rights

14. A draft resolution on this question transmitted by the Commission on Human Rights (E/3873, chap. XI, draft resolution III) was considered by the Committee during the discussion of chapter VII of the report.

15. The Committee adopted unanimously, by roll-call vote, the draft resolution on the International Year for Human Rights (see para. 17, draft resolution IV, below).

¹ In accordance with rule 70 of the Rules of Procedure of the Economic and Social Council.

16. Following consideration of the various chapters of the report, the Committee unanimously decided to recommend to the Council the adoption of the draft resolution under which the Council takes note of the report of the Commission on Human Rights on its twentieth session (see para. 17, draft resolution V, below).

17. The Committee recommends the adoption by the Council of the following draft resolutions:

I

DRAFT INTERNATIONAL CONVENTION ON THE ELIMINATION OF ALL FORMS OF RACIAL DISCRIMINATION

[Text adopted by the Council without change. See below “Resolutions adopted by the Economic and Social Council”, resolution 1015 B (XXXVII).]

II

DRAFT DECLARATION ON THE ELIMINATION OF ALL FORMS OF RELIGIOUS INTOLERANCE

[Text adopted by the Council without change. See below “Resolutions adopted by the Economic and Social Council”, resolution 1015 C (XXXVII).]

III

STUDY OF DISCRIMINATION IN RESPECT OF THE RIGHT OF EVERYONE TO LEAVE ANY COUNTRY, INCLUDING HIS OWN, AND TO RETURN TO HIS COUNTRY

[Text adopted by the Council without change. See below “Resolutions adopted by the Economic and Social Council”, resolution 1015 D (XXXVII).]

IV

INTERNATIONAL YEAR FOR HUMAN RIGHTS (1968)

[Text adopted by the Council without change. See below “Resolutions adopted by the Economic and Social Council”, resolution 1015 E (XXXVII).]

V

REPORT OF THE COMMISSION ON HUMAN RIGHTS

[Text adopted by the Council without change. See below “Resolutions adopted by the Economic and Social Council”, resolution 1015 A (XXXVII).]

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1015 (XXXVII). Report of the Commission
on Human Rights

A

REPORT OF THE COMMISSION

The Economic and Social Council

Takes notes of the report of the Commission on Human Rights (twentieth session) (E/3878).

*1338th plenary meeting,
30 July 1964.*

B

DRAFT INTERNATIONAL CONVENTION ON THE ELIMINATION
OF ALL FORMS OF RACIAL DISCRIMINATION*The Economic and Social Council,*

Recalling that the General Assembly, in resolution 1780 (XVII) of 7 December 1962 and 1906 (XVIII) of 20 November 1963, requested the Commission on Human Rights to prepare a draft international convention on the elimination of all forms of racial discrimination.

Noting that the Commission on Human Rights has adopted at its twentieth session, in pursuance of the General Assembly's request, the substantive articles of a draft convention on the elimination of all forms of racial discrimination, on the basis of a preliminary draft prepared by the Sub-Commission on Prevention of Discrimination and Protection of Minorities,

Submits to the General Assembly, for its consideration at its nineteenth session, the substantive articles prepared by the Commission on Human Rights, which are annexed to the present resolution, as well as the following documents which have not been voted upon by the Commission:

(a) The proposal for an additional article submitted by the United States of America and the sub-amendment submitted thereto by the Union of Soviet Socialist Republics (E/3873, paras. 273 and 274) as well as the records of the discussion thereon in the Commission;²

(b) Article X of the draft convention transmitted to the Commission on Human Rights by resolution 1 (XVI) of the Sub-Commission on Prevention of Discrimination and Protection of Minorities (E/3873, para. 281), which deals with measures of implementation as well as the records of the discussion thereon in the Commission;³

(c) The preliminary draft on additional measures of implementation transmitted to the Commission by resolution 2 (XVI) of the Sub-Commission (E/3873, annex I) as well as the record of the discussion thereon in the Commission;⁴

(d) The working paper prepared by the Secretary-General for the final clauses of the draft convention on the elimination of all forms of racial discrimination;⁵

(e) The records of the discussion of this item by the Commission on Human Rights.⁶

*1338th plenary meeting,
30 July 1964.*

ANNEX

PROVISIONS OF THE DRAFT INTERNATIONAL CONVENTION ON THE
ELIMINATION OF ALL FORMS OF RACIAL DISCRIMINATION ADOPTED
BY THE COMMISSION AT ITS TWENTIETH SESSION*The States Parties to this Convention,*

Considering that the Charter of the United Nations is based on the principle of the dignity and equality inherent in all human beings, and that all States Members have pledged themselves to take joint and separate action in co-operation with the Organization for the achievement of one of the purposes of the United Nations, which is to promote and encourage universal respect for and observance of human rights and fundamental freedoms for all without distinction as to race, sex, language or religion,

Considering that the Universal Declaration of Human Rights proclaims that all human beings are born free and equal in dignity and rights and that everyone is entitled to all the rights and freedoms set out therein, without distinction of any kind, in particular as to race, colour or national origin,

Considering that the United Nations has condemned colonialism and all practices of segregation and discrimination associated therewith, in whatever form and wherever they exist, and that the Declaration on the Granting of Independence to Colonial Countries and Peoples of 14 December 1960 has affirmed and solemnly proclaimed the necessity of bringing them to a speedy and unconditional end,

Considering that the United Nations Declaration on the Elimination of All Forms of Racial Discrimination of 20 November 1963 solemnly affirmed the necessity of speedily eliminating racial discrimination throughout the world in all its forms and manifestations,

Convinced that any doctrine of superiority based on racial differentiation is scientifically false, morally condemnable, socially unjust and dangerous, and that there is no justification for racial discrimination in theory or in practice anywhere.

Reaffirming that discrimination between human beings on the grounds of race, colour or ethnic origin is an obstacle to friendly and peaceful relations among nations and is capable of disturbing peace and security among peoples as evil racial doctrines and practices have done in the past,

Concerned by manifestations of racial discrimination still in evidence in some areas of the world and by governmental policies based on racial superiority or hatred, such as policies of apartheid, segregation or separation,

Resolved to adopt all necessary measures for eliminating speedily racial discrimination in all its forms and manifestations and to prevent and combat racist doctrines and practices in order to

² E/CN.4/SR.805, 807 and 808.

³ E/CN.4/SR.805, 808 and 810.

⁴ E/CN.4/SR.810.

⁵ E/CN.4/L.679.

⁶ E/CN.4/SR.774-810.

build an international community free from all forms of racial segregation and racial discrimination.

Bearing in mind the Convention on Discrimination in Respect of Employment and Occupation adopted by the International Labour Organisation in 1958, and the Convention against Discrimination in Education adopted by the United Nations Educational, Scientific and Cultural Organization in 1960,

Desiring to implement the principles embodied in the United Nations Declaration on the Elimination of All Forms of Racial Discrimination and to secure the earliest adoption of practical measures to that end,

Have agreed as follows:

Article I

1. In this Convention the expression "racial discrimination" shall mean any distinction, exclusion, restriction or preference based on race, colour, [national] or ethnic origin which has the purpose or effect of nullifying or impairing the recognition, enjoyment or exercise, on an equal footing, of human rights and fundamental freedoms in the political, economic, social, cultural or any other field of public life. [In this paragraph the expression "national origin" does not cover the status of any person as a citizen of a given State.]

2. Special measures taken for the sole purpose of securing adequate development or protection of certain under-developed racial groups or individuals belonging to them in order to ensure to such groups or individuals equal enjoyment or exercise of human rights and fundamental freedoms shall not be deemed racial discrimination, provided, however, that such measures do not, as a consequence, lead to the maintenance of separate rights for different racial groups and that they shall not be continued after the objectives for which they were taken have been achieved.

Article II

1. States parties to the present Convention condemn racial discrimination and undertake to pursue by all appropriate means and without delay a policy of eliminating racial discrimination in all its forms, and to this end:

(a) Each State party undertakes to engage in no act or practice of racial discrimination against persons, groups of persons or institutions and to ensure that all public authorities and public institutions, national and local, shall act in conformity with this obligation;

(b) Each State party shall take effective measures to review governmental and other public policies, and to amend, rescind or nullify any laws and regulations which have the effect of creating or perpetuating racial discrimination wherever it exists;

(c) Each State party shall prohibit and bring to an end, by all appropriate means, including legislation if necessary, racial discrimination by any person, group or national organization.

2. States parties shall take special concrete measures in appropriate circumstances for the sole purpose of securing adequate development or protection of certain under-developed racial groups or individuals belonging to them in order to ensure to such groups or individuals equal enjoyment or exercise of human rights and fundamental freedoms, provided, however, that such measures do not, as a consequence, lead to the maintenance of separate rights for different racial groups and that they shall not be continued after the objectives for which they were taken have been achieved.

Article III

States parties particularly condemn racial segregation and apartheid, and undertake to prevent, prohibit and eradicate, in territories subject to their jurisdiction, all practices of this nature.

Article IV

States parties condemn all propaganda and organizations which are based on ideas or theories of the superiority of one race or group of persons of one colour or ethnic origin, or which justify or promote racial hatred and discrimination in any form, and undertake to adopt immediate and positive measures designed to eradicate all incitement to such discrimination, and to this end, *inter alia*:

(a) Shall declare an offence punishable by law all incitement to racial discrimination resulting in acts of violence, as well as all acts of violence or incitement to such acts against any race or group of persons of another colour or ethnic origin;

(b) Shall declare illegal and prohibit organizations or the activities of organizations, as appropriate, and also organized propaganda activities, which promote and incite racial discrimination;

(c) Shall not permit public authorities or public institutions, national or local, to promote or incite racial discrimination.

Article V

In compliance with the fundamental obligations laid down in article II, States parties undertake to prohibit and to eliminate racial discrimination in all its forms and to guarantee the right of everyone, without distinction as to race, colour or ethnic origin, to equality before the law, notably in the enjoyment of the following rights:

(a) The right to equal treatment before the tribunals and all other organs administering justice;

(b) The right to security of person and protection by the State against violence or bodily harm, whether inflicted by government officials or by any individual, group or institution;

(c) Political rights, in particular the rights to participate in elections through universal and equal suffrage, to take part in the Government as well as in the conduct of public affairs at any level and to have equal access to public service;

(d) Other civil rights, in particular:

(i) The right to freedom of movement and residence within the border of the State;

(ii) The right to leave any country including his own, and to return to his country;

(iii) The right to nationality;

(iv) The right to marriage;

(v) The right to own property alone as well as in association with others;

(vi) The right to inherit;

(vii) The right to freedom of thought, conscience and religion;

(viii) The right to freedom of opinion and expression;

(ix) The right to freedom of peaceful assembly and association;

(e) Economic, social and cultural rights, in particular:

(i) The right to work, free choice of employment, just and favourable conditions of work, protection against unemployment, equal pay for equal work, just and favourable remuneration;

(ii) The right to form and join trade unions;

(iii) Housing;

(iv) Public health, medical care and social security and social services;

(v) Education and training;

(vi) Equal participation in cultural activities;

(f) Access to any place or service intended for use by the general public such as transport, hotels, restaurants, cafes, theatres, parks.

Article VI

States parties shall assure to everyone within their jurisdiction effective protection and remedies through the competent national tribunals against any acts of racial discrimination which violate his human rights and fundamental freedoms contrary to this Convention, as well as the right to seek from such tribunals just and adequate reparation or satisfaction for any damage suffered as a result of such discrimination.

Article VII

States parties undertake to adopt immediate and effective measures, particularly in the fields of teaching, education and information, with a view to combating prejudices which lead to racial discrimination and to promote understanding, tolerance and friendship among nations and racial or ethnical groups, as well as to propagating the purposes and principles of the Charter of the United Nations, the Universal Declaration of Human Rights, and the United Nations Declaration on the Elimination of All Forms of Racial Discrimination.

C

DRAFT DECLARATION ON THE ELIMINATION OF ALL FORMS OF RELIGIOUS INTOLERANCE

The Economic and Social Council,

Having considered resolution 2 (XX) of the Commission on Human Rights (E/3873, para. 303),

Having noted the report of the working party set up by the Commission on Human Rights for the purpose of preparing a draft declaration on the elimination of all forms of religious intolerance,

Noting that the Commission, in the terms of preambular paragraph 5 of its resolution 2 (XX), could not study and approve a draft declaration on the elimination of all forms of religious intolerance for lack of time,

Recalling the terms of General Assembly resolution 1781 (XVII) of 7 December 1962 by which the General Assembly requested the Economic and Social Council to ask the Commission on Human Rights to prepare the above-mentioned draft,

Having considered the various opinions expressed on this matter at the Council during its thirty-seventh session,

1. *Expresses its high appreciation* to the Commission on Human Rights for the work it has been able to achieve although the difficulties encountered have not enabled it to complete this work within the term given in resolution 1781 (XVII) of the General Assembly;

2. *Decides* to refer to the General Assembly resolution 2 (XX) of the Commission on Human Rights, together with the documents therein mentioned, as well as the records of the debate held on this subject at the thirty-seventh session of the Economic and Social Council;⁷

3. *Suggests* to the General Assembly that it take a decision at its nineteenth session on the further course to be followed on this matter.

*1338th plenary meeting,
30 July 1964.*

⁷ E/AC.7/SR.490-496 and 500; *Official Records of the Economic and Social Council, Thirty-seventh Session, 1338th meeting.*

D

STUDY OF DISCRIMINATION IN RESPECT OF THE RIGHT OF EVERYONE TO LEAVE ANY COUNTRY, INCLUDING HIS OWN, AND TO RETURN TO HIS COUNTRY

The Economic and Social Council,

Having considered resolution 4 (XX) adopted by the Commission on Human Rights at its twentieth session (E/3873, para. 333 and annex III C),

Requests the Secretary-General to make arrangements for Mr. José D. Ingles, Special Rapporteur for the study of discrimination in respect of the right of everyone to leave any country, including his own, and to return to his country, to attend the meetings of the Commission on Human Rights when it undertakes the consideration of his report.

*1338th plenary meeting,
30 July 1964.*

E

INTERNATIONAL YEAR FOR HUMAN RIGHTS (1968)

The Economic and Social Council,

Having considered chapter VII of the report of the Commission on Human Rights at its twentieth session (E/3873, para. 370),

Recommends the following draft resolution to the General Assembly for adoption at its nineteenth session:

" The General Assembly,

" Recalling its resolution 1961 (XVIII) of 12 December 1963 designating the year 1968 as International Year for Human Rights,

" Recognizing the need for effective measures to be taken at both the international and the national levels to encourage the further development of human rights and fundamental freedoms,

" Reaffirming the belief that the cause of human rights will be well served by an increasing awareness of the extent of the progress made, and the conviction that the year 1968 should be devoted to intensified national and international efforts and undertakings in the field of human rights and also to an international review of the achievements in this field,

" Convinced that an intensification of efforts in the intervening years will heighten the progress that can be made by 1968,

" 1. Recommends that all Member States be invited to ratify before 1968 the conventions already concluded in the field of human rights, and in particular the following:

" Supplementary Convention on the Abolition of Slavery, the Slave Trade and Institutions and Practices similar to Slavery;

" International Labour Organisation Convention Concerning the Abolition of Forced Labour;

" International Labour Organisation Convention on Discrimination in Respect of Employment and Occupation;

- “ International Labour Organisation Convention concerning Equal Remuneration for Men and Women Workers for Work of Equal Value;
- “ United Nations Educational, Scientific and Cultural Organization Convention Against Discrimination in Education;
- “ Convention on the Prevention and Punishment of the Crime of Genocide;
- “ Convention on the Political Rights of Women;
- “ 2. *Decides* to hasten the conclusion of the following draft conventions so that they may be open for ratification and accession before 1968;
- “ Draft Covenant on Civil and Political Rights;
- “ Draft Covenant on Economic, Social and Cultural Rights;
- “ Draft International Convention on the Elimination of All Forms of Racial Discrimination;
- “ Draft International Convention on the Elimination of All Forms of Religious Intolerance;
- “ Draft Convention on Freedom of Information;
- “ 3. *Decides* to complete by 1968 the consideration and preparation of the following draft declarations:
- “ Draft declaration on the elimination of discrimination in the matter of political rights;
- “ Draft declaration on the elimination of discrimination in relation to women;
- “ Draft declaration on the right of asylum;
- “ Draft declaration on freedom of information.”
- 1338th plenary meeting,
30 July 1964.*

Progress report by the Secretary-General

[Original text: English]
[15 June 1964]

1. In resolution 1905 (XVIII), entitled "Publicity to be given to the United Nations Declaration on the Elimination of All Forms of Racial Discrimination", adopted by the General Assembly at its 1261st meeting on 20 November 1963, the Assembly requested all States to undertake all necessary measures in order to implement fully, faithfully and without delay the principles contained in the United Nations Declaration on the Elimination of All Forms of Racial Discrimination. The Governments of States, and non-governmental organizations, were requested to publicize the text of the Declaration as widely as possible, using every means at their disposal, including all the appropriate media of communication. The Secretary-General and the specialized agencies were requested to ensure the immediate and large-scale circulation of the Declaration, and to that end to publish and distribute texts in all languages possible. Further, the Governments of Member States, the specialized agencies and the non-governmental organizations concerned were invited to inform the

Secretary-General of action taken by them in compliance with the Declaration, and the Secretary-General was requested to submit a report on this matter, to be considered by the General Assembly at its nineteenth session as a separate agenda item.

2. The Economic and Social Council at its resumed thirty-sixth session decided to include in the provisional agenda for the thirty-seventh session an item entitled "Measures to implement the United Nations Declaration on the Elimination of All Forms of Racial Discrimination".¹

3. The attention of the Council is drawn to the report (A/5698 and Corr.1) submitted by the Secretary-General to the nineteenth session of the General Assembly in connexion with the agenda item, "Measures to implement the United Nations Declaration on the Elimination of All Forms of Racial Discrimination".

DOCUMENT E/3953

Report of the Social Committee

[Original text: English]
[24 July 1964]

1. The Social Committee, under the chairmanship of Mr. Abdelkader Chanderli (Algeria), second Vice-President of the Council, at its 497th, 499th and 500th meetings held from 22 to 24 July 1964, considered item 28 of the Council's agenda (Measures to implement the United Nations Declaration on the Elimination of All Forms of Racial Discrimination) which had been referred to the Committee by the Council at its 1314th meeting held on 13 July 1964.

2. The Committee had before it a progress report by the Secretary-General on measures to implement the United Nations Declaration on the Elimination of All Forms of Racial Discrimination (E/3916) and a report by the Secretary-General on the same subject prepared for the nineteenth session of the General Assembly (A/5698 and Corr.1).

3. During discussion of this item, the representatives of Cameroon, Ghana, India, Indonesia, Senegal, the United Arab Republic, the United Republic of Tanganyika and Zanzibar, and Yugoslavia submitted a draft resolution (E/AC.7/L.439). The representative of Iraq subsequently joined as a co-sponsor of this draft resolution.

4. On the basis of proposals made during the discussion of the draft resolution, the sponsors revised the text as follows:

(i) In the second preambular paragraph of the Council's resolution the words "the principles contained in" were added between the words "Believing that" and "this Declaration";

(ii) In the same paragraph the words "carried out" were replaced by "put into effect";

(iii) In the fourth preambular paragraph of the Council's resolution the word "provided" was replaced by "called";

(iv) The third preambular paragraph of the draft resolution recommended for adoption by the General Assembly was replaced by the following text:

"Recognizing that in order to put into effect the purposes and principles of the present Declaration, all States shall take immediate and positive measures, including legislative and other measures, to prosecute and/or outlaw organizations which promote or incite to racial discrimination, or incite to or use violence for purposes of discrimination based on race, colour or ethnic origin,";

(v) In operative paragraph 1 of the draft resolution recommended for adoption by the General Assembly the words "once again," were deleted; and

(vi) In operative paragraph 2 of the draft General Assembly resolution the words "prosecute or outlaw" were replaced by the words "prosecute and/or outlaw".

5. The draft resolution E/AC.7.L/439, as orally revised by the sponsors, was adopted unanimously, by roll-call vote.

6. The Committee therefore recommends the adoption by the Council of the following draft resolution:

[At its 1338th meeting, the Council decided that the word "present", before the word "Declaration" in the third preambular paragraph of the draft resolution recommended for adoption by the General Assembly, be deleted. For the text, as amended, adopted by the Council, see below "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1016 (XXXVII). Measures to implement the United Nations Declaration on the Elimination of all Forms of Racial Discrimination

The Economic and Social Council,

Having considered the report of the Secretary-General on the measures for implementation of the United Nations Declaration on the Elimination of all Forms of Racial Discrimination,²

Believing that the principles contained in this Declaration should be put into effect as completely and speedily as possible,

Noting that some countries have taken positive steps towards eliminating all forms of racial discrimination,

Recalling that the Declaration called for the prosecution and/or outlawing of organizations which promote or incite to racial discrimination,

I

Recommends to the General Assembly the adoption of the following draft resolution:

"The General Assembly,

"Having considered the question of the implementation of the United Nations Declaration on the Elimination of all Forms of Racial Discrimination,

² A/5698 and Corr.1. See also E/3916.

“ *Noting* that racial discrimination still continues to exist in some countries in spite of the decisive condemnation of it by the United Nations,

“ *Recognizing* that in order to put into effect the purposes and principles of the Declaration, all States shall take immediate and positive measures, including legislative and other measures, to prosecute and/or outlaw organizations which promote or incite to racial discrimination, or incite to or use violence for purposes of discrimination based on race, colour or ethnic origin,

“ 1. *Calls* upon all States in which racial discrimination is practised to take urgent effective steps, including legislative measures, to implement the Declaration;

“ 2. *Requests* the States where organizations are promoting, or inciting to, racial discrimination to take all necessary measures to prosecute and/or outlaw such organizations;

“ 3. *Requests* the Secretary-General to submit to the General Assembly at its twentieth session a report on the progress made in the implementation of the United Nations Declaration on the Elimination of all Forms of Racial Discrimination;

“ 4. *Decides* to include the question ‘ Measures to implement the United Nations Declaration on the Elimination of all Forms of Racial Discrimination ’ in the agenda of its twentieth session ”;

II

Decides to include the question “ Measures taken in the implementation of the United Nations Declaration on the Elimination of all Forms of Racial Discrimination ” in the agenda of the thirty-ninth session of the Economic and Social Council.

*1338th plenary meeting,
30 July 1964.*

DOCUMENT E/3882 AND ADD.1

Notes by the Secretary-General

[Original text: English]
[28 April 1964]

DOCUMENT E/3882

1. The attention of the Council is drawn to the report (E/CN.4/863) submitted by the Secretary-General to the twentieth session of the Commission on Human Rights in connexion with the agenda item, "Advisory Services in the Field of Human Rights". Due to lack of time, the Commission was unable to examine this item and postponed its consideration to the twenty-first session.

2. The Secretary-General will report on any further developments relating to the programme of advisory services in the field of human rights in an addendum to this note.

Document E/3882/Add.1

[Original text: English]
[25 June 1964]

1. Since the Secretary-General submitted his report (E/CN.4/863) to the 20th session of the Commission on Human Rights, which, as mentioned by the Secretary-General in his note to the Council, the Commission was unable to examine, there have been further developments relating to the programme of advisory services to which the Secretary-General wishes to draw the attention of the Council.

2. Subject to whatever decision the Technical Assistance Committee of the Council may take in the matter,

the budget proposed for the human rights advisory services programme for 1965 is \$180,000, out of which approximately \$100,000 would be available for the holding of seminars and \$80,000 for the award of fellowships (E/3870/Add.1, annex II). A training course is included in category II and will be held if savings are available from part V of the budget.

3. In accordance with procedure initiated by the adoption of its resolution 1768 (XVII) of 23 November 1962, the General Assembly determines the levels of the provisions under part V for every year on the basis of the recommendations of the Technical Assistance Committee, as endorsed by the Economic and Social Council.

4. The appropriation for seminars was based upon the holding of three regional seminars. As regards the organization of seminars in 1965, the Secretary-General reported to the Commission on Human Rights that he had accepted invitations from the Governments of Yugoslavia and Mongolia to act as host countries for a seminar for the European countries and a seminar for the countries and territories within the geographical scope of the Economic Commission for Asia and the Far East respectively. The Secretary-General also reported that he was negotiating with other Governments which had expressed interest in being host to another seminar during 1965 (E/CN.4/863, paras. 8-9).

5. It now appears, as a result of further study of the proposal to hold a seminar in Mongolia on the participation of women in public life, that for a number of

reasons this seminar will cost considerably more than the normal \$30,000 to \$35,000 allocated for a seminar. Because of the additional cost of travel in that area and the technical difficulties involved, the estimated cost of the seminar would be in the neighbourhood of \$90,000.

6. With regard to the proposed seminar in Yugoslavia on the problems of a multinational society, the situation now is that the host Government would prefer the seminar to be organized on a world wide instead of a regional basis. This would be in accordance with the wishes of the Council as expressed in resolution 684 (XXVI) when it requested the Secretary-General to keep in mind the possibility of holding "an international seminar" at some future date on a subject of universal interest. This resolution was subsequently noted by the General Assembly in resolution 1261 (XIII). The Secretary-General agrees that this seminar would be more useful if participants from various parts of the world could attend. It is obvious however that even if the participation at such a seminar could be kept to the level of 30 to 35 participants, which is the normal attendance at a regional seminar, the cost would be greater than that of a regional seminar because of the additional travel costs involved. The Secretary-General estimates that for a seminar at which the participants would be chosen on a world wide rather than a regional basis the costs for travel alone would amount to approximately \$30,000, making a total of approximately \$60,000. If the participation were greater, the cost would be proportionately heavier.

7. As regards the training course the Secretary-General

informed the Commission on Human Rights that he believed that it would be the wish of the Commission that the proposed experimental regional training course, envisaged by Council resolution 959 (XXXVI), be assigned to category II for 1964, for implementation at such time as savings were available under part V of the United Nations budget (E/CN.4/863, para. 4). At the same time the Secretary-General has been in negotiation with the Government of Japan with a view to holding a training course in 1965 at the Asia and Far East Institute on the Prevention of Crime and Treatment of Offenders at Fuchu, Tokyo. The cost of this training course would be approximately \$50,000. If the Council so directs, the Secretary-General would allot from the funds available for fellowships (\$80,000) an amount of \$25,000 which would cover the expense of the trainees or fellows at the course which would leave a balance of \$25,000 which under present arrangements would have to be financed from savings, if available, under part V of the budget. It should be noted that when in 1962 the General Assembly decided by resolution 1782 (XVII) to expand the programme of advisory services on human rights it was "to permit the award of at least double the number of fellowships available in 1962".

8. The Secretary-General is still in negotiation with two Governments both of which are interested in sponsoring seminars in 1965. If a third seminar were not held in 1965, the saving could be utilized for one or other of the purposes mentioned above.

9. The Secretary-General would appreciate the guidance of the Council concerning these matters.

DOCUMENT E/3954

Report of the Social Committee

[Original text: English]
[24 July 1964]

1. The Social Committee, under the chairmanship of Mr. Abdelkader Chanderli, Second Vice-President of the Council, considered, at its 498th and 499th meetings held on 23 July 1964, item 29 of the Council agenda: "Advisory Services in the Field of Human Rights". This item had been referred to the Committee by the Council at its 1314th plenary meeting, held on 13 July 1964.

2. In the consideration of this item the Committee had before it the following documents: a note by the Secretary-General on advisory services in the field of human rights (E/3882 and Add.1); a document on advisory services in the field of human rights prepared for the twentieth session of the Commission on Human Rights (E/CN.4/863); and a provisional summary of the financial implications of the actions of the Council, including the section on advisory services in the field of human rights (E/3941, paras. 34-37).

3. The Committee's attention was drawn to the revised version of the draft resolution contained in annex IV

of the Report of the Technical Assistance Committee (E/3933), which had been adopted by the Council at its 1325th meeting.

4. During consideration of the item in the Committee the representatives of India and the United Arab Republic introduced orally a draft resolution on Advisory services in the field of human rights. The co-sponsors revised their draft resolution on the basis of oral revisions suggested by the representatives of Argentina, Indonesia and Austria, and the text of the resolution was contained in document E/AC.7/L.440.

5. The Committee then adopted the draft resolution by eighteen votes in favour to none against, with eight abstentions.

6. The Committee therefore recommends the adoption by the Council of the following draft resolution:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

**1017 (XXXVII). Advisory services
in the field of human rights**

The Economic and Social Council,

Having considered the note submitted by the Secretary-General,

1. *Recommends* that the proposed seminars in Mongolia and Yugoslavia during the year 1965 should be held as a matter of priority;

2. *Recommends further*, as an exceptional measure, that the programme of fellowships should be adjusted within the allocations made for the programme, taking into account the need to hold the aforesaid seminars;

3. *Recommends strongly* that the proposed seminar in Africa should be held at an early date.

*1338th plenary meeting,
30 July 1964.*

Report of the Social Committee

[Original text: English]
[24 July 1964]

1. The Social Committee, under the chairmanship of Mr. Abdelkader Chandlerli (Algeria), Second Vice-President of the Council considered at its 499th meeting held on 23 July 1964, item 30 of the agenda entitled: "Slavery". This item had been referred to the Committee by the Council at its 1314th plenary meeting on 13 July 1964.

2. The Committee had before it a note on the item by the Secretary-General (E/3897) and a note by the Secretary-General on the implementation of the Supplementary Convention of 1956 on the abolition of slavery, the slave trade, and institutions and practices similar to slavery (E/3885).

3. Following a discussion on Slavery, the Committee decided to recommend no action for adoption by the Council on this item.

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL
1023 (XXXVII). United Nations Children's Fund

The Economic and Social Council,

Noting the reports of the Executive Board of the United Nations Children's Fund on its June 1963, January 1964 and June 1964 sessions,

Noting also the growth of the activities of the United Nations Children's Fund in response to the requests of countries for assistance directed towards meeting the needs of children,

1. *Reaffirms* the recommendation to Governments contained in its resolution 918 (XXXIV) of 3 August 1962 to take full advantage of the aid which the United Nations Children's Fund can offer;

2. *Expresses the hope* that Governments and private groups will intensify their efforts to increase the resources of the United Nations Children's Fund;

3. *Urges* Governments to give appropriate priority to the needs of children in their national development plans and in their requests for assistance, taking advantage of all sources of aid available, both bilateral and multilateral;

4. *Invites* the United Nations Children's Fund to continue its efforts to aid Governments to improve the lot of children and to prepare them for life.

*1347th plenary meeting,
13 August 1964.*

*** Document E/3875/Add.1, dated 17 June 1964, contained the summaries of the reports from the Governments of Burma and Colombia; E/3875/Add.2, dated 26 June 1964, the summary of the supplementary report from the Government of Sweden; and E/3875/Add.3, dated 13 July 1964, the summary of the report from the Government of Czechoslovakia.

Introduction

1. This is the fifth in a series of periodic reports on teaching about the United Nations in Member States compiled by the Secretary-General of the United Nations and the Director-General of the United Nations Educational, Scientific and Cultural Organization (UNESCO) on the basis of inquiries to Member States. It has been prepared, as requested by the Economic and Social Council in its resolution 748 (XXIX) of 6 April 1960, for consideration by the Council in 1964.

2. The special importance of education in developing wide-spread knowledge and understanding of the role of the United Nations in world affairs was recognized, by the General Assembly when, at its second session, it adopted resolution 137 (II) of 16 November 1947 on "Teaching of the purposes and principles, the structure and activities of the United Nations in the schools of Member States". It recommended to all Member Governments that they take measures to encourage such teaching in the schools and institutions of higher learning in their countries. It also requested Member States to provide information of the resolution which would be presented to the Economic and Social Council in the form of a report by the Secretary-General in consultation with UNESCO. In accordance with this resolution, reports on this subject were submitted to the Council by the Secretary-General of the United Nations and the Director-General of UNESCO in 1950 (E/1667), 1952 (E/2184 and Add.1-5), 1956 (E/2837 and Corr.1 and 2) and 1960 (E/3322 and Add.1-3).

3. In resolutions adopted after discussion of the reports, the Economic and Social Council affirmed the importance of teaching about the United Nations and recommended measures to extend it.¹

4. On 12 December 1960, the General Assembly, in its resolution 1511 (XV), endorsed the action taken by the Council in encouraging teaching about the United Nations and its related agencies and urged all those concerned to continue their efforts in this field.

5. The present report covers the period January 1960-December 1963. The information given is based largely on official reports sent to the Secretary-General from seventy Member States and to the Director-General from three States members of UNESCO but not Members of the United Nations. Further information was secured from reports and supporting materials sent in by the United Nations Information Centres concerning developments in countries falling within their respective areas. The annual reports made to the Trusteeship Council by Members administering Trust Territories were also examined, as well as the Secretary-General's periodic reports to that Council on the dissemination of information on the United Nations and the International Trusteeship System in the Trust Territories. Further data were obtained from the files of the United Nations and UNESCO and from statements by other members of the United Nations family and by some

non-governmental organizations concerning their work in this field.

6. As in previous years, the present report comprises three chapters. Chapter I provides a general survey of developments in teaching about the United Nations in Member States during the period covered, with a statement of the main conclusions which can be drawn from the evidence at hand. Chapter II presents a summary of each of the official reports from Member States, set out in alphabetical order.² Taken together, these two chapters are intended to achieve two purposes: to give a world view of the present state of teaching about the United Nations and to provide a more detailed account of current programmes, problems and trends in each country which submitted an official report on this subject. Chapter III outlines the programmes and services of the United Nations, UNESCO and other members of the United Nations family in promoting and assisting teaching about the United Nations and its related agencies in Member States.

7. The limits of the report should be stated clearly. On the positive side, the fact that replies were received from a total of seventy-three Governments (as against fifty-four in 1960, the highest to that date) has made it possible to obtain a considerably more comprehensive view, geographically, of the current state of teaching about the United Nations than has previously been the case. This wider compass is due chiefly to the increasing universality of membership in the United Nations and its related agencies, since the additional replies came almost entirely from countries which have acceded to membership since the last report made to the Council on this subject, in April 1960. Also, some of the replies provided detailed surveys of the subject in their respective countries. However, the reports from Member States varied considerably in scope and scale, as did the supplementary data available from other sources. Some topics, such as teacher-training, school curricula, out-of-school education, and the work of non-governmental organizations in this field were treated extensively in some reports and meagrely dealt with or omitted in others. Much supporting material was received, including specimen copies of official directives, courses of study, textbooks and other teaching aids, but not from all countries. The difficulties of presenting accurate information in comparable form are apparent.

8. Further, in attempting to assess these varied data, the widely different nature and state of development of the educational systems in the countries concerned must be taken into account. Generalizations such as those in the first chapter are therefore made with caution and are subject to the limitations stated.

9. Nevertheless, it is hoped that a useful view of the present state of teaching about the United Nations can be obtained and that awareness of the advances made and of the gaps that remain may help to provide a fresh

¹ See Economic and Social Council resolutions 170 (VII), 203 (VIII), 314 (XI), 446 (XIV), 609 (XXI), 748 (XXIX).

² The full texts of the replies, and the supporting materials submitted, are available for consultation, in the case of States Members of the United Nations, at the United Nations Secretariat, and in the case of States members of UNESCO but not Members of the United Nations, at the headquarters of UNESCO.

stimulus to efforts which must be continued, strengthened and extended if education at all levels is to contribute fully to the work for peace and international co-operation.

CHAPTER I

General survey of developments in Member States

10. This chapter presents a broad survey of developments in teaching about the United Nations and its related agencies during the period 1960-1963, with a statement under each head of the main conclusions which can be drawn from the available evidence.

General observations

11. On the whole, the replies from Member States indicate that there has been a considerable development of effort in many countries to increase and improve programmes of teaching about the United Nations during this period. A solid upward trend in the volume of attention devoted to the United Nations and its agencies in instructional programmes at all levels of education and in the mass media is widely evident.

12. In a steadily increasing number of countries, and in many more local school systems and individual schools within countries, action has been taken by relevant education authorities to provide or strengthen sustained programmes of teaching in this field in the regular school curriculum, with a general orientation of the whole school programme toward education for international understanding. The replies from Member States indicate that, in this field, the Associated Schools Project of UNESCO, which has just completed its first ten years of work, has made a notable contribution to this development.

13. In some countries, school radio and increasingly television are being more and more used to help meet the need for current information about the United Nations and its agencies presented in local languages and in interesting form.

14. However, as in 1960, the position in most countries continues to be less than satisfactory with regard to the preparation of teachers in training and in service in this field, the provision of suitable teaching materials and effective programmes for adults and out-of-school youth. In sum, much has been accomplished, but progress has been uneven in the different countries and in the various components of development within countries. These matters are discussed in further detail below.

15. Quantitatively, a particularly marked expansion in this field is reported in the newly independent countries which have become Member States since the previous four-year survey on this subject was presented to the Council in April 1960. A statement which finds expression in various terms in the replies received from Member States in this group says: "Since independence and admission to the international organizations, there

has been a great upsurge of interest in the activities of the United Nations and its related agencies in this country. There was some teaching in this field before 1960, but since then it has widened considerably." Also, it seems safe to say that the large and continuing increase in enrolment at all educational levels during recent years in most countries of the world probably has resulted in a substantial growth in the number of students reached by instructional programmes and extra-curricular activities in this field.³ This is especially likely to be the case in secondary schools, since it is at this level that world enrolment has increased most sharply and also that teaching about the United Nations seems to be most wide-spread and systematic.

16. Qualitatively, it is of special importance that during this period, in various countries, official action has been taken to include a planned and cumulative programme of study about the role of the United Nations and its agencies in world affairs as an integral part of history, geography, civics, science and other subjects in the regular school curriculum, set within the broad context of education for international understanding. On a national basis, revised curricula incorporating such instruction came into force in Denmark in primary and secondary schools in 1960 and 1961, in Hungary in secondary schools by stages since 1961, in New Zealand primary schools in 1962, and in Finland in secondary schools beginning with the 1963-1964 school year. In India, a nation-wide programme of education for international understanding, including teaching about the United Nations, was launched in December 1962 by the Indian National Commission for Co-operation with UNESCO, in concert with the State Directors of Public Instruction, as an extension of the Associated Schools Project of UNESCO. By the end of 1963, the programme included more than 400 secondary schools and teacher-training institutions throughout the country. In the highly decentralized pattern of education in the United States, comprehensive instructional programmes of this kind have been provided in various school systems, most notably in New York City and Glens Falls (New York), which have done pioneer work in this field. In some other countries, including Sweden and Canada, a vigorous effort to strengthen teaching about the United Nations and world affairs generally is well under way, with a good deal of the impetus provided through effective co-operation between the education authorities and the national and local United Nations Associations. Although such large-scale undertakings are still the exception rather than the rule, the fact that actions aimed at these goals have been taken in countries with such varying educational situations seems to suggest a growing recognition of the importance of teaching in this field.

17. A further encouraging development during this period was the decision of the World Confederation of

³ Statistics published by UNESCO indicate that from 1950-1959, world enrolment increased by 54 per cent in primary schools, 100 per cent in secondary schools, and 71 per cent in higher education. Enrolment figures continue to mount. For discussion, see *1963 Report on the World Social Situation*, United Nations publication, Sales No.: 63.IV.4, chap. VI.

Organizations of the Teaching Profession (WCOTP),⁴ which now comprises 139 national member associations in 85 countries representing over 4 million teachers, to undertake as its main theme for study and action in 1964 the topic "Increasing international understanding through teaching about the United Nations". The 1964 theme was introduced to the WCOTP Assembly of Delegates, held in Rio de Janeiro in August 1963, by Dr. William G. Carr, Secretary-General of WCOTP. Following its usual pattern of work, WCOTP has requested its members to prepare national reports on the theme, which will be analysed and presented to delegates to the 1964 World Assembly when it meets at UNESCO headquarters in Paris from 31 July to 6 August 1964. The aim of the WCOTP study is not to provide information on the present state of teaching about the United Nations but to analyse, both in terms of principle and potentialities, what should be the situation. In view of the crucial importance of interest and adequate preparation on the part of the teacher to further progress in this field, it is much to be hoped that this special effort will bear fruitful and continuing results in the years ahead.

18. In their 1956 and 1960 reports to the Council on this subject, the Secretary-General of the United Nations and the Director-General of UNESCO pointed out that the development of wide-spread and effective programmes of teaching about the United Nations and its related agencies had been impeded by two major obstacles: the lack of adequate teacher-training in this field and the paucity of suitable teaching materials.⁵ The available evidence indicates that, although some advances have been made in the intervening years, these two main difficulties, in varying measure, continue to exist in most countries.

Teacher-training

19. Replies from Member States indicate that sustained and systematic study of the United Nations and world affairs is not required or provided as a part of the regular preparation of prospective and in-service teachers except in a few countries, and within some State and local school systems in several other countries. The principal exception is to be found, as would be expected, in the case of those teachers, chiefly in secondary schools, whose special field of study is political science or contemporary history. Many countries express concern in respect of this matter and indicate that steps are being taken or planned to improve the situation. These advances and trends are discussed below.

20. Meanwhile, the prevailing position in this vital sector appears to remain much the same as it was reported to be in 1960. In essence, most countries indicate that their teacher-training institutions make some provision for teaching about the United Nations family,

but usually such provision seems to be fairly meagre or marginal. For prospective primary-school teachers, the general practice is to provide a limited amount of basic information and training in methodology as part of one or more subjects in the curriculum, most often history, social studies or civics. In addition, aspects of the work of relevant United Nations bodies — for example, the World Health Organization (WHO), the Food and Agriculture Organization of the United Nations (FAO), and the United Nations Children's Fund (UNICEF) — are sometimes introduced into other subjects, such as health teaching.

21. Nearly all countries report that extra-curricular activities, such as United Nations Day observances and international relations clubs, are to some extent devoted to learning about the work of the United Nations family. In some countries, such activities in fact provide the main basis for teacher education in this field. For the keen student, this learning can be and often is enlarged by voluntary reading and study, exposure to radio and television programmes and the like.

22. In most countries, students who intend to teach at the level of higher education — and, in a growing number of countries, at the secondary level as well — follow a university course emphasizing specialization in subject-matter. Information about the United Nations is included in a number of courses offered by many universities (e.g., history, political science, international relations, law and economics) but whether students take such courses, and the extent of their study depends largely on their field of specialization. Thus, students in many subject fields may complete their college or university training without securing any information about the United Nations, except through voluntary participation in extra-curricular activities such as student United Nations associations and model United Nations sessions, or through individual initiative in securing information through such means as individual reading and study, campus-wide lectures by distinguished speakers, or the mass media.

23. In this connexion, it may be noted that in a growing number of countries with highly developed educational systems, it is becoming more and more generally the practice to shift the training of teachers for primary as well as secondary schools from non-degree-granting normal schools to universities or college-level teacher-training institutions. Major movements on these lines have already taken place in recent years in at least fifteen countries, including Australia, the USSR, the United Kingdom and most parts of the United States of America. The effect of this upward shift on teacher education in the field of the United Nations and world affairs seems to be mixed. One country reports: "All states continue to include preparation for teaching about the United Nations in their primary and secondary teacher-training courses. In one state, as the period of primary teacher-training has been extended, more time has become available for such preparation. In other states, the existing preparation has been intensified." A second Member State in this group writes: "The most varied aspects of United Nations work are studied

⁴ WCOTP is a non-governmental organization in consultative status with the Economic and Social Council (category B) and UNESCO (category A) and is a member of the NGO Committees of FAO, WHO and UNICEF.

⁵ See E/2837, para. 307; and E/3322, para. 50.

at the universities, especially in the historical faculties of the pedagogical institutes which prepare teachers for primary and secondary schools." In contrast, a third country states: "Colleges and universities which train teachers have reflected quickened interest in international affairs generally, but it cannot be said that there has been any significant increase in emphasis on teaching about the United Nations during the past four years... In the field of teacher education, there do not appear to be any strong general convictions regarding teaching about the United Nations, *per se*, nor any clear prescription of just what knowledge about the United Nations and its related agencies should be of most worth to teachers."

24. It is curious also to note that the uneven but generally marginal measure of training in this field received by most teachers continues to prevail in some countries in which considerable provision has already been made in the curricula for teaching about the Organization in the schools. One such country states: "The most significant development during the period 1960-1963 has been the incorporation of teaching about the United Nations in the curricula of the elementary as well as secondary schools... However, it will be a long time before the subject is finally accepted by all teachers and is mastered even fairly satisfactorily." Another says: "In spite of the official attention given to teaching the subject, many educational authorities feel that it is inadequately taught. Many teachers feel that they are insufficiently informed and are unable to do justice to the topic. The situation is not aided inasmuch as no province offers short courses for experienced teachers on the topic." A third country indicates that "the greatest problem remaining to be solved in this field concerns the preparation of teachers in training and in service".

25. A further factor that must be taken into account is that the different systems of education in the world are not all at the same stage of development and are not moving at the same rate. Particularly in the less-developed countries, rapid expansion of the schools is resulting in severe shortages of qualified teachers. As UNESCO's *World Survey of Education* points out:

"The average primary school teacher in one country may have only an elementary school education or less with no special training for teaching; in another he may be a graduate of a higher level teacher training institution.... Many of the teachers [in some countries] are 'teaching at the limit of their own knowledge, unable to do more than drill their pupils, to memorize facts that the teacher hardly understands'."⁶

26. In the light of the available data, it is clear that the measures required to effect substantial improvement in teacher education in this field need to be as varied as are the causes of the present wide-spread deficiencies.

27. As a first step, replies from Member States indicate that, in a considerable and growing number of countries in different parts of the world, more and more seminars,

workshops, conferences and short courses for teachers are being held on the United Nations, world affairs, and education for international understanding. These various short programmes, which usually provide basic subject-matter information, training in methodology and examination of available teaching materials, constitute the most wide-spread gain in teacher education in this field made during the period under review.

28. In this work, a notable role continues to be played by the World Federation of United Nations Associations (WFUNA) and by its national affiliates and their local branches, in co-operation with national and local education authorities. At the international level, nineteen such seminars have been organized since 1946 by WFUNA, with the financial assistance of UNESCO, for groups of countries on a regional basis. Three were held during the period under review (in Australia, Ghana and India) and two are being planned for 1964. Within the various countries, carefully planned and effective seminars for teachers-in-service have been conducted during the past four years by the United Nations Associations of Argentina (forty-three seminars), Canada (five seminars), Denmark, Finland, the United Kingdom, Italy, Norway, the Philippines and Sweden. In addition, short courses on the United Nations for elementary school teachers-in-training were conducted by the Italian Society for International Organization (ten elective courses in different cities, each attended by 100 students) and by the Norwegian United Nations Association (annual short courses at nine of the fifteen teacher-training institutions, with plans to extend this programme to the other six in the near future). Mention has already been made of the nation-wide programme in this field, with its emphasis on improving teacher preparation, currently under way in India, under the leadership of the Indian National Commission for Co-operation with UNESCO. Further, in a number of countries, universities offer courses on the United Nations in which interested teachers, either in training or in service, can and do enrol.

29. A number of replies from Member States refer in this connexion also to the UNESCO Associated Schools Project in Education for International Understanding, which is concerned largely with teaching about the United Nations. By the end of December 1963, there were 289 secondary schools and teacher-training institutions, in forty-three countries, taking part in this project. Teachers-in-training as well as teachers-in-service are co-operating in the work and the project may therefore be considered as contributing to teacher preparation at both levels. In addition, as the basic aim of this project is to provide stimulation and opportunity for experiment in this field, its significance extends much beyond the particular schools and teachers directly engaged in the work as participants.⁷

30. It is much to be hoped that the good work now being done in the stimulation of effort in teaching about

⁶ See United Nations Educational, Scientific and Cultural Organization, *World Survey of Education*, Vol. II, *Primary Education* (Paris, 1958), pp. 19-20.

⁷ For an extended appraisal of the project, made by a qualified observer, see "The Associated School Project: 1953-1963," by Terence Lawson (Secretary, Council for Education in World Citizenship, United Kingdom), contained in UNESCO document EA/Sèvres/6 (1963).

the United Nations and in the provision of short courses and seminars for teachers in service will be extended to more countries and intensified in the years ahead.

31. At the same time, major attention needs also to be focussed, in most countries, on strengthening the preparation of prospective teachers for work in this field within the framework of the regular instructional programme of the various teacher-training institutions.

32. In work toward this goal, current developments and trends in the field of curriculum revision constitute a powerful and positive force. As noted earlier (see paragraphs 16-18), revised school syllabuses and curricula, with provisions for increased instruction on the United Nations, world affairs and education for international understanding, came into effect in several countries during the period under review. Similar revisions are stated to be currently under way or in early prospect in several additional countries. These revised curricula in the schools will necessarily also result in improved programmes of teacher-training in this field. One country states the matter as follows: "It is strictly provided that the instruction given in teacher-training colleges shall be closely related to subject-matter on which instruction is given in schools. Thus, the inclusion of teaching about the United Nations in elementary school curricula will entail that the subject is taken up also in teacher-training institutions."

33. In this regard, the situation of countries or school systems in which the provision for requisite teacher-training is lagging behind the school curricula in this field presents a clear anomaly, requiring appropriate and early remedy.

34. Meanwhile, within the developing countries, as more teachers are trained and the general levels of teacher-training are raised — in line with current trends —, it can be expected that teacher education on the United Nations and world affairs will be strengthened. In these countries, especially, the matter of suitable teaching materials is crucial. Further, because of the magnitude of the teacher shortages involved, it seems likely that there will be increasing experimentation, in Asia and Africa particularly, aimed at making optimum use of radio and television for teaching purposes and possibly also of such further devices as teaching machines and "programmed" instruction.

35. Lastly, it is clear that the success or failure of any programme designed to further teaching about the United Nations depends ultimately on the interest, knowledge and attitudes of the members of the teaching profession. Thus, the decision of the World Confederation of Organizations of the Teaching Profession (WCOTP) to take as its 1964 theme for study and action "Increasing international understanding through teaching about the United Nations" constitutes a development of major importance in this field. As would be expected, the WCOPT survey which is currently under way among its members devotes special attention to the basic practical question in this field, How should teachers be prepared to teach about the United Nations?

36. In this role as a non-governmental organization in consultative status, WCOPT will present a separate

written statement on this subject to the Council at its forthcoming session.

Teaching materials

37. While a growing volume and variety of materials for use in teaching about the United Nations in schools is reported in many countries, the insufficiency of suitable materials remains wide-spread and, in most countries, continues to constitute a major handicap to effective instruction in this field.

38. The data indicate clearly that the most acute and serious shortages exist in the field of instructional materials for use in primary and secondary schools in the developing countries, particularly those in which the languages used in instruction are not among the official languages used by the United Nations organizations.

39. One such country states the matter thus: "Students at the primary and secondary stage are normally taught in the national or local language and it is here that there is a scarcity of printed material to aid the teacher. . . . He is, however, encouraged to prepare his own charts and maps, supplemented by press cuttings, and utilize them in the classroom Films and filmstrips cannot be used on a wide scale as the projectors and other facilities are not widely available." Another country in this group writes: "The main difficulty in the promotion of teaching about the United Nations is the dearth of suitable teaching materials, including audio-visual aids and manuals for teachers There is a great need for simple and illustrated reading materials written in national and regional languages for use in the classroom and by the teacher."

40. The types of needed materials most frequently cited include the following: well-presented and illustrated basic information about the United Nations organizations in relevant school textbooks; study guides and sample lesson plans for teachers; up-to-date lists of useful materials now available in the country with the necessary addresses for obtaining them; pictures, posters, maps and photo-sheets; loan kits or boxes of materials for schools with books, leaflets, pamphlets and other materials for use by teachers and by pupils of different ages; weekly or monthly newsletters or magazines on current United Nations and world affairs; and, most especially, simply written and illustrated story-type booklets for younger children which describe the work and practical achievements of the United Nations organizations in easily understood ways.

41. In countries in which resources appear to be fairly abundant, the printed materials still lacking and most wanted are stated to be illustrated readers for younger children, and a range of booklets designed to describe the main activities of the United Nations and its related agencies in a given country or region. Political problems with which the United Nations may have been concerned should be included, as well as accounts of its work in connexion with economic and social matters, such as health, agriculture, education, child welfare, air transport and the like. Such booklets would be readily usable in subjects already found in

the standard school curriculum in most countries, particularly in history, geography, social studies and current events.

42. A special problem noted in several countries in which abundant and varied teaching aids are produced by many different sources lies in the difficulty of selection and procurement of such materials. In Canada, much of this service is rendered to schools by the headquarters office of the United Nations Association, and in the United Kingdom by the Council for Education in World Citizenship (the schools division of the United Nations Association), to which more than 1,400 member schools and thirty affiliated teacher-training colleges subscribe. The United Nations Information Centres, now forty-six in number, and the field offices of the specialized agencies also assist in this work, within their budgetary limits of staff and resources. However, the problem is not yet satisfactorily solved in many countries. As an example, one such country states: "The continuous distribution of current up-to-date material for teachers and students has yet to be organized". It would seem that school and public libraries should be able to help considerably with this problem. In situations where efficient library services exist, teachers and librarians should work closely together to ensure that the printed and audio-visual materials needed for school and adult education programmes in this field are obtained promptly and organized efficiently for use by teachers and students. The provision of up-to-date subject bibliographies for teachers, short annotated reading lists for students, and featured displays of relevant materials are further ways in which librarians could assist teaching in this field.

43. Even in countries where library resources are limited, it would be useful if each school could undertake to assemble a small United Nations collection and keep it regularly refreshed with new pamphlets and other current materials. As a matter of course, such collections should include yearly subscriptions to the *UN Monthly Chronicle* (formerly called the *United Nations Review*), the *UNESCO Courier*, and the pictorial journal of WHO entitled *World Health*. It should be noted especially that each of these journals is issued in various language editions and each is distinctly modest in cost. It may also be suggestive to note that the collection and presentation of funds for the purchase of a United Nations Bookshelf for school and public libraries has been made a school or community project for United Nations Day in some countries.

44. Lastly, replies from Member States indicate that considerable and increasing use is being made of school radio broadcasts and, in more and more countries, television in school programmes of teaching about the United Nations family. This trend is manifest, not only in countries with highly developed educational systems, like Australia, Canada, the Scandinavian countries, the USSR, the United Kingdom and the United States, but also in many of the developing countries, especially in Asia, African and the Caribbean.

45. One country in this group writes: "Regular [radio] programmes cover UN topics for primary and secondary

schools. . . . The use of television as a vehicle to spread knowledge of the United Nations, both to children in schools and to the public generally, is growing rapidly". Another country states: "There have been programmes on the United Nations and related agencies in radio broadcasts for schools twice or thrice per term [three months]. There are no major obstacles to the provision of more teaching about the United Nations except in the way of more radio and television sets for schools which will make it possible for expert and specialized instruction to reach as wide an audience as possible". A third country reports: "Wide coverage is given by the radio and television networks to the activities of the United Nations and the specialized agencies and to the part played therein by the [country concerned]". It seems clear that, by their very nature, radio and television, if used with skill and care, can make a major contribution in many countries toward the provision of a wide range of current and background information about the purposes and work of the United Nations family, presented in interesting form, in the language and idiom of the country concerned, and with due attention given to subjects of special topical or regional interest.

46. To sum up, the data indicate that, while some progress has been made during the period under review, an adequate supply of suitable teaching materials is still lacking or difficult to obtain in most countries. Solutions appropriate to the particular educational needs and conditions in the different countries should be worked out and progressively applied.

47. First, experience shows that the inclusion of teaching about the United Nations in school curricula has a strongly favourable effect in improving the quantity and variety of textbooks and other teaching aids produced in this field. As an example, one country reports on this matter thus: "In conformity with the new curricula, greater attention than previously is given to the United Nations and its related agencies in the textbooks produced in recent years. Supplementary reading materials and other teaching aids have also been issued by the United Nations Association and by a growing number of commercial publishers."

48. International organizations such as the United Nations and UNESCO can continue to help in limited ways — for example, by making available basic information to be suitably adapted and presented; by disseminating information and documentation on promising teaching methods or suggestions based on the experience of schools in different countries; by facilitating the exchange of syllabuses, materials and information among the different countries through the United Nations Information Centres or through activities such as the UNESCO Associated Schools Project. Also the work of UNESCO in organizing international meetings of educational publishers and editors of educational journals, and such further UNESCO activities as its regional centres dealing with teacher-training, educational documentation and school textbooks and its aid given to Member States, at their request, in the fields of teacher-training, curriculum construction or revision, provide a variety of opportunities for bringing the matter of

teaching about the United Nations to the attention of Governments and other interested bodies.

49. But, as pointed out in the 1960 report to the Council on this subject, "it is clear that the preparation, production and distribution of teaching materials must remain primarily a task for the countries themselves" (E/3322 and Add.1-3, para. 24).

50. The need for giving particular attention to introducing or improving information on the United Nations family in school textbooks is apparent. For this purpose, it would be useful if funds could be provided through the United Nations and/or UNESCO to afford textbook writers in the developing countries opportunities to study the work of the United Nations and its related agencies at first hand and consult with staff members in various subject fields, through visits to the headquarters of the organizations and to field projects. High priority should also be given to the provision of similar opportunities to persons in charge of school radio and television broadcasts in the developing countries.

Teaching in schools and other educational institutions

51. Replies from Member States indicate that, although progress has been uneven in the different countries and also among States and local communities within countries, a well-marked upward trend in the amount and depth of attention given to teaching about the United Nations is widely evident.

52. During this period, relevant educational authorities at the national, state and local level in many countries have taken administrative action to encourage and assist the development of teaching about the United Nations in schools and other educational institutions in a variety of ways.

53. In particular, as noted earlier, reforms and revisions in school syllabuses and curricula, with provisions for increased study of the United Nations and world affairs, entered into force in several countries and in various local school systems in other countries, and have had a most bracing effect in improving such instruction. Similar reforms are currently under way or under active consideration in several additional countries. It is much to be hoped that the requisite administrative steps will be taken in other countries to effect similar results.

54. It is understood, of course, that measures appropriate to the situation will vary considerably among countries, including those with centralized school systems and those in which education is decentralized. However, the goal in view is the same: to provide the curricular framework necessary to implement the basic concept that effective teaching about the United Nations and world affairs, in the context of education for international understanding, requires for its achievement a sustained and carefully planned programme of study that will reach the whole school population and that will be continued on a cumulative basis over a period of years.

Pre-school and primary education

55. Replies from Member States indicate that "direct" teaching about the United Nations is generally not pro-

vided at the pre-school and lower primary school levels. Instead, such means as stories, pictures, songs, games, maps, globes, flags, stamps, films and filmstrips are used to help children to develop a sympathetic awareness of and interest in other lands and other peoples. In many countries, the purposes and work of UNICEF form the child's first introduction to specific study of the United Nations. Otherwise, most activities concerning the United Nations family for younger children are usually centred around observances of United Nations Day, World Health Day and Universal Children's Day.

56. The replies from Member States are not always precise on this matter, but the data seem to indicate that in the majority of the countries reporting, formal study of the United Nations now begins in primary schools at about the fifth or sixth year. Such instruction is most often provided as a part of other subjects, most often history, geography, civics or social studies. In addition, other subjects are also cited in some reports, particularly health teaching (for instruction about WHO, UNICEF, FAO) and, in a few countries, general science (for instruction about WHO, the World Meteorological Organization (WMO) and the International Telecommunication Union (ITU)).

57. Thus, it appears that teaching about the United Nations, always more widely found at the secondary level, is gradually being extended downward through the primary school. This trend, first visible in 1960, is now clearly marked. It is also a particularly important development, since most of the world's children who go to school receive no formal education beyond this point.

Secondary education

58. The available evidence indicates that some measure of study of the United Nations has become widely accepted as an integral part of the educational programme of secondary schools in most countries, both in curricular work and in related extra-curricular activities. Particularly in view of increasing enrolments at this level in most countries of the world, it seems likely that planned programmes of instruction on the United Nations probably reach more students in secondary schools than are at present reached at any other level of education. However, it should be added that the amount of time devoted to such study, and the degree of competence aimed at, varies considerably in the different countries.

59. Teaching about the United Nations is most usually provided as a part of history, geography, social sciences and current events, but it is cited by a number of countries also in connexion with other subjects, including science and foreign languages. In respect of language study, it is interesting to find that increasing use in a number of countries seems to be made of films, filmstrips, poster sets, tape recordings and other audio-visual materials produced by the United Nations organizations, as well as of printed materials, particularly the *UNESCO Courier* and the *United Nations Review*. One country noted that pupils studying foreign languages often were asked to translate chapters from the United

Nations Charter or other documents as a part of final examinations for matriculation.

60. While some of the instruction provided is no doubt fairly lifeless, a good deal of it clearly is not. Three approaches used in this field in secondary schools are widely mentioned as yielding particularly good results: (a) the historical approach aimed at giving a view of the United Nations as the current and most wide-scale effort to maintain peace and improve world conditions through international co-operation; (b) the study of world problems and the role of the United Nations and its agencies toward their solution, and (c) study and group discussion of current events. Considerable interest has been expressed and some interesting work has been done also in area studies at this level, particularly in the Associated Schools Project. Although promising, this approach has not yet seemed to come into wide-spread use in many countries, owing chiefly to the difficulty of locating and obtaining the requisite study materials.

61. It is at the secondary level, also, that extra-curricular activities in many countries are particularly wide-spread and well-organized. In addition to observance of special international "days", participation is fairly general in such activities as international relations clubs, model United Nations sessions, quiz and essay contests and combined study-and-action programmes in support of special international efforts such as the work of UNICEF, World Refugee Year and the FAO Freedom from Hunger Campaign.

62. Special mention should also be made of such large-scale programmes as the yearly Scholastic Olympics in Poland, in which some 400,000 secondary-school students took part in 1963; the nation-wide United Nations essay and examination contest organized each year by the United Schools Organization in India; the series of carefully-planned summer seminars for high-school students conducted throughout Canada by the United Nations Association; and the Christmas holiday lectures in London, organized by the Council for Education in World Citizenship and attended each year by some 2,500 students from grammar schools in all parts of the United Kingdom.

63. In sum, it seems safe to say that school administrators and teachers in many countries probably would find it helpful to examine the subject-matter covered and the methods used in teaching about the United Nations in the best of the secondary school programmes, both in curricular and extra-curricular activities.

Higher education

64. More than half of the replies from Member States in which universities are in existence stated that instruction on the United Nations is provided in courses of study at both the undergraduate and graduate levels. At the undergraduate level, such instruction usually is included as a part of one or more courses offered in faculties of law, history, international relations, political science and government, and economics. Separate courses

on the United Nations system as a whole, or on particular aspects of its work (e.g., in economic development), are quite often found at the graduate level. Much of this instruction for graduate students takes the form of small seminars and includes extensive reading, group discussions and individual research for required term papers. However, courses which deal with the United Nations, in whole or in part, generally are optional or elective, and whether students take such courses and the extent of their study depends on their field of specialization.

65. A number of the replies from Member States indicated that questions concerning the United Nations and its related agencies constitute a growing field of university research in their respective countries. One such country noted that during the period 1945-1962, a total of 180 doctoral dissertations on topics dealing with the work of the United Nations organizations were completed at forty-two universities. Eighty-six (or almost half) of these appeared during 1958-1962. A few countries made special reference to advanced study and extensive research on a wide range of United Nations questions undertaken by the staff and graduate students at special schools of international relations attached to universities or at autonomous research institutes. The results of such research are usually published in the form of monographs, collected papers, articles in specialized journals and the like. A main function of such specialized schools and institutes is the training of career staff for the foreign service of the country concerned. One of the replies from Member States pointed out that a growing number of university professors have participated actively in United Nations affairs as members of the secretariats of one or more of the international organizations, or as members of national delegations to United Nations or other conferences, or as technical assistance experts or in other consultative capacities; hence they bring the vitality and realism of first-hand experience to their teaching and research work in universities. This would also be the case, of course, in a number of other countries.

66. Extra-curricular activities among college and university students were described in many of the replies, with frequent mention given to student United Nations associations, model sessions of United Nations bodies, international relations clubs, debates, sponsorship of public or campus-wide lectures by professors or distinguished guest speakers, and film showings. For students in many subject fields, such activities, together with voluntary reading, constitute the main channels used for giving more than incidental attention to the United Nations and world affairs.

67. Several of the replies from Member States indicated that, beyond the campus, some universities contribute to adult education in this field in various ways, most often through the inclusion of United Nations subject-matter in courses on international relations provided in university extension services and extra-mural departments, and through public lectures on United Nations topics which are open to all interested persons in the area as well as to the faculty and students of the uni-

versity. Such public lectures are often also broadcast by radio and/or television. A few of the replies referred to some special seminars for adults, including several on teaching about the United Nations, held in different countries for in-service teachers; and others on human rights, organized in connexion with the fifteenth anniversary of the Universal Declaration of Human Rights in December 1963.

68. In broad terms, however, it would seem that universities in many countries might find it desirable and feasible to expand their work in the field of teaching about the United Nations in a number of ways. First, in view of the wide range of United Nations operations and activities, which run parallel to so many fields of university teaching and research, it seems likely that the content of some existing courses might be considerably enriched by the inclusion or expansion of study of the relevant work of the United Nations agencies involved. Examples, of related subject fields include not only international relations, history, economics and law in which most university courses with United Nations content now are found; but also such further fields of study and research as public administration, banking and finance, education, public health, science and technology, agriculture, labour relations, foreign languages, journalism, mass communications, librarianship, and, of growing importance in many universities, area studies, to name only a few possibilities. Through this means, the number of students made aware of the nature and extent of United Nations work in their fields of specialization would be considerably increased. Since university graduates tend to assume a leadership role in national and world affairs, universities might wish to consider the possibility of providing further opportunities for the student body as a whole to engage in more study and discussion of the United Nations organizations than is now generally the case, through such means as the inclusion of United Nations units in one or more required courses, or the provision of a regular series of campus-wide lectures and discussions on United Nations affairs as a recurrent feature of the university's official calendar of events. Lastly, some universities might find it possible to expand or intensify their present programmes of adult education in this field, especially in the urgent matter of the provision of seminars and short courses on the United Nations for in-service teachers.

Examinations

69. Replies from Member States indicate that, with varying frequency, questions on the United Nations and its related agencies are included in matriculation, university entrance and other externally administered examinations for secondary school students in a growing number of countries. This trend is fairly wide-spread, both in countries with centralized systems of education and in some states in countries where education is decentralized. Specimen copies of such examinations were attached to several of the reports. They indicate that questions on the United Nations family appear usually in examination papers in modern history or social

studies and require essay-type discussion rather than quick-information replies. Examples of such questions are: "What are some of the major problems facing the United Nations today? Discuss one of these problems in some detail"; "What contribution do United Nations agencies (such as the World Health Organization) make towards world peace?"; "Outline the steps by which the United Nations can deal with a threat of war, giving illustrations from recent events"; "As an international welfare agency the United Nations has more than justified itself, but as a security organization it has been disappointing. Discuss."

70. Educators hold mixed views on the desirability of external examinations, but in systems in which they are generally in use, there can be no doubt that the inclusion of questions on the United Nations in papers set in such examinations tends to stimulate study and teaching of the subject. Thus it is to be hoped that in relevant situations educational authorities which have not already done so will consider the inclusion of questions on the United Nations family in appropriate examinations.

Extra-curricular activities

71. For extra-curricular activities to play their optimum role in the learning process, educators generally are agreed that they should be planned and conducted in such a way as to complement and enrich the instructional programme provided in the school curriculum. For this reason, such activities have been discussed earlier in this chapter in connexion with each level of education concerned.

72. However, a few general comments may be added under this head. First, it is encouraging to note that observances of United Nations Day, which are now wide-spread in countries throughout the world, have tended over the years to become increasingly linked with sustained programmes of study in schools which are continued throughout United Nations Week or even longer periods. This development has been much assisted by circular letters of instruction or suggestions to schools issued by national, state or local education authorities, and by special study materials issued or distributed by Governments and/or United Nations Associations or other non-governmental organizations. Human Rights Day is also widely observed, and, in many countries, special study programmes at the various levels of education were undertaken in connexion with the fifteenth anniversary of the Universal Declaration of Human Rights in 1963. World Health Day and Universal Children's Day have also become a part of the official calendar of events in many countries. Sustained study and action programmes in support of special efforts such as FAO's Freedom from Hunger Campaign have also been widely developed in schools in many countries. When planned and conducted as an integral part of the school's instructional programme, such international "days" and special efforts have undoubted educational value and impact.

73. It should also be noted that in many countries, non-governmental organizations, particularly national

and local United Nations Associations, have worked closely with schools in conducting or assisting extra-curricular activities which are felt to have substantial educational worth but which require adult skills and material resources that the schools either cannot provide or cannot spare for these purposes. Examples of such activities include supervised group visits to the headquarters or field projects of the United Nations and the specialized agencies, summer or other holiday seminars for secondary-school students, and large-scale model United Nations assemblies, all of which typically require mature and knowledgeable guidance in programme-planning and preparation, the provision of well-selected study materials, and often also living accommodations for the period concerned. However modest or extensive in scale, well-planned extra-curricular activities on the United Nations for primary and secondary schools constitute a field of work in which the further assistance of relevant non-governmental organizations would be most welcome in many countries.

74. Lastly, it should be stressed that extra-curricular activities, however well-planned, should not be used as a substitute for a programme of systematic study in the school curriculum, for at least two main reasons: (a) such activities tend to engage the active participation on a voluntary basis of only the most able and/or interested students; and (b) most extra-curricular activities, by their very nature, are usually fairly *ad hoc* and thus do not provide a suitable functional framework within which to plan and achieve long-term educational objectives in a complex subject-field.

Education out of school

75. Replies from Member States indicate that, throughout the world, most adults and out-of-school youth learn most of what they know about the United Nations, not through formal programmes of instruction, but through the mass media, including the Press, films, radio, and, in more and more countries, television.

76. A key role in this process is played by the public information offices of the United Nations and its related agencies, both directly through their own output, and indirectly through assistance to national information services. For example, during the year 1963, more than 3,000 press releases were issued at United Nations Headquarters by the United Nations Office of Public Information, some seventy-five booklets, pamphlets and other publications were printed in over sixty languages, sixty-three countries received United Nations films and television productions in fourteen languages, and United Nations Radio supplied networks and stations around the world with regular news programmes and a wide range of features and documentaries. In addition, each of the specialized agencies and other bodies related to the United Nations — for example, UNICEF — also has its own public information programme and output. The programmes and services of the United Nations organizations are described in further detail in chapter III of the present report.

77. In addition to the information materials produced directly by the United Nations family itself,

these international organizations also assist the national information services in the various countries to produce their own programmes and/or to disseminate through their national channels materials produced by the United Nations agencies. In this connexion, it is encouraging to note that, in addition to news items, a considerable and growing volume of feature material on United Nations subjects, in Press, films, radio and now television, is being used by the mass media in a steadily increasing number of countries. Such feature and documentary programmes give treatment in some depth not only to topical political and security questions but also to such other activities of the United Nations family as the large-scale United Nations Conference on the Application of Science and Technology for the Benefit of Less Developed Areas (Geneva, February 1963), the World Food Congress (Washington, D.C., June 1963), the continuing FAO Freedom from Hunger Campaign and the United Nations Development Decade.

78. Meanwhile, apart from the information provided through the mass media, wide-spread programmes of formal education on the United Nations for adults and out-of-school youth are reported in only a few countries, chiefly in Eastern Europe, and to a lesser extent in countries in Scandinavia, North America and Australasia. One country in Eastern Europe writes:

“In 1962, 143,000 students taking primary instruction in evening schools studied the world organization, under the heading ‘The United Nations, its tasks, its importance’. More advanced study is offered in the final year of the secondary-school evening courses and correspondence courses, in which some 21,000 persons are enrolled. In the vocational and technical training courses for workers, approximately 100,000 persons are learning about the United Nations in the course ‘The United Nations, its objectives and importance; the role of the socialist States in the United Nations’. In the people’s universities, with a total student body of about 200,000 adults, a course is given on ‘International problems’ which includes a detailed study of the work of the United Nations.”

79. A second country in this area outlines its programmes in this field as follows:

“The specific feature of adult education is the large attendance of popular and workers’ universities, at which lectures are held from time to time on United Nations questions... Courses, discussions and lectures are systematically organized also by different public and political organizations. Special attention is paid to teaching about the United Nations in the Army.”

80. In most of the other countries in which sizable programmes of adult education on the United Nations are found, some formal instruction is provided through courses on international relations, which include some treatment of the United Nations, conducted by university extension or extra-mural departments, public evening high schools and adult education councils, but the preponderant volume of work in this field is done by a very wide range of non-governmental organizations. These voluntary and private bodies, which often have large memberships, include civic, religious and women’s organizations, trade unions, service clubs, professional associations and many youth organizations. Concern-

ing the work of these bodies, the report of one country in North America states:

“In the pattern of extra-curricular and out-of-school activities related to teaching about the United Nations, the organizations play a most important role. Not only do they sponsor educational activities for the thousands of adults holding membership in these bodies, but they publish and/or distribute periodicals, booklets, guides, reading-lists and the like, which have become a major source of domestic material on the United Nations.”

The report then outlines the publications and activities in this field of some of the most important bodies concerned. These activities most often comprise discussion groups, lectures, seminars, public meetings, sponsorship of radio and television programmes, and fund-raising and educational activities in support of such programmes as the work of UNICEF, the FAO Freedom-from-Hunger Campaign, refugees, and the UNESCO Gift Coupon Scheme. This section of the report concludes with a five-page annotated bibliography which lists and describes journals, books, pamphlets and other materials on United Nations affairs issued by the various organizations concerned.

81. In this connexion, special mention should also be made of the work of the World Federation of United Nations Associations (WFUNA) and of its national affiliates with their local branches which currently are actively in operation in sixty-two Member States. In addition to seminars for teachers on teaching about the United Nations and extra-curricular activities for young people in schools (both noted earlier), the Federation and its affiliates provide publications and a continuing programme of adult education in this field in their countries of membership, as well as such further activities as study-visits to United Nations Headquarters for groups of members from various national Associations, summer schools at WFUNA Headquarters (Geneva) and the like. A separate written statement by WFUNA on the subject of teaching about the United Nations will be presented to the Council at its thirty-seventh session.

82. Nevertheless, although the volume of work done is both impressive and important, the available evidence seems to indicate that effective programmes of adult education on the United Nations are not yet in operation except in a few countries. Moreover, even in some of these countries, they probably do not reach directly more than a relatively limited, albeit usually quite influential, proportion of the total adult population. Further action along a broad front would seem to be needed, appropriate to the particular situation and to the resources available.

83. For example, in a sizable number of countries, effective adult education channels exist, but many of them — university extension and extra-mural departments, public evening high schools, armed forces education programmes, trade unions, agricultural extension services, farmers' associations, women's organizations, community development programmes, national literacy campaigns, and the like — are not at present engaged,

or not vigorously so, in this field. It seems not unlikely that a careful analysis would be able to demonstrate that many of the primary interests of these bodies are directly served by and can be linked to relevant operations of the United Nations organizations and thus that progress towards their own main goals would be accelerated as a result of giving increased attention to the purposes and work of the United Nations family in their educational programmes. At the international level, it might be helpful if the International Committee for the Advancement of Adult Education, constituted in 1961 to advise the Director-General of UNESCO in the planning and execution of UNESCO's adult education programme, could be invited to consider the possibility of having a study made of the question, with a view to the formulation of recommendations for various measures which might be taken to extend and strengthen programmes of adult education on the United Nations family through existing adult education channels, including the mass media.

Role of non-governmental organizations

84. The important work done by non-governmental organizations in the field of teaching about the United Nations has been referred to under various heads in preceding sections of this chapter. These entries in themselves form a roster of the wide range of activities undertaken by the United Nations Associations and many other bodies in this field: teacher-training (including in-service programmes), teaching materials, teaching in schools at all levels of education, extra-curricular activities, and programmes of education on the United Nations for adults and out-of-school youth. In addition, detailed accounts of the work of the various organizations in the different countries are given in many of the replies from Member States set out in chapter II of the present report.

85. Thus, only a few general observations will be noted here. First, it is clear that many non-governmental organizations have notably extended and intensified their efforts in this field during the past four years. Two main factors appear to have contributed to this welcome development: (a) some of the international organizations which have been most actively engaged in this field for some years have themselves in this period experienced a remarkable growth in membership and hence have been able progressively to extend their efforts into many countries not previously reached (e.g., WFUNA's national affiliates grew from forty-two in 1960 to sixty-two in 1963; WCOTP's membership mounted from 105 national teachers' associations in 1960 in sixty-two countries to 139 affiliated bodies in eighty-five countries at the end of 1963); and (b) as experience is gained in this field by Governments and by the international bodies concerned, it has become possible to determine crucial areas of need with more precision, and also to develop through study and experimentation a growing body of knowledge concerning promising teaching practices and useful materials and aids in this field, which can be shared with others and adapted as required by the particular situation.

86. Next, a considerable widening in scope of the interests of non-governmental organizations can also be clearly seen. NGO Committees which give active support to the work of UNICEF, WHO and FAO have long been in operation in many countries and they have steadily increased in number and in the range of their work. A recent FAO report notes that at the end of 1963, more than 150 non-governmental organizations and voluntary bodies had pledged support for the Freedom from Hunger Campaign, sponsored hundreds of projects and informed their members about the goals and work of the Campaign through articles in their official journals. It appears further that as the United Nations organizations become increasingly operational, the interest of groups with broad general interests, such as local adult education councils, as well as specialist bodies, are manifesting growing interest in the work of such United Nations agencies as the International Bank for Reconstruction and Development (IBRD) and its affiliates, the International Development Association (IDA) and the International Finance Corporation (IFC). The statement provided by the Bank for this report, which appears in chapter III (paras. 335-341), states: "[These agencies] have noted an increasing interest in their activities by schools, colleges, universities and adult education organizations during the period under review... Such groups as local United Nations Associations, World Affairs Councils, Committees on Foreign Relations and many others regularly seek staff members to participate in seminars, conferences and other gatherings in which the work of the organizations will be studied."

87. A parallel development has been the steady growth of study programmes among some non-governmental organizations with clearly defined special interests, for example, trade unions. Such programmes often attract as participants many persons whose attention has not previously been engaged more than casually in the work of the United Nations. Typically such programmes start by focussing directly on the subject of special interest, but as they proceed they seem also to become considerably extended in breadth. A very interesting case study which illustrates this process is reported in a document (un-numbered) issued by the International Labour Organisation in 1960 entitled "Teaching Workers about the ILO", which provides an account of a workshop held in Canada in 1960, sponsored jointly by the International Labour Office and the Canadian Labour Congress. The aim of the workshop was to provide an opportunity for labour educators in Canada and the United States to exchange views and experiences with each other and with various ILO staff specialists as to how to bring the ILO and its work into the educational programmes of their own union or organization. Some of the topics covered were how to stimulate the interest of workers in the ILO; how to teach about the ILO: subjects of general interest — subjects relating to particular industries; technical assistance and operational activities; teaching materials and study aids; and suggestions to labour educators.

88. It would seem useful for other special-interest groups also to undertake to organize similar workshops

jointly with the secretariats of other agencies whose work is of special interest to the organization's membership.

89. Lastly, the United Nations General Assembly having designated 1965, the twentieth year of the United Nations, as International Co-operation Year, that year would seem to provide a particularly suitable occasion for non-governmental organizations to undertake special efforts, with stress on educational programmes for adults, aimed at helping to develop increased public awareness of the extent and significance of existing everyday co-operation, which, it is hoped, will lead to a better appreciation of the true nature of the world community and of the common interests of mankind.

Conclusions and suggestions

90. The survey indicates that, although much has been accomplished during the four years 1960-63, much still remains to be done before education on the United Nations in schools and among adults can be considered adequate to contribute fully to the urgent and basic needs of mankind now: peace and a better world through international co-operation. In particular, attention needs to be focused in most countries on including more effective preparation for work in this field as a part of the regular instructional programme for prospective teachers in teacher-training institutions at all levels. At the same time, more short courses and seminars for teachers already in service should be organized. The lack of suitable teaching materials remains widespread. Needs are particularly acute in the developing countries, especially in the matter of introducing or improving basic information on the United Nations family in relevant school textbooks, written in the language of instruction and the idiom of the country concerned. For this purpose, it would be helpful if funds could be provided through the United Nations and/or UNESCO to afford textbook writers in the developing countries opportunities to study the work of the United Nations family at first hand. High priority should also be given to the provision of similar opportunities to persons in charge of school radio and television services in these countries. United Nations subject-matter should be introduced into relevant courses in school curricula at all levels, from primary schools through universities, in a form suitable to the age and maturity of the students concerned. Educational experience in various countries in different parts of the world indicates clearly that where curriculum revision is done with skill and care, the introduction of information about the United Nations and world affairs does not overcrowd the curriculum but enriches it. The aim is to replace material that is now obsolete with dynamic new concepts of today's world in the process of change for a better tomorrow.

91. Lastly, further efforts in the field of adult education on the United Nations and its related agencies are urgently needed in most countries. In this connexion, it might be helpful if the International Committee for the Advancement of Adult Education could be invited

to consider the possibility of having a study made of the question, as suggested in paragraph 83 above. Meanwhile, it is hoped that non-governmental organizations of every kind, including particularly the United Nations Associations and professional educational bodies, will continue, expand and intensify their important work in this field, during and beyond the International Co-operation Year.

92. It would be helpful if Member States, in their future reports, could describe the progress made in some detail, so that a comprehensive survey of the results achieved could be submitted to the Economic and Social Council.

CHAPTER II

Reports on teaching about the United Nations in States Members of the United Nations and/or UNESCO and in Trust Territories

93. This chapter presents summaries of the official reports received from Governments in reply to a request for information on this subject sent to Member States by the Secretary-General of the United Nations in February 1963 and to member States of UNESCO by the Director-General of UNESCO in March 1963. The summaries are set out by country in English alphabetical order. The chapter concludes with a section on teaching about the United Nations in Trust Territories, summarized from information provided by the Administering Authorities to the Trusteeship Council.

94. As noted in the preface, the replies from Governments varied considerably in nature and extent. Some were limited to brief general statements; others comprised extensive appraisals, made in some cases by committees of educators and other specialists working over a considerable period of time.

95. It is hoped that these summaries will help to convey some view of the varied approaches taken and methods used in teaching about the United Nations.

A. REPORTS FROM STATES MEMBERS OF THE UNITED NATIONS AND/OR UNESCO

AFGHANISTAN

[Original text: English]
[13 June 1963]

During the period 1960-1963, teaching about the United Nations and its agencies has been provided within the scope of social studies. United Nations Day, Human Rights Day and World Health Day are widely observed. In teacher-training programmes, lectures on the United Nations have been given regularly. Afghan representatives participating in international conferences publish articles or give lectures on the proceedings and results of these conferences in order to create greater public awareness of the work of the United Nations. Kabul Radio regularly broadcasts a special programme on the United Nations.

ARGENTINA

[Original text: Spanish]
[2 September 1963]

Secondary schools

The use of seminar is one of the main methods for teaching about the United Nations in Argentina. In 1961, seminars on the United Nations were held in all secondary schools in Buenos Aires, sponsored by the National Centre of Documentation and Educational Information, a division of the Ministry of Education. In 1962, eleven similar seminars, and in 1963, twenty-two, were held in secondary schools and universities throughout Argentina. Typically, each seminar comprises seven weekly sessions, planned so that the final meeting is held on United Nations Day. Faculty members and visiting lecturers conduct the sessions. Study material is furnished chiefly by the United Nations Information Centre.

The National Centre of Documentation and Educational Information prepares and distributes each year material for United Nations Day observances and also organizes exhibitions. In 1962, educational officials joined in sponsoring a United Nations contest for students of industrial schools in the interior. These schools were chosen because their technical curriculum and geographical location afforded little opportunity for their students to learn about the United Nations. Three silver medals were awarded on United Nations Day.

Higher education

Significant steps in teaching about the United Nations have been taken at the university level. Since 1961, a United Nations seminar comprising twenty weekly sessions has been conducted yearly by the Institute of International Law of the National University of the Litoral, in co-operation with the Rosario branch of the Argentine Association for the United Nations. Participants include primary and secondary school teachers and senior university students; attendance rose from 185 in 1961 to over 300 in 1963.

In 1961, the University published a detailed syllabus and summary of the seminar lectures in a volume entitled *Curso de preparación para la enseñanza sobre Naciones Unidas*, with the financial assistance of UNESCO. It is intended to serve as a prototype course for the preparation of teachers in this field.

The basic subjects of the seminars are repeated yearly, supplemented by discussions of current activities of special interest to Argentina, such as the United Nations Development Decade and the FAO Freedom from Hunger Campaign.

Smaller seminars usually timed to coincide with United Nations Day are held along with United Nations and UNESCO film showings and graphic expositions. Examples include a three-day seminar on the United Nations family held in October 1962 by the Extension Division of the National University of the Litoral, and

a well-attended ten-day seminar on "The University and the United Nations" held in 1963 in Santa Fe City. The 1963 seminar concluded with a student-team quiz on the United Nations which was broadcast over the University's radio station. "The United Nations and Human Rights" was the subject of another seminar, organized in 1963 by the Provincial University of Mar del Plata, in which professors and students from four other universities also participated.

Non-governmental organizations

Non-governmental organizations continue to play a leading role in arranging seminars both on United Nations activities generally and on specific topics. Examples include the month-long seminar sponsored by the Argentine Association for the United Nations in 1961 on "Science and Technology in the Development Decade", and the seminar for human rights leaders organized in 1963 by the international relations section of the Junior Chamber of Commerce in Bahía Blanca and the Argentine Association of Human Rights Leaders. In addition, the Argentine Association for the United Nations translated and published a useful handbook for teachers entitled in Spanish *La Enseñanza sobre Naciones Unidas* (Buenos Aires, 1961), by Paul Ferraud. This manual was issued initially in French, under the title *L'Enseignement sur la famille des Nations Unies*, by the World Federation of United Nations Associations (Geneva, 1959). Local chapters of the United Nations Committees and the voluntary correspondents who co-operate with the United Nations Information Centre also help to disseminate information about the United Nations.

AUSTRALIA

[Original text: English]
[14 August 1963]

General observations

During the period 1960-1963 activities related to teaching about the United Nations have continued, with some extensions and developments, along lines indicated in earlier reports. Children in primary and secondary schools have continued to be instructed formally on the work of the United Nations, and extra-curricular activities have been further developed; teachers for both levels of schooling have continued to receive appropriate instruction in their training, and this has been followed up by conferences and seminars for teachers in service. A wide range of reference materials has been drawn from for use in schools, and teaching has been further supplemented by special school broadcasts and telecasts. The United Nations and its agencies have continued to be included in certain courses at universities, and in the general community interested adults have been able to participate in adult education courses and discussion groups by various authorities.

A significant development has been the extension of television as a mass communication medium in Australia: the number of the viewers' licences increased from 577,000 in 1959 to 1,378,000 in 1962. The use of television as a vehicle to spread knowledge of the United Nations, both to children in schools and to the public generally, is noted elsewhere in this report.

In 1963, the first interstate conference of school children on the United Nations and international affairs was organized in Melbourne by the United Nations Association of Australia and is expected to become a regular feature.

The volume *Education for International Understanding* (a source unit for teachers) first published in 1957 by the Australian National Advisory Committee for UNESCO, was revised and reprinted. Some thousands of copies were distributed to state Departments of Education for use in secondary schools.

There always remains the problem of further capturing the interest of the community at large. It is difficult to awaken further co-operation amongst metropolitan newspapers — only special items such as disarmament, Trusteeship Council reports, the take-over of West New Guinea, the UNESCO Nubian Monuments Campaign and financial problems appear regularly in the newspaper columns.

In January 1961, a two-week seminar on teaching about the United Nations was held at Armidale, New South Wales, organized by the World Federation of United Nations Associations with the assistance of UNESCO and in collaboration with the United Nations Association of Australia. It was attended by forty participants from eight countries and territories in South-East Asia.

Increasing numbers of speakers have been requested by and supplied to various groups (including schools) and there is an undoubted increase in the number of requests by teachers and school children for information on the United Nations.

In the second quarter of 1962, there were over 12,000 students from other countries in Australia, including more than 10,500 from Asian countries. It seems possible that if information on the United Nations could be included in courses taken by these students, a significant Australian contribution to teaching about the United Nations in countries other than Australia might be made.

Teacher-training

All states continue to include preparation for teaching about the United Nations in their primary and secondary teacher-training courses. In one state, as the period of primary teacher-training has been extended, more time has become available for such preparation. In other states, the existing preparation has been intensified. Such instruction is usually given as part of social studies, health, education, history and geography. Primary teachers are trained to instruct their pupils in all subjects of the curriculum and each receives instruction on United Nations topics to apply in teaching

appropriate subjects. Teachers at the secondary level, however, seldom teach more than two subjects and whether or not they receive extended instruction on the United Nations depends on the subjects they are to teach. Extra-curricular activities include observance of international days, debates, talks by visiting speakers, and fund-raising appeals, e.g. the Freedom from Hunger Campaign.

In-service teacher-training

At in-service seminars or conferences teachers are brought up to date by means of lectures, displays of relevant material, and group discussions. Such provision applies both to primary and secondary teachers, particularly of history and social studies. Teacher college staff usually promote and service the conferences.

The United Nations in school programmes

Provision for teaching about the United Nations and its related agencies is included in the various state primary curricula as part of the work to be covered in various subjects. Extra-curricular activities such as observance of United Nations Day form a regular part of the primary school programme.

Teaching about the United Nations is included in the various state secondary curricula and in some states during the period under review greater emphasis has been placed on this topic. As at the primary level, such instruction is given as part of the work to be covered in various subjects, although here it is treated more extensively and often as a separate unit within the appropriate syllabus. Questions on the United Nations are included with varying frequency in the matriculation and other external examinations of the various states.

Secondary schools engage in extra-curricular activities concerned with the United Nations similar to those noted for primary schools. In addition, regular inter-school essay competitions are held on topics related to the purpose of the day. Further relevant extra-curricular activities are occasioned by the existence of various clubs and debating societies within secondary schools.

Classroom teaching materials and aids

It would appear that textbooks in use, together with the supplementary material outlined below provide, adequate coverage. Schools and teachers' colleges obtain up-to-date information from the United Nations Information Centre. In some states, additional material in the form of newsletters and current affairs bulletins is available.

Radio and television

School radio programmes are arranged and relayed by the Australian Broadcasting Commission on a national or a state basis. National programmes are designed to supplement the general topics of school curricula throughout Australia while state programmes are directly related to the curriculum of the state concerned. Each year, in both types of broadcast, there are programmes

devoted to the United Nations and its related agencies. At the national level, for example, regular programmes entitled "The world we live in" and "Behind the news" cover United Nations topics for primary and secondary schools respectively. Important days and events, such as the Freedom from Hunger Campaign, are given special coverage. National programmes reach approximately 200,000 pupils in some 5,000 schools throughout Australia, while state programmes reach 15,000-30,000 pupils in 700-800 schools.

At present, further developments are taking place in this field. The Australian Broadcasting Commission's office in New York is preparing tapes of basic material on the United Nations at work, such as interviews and sound tracks of debates at United Nations Headquarters, so that programmes of more intensity and impact will be incorporated into school broadcasts.

Television programmes on United Nations topics are similar in content to those relayed by radio and are syndicated throughout Australia. The audience at present is much smaller than radio audiences.

United Nations study in colleges and universities

Although there are no separate courses devoted to the United Nations, such study forms a substantial part of undergraduate courses in history, geography, economics, international law, international relations, government and political science. United Nations topics may also be selected for post-graduate research in the fields of economics, history, law, government and political science. Most extra-curricular activities in this field are sponsored and organized by student international societies, political clubs, etc., and include a wide range of programmes such as conferences, debates, film-screenings, guest-speaker talks and fund-raising projects.

Adult education programmes on the United Nations

In all states, programmes on the United Nations and its related agencies have been organized within the scope of adult education. Week-end, seminars in which social studies teachers and the general public participate, have discussed United Nations topics and "study days" have also been devoted to these matters. Discussions and lectures have dealt with subjects such as "The United Nations and World Trouble Spots", "New Guinea and Trusteeship Activities" and "The International Labour Organisation". Programmes of this type are organized under the auspices of United Nations Associations, religious societies, women's organizations, adult education bodies and extra-mural departments of universities and service clubs. Audiences in smaller centres number approximately thirty-five to fifty while in larger areas several hundred attend each course.

For the general adult audience, new announcements and feature programmes on the United Nations and its related agencies are presented on radio and television. Recorded material made available by UNESCO has been a major source of radio programmes in the past, but recently the New York representatives of the Australian Broadcasting Commission have been

obtaining suitable material for radio "magazine articles", short programmes of three to four minutes' duration on United Nations topics. In the television field, programmes on the United Nations are presented whenever a significant event, which affords topical coverage, occurs.

Appendices

Materials appended to the report included specimen instructions circulated to teachers by the various state Departments of Education, lesson plans for use in teaching about the United Nations in primary and secondary schools, and syllabi of university courses in international relations and international law.

AUSTRIA

[Original text: German]

[31 July, 19 November and 3 December 1963]

Teacher-training

The curriculum for teacher-training institutions in Austria provides for instruction on the United Nations in the third-year courses in history and in geography, and in fifth-year courses in history and in pedagogy. Questions on the material covered appear in relevant sections of the matriculation and qualifying examinations.

An increasingly large number of reports and discussions on the United Nations family is included in in-service training programmes for teachers at primary, secondary and special schools.

The Austrian National Commission for UNESCO aims nearly all of its activities at teachers. The Commission, whose seminars are well attended by teachers, has also instituted UNESCO study groups in several areas of the country. The Commission and the Federal Ministry of Education also work to ensure the widest possible circulation of the Commission's various publications among teaching institutions.

Teaching about the United Nations in the school curriculum

In the history curriculum for the final grade of primary, secondary and special schools, explicit provision is made for study of United Nations activities and the Charter. A less detailed study is prescribed in the curriculum for lower primary schools. The United Nations could provide the basis for discussion in current events classes.

The curriculum for the secondary schools observes that in the teaching of geography "changes which have taken place in the world situation as a result of the Second World War are to be viewed from the standpoint of the United Nations . . . geography teachers must also constantly bear in mind the need to train good Austrians and democrats to further the cause of the United Nations".

Examinations for school-leaving certificates in secondary schools regularly include questions on the United Nations family, especially in geography and history.

In addition, texts dealing with international organizations are frequently included for translation in the English language examinations.

Teaching about the United Nations in universities

Studies of international organizations are mainly conducted at the faculties of law under the heading of international law, which is one of the main subjects offered. The minimum requirement comprises five hours a week. Under the aegis of the faculty of law at the University of Vienna a two-year post-graduate programme for international studies has been set up; one of its main purposes is to study all international organizations. Special attention is given to the work of the United Nations in the field of human rights.

At the University for International Commerce courses are given on international, financial and economic institutions, some of which focus especially on assistance to developing countries. In this context the important role of the United Nations and some of its specialized agencies in the economic and financial field is stressed.

At the faculties for theology and philosophy the United Nations is studied from a sociological, ethical and moral point of view. For students of recent history, the League of Nations is compared with the United Nations in respect to organs, competence and procedure.

Teaching materials

History textbooks for upper primary and secondary schools contain chapters on the United Nations and the specialized agencies. English textbooks for these schools also make frequent references to the United Nations family. The *UNESCO Courier* is used from time to time in French and English lessons and newspaper articles on the United Nations family from a popular part of modern language lessons.

Extra-curricular activities

United Nations Day is observed in all Austrian schools from the fifth grade upwards, generally in the form of lectures and discussions. A circular of directives on the subject is issued each year by the Ministry of Education.

Non-governmental organizations

The United Nations Association of Austria is particularly active in work with schools and out-of-school young adults. The Association regularly supplies information materials for use in school observances of United Nations Day, Human Rights Day and World Health Day. It also meets requests for school exhibits on the work of the United Nations family.

The School Clubs Section of the UNA arranges frequent lectures, group discussions and film showings in United Nations agencies in schools throughout the country. Since 1953 it has organized a nationwide public-speaking competition on the United Nations for secondary school students and young workers. Interest

in these contests has grown steadily: in the 1963 annual competition 4,000 young people participated.

The Youth Section of the UNA organizes an annual seminar in Geneva, which features briefings and discussions with United Nations officials and film showings. Similar study-visits are arranged to FAO headquarters in Rome and UNESCO in Paris.

BELGIUM

[Original text: French]
[18 October 1963]

General observations

During the period 1960-1963, a considerable effort has been made to draw the attention of teachers to the problems being dealt with in the United Nations and the specialized agencies. The media employed for this purpose include a large volume of printed matter, exhibitions, films, etc.

This experience leads us to believe that the distribution, both nationally and internationally, of material on the United Nations and the specialized agencies is one of the best ways of improving the teaching about them and of bringing about a deeper knowledge of international problems.

Teacher-training programmes

In the syllabus of teacher-training establishments provision is made for teaching about the United Nations and its agencies. This is a compulsory item and is included in the history course and in the civics and ethics courses.

In addition, prospective primary and secondary school teachers can widen their knowledge of the United Nations and its agencies by such means as student exchange schemes, travel, individual research projects for which the various departments are frequently asked to provide necessary documentation, films, etc.

In-service teacher-training programmes

For in-service teachers an effort is made to broaden their knowledge in this field through the provision of printed matter and other materials, e.g. films about the United Nations are placed at the disposal of the schools; publications such as *The UNESCO Courrier* are circulated to the schools; circulars are sent out to the heads of primary and secondary schools on such occasions as United Nations Day, Human Rights Day, or a special effort launched by a specialized agency (Freedom from Hunger Campaign).

The United Nations in school programmes

A substantial part of the civics courses in the primary education syllabus is devoted to teaching about the United Nations family. Thus the syllabus for the third stage (pupils aged 10 to 12-13 years) includes the item: "Brief survey of international organizations: United Nations and UNESCO". Other related activities include

competitions, school radio and television programmes, correspondence between schools, etc.

At the secondary school level, teaching about the United Nations is included in the syllabus for: (a) History: (i) fifth year (pupils aged 13 to 14-15 years): "Attempts to organize world peace and international co-operation: League of Nations, ILO, International Bureau of Education, United Nations, UNESCO, etc.;" (ii) first year (pupils aged 17 to 18-19 years): "The inter-war period: attempts at international organization; post-war problems and attempts at international co-operation"; and (b) Civics: considerable attention is devoted to these topics in first-year classes. In addition, extra-curricular activities of various kinds are arranged.

Classroom teaching materials and aids

An important place is given to the United Nations and its agencies in relevant textbooks. Examples of history textbooks in use are Michel Vanden Eynde and Dorchy, *Temps modernes et contemporains* and Franz Hayt, *Du XVII^e siècle à nos jours*. The number of textbooks has been found to be sufficient, and they are regularly brought up to date by their authors. Films about the United Nations and its activities and school radio and television programmes are also used.

Study about the United Nations in colleges and universities

In all universities and schools of higher learning courses in history, political economy and international public law to a very great extent cover the international organizations, including the United Nations and the specialized agencies.

Adult education programmes on the United Nations

Adults are encouraged to learn about, or to learn more about, the United Nations and the specialized agencies through lectures and study groups.

BRAZIL

[Original text: Portuguese]
[14 October 1963]

Under a new law promulgated in December 1961, the Federal Education system was decentralized and the responsibility for the organization of teaching systems at all levels assigned to the individual states. Revised curricula have been established by the Ministry of Education, in collaboration with the newly created state Councils of Education.

Under new curricula for secondary schools the study of the United Nations is included in general history in the fourth year, under the main heading "The contemporary world".

In primary schools, the United Nations is taught as part of social studies, civics and ethics. These programmes stress the interdependence of peoples, the individual's

duties towards his own country and toward mankind generally. Pan-Americanism and an understanding of the political, economic and cultural solidarity of the countries of the New World is also emphasized.

In the experimental programme of social studies in the primary schools of Rio Grande do Sul, the structure, functions and achievements of the United Nations are studied within the unit "Brazil and the World". Among the activities suggested by the state education authorities is the study of and comment on the most significant aspects of the Universal Declaration of Human Rights.

Teacher-training

Some states are also reorganizing their programmes for the training of primary school teachers. Others, however, continue with the pre-1961 syllabus in which teaching about the United Nations is included in courses on educational sociology or history.

Examinations for admission to teacher-training institutes may include questions on Brazil's participation in the United Nations. The State of São Paulo, for example, gives such examinations.

Teaching aids

In 1962, the Federal Ministry of Education and Culture issued a series of handbooks aimed at assisting the primary school teachers. The series, called "Library of the Brazilian Teacher", included among its six guidance manuals one on the teaching of social studies in primary schools, which suggests principles and methods for use in teaching about the United Nations. The manual states that the aim of such teaching is to help pupils to understand the objectives of the United Nations system as "the safeguarding of peace by means of conciliation and diplomatic action, the development of the less-favoured areas through technical, financial, health and educational aid, and the defence of human rights". The principles and purposes of the Charter are studied and instructors are advised to stress the value of the United Nations accomplishments, against the background of the obstacles to be overcome and the limitations within which it may act. Teachers are asked also to stimulate discussion of the humanitarian aims of the United Nations, using the Universal Declaration of Human Rights as a basis. The manual counsels the use of United Nations films from the National Institute of Educational Cinema, as well as United Nations leaflets and posters as teaching aids. United Nations Day is observed in elementary and secondary schools throughout the country, in accordance with directives issued by state education authorities.

BULGARIA

[*Original text: French*]
[8 August 1963]

Teaching about the United Nations is concentrated primarily in higher educational establishments. Thus,

in the Faculty of Law of the University of Sofia, the course on international law includes sixteen lectures a year on the United Nations. At the Higher Institute for Economic Studies, in the subject "Foreign trade", as well as in the political economy course, twelve lessons are devoted to the United Nations. Students taking "International relations" have a one-year course consisting of six hours of instruction per week on international organizations, principally the United Nations. In the Institute of Law of the Bulgarian Academy of Sciences, United Nations problems are also studied.

In the primary and secondary schools there is no special teaching about the United Nations. However, lectures are organized in the schools each year on United Nations Day.

The important task of popularizing the purposes of the United Nations and its activities among the Bulgarian public is entrusted to the Bulgarian United Nations Association, with the active co-operation of the Ministry of Foreign Affairs. For some fifteen years it has done this work by means of public meetings, radio broadcasts, press articles and films. The fact that the Government maintains a policy of peaceful coexistence greatly facilitates the Association's task. The United Nations Association is assisted by the lecturers attached to the National Council of the "Fatherland Front", a social and political organization, which organizes lectures throughout the country.

BURMA

[*Original text: English*]
[20 May 1964]

General observations

During the period 1960-1963 public interest in the work of the United Nations and the specialized agencies, particularly the interest of educational authorities and of teachers, has grown considerably. There is a growing emphasis on the teaching of the subject in schools and other educational institutions.

The translation of available literature on the work of the United Nations into Burmese has been extended. However, suitable textbooks for all levels of education are still needed, as well as other teaching materials and aids.

As the educational system in Burma is centralized, the Ministry of Education through the Directorate of Education is able to direct the activities in schools. The subject "The United Nations and its specialized agencies" has been included in the school curriculum. Pamphlets on the United Nations and its agencies are distributed to schools throughout the country, as well as articles written in Burmese, special messages and newsheets.

A variety of extra-curricular activities, such as observances of United Nations Day, United Nations Week, Human Rights Day, and Universal Children's Day are organized by the education authorities in co-operation with the local communities and voluntary organizations.

These programmes include such features as the reading of special messages from the Chairman of the Revolutionary Government and from the Secretary-General of the United Nations, lectures by eminent persons on the United Nations and its specialized agencies, debates, essay contests, seminars, film shows and radio talks. In some schools, students read about and discuss the United Nations or participate in model United Nations meetings.

To extend and improve education in this field, it is suggested that information materials provided by the United Nations should be better adapted for use in schools at the national and local levels. Suggestions concerning plans and programmes for systematic teaching about the United Nations and its related agencies would also be desirable.

Teacher-training

Instruction on the United Nations and its related agencies is provided in teacher-training institutions as part of the study of history and civics. These courses are among the professional subjects required of all teachers for a teaching certificate.

Instruction on the United Nations is based on the principle of linking it to suitable situations. The use of books, pictures, songs, dances, etc. is stressed.

Teacher-training institutions observe United Nations Day and Human Rights Day and organize model sessions of the United Nations. Teacher-trainees are also encouraged to take part in dramatic sketches and in essay and poster contests on the United Nations. Materials produced by the United Nations and its related agencies are exhibited and persons who have participated in activities of the United Nations organizations are invited to give lectures.

In-service teacher-training

For teachers already in service, radio talks, and official documents and publications of the United Nations and UNESCO, including reports of seminars and conferences, which are available in official libraries, serve as sources of study.

In addition, the Directorate of Education issues some Burmese versions of United Nations publications to all schools and other educational institutions throughout Burma. Considerable information is given also through official circular communications.

The United Nations in school programmes

In primary schools, teaching about the United Nations is done indirectly as a part of education for international understanding, with attention focused on the life of children in other countries, using games, songs, dances, etc.

In secondary schools, instruction on the United Nations family is provided as a part of history and

civics in the regular school curriculum. Questions on the United Nations are sometimes included in school-leaving examinations.

United Nations Day is observed annually in all schools throughout Burma, with programmes adapted to the various age levels concerned. An official circular concerning such observances is sent to schools by the Directorate of Education, together with relevant leaflets, posters and other publications.

Classroom teaching materials and aids

There are no separate textbooks on the United Nations and its related agencies, although this subject is dealt with in a separate chapter in some history and civics textbooks.

Some progress has been made in the popularization of leaflets, pamphlets and posters distributed by the United Nations. However, more systematic teaching about the United Nations is necessary, and for this purpose curriculum materials to suit all levels of education still need to be developed.

Colleges and universities

At the University of Rangoon, a study of the United Nations and its related agencies is provided, not as a separate subject, but as a part of relevant courses in various fields. For example, in the Department of Economics, the objectives, functions and operations of the Economic Commission for Asia and the Far East, the World Bank, the International Monetary Fund, etc. are examined. In the Law Department, the United Nations Charter and the questions brought before the Security Council and the International Court of Justice form a substantial part of the courses in international law. In the Political Science and History Department, courses entitled "International Organization" are given at both the graduate and undergraduate levels as part of the programme of study in international relations. Thus far, no theses or dissertations have been submitted on United Nations subjects.

At the University of Mandalay, instruction on the United Nations and its related agencies is provided as part of the undergraduate course in political science.

Adult education

Voluntary non-governmental, organizations, including the Burma Council of World Affairs, the Young Women's Christian Association, the Young Men's Christian Association and the Youth Improvement Society, have done valuable work in teaching about the United Nations. These organizations sponsor panel discussions, model United Nations General Assemblies, debates, essay contests, seminars and talks about the United Nations and its related agencies.

Radio broadcasts, which comprise news announcements and feature programmes, also assist adult education in this field.

BYELORUSSIAN SOVIET SOCIALIST REPUBLIC

[Original text: Russian]
[9 September 1963]

Elementary and secondary school programmes

During the period 1960-1963, teaching about the United Nations has received great prominence in schools.

From their first school years, children learn from various textbooks about social and political systems, ways of life and cultural achievements in the different parts of the world. Teachers make use of reading, nature studies and history lessons to educate the children in the spirit of friendship among peoples. Films and film-strips are extensively used.

Pupils in the senior classes (IX-XI) study general history, international relations, and learn about the life of peoples of other countries from school exhibitions, school radio broadcasts, and correspondence with pupils and teachers abroad. Classroom "trips" to different countries are organized. Many pupils take part in youth festivals and discussions of the international situation, including the work of the United Nations. An important place in educating pupils on the spirit of the United Nations Charter is held by the school literature syllabus. Through history, geography and foreign language studies the pupils become acquainted with the historical development, economy and culture of many countries. In history lessons they also learn about the United Nations; the acquisition of independence by new countries; progress in human rights, etc. A spirit of humanism, friendship and mutual understanding between peoples permeates the teaching of these subjects.

United Nations study in colleges and universities

The most varied aspects of United Nations work are studied at the universities, especially in the faculties of history in the pedagogical institutes which prepare teachers for primary and secondary schools. Section 13 of a draft course in modern history published by the Ministry of Higher, Special Secondary and Professional Education provides for a detailed analysis of United Nations work. A special course entitled "International relations during the Second World War" discusses in detail the formation of the United Nations and analyses the provisions of its Charter.

Year by year the students in the faculties of history write essays and dissertations on United Nations subjects. The results of the sessions of the United Nations General Assembly have been set as general subjects, and are constantly studied by research groups in the departments of modern history and the history of the USSR.

United Nations material is no less important in the teaching of the Faculty of Law of the Byelorussian State University. Here a course on international law is given in accordance with the syllabus approved by the University Teaching Methods Board of the Ministry of

Higher and Special Secondary Education of the USSR. Section 11 of this syllabus includes the following topics:

"The United Nations. History of its foundation. The part played by the USSR. The Charter. Purposes and principles. Membership of the Organization. Change in the distribution of strength in the United Nations. Its principal organs. The need to abolish the Trustee-ship System. Procedure for amending the United Nations Charter. USSR suggestions for change in the structure of the United Nations.

"United Nations specialized agencies. History; concept; types. Interrelationship with the United Nations; the nature of their work. The part played by the USSR. Non-governmental international organizations and their consultative status with the United Nations. Regional organizations under the United Nations Charter."

United Nations questions are dealt with also in other sections of the international law syllabus. For instance, in section 5 the United Nations Charter is studied as a particular kind of international treaty, and attention is given to the work done by the United Nations in codifying and progressively developing international law. A special course entitled "The United Nations", consisting of eighteen lectures and ten tutorials, is also given in the Faculty of Law. Undergraduates in law and history write a considerable number of essays and theses on aspects of United Nations work.

Adult education

Information about the United Nations is disseminated among the adult population of the Republic through lectures, the Press, radio and television, special pamphlets, books and photographic exhibitions. The programmes of Republican, regional and city societies for the dissemination of political and scientific knowledge include lectures on the latest United Nations events and other United Nations matters. Similar lectures and talks are also given on television and radio. Political leaders contribute to Republican and local newspapers and magazines surveys of the major problems dealt with by the United Nations, and also speak of these on United Nations Day and Human Rights Day. The current activity of United Nations bodies and agencies is reported regularly in the Press.

CAMBODIA

[Original text: French]
[12 August 1963]

General observations

Since 1960 lessons on the United Nations have been included in the curriculum in all secondary schools. United Nations Day and Human Rights Day have been observed regularly since 1951.

The main obstacles to effective teaching in this field are the lack of financial means and of adequate teaching

materials. To overcome the latter shortcoming, teachers have had to rely on publications furnished chiefly by UNESCO. In addition, some United Nations information is provided through lectures and speeches, radio broadcasts, and articles in the official journal, *L'instituteur Khmer*.

At the international level UNESCO might make available the results of research undertaken in education, science, etc. for dissemination by Press, radio or films. Cambodia also would like financial aid from UNESCO as well as materials to improve teaching in this field.

Teacher-training

Lectures are given on United Nations Day and Human Rights Day to teachers in training for primary schools. For secondary school teachers, the new curriculum intends to devote more attention to this subject, but such instruction will be feasible only if the appropriate materials are available. Meanwhile, it forms part of history, social studies and health education courses. Information on United Nations subjects is regularly published in the monthly journal *L'instituteur Khmer*, which is distributed to all teachers.

The United Nations in school curricula

At the primary level, information on the United Nations is given in civics courses and in secondary schools, in history and social studies. Final and university entrance examinations often include questions about the United Nations. Plans are under way to start more advanced United Nations studies during the next school year.

Teaching materials and aid

No textbooks in this field have been issued. Documents furnished by UNESCO are used but they are not available in sufficient quantities. Owing to lack of suitable films and filmstrips, there have been no showings in schools. The Department of Information sponsors special programmes to mark United Nations and Human Rights Day which reach the general public, including students. There is also a weekly radio broadcast, *Le monde en marche*, which provides United Nations news.

Higher education

Instruction on the United Nations is given in the first year at the Law School of Phnom Penh. This course, however, is limited and the Department of Higher Education will approach the Dean to expand it in order to comply with the resolutions of the Economic and Social Council

Adult education

Adult education in this field is provided through radio programmes, lectures for United Nations Day and Human Rights Day and the distribution of pamphlets, posters and display sets.

CANADA

[Original text: English]
[30 July 1963]

The report below is in two parts: part 1 was prepared by the Canadian Education Association based on information supplied by the Provincial Departments of Education; part 2 is a report from the United Nations Association in Canada through which educational liaison work is done in the field of teaching about the United Nations.

1. Information supplied by the Provincial Departments of Education

Teaching about the United Nations in school curricula

The courses of study in each province require that information about the United Nations be taught, generally more briefly and informally in elementary school and more thoroughly and formally in secondary school. The topic is not treated as a separate subject, but is integrated into the teaching of such subjects as social studies, civics, history and geography and the discussion of current events. In addition to textbook information, its teaching may be assisted by use of *World Review*, a monthly publication of the United Nations Association in Canada written for high school students and supported by the Departments of Education in six provinces; by Canadian Broadcasting Corporation radio and television school broadcasts; and by teaching materials supplied by the Canadian National Commission for UNESCO, and from United Nations Headquarters in New York. Also, extra-curricular activities aid in making pupils aware of the work of the world organizations.

Provinces vary in the emphasis given to teaching about the United Nations, some devoting considerably more time to it in the curriculum than others. The course of study in New Brunswick contains material on the United Nations in history and civics courses in grades 9 and 12.

Nova Scotia teaches about the United Nations in its civic and citizenship courses in grades 7, 8 and 9, in grade 11 modern history, and the grade 12 history course on Canada and the modern world. The United Nations also is discussed in current events and is alluded to in grades 1 to 6 in the social studies programmes, which emphasizes co-operation, interdependence and understanding among people.

In Quebec Protestant schools, the topic is contained in the grade 10 Canadian history course and in the grade 11 world history course, while in the secondary Catholic schools, it is included in history and civics courses. Ontario pupils will be studying the United Nations in a new and optional grade 10 history course "Modern world affairs". Most recent textbooks in social studies, history and geography used in Ontario have many references to the United Nations. Saskatchewan pupils in grades 7 and 8 study the various branches of the Organization and documents such as the Universal Declaration of Human Rights, under the social studies topic, "Working

with neighbours around the world". In 1960, a manual entitled *Civics and Citizenship, A Sourcebook for Schools*, which includes some twenty pages of United Nations information, was issued to every school. In grade 11 a new topic was begun in 1962 called "The problems of peace in the world", which includes the work of the United Nations; in grade 12 a new course provides study of United Nations affairs and Canada's contribution and commitment.

Current events are stressed in high schools. Many teachers find it advantageous to discuss the United Nations when a relevant world issue is current in the Press.

Extra-curricular activities

All provincial education departments advocate celebration of United Nations Day and suggest appropriate programmes. High schools throughout the country hold model Security Councils and General Assemblies, and there are many United Nations Clubs. Elementary school children participate in the annual UNICEF collection on Halloween 31 October. Well-planned seminars for high school students on the United Nations and world affairs are held each summer at twelve centres throughout Canada.

Preparation of teachers

In spite of the official attention given to teaching the subject, many educational authorities feel that it is inadequately taught. Many teachers feel they are insufficiently informed and are unable to do justice to the topic. No province offers short courses for experienced teachers in this field.

In an awareness of these conditions, a series of workshops for teachers on teaching about the United Nations was conducted at four centres in British Columbia in the fall of 1962 under the sponsorship of the United Nations Association in Canada, the British Columbia Teachers' Federation and the Extension Department of the University of British Columbia.

The following suggestions concerning ways and means to improve the teaching of the topic were made: Curriculum revision and up-dated textbooks; organization of in-service institutes for teachers; a handbook for teachers giving suggestions on the handling of current affairs; more guide-lines from the Department of Education; book lists for teachers and acquisitions for the school library of books suggested by social studies teachers; participation by organizations and institutions outside the school, such as the local branch of the United Nations Association and the nearest university, in such matters as providing speakers for school assemblies, extramural meetings and local teachers' conventions; the availability for teachers, by an organization, of a collection of statements from various countries on international problems, to be used as raw material for model Security Councils and General Assemblies; and a kit of materials about the United Nations for teachers. The entire workshop project was a conscientious and well-thought-out attack on the problem of teaching in this area. A report

on the organization, content and recommendations of the workshops is published in a booklet entitled *Teaching about the United Nations* (Vancouver, University of British Columbia, 1963, 43 p.). Teachers in other provinces would be wise to avail themselves of this report, which also contains a list of specific pamphlets, booklets and articles on this question.

Adult Education

Not a great deal is done in the way of adult education on the subject, though as school boards continue to make school facilities available for adult groups after school hours, more will be done. It was the opinion of the Nova Scotia Department of Education that "not enough is done in a formal way on the part of non-governmental organizations in expanding facilities for adult education on the United Nations. However, the mass media, particularly television, do a very commendable job on the coverage of United Nations activities. It appears that much effective education is carried on in an informal manner".

Conclusions and recommendations

The degree of satisfaction, then, with the teaching of this topic, differs with the province. The director of Curriculum for Alberta states, "We are of the opinion that the present methods of dealing with the United Nations within the programme are adequate". Similar is the official view from Saskatchewan. The Deputy Minister and Director of Education for Prince Edward Island was of the opinion that the Island's curriculum "could be extended to include a broader and deeper study of the United Nations. The history syllabus will be re-written for 1964-65, and will provide for this need".

The words of the Director of Curriculum and Research for the New Brunswick Department of Education appropriately summarize the situation as regarded by several Canadian educators: "There is a keen awareness of the importance of the work of the United Nations by teachers and pupils in this province. However, teaching and learning about it are often less than effective. The reason for this situation is the difficulty teachers have in procuring relevant and up-to-date information about the Organization. Current information about it is just not made sufficiently available to schools".

Were the monthly *World Review* made accessible to every high school student desirous of reading it, it would help bridge the gap. A publication at regular intervals specifically designed and edited for teachers might prove extremely useful. An excellent publication for general information, illustrations and photography already in existence is the *UNESCO Courier*, which would be an admirable addition to classroom libraries for teacher and pupil usage.

Definitely, the formation of in-service courses for teachers to produce ideas, projects and lesson topics which enable students to learn more about the United Nations, and, in the procedure, broaden their international understanding and knowledge of international affairs, needs to be considered and carried out.

Whatever the provincial educational variations in approach, methodology and emphasis given the subject those administrators and teachers aware of the problem are concerned with impressing the importance of the ideals, influence and functions of the United Nations at home and on the world scene. The difficulty lies not with teaching about its birth and historical development in the twentieth century, for which there is a wealth of material to draw upon, but with keeping it alive, contemporary and vital in the minds of the pupils.

2. Report prepared by the United Nations Association in Canada

Educational objectives

A major objective of the Association is to provide services to teachers and schools for teaching about the United Nations. Such instruction should be in sufficient depth to explain the reasons behind the development of the United Nations idea and to consider the problems and aspirations of modern man around the world, his cultural patterns, philosophies, religions and material standards of well-being.

United Nations study in schools

Extra-curricular activities will, by their nature, always remain on the periphery of the educational process. Thus the Association is placing greater emphasis upon integrating study of the United Nations within four key areas of formal education: the curriculum, teacher-training, textbooks, and classroom teaching. A Canada-wide Educational Programme Service is being developed that, it is hoped, will ultimately be able to serve the needs of educators in these four areas.

Present services include: (a) an information Office, which provides teaching aids and general information on the United Nations either free or at a nominal charge; (b) teachers' seminars on the United Nations: during 1962-63 five such seminars were held, four in British Columbia and one in Ontario in conjunction with a UNESCO Associated School; (c) Youth Secretary: in September 1962, a full-time officer was appointed to strengthen the Association's work in the youth education field; and (d) numerous publications for teachers and students including: *World Review*, a four-page monthly leaflet covering United Nations and other international topics, distributed through six Departments of Education, at cost, to most secondary schools in Canada (70,000 copies in English, 5,000 in French); *Annual Catalogue of Materials on the UN*; *Teaching about the United Nations*, a handbook of suggestions for elementary school teachers (1962); and *The UN in your High School*, a handbook for secondary school students on United Nations Clubs; etc. (2nd ed., 1962).

Future activities in schools include: (a) pilot teaching project: early in 1964, a number of Ontario elementary teachers will be selected to initiate and implement programmes over a two-year period which will foster international understanding and a greater awareness of the purposes and functions of the United Nations, and if the project proves successful, it is hoped to expand it into the

senior grades and to other provinces; (b) *UN Association Education Bulletin*: the purpose of this new quarterly (autumn 1963) is to provide teachers with information on teaching aids, both written and audio-visual, on the UN; and (c) UNESCO seminars: during 1964, a series of community seminars will be initiated throughout Canada to provide teachers and the general public with education-leadership programmes on the work of UNESCO.

Teaching materials

A report entitled "Proposed: Teaching Project" prepared for the Association's Educational Policy Committee in May 1963 made the following observations: (a) there is an abundance of resource of materials and programme suggestions for teaching about the United Nations; (b) there is a serious failure to derive maximum educational benefit from these resources, even though many are excellent in themselves; and (c) this situation indicates the need for the interested teacher to be given specialized guidance and assistance in the proper selection, procurement and use of such materials. The only exception to the "abundance" position is in the French language, in which there are very few classroom materials. The resources of the United Nations Association need to be expanded in order to provide assistance to teachers in this field.

Additional services could also be made available to Departments of Education and teachers' colleges when courses and textbooks are being revised. In general, the provincial Departments of Education are most receptive to the inclusion of more United Nations material, if relevant data are made readily available. It is not possible to do this at present.

CEYLON

[Original text: English]
[17 August 1963]

General observations

During the period 1960-1963, a significant development has been the establishment of a number of study groups in leading schools and teacher's colleges whose aims are to disseminate knowledge of the United Nations and to foster the idea of the oneness of all mankind.

The Education Department under the Ministry of Education and Cultural Affairs has taken action to teach about the United Nations and its agencies in schools and teachers' colleges; to celebrate United Nations Day in all schools; to hold essay competitions; to display UNESCO exhibits in all provincial towns; and to encourage all schools to participate in international competitions.

There is a growing appreciation of the services rendered by the United Nations and its agencies. However, education in this field would derive a further impetus if films showing this work could be made available for island-wide display. The films should be accompanied by explanatory pamphlets.

Teacher-training

Actions has been taken to provide United Nations collections in the libraries of the training colleges and to have regular lectures and discussions on United Nations subjects. The social studies course, which includes the United Nations, is compulsory for all teachers. The United Nations Society, with voluntary membership and supervised by a teacher, arranges talks, discussions, film shows, etc. Training programmes for in-service teachers have not been organized hitherto. This is a useful new idea. However, through the teachers' college, about 2,500 trained teachers go out annually to schools with a fair knowledge of the United Nations, its aims and work, and they disseminate knowledge.

The United Nations in school programmes

Direct instruction about the United Nations is not given in primary schools, but booklets, pictures, etc. about other countries are supplied and studied. Thus, instruction on the United Nations is indirect and is part of the social studies course. All schools observe United Nations Day, Human Rights Day, World Health Day, and Universal Children's Day.

In secondary schools instruction on the United Nations is included in the social studies course. Questions have not been asked regularly in school-leaving examinations, but are sometimes included in the General School Certificate Examination. International "days" are widely observed. Some secondary schools have international relations clubs, United Nations materials in libraries, etc.

Classroom teaching materials and aids

Textbooks produced during the period under review have given greater attention than previously to United Nations subjects. Also, some materials issued by the United Nations, such as the Universal Declaration of Human Rights and UNESCO manuals like the *Source Book in Science Teaching, Teaching of History, etc.*, have been translated into the two chief national languages.

It is suggested that a scheme of work on teaching about the United Nations and its agencies, appropriate to the different age groups at the primary and post-primary levels, be published. The main achievements in recent times should be pinpointed. Suggestions regarding extra-curricular activities with lists of appropriate available aids would also be useful.

Extracts from recent reports, paper cuttings, pictures, etc., have been used to provide up-to-date information. News bulletins for schools can be very useful, but they would have to be prepared and circulated by a central authority like the [Ceylon] National Commission for UNESCO.

About 10 per cent of the schools use United Nations films and filmstrips. All schools do not have projectors. Radio broadcasts in three languages have been given, particularly for United Nations Day and other special events. The audience reached is approximately half a million.

United Nations study in colleges and universities

Such instruction is given as part of other subjects, both at the undergraduate level and in universities. Information concerning theses and dissertations is not available. Model sessions of the General Assembly and other United Nations bodies form the chief extra-curricular activities at this level.

Adult education

This aspect of work has so far not received serious attention. Talks and discussions, particularly on United Nations Day, are common at rural development societies, adult education centres, community centres and youth clubs. About 10,000 adults are reached, particularly young men and women who have left school and are employed in the public or private sector or engaged in helping their families in agricultural work. Radio broadcasts also provide information, mainly in the form of news announcements, but with some feature programmes.

CHAD

[Original text: French]
[16 September 1963]

General observations

The main events during 1960-1963 have been the independence of Chad, on 11 August 1960, and its admission to the United Nations, on 20 September 1960, and to UNESCO, on 19 December 1960.

As a result, progress has been made in closer and more effective collaboration between national and international organizations. Public interest in the activities of the United Nations and its related agencies, especially in urban centres, is growing noticeably.

New programmes have been started at the primary school level and are at present being adapted to secondary schools. Pupils participate in observances of United Nations Day and Human Rights Day. The chief obstacles continue to be the lack of financial and material resources.

Teacher-training

Studying about the United Nations is compulsory for teachers in training and is a part of civics and history courses. Students and faculty actively participate in observances of United Nations Day and Human Rights Day. During the summer vacation period, eighty teachers in service attended seminars on international understanding.

United Nations in school programmes

In primary schools, emphasis is placed on the concept of universal brotherhood within the United Nations. At the intermediate level, teaching about the United Nations and its related agencies becomes part of civics and history courses. Specifically, the Universal Declaration of Human Rights is studied as an integral part of civics, whereas the aims and achievements of the United

Nations and UNESCO are included in history courses. In addition, the students participate in parades on United Nations and Human Rights Days and are prepared by previous instruction as to the meaning of these events.

In five of the seven years of secondary education, the aims and achievements of the United Nations and its agencies are studied as an integral part of history and civics courses. During the sixth year, the focus of study is on the role of Chad as a member of the United Nations, UNESCO, WHO, FAO, ILO and ICAO. In the seventh (terminal) year, the work of the previous year is reviewed in fuller detail, with emphasis on the study of economic and social problems. At present the basic curriculum is the same as the French programme of secondary education but it is currently being modified.

There are at present no institutions of higher education in Chad. Students attend courses in Brazzaville or go to French universities.

Teaching aids and material

An effort should be made to supply schools with books, pamphlets and visual material concerning the activities of the United Nations and its agencies. In addition, there is a need for films and projectors as well as records and tape recorders which could be used for lectures and courses.

Adult education on the United Nations

During 1962 and 1963, several radio programmes were broadcast and speeches given by UNESCO officials visiting Chad on mission. Speeches made during United Nations Day and Human Rights Day were re-broadcast by radio. Some non-governmental organizations, such as the Veterans Association, participate in these observances. These programmes reach an extensive proportion of the population, as they are held in the main towns and villages throughout the country. Radio broadcasts provide further information about the United Nations and its related agencies through the news and through special programmes.

CHINA

[Original text: Chinese]
[13 September 1963]

Teaching about the United Nations and its related agencies is included in the prescribed standard curriculum in primary and secondary schools and in specialized junior and senior vocational schools, including normal schools for training primary school teachers. This instruction forms part of required courses in civics and in history, with chapters included in the textbooks for these subjects provided by the Ministry of Education. Observances of United Nations Day and Human Rights Day are held each year in schools at all levels and include such activities as group discussions, speech contests, exhibits and lectures by experts on particular aspects of the work of the United Nations.

The topic "International organizations and the current international situation" is a required subject of

study in all teacher-training courses at the college level and in political science and foreign service courses offered by other colleges and universities.

The Chinese Association for the United Nations plays an active role in informing the general public about the activities of the United Nations. The Association issues a monthly newsletter, distributes other information materials, particularly for United Nations Day and Human Rights Day, conducts seminars, and arrange frequent lectures and film showings. On United Nations Day and Human Rights Day, newspapers and periodicals throughout the country carry special editorials and articles; public and private radio stations also broadcast appropriate special programmes on these anniversaries.

COLOMBIA

[Original text: Spanish]
[14 May 1964]

The Curriculum for general secondary education (leading to the *bachillerato*, i.e., university-entrance diploma), established in accordance with Decree No. 45 of 11 January 1962, includes a special course within the social studies entitled "Colombian institutions and international civics". This course comprises study of the United Nations as an international organization which assists the progress of its Member States, and consideration also of the purposes and activities of the agencies related to the United Nations, within the context of contemporary history.

The programme of teacher-training, which was reorganized in 1963, includes as one of its objectives "to contribute to the study of national and international organizations which promote social progress, in order to understand their functions and achievements and to stimulate interest in national and world problems".

In accordance with article 4 of Decree No. 3035 of 30 September 1950, the Ministry of Education each year issues a special circular requesting schools throughout the country to organize appropriate observances of United Nations Day, with a view to making more widely known the work of the United Nations.

As extra-curricular activities and with varied programmes, educational institutions at all levels also observe World Health Day (7 April) and Human Rights Day (10 December), through such means as lectures, film and filmstrip showings, poster exhibitions, and the like.

COSTA RICA

[Original text: Spanish]
[6 July 1963]

General observations

In a time as complex as the present, common endeavour and understanding are indispensable in solving health, economic and other problems and maintaining world peace. Such attitudes, feelings and understanding should be inculcated in children throughout the world at the earliest possible age.

It seems to us that the programmes which the various United Nations bodies carry out in the country and the participation of the people in them are the best and most convincing means of teaching about the United Nations, e.g., UNESCO assistance in a national literacy campaign, the nutrition and school gardens programme conducted jointly by the Ministries of Education, Health and Agriculture in co-operation with UNICEF, FAO and WHO, etc.

The Ministry of Education is concerned that teaching about the United Nations be provided in all educational institutions. United Nations Week is officially included in the school calendar and observed in schools throughout the country.

Teacher-training

Instruction on the United Nations is given in various courses in teacher-training institutions, especially in sociology. Prospective teachers prepare three-to-six-day work units on United Nations topics for use during United Nations Week.

School programmes

In primary and secondary schools, the work of the United Nations family is taught as a unit in social studies during United Nations Week. In addition to textbooks and pamphlets, radio and television broadcasts are used intensively in this instruction.

It may be noted that a half-hour of radio and television time is reserved by law each week for the Ministry of Education at every station in the country, and is actively in use. The material most frequently used is that which UNESCO regularly provides. More current recordings and films on the activities of the United Nations family are needed for this work.

Adult education

Programmes are provided jointly by the Ministry of Education, the University of Costa Rica and the National Commission for UNESCO, acting in co-operation with each other, in the form of lectures, seminars and information provided by radio and the Press.

A number of short courses have been provided on a co-operative basis by UNICEF, FAO, WHO and the Ministries of Education, Agriculture and Health for (a) school teachers, principals and supervisors; (b) leaders of the communities in which the nutrition and school garden programmes are being carried out; and (c) professors at teacher-training schools.

CUBA

[Original text: Spanish]
[15 October 1963]

Primary school programme

In the primary school curriculum in force, provision is made for instruction on the aims and work of the United Nations. It is also included in the proposed new

curriculum which is currently under consideration. The UNESCO *Source Book in Science Teaching* is used in primary schools as a teacher's aid and source of information.

Secondary school programme

History syllabuses in pre-university and basic secondary schools contain a section on the United Nations. A history textbook which is due to appear during the current academic year includes abundant material on the United Nations.

Under the new curricula, effective November 1963, more time will be devoted to social studies. This will permit more extensive study of the role the United Nations can play in safeguarding peace and maintaining international harmony and of the work done by UNESCO to spread culture and clarify questions of fundamental social and economic significance. In this connexion, teachers are encouraged to use UNESCO publications, particularly the *UNESCO Courier*, as documentary material and as a classroom aid.

Teacher-training

The Department of Social Studies of the Ministry of Education plans to make extensive use of UNESCO publications on the social sciences in the advanced training courses for secondary school teachers. For this purpose, it will need all the help which the regional office of UNESCO can provide.

Colleges and universities

University study programmes in political science, modern history and international law include topics concerning the United Nations and its related agencies. Such instruction is given at the undergraduate level, but in addition a number of graduate theses on United Nations subjects have been written by students at the University of Havana.

CYPRUS

[Original text: English]
[9 December 1963]

The text below summarizes the respective reports of the Greek and Turkish Educational Authorities of the Republic of Cyprus, transmitted to the Secretary-General of the United Nations by the Ministry of Foreign Affairs.

Teaching about the United Nations in Greek schools in Cyprus

In our elementary and secondary schools the United Nations is studied in history, civics and as it may arise in other subjects. In our Pedagogical Academy (teacher-training college) instruction on the United Nations is given in social studies and civics. In addition, a special seminar, conducted by the Principal of the Academy,

focuses on current world affairs, including the United Nations. We have no special textbooks in this field but relevant material received in the Office of Education is distributed to teachers throughout our school system.

Extra-curricular activities are the chief means used for teaching in this field, through observances of United Nations Day or Week, Human Rights Day, World Health Day, etc. We are presently concerned with providing more adequate teacher-training in this field, including special courses and seminars for teachers-in-service.

*Teaching about the United Nations in
Turkish schools in Cyprus*

In September 1960, it was decided to introduce teaching about the United Nations in our schools. Instruction is given in the course in civics, which is a compulsory subject in junior high schools.

United Nations Day is regularly observed in our schools. Relevant films are shown wherever possible. The children's magazine published monthly by the Office of Turkish Education gives information about the United Nations; also, all United Nations publications, filmstrips, etc. received by this office are forwarded to schools, including the Turkish Teacher-Training College.

CZECHOSLOVAKIA

[Original text: English]
[20 May 1964]

Primary education

Basic information on the purposes and work of the United Nations is included in the curriculum of the nine-year schools, especially in the sixth and ninth forms (first cycle). This instruction is provided as a part of history and geography, within the courses comprising "citizenship education". In ninth-form history, pupils learn about the United Nations in studying the theme "Mankind in the struggle for world peace" and, in seventh-form geography, through the theme "The idea of peaceful co-existence between the socialist and capitalist countries." In addition, pupils in the sixth to ninth forms consider topical United Nations activities in the group discussion of current political, cultural and economic matters in the course on citizenship education." Pupils in the ninth form devote more systematic attention to the United Nations in studying the theme "The world struggle for peace, co-operation and friendship among nations."

Secondary education

The theme "International organizations in the struggle for peace" (which includes the United Nations) is discussed in the course on citizenship education in the fourth year in technical schools. Pupils in the second year of the high schools also study the activities of the United Nations and its agencies in history and geography classes.

School-leaving examinations do not include special questions concerning the United Nations. However, a knowledge of the United Nations may be involved in questions included in major subjects in the curriculum and according to the principle "The school united with life".

Information about the United Nations is also provided in discussions of current events or in after-school activities, classmasters' lessons, meetings of the Czechoslovak Union of Youth, and the like.

Educational aids

Textbooks issued during the years 1960-1963 pay great attention to the problems of the United Nations; for example, a history textbook for the ninth year of the basic nine-year school, a textbook for seventh-year geography, etc. Schools of all degrees are sufficiently supplied with textbooks.

Teachers learn new data in pedagogic and special periodicals and also read about current events in the daily Press.

For the time being, not a sufficient number of films about the activities of the United Nations and the specialized agencies are available and thus films cannot be used much in schools. There are two diafilms "We and the UN" produced in 1961 and "UN in Asia" issued in 1960.

From time to time information is also provided through school radio broadcasts and television.

University and college studies on the United Nations

The purposes and work of the United Nations are taught especially at colleges of law (international public law) and are obligatory. Occasional lectures connected with special subjects are read at other colleges as well.

Adult education on the United Nations

Adults discuss the main current problems of the United Nations and the specialized agencies in cycles of lectures organized by people's universities and academies as well as in special discussions and seminars on topical events. The lectures are popular, and attract wide circles of listeners. They are organized by cultural institutions in co-operation with the trade unions or the Czechoslovak Society for Dissemination of Political and Scientific Knowledge.

DAHOMY

[Original text: French]
[28 June 1963]

Teacher-training

Teaching about the United Nations is not provided systematically in the teacher-training institutions but it is included prominently in school programmes. Dahomey became a Member of the United Nations only

recently (20 September 1960) and it will in future arrange for teachers in training to have such instruction, particularly concerning the role of the United Nations and its related agencies in technical assistance.

Teaching about the United Nations in schools

Teaching about the United Nations is included in school courses in history and civics. Following directives of the Ministry of National Education and Culture, all schools participate actively in observances of United Nations Day and Human Rights Day. Briefings and lessons on the United Nations interest only the students in upper classes of secondary schools and those at the university level because of the philosophical character of these lessons and also the lack of suitable documentation.

Scholarship awards, the provision, through various UNESCO programmes, of materials for science teaching in secondary schools and books for the university library and the World Week against Hunger held under the auspices of FAO, during which trees were planted by students, have given teachers opportunities to make better known the aims and activities of the United Nations and its related agencies, with emphasis on their practical usefulness.

Teaching materials

Available teaching materials consist of a few posters and pamphlets furnished by UNESCO on the activities of the United Nations and specialized agencies and on the Universal Declaration of Human Rights. Basic and varied documentation would be desirable, including pictures, posters, pamphlets, maps, films and records.

Out-of-school activities and adult instruction

There are no out-of-school or non-governmental organizations concerned with the dissemination of information about the United Nations. On the other hand, committees and semi-governmental organizations have been created at the ministerial level, such as the Dahomey National Commission for UNESCO and the Committee for the FAO Freedom from Hunger Campaign. Seminars on education and co-operative schools were organized with UNESCO's participation under the auspices of the Ministry of National Education and Culture. The World Week against Hunger was the occasion for close collaboration between FAO, UNESCO, WHO and the Resident Representative of the Technical Assistance Board. To promote co-operation and understanding on the national as well as international level, all racist and aggressive propaganda is strictly forbidden and all youth movements are unified.

Mass information media

More than through the austere and academic work of the teaching institutions, it is the mass communication services that disseminate information to the general public on the aims and activities of the United Nations

and its agencies. Over and above the regular programme devoted to the United Nations, hardly a week goes by without a further broadcast from the National Radio on United Nations subjects. Each Thursday afternoon, film theatres project newsreels in which the activities of the United Nations are mentioned. A special film session was devoted to the World Week against Hunger. It is expected that the Dahomey National Commission for UNESCO will do much to broaden understanding of the aims and principles of the United Nations. Nevertheless the achievements of the United Nations and its related agencies are better messengers than the information media.

DENMARK

[Original text: English]
[9 September 1963]

General observations

The most significant development during the period 1960-1963 has been the incorporation of teaching about the United Nations in the curricula of elementary as well as secondary schools — in 1960 and 1961, respectively. In recently published textbooks, the work of the United Nations and its agencies is dealt with more extensively than previously. However, it will be a long time before the subject is finally accepted by all teachers and is mastered even fairly satisfactorily.

Teaching about the United Nations has been introduced into geography, with emphasis on economic and social developments in developing countries, and also as part of modern history. In geography, relevant United Nations topics are fairly readily accepted. However, in history, the teachers seem to be somewhat more hesitant. This may be because contemporary history does not have a long tradition as an academic subject. Moreover, descriptions of the efforts and achievements of the United Nations in the political field require detailed knowledge on a level higher than that imparted to school children (except in upper secondary schools).

The Ministry of Education and local school authorities have started teachers' courses on the United Nations, which will probably increase in number and attendance in the coming years, owing to the inclusion of teaching about the United Nations in the curricula.

Among secondary school students there is a growing interest in foreign affairs, including the United Nations, but it is considered that, for the time being, local and national action should be focused on educating teachers and youth leaders in this field. Such action is now in progress. At the international level this work could be supported by the provision of readily digestible, varied educational material. Publications in Danish are of great value, since many readers know no other language. There has been great interest in United Nations model sessions. As much work is involved in reviewing the material necessary for presenting an illustrative subject in a twenty to fifty minutes' session, it would be very helpful if such material could be prepared at an

international level. It may be noted that *UNESCO Features* and the monthly journal *World Health* are especially useful.

Teacher-training

It is strictly provided that the instruction given in teacher-training colleges shall be closely related to subject-matter on which instruction is given in schools. Thus, the inclusion of teaching about the United Nations in elementary school curricula will entail its being taken up also in teacher-training programmes.

Several teacher-training institutions arranged separate courses on the United Nations in 1961-62 and in 1962-63, but usually such instruction forms part of history and geography. Eight hours were devoted to these (fairly rare) extra-curricular courses, which most often are given for students in their final year of training. However, lectures are occasionally held for all students, or more detailed knowledge is provided to smaller groups.

At universities, study of the United Nations forms a regular part of the education of prospective secondary school teachers, supplemented by voluntary courses arranged by the United Nations Association. One institution has, by way of experiment, introduced a three-year course in which the main emphasis is on UNESCO.

In-service teacher-training

With the introduction of the new curricula, the Ministry of Education has instituted short courses on the United Nations for teachers of history and geography. The total number of primary school teachers is about 27,000. It is estimated that 7,000 to 8,000 of these are teaching geography and history and have thus had the opportunity of attending such courses. Geography and history courses of six to eight hours' duration, organized in connexion with a three-year UNESCO project in Danish schools, were attended by 1,000 teachers in 1962. All these courses included United Nations subjects.

As a general rule, the programme of such courses includes: introduction of the subject; presentation of material for teachers and for pupils (books, pictures, magazines); examples of instruction to be given at different levels of education. The methods used include lectures, group discussions and demonstrations.

The United Nations in school programmes

Instruction on the United Nations is not obligatory until the seventh year, although some teachers introduce the subject in classes 1-5. Such teaching usually is provided as part of history and geography. In some schools, all classes devote one day, several days or a whole week to work on subjects designed to promote international understanding. The first five classes may contribute by the making of drawings or by participation in games, exhibitions of dolls or utility objects from foreign countries. United Nations Day is observed in an ever-increasing number of schools, but not in all, although this

has been recommended. Other "days" are very rarely observed, and it is the general wish to limit the observance of special days as much as possible.

Instruction on the United Nations and its agencies must be provided in the seventh, eighth- and ninth-year classes of the gymnasium (upper secondary school) and in third-year classes of the practical *realskola* (lower general secondary school). In the seventh-year gymnasium classes, it is included in social studies in the wider sense. In oral examinations held in the ninth-year gymnasium class and in the third-year *realskola*, questions about the United Nations are fairly regularly asked.

As from August 1963, the instruction provided to pupils in their last year of study for the matriculation examination will be centred on the global aspect of developments since 1900. Emphasis will be placed on making the pupils conscious of the value of freedom of thought, tolerance and international understanding. Extracurricular activities concerned with the United Nations include film showings, lectures, especially on United Nations Day, competitions and exhibitions.

The curricula of the universities are now being revised. In existing courses, the United Nations only plays a modest role.

Classroom teaching materials and aids

In conformity with the new curricula, greater attention than previously is given to the United Nations and its agencies in textbooks. Teaching materials in this field are available in fairly large amounts and are of a relatively high standard at the levels of education at which teaching about the United Nations is obligatory. The needs of private organizations, however, for teaching materials have not yet been adequately met. School bulletins are published for seventh-, eighth- and ninth-year classes, which include material on current United Nations subjects. School radio broadcasts also provide United Nations information, but school television, which is still in its infancy, has not yet done so.

Adult education

Denmark Radio provides considerable information on the United Nations, both in news and feature programmes, particularly during the General Assembly, when a special correspondent is stationed in New York.

United Nations Day and Human Rights Day are observed by Denmark Radio, both in ordinary programmes and in school broadcasts. On UNICEF Day a special children's programme is broadcast, and during the 1963-64 season, special study courses concerning the activities of UNICEF will be provided in broadcasts for children. In school radio broadcasts, information is provided on various campaigns organized under the auspices of the United Nations, e.g. assistance to refugees, the Freedom from Hunger Campaign, etc. In 1960, Denmark Radio published an elementary manual entitled "International Co-operation", and broadcast a series of programmes on the United Nations.

ECUADOR

[Original text: Spanish]
[29 November 1963]

Social science courses in primary schools provide instruction on the United Nations and its agencies in a form adapted to the understanding of the children. In secondary schools, the first-year course in social education includes the following topics: peace as a universal aspiration, science in the service of humanity, the League of Nations, the United Nations, the Organization of American States. The fifth-year course in economics and political geography deals with the League of Nations, its mission and failure; the United Nations and its related agencies. In addition, Ecuador has an experimental institution (24 de Mayo College) which participates in the UNESCO Associated Schools Project in Education for International Understanding.

The curricula of the Faculties of Common Law and Social Science, with their various related schools, include teaching about the United Nations. However, the programme of study varies from one university to another as each institution is autonomous. The UNESCO National Commission in Ecuador maintains a permanent programme of teaching through lectures given by its members or by outstanding intellectuals, the printing and distribution of the United Nations Charter and Universal Declaration of Human Rights, the publication of bulletins and the organization of student contests. With the support of the Ministry of Education, the Commission ensures that United Nations anniversaries are observed in appropriate ceremonies.

EL SALVADOR

[Original text: Spanish]
[14 May 1963]

The people of El Salvador are taught in a systematic way to love and respect other nations. There are no programmes especially dedicated to teaching about the United Nations, but at all education levels the functioning and goals of the organs of universal and regional co-operation are explained (Organization of Central American States, Organization of American States, United Nations).

The school authorities make sure that United Nations Day, World Health Day, etc. are observed. Speeches are made and round-table discussions are broadcast and televised on such occasions.

FEDERAL REPUBLIC OF GERMANY

[Original text: English]
[27 November 1963]

In the schools of the Federal Republic of Germany teaching about the United Nations and its specialized agencies is mainly part of those subjects which are devoted to civic education; i.e., social studies, civics, current events. However, in accordance with a resolution adop-

ted in June 1950 by the Permanent Conference of Ministers of Education of the German *Laender*, which states that civic education is to be incorporated into all subjects, the discussion of problems related to the activities of the United Nations is not limited to the special subjects mentioned above.

The plans of instruction drawn up by the German *Laender* explicitly provide for formal study of the United Nations system in one of the last grades of all kinds of schools, ranging from primary schools, professional and vocational schools to the various branches of secondary schools. In most cases the studies are based on a general theme, e.g. "Nation and Humanity", covering subjects of world-wide importance such as world economy, food production, international law, human and basic rights, international organizations and the like. Special emphasis is given to the efforts of the United Nations towards the maintenance of world peace, with retrospective views of the League of Nations and to the causes of its failure. The subject "United Nations" as a whole is dealt with in the eighth or ninth grades of primary schools, in the first or second grades of professional schools and in the eighth or ninth grades of secondary schools. Special attention is given to the activities of UNESCO, UNICEF and the International Labour Organisation.

In respect of teaching materials, basic textbooks on civic education for the use of teachers and students include information on the structure and activities of the United Nations, as do also brochures and periodicals on topical subjects related to civic education. Teachers also make use of audio-visual materials on the United Nations, including films, filmstrips, transparencies, posters and tape recordings.

On Human Rights Day, the Deutsche Gesellschaft für die Vereinten Nationen (German Association for the United Nations), which was established in 1952, regularly distributes to school information material about the United Nations. The Association also distributes brochures and pamphlets about the United Nations at the request of teachers and students. They are generally obtainable free of charge or at low cost. The Association also provides films, e.g. on UNICEF, as well as filmstrips and transparencies.

Teaching about the United Nations is integrated into the training programmes for teachers. All teachers who wish to teach history or civic education are obliged to acquaint themselves thoroughly with the United Nations and its specialized agencies. In some German *Laender*, the subjects of social studies and politics are included in the final examination for elementary and intermediate school teachers.

At the universities, where secondary school teachers receive their education, students have many possibilities of informing themselves about the United Nations in lectures and study groups organized in the framework of the *studium universale*. They may also participate in political seminars and working units which are organized either by universities or by student organizations. Also, most universities and the colleges for political and social sciences (Berlin, Wilhelmshaven, Munich)

organize seminars and lectures on problems related to the United Nations, which are held by the institutes for political science of the universities concerned.

FINLAND

[Original text: English]
[14 August 1963]

General observations

Teaching about the United Nations and its related agencies will increase in Finland as a consequence of reforms in the teaching of history, social studies (civics) and economics in secondary schools. New syllabuses prepared by the Ministry of Education will be applied from the autumn of 1963, calling for more stress on current affairs. As the emphasis in the secondary-school teaching of history has now been shifted to modern times, special attention will be given particularly to the activities of international organizations.

Another significant development is the implementation of UNESCO's Associated Schools Project, which has been in operation in twenty Finnish schools for three years. The subjects of experiments in successive years have been India, the United Nations, and human rights.

Interest in international problems has increased among both teachers and pupils. In the revision of school textbooks special attention is given to introducing basic facts in this field. However, the continuous distribution of current up-to-date material to teachers has yet to be organized. Refresher courses and other in-service training for teachers will also have to be arranged. A study made in 1962 among teachers in primary and secondary schools under the auspices of the Centre for Training in Citizenship revealed that in the opinion of some 80 per cent of the teachers, instruction designed to further international understanding ought to be increased, particularly by including more relevant material in textbooks and also by distributing special material to teachers, more films and filmstrips, etc.

The Finnish authorities consider that the most important task is to train teachers in this field. The Finnish Association for the United Nations has extended its activities, particularly in the provinces. In February 1963, the Finnish Students United Nations Association was founded.

Teacher-training

In training institutions for primary school teachers, increased attention has been given to the United Nations in the fourth-year history course.

Teachers in secondary schools are in most cases required to hold a master's degree. The amount of knowledge about the United Nations acquired at university depends on the subjects in which they specialize. For prospective teachers in history and social studies and to some extent geography, assignments on United Nations subjects are given regularly. A number of

teachers have taken part in seminars arranged by the United Nations Associations of Finland and the other Scandinavian countries.

For teachers in service the main source of classroom material on the United Nations has been the book *YK-tietouta kouluille* by Kaveli Kajava, published in 1962. The Associated Schools Project should also be mentioned in this connexion.

United Nations Day has been observed regularly in both primary and secondary schools and in teacher-training institutions using material distributed by the National Board of Schools.

The United Nations in school programmes

In primary schools the syllabuses in force provide for instruction on the United Nations in history and social studies (civics). Some primary schools participate in the Associated Schools Project.

In secondary schools a section of the new (1963) history, economics and social studies (civics) syllabus for the last grade of the junior secondary school (fifth year) is entitled "The world today" and comprises modern cultural achievements, the world economy, international co-operation (including international organizations), current world problems. A corresponding section in the syllabus for the last grade of the senior secondary school (eighth or ninth year) comprises international politics, improvement of the standards of living, international cultural co-operation, and current world problems.

The written tests for the national school-leaving certificate have sometimes but not regularly included questions on the United Nations. The introduction of the new syllabuses will probably result in an increased number of such questions.

An increasing number of civics clubs organize discussion programmes on world affairs. The Associated Schools Project may also be mentioned in this connexion.

Classroom teaching materials and aids

Revised editions and new school textbooks produced during this period have given greater attention than before to United Nations subjects. The main textbook entirely on the United Nations is *Koulun YK-kirja* (*United Nations Book for Schools*), used in both primary and secondary schools. Information material is also made available by the Finnish United Nations Association. The 1962 study referred to above revealed that most teachers wish to have more material to assist in teaching. It also indicated that the types of materials most used now are current materials from newspapers, magazines, pamphlets, films and filmstrips, school radio programmes and books. There are no current affairs bulletins prepared especially for schools. The initiative of the teacher usually determines to what extent supplementary up-to-date material is used.

School radio broadcasts, mainly intended for primary schools, have dealt with the following United Nations

subjects: UNICEF (two programmes, 30 minutes each); the World Refugee Year; the United Nations fifteenth anniversary; the memory of Dag Hammarskjöld; news about the Konkan area in India; target for the Freedom from Hunger Campaign in Finland; the whole world as a field of work. The general public also listens to these programmes. The estimated total audience for each programme comes close to a million, i.e. more than every fifth person in the country.

United Nations study in colleges and universities

Study of the United Nations is required for all students of international law, political history, international relations, and political science. Relevant aspects are studied also in economics and social policy. A number of United Nations publications in the economic and social fields are used as textbooks.

A number of master's theses in the faculties of political science have been written on such topics as the veto in the Security Council, bloc voting in the United Nations, the Palestine question, UNESCO etc. No doctoral theses on United Nations subjects have been published during this period.

Adult education

Folk high schools, folk academies and workers' institutes study the United Nations in discussion groups, conferences and lecture courses. Initiatives have been taken by the United Nations Association, the National Commission for UNESCO, the National Board of Schools, the League of Workers' Institutes, the Association of Folk High Schools and local institutes. Altogether some 10,000 persons per year take part in these activities. Participants are adults or young persons from the age of 17 years upwards.

During the period 1960-1963 a total of 159 programmes on United Nations subjects were broadcast over radio and television (not including news announcements). As mentioned above, school radio programmes have also reached the general public.

* * *

An annotated bibliography listing seven textbooks and many other materials in this field was sent with the report, as well as copies of the books.

FRANCE

[Original text: French]
[27 June 1963]

General observations

Since 1961, the Ministry of National Education has sought to improve the curricula in civics by making these courses serve as an introduction to the life of the citizen and to the role which each human being plays, not only within his family and national community, but in the world at large. Thus, the civics curriculum at the secondary level, from the sixth class (first year)

to the final class (seventh year), embraces the various administrative and national institutions; then, in the sixth year, France's role in the French Community and in European and international organizations; and, lastly, in the final class, the international and supranational economic organizations.

Teachers and civic or religious organizations, such as the Ligue de l'enseignement and the Union féminine civique et sociale have always taken an interest in the work of the United Nations Commissions on Human Rights and on the Status of Women, and in the large-scale campaigns with which UNESCO is associated, such as the campaign against hunger and against illiteracy, and for the preservation of the Abu-Simbel Monuments.

The Institut pédagogique national and the regional educational centres, among others, publish a summary of the main articles dealing with such problems and disseminate widely the conclusions set out in the reports of the various United Nations bodies.

Teaching-training

Since all teachers must have the *baccalauréat*, they have studied the role of international organizations as part of the civics course in the final class (the second part of the *baccalauréat*).

For teachers in service, a detailed syllabus for use in the teaching of civics was issued by the Institut pédagogique national in 1963, and an extensive annotated bibliography in this field in 1962. Various other publications of the Institute, which are distributed free to teachers, provide current information on the international organizations.

The United Nations in school programmes

The role of the United Nations is not taught as a distinct subject in the primary grades, but teachers explain it to the children on United Nations Day, Freedom from Hunger Day, etc. In secondary schools, civics is most often taught in relation to the courses in history and geography. For example, a study of the Second World War would be inconceivable without discussion of the United Nations Charter, the Universal Declaration of Human Rights, etc.

Classroom teaching materials and aids

The history and civics textbooks adopted for the new curricula give an important place to the United Nations and its related agencies. The Public Education Film Library makes available to teachers filmstrips concerning the activities of the United Nations and the international agencies. Radio and television programmes and newsreels are devoted to the more important international days.

United Nations study in colleges and universities

Students of history and law study the functioning of the international organizations in connexion with various

courses. This topic may also receive attention in the courses on general culture given by the large specialized schools. However, there are no civics courses as such at the university level.

Adult education programmes

To the extent that the various programmes of adult education include a course on general culture and an introductory course on the economic and social problems of the modern world, the work of the United Nations and its related agencies is dealt with.

* * *

Specimen copies of the vicis syllabus (*Instruction civique*, 1963, 23 p.) and various other publications of the Institut pédagogique national accompanied the report.

GHANA

[Original text: English]
[30 July 1963]

General observations

During this period, the most important developments in this field were (a) the wide publicity given by the Press to the United Nations Operations in the Congo; and (b) the Seminar on Teaching about the United Nations, organized by the World Federation of United Nations Associations in collaboration with UNESCO and the United Nations Association of Ghana, held in August 1961. It was attended by teachers from six West African countries.

The Minister of Education encourages the formation of student's associations which are devoted to study of the United Nations. There has been a significant growth in the interest shown by various groups (e.g. teachers, civic and religious organizations, youth groups and the general public) in the work of the United Nations.

Teacher-training

Teaching about the United Nations is included in the syllabuses for history, civics and current affairs. United Nations Students' Association branches meet regularly to discuss United Nations subjects.

The Ministry of Education arranges film shows on United Nations activities for teachers attending refresher courses. Their attention is drawn to the United Nations sections of the syllabuses.

The United Nations in school programmes

The syllabuses in force in the primary and middle schools provide for instruction on the United Nations in history, civics and geography. Emphasis is placed on the influence of the United Nations in resolving world problems and reducing tension among nations, and on

the help given in scientific development, civil aviation, agriculture, health and in cultural fields. United Nations Day and World Health Day are observed in the form of march-pasts, demonstrations, distribution of literature and talks on the work of the United Nations. There are active branches of the United Nations Students' Association in many secondary schools.

Classroom teaching materials and aids

No textbooks have been produced. However, as new textbooks in all school subjects are being written by Ghanaian authors, books in history and civics may include chapters on the United Nations. Pamphlets on the United Nations and its agencies are distributed to the schools when available. Adequate informative materials have not been regularly supplied by the United Nations or its specialized agencies. Very few schools use films or filmstrips on the work of the United Nations. Television has not yet been introduced.

United Nations study in colleges and universities

Instruction on the United Nations forms part of the courses in political science, government, international relations, etc. No theses or dissertations have been written on the United Nations. Conferences and discussion groups are organized by the United Nations Students' Association.

Adult education programmes on the United Nations

Lectures on the United Nations are given at the School of Social Welfare to the assistant mass education officers, who conduct literacy campaigns in the country. Radio broadcasts provide information on the United Nations. Feature programmes are relayed from United Nations Headquarters in New York.

GUINEA

[Original text: French]
[14 May 1963]

The National School of Administration has included in its teaching programme a special section on the United Nations and its specialized agencies. As this programme is relatively new, the Government of Guinea would greatly appreciate any help that might be given by the United Nations and its related agencies, particularly teaching material to equip a library which would contribute efficiently to the education of students in this field.

HAITI

[Original: French]
[27 May 1963]

The introduction of teaching about the United Nations in Haiti is under study and its implementation will take place in the near future.

HONDURAS

[Original text: Spanish]
[3 May 1963]

Our Government reaffirms its belief that to resolve more efficiently the various problems existing in today's world, the dissemination of information on the United Nations and its specialized agencies is becoming more necessary. From 1960 to 1963, our Government has taken steps to reach this objective, inviting civic and youth organizations and the public in general to co-ordinate various campaigns related to the activities of the United Nations family.

A special training course to prepare the teachers on the United Nations has not been provided, as this would require substantial modification of the curricula for teacher-training. Nevertheless, such teaching has been given to some extent in history, social study or hygiene courses, or through extra-curricular activities such as seminars or briefings on the United Nations.

Teaching about the United Nations and its related agencies is given in the upper years of primary school as part of courses such as history, social studies and civic instruction. Extra-curricular activities include the observance of United Nations Day or Week, Human Rights Day, World Health Day, UNICEF projects, etc. The programmes in secondary schools have been the same as in primary schools but with more detailed treatment.

Classroom teaching materials and aids have been deficient. This difficulty has sometimes been overcome by the use of material prepared especially by the United Nations but which are nevertheless insufficient. Films and filmstrips have very seldom been used.

Because of the autonomy of the University of Honduras the Government has not taken any steps as regards teaching about United Nations activities in faculties of the colleges. Nevertheless, the University of Honduras has acted positively through observance of United Nations Day or Week, Human Rights Day, briefings, essay contests, etc. As a practical measure the Law Faculty has included in the curricula of the international and public law courses the aims and activities of the United Nations and its related agencies. To obtain the title of Doctor of Laws, the Faculty has given as a theme for theses the activities of the United Nations.

Adult education programmes on the aims and work of the United Nations include discussion groups, briefings, series of conferences, film projections held under the auspices of civic and cultural organizations, clubs or workers' unions. This year, the FAO Freedom from Hunger Campaign was conducted at the national level, with the contribution of all sectors of the population.

HUNGARY

[Original text: English]
[6 November 1963]

Teacher-training

In teacher-training institutes there are three channels through which to acquire knowledge about the United

Nations and its agencies: (a) prospective history teachers study the subject in modern history, which is mandatory for all students in this field; (b) all candidates study these organizations in the course on "Scientific Socialism"; (c) as members of the Young Communist League (YCL), most students attend lectures and discussions on United Nations affairs, arranged by YCL as extra-curricular activities. The Ministry of Education is at present working on new study programmes to provide teaching about the United Nations on a more systematic basis and in greater depth.

Teachers in service receive information chiefly through extension training courses and lectures arranged by the National Pedagogical Institute. In addition, pedagogical journals carry regular reports and studies on United Nations subjects. UNESCO publications are also of great use in this work.

The United Nations in school programmes

In the upper grades, elementary school pupils are given, at a level appropriate to their age, a general introduction to the United Nations and are kept informed of the work of the General Assembly and other organs at different school gatherings. This pattern will continue unchanged even after the pending educational reform.

Teaching about the United Nations occurs in greater depth in the secondary schools. In the period under review the subject was incorporated into history, geography and language courses. In modern history since the Second World War, teachers deal with United Nations in the fourth year. Related questions are frequently included in the final examinations. "Form master classes" in the different grades also study the United Nations and related questions such as the disintegration of the colonial system and the economic, social and cultural progress of under-developed peoples. Schools arrange annual festivities in observance of Peace Day. In youth organizations, pupils keep abreast of United Nations affairs by attending lectures and giving reports on the work of the General Assembly sessions.

In the future, United Nations study will have greater depth and variety as the new syllabuses gradually are introduced. Study of the United Nations will be included in the history and form master classes as a compulsory subject and will also be integrated into other subjects. In geography, second-year pupils will study the Member States of the United Nations and the special problems facing the newly independent countries. Emphasis will be given to the statistical publications of the United Nations and UNESCO. *A Handbook of Suggestions on the Teaching of Geography* (UNESCO) has been much used in the preparation of the revised curricula. Language courses will use various United Nations and UNESCO publications as reading material.

The new curricula state that secondary school students should be intelligently aware of the fundamental principles governing United Nations activity and its functions in order that they may be able to think in terms of firm support to United Nations actions to promote

the friendship and welfare of peoples. A new subject called "Ideologies", to be introduced in the fourth grade of high schools and other kinds of schools, is also related to this theme.

Textbooks and other teaching aids

In addition to history textbooks, the handbook most used is *Present-day International Organizations* (1959) published by the Ministry of Education in the series for form masters. More space will be devoted to United Nations subjects in textbooks for history, geography, foreign languages, etc., which will be prepared to implement the new syllabus.

United Nations study in universities

All university students deal with the United Nations in the subject "Scientific Socialism". In addition, in certain faculties, aspects of United Nations work are included in such subjects as international law and international economics. As YCL members, most university students follow current United Nations affairs through lectures and discussions arranged by the Young Communist League.

Adult education

Adults study the work of the United Nations and its agencies in history, geography and form master classes. Subject-matter is arranged in accordance with age requirements but is similar in content.

* * *

A bibliography listing as examples nine recent articles on United Nations subjects which appeared in pedagogical journals was attached to the report.

INDIA

[Original text: English]
[6 January 1964]

General observations

The most significant development during the period under review has been the launching, by the Indian National Commission for Co-operation with UNESCO, of a programme of education for international understanding, as a national extension of the Associated Schools Project of UNESCO. The programme covers more than 400 secondary schools and teachers' training institutions. Participating institutions are encouraged to develop and implement experimental activities, stressing three themes: (a) the study of other countries, peoples and cultures; (b) human rights; and (c) the United Nations. The results of these activities will be disseminated to educational authorities and teachers throughout the country. Effecting improvements in curricula, teaching methods and the production of teaching materials is being given special emphasis.

The main difficulty is the dearth of suitable teaching materials, including audio-visual aids and manuals for teachers. Most of the reading materials brought out by the United Nations and its agencies are found to be of little classroom use. There is a great need for simple and illustrated materials written in national and regional languages for students and teachers. Also, more seminars on the United Nations should be organized for teachers, as well as extended summer courses on how to teach about the United Nations in the context of the school syllabi.

In addition to the programme launched by the Commission, the following actions have been taken to promote teaching about the United Nations: (a) educational authorities were requested to encourage textbook committees and authors to bring of suitable textbooks; (b) celebrations of United Nations Day, Human Rights Day, etc., are held in schools at all levels, and relevant information materials are supplied; (c) financial assistance is given to non-governmental organizations for various activities in this field. Such assistance was given to the Indian Federation of United Nations Associations as host to the regional seminar for teaching about the United Nations in South and East Asia held under the joint auspices of the World Federation of United Nations Associations and the International Student Movement in New Delhi in November 1962.

A number of other voluntary bodies, such as the United School Organization, also are actively engaged in this work. For example, the USO issues publications on the United Nations in several languages and conducts an annual general knowledge test on the United Nations in which a large number of schools take part.

Since education is the responsibility of state Governments in India, there is a high degree of decentralization in educational programmes at all levels. Because of the resulting variety in syllabi, textbooks, teacher-training, and the like, this account is merely illustrative and not exhaustive.

Teacher-training

A survey of the curricula in teacher-training institutions shows that there is ample scope in the prescribed syllabi to give instruction about the United Nations. In most of the states, education for international understanding also is included, as a topic in "Principles of education". Besides, the work of the United Nations family is included in subjects such as history, geography, social studies, health education, civics etc. During the numerous seminars organized for teachers by the Indian National Commission for UNESCO, suggestions were made that every teacher trainee should be asked to submit an essay on a United Nations topic as part of his class work, and the Commission plans to approach relevant institutions on this matter.

All secondary teacher training colleges are being supplied with United Nations, UNESCO and other agency materials, free of cost. A bi-monthly bulletin *The World in the Classroom*, which began publication in April 1963, is issued by the Commission specifically

to provide information and ideas on teaching about the United Nations and education for international understanding, and is distributed regularly to teacher-training colleges.

In-service teacher-training

In-service training provided to teachers usually does not include teaching about the United Nations. However, the Indian National Commission for UNESCO, as a part of its programme mentioned earlier, has been organizing a series of seminars for the teachers of participating schools and teacher-training colleges. To date, seven such seminars have been held, each attended by about 300 teachers. The main topics studied were the United Nations and human rights. Lectures, reading materials and visual aids were used and participants were encouraged to develop relevant teaching projects for their schools and colleges. A selection of these projects is published in various issues of *The World in the Classroom*.

The United Nations in school programmes

Teaching about the United Nations is included in different subjects in the primary school programme, but experience indicates that the best way to promote such teaching at this level is through co-curricular activities. Observances of United Nations Day, Human Rights Day, World Health Day, Universal Children's Day, etc., are wide-spread.

The secondary school curricula in all states in India provide numerous opportunities for teaching in this field, not only as a part of general education for citizenship but also in the study of other subjects such as history, geography civics, social studies, etc.

A main obstacle is that supplementary reading materials and visual aids are not easily available. To help schools in the Associated Schools programme, the National Commission has made arrangements with UNESCO, the United Nations Information Centre in New Delhi, local offices of other specialized agencies and foreign diplomatic missions to obtain sets of relevant materials. In view of the size of the country and the tens of thousands of primary and secondary schools, it is a formidable task to provide the needed materials. However, a beginning has been made, with significant results. Educational authorities of the state Governments have been asked to pay special attention to the production of suitable reading and visual materials in this field in the regional languages and the Commission has offered limited financial assistance from its own resources.

Classroom teaching materials and aids

As stated above, a special appeal has been made by the Central Ministry of Education to the states to include relevant United Nations topics in textbooks. Such information will, however, be brief and textbooks alone will not provide a comprehensive basis for work in this field. Hence urgent steps must be taken to prepare

and produce suitable supplementary teaching materials and aids on a large scale to cater to the needs of all schools. This is all the more essential as only a small number of schools in India can use films and filmstrips, owing to the paucity of projection equipment.

United Nations study in colleges and universities

Subjects at the university level provide much scope for United Nations study, e.g., students of modern history, as a normal part of their work, come to know quite a lot about the United Nations; as those in economics do about the World Bank, etc.

Quite a number of colleges have set up United Nations Clubs. Activities include model United Nations sessions, debates, lectures, films shows, etc. In addition, a number of seminars and symposia are held by the universities and a project has been undertaken by the Institute of Economic Growth, Delhi, on the "Choice and effectiveness of foreign aid programmes" as a part of the studies sponsored by UNESCO.

Depository collections of United Nations and agency publications held in some universities are very important for teaching and research.

Adult education

For the last three years, UNESCO has been helping the Government of India to bring out books and pamphlets particularly designed for new literates. Several of these have been issued on the United Nations, human rights, and other topics related to international understanding and co-operation. Every year prizes are awarded to writers of the best books. Authors are invited to submit scripts in the national and regional languages. Those accepted are usually produced in several languages.

IRAN

[Original text: English]
[27 June 1963]

The teachers responsible for teaching about the United Nations, all of whom are trained at the University of Teheran, are usually graduates in social sciences, with some also in humanities or law.

Teaching about the United Nations is provided in courses in social sciences, history and geography. The first matriculation courses include brief coverage of the United Nations and a short history of international relations; a more detailed study is provided in the second matriculation courses. In colleges and universities, instruction in this field is given either as a part of international law or as a separate course. Textbooks play an important role in familiarizing students with United Nations activities, as do lectures by experts.

In adult education classes, some instruction on the United Nations is given. In addition weekly radio and television broadcasts as well as magazines and other publications provide information in this field. Occasions such as United Nations Day and Human Rights Day are widely observed.

ISRAEL

[Original text: English]
[July 1963]

During the period under review, the following actions were taken by the Ministry of Education and Culture (with the Israeli National Commission for UNESCO) to assist teaching in this field:

The monthly "Circular of the Director-General of the Ministry of Education and Culture" has provided directives each year for United Nations Day and other special events.

The following exhibitions were held in Israeli schools: "East and West Do Meet", "Going to school around the World", "For All Children". Materials pertaining to those exhibits were translated into Hebrew and 3,000 sets were distributed to schools, youth centers, and teachers' colleges.

Three books on the United Nations were given wide distribution: *The First Book of the United Nations* by E. Epstein, translated into Hebrew and published under the title *Know the United Nations*; *The United Nations* by Y. Perakh, with an introduction by the Minister of Education and Culture and a UNESCO booklet *East and West... towards Mutual Understanding* by George Fradier. Materials concerning the United Nations and UNESCO are regularly furnished to schools and children's magazines.

A senior secondary school superintendent recently returned from a study tour during which he observed teaching about the United Nations in other countries. Israeli schools engage in exchange programmes (toys, books, etc.) under the auspices of UNESCO. Israel joined the Associated Schools Project in 1958. Six secondary schools and one teachers' college are participating. Israeli school children are encouraged to carry on extra-curricular activities, such as Friends-of-UNESCO Clubs.

The United Nations is taught as part of modern history in the higher classes of secondary schools.

For Freedom from Hunger Week, a special inter-ministerial committee conducted a widely publicized campaign, in which the Ministries of Agriculture, Education and Culture, Posts, Religion, and Foreign Affairs participated. Many non-governmental organizations took an active part. A commemorative stamp was issued, a special official circular was sent to schools, a special broadcast to schools was made, posters were distributed throughout Israel, and all participating bodies conducted relevant programmes.

Non-governmental organizations

The following bodies are engaged in programmes about the United Nations and in various exchange projects: Council of Women's Organizations; Youth Movement Council (connected with the World Assembly of Youth, which has consultative status with the United Nations and UNESCO); Israel Students' Association; International Cultural Center for Youth, Jerusalem; International Youth Hostel Association, Israeli branch.

ITALY

[Original text: French]
[25 July 1963]

General observations

During the period 1960-1963, a series of reforms were undertaken which have modified the structure and curricula of Italian schools. Through these reforms education in Italy has become better adapted to the principles set forth in the Constitution of 1948 and in the Universal Declaration of Human Rights. Education has become free and compulsory for all children up to 14 years of age. In the new curriculum of the lower secondary school, special emphasis has been placed on history, geography and civic education. The syllabus provides for instruction in "the principles and agencies of international co-operation" as a specific subject of study in the third year. In the teaching of history, the importance previously placed on the dates of battles has been replaced by stress on the effects of industry, production, trade, transport and communications on the course of events. The geography syllabus specifically reminds teachers that "no other subject lends itself so well to making the young student understand the interdependence of the peoples of the world and the fundamental unity of mankind".

These reforms in the lower secondary school are closely linked with those already in effect since the school year 1958-59 in all types of secondary schools, where the syllabus in civic education includes as a required subject instruction in "international and supranational agencies for co-operation among peoples".

Although much remains to be done to strengthen and enrich teaching in this field, there exists in Italy today a "climate of opinion" favourable to the purposes and activities of international organizations. This positive attitude has been greatly strengthened by the profound effect which the two recent encyclicals of the late Pope John XXIII have had on public opinion in Italy, particularly in respect of their explicit support for the United Nations.

Teacher-training

In the normal schools, study of the United Nations is included in civic education. Instruction, which is given in the last year, is mandatory and reinforces the subject-matter which students have acquired in many different courses. The history syllabus in force since 1960 concludes with the study of "institutions and agencies for co-operation among peoples".

In addition to these required courses, ten elective courses in different cities for elementary school teachers-in-training were organized during 1960-1963 by the Italian Society for International Organization. These courses, which are approved by the Ministry of Education, entitle participants who pass the final examination to a diploma which is recognized as one of the qualifications for the elementary teacher's certificate. Each course comprised sixty lessons and was attended by 100 students.

The Society also organized six courses in this field for elementary school teachers, including four in Turin, two in Cuneo and one in Florence. Each course consists of about eight sessions and attendance has averaged about 100 teachers.

Twelve courses on the United Nations for secondary school teachers were also described in the report. Attendance varied between 60 and 180 teachers. Stress was placed on the social, economic and cultural work of the United Nations bodies, rather than on political aspects, and on their concrete activities rather than on abstractions and structure.

Numerous lectures, and lecture tours, on various problems of education for international understanding and co-operation, including methods of teaching in this field, were also held during this period under the auspices of the Society, for elementary and secondary school teachers.

The United Nations in school programmes

The civic education syllabus, which specifically includes teaching about international organizations, is designed to make the children conscious that the aim of such study is to increase rapport among peoples and international co-operation. Interested agencies have assisted this work in many ways, e.g., the Italian National Commission for UNESCO has issued a series of booklets on international understanding, assembled and selected drawings by young children for exhibits in Tokyo, Nagasaki, Seoul, Warsaw, Belgrade, etc.

Developments in teaching about the United Nations in lower and upper secondary schools, including both curricular and co-curricular activities have already been covered in the first section of this report.

Classroom teaching materials and aids

Owing to the changes made in the curricula, new textbooks for schools of all kinds and levels devote attention to United Nations subjects in a manner deemed satisfactory. Schools are also supplied with special materials for United Nations Day and Human Rights Day. Special mention should be made of fifteen volumes for primary school students, produced by the Italian National Commission for UNESCO, on various aspects of international collaboration, which accompany a series of films produced by UNESCO.

A particular effort has been made to provide primary and secondary school teachers with useful materials. These include: two brochures on the Freedom from Hunger Campaign; three booklets issued by the Commission on methods of teaching for international understanding, on racial prejudice, and on UNESCO's East-West Major Project; the manual *L'insegnamento sulla Famiglia delle Nazioni Unite nei paesi della regione del Mediterraneo settentrionale* (1961) and the Italian edition of *Il decennio delle Nazioni Unite per lo sviluppo* issued jointly by the United Nations Information Centre in Rome and the Italian Society for International Organization.

Teaching about the United Nations in higher education institutions

During the past few years, the Society for International Organization has concentrated its efforts on university circles. Thus, the Society in 1962 made a survey of teaching about international organizations in Italian universities. The inquiry was addressed to 2,917 professors and lecturers in fifteen universities, and to 129 post-graduate and research institutes. The rectors of all the universities in Italy were also consulted. One hundred and seventy-five direct interviews were held. The results of the inquiry are given in a detailed final report. Some of its findings are noted below.

At present four Italian universities offer courses in international organizations: Rome, Padua, Bari and Milan. Three others — Florence, Genoa and Pisa — are in the process of adding such courses; additional universities are considering doing so. In other universities, little teaching is done in this field. Such subjects as international law, political science and economics, labour law, the history and institutions of the African-Asian countries, and the history of treaties would seem to be among those best suited for the inclusion of teaching about international organizations. The work of FAO is followed with great interest by the Faculties of Agricultural Sciences of many Italian universities.

The fifteenth post-graduate course in international organization was held in Venice in 1962, under the auspices of the Ministry of Foreign Affairs. The course comprised fifty lessons given by university professors and outstanding specialists.

Most of the university theses on international organizations are on legal subjects. Several deal with economic questions, while topics in history or sociology are rare. The report lists by subject the titles of ninety-two theses on United Nations subjects presented to the Faculty of Political Sciences of the University of Rome between 1958 and 1963.

The survey also found that almost two-thirds of the professors favoured developing university teaching in this field. Those faculties most interested in starting courses were political science (80 per cent), economics and commerce (77 per cent) and law (60 per cent). Most professors of political science considered that instruction in this field should be compulsory. Some of the technical faculties such as medicine and agriculture also favoured the introduction of relevant courses or lectures.

The Society has worked closely with university students in twelve cities which now are members of the International Student Movement for the United Nations. The number of students involved has grown steadily. Their research activities are focused around three main themes: study of the achievements and major problems of the United Nations organizations; the United Nations and decolonization; and the specialized agencies and international work for human rights. Two national seminars were held in Florence (May 1962) and Bordighera (May 1963).

JAMAICA

[Original text: English]
[25 October 1963]

There has been no planned programme for the specific inclusion of teaching about the United Nations in schools curricula. Individual schools, on their own initiative, do in fact include such instruction in civics and history courses. Our teacher-training colleges follow the same pattern.

The United Nations Association in Jamaica, which is an independent body on which a representative from the Ministry of Education sits, has, during the past two years, organized and conducted special programmes on United Nations Day, and special appeals have gone forth to all schools urging their fullest support. Posters and other literature issued by the Association have been circulated to all our schools and have been widely used.

It is considered that it would be useful to place some additional emphasis on United Nations operations in the curriculum of Jamaica's schools but it is not possible to implement this immediately. The matter, however, will be kept in view until it is possible to take further action. It should be emphasized, however, that teachers are most interested, on a voluntary basis.

JORDAN

[Original text: English]
[20 May 1963]

Students in the first year of the high school (secondary school) are given a brief course on the United Nations and its specialized agencies. The third year of the high school (literary division) includes a course on international organizations, the development of intellectual and political thought, the formation of the United Nations, its purposes and work and the activities of its various agencies, and the role of the League of Arab States as a regional organization. The third year of the high school (scientific division) provides a less elaborate course in the same subjects taught in the literary division.

KUWAIT

[Original text: English]
[4 August 1963]

The Kuwait Ministry of Education lays much emphasis on teaching about the United Nations. At the end of the intermediate level (eight-year course) the civics syllabus includes a large portion about the United Nations and its related agencies. The syllabus outlines the effective role they play in the effort to achieve and maintain universal peace, and the services they render to underdeveloped countries, in general, to raise their cultural, social and economic standards, and to the Arab States in particular. A section on the historical background of the United Nations and its related agencies is also included.

LAOS

[Original text: English]
[3 December 1963]

In the first cycle of the four-year normal school, teachers in training study the curriculum of primary education which comprises six grades. The study of UNESCO and the United Nations is covered in the fifth grade in primary schools and consequently is so included in the normal school. The topics treated are compulsory education and UNESCO; decolonization; the United Nations; independent Laos and its role — Buddhist and neutral — in the world. In addition, whenever the subject is relevant, teachers discuss the United Nations, especially in history and geography classes. United Nations Day is celebrated regularly.

Teaching about the United Nations is incorporated in secondary school courses in civics, philosophy and history. Questions on the United Nations are not included in the final examinations. Lectures and group discussions are organized in all secondary schools on United Nations Day, World Health Day and Human Rights Day.

There are no special adult education programmes on the United Nations. However, speeches are made in the pagodas on United Nations Day to the population of the villages, and the National Radio broadcasts United Nations programmes.

LEBANON

[Original text: English]
[27 August 1963]

Programmes of the Ministry of Education

Teaching about the United Nations will be included in the revised elementary curricula which the Ministry of Education is at present formulating. Secondary school curricula contain material on the principles and activities of the United Nations and specialized agencies, which is taught one hour each week. In addition, students receive special instruction on United Nations Day and Human Rights Day. At the university level, a full programme is given in the third year dealing with international and regional organizations in general and the history and development of the United Nations in particular.

Programmes of the Ministry of Guidance, Information and Tourism

The United Nations Information Centre in Lebanon furnishes information on activities of the United Nations to newspapers, magazines and the Lebanese Radio station, and distributes television programmes and other visual aids. An educational programme is provided by UNRWA to children of the Palestinian refugees in Lebanon with the help of UNESCO. Likewise, UNESCO co-operates with the Government of Lebanon in the field of education. The Lebanese Radio station offers a weekly programme on the United Nations which it prepares itself or receives from New York or the United Nations Information Centre in Beirut. It also diffuses

special programmes on United Nations Day and Human Rights Day.

LIBERIA

[Original text: English]
[18 October 1963]

General observations

During the period 1960-1963 there has been an upsurge of interest in the increased role the United Nations continues to play in the maintenance of international peace and security. Public interest was further heightened when a Liberian contingent was sent to assist the United Nations Operation in the Congo.

The Liberia United Nations Association acted as host to the Seventeenth Assembly of the World Federation of United Nations Associations (WFUNA) in May 1962.

The post of United Nations travelling teacher is still maintained by the Department of Education. This officer is responsible for teaching about the United Nations, chiefly in weekly classes, in six high schools in Monrovia. Plans are under way to expand teaching in this field to other countries.

Teacher-training

Instruction on teaching about the United Nations has not been provided in the past, but plans are under way to include it in the curriculum as a part of the social studies course.

A course on the United Nations for in-service teachers at the Monrovia Extension School is provided by the United Nations travelling teacher once a week.

United Nations in the school programmes

In a general way, primary pupils learn about the United Nations from extra-curricular activities like United Nations Day, and through film shows and radio news and feature programmes.

The Curriculum Guide of the Department of Education provides for teaching about the United Nations in junior and senior high schools. This instruction is separate in some schools and in others forms part of social studies. The annual national examination for the completion of secondary school, administered by the Division of Evaluation of the Department of Education, included questions on the United Nations for the first time this year and assurances have been given to do so in future.

Observances of United Nations Day, Human Rights Day and World Health Day take place each year, as well as a nation-wide model United Nations Assembly.

Classroom teaching material and aids

Recent textbooks have given greater emphasis to the United Nations, supplemented by weekly news bulletins (USIS and UNIC), radio news and local newspapers.

Feature stories about the United Nations appear regularly in the bi-monthly news bulletin *New Day*, published for semi-literates by the Literacy Division of the Department of Education. These simple write-ups on the United Nations and its activities help to educate adults and are also useful for primary education.

Film and filmstrips have been used in high schools at meetings of the Liberia United Nations Association and the International Relations Clubs and during observances of United Nations Week and World Health Day.

The main problem still remaining is the availability of textbooks, equipment (movie projectors) and other educational material for effective teaching.

United Nations study in colleges and universities

United Nations studies have not been emphasized in the past but, in the future, they will be given at the undergraduate level. The University has an active Student United Nations Association.

Adult education

The International Relations Club of the Young Men's Christian Association and the Liberia United Nations Association sponsor lectures and group discussions. The office of the United Nations travelling teacher distributes United Nations displays to rural and county schools, where they reach adults as well as children.

LUXEMBOURG

[Original text: French]
[17 April 1963]

The situation in this field has remained generally constant during the period under review. Thus the five main points outlined in the previous (1960) report on this subject (see E/3322) are still valid and may be summarized as follows:

Teacher-training

In teacher-training institutions, instruction on the United Nations is given in other courses, such as history and civics. Courses for teachers in service are not given through official channels.

Elementary and secondary school curricula

Teachers in upper primary schools are requested by the authorities to provide information adapted to the age levels of their pupils in connexion with United Nations Day. In the secondary schools much more detailed instruction on the United Nations is given by teachers of history. Lessons on the United Nations are included in a course on public and administrative law given in the first class of the general secondary schools, both for boys and for girls. The final examinations held at the end of the primary and secondary levels do not include questions about the United Nations.

Teaching materials

The history textbook for secondary schools contains detailed information about the United Nations. Each year, for United Nations Day, information materials are supplied in bulk by the United Nations Information Centre, Paris, and distributed through the United Nations Association of Luxembourg to all secondary and some primary school teachers.

Extra-curricular activities

In addition to United Nations Day, Human Rights Day and World Health Day are important yearly occasions. Circulars concerning their observance are sent to schools by the Ministry of National Education, and the United Nations Association plays an active role in distributing documentation to schools, arranging film showings, lectures, poster competitions, and other special events. In addition, considerable coverage is given to the United Nations in the Press and on radio and television.

In January 1963, a Freedom from Hunger Campaign Week was held in Luxembourg. Members of the Committee gave lectures in the principal towns on FAO, UNESCO and the United Nations in general. These speeches were illustrated by films provided by the United Nations Information Centre in Paris. In addition to the satisfactory financial results achieved, these activities have also helped to make the work of United Nations agencies more widely known.

MADAGASCAR

[Original text: French]
[13 July 1963]

Madagascar has as yet no definite programme of teaching about the United Nations. Nevertheless, on special occasions such as United Nations Day, lectures are arranged for school children to acquaint them with the activities and ideals of the United Nations and its specialized agencies.

In addition, questions on international organizations are set in certain examinations. Thus, in the *brevet élémentaire* (lower secondary school) syllabus for 1963 the following topics were included in the civics examination: freedom — its requirements and limits; basic ideas concerning international organizations — the United Nations and its agencies (UNESCO, FAO, UNICEF, WHO, the ILO), African and Malagasy Union, African and Malagasy Organization for Economic Co-operation and the Common Market.

MALAYSIA

[Original text: English]
[25 September 1963]

Teaching about the United Nations has not heretofore been included in the curriculum. However, action is now being taken to include such instruction in the syllabuses of both primary and secondary schools.

MALI

[Original text: English]
[14 November 1963]

Teaching about the United Nations is provided in primary schools in history (fifth year) and in civics (eighth year); and in secondary schools in history and civics (eleventh year) and in domestic science education (third year).

As part of the world Freedom from Hunger Campaign, booklets prepared by the Ministry of National Education on the problem of hunger were sent to all teachers as well as a model lesson on this subject. Posters, photographs and written material on UNESCO also have been sent to schools.

A training course for primary-school teachers, which includes several lectures on the United Nations family, has been organized jointly by the Ministry of National Education and the Malian National Commission for UNESCO.

MEXICO

[Original text: Spanish]
[27 August 1963]

General observations

At all levels in schools controlled by the Department of Public Education, syllabuses include instruction about the United Nations. Teaching aims at impressing upon the minds of Mexican youth the significance of the United Nations and its agencies in their efforts to enable nations and peoples to live together in peace and harmony and to achieve material and cultural progress. All Mexican schools, whether public or private, commemorate United Nations Day with civic activities, which for the most part constitute the culmination of related work units.

Primary schools

In all primary schools the significance of United Nations Day is the central theme of widespread civic and educational programmes. For this purpose, the Ministry of Public Education distributes to all schools relevant study material. In the textbook provided free of charge to all primary schools (*My Third Year Reader, Our National Language*), there is a long chapter on United Nations Day, the United Nations, its purposes and work. During United Nations Week a wall newspaper, which is changed every day, depicts in words and drawings achievements and ideals of the United Nations.

Secondary schools

The main event is the nation-wide essay competition. Adjudication is by a panel of officials from different schools and the prizes are books dealing with the United Nations or general culture. Some of the prize-winning essays are published in newspapers in the Federal Dis-

strict and the various states. The Libraries Division of the Department of Public Education also arranges exhibitions about the United Nations which are open to the public during October and November.

Teacher-training

In training colleges for elementary school teachers, instruction on the United Nations family is provided as part of the civics, world history and geography syllabus, and also under the social sciences. The new study plans which are being introduced as part of the educational reform movement give wide scope to work in this field in the various subject syllabuses and activities.

Usually in October, lectures and seminars on the United Nations family are arranged in the various types of schools. Units of work are arranged on the United Nations and UNESCO, and simple publications prepared with the available material.

The syllabus of the Higher Training College for Teachers includes instruction on the United Nations and its agencies, particularly UNESCO. For history specialists this forms part of the fourth year's work in world history. For specialists in civics and the social sciences, it occurs in "Problems of the world today" and again under the heading of "Problems of Mexico". In the syllabus devoted to "Educational policy in Mexico", which is common to all specialist syllabuses, under the heading "National Plan for the improvement and spread of primary education" reference is made to the fact that this plan is part of UNESCO's Major Project for Latin America.

MONGOLIA

*[Original text: Mongolian]
[17 October 1963]*

The Charter of the United Nations and Statute of the International Court of Justice were translated into Mongolian and thousands of copies of the translated texts distributed throughout the country so that the purposes of the United Nations could be learned by the Mongolian people at first hand.

The goal of the Mongolian United Nations Association, established in 1957, is to explain to the Mongolian people the purposes and basic principles of the United Nations and its specialized agencies. Accordingly, the Association, using mass information media (Press, radio and other publications), continues its functions aimed at broadening and deepening public understanding of the United Nations and its related agencies. A special book on the United Nations was published by the Association.

The United Nations and its agencies are studied at specialized schools and establishments of higher education as a part of subjects such as the history of international relations, international law and the like.

On United Nations festivals such as United Nations Day and Human Rights Day, lectures, club evenings, radio talks and the like are organized regularly for

pupils in schools, students, farmers and working people in various enterprises on the role of the United Nations in securing international peace and on co-operation between the Mongolian People's Republic and the United Nations and its related agencies.

An all-round use of the daily Press is another form of dissemination of knowledge about the United Nations; its deliberations are frequently mentioned in the newspapers. The fundamental facts about the United Nations are usually included in handbooks designed for the general public.

NETHERLANDS

*[Original text: English]
[22 July 1963]*

As in previous years, the Educational Committee of the United Nations Association of the Netherlands (VIRO) has drawn up a lesson, which has been sent by the Ministry of Education, Arts and Sciences to 2,600 secondary and preparatory higher schools and industrial schools. Particular attention has been paid this year to the world Freedom from Hunger Campaign organized by FAO and to the United Nations Development Decade. An application form for documentation, which many schools have made use of, was enclosed with the lesson. Special campaigns like the Freedom from Hunger Week, as well as the normal press reports on the United Nations and its agencies, often provide teachers with a motive for discussing these organizations in class in somewhat greater detail.

At preparatory higher schools and secondary schools, the United Nations is dealt with in modern history. Every new history book devotes some attention to the international organizations. In addition, sociology was taught in forty-seven secondary schools (most of them for girls) during the year 1962-63, giving teachers and pupils an opportunity of discussing the United Nations and the specialized agencies.

A new subject entitled "Cultural and social education", in which the international organizations are touched upon, has been introduced in teacher-training colleges and in primary and advanced technical schools for boys and in post-primary industrial training courses for girls.

The UNESCO Centre in Amsterdam and the Netherlands Information Service for the United Nations (NISUN), which give information, organize exhibitions, distribute literature and show films, do much to arouse interest in the work of the international organizations, notably UNESCO. NISUN co-operated in the second Model United Nations General Assembly held by the Amsterdam Youth Council on 10 March 1962.

As usual, the Netherlands newspapers carried special articles on World Health Day and United Nations Day. Teachers' professional journals also contain incidental information on methods of teaching pupils about problems concerning international organizations.

In the years 1961-62 and 1962-63 the Netherlands Universities International Co-operation Foundation gave

special courses for university students on the problems of the developing countries. In addition, private organizations, established with the object of training young people for missions in developing countries, help to make the United Nations and its agencies more widely known.

In adult education work attention is given to the aims and activities of the United Nations family in courses lasting several days or in lectures followed by discussions. Generally speaking, interest in the United Nations and its related agencies is steadily increasing.

NEW ZEALAND

[Original text: English]
[1 July 1963]

The New Zealand authorities are continuing their efforts to stimulate knowledge of the United Nations and of other movements towards international co-operation and understanding. The new social studies syllabus for primary schools, which came into effect in 1962, places increased emphasis on this. The attention of teachers is regularly drawn to helpful publications on this subject, and from time to time the Department of Education distributes material to schools, particularly for United Nations Day. Teachers use a wide variety of materials from the United Nations and its agencies.

New Zealand's participation in the Colombo Plan and the programmes of the United Nations and its agencies has resulted in the assignment of many of the best teachers for periods abroad. This, together with the presence of foreign students admitted under these programmes, has increased the interest of school children and adults in international organizations.

There is now a Department of Asian Studies at Victoria University and other universities are developing courses on Asia and the ECAFE area. The Regional Councils of Adult Education, whose activities are an extension of the universities, have also increased the number of courses on Asia and the Pacific and the regional and international bodies associated therewith. The adult education movement, the Press and the broadcasting service have all contributed actively to wider knowledge of the United Nations and of other peoples, and to engendering sympathy for the ideals of peaceful co-operation.

Inspectors of schools spend some time with the secretariat of the National Commission for UNESCO, to discuss the work of UNESCO and the ways in which they can help teachers to promote United Nations ideals in the classroom. In 1961, an inspector of schools was sent to a seminar on teaching about the United Nations in Australia.

In January 1960, New Zealand was host to a UNESCO regional seminar on the use of publications for schools in increasing the mutual understanding of Eastern and Western cultural values. As a follow-up to the seminar, the Minister of Education recently approved the establishment, for two years, of a UNESCO project on

teaching about Asia in New Zealand schools. Attention will be devoted also to the work of the United Nations and its agencies.

As a further aid to teachers in primary schools, the School Publications Branch of the Department of Education intends to publish during 1963 a bulletin dealing with the work of the United Nations and its agencies.

In July 1962, the Government Printer took over the sale of UNESCO publications and since then also those of the United Nations, FAO, ICAO, WHO and OECD. The Government Printer has retail shops in the four main cities and a maining list of about 10,000: this has made these materials much more accessible to all, including teachers and students. The Department of Education officially encourages teachers to make use of these publications in the classroom.

Cook, Niue, Tokelau Islands

In the Cook Islands both specific and indirect study of the United Nations are included in the curricula in secondary schools, as laid down for the New Zealand School Certificate social studies and history prescriptions, and in the local primary schools and primary teacher-training course. Cook Islands primary schools annually observe United Nations Day with stories, songs and plays and the like. It is reasonably well observed in Rarotongan schools, but less well in the outer islands of the group. Recently, senior staff of five educational institutions in the islands have become members of the New Zealand United Nations Association, on behalf of their schools in order to gain a direct link with a source of up-to-date information, posters, charts and general literature. Two one-guinea book prizes for individual student projects on the United Nations have this year been offered at the Teachers' Training College and Tereora College, Rarotonga.

Publicity is given to the work of the United Nations in articles in the *Cook Islands News* and the *Niue Island Newsletter*. Instruction is included in the syllabuses of all primary schools on Niue and in the Niue High School and Teachers' Training Centre. Occasional films on the United Nations work are shown for adult education, and brief instruction is included in staff training classes for public servants on Niue. Teaching in all spheres is extended as the availability of material and opportunity permits, although Niue's isolation poses problems in the development of the people's interest in, and understanding of, the United Nations.

The curriculum of the Western Samoan Department of Education is used in schools in the Tokelau Islands and pamphlets, etc., on the United Nations are regularly sent. Western Samoan school broadcasts are also followed in the Tokelaus. The Tokelau Administration obtains books and periodicals on United Nations subjects from the Nelson Memorial Public Library in Western Samoa and also from private sources. Documentary films are shown as opportunity offers.

The following publications of the New Zealand Department of Education accompanied the report: *Syllabuses of Instruction and Prescriptions for the School Certificate Examinations*, 1962, 62 pp; *Social Studies in the Primary School* (Syllabus), 1961, 12 pp.; *Suggestions for Teaching Social Studies in the Primary School*, 1962, 55 pp.

NICARAGUA

[Original text: Spanish]
[10 October 1963]

The training programme for teachers in elementary and secondary schools includes, in the courses on social sciences and cultural history, study of the following subjects: the Atlantic Charter (1941), underlining the goals of the Allies after the war and also in peace time; the San Francisco Conference and the United Nations Charter (1945); the United Nations from 1945 to 1963; comparison of the United Nations with the League of Nations; the Universal Declaration of Human Rights and the Declaration of the Rights of Man and the Citizen proclaimed by the French Revolution 1791.

The following subjects are studied in the programme on school organization and administration in the normal schools: Major Project of UNESCO; general aspects of primary education in Latin America; Carazo Plan and teacher-training institutions associated with UNESCO; recommendations of the Conference on Education and Economic and Social Development (Santiago, Chile) in relation to the planning of education.

NIGERIA

[Original text: English]
[14 April 1964]

General observations

The two most significant developments in the period under review have been Nigeria's admission to the United Nations on 7 October 1960 and Nigeria's contribution in police and troops to the United Nations Operation in the Congo. Both events have undoubtedly resulted in a much greater and more personal interest in the United Nations on the part of the general public than previously.

Since 1960, the Universities of Ibadan and of Nigeria (Nsukka) have included United Nations studies in their curricula. The new primary school syllabus also provides for study of the work of the United Nations family. In addition, the Nigerian Broadcasting Corporation gives regular coverage, in news and feature programmes, to United Nations activities.

Nigeria's pressing concern in education is to provide as quickly as possible large numbers of trained personnel at all levels to serve the country's development and to raise general standard of living. Thus, educational curricula are concentrated and trend positively towards the utilitarian. It does not therefore appear at present that it would be possible to insert any appreciable amount

of additional teaching about the United Nations into the curricula as this would be at the expense of other subjects considered to be of more immediate priority. Further information about the United Nations appears most feasible through extra-curricular activities or the mass information media.

Teacher-training

At teacher-training colleges, the work of the United Nations appears in the history syllabus under the heading "Attempts at international co-operation" and in the health and hygiene syllabus (WHO and UNICEF). Extra-curricular activities include discussion groups, debating societies, current affairs clubs, film shows and lectures. But these are optional, and activity varies greatly from one school or college to another.

There is no official programme designed to provide information on the United Nations to teachers in service at any level, except through distribution of United Nations pamphlets. Also, teachers are influenced through the usual mass information media of the Press, radio and television.

The United Nations in school programmes

The new primary school syllabus specifically includes "the work of the United Nations and its allied organizations" under the subject of civics. Such instruction has been and for the future will be included (by inference) also in history, social studies, geography and health. Extra-curricular activities connected with the United Nations do not form part of the primary school programme, e.g. United Nations Day, etc.

The secondary school syllabus does not include teaching about the United Nations. Thus, it is at the discretion of individual tutors if the United Nations is dealt with in secondary schools. In such cases, it forms part of history, current affairs, health science, or social studies for not more than two or three hours. The only other exception is in the General Paper at post-secondary, sixth form, level, of which current affairs forms a part. Information about the United Nations is often useful here but tuition tends to be informal and students gather most of that information from private reading in current affairs. Secondary school examinations do not include questions on the United Nations though knowledge of these may be of assistance in answering certain questions. Extra-curricular activities include debates, discussion groups, current affairs clubs, films and lectures, but United Nations Day, etc. are not usually observed.

Classroom teaching material and aids

No special textbooks have been produced during the period under review. Any such material is obtained by individual schools and colleges from the United Nations or from agency sources. There is in fact negligible material available in schools. News bulletins issued by the United States and the British Council Information Services often include items about the United Nations.

There are no bulletins or newsheets specifically designed for schools. Films of a semi-documentary nature with an emphasis on Africa and current affairs are available from the United States and the British Council Information Services but not all schools have the necessary facilities.

There are no radio or television programmes on the United Nations specifically for schools. However, the Nigerian Broadcasting Corporation and the Regional Broadcasting Corporation Services transmit regular weekly programmes such as "United Nations Features", "Report to Africa", and "Report from London", which include United Nations topics. Much of the material is obtained directly from United Nations sources. There are also special purpose programmes, e.g., on World Health Day, etc. UNESCO assists school broadcasting on a national level but to date there have been no specific programmes on the United Nations.

In the universities of Nigeria, United Nations studies are included in the faculties of law and political science only, i.e., a one-year course in public international law (nine credits), and in political science a course lasting one term (three credits) which covers the history, functions and activities of international organizations, including the League of Nations and the United Nations family. No theses or dissertations have yet been written on United Nations subjects.

There are Student United Nations Associations at some of the five universities, which sponsor lectures, films, radio debates and talks. However, they are seriously handicapped by lack of funds and literature is restricted to an occasional pamphlet. United Nations Week and Human Rights Day are observed by lectures, films or symposia.

Adult education

There are no formal programmes of adult education on the United Nations. The chief concern of the adult education programmes at present is adult literacy, which leads to the reading of more advanced material on general subjects, current affairs, newspapers, etc. Adults are also reached through the radio and television programmes which provide information on the United Nations in news bulletins, semi-documentaries and feature programmes.

NORWAY

[Original text: English]
[11 September 1963]

General observation

No great changes have taken place but in all schools there is a marked trend towards a more comprehensive study of international co-operation and of the United Nations. The information provided to schools by the United Nations Association of Norway has been steadily increasing, and the Association now plans to appoint a special school secretary. The courses held in secondary schools for students preparing for the university entrance

examination have received official recognition and increased grants. Government grants in this sector to the Norwegian National Commission for UNESCO have also been increased.

Teacher-training

In training colleges for prospective elementary teachers, special stress on the United Nations is given to history and civics.

In the four-year teacher-training colleges some knowledge of the United Nations is a requirement for passing the final examination, and a relevant chapter has been included in the civics textbooks. In classes in the Norwegian language, a number of compositions are required on United Nations subjects. In the two-year teacher-training colleges civics is not a subject required for examination and accordingly no definite syllabus is prescribed. Some attention is given to the political and economic activities of the United Nations, comprising about one-third of the thirty-five instruction hours in civics. In addition to textbooks, some publications of the United Nations Association are used, especially Elster's *A Challenge to Humanity*. All students assist in the celebration of United Nations Day. In future greater importance will be attached to civics. An illustrated manual for extra-curricular studies would be useful. It also has been proposed to appoint a United Nations "contact man" at each teacher-training college, to keep students informed on topical subjects.

During this period, the United Nations Association has arranged courses at nine of the fifteen teacher-training colleges. One of the subjects discussed is how to teach about the United Nations in elementary schools. Moore and more students choose United Nations subjects for their special papers presented before the final examinations.

The Norwegian National Commission for UNESCO has appointed a committee for experimental education in international understanding at teacher-training colleges. Such teaching began in three colleges in 1961 as a part of UNESCO's Associated Schools Project. A careful study of this work has been issued, entitled *Educational Experiments carried out over a Three-Year Period* (Oslo, Norwegian National Commission for UNESCO, 1963, 77 pp.).

At the State College for Superior Teacher Training, the United Nations is dealt with in history. The new curricula now being prepared aim at enlarging this study.

The United Nations in school programmes

The new Act of 1959 concerning the elementary school and the nine-year school includes education for international understanding as a part of history and civics. With these new programmes as a starting-point a number of new textbooks have been approved. In the continuation schools and the "folk high schools", education for international understanding is included similarly in civics and history.

In the current revision of teaching programmes for secondary schools, the importance of providing more information about the United Nations is constantly being kept in mind. An indication of this can be found in the fact that during the period 1960-1963, all university entrance examinations, and also final examinations in the modern secondary school, have included one subject pertaining to international relations, including the United Nations.

As at 1 April 1963, the United Nations Association has arranged 117 courses in secondary schools and in one senior commercial school. These courses include lectures and films for several Students' Unions in secondary schools, as well as material for classroom teaching. Through the Ministry of Church and Education the Association annually circulates a list of material available to all schools.

In 1963 the Norwegian National Commission for UNESCO, in consultation with the Ministry of Education, appointed a committee to organize a conference for teachers in history and geography, which was held in July 1963, on "Better education about developing countries". The conference proposed various measures to improve the teaching of international subjects. These proposals are now being examined by the Commission with a view to making specific recommendations to national educational authorities and other competent bodies.

All school libraries are continually enlarging their United Nations collections. Audio-visual aids are being increasingly used, e.g., filmstrips, maps, sound recordings, radio etc.

When examining textbooks and auxiliary books for approval, particularly in history, civics and geography, the consultants of the State Council for Education continually pointed out to the authors that United Nations subjects must be treated as fully as possible.

Adult education

In adult schools for social affairs, the subject "International social policy" aims at giving the students insight into the purposes and functions of the United Nations, ILO, UNESCO, UNICEF, etc. Many of the teachers at these schools have participated in special courses, at home and abroad, to prepare for this work. These schools also have their own contacts and their own system of co-operation with the United Nations Economic and Social Council.

The Norwegian National Commission for UNESCO also has prepared a series of study plans for adults, and more are in train on such subjects as "The Arab countries and racial problems". In January 1963 the Commission organized a course for study-group leaders to review available materials.

Radio and television provide regular information on the United Nations in news and feature programmes.

It will be evident that teaching about the United Nations and its agencies is constantly improving in quality and expanding in scope. The Norwegian schools

and the school authorities are aware of the importance of such education and take this into account in the preparation of new curricula and new textbooks.

PAKISTAN

[Original text: English]
[20 January 1964]

General observations

The most significant development during the period 1960-1963 was the special attention given to the United Nations and its agencies in the revised curricula for primary and secondary schools, including a general emphasis on the inculcation of the brotherhood of mankind and the interdependence of nations. The major difficulties of implementation are those inherent in the progress of a developing nation—it is a question of economics and priorities.

There is a deep interest in and support for the work of the United Nations family in the economic and social fields. However, there is a critical and sceptical attitude among most groups and the general public in relation to the effectiveness of the United Nations in settling the Kashmir problem.

In the matriculation examinations, secondary school certificate questions are set on United Nations topics, especially in the social studies paper, which also includes history.

Every year United Nations Day, Human Rights Day and World Health Day are celebrated officially in schools and colleges under the auspices of the high officials of the government.

To extend and improve education in this field, the following suggestions have been made by various authorities: (a) greater emphasis on the United Nations should be introduced into civics or history in secondary schools and political science at the graduate and post-graduate levels; (b) suitable teaching materials should be made available, particularly in the national languages; (c) United Nations centres should be opened in each region, possibly with government support, where the work of the United Nations could be publicized through work groups, seminars and reading material; (d) intensive programmes supported by films and exhibitions should be organized on the lines of those held by the Pakistan United Nations Association. Students and teachers should be sent on goodwill missions to other countries.

Teacher-training

The curricula of teacher-training institutions are at present being revised in West Pakistan and it is anticipated that increasing importance will be given to United Nations subjects. Even at present, some instruction is provided. In East Pakistan, steps have been taken during this period to provide prospective teachers in primary and secondary schools with such instruction, as part of other subjects: history, social studies, languages, health education and the methodology of teaching.

The United Nations in school programmes

The syllabus for primary schools, which has recently been revised, for the first time includes a specific section on teaching about the United Nations. Aspects of the subject are taught in all classes, particularly in language and social studies. The objectives of this teaching are clearly defined: an appreciation of the interdependence of nations leading to world understanding and the brotherhood of mankind; an acquaintance with the achievements of prophets and great personalities of Pakistan and of other countries of the world; a general knowledge of the world as a preparation for citizenship; skills in human relations, such as co-operation and consideration for others.

In secondary schools, the United Nations is treated in the prescribed textbooks for social studies and civics. This basic material is augmented by periodicals and newspapers. Two Associated Schools projects were commenced during the period under review.

Classroom teaching materials and aids

Textbooks prescribed for primary and secondary schools certainly give greater attention than previously to United Nations subjects, particularly those used in languages, social science and civics.

Students at the primary and secondary stage are normally taught in the national or local language and it is here that there is a scarcity of printed material on the United Nations. The teacher is encouraged to prepare his own charts, maps, press cuttings, and the like. Supplies of other teaching aids such as films, filmstrips, pictures, stamps, reference books and radios are very inadequate. Films of filmstrips cannot be used on a wide scale as projectors are not readily available. Films on United Nations subjects are occasionally shown in urban schools.

Where possible, schools maintain libraries and funds are made available for purchasing reports, books and other materials. Use is also made of the information services of foreign Governments in Pakistan. In addition, the activities of the United Nations receive wide coverage in the national Press.

School broadcasts are provided by Radio Pakistan in specific urban areas, and frequently the work of the United Nations bodies is presented. The establishment of an educational television project is at present under consideration by the Government.

United Nations study in colleges and universities

The United Nations is included in courses in political science, history, economics, international relations and international law at most colleges and universities. Instruction is given at both the graduate and undergraduate levels. At present, there is no provision for the students to write theses and dissertations on the United Nations.

Extra-curricular activities include films, lectures, model United Nations sessions and debates, and symposia and conferences on the work of the United Nations.

Adult education programmes on the United Nations

The All-Pakistan Women's Association (APWA) is one of the national organizations most active in disseminating information to adults on the work of the United Nations family. On World Health Day, its members visit villages and carry out a programme based on WHO's Freedom from Blindness Campaign. They also demonstrate the activities of WHO, through charts, diagrams, slides and film shows. APWA holds seminars, group discussions and lectures on FAO's theme of Freedom from Hunger. Villagers are shown modern techniques in farming and are advised on the principles of family planning. During United Nations Week and Human Rights Day, the Adult Education Unit of the Association exhibits relevant films and slides. APWA and other social organizations also participate in seminars held outside the country under the auspices of the United Nations.

On the various United Nations anniversaries, Radio Pakistan broadcasts programmes on the United Nations and its agencies, including features, news, announcements, talks and commentaries.

PERU

[Original text: Spanish]
[12 November 1963]

Since the educational reform of 1957, teaching about the international community, including the United Nations, has been included in the third and fifth year of the secondary school civics syllabus. In addition, a special period, although very limited, has been devoted to such instruction, especially on FAO and ILO, in agricultural, commercial, and industrial schools. Prior to 1957, teaching about the United Nations took the form of extra-curricular activities. United Nations Week, Human Rights Day and World Health Day are observed in schools at all levels.

Teacher-training

In the syllabus on the general theory of education, special attention has been given to international co-operation in education and a further section is included in the social education syllabus.

Colleges and universities

Special attention to the United Nations is given in universities, especially in public international law, the history of diplomatic and consular law and also in some other subjects, such as political economy, sociology and finance.

Adult education

Since 1958 the Department of Fundamental and Adult Education has organized short courses during the vacation months (January and February) to train hundreds of teachers in subject-matter and methods of adult educa-

tion for community development. These programmes have been carried out in co-operation with the Ministries of Health and Social Affairs, Agriculture, Labour and Indigenous Affairs, and co-ordinated with the programmes in Peru of the various international organizations.

Statistics show that the Literacy and Adult Education Service has benefited 473,778 adults. In more than 25 per cent of the cases, there has been a change of attitude towards cultural, social and economic improvement.

Information on the significance and activities of the United Nations family has been an essential part of the training of teachers for this work.

PHILIPPINES

[Original text: English]
[18 July 1963]

General observations

The period 1960-1963 was characterized by increasing awareness of the role of the United Nations in promoting world understanding and maintaining peace. This awareness was stimulated by an expanded programme of United Nations Technical Assistance in the Philippines, especially in the field of education, by participation in UNESCO's East-West Major Projects and Associated Schools Project for international understanding, by an enriched programme in mass communications and by increasing attention to the education of out-of-school youth and adults.

The major problem is the inadequate supply of teaching material, particularly for the primary grades, owing to lack of funds.

Official action to encourage teaching in this field has taken many forms. The Bureau of Public Schools arranges annual observances of United Nations Week and other occasions. Conferences of teachers have been held, and publications issued by and about the United Nations have been made available to schools by the Bureau of Public Schools.

Suggestions for intensified action include seminars for the preparation of materials of instruction; international exchange of teaching materials, and more teacher and student exchanges; introduction of a course in international understanding or inter-group education in the colleges; publications about the United Nations and its agencies in simple language; and more extensive use of the media of mass communication.

Teacher-training

Instruction about the United Nations is integrated with social science courses. Trainees also learn something about the United Nations through extra-curricular activities, such as essay contests, radio programmes, films, etc.

Outstanding teachers in primary and secondary schools and teacher-training institutions have attended national or regional seminars and workshops and have then served as leaders in local conferences.

United Nations in school programmes

Instructions about the United Nations in primary schools is integrated with social studies, especially in grade six. In secondary schools, the United Nations is studied in social science, and also in the UNESCO Associated Schools Project. Extra-curricular activities include international relations clubs, model United Nations sessions, essay contests and poster-making.

Adult education

Although the National Programme of Adult Education seeks to promote the ideals of the United Nations, no special course has been organized. However, many voluntary bodies sponsor programmes which give some attention to the United Nations. Also, the mass media provide news and occasional feature programmes about the United Nations. The Bureau of Public Schools and the Philippine Broadcast Service jointly sponsor a service of education broadcasts which have included such topics as "One world", "Mother Philippines Thanks the United Nations Agencies", and "Our Neighbours Near and Far".

POLAND

[Original text: French]
[16 January 1964]

Teaching about the United Nations and its agencies is provided in the course "Poland and the contemporary world", which is compulsory in all schools: primary, secondary and professional as well as in teacher-training institutions. The subject is dealt with in textbooks and also in extra-curricular activities, particularly group discussions.

Teacher-training

The United Nations unit in the subject "Poland and the contemporary world" is given in the fifth year. Important United Nations problems are also studied in the history programme: "The United Nations — the policy of coexistence — disarmament problems". Current United Nations affairs are included in group discussions and in the activities of school clubs.

Many in-service conferences and seminars on United Nations subjects are organized for the teachers in charge of the courses on "Poland and the contemporary world". Typical subjects include the genesis and aims of the United Nations, its related agencies, the role of the United Nations in the development of international co-operation and problems of peace and international security.

The United Nations in school programmes

In primary schools, the United Nations unit is taught in the seventh and final year of studies. These schools also join in United Nations Day observances which are organized by the Polish Association of the Friends of the United Nations.

New teaching programmes arising from educational reforms have taken into consideration the question of

teaching about the United Nations. As a result, secondary school curricula now include the following additional course: "The United Nations and its principal organs; the role of the United Nations in the maintenance of peace", in the ninth (last) year of the lycée. Questions on the United Nations are included in the yearly Scholastic Olympics, in which 400,000 young people took part in 1963. Organized by the Quiz Leagues, these competitions are open to all secondary school students.

During the first year of study in the Faculty of History of the *écoles supérieures* students learn about the United Nations in two required courses: "The sovereignty of the State and international co-operation" and "Poland's participation in the United Nations".

Teaching material and aids

United Nations subjects are covered in the following textbooks: for primary schools, *Knowledge about Poland and the Contemporary World*, by T. Szymozak (1961); for secondary schools and teacher-training institutions, *Civic Knowledge*, by W. Nalepinski (1961), and "Contemporary World", by B. Petrozolin and A. Skowronski (1960). The quantity of books is sufficient and the schools do not feel any lack of materials on this subject. Teachers keep textbooks up to date with information supplied through the Press, radio and television. Many school libraries are stocked with books and pamphlets on United Nations subjects. Schools have slides on the United Nations and its agencies, and those which have projectors also use films. In 1962, an entire school television broadcast in the "Panorama" series was on the United Nations. United Nations activities are often included also in radio broadcasts for schools. All teacher-training institutions have epidiascopes and film projectors and use relevant audio-visual materials in this field.

Adult education

Study of the United Nations is provided in evening classes and correspondence courses for workers. In 1962, 143,000 students taking primary instruction in evening schools studied the world organization, under the heading "The United Nations, its tasks, its importance". More advanced study is offered in the history curriculum during the final year of the secondary-school evening and correspondence courses, in which some 21,000 persons are enrolled. In the vocational and technical training courses for workers, approximately 100,000 persons are learning about the United Nations in the course "The United Nations, its objectives and importance; the role of the socialist States in the United Nations".

In the peoples' universities, with a total student body of about 200,000 adults, a course is given on "International problems" which includes a detailed study of the work of the United Nations. Besides the prescribed textbooks, teaching aids and devices include audio-visual materials, seminars, conferences and the monthly *Bulletin* of the Polish National Commission for UNESCO. This course is organized under the joint auspices of the Ministry of National Education, the Society of Universal Science and the Polish Association of Friends of the United Nations.

REPUBLIC OF KOREA

[Original text: English]
[4 October 1963]

Close relations exist between the United Nations and Korea, rooted in the Korean quest for independence. Accordingly, the Korean people's interest in and concern for the United Nations steadily increase. Although Korea has not yet been admitted to the United Nations, it has membership in most of the specialized agencies.

Teacher-training

Following the educational reforms promulgated in 1961, the normal schools have been abolished and the primary school teachers are now trained in the junior colleges. A graduate school of education has been established. In junior teachers' colleges instruction on the United Nations is provided as part of other subjects, including the Korean language, social studies, foundations of education, foreign languages and audio-visual education. In colleges of education, a separate course solely on the United Nations is provided in social studies, whereas none is given in the departments of mathematics, science and physical education. In optional courses also, the amount of teaching related to the United Nations varies from one department to another.

At the Graduate School of Education, all students are required to take up the study of educational philosophy (one credit), which includes a section entitled "The ideals of the United Nations and the direction in education". In major and optional courses teaching about the United Nations and its specialized agencies differs; for example, social studies include study of the formation of the international community; in scientific education, biology includes study of the activities and research projects of FAO; in physical education, physical hygiene includes study of WHO activities and research.

Three of the nine junior teachers' colleges had a branch of the United Nations Students' Organization. Their programmes included group meetings, lectures and discussions on United Nations subjects, exhibitions, and observances of United Nations Day and other celebrations. Most colleges of education had a United Nations Students' department within their student councils. Students of the departments of education and social studies organized seminars on the aims and work of the United Nations.

In-service teacher-training

In-service training of teachers is organized by the teacher-training institutions or by local governments. Teaching about the United Nations has been, in general, included as a part of other subjects which in 1963 totalled about 25 per cent of all subjects.

UNESCO's Associated Schools Project in Education for International Understanding, first introduced by the Korean National Commission for UNESCO in 1961, has been accepted with enthusiasm by many school authorities. During summer and winter vacations in 1962,

three provinces (Kyung-nam, Choong-nam and Chun-nam) included a two-hour course on the project in their thirty-two hours of in-service training for all supervisors and teachers concerned.

In 1962, the Ministry of Education instructed all in-service training institutes to devote more than 5 per cent of their programme to the subject of family planning, as part of the international Freedom from Hunger Campaign.

A total of 360 technical and vocational school teachers and 220 agricultural school teachers, the former with the assistance of the International Development Association and the latter with help from FAO, received in-service teacher-training during the summer of 1962. The Hankook University of Foreign Studies has been conducting an annual training programme for foreign-language teachers, with the assistance of the foreign embassies in Seoul and of the Korean National Commission for UNESCO. All these training programmes included teaching about the United Nations.

The first national seminar on UNESCO's Associated Schools Project in Korea, sponsored by the Korean National Commission for UNESCO with assistance from UNESCO headquarters, in June 1962, and the seminars on education for democratic citizenship sponsored by the Central Educational Research Institute, held during 1962 and 1963, contributed much to the promotion of teaching about the United Nations.

The United Nations in school programmes

In the revised primary school curriculum (1963) the social studies in the sixth grade includes a unit on "Korea and the United Nations". Four other units also have a bearing on the United Nations ("Development of our country", "Democratic government", "Life in other countries", "Our tasks ahead"). In the subject entitled "Morality", the topic "Basis principles of democratic society" has close relation to the principles of the United Nations.

In the middle school, the curriculum was revised in 1962 and new textbooks are being prepared. In the new course on social studies, lessons about the United Nations are given in each of the three years as part of the unit on "The World and our country" (first grade), "The World today and efforts for peace" (second grade) and "International relations in our life" (third grade). Teaching about the United Nations is sometimes found also in other subjects. For example, in Korean language studies for first grade students, the activities of FAO are mentioned in a study unit entitled: "Let us take care to preserve our forests".

In the high school, lessons on Korea and the basic principles of the United Nations are given in the first grade as part of the social study units on "Basic principles of democracy" and "Road for good citizens". In the second grade, the organization and activities of the Economic and Social Council of the United Nations and its relations to Korea are considered. In the third grade, units in social studies deal in detail with the United Nations, UNESCO, etc.

Extra-curricular activities

Three among the thirty-three schools recently surveyed had branches of the United Nations Student Organization. Activities included lectures, displays of posters and other materials, films, discussion panels, visits, participation in various ceremonies and oratorical or essay contests.

The United Nations in the universities and colleges

The United Nations does not constitute a separate course, but is prominent in the general arts courses, such as economic, politics and law. Thirty-eight theses dealing wholly or in part with the United Nations were presented by candidates for the bachelor's degree in 1960 and seventy-six in 1961.

Five universities have United Nations students clubs. A model United Nations Assembly is organized annually by four universities in Seoul; it aroused much public interest and the audience in 1962 numbered over 4,500 for the three days. The United Nations Students Organization also organizes discussion meetings three times a year in collaboration with the Korea College of Foreign Languages, publishes a magazine on the United Nations, and occasionally sends student goodwill missions to foreign countries.

Adult education

Civic schools provide a basic elementary education for young people and adults, and higher civic schools furnish the equivalent of the middle school curriculum for graduates of elementary and civic schools. Teaching about the United Nations is given as in the primary and middle schools. One of the textbooks for use in these schools is *The United Nations and our Country*. This is one of a series entitled "Books for Farmers", which the Ministry of Education distributes free to farmers throughout the country.

Classroom teaching materials and aids

Teaching materials and aids dealing with the United Nations are in extremely short supply in Korea. In a survey of primary schools, the main reasons for inactivity in teaching about the United Nations were stated to be the lack of equipment and lack of teaching materials and aids. Seventy-five per cent of the schools had no equipment for showing films and over 50 per cent lacked equipment for playing records, receiving radio broadcasts or showing slides. The situation is much the same in secondary schools. Fortunately the Korean National Commission for UNESCO is able to supply schools with some pertinent materials such as UNESCO wall charts and publications. The most widely available reference books are *The UN Reader* published by the Federation of Korean Education Associations and *International Understanding and the Associated Schools Project*, published by the Korean National Commission for UNESCO.

Mass information activities

There are twenty governmentally operated and twelve private radio broadcasting stations and one television station, as well as a radio broadcasting station, operated by United Nations Forces. Information about the activities of the United Nations is broadcast mostly in news programmes. The Seoul Television Station has no regular programmes on the United Nations but deals with the subject in its news hours.

Newspapers are giving increasing attention to the United Nations. In one newspaper, from 1 January 1961 to 1 May 1963, the United Nations was the subject of sixteen editorials, 538 new items, twenty-one special reports, eleven round-table discussions and sixty-three other articles. Numerous articles dealing with the United Nations have appeared in magazines which are widely read by students, such as *Thought* and *Study of Current English*. Several films dealing with the United Nations and its specialized agencies have been shown each year in the cinema theatres.

SENEGAL

[Original text: French]
[24 April 1963]

In primary and secondary schools the programme in civic instruction concentrates mainly on the spirit of the Universal Declaration of Human Rights, the goals, principles and activities of the United Nations and specialized agencies. The history and geography courses are also inspired by these themes. In the teachers training centres, the programme includes the same instruction in civics, history and geography. At all teaching levels United Nations Days is celebrated in a spirit of international co-operation and hope for a better understanding among nations.

SIERRA LEONE

[Original text: English]
[18 July 1963]

General observations

Sierra Leone became an independent country and a Member State of the United Nations in 1961. Since then there has been a great upsurge of interest in the activities of the United Nations and its related agencies. Also, through experts and other United Nations personnel in the country, the United Nations has become much more of a living force to Sierra Leone than before.

Sierra Leone is not mentioned in earlier reports to the Economic and Social Council on this subject, but there was some teaching about the United Nations before 1960, some extra-curricular activity in schools and colleges and some adult education work through the Sierra Leone United Nations Association. Since 1960, however, interest has widened considerably. Extra-curricular activities have been intensified in colleges and schools, and the general community is taking more of an interest than before.

The Ministry of Education and the Ministry of Information and Broadcasting are doing all they can to foster teaching about the United Nations and its agencies. Programmes about the United Nations and its work are a regular feature on the Sierra Leone Broadcasting Service.

There is still room for more publicity to be given in Sierra Leone communities about the aims and work of the United Nations and its agencies. Also more guidance can be given to schools and colleges with regard to teaching about the United Nations, and more materials and information supplied to them to facilitate such teaching.

Teacher-training

Formal teaching about the United Nations forms part of the history syllabus used in the preparation of elementary and secondary school teachers. For the latter it is optional, being given only to those who choose to take history as a subject; for the former it is obligatory for all. An increasing number of teacher-training colleges now have branches of the Sierra Leone United Nations Students Association (UNSA). Activities include holding regular meetings at which there have been speakers, films and filmstrips (most of these meetings are open both to registered members of the UNSA branch concerned and to other members of the particular college); celebration of United Nations Day, which may take various forms; special services on United Nations Sunday. Also, in at least one college, informal teaching about the United Nations and its agencies is sometimes given at weekly discussion groups which form part of the regular programme of the students.

In-service teacher-training

The Ministry of Education and/or the Ministry of Information and Broadcasting sends out to teachers, schools and teacher-training institutions printed matter on the United Nations and its related agencies whenever available. Apart from this, no special programmes of in-service training have been initiated for providing information about the United Nations to teachers, although this might well be taken in hand. At the moment, there is a vacation course of in-service training for primary school teachers being run with the help of fifteen American teachers specially brought over from the United States of America. Such programmes as this help to put across to our teachers more forcefully and realistically the usefulness and the benefits of international co-operation.

The United Nations in the primary school programme

A new unified syllabus is being introduced into primary school as from September 1963, which includes specific provision for teaching about the United Nations and its agencies for older primary pupils. Such instruction is provided as part of history and civics in social studies during the first three years of school, and of geography. For example, our third-term civics syllabus (1963) for Class 7 reads: "Sierra Leone in the Uni-

ted Nations: What the United Nations stands for; Our Ambassador to the United Nations and his duties; The work of such agencies as UNICEF, UNESCO, WHO, FAO". Extra-curricular activities include class discussions in observance of United Nations Day, Human Rights Day, and World Health Day.

The United Nations in the secondary school programme

Some formal teaching about the United Nations and its agencies is done in the topmost classes of most secondary schools, and increasingly so in the other classes. It is generally felt that much more can and should be done in this field. In the topmost classes, such teaching forms part of preparation for the general paper of the Advanced General Certificate of Education examination. In other classes, some instruction is given as part of courses in history and/or civics. There is a possibility of questions about the United Nations and its agencies being asked in the general paper of the Advanced General Certificate of Education examination, but there is no stipulation for the regular inclusion of such questions.

Some secondary schools have branches of the Sierra Leone United Nations Students Association and these hold regular meetings at which the United Nations and aspects of its work are discussed. External speakers are sometimes invited. The Sierra Leone UNSA has a yearly conference at which these branches are represented. United Nations Week, Freedom from Hunger Week, Health Week and Human Rights Day are celebrated in many schools, and school assemblies are sometimes devoted to the United Nations, its agencies and their work. World Health bulletins, posters and pamphlets, etc. dealing with activities of the United Nations are regularly on display in many schools. Papers about the United Nations and its activities are read and actively discussed in school literary and debating societies. Talks are sometimes given by teachers, and United Nations quiz competitions and exhibitions are sometimes organized.

Classroom teaching materials and aids

More attention needs to be given to the United Nations in history and other textbooks. At present there is an occasional book dealing with the United Nations in the school library, but in the main teachers and pupils have to rely on United Nations pamphlets supplied by the Government. On the Sierra Leone Broadcasting Service (radio) there are regular weekly programmes devoted to the activities of the United Nations and its agencies. These programmes are of considerable educational value to secondary school pupils, although they are not specifically geared to schools.

United Nations study in colleges and universities

The statement below was provided by the Principal of Fourah Bay College, the University College of Sierra Leone, which at present is the country's only universities:

"Fourah Bay College, the University College of Sierra Leone, does not offer courses which are solely concerned with the work

and aims of the United Nations and its related agencies, although such courses may be given when an independent university of Sierra Leone has been established. Even now, in some courses at the undergraduate level, considerable attention is paid to particular aspects of the work of the United Nations. Within the Faculty of Economic Studies, the courses on monetary theory and applied economics include many lectures and seminars on the principles and policies of the World Bank, the International Monetary Fund, the International Labour Organisation and the various aid agencies which channel capital funds to the newly developing countries. Students are also required to study aspects of the work of the United Nations in connection with their courses in law, politics and government, and modern European economic history. In the final-year history course the various aspects of international alignments are discussed, and the League of Nations, especially the Mandates System, is treated in some detail. A separate course in international relations is envisaged in the near future. Post-graduate studies are still somewhat undeveloped within the college and no dissertations or theses have been concerned with the United Nations as such. Both staff and students of the college are extremely active in the study of, and in dissemination of knowledge about, the United Nations. There is a student United Nations Association and lectures and discussion groups are organized regularly.

"The Faculty of Economic Studies has close and friendly relations with the United Nations Economic Commission for Africa and members of the Department have attended United Nations conferences in various countries in Africa. For the past two years students of Sierra Leonean nationality have been sent to the Seminars on Economic Development held in Addis Ababa under the auspices of the Economic Commission for Africa. The advice of the Faculty has also been sought in connection with the establishment of the new Institute for African Economic Development, which is to be opened shortly in Dakar, and has recommended six Sierra Leonean students for entry to the Institute in October 1963.

"Finally, an FAO Conference on Nutrition was held at the College in the summer of 1962, which was attended by delegates from all parts of Africa. At the Conference lectures were given by members of the College staff and by their wives."

Adult education

Adult education work on the aims and activities of the United Nations and its agencies has been carried on. In addition to regular news and feature programmes on the radio, public lectures and discussions have been held under the auspices of the United Nations Association of Sierra Leone. Such programmes reach not only literate people but also other groups in the community.

SPAIN

[Original text: Spanish]
[9 July 1963]

Teaching about the United Nations and its specialized agencies is being developed gradually in all subjects in the country's schools and educational centres; such instruction is on a broader and faster scale in the schools of higher learning and is gradually spreading to the intermediate and lower grades. Information of all kinds on the international organizations is also being widely disseminated through the constant efforts of the mass information media — radio, Press, television, etc. —

which are directed towards the public in general as well as the school-age population. It is these audio-visual educational media which at present are doing the most effective work in this field, particularly in respect of the United Nations, UNESCO and WHO.

In the field of higher education the subject of the United Nations and its specialized agencies is treated extensively in the faculties of law, political science and economics. Special degree courses on the international organizations have been conducted at various times. The subject is also studied in the contemporary history courses of the faculties of letters.

In the secondary schools, topics relating to the United Nations and the specialized agencies are included in the lectures on the formation of a national spirit, a subject which stresses a world outlook and broad international co-operation. The current curricula for the *bachillerato* are so heavily burdened that it has not yet been possible to do more, or even enough, to make known the purposes and work of the United Nations and its related agencies. Attention is nevertheless given to this matter during the study of contemporary history. Although most textbooks contain a few brief references to these organizations, they are dealt with at much greater length in the oral explanations of the teachers.

The foregoing remarks on the secondary schools apply equally to the teacher-training schools for primary-school teachers.

Present-day trends in education and the experience of a number of countries have led the Ministry of National Education to establish new methods of study on an experimental basis. The first-year course for the *bachillerato* is now being given over the radio, with complete success. As a further development, it is hoped to conduct a cultural extension campaign on television in the not too distant future. The Ministry of National Education is anxious that due attention should be given to the United Nations and its affiliated agencies, and it hopes to start a series of general lectures on radio and television within the framework of the secondary-education programme. Available publications, posters and recordings will be used to create the right atmosphere for making secondary-school students aware of the extraordinary and purposeful task being performed by the United Nations.

Finally, it is suggested that the United Nations, either directly or through UNESCO, should study the possibility of supplying adequate instructional material of a general nature which each country could adapt to its own circumstances.

SWEDEN

[Original text: English]
[3 September 1963]

General observations

Educational material for use in teaching about the United Nations has improved considerably. Two booklets on the United Nations have been published and are being used in many schools. In recent textbooks on

history and sociology, increased space has been devoted to United Nations subjects. More pamphlets on topics of current interest have been issued.

The greatest problems remaining to be solved concern the preparation of teachers in training and in service. The Board of Education engaged a full-time consultant on the subject for one term (spring 1962) to visit the schools and in other ways to activate education on international affairs. The following proposals for intensified action in this field may be mentioned: the training of the teachers would be improved if instruction on the United Nations were included as a regular subject at different stages of their training, and if the facilities for arranging refresher courses were increased; during the so-called planning days prior to the beginning of the autumn term, special consideration should be given to the question of which current United Nations questions should be included in the instruction; some periodical published regularly, such as the *UNESCO Courier*, should be available in every school.

Teacher-training

In the elementary-teachers training college, sociology includes international co-operation as a special item. The instructions read: "Regarding international co-operation, it goes without saying that the United Nations, the Council of Europe and the Nordic Council are to be included in the instruction, but also other international organizations of general interest should be touched upon. The problems these organizations are trying to solve, the difficulties encountered, etc., should be discussed. Special attention should be paid to the work carried on by the United Nations ancillary organizations, particularly to technical assistance given to the under-developed countries." No decision has been taken regarding the number of lessons that are to be devoted to the United Nations, but as sociology includes many other branches, the percentage of time available cannot be very large. The training programme also lays special emphasis on group work, individual tasks, discussions, and study-circle practice, all of which can be utilized by a teacher in teaching about the United Nations or associated subjects.

In-service teacher-training

United Nations subjects have been discussed fairly often on so-called study-days. In addition, special courses have been arranged; for example, in June 1963, the Committee for International Aid arranged a course for teachers of sociology, history and geography on technical assistance to the under-developed countries. Similar regional courses are planned.

This summer (1963) the Institute for Advanced Training is arranging a course called "A new world perspective — new knowledge". Its aim is to make it easier for the teacher — irrespective of the subject, stage of education, or type of school — to incorporate the extra-European civilizations and the new States in the pupils' idea of the universe. The international perspective will be fused into one subject in lectures and group work, and the possibilities the school affords of promoting

international understanding in different ways will be illustrated by, *inter alia*, a presentation of different international forms of co-operation. Another course — with the same title — will be arranged by the Training College for Teachers in Malmö. The course is intended for teachers in all types of schools and for all stages of education. In the form of lectures, platform and group discussions, the course will cover experimental instruction on international understanding and co-operation within the framework of the relevant subjects, the international element in the training of teachers and in textbooks, the place of the United Nations, Africa, Asia and Latin America in school education, and current problems in the new countries.

The United Nations in the primary school

Special lessons occur only a few times during the school year, and then consist mostly of programmes in connexion with United Nations Day, the Red Cross or "Save the Children" activities. Teachers usually deal with international matters in connexion with the regular lessons. The programme for 1962 states: "Generally speaking, the work should aim at giving the pupils sufficient grounding to enable them to function as independent members of society, with an interest in the world around them that can be developed into a feeling of shared international responsibility. In the Syllabus for sociology (intermediate stage) we read: "In broad outline the school shall endeavour to create in the pupils respect for human dignity, a sympathetic understanding of all human beings, irrespective of differences in nationality, language, religion and colour. The Universal Declaration of Human Rights should be kept alive by quoting its rules in different connexions."

On international "days," as well as in the regular lessons, drawings, picture postcards and the like are used. In some cases the teachers and pupils are in communication with teachers and pupils in other countries. In addition, a number of foreign pupils go to Swedish schools. Many of the classes have "godchildren", collections are made, gift-parcels are sent, and the classes receive letters and photographs. Correspondence between individuals also occurs. The teachers link topics of current interest on the television and wireless, and in the newspapers.

The United Nations in the secondary school

Instruction on the United Nations is included as a compulsory part of history, including sociology. The sociology syllabus states: "To present-day sociology belongs also a knowledge of international organizations. In dealing with the United Nations and other international bodies, as realistic as possible a description should be given of the difficulties that have to be overcome and of the work that has already been done. Instead of giving merely a dry account of these bodies, their activities should be given more concreteness by presenting examples of methods and results. In this connexion, the attempts to codify the human rights, the present-day Declaration of Human-Rights, as well

as its predecessors in the American and French revolutions, should be touched upon."

United Nations Day is usually celebrated and this has been recommended by the Board of Education. Experimental activities under the Associated Schools Project of UNESCO have been carried on in a number of schools.

Classroom teaching materials and aids

Textbooks produced during the period under review have given greater attention than previously to the United Nations and its agencies. Unfortunately, audio-visual aids are not used as much as could be desired. Educational programmes on the United Nations are usually broadcast on United Nations Day. An educational programme on Dag Hammarskjöld's life and activity was telecast in the autumn of 1961. In the television programme "Behind the Headlines", current United Nations activities are presented.

Adult education

Random lectures, and series of lectures, are arranged usually by the Workers' Educational Association, the Office Workers' Educational Activity, and the Stockholm University Extra-curricular Activity. The Institute of International Affairs holds a series of lectures on international problems every spring and autumn and also arranges for lectures upon application by organizations. News items and special programmes are given on radio and television.

* * *

Twenty-five items of documentation were appended to the report, including courses of study for primary and secondary schools and for teacher-training colleges, lists of radio and television programmes on the United Nations subjects broadcast during 1957-1962, selected *News Bulletins* issued by the Board of Education and selected publications of the Swedish United Nations Association.

Supplementary report dated 21 May 1964

United Nations study in universities and other institutions of higher education

Uppsala University: The purposes and activities of the United Nations and its related agencies are studied in discussion-seminars on international politics (sixteen hours), as a part of the basic studies for lower and middle degrees in the Political Science Faculty. It is also possible for United Nations subjects to be selected as topics for the written theses which are required for middle and higher degrees.

Apart from the academic work of the University, the Uppsala Branch of the Swedish United Nations Student Association conducts an active programme of extra-curricular activities.

Lund University: In the Law Faculty, the United Nations is studied in the courses in public law and inter-

national law, including the Charter of the United Nations and the Statute of the International Court of Justice. Specialized practical studies are compulsory at the end of the study-period, and theses may be written on topics concerning the United Nations or any specialized agency. A recent thesis discussed "The role of the international civil servant"

At the Institute of Economics, studies are focused on the work of the United Nations and of the relevant specialized agencies in the economic field. The curricula for higher studies includes special courses in international economics. Relevant United Nations topics are often treated in written theses; for example, in the autumn term, 1963, two studies were in preparation on the International Monetary Fund and the International Bank for Reconstruction and Development, respectively.

For students specializing in statistics, specific courses on the United Nations are not given, but a thorough knowledge of the United Nations and other international statistical publications is required.

In the Political Science Faculty, the United Nations and its agencies form an important part of the study of foreign and international politics. In the autumn term, 1963, a doctoral dissertation was presented on the topics: "Balance of power versus community of power: competing doctrines of peace organizations."

Stockholm University: Studies on the United Nations and its related agencies are included in courses offered in the following subject fields: geography (cultural geography), history, political science, international politics, economics and statistics.

Göteborg University: In the Political Science Faculty, study of the United Nations forms part of the course on "Foreign countries and international politics." In the programme of basic studies, one work on the United Nations is included in the compulsory literature course, as well as two lectures on the United Nations. For higher studies, the reading assignments are enlarged and a written paper is required; for example, in the autumn term, 1963, students were given the option of participating in an extensive analysis of the voting of Member States in the United Nations General Assembly and the Security Council.

Göteborg School of Economics: No formal instruction is given, but plans are under way to provide information in studies in the field of international economics.

SWITZERLAND

[Original text: French]
[3 May 1963 and 16 January 1964]

Teacher-training

For the past ten years, the Swiss National Commission for UNESCO has organized courses for teachers of senior secondary schools on the objectives and work of UNESCO. Approximately sixty persons attend these courses regularly.

During the conference of directors of cantonal teacher-training institutions held in 1963, two days (sponsored by the Swiss National Commission for UNESCO) were devoted to the study of the various activities of UNESCO. Similar conferences will be organized regularly in the future.

In Pestalozzi Village, at Trogen, international education conferences are held annually under the auspices of the Swiss National Commission for UNESCO. Each year educators from different countries have had the opportunity to study questions concerning the United Nations.

Elementary and secondary schools

In 1957 a commission of experts appointed by the National Commission for UNESCO published its report entitled *Programme et manuels d'histoire: suggestions en vue de leur amélioration (History Curriculum and Textbooks: Suggestions for their Improvement)*. The experts recommended that more attention should be given to the international organizations and to their efforts, past and present, on behalf of peace and international co-operation. The associations of school teachers and university professors took this study quite seriously and it was discussed in various educational journals. Teaching about the United Nations is now included in the history, geography and civics courses. In the years 1960-1963, thirteen cantons out of twenty-five brought out new syllabuses dealing with elementary and secondary education and teacher-training, in which teaching about the United Nations is included in modern history. Textbooks published in the last three years include extensive chapters on this subject and in 1960, Lucerne canton published a special study guide, entitled *Der Völkerbund — Die Vereinten Nationen* on the League of Nations and the United Nations.

A growing interest in the United Nations and the specialized agencies has become evident in the schools throughout Switzerland. For the past ten years, the Swiss National Commission for UNESCO has urged teachers, through educational bulletins, to give lessons on the United Nations on Human Rights Day. The subject suggested for 1963 was the World Literacy Campaign.

Higher education

Swiss universities give courses and seminars on the United Nations and its specialized agencies in programmes of study in international law, political science and economics.

In this connexion, a very special place is held by the Institut universitaire des hautes études internationales at Geneva, which has always encouraged the study of the structure and functions of international organizations. A chair of international law is devoted to this study, while professors attached to the institute or visiting distinguished lecturers from various countries deal with more particular problems in this field. Staff members of the European Office of the United Nations

or of specialized agencies have been called upon to conduct seminar or conferences on various subjects.

A list of seminars and semester-length courses given during the period under review was appended to the report; it includes such subjects as the practice and politics of international organizations, a comparative study of the international economic institutions, problems of multilateral diplomacy and selected problems in international law.

A list of these completed (six) and in preparation (nine) at the Institut universitaire des hautes études internationales during the period under review was also appended to the report.

Adult education

The Swiss National Commission for UNESCO has organized several courses on the United Nations and UNESCO for women's guilds, youth organizations, and several conferences on United Nations subjects have been held in co-operation with the Swiss Association of Commercial Employees and the Swiss Society for Civic Instruction. The *université populaires* (people's colleges) have included the United Nations and the specialized agencies in several of their courses.

Information media (radio)

News concerning the work of the United Nations and its related agencies, in the General Assembly and in the numerous commissions and congresses meeting at Geneva, is broadcast regularly through the various radio services (French, German and Italian) and is supplemented by interviews, forms and commentaries. Feature programmes (documentaries) are broadcast frequently on many aspects of the work of the United Nations agencies. The *Tour du monde des Nations Unies* (Around the World), produced jointly by Radio Geneva and the United Nations, is widely distributed to many countries.

SYRIA

[*Original text: French*]
[24 September and 23 December 1963]

General observations

In the 1962-63 academic year two schools — a secondary school for girls and a men's teacher-training school — participated in the UNESCO Associated Schools Project. It is hoped that the number of associated schools can be increased and their activities broadened in scope. Films likely to interest adults would stimulate interest in the United Nations.

Teacher-training

The Men's Primary Teacher-Training School at Damascus provides an optional course on the United Nations for two hours weekly during one semester. Teacher trainees can secure further knowledge through newspapers, radio, lectures, films, etc.

The United Nations in school programmes

Primary school curricula include instruction about the United Nations as part of the civics courses.

The preparatory course curriculum (first cycle of secondary education) amplifies the instruction about the United Nations provided at the primary level, as a part of the civics courses.

The preparatory school-leaving examinations (*brevet*) generally include questions on the United Nations. United Nations Day is observed in the preparatory and secondary schools.

Classroom teaching materials and aids

School textbooks give due attention to the United Nations. Steps will be taken to increase the proportion of schools making use of United Nations films and filmstrips. Special radio and television programmes are broadcast on United Nations Day.

United Nations study in colleges and universities

The Ministry of Education and National Guidance ensures that United Nations affairs are included in a great number of lectures which are given in schools and universities every year. The course of study at the Faculty of Law of the University of Damascus includes a detailed study of the United Nations. This instruction forms part of the courses in public international law given in the second year and of courses in diplomacy and consular affairs given in the fourth year of law studies. This instruction is given at the undergraduate level. Graduates have been sent abroad to prepare theses on the United Nations subjects.

Adult education

The Ministry of Culture and National Guidance organizes talks on United Nations Day, World Health Day, Universal Children's Day, etc. The approximate number of adults reached by these programmes is 2,000.

TANGANYIKA

[*Original text: English*]
[10 July 1963]

General observations

Nothing specifically has been done by national and local governments to encourage and assist the development of teaching about the United Nations and its related agencies, but there is no doubt that there has been a spontaneous interest in the activities of these agencies already operating in the country. ILO has developed good relationships with the Tanganyika Federation of Labour, particularly in its scholarship programme for study by labour leaders at Geneva. Voluntary agencies and the general public have shown great appreciation for the services of WHO and UNICEF, particularly their supply of drugs, equipment for hospi-

tals, dry milk and landrovers. It may also be possible that individual teachers, with their better understanding of the world, particularly since the emergence of this country to nationhood, have improved their instructional methods on the United Nations.

In Tanganyika the work of the United Nations and its agencies is still in its infancy. At the local level few people really understand what the international Organization is. To improve education in this field, action should start, as has already been done, at the national and international level. The services of resident international organizations' officers should be used to the maximum through the responsible officers of the national Government.

Teacher-training

There have been no special courses designed to prepare teachers in training on the international Organization. Any such instruction has been given as part of world affairs discussions, which in themselves do not constitute a course. Knowledge about the United Nations has not been provided through extra-curricular activities. There has been no special programme designed for in-service teachers.

The United Nations in school programmes

In the Swahili curriculum for the upper primary schools general knowledge (comprising history, geography and current affairs) includes a small section on the United Nations for its highest class. Emphasis has so far been placed on the relationship between the United Nations Trusteeship Council and Tanganyika. Teaching about the United Nations and its related agencies seems to have no special place in the revised primary schools curriculum. Both United Nations Day and Human Rights Day are observed as festivals but not public holidays in Tanganyika.

Current secondary school curricula include provision for instruction in the aims and work of the United Nations and its related agencies. In the second year of the secondary school, the United Nations is included in the history curriculum under the unit headings "Social institutions and welfare" and "World organizations." So far no questions on the United Nations have been included in the school certificate examination. As in the primary schools, both United Nations Day and Human Rights Day are observed.

Classroom teaching material and aids

There are no textbooks published in this country on the United Nations. This would be unnecessary as literature published by the United Nations and its agencies is available. Some textbooks containing several paragraphs on the United Nations are used by schools for reference. As films are not a regular feature in schools, their use as visual aids about the United Nations is negligible. Radio broadcasts in the Republic's primary schools are the best developed and have the longest

history in East Africa. Their use on instruction about the United Nations is limited to what is specified in the school curricula. There is no television service in Tanganyika.

United Nations study in colleges and universities

A course on the United Nations is taught as a subject in the Institute of Public Administration of the University College, Dar es Salaam. Officers of the Ministry of External Affairs and Defence get some instruction on the United Nations, particularly on matters affecting the foreign policy of Tanganyika. Reference is also made to the United Nations in the study of international law. The University College carries out no extra-curricular activities on the United Nations.

In the extra-mural department of the University College, some courses are offered on the United Nations and its related agencies.

* * *

Copies of the interim *Specimen scheme of work for History in Form 2 (standard course)* and a study guide entitled *United Nations* (8 pages), designed to accompany a series of four radio broadcasts for schools, were attached to the report.

THAILAND

[Original text: English]
[17 December 1963]

Teacher-training

Instruction on the United Nations forms a part of the formal courses of training for elementary and secondary school teachers. Apart from the normal lecture methods, students are encouraged to conduct research on United Nations activities, hold class discussions, and assemble albums of photographs and press clippings on the United Nations. Extra-curricular activities also have been organized, e.g., special exhibits on United Nations Day, visits to ECAFE headquarters, film and slide shows. The results obtained have been most satisfactory. The students become familiar not only with the work of the United Nations family but also with other countries and peoples and with world problems. Such study helps much in education for international understanding.

United Nations in school programmes

Teaching about the United Nations is not prescribed in elementary schools but some lesson plans on the United Nations are included in social studies. The results therefore depend on the enthusiasm of individual teachers. Some teachers, assisted by the pupils, arrange United Nations displays on bulletin boards and hold class discussions. Others attempt more ambitious projects, e.g., a model session of the General Assembly. Teaching about the United Nations at this level will

be improved when more visual aids such as posters, photographs, diagrams, slides and motion pictures become more easily available.

The United Nations forms a part of the secondary school syllabus and the matriculation examination generally includes some questions on United Nations subjects. The methods of teaching are similar to those used in teacher-training colleges; results also depend on the enthusiasm of the teacher and the availability of teaching materials. On the whole, secondary school children have a fairly sound knowledge and appreciation of the United Nations and its work.

Classroom teaching materials

Classroom materials on United Nations subjects are mostly produced by the students themselves under the supervision of the teachers. Teachers at all levels stress the lack of teaching materials. Books, documents and periodicals, preferably in Thai, concerning the United Nations family are urgently needed. Photographs, posters, charts, diagrams, flags, slides, filmstrips and motion pictures relating to the United Nations activities are also requested, as these materials are essential to the instruction. Biographies of the United Nations great personalities are found to be most stimulating.

Extra-curricular activities

Film and slide shows are held and lectures are given by persons familiar with United Nations activities. United Nations Day is observed in every school. The Prime Minister's message is normally read out, followed by a debate or a quiz programme and an exhibit on United Nations activities prepared by the students themselves. In addition, an annual essay contest is organized by the Department of International Organizations of the Ministry of Foreign Affairs.

All forms of mass media — Press, radio and television — are excellent means of propagating the aims and activities of the United Nations not only to school children but to the public in general.

TOGO

[*Original text: French*]
[12 August 1963]

There has been no notable progress in teaching about United Nations, although Togo is favourably disposed to the Organization. Steps which might be taken at the national level to promote teaching in this field would be to authorize a United Nations Week in schools, and include simple questions on the United Nations in the oral examinations for the primary school-leaving certificate.

For teachers in training, instruction in this field is compulsory and is provided in the course in history. In primary schools, lessons on the United Nations are included in history in the first and second year; in secondary schools, in history and in civic education.

Booklets and posters on the United Nations are distributed to schools, but there are no specially designed school materials. Films are shown in secondary schools. Radio programmes are broadcast on United Nations Day.

There are no establishments of higher education in Togo. The Togo United Nations Association is the only organization with concern for adult education in this field, but it is not active at present. Thus, education among adults on the United Nations is now limited to observance of United Nations Day.

TRINIDAD AND TOBAGO

[*Original text: English*]
[15 October and 5 and 7 November 1963]

General observations

Increased interest has been displayed by the general public in the work of the United Nations and in world affairs generally since the independence of Trinidad and Tobago (August 1962), which led to the country's admission to the United Nations and to UNESCO and its participation, in the deliberations of these bodies. Such participation was and is widely publicized.

Between 1960 and 1963 a school radio broadcasting service has been developed and a school television service is beginning. Radio programmes on the work of the United Nations supplied by the United Nations Office of Public Information are broadcast regularly. The programme "This Week at the United Nations" is in constant use. Other special programmes are also carried, including those supplied for United Nations Day and Human Rights Day, and a series on the development of aviation in the Caribbean, prepared and supplied by the International Civil Aviation Organization (ICAO).

In both primary and secondary schools, more emphasis has been placed on social studies and civics, which include reference to the United Nations and UNESCO, as part of a conscious effort to provide more environmental studies.

Information about assistance offered by and accepted from the United Nations and its specialized agencies is referred to in the course of lectures, talks, films shows and discussions by welfare officers of the Ministry of Local Government and Community Development and by voluntary and other groups. For example, the work of United Nations agencies in the field of home economics was forcefully brought to the fore during recent run by a welfare officer of this Ministry. The road officers and technical officers of the country councils have been made aware of the assistance given in the field of town and country planning by visits paid to the councils by members of the United Nations Physical Planning Team. Similar information is given in respect of United Nations aid in health education and the feeding of school children. Throughout, the accent is placed on partnership rather than on the work of the United Nations as a separate unit.

More radio and television sets are needed for schools to make it possible for expert and specialized instruction to reach a maximum school audience. There is need also for material of a sufficient quantity and in a form suitable for schools, such as light journals, newsletters, etc. At the national level, it would be advisable to make literature on the United Nations available to the Ministry of Education for dissemination to schools and colleges of various kinds, to adult education centres, and to libraries.

TUNISIA

[Original text: French]
[6 August 1963]

Primary schools

The programme of civic instruction in the fifth and sixth years includes teaching about the United Nations and about the Universal Declaration of Human Rights.

Secondary schools

Half of the programme of civic instruction deals with the Universal Declaration of Human Rights and the United Nations and its specialized agencies. The programme of history in the sixth year deals with the League of Nations, and the United Nations and its agencies.

In connexion with United Nations Day observances, a circular-letter is sent each year by the Secretary of State for National Education to all directors of primary and secondary schools to request them to ensure that geography and history teachers in their schools provide the pupils with instruction appropriate to each level of education concerning the aim and role of the United Nations and its agencies.

TURKEY

[Original text: French]
[1 August 1963]

Teaching about the United Nations and its specialized agencies is given in history books used in the fifth year of the primary schools, in courses related to civic education, and in history books of the third year of the secondary schools as well as in the last year of secondary schools. In addition this subject is given an important place in history books used in the fifth year of the teacher-training institutions for primary schools. Such instruction is also included in the programmes of other professional schools in classes of similar level.

The programmes of the institutions training teachers for secondary schools are prepared appropriately to meet the needs of these schools in the field of teaching about the United Nations.

Teaching about the United Nations has undergone a change of method since 1960 but its meaning remains the same. For example, in the experimental programme prepared recently for primary schools, history, geography and civic instruction are taught together in one comprehensive course under the title: "Studies of countries and peoples."

Syllabuses and textbooks currently used in such teaching at the different levels of education in Turkish schools were submitted: *Türkiye Cumhuriyeti Tarihi 1918-1960* (1962, 199 pp.); *Testli Yurttaşlık Bilgisi* (1962, 135 pp.); *Tarih — Ortaokul III — Yeni Ve Yakın Çağlar* (1962, 242 pp.); *Tarih: Aktif Metoda Göre Uygulanmış* (1961, 127 pp.).

UKRAINIAN SOVIET SOCIALIST REPUBLIC

[Original text: Russian]
[27 December 1963]

Teaching about the United Nations is regularly included in the curricula of the secondary schools and of the secondary specialized and higher educational establishments. The scope of the teaching differs according to the type of educational establishment and the nature of its specialization.

In the modern history course in senior secondary school classes, attention is given to the history, structure, and working principles of the United Nations. In addition, the weekly bulletins on international relations which are issued for secondary school pupils systematically cover the current activities of the United Nations organizations.

In the secondary specialized and higher educational establishments of the Republic, the history, purposes, problems, principles, and practical work of the United Nations family are studied in such courses as "History of international relations", "Basic principles of the foreign policy of the Soviet Union" and "International law". In addition, frequent talks and reports on United Nations subjects are given by prominent scholars, jurists, economists and participants in various international conferences. In the students' societies, which have been set up at every higher educational establishment, United Nations subjects are discussed regularly.

The following are recommended as texts for students: Ukrainian translations of the United Nations Charter and the Statute of the International Court of Justice; the Universal Declaration of Human Rights; N. S. Khrushchev, *For Peace, Disarmament and Freedom of Nations* (addresses at the fifteenth session of the United Nations General Assembly); and, also in Ukrainian: *The Ukrainian SSR in International Relations*; *The Ukrainian SSR in the International Arena*; S. B. Krylov, *The History of the Founding of the United Nations*, and *The International Court*; G. I. Morozov, *The United Nations*; R. L. Bobrov, S. A. Malinin, *The United Nations and International Economic Organizations*, a handbook. These materials are on sale in bookshops in the Republic. Literature on the United Nations in public, university and institute libraries is also available for the use of students.

UNITED ARAB REPUBLIC

[Original text: English]
[5 July 1963]

The sixth grade in primary schools includes a unit in civics on "The relations between the United Arab Repub-

lic and international organizations". Two textbooks on social and civics education, each containing a chapter on the United Nations, are used by the pupils. Study of the United Nations appears in the civics curriculum for the third grade in general and industrial preparatory schools and for the second grade in agricultural preparatory schools. *The Arab World and its Foreign Relations* (translated title) is the textbook in civics used by the third grade. The course "Arab Society", for the third grade in secondary schools, both the scientific and literary sections, includes the study of the United Nations, the League of Arab States, and current events in the United Nations.

The United Arab Republic National Commission for UNESCO has participated in the Associated Schools Project in Education for International Understanding since 1958. Four schools (two secondary schools and two teacher-training institutions) carry out experimental projects on three subjects: The United Nations and the specialized agencies; the Universal Declaration of Human Rights; and study of the life and culture of other countries.

Teaching about the United Nations and the specialized agencies is given in the universities, particularly in the faculties of law, political science and economics.

Most educational institutions in the United Arab Republic celebrate United Nations Day and Human Rights Day.

UNION OF SOVIET SOCIALIST REPUBLIC

[Original text: Russian]
[30 August 1963]

The Soviet Government and public attach great significance to the United Nations as an important instrument for the maintenance of peace and international security and as a centre where the States Members of the United Nations can agree on the action to be taken to carry out that task. Soviet Government bodies and public organizations spare no effort to spread information about the United Nations and its specialized agencies through the Press, radio, television and other media. An Association for Co-operation with the United Nations works actively in the Soviet Union to co-ordinate the activities of numerous public organizations in the country in the field of teaching about the United Nations.

Teaching about the United Nations in schools and higher educational institutions

The curricula of secondary schools and special secondary educational institutions provide for study of the United Nations as part of courses on the history of the USSR and on recent world history. Pupils in Soviet schools are trained to observe the principle of equality of all nations and of respect for all races of the globe.

The extra-curricular work done by pupils in international friendship circles, set up in schools and pioneers' club houses throughout the Soviet Union, is also of great

importance. In these circles, school-children become familiar with the current activities of the United Nations, learn about the lives of other peoples, correspond with school-children in foreign countries, study foreign languages, and so forth.

Pupils at higher and special secondary educational institutions receive a wide general education in addition to training in their chosen speciality. Special lectures, reports, seminars, the activities of student scientific groups and special publications enable them to keep constantly up to date regarding international problems and the activities of the United Nations. The United Nations and its agencies are studied with the greatest thoroughness in higher educational institutions devoted to art subjects and in the law, history and economics faculties of universities.

Students in the law faculties take a compulsory course in international law, which gives an important place to the United Nations. Special courses and seminars devoted entirely to the United Nations organizations occupy a total of about forty academic hours, during which five or six themes are discussed.

In the history faculties, all students, regardless of their intended speciality, take a general course on recent history in which the United Nations is dealt with in the section "International relations after the Second World War" and in the sections devoted to the history of individual countries. Particular attention is paid to the United Nations organizations also in the syllabus of the Moscow Institute of International Relations.

Scientific research on activities of the United Nations

Extensive scientific research work on problems connected with the United Nations is carried on in the higher educational institutions and research institutes of the USSR, and published in the form of monographs, collected papers, pamphlets, newspaper articles, etc. Particular reference should be made to the work of the scientific staff of the Institutes of Government and Law, World Economics and International Relations, and the Historical Institute of the USSR Academy of Sciences. Faculty members of the Moscow Institute of International Relations, the Moscow State University and the Leningrad State University also do important work in this field. A bibliography of some of these studies was appended to the report.

Press, radio and television

The whole of the Soviet Press, radio and television devotes considerable attention to the United Nations organizations. Particularly full coverage is given to the work of the General Assembly (reports of its proceedings, and the main statements and resolutions, are printed), the Security Council, and the principal specialized agencies. The Press also regularly publishes articles reviewing the activities of the United Nations and the specialized agencies, as well as articles on special occasions such as the anniversary of the signing of the United Nations Charter (26 June), United Nations Day and Human Rights Day.

Considerable attention is devoted to the problems of the United Nations in periodicals specializing in international relations, such as *Mezhdunarodnaya Zhizn*, *Mirovaya Ekonomika i Mezhdunarodnye Otnosheniya*, *Sovetskoe Gosudarstvo i Pravo*, *Novoe Vremya*, *Azia i Afrika Segodnya*, *Novaya i Noveishaya Istoria*, and many others.

Similarly, wide coverage is given to United Nations activities by the radio and television networks. In the *Poslednie izvestia* ("Latest news") programmes, regular reports are given on important measures taken, the part played by the Soviet Union, and so forth.

Teaching activities of public organizations in the Soviet Union

Soviet public organizations play an important part in disseminating information about the United Nations. Their work in this field is co-ordinated by the Soviet Association for Co-operation with the United Nations, of which the various public, cultural and educational organizations of the Soviet Union — such as the All-Union Society *Znanie* ("Knowledge"), the USSR Academy of Sciences, the Moscow State University, the Union of Societies for Friendship and Cultural Links with Foreign Countries, and many others — are collective members. In their teaching activities the Soviet public organizations also maintain close ties with the State Committee for Cultural Links with Foreign Countries, the USSR National Commission for UNESCO, and the United Nations Information Centre in Moscow, which supplies the necessary material to interested institutions and private citizens. The United Nations is publicized by various means:

(a) *Celebration of memorable dates in United Nations history*

On these dates the USSR Association for Co-operation with the United Nations, in collaboration with its collective members, organizes mass public rallies in Moscow and at Leningrad, Kiev, Minsk and other large towns. Outstanding experts and public figures and representatives of various public organizations speak about the successes of the United Nations and give a critical analysis of its work. Reports of these rallies are published in the Moscow and local newspapers, transmitted over radio and television, and included in newsreels which are also shown on the national television network. The Soviet public frequently observes other dates also. Thus, for example, the Soviet medical profession annually observes World Health Day.

(b) *Lecturing activities*

Great importance is attached to teaching through lectures. The experts on international affairs who lecture for the All-Union Society *Znanie* alone deliver, each year, over one and a half million lectures on international questions; many of these are devoted to the main decisions of the General Assembly and the Security Council, and the problems facing the United Nations — such as disarmament, the peaceful coexistence of States with

different social systems, and the elimination of colonialism.

Lectures and reports are also given by members of the Soviet Association for Co-operation with the United Nations. Thus, in April of this year, Professor V. G. Trukhanovsky delivered a report on "The present situation with regard to the problem of the suspension of nuclear weapons tests" at an enlarged meeting of the Board of Administration of that Association.

(c) *Exhibitions*

On anniversary occasions, exhibitions on the United Nations, the specialized agencies, and the part played by the Soviet Union therein are organized on the premises of the USSR Association for Co-operation with the United Nations, the Society *Znanie*, the V.I. Lenin State Library, the State Library of Foreign Literature, and many other places. Permanent exhibitions of new books on the United Nations organizations are held in all State libraries and libraries of scientific and educational institutions in the USSR. Wide use is also made of a permanent exhibition of material on the United Nations displayed at the United Nations Information Centre in Moscow.

(d) *Distribution of United Nations publications*

Extensive use is made of the various publications produced by the United Nations and its agencies. These include both popular publications such as the *UNESCO Courier* or the *UNESCO Features*, the various statistical materials published by the United Nations and reviews of the activities of the United Nations organizations. All these publications, together with popular pamphlets and booklets about the United Nations and information bulletins, are supplied by the United Nations Information Centre in Moscow.

* * *

Two extensive bibliographies were appended to the report: Appendix 1 lists thirty-two book-length studies (including university dissertations) on United Nations subjects, published in the USSR during 1960-63. Appendix 2 provides a selected bibliography of some important articles which appeared in scholarly journals in the USSR during the same period.

UNITED KINGDOM OF GREAT BRITAIN
AND NORTHERN IRELAND

[Original text: English]
[15 August 1963]

General observations

The Ministry of Education of the United Kingdom and the Scottish Education Department continue to issue annually their circulars on teaching about international affairs. These circulars draw the attention of local education authorities and governing bodies of schools to specific international "days" and to relevant

sources of information. In the United Kingdom education for international understanding naturally starts from teaching about the Commonwealth. Thus a further pamphlets issued by the Ministry in 1961 lists teaching materials on the Commonwealth and other international affairs, including the United Nations.

The Ministry of Education continues to grant aid to the Council for Education in World Citizenship (CEWC), as do the appropriate Departments in Scotland and Northern Ireland. The Council, which is the main organization concerned with publicizing the United Nations in schools of the United Kingdom, has 1,411 member schools and 30 affiliated teacher-training colleges but by assisting local education authorities, particularly in the organization of teacher/pupil conferences, reaches a very much larger number of schools.

Some 1,500 schools and colleges each year have applied to the United Nations Information Centre, London, for material, many for the first time. Most of these institutions are additional to those served by the CEWC.

Although the first series of UNESCO Associated Schools projects in education for international understanding were completed in 1958, the schools which took part have continued with projects and other allied activities. These include meetings and conferences, organized by the CEWC with the co-operation of local education authorities, for sixth form pupils (aged 16 to 19) and for all pupils of secondary schools (aged 13 to 15). Conference themes have included "One World", "East and West", "The Future of Europe" and "Activities of the United Nations".

Active participation in the Freedom from Hunger Campaign by United Kingdom schools has given a stimulus to teaching about the United Nations and its agencies, in particular WHO and FAO. The geographical and scientific aspects and the problems of food and population have been used by teachers in presenting relevant parts of their particular subjects. Interest is kept alive by competitions for posters, essays and projects as well as by various money-raising schemes. In agreement with FAO and UNESCO, the CEWC has arranged that all contributions from British schools to the Freedom from Hunger Project should be transferred in the form of UNESCO gift coupons, thus linking in the public mind the activities of two important agencies of the United Nations.

The annual Christmas holiday lectures organized by the Council have been attended each year by some 2,500 pupils from grammar schools in all parts of the United Kingdom. Themes for the past three years have been "The Work of the United Nations Specialized Agencies", "Africa", and "Freedom from Hunger". In Wales, the United Nations topics have been studied at residential courses for sixth-form pupils, organized by the Welsh Association of the CEWC, and held annually at Easter at Coleg Harlech.

A noticeable trend has been the concern of United Kingdom schools to examine the development of the United Nations and its relevance to contemporary political and economic problems from a constructively

critical viewpoint. This approach has been quickened, amongst other things, by the Congo situation and by the prolonged disarmament negotiations. Such an approach calls for an informed knowledge of the United Nations, and the fact that this is to be found in a large number of senior pupils argues that foundation studies have been well laid.

Another significant development is the increasing attention paid to the planning of syllabuses in history, geography and modern studies to include the history of international organizations culminating in a study of the United Nations. These are intended for teaching over a period of two years for eventual examination for ordinary level of the General Certificate of Education. Permission has been granted to schools by certain examining boards to follow such syllabuses. In Scotland, most pupils in courses leading to the ordinary grade of the Scottish Certificate of Education in history and modern studies must now make some study of the United Nations.

Teacher-training

There has been a noticeable increase in requests from teachers in training for materials, visual aids, etc., for use in study projects and lessons on United Nations subjects.

Conferences have been arranged for teachers in service and in training on classroom methods in connexion with the Freedom from Hunger Campaign and "Teaching Current Affairs".

Those training colleges which are associated members of the CEWC are regularly supplied with relevant materials. Other sources of supply are the United Nations Information Centre and the United Kingdom National Commission for UNESCO.

Primary schools

By virtue of the age of children in primary schools in the United Kingdom (5 to 11) most activity concerning the United Nations is related to specific observances, such as United Nations Day and Universal Children's Day, which have become increasingly wide-spread.

An experiment in a rather more sustained activity has been initiated in a few primary schools and focused on the theme of education towards international understanding, with which the United Nations in general, and UNESCO in particular, are concerned. Entitled the "Primary School Box Scheme", it is designed to give children the opportunity to collect and prepare material on their own way of life and to exchange this for similar material with a school in one of the developing countries of Africa or Asia.

Secondary school programme

Reference has already been made to the current moves in the United Kingdom towards the preparation of syllabuses incorporating study of the United Nations. Such study has taken its place usually within a normal

subject in the regular school curriculum, particularly geography and history. Occasionally it is introduced as a special project, as in the case of the Associated Schools Project.

Participation in extra-curricular activities concerned with the United Nations is now an accepted part of the lives of a great number of secondary schools. Observance of United Nations Day is increasingly wide-spread and UNESCO or United Nations clubs are quite a feature in many schools.

Apart from the work of the CEWC in individual schools, activities in Scotland are organized by three district councils and, in Edinburgh, by the Edinburgh Schools Citizenship Association. Conferences and other meetings arranged by these bodies cover a wide range of current affairs and are attended by large numbers of pupils. Most of the work of CEWC is done in the upper classes of senior secondary schools but conferences are now held each year for junior secondary pupils. The major event in Scotland is the annual residential Easter conference for senior pupils, which usually lasts for about five days and at which a certain topic, usually related to the work of the United Nations, is dealt with very thoroughly in lectures, discussions and films.

Radio and television

The United Nations and its agencies are given quite substantial coverage in both British Broadcasting Corporation (BBC) and Independent Television news and feature programmes. News bulletins, newsreels and reports from overseas by BBC correspondents regularly include topical material on the United Nations. A great deal has also been broadcast on the BBC Home Service (radio), from full-scale documentary programmes on the FAO Freedom from Hunger Campaign and substantial pieces on WHO to brief references to United Nations work relevant to a current news story. During the past four years, BBC Television carried about seventy-five programmes concerned with the United Nations. Most of these were items in "Panorama" or "Tonight", e.g. "A Portrait of U Thant", a film on the new session of the General Assembly, the Congo situation, the United Nations Development Decade. The BBC educational television programme "Spotlight" (current affairs) is usually on a United Nations subject on or near United Nations Day each year. This programme is aimed at 13-15 year-olds and is seen by approximately 50,000 pupils, in 1,000 schools. In addition, other programmes for schools (approximately two per term) deal with topics such as the Congo, the Middle East and defence which relate to United Nations activities. United Nations affairs are regularly covered also by the Independent Television Authority in news bulletins and in current affairs programmes, such as "This Week" and "Date-line". In addition, "International Zone", an annual series of thirteen feature programmes by the United Nations Television Service was broadcast during 1961-62 and 1962-63, and a school television series by Andrew Schonfield on the United Nations, entitled "Patterns of Power", was shown in 1962.

Classroom teaching materials and aids

Collections of films and filmstrips on the United Nations are maintained by the Educational Foundation for Visual Aids, the Central Film Library, CEWC and by local education authorities. These materials are used regularly and extensively, but a far greater use would be made if the supply of good quality films and filmstrips were larger than it is. The shortage of materials readily adaptable to classroom use is still a major handicap to the increasing willingness and desire on the part of United Kingdom teachers to include study of the United Nations and its agencies in their work. The current affairs newspaper, *News Club*, published by the CEWC continues to circulate to all member schools of the Council and a major part of each issue is devoted to the United Nations.

United Nations study in colleges and universities

Study of the United Nations forms part of most courses in political science, history, etc. in universities and in general or social studies in technical colleges or colleges of further education. During the period under review, Professor Ritchie Calder was appointed Professor of International Relations, including United Nations matters, in the University of Edinburgh. In recent years international law has been introduced as an alternative subject in the Bar Finals and questions have included the United Nations and legal issues arising.

The United Nations Students Association programmes include talks, debates, discussion groups and one-day conferences.

Adult education programmes on the United Nations

In the extra-mural departments of universities and in the adult education field generally, study of the United Nations forms an important part of most courses in modern history, world history, etc. One-day schools and conferences on the United Nations are held from time to time by organizations such as the Workers' Educational Association.

The branches of the United Nations Association have, in varying degrees, promoted programmes of adult education in this field. Systematic courses are rare, but over 1,000 lectures or discussion group meetings are arranged every year, as well as some week-end schools. In addition, speakers are supplied to meetings arranged by churches, trade unions, youth groups, etc. Every August the Association also runs a United Nations summer school in Geneva and in October 1962, arranged for a party of over sixty persons to spend a fortnight at United Nations Headquarters (New York), pursuing an intensive lecture course and attending meetings of the General Assembly. It is hoped to repeat this experiment again.

A number of publications are issued by the Association, including a quarterly journal, *United Nations News*

(circulation 30,000), a monthly paper, *New World* (circulation 7,000) and the monthly *Information Notes* (circulation 1,000).

* * *

Specimen copies of official circulars, syllabuses and pamphlets issued by education authorities, and of journals, newsletters, annual reports, programme kits and other study materials issued by the United Nations Association, the CEWC and the United Nations Student Association, accompanied the report.

UNITED STATES OF AMERICA ⁸

[Original: English]
[27 September 1963]

This report offers an overview of recent developments in the field of teaching about the United Nations, with emphasis on higher education, teacher education, new trends in elementary and secondary education, and spot surveys of study materials, teaching aids, libraries, adult education activities, the mass media and the role of non-governmental organizations. Some of this reporting is rich in detail, while other aspects are treated synoptically. In reading this report, it should be kept in mind that education in the United States is a state and local prerogative, and that institutions of higher education enjoy a large measure of autonomy. Therefore, no report of this type can give complete and precise coverage.

Colleges and universities

Approximately one-third of all higher education institutions now offer instruction about the United Nations. At the undergraduate level, larger institutions are more inclined to organize separate courses on the United Nations, whereas junior colleges and smaller liberal arts colleges customarily include United Nations units as a part of courses in political science, government or history.

Most universities now offer one or more graduate courses in this field. The United Nations also constitutes a popular field for M.A. and Ph.D. theses. During the period 1945-1962, a total of 194 doctoral dissertations, on a wide range of subjects, were completed at forty-two universities.

Teacher-training

Today approximately 90 per cent of all American teachers are educated in multipurpose colleges and universities. Of approximately 2,100 institutions of higher education in the United States in 1963, some 1,100 prepare teachers for elementary and secondary schools. Programmes for teachers in service are also provided by these institutions as well as by school systems, by

⁸ This text is a summary of a full-length study prepared by the U.S. Office of Education which will be published in 1964 by the Government Printing Office (Washington, D.C.) as a booklet entitled *Teaching about the UN in the USA, 1960-63*.

professional associations, and by local or national voluntary organizations. In general, information provided to teachers about the United Nations is incidental to courses in international relations and education for international understanding.

However, it is estimated that most teachers who teach about the United Nations in elementary and secondary schools acquire their competence to do so largely through independent study and current information from magazines, newspapers and special publications, with a minimum of dependence upon formal course work.

During the past four years, colleges and universities which train teachers have reflected quickened interest in international affairs generally, but it cannot be said that there has been any significant increase in emphasis, either in pre-service or in-service programmes, placed on teaching about the United Nations *per se*.

Meanwhile, there appears to be a trend today, both in elementary and secondary schools and in colleges and universities, to expand education for world understanding throughout the entire curriculum. Such instruction is given through courses in relevant subject fields such as languages, literature, history, science, geography and music, as well as through intensive area studies, which tend to emphasize non-Western countries and cultures.

Special note should be made of the contribution of voluntary professional organizations to teacher education in this field. The American Association of Colleges for Teacher Education regularly distributes information on United Nations affairs to its membership of 634 colleges and universities and sponsors conferences in this field. The National Education Association, with 900,000 members, maintains a full-time Observer to the United Nations and issues or sponsors handbooks for teachers and other relevant publications, films, filmstrips and educational television programmes. The Association for Supervision and Curriculum Development has had a continuing interest in international education since 1940.

Thus, there do not appear to be any strong convictions in the specific field of teacher education, either pre-service or in-service, regarding teaching about the United Nations, as such, nor any clear prescription of just what knowledge about the United Nations and its related agencies should be of most worth to teachers.

Teaching about the United Nations in elementary schools

During the past four years, study of the United Nations has been increasingly interwoven with programmes of education for international understanding. Less emphasis is placed on the United Nations structure than on the purposes and work of the United Nations and its related agencies.

Specific provision is made for children to learn about the United Nations in various parts of the school day and curriculum. The social studies courses in many parts of the country include United Nations units, most

of which are taught in the sixth grade, where they often provide a unifying factor and culmination for the study of the various countries of the world. Such units are occasionally found in other elementary grades. Most United Nations units and curriculum outlines also include study about the specialized agencies, most often, FAO, UNESCO and WHO.

Throughout elementary grades children have continuing opportunity to keep informed about the United Nations through school-level current news weeklies, regular newspapers, radio and television. Much study of the United Nations is carried out in connexion with the observance of United Nations Day and/or Week and Human Rights Day. In addition, many school groups visit United Nations Headquarters in New York.

Teaching about the United Nations in secondary schools

Teaching is carried on within other subjects, particularly world history, an elective course in the tenth grade, with a large enrolment; and United States history, which is required of all high school pupils in the eleventh grade. In addition, some school systems include such instruction at all grade levels and in all subjects, as in New York City and in Glen Falls, N.Y. In general, there is a strong tendency in United States secondary schools to teach more about other countries, e.g. to devote much more attention in world history to Asia and Africa; for more students to enroll in the elective course in world geography, in the ninth grade, in which emphasis is placed on the social and economic aspects of the subject; and to include international questions in the course in "Problems in democracy", which is taught in the twelfth grade.

The opinion of many American educators is that much more can be done to strengthen and improve teaching about the international scene. More and better school materials need to be prepared, teachers should have improved in-service courses, and more effective methods of teaching need to be employed, including the use of educational television.

Teaching materials

A study of relevant publications received by the Educational Materials Laboratory of the United States Office of Education during the period 1960-1963 indicates that there has been a continuing increase in resource materials on the United Nations for use in elementary and secondary schools. A review of textbooks shows that at least thirty-three include materials in this field. Some of these are revised editions of books analysed in the previous (1960) report to the Economic and Social Council on this subject (see E/3322). No major developments are apparent in the treatment of the facts presented, but in the newer materials coverage is fuller than in the past. There has been a marked increase also in the number of supplementary reading books for young people on United Nations subjects issued by commercial publishers.

Encyclopaedias also constitute an important source of information about the United Nations. In a set published in 1963, one of five volumes is devoted exclusively to the United Nations. Another encyclopaedia which includes articles on the United Nations has appeared in a Braille edition, for the blind. Of great value to teachers and to many secondary school students are bibliographies listing books, pamphlets, monographs, films, slides and other materials.

During this period, a number of useful handbooks for teachers were published in this field. The comprehensive manual *Towards Better International Understanding*, issued by the New York City Board of Education in 1960, has had wide influence. It suggests basic concepts and specific ways of teaching about the United Nations and its agencies in relevant subjects throughout the regular school curriculum from kindergarten through senior secondary school (twelfth grade).

While more and better information is needed, particularly material suitable for use with children at the elementary school level, it is clear that progress is being made. This chapter of the report ends with an extensive bibliography which lists and describes 118 items.

Libraries

Comments made by supervisors of school libraries indicate that, as reported in 1960, United Nations materials suitable for elementary and junior high school libraries are still not sufficient to meet needs. Also, there is greater interest in 1963 in materials about the member countries, especially the new nations.

In colleges and universities, the nature and scope of academic library collections are closely related to their curricula. Twenty-three universities have complete depository collections, while many others maintain partial such collections. Sizable collections of nationally issued books, pamphlets and journals which include discussion of the United Nations are much more widespread.

Public libraries also supply printed and audio-visual materials on the United Nations, prepare bibliographies on important United Nations issues and undertake a wide variety of other activities in this field.

Use of new educational media

Recorded radio programmes prepared by the United Nations are broadcast regularly over educational and commercial stations. After broadcast, stations frequently make the recordings available for off-the-air use by schools, libraries and community organizations. Pupil activities are often based on these radio programmes. A simple class project may begin with a student survey of United Nations broadcasts, followed by the preparation of a listener's programme log. Students may then be encouraged to develop their own live broadcasts, such as panel discussions on United Nations subjects.

There are at present 225 school-operated radio stations throughout the country. Many of these stations, in addition to carrying recorded programmes, develop

regularly scheduled series for integration into units of study in various subjects as suggested by curriculum directors and classroom teachers. Manuals for teachers are also issued to accompany these programmes. The report gives details of outstanding work in this field done by Station WBEZ, Chicago, Station WNYC, New York City, and Station KLON, Long Beach, California.

In 1962, United Nations Television produced a special series of five fifteen-minute programmes entitled, "The United Nations and Education" for the Committee on International Relations of the National Education Association.

Space does not permit more than a brief reference to the considerable number of United Nations films which are widely used in schools and adult study programmes.

Adult education

During the period 1960-1963 study programmes conducted in evening public high schools or sponsored by adult education councils and by voluntary organizations devoted considerable attention to helping adults and out-of-school youth understand the United Nations.

Units of study on the United Nations are included in many courses in United States history, community civics, world geography, world history, American government, and problems of American democracy. Adult Education Councils also organize group discussions, talks, and other programmes on United Nations subjects. Speakers bureau services are provided, and sponsorship of discussion groups in connexion with the United States National Commission for UNESCO are continuing activities. Adult education about the United Nations is provided also through university extension courses and discussion groups. For example, at the University of California during 1960-1963 there have been at least 400 such courses and discussion groups through which approximately 12,000 adults have been reached.

The role of voluntary organizations

Many more adults are helped to learn about the United Nations through a wide variety of activities and publications provided by voluntary and private organizations.

The report states: "The organizations play a most important role. Not only do they sponsor educational activities which spark thousands of adults holding membership in these bodies, but they publish and/or distribute periodicals, booklets, reading lists, etc., which have become a major source of domestic material on the United Nations."

The American Association for the United Nations issues the monthly *AAUN News* and among other activities sponsors an annual high school contest on the United Nations in which usually more than 60,000 students compete.

The United States Committee for the United Nations, which include 138 national member organizations, issues

a monthly bulletin *Spectrum* and many other publications, and distributes approximately 3 million pieces of literature yearly in answer to approximately 40,000 requests.

The report describes the publications and activities in the field of many other non-governmental organizations interested in United Nations affairs, including: The American Association of University Women, the American Jewish Committee, the National Federation of Business and Professional Women's Clubs, the General Federation of Women's Clubs, Kiwanis International, the League of Women Voters, the National Education Association, the Quaker Programme at the United Nations, Rotary International, the World Affairs Center and Foreign Policy Association, the United States Committee for UNICEF, the Carnegie Endowment for International Peace and the United States National Commission for UNESCO.

UPPER VOLTA

[Original text: French]
[9 November 1963]

Lessons on the United Nations are provided in all educational institutions. In primary schools, teaching programmes in the middle courses (pupils from 9 to 11 years) include a history lesson on international organizations and a group discussion on the Universal Declaration of Human Rights. In secondary schools, the third-year programme of civic instruction includes the study of human rights. In history, several lessons are provided on the United Nations and its related agencies, particularly UNESCO, FAO, WHO and WMO. In the final year of secondary schools, the programme of civic instruction includes several lessons on the subject "Upper Volta, Member of the United Nations and the specialized agencies".

In the *cours normaux* (a five-year teacher-training course at lower secondary level for intending primary school teachers), students receive the same lessons on the United Nations family of organizations as are provided to students in the general secondary schools.

URUGUAY

[Original text: Spanish]
[5 September 1963]

Primary schools

The Council for Primary and Teacher-Training Education provided in its resolution of 25 September 1952 (*School Regulations*, vol. XVI, regulation 51) that "in each year in all the country's public primary schools, the last lesson on 24 October, which is designated United Nations Day, or, if schools are closed on 24 October, on the working day immediately preceding that date, shall be devoted to making known the purposes and achievements of the United Nations". This resolution has been restated on a number of occasions. The offices of the departmental superintendents and the regional co-ordin-

ating offices have brought it to the notice of all teaching establishments within their jurisdiction by circular, and the area inspectors have supervised compliance with it.

The programmes for urban schools, approved on 1 March 1957, direct that in the geography curriculum for the sixth year, "The United Nations, its purposes and structure" shall be a subject for study in class. This directive relates to the specific and express treatment of the subject. It is equally important to note that the instructions concerning the history programme state: "The teacher should also make the children understand that they will be citizens of the world and that their country will have to live together with other countries in a climate of growing international understanding". To that end, the teacher, when commenting in class on topics concerning history, geography, civics and the like, very frequently will refer to the purposes and structure of the international organizations, and the children will be made familiar with all the relevant information distributed by these organizations.

Secondary schools

Topics relating to the international organizations are treated in various courses in the secondary schools. In the fourth year of the first cycle (a general four-year course), such instruction is given in history (three lessons a week) and in civics and democracy (one lesson a week). In the second year of the second cycle of secondary education (two years of preparation for higher education), teaching about the United Nations and other international organizations is given in world history (for advocates and notaries, six lessons weekly), in economics (three hours weekly) and in national and American history (six hours weekly; emphasis is placed on the role of Uruguay in the United Nations and in other international organizations).

Higher education

Instruction about the United Nations and its related agencies, the Organization of American States and human rights is given in the courses entitled "Introduction to law" (for advocates, notaries and economists, second year, three lessons weekly) and "Ordinary law" (for students of medicine, pharmacology, industrial chemistry, dentistry and veterinary science, second year, three lessons weekly). The course for architects entitled "History and culture" (first year, three hours weekly) includes international economics, social and political affairs, with particular stress on the growing importance of science and technology.

YUGOSLAVIA

[Original text: English]
[26 August 1963]

General observations

The General Law on Public Education of 1958 states, *inter alia*, that instruction in all schools and universities should be in the spirit of international understanding and

co-operation. Consequently, curricula have been revised so as to define precisely the extent to which every subject relating to the United Nations is to be covered. A steady increase in teaching in this field in primary and secondary schools has been noted.

Each year, on United Nations Day, leaflets (translations of original United Nations texts) are printed in all Yugoslav languages, the cost being borne by the Government.

Teacher-training

At present, there are no special courses for teachers on the United Nations. However, there are teachers — for the time being, only in secondary schools — who have graduated from faculties of economics and law and are able to teach in this field.

During this period, there were no official programmes on the United Nations for teachers in service in primary and secondary schools. However, teachers are expected to compile material and prepare lectures for United Nations Day and other occasions. All schools must keep in their libraries the material required for this purpose.

It would be useful to organize seminars for teachers interested in this field.

The United Nations in school programmes

In primary schools, instructions is given within relevant subjects — history, geography, governments. In addition, special lectures are given on United Nations Day and on the days observed by some of the specialized agencies. Observances are left to the schools, which carry them out each in its own way.

In secondary schools, lectures about the United Nations are given in third- and fourth-year history; in first-year geography; and in the fourth-year course on the state and social system of the Socialist Federal Republic of Yugoslavia. In many schools, questions on the United Nations are included in the final examinations. Pupils studying foreign languages are asked to translate chapters from the United Nations Charter or any other subject-matter on the United Nations for their matriculation. School clubs for international co-operation, United Nations clubs and other youth organizations usually are given guidance or instruction by professors of the respective schools.

Teaching materials and aids

It cannot be said that new textbooks and manuals devote greater attention to this subject than earlier, except in law and economics, in which programmes have been expanded.

The need for appropriate textbooks and teaching materials for different levels of education is still being felt, although to some extent textbooks are supplemented by materials issued by the United Nations Information Centre and by the United Nations Association of Yugoslavia. The publication of Paul Feraud's booklet *L'Enseignement sur la famille des Nations Unies dans les pays*

de la région de la Méditerranée du Nord into Serbo-Croat in 1960 by the United Nations Association, with assistance from UNESCO, has provided a useful guide for public school teachers and professors to whom it was widely distributed. There are no special current events bulletins for schools. Many schools use films loaned from the United Nations Information Centre. Special school radio broadcasts are made for United Nations Day. No special television programme exists in the schools.

Colleges and universities

Since 1962 students in law and economics follow a series of lectures based on *International Law and the Maintenance of Peace*, issued by the European Office of the United Nations (Geneva).

A considerable number of students write about the United Nations for their final examinations. The United Nations Information Centre provides students with the requisite material.

Clubs of International Understanding represent a very interesting form of work. A large number of foreign students (especially from Africa) are studying at Yugoslav universities. They are also active members of these clubs which are concerned with the rapprochement and understanding of different nations and peoples. Model General Assembly sessions are held. There are also evenings dedicated to the music, culture and customs of various peoples.

Adult education

The special feature of adult education in Yugoslavia is the large attendance at popular and workers universities, at which lectures are held from time to time on United Nations subjects.

Courses, discussions and lectures are systematically organized also by different public and political organizations. Special attention is paid to teaching about the United Nations in the Yugoslav Army.

Radio and television broadcasts inform the public about the United Nations in their regular news broadcasts. In addition, all radio stations, except Ljubljana, have weekly United Nations programmes, using information materials supplied by the United Nations Information Centre. Radio broadcasts for schools and for universities also give information on United Nations activities.

B. REPORTS ON TRUST TERRITORIES

96. The Trusteeship Council, in its resolution 36 (III) of July 1948, requested the Secretary-General and the Administering Authorities "to co-operate in ensuring an adequate flow of suitable information concerning the aims and activities of the United Nations to the inhabitants of the Trust Territories". The General Assembly, in resolution 324 (IV) of November 1949, drew the attention of the Trusteeship Council to the necessity of requesting the Administering Authorities to "study the possibility of including in the curricula of schools in the Trust Territories instruction on the United Nations, the

International Trusteeship System and the special status of Trust Territories". The General Assembly also recommended that the Trusteeship Council should include in its annual reports to the General Assembly a special section on the manner in which the Administering Authorities had implemented resolution 36 (III). In its resolution 754 (VIII) of 9 December 1953, General Assembly requested the Secretary-General to initiate, on the basis of suggestions from the Administering Authorities or of his own knowledge, or both, a direct flow of information material addressed to the general public in the Trust Territories.

97. Information for this section of the report on teaching about the United Nations has been drawn largely from the annual reports of the Administering Authorities.

Camerrons under United Kingdom administration

98. During 1960 and the part of 1961 that the Camerons remained under United Kingdom administration, it was reported that the history and principles of the United Nations continued to be taught in primary schools and that the examinations at the end of the primary course included questions on the implications of trusteeship. Visual aids were found valuable in these courses. During 1960 these visual materials were augmented by filmstrips and photo-display sets supplied by the United Nations Office of Public Information.

99. Of the forty-five Southern Cameroonian students studying overseas or at higher institutions of education in West Africa at the beginning of 1960, four were studying on awards sponsored by United Nations organizations.

100. In the Southern Camerons during the period under review the Public Relations Department distributed through the Education Department, as well as directly, information, newspapers and magazines. In the Northern Camerons such distributions was done through the Information Division of the Ministry of Internal Affairs.

Nauru

101. In the Trust Territory of Nauru, under the joint administration of Australia, New Zealand and the United Kingdom, instructions on the United Nations forms part of the social studies syllabus. Regular lessons on the United Nations and the Trusteeship System are given in the senior primary classes and in the secondary school. Posters and literature received from the United Nations Office of Public Information are displayed in the classrooms and wallsheets on United Nations activities, photographic display sets, especially flag posters in colour and world maps showing Trust and former Trust Territories are widely used in Administration schools as teaching aids.

102. In 1962, it was reported that there were no facilities for using filmstrips in Administration schools and that no broadcasting facilities existed on Nauru. Supplies of school textbooks in English are obtained mainly from Australia and the United Kingdom, but readers produced by the Administration with controlled sentence structure

and vocabulary are in use in the schools. Many modern simplified English publications are kept in school libraries. A two-pages children's supplement is published with every fourth issue of the Administration's weekly *Nauru News*. Its aim is to provide easy supplementary reading, with controlled sentence patterns, on local matters of interest to all children on the island. The Education Office houses both a large bookcase and two gabled display boards where United Nations material is stored and displayed and is open to all members of the public. A small library which includes copies of United Nations publications is maintained by the Nauru local Government Council.

103. United Nations Day is celebrated annually and usually is marked by a rally and sports competition in the grounds of the secondary school, in which all pupils take part. A series of circular letters on United Nations topics were distributed to teachers during the period under review and arrangements were made for all teachers to be addressed by the Nauruan delegate on his return from the Trusteeship Council meeting in 1961.

104. The Administering Authority has pointed out that it may be necessary to adapt educational aims in detail to the probable needs of the future Nauruan community when a decision is made on the resettlement of the Nauruan people. In the meantime, it is intended that a soundly based primary education for all Nauruan children which includes a high standard of mastery of English followed by a secondary course with an emphasis on the inculcation of technical skills should provide a sound foundation for such additional knowledge and skills as may be required in the new environment.

New Guinea

105. Australia, the Administering Authority for the Trust Territory of New Guinea, reports that it is recognized that universal literacy in English, which it is intended will eventually become the common language of the Territory, is one of the most important single means by which the progress of the people can be promoted. Accordingly, in Administration schools, English is used as a medium of instruction from the time the child commences school. Mission schools may use the vernacular as a medium of instruction up to the end of Standard II, but from the beginning of Standard III the instruction is in English.

106. Provision is made in the social studies syllabus for instruction on the United Nations, describing the work of the United Nations, the specialized agencies and the International Trusteeship System. Textbooks containing comprehensive information on the United Nations are prescribed, and the books, *The United Nations*, by Spaul, and *United Nations for the Classroom*, by Jones and Davis, are used in the senior classes in indigenous schools. For primary schools, *The United Nations — What You Should Know about It*, issued by the United Nations, is used. Information material such as films, filmstrips, pamphlets and special United Nations Day student leaflets produced by the United Nations is distributed to schools.

107. In April 1962 a United Nations Information Centre was established at Port Moresby to provide services to the Trust Territory. The Centre has been provided with a reference library and a supply of audio-visual materials. An indigenous information assistant has been appointed to the staff of the Centre, which also has the services of an official possessing a good knowledge of Pidgin and Motu. It is reported that groups of students, with their teachers, often visit the United Nations Information Centre for further briefing on the work of the United Nations and the specialized agencies.

108. The Information Centre maintains close co-operation with the Administering Authority in preparing the translation and reproduction of information materials into local languages. A textbook for primary schools, which approaches the subject of teaching about the United Nations from a regional angle and presents certain concepts against the background of local environment and tradition, has been prepared in collaboration with the Department of Education. Entitled *The United Nations: What It Is, What It Does, How It Works*, this textbook has been written in the language of Standard VI, at the top of the primary school level, and is to be used in the two types of primary schools (those which follow an Australian syllabus and those which follow a Territory syllabus), as a textbook for pupils in Standard VI and above. It also serves as a teacher's book for teachers of grades lower than Standard VI. The material it contains is drawn from all relevant existing texts on the United Nations and has been printed in both English and Pidgin. Distribution to schools, and also to local government councils and non-governmental organizations was carried out in November 1963.

109. On the occasion of Human Rights Day 1963, the Administering Authority also published for school use a special pamphlet entitled "What is Freedom?" and a simplified version of the Universal Declaration of Human Rights in both English and Motu. A Pidgin translation of the Declaration is reported to be in preparation. The Administering Authority has pointed out that, while the Declaration of Human Rights is exposed and explained in schools, the Declaration has not been translated into the numerous local languages. Therefore, it is for the benefit of those beyond school age that translation has been undertaken into the two main lingua franca of the Territory of Papua and New Guinea.

110. A further teaching aid developed by the Department of Education in 1962 is the *United Nations Colouring Books* which is accompanied by a booklet, "Teacher's Notes on how to use the Colouring Book". The *Colouring Book* is used in Standard IV to teach a series of lessons about the United Nations over an eight-week period.

111. The Information Centre has reported that the teacher-training colleges have held a number of seminars on teaching about the United Nations. One, held during the 1961 school summer vacation, was entitled "A workshop for the preparation of material to teach the indigenous people of the Territory about the United

Nations". The Teachers' Training College at Goroka, in the Eastern Highlands, has expressed a particular interest in UNICEF, and material has been supplied by the Information Centre. The "Child of UNICEF" leaflet series, issued by UNICEF, has been found particularly useful by the Department of Education and has now been distributed to primary schools. Also, the picture display sets, issued by the United Nations, are in great demand with schools and the Information Centre has indicated that these are used to great advantage by teachers. Further teaching about the United Nations in schools has been undertaken by the liaison officer attached by the Administration to the Information Centre. This has consisted of talks given on particular aspects of the United Nations whenever requested by individual schools within reasonable access of the Centre.

112. The Administration has reported that, in the period 1962-1963, the film library of the Department of Information contained thirty-one United Nations and specialized agency films, which are kept in circulation throughout the Territory. The Department is also distributing an educational film series, has purchased nineteen additional titles and has undertaken to add sound tracks in local languages and dialects to several United Nations films.

113. Special days sponsored by the United Nations are widely recognized in the Territory. The most important of these is Children's Day, which is celebrated with appropriate features at every school throughout the Territory. United Nations Day also is regularly observed in schools — with essays, pageants, and flag parades. In addition to the other materials supplied by the United Nations Office of Public Information, the United Nations Day statements from the Secretary-General and the President of the Trusteeship Council usually are read out in schools.

114. The United Nations Information Centre has reported that United Nations Day 1963 marked the second year that the Port Moresby Chamber of Commerce offered a two-year United Nations Day Scholarship for advanced technical studies in Australia for indigenous people of the Territory. Two essays on United Nations subjects form part of the selection test, and all candidates are given the necessary United Nations literature to enable them to prepare properly for the written test. It is understood that this United Nations Day Scholarship is intended to become a permanent annual feature.

Trust Territory of the Pacific Islands

115. The United States of America, as Administering Authority, reports that in 1962, English was adopted as the medium of instruction at the elementary school level in the Trust Territory of the Pacific Islands. This new policy is in contrast to the former educational policy, which held that all elementary instruction should be conducted in the vernacular. It is stated that this change was made in conformity with the desire of the Micronesian people as expressed at the Council of Micronesia, and by Micronesian teachers and students.

116. The aims and work of the United Nations family and the Trusteeship System is part of the school curricula at all levels. The basic facts about the Trust Territory Government and the United Nations are learned in the fourth grade. All school districts receive United Nations information material for distribution. The work of the United Nations is included in the social studies curriculum of the intermediate schools, and of the Pacific Islands Central School, where students examine the needs and problems of Micronesia and the problems of self-government beginning at the family level and progressing to the community or village, island or atoll, the district, the Trust Territory, and the world, including the United Nations. Attention is given to the forms of government which exist outside the Trust Territory and to the role of the United Nations in Trust Territory affairs.

117. At the elementary school level, discussions on subjects connected with the United Nations are arranged as part of the teacher-training programme, and similar discussions are held with other community leaders. Information material supplied by the United Nations is simplified, and teaching aids are prepared for the participants in the training programmes to take back to outlying communities.

118. It is reported that close co-operation exists between mission and public schools in conducting community projects, specifically, the celebration of United Nations Day, which is an official annual holiday. The Pacific Islands Central School as a whole participates actively in these observances.

119. The Administering Authority points out that materials published by or pertaining to the United Nations and UNESCO are regularly received by all libraries. They are used in educational programmes and are made available for withdrawal by interested individuals. Other United Nations information booklets are translated and large-scale distribution made throughout the Territory. During 1962-1963, six United Nations films were rotated among all districts comprising the Trust Territory and were shown to large numbers of children and adults at various community gatherings.

120. Scholarships and fellowships are awarded to Micronesians by the United Nations Technical Assistance Administration and UNESCO.

Ruanda-Urundi

121. In Ruanda-Urundi, until the conclusion of Belgian administration of the Trust Territory in 1962, teaching about the United Nations and Trusteeship System at schools of all types was the responsibility of the government authorities.

122. Instruction on the United Nations in government schools, including vocational institutions, was adapted to the different scholastic levels. Films and photographs supplied by the United Nations Office of Public Information were used in a number of schools.

123. Secondary school classes at intermediate and senior levels included teaching about the United Nations in courses on history and ethics. Medical classes included lectures on WHO.

124. Study of the United Nations was included in the syllabus of all levels in subsidized private schools, including primary, post-primary and secondary schools. Courses on social education and the Public Law of Ruanda-Urundi in professional schools also included information on the United Nations.

125. In June 1961, a United Nations Information Centre was opened in Usumbura and equipped with a reference library and audio-visual aids. The staff included two indigenous information assistants and the Centre arranged for the translation, printing and distribution of local language versions of a number of basic pamphlets on the United Nations. During the same period 1961-62, a course on the United Nations was organized at the College du Saint-Esprit in Usumbura.

Tanganyika

126. Instruction on the work of the United Nations and the Trusteeship System formed part of the syllabus in citizenship in all schools during the remaining period (1960-1961) of United Kingdom administration of the Trust Territory of Tanganyika.

127. Schools throughout the Territory received pamphlets on these subjects published in both English and Swahili.

128. Material received from the United Nations was circulated to schools, and with the establishment in the Territory of a United Nations Information Centre in June 1961 its resources, including a reference library, audio-visual materials on the United Nations and pamphlets on United Nations activities in English and Swahili became available to schools.

Western Samoa

129. The Government of New Zealand, as Administering Authority for the Trust Territory of Western Samoa until the attainment of independence on 1 January 1962, reported that teaching concerning the aims and work of the United Nations, the specialized agencies and the Trusteeship System was a feature of the curriculum of all schools and a recognized part of the social studies course.

130. It is reported that English is taught in all schools and from the fourth year of primary schools. In all secondary schools and in the teacher-training college it is the language of instruction. Photo-display sets, posters, pamphlets, filmstrips and four educational films on the United Nations have been supplied by the United Nations and it is reported that the material was widely distributed through the schools in Western Samoa, in the teacher-training college and in Samoa College. Facilities for screening films and filmstrip projectors are reported to be available in many of the schools.

131. Copies of the report on teaching about the United Nations and the specialized agencies made by the Secretary-General of the United Nations and the Director General of UNESCO to the Economic and Social Council in 1960 (E/3322 and Add.1-3) have been supplied to the teacher-training college.

Dissemination of information on the United Nations and the International Trusteeship System in the Trust Territories

132. The Secretary-General has reported⁹ that during the period 1 June 1962 to 31 May 1963, a total of 54,618 copies of publications consisting of thirty different titles in English, Chamorro, Marshallese, Ponapean, Trukese and Yapese was dispatched to the three remaining Trust Territories of Nauru, New Guinea and the Pacific Islands. This total included both basic information materials on the United Nations and its activities and materials especially intended for the observance of United Nations Day in 1962. Not included in this total are additional materials distributed in the Trust Territory of New Guinea by the United Nations Information Centre established at Port Moresby in 1962. The material was forwarded to over eighty addressees, comprising government officials, educational authorities, newspaper editors, school teachers and non-governmental organizations.

133. The number of paid subscriptions to the *United Nations Review* increased from 130 during the period 1961-1962 to 161, even though the number of Trust Territories had decreased. Full coverage of the operation of the International Trusteeship System and of the activities of the Trusteeship Council continued to be provided in the *United Nations Review* and reprints of articles which has appeared in this publication, as well as booklets and factsheets on the subject, were sent to Trust Territories.

134. In addition to recorded radio programmes and scripts supplied to the Trust Territories by the United Nations Office of Public Information, radio talks in English simplifying the Declaration on the granting of independence to colonial countries and peoples and General Assembly resolution 1698 (XVI) on racial discrimination in Non-Self-Governing Territories were also supplied to the Territories.

135. As is done annually, the United Nations Day messages recorded by the Secretary-General and the President of the Trusteeship Council, the Human Rights Day message recorded by the President of the General Assembly and a half-hour feature programme for United Nations Day prepared by United Nations Radio in New York were supplied for broadcasting in the Territories.

136. During 1962-1963, prints of a series of seven educational films were distributed in the Trust Territories: "The Charter of the United Nations", "Workshop for Peace", "The General Assembly", "The Trusteeship Council and System", "The Economic and Social Council", "The Security Council" and "The International Court of Justice". In addition, fifteen other film titles covering a variety of United Nations and specialized agencies activities were also distributed.

⁹ See *Official Records of the Trusteeship Council, Thirtieth Session, Annexes*, agenda item 11, document T/1610.

CHAPTER III

Programmes and services of organizations
in the United Nations family

INTRODUCTION

137. In resolution 748 (XXIX) of 6 April 1960, the Economic and Social Council requested the Secretary-General of the United Nations and the Director-General of UNESCO to continue to co-operate in the field of teaching about the United Nations and to assist interested non-governmental organizations in this work. It further commended the Secretary-General and the administrative heads of the specialized agencies for the efforts made by them to provide materials relating to the activities of their respective organizations for this purpose and expressed the hope that these efforts be maintained, and if possible intensified, within existing budgetary limitations.

138. The relevant programmes and services provided by the United Nations and UNESCO are described in this chapter. Examples of activities undertaken jointly by various members of the United Nations family are also noted. The chapter concludes with statements provided by other agencies related to the United Nations concerning their efforts to assist study and teaching in this field.

A. JOINT ACTIVITIES

139. The Consultative Committee on Public Information (CCPI), which meets annually and has the task of ensuring co-ordinated and joint information activities by the United Nations and the agencies, undertakes as part of its mandate certain inter-agency projects concerned with teaching about the United Nations. For example, at its twenty-ninth session, in March 1961, CCPI member agencies agreed to provide information and materials for the preparation of a basic Study Guide Series for teachers and youth leaders for use in teaching about the United Nations family. The production of the series was sponsored jointly by the United Nations and UNESCO. By the end of 1963, four volumes, comprising six booklets which are also available separately, has been issued by Oceana Publications (Dobbs Ferry, New York) through the Special Projects Office of the Publishing Services Division of the United Nations. The four volumes are: *World Peace and the United Nations*, *Food life — Food for Thought*, *Toward Mankind's Better Health*, and *Energy and Skills for Human Progress*. A separate booklet in this series entitled *Human Rights: The Dignity of Man* was issued in 1963 in connexion with the fifteenth anniversary of the Universal Declaration of Human Rights. Two additional volumes are currently in preparation, one of which deals with the United Nations Special Fund, Technical Assistance and the International Bank for Reconstruction and Development. The series has thus far been issued in English only, with translation rights reserved for the United Nations family.

140. Two additional series of publications resulting from inter-agency co-operation, although not specifically

designed for schools, are of direct interest and usefulness in this field, as they provide basic information for teachers and advanced students in readable form on programmes of the United Nations family of major importance. The first is a series entitled "Basic studies" supporting the Freedom from Hunger Campaign which is being published by FAO and other organizations of the United Nations. Sixteen studies are planned, of which fourteen had been published by the end of 1963: eight were issued by FAO, three by the United Nations, and one each by the ILO, WHO and WMO. The series is issued in English, French and Spanish, except for volume 14, which is issued in English only. The second series is "a report to the public" of the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas, held in Geneva in February 1963, and published by the United Nations in eight volumes under the title *Science and Technology for Development*. Written in non-technical terms by an international staff of editors and writers, each of the first seven volumes is devoted to a particular aspect of development: *World of Opportunity* (an overview); *Natural Resources*; *Agriculture, Industry, People and Living*; *Education and Training*, and *Science and Planning*. The eighth volume presents the major addresses given at the plenary sessions, a complete list of all the scientific papers and the index. The series is being issued in English; French and Spanish editions are in preparation, and a Russian edition will appear at a later date.

141. Numerous film and television productions are also the result of the joint efforts of two or more agencies. For example, in 1962 "The Flags are Not Enough", a series of three thirty-minute films for television describing different aspects of the activities of the United Nations and its agencies during the current Development Decade were produced jointly by the United Nations and UNESCO. The titles of the three films are: "The Widening Gap", "Generators of Hope" and "Life is Short". In 1963 a programme on teacher-training activities in Africa, Asia and Latin America was begun by the Radio-diffusion télévision française in co-operation with the United Nations and UNESCO and will be shown early in 1964. Also in 1963, the Hamburg Television and Documentary Programs, Inc. began production of a television film on medical education and training in co-operation with UNESCO and the World Health Organization.

142. On a continuing basis, information about the work of the specialized agencies is channelled regularly through the United Nations Office of Public Information at Headquarters and through the United Nations Information Centres in the field. Varying amounts and kinds of materials are also issued direct by the agencies, most of which have information services.

143. It should be noted also that it is the practice of the United Nations and its related agencies to meet, as fully as circumstances permit, requests by education authorities and non-governmental organizations in Member States for limited quantities of selected information materials needed for use at seminars, conferences, exhibits and other activities concerned with teaching about

the United Nations. In addition, staff members of the various organizations often serve as lecturers, consultants or resource people at educational conferences, seminars and other meetings, particularly when such meetings are held at the national or regional level.

B. UNITED NATIONS PROGRAMME AND SERVICES

144. The activities undertaken by the United Nations Office of Public Information (OPI) to encourage and assist teaching about the United Nations concern all aspects of its work and services, both at Headquarters and in the field, and hence are presented in this larger frame of reference.

145. The basic policy of the United Nations public information programme, set forth by the General Assembly in resolutions 13 (I) of 13 February 1946 and 595 (VI) of 4 February 1952, is "to promote to the greatest possible extent, within its budgetary limitations, an informed understanding of the work and purposes of the Organization among the peoples of the world."¹⁰

146. As the membership of the United Nations has expanded over the years and as the world-wide activities of the Organization and its related agencies have multiplied, demands for public information services, materials and facilities have steadily mounted. Thus, in its resolution 1335 (XIII) of 13 December 1958, the General Assembly emphasized the increased need to enlist the co-operation of Governments of Member States, privately owned mass media of information, private institutions, non-governmental organizations and educators in the task of publicizing and interpreting the work of the United Nations family for peace and welfare.

147. Accordingly, the Office of Public Information of the United Nations, recognizing the special importance that must be attached to school and adult education programmes of teaching about the United Nations, provides as appropriate through each of its three divisions and the newly established Economic and Social Information Unit, the fullest assistance possible in materials and services. For example, as a matter of course, the United Nations Information Centres in their respective areas establish and maintain direct contact with education authorities, teachers' training colleges, school broadcasters and textbook writers, as opportunity offers.

148. From Headquarters, the Economic and Social Information Unit, the Press, Publications and Public Services Division and the Radio and Visual Services Division of OPI, together with the External Relations Division, help to stimulate teaching about the United Nations family in a variety of ways.

1. Economic and Social Information Unit

149. In 1962, an Economic and Social Information Unit was established in OPI, attached to the Office of

¹⁰ *Official Records of the General Assembly, Sixth Session, Annexes, agenda item 41, document A/C.5/L.172, annex.*

the Under-Secretary for Public Information, in order to provide intensified information services concerning the programmes and activities of the United Nations family in the economic and social fields, within the context of the United Nations Development Decade.

150. During 1962 and 1963, the Unit has given particular attention to facilitating and expanding the flow of public information in respect of conferences and other special projects of the United Nations family in the economic and social fields. Examples include the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas, held in February 1963; the continuing Freedom from Hunger Campaign organized by FAO, including the World Food Congress in June 1963; and forward planning and preparations for information coverage by all media of the United Nations Conference on Trade and Development, which will meet for three months in Geneva, beginning in March 1964.

151. The Unit has also begun a series of Press Features to fill the need for information on the progress and successful completion of technical assistance and Special Fund projects. The information is gathered from the field, through Information Centres, from the project personnel directly concerned, and from various other sources and is co-ordinated as regards release time and content with the appropriate agency or substantive department. The Features are also used for special United Nations reports and activities which do not otherwise lend themselves to normal press release treatment.

152. Finally, the Unit is continuing to develop mailing lists of specialized publications and newspapers covering many categories and is being increasingly utilized as a point of contact and research on the full range of the economic and social activities of the United Nations family.

2. Press Services

153. The media of mass communication, particularly newspapers and radio, constitute major sources of information about the United Nations family for use by students and teachers as well as the general public in countries throughout the world. The daily output of OPI Press Services — totalling some 80,000 words a day at peak periods — in the form of press releases, communiqués, background papers and features, provides basic coverage of the activities of the United Nations, its organs and agencies, for use by accredited correspondents at Headquarters, other OPI media, the network of United Nations Information Centres and non-governmental organizations. Since some 800 accredited press correspondents — embracing Press, radio and television — work from United Nations Headquarters and use the daily material produced by the Press Services, its ultimate impact in countries throughout the world is manifest. In this connexion, it may be noted that at least 90 per cent of the news printed about the United Nations comes from accredited correspondents.

154. Of special value to schools and universities and to non-governmental organizations are the background

papers and features produced by the Press Services, which expand on economic and social problems, as well as the *Weekly News Summary*, which gives a continuing picture of the main issues and discussions before the United Nations. During the period under review there has also been a sharp increase in the coverage of activities of the specialized agencies.

3. Publications

155. The basic policy of providing publications about the United Nations in as many languages of the world as possible for use at all levels of understanding (from junior school to university) was continued through the period covered by this report.

156. Thus a growing proportion of the OPI budget for contractual printing was made available to the Information Centres for local production, adaptation and initiation of publications. The allocation for the use of Centres in the years 1960 through 1963 has amounted to about 80 per cent of the OPI appropriation for leaflets, pamphlets and visual materials. With the increase in the number of Centres from thirty-two in 1960 to forty-six in 1963, there has also been a sharp rise in the number of languages in which OPI material is printed. Thus, the languages in which OPI material is produced has mounted from forty-six in 1960 to seventy-nine in 1963.

157. An impetus to provide printed materials giving basic information about the United Nations to inhabitants of the Trust Territories in their own languages came from the General Assembly in 1961, when the Assembly adopted resolution 1607 (XV). Under the resolution the OPI made available, over the last three years, pamphlets especially written for adaptation or translation into languages of the Trust Territories. The publications concerned the purposes and principles of the United Nations, the objectives of the Trusteeship System and the principles underlying the Universal Declaration of Human Rights; they included the text of, together with a short introduction to, the Assembly's Declaration on the granting of independence to colonial countries and peoples. Beside English and French, these publications also appeared in languages in which United Nations information material had not appeared before—Swahili (for Tanganyika), Kinyarwanda, Kirundi (for Ruanda-Urundi), and Marshallese, Panopean, Palauan, Turkese, Yapese and Chamorro (for the Trust Territory of the Pacific Islands).

158. Since 1961, in response to General Assembly resolutions 1695 (XVI) and 1698 (XVI), the Assembly's Declaration on the granting of independence to colonial countries and peoples and its resolution on 1698 (XVI) racial discrimination in Non-Self-Governing Territories, in addition to being translated into Arabic, Chinese, English, French, Portuguese and Spanish, have also been translated into the following local languages of the Territories: Creole (Portuguese Guinea); Hindi (Fiji and Mauritius); Kimbundu (Angola); Swahili (Kenya); Bemba (Northern Rhodesia); Nyanja (Nyasaland); Tonga (Northern Rhodesia); Malay (Brunei, North Borneo, Sarawak,

Singapore); Luganda (Uganda); Thonga (Mozambique); Zulu (Swaziland); Fijian (Fiji); Chamorro (Guam); Mbundu (Angola); Samoan (American Samoa); Maori (Cook Islands and Tokelau Islands); Niuean (Niue Island) and Silozi (Northern Rhodesia).

159. The programme for providing printed material through the distribution facilities of Headquarters and of the Centres has included the following titles, with the number of languages into which they have been translated noted against each:

	<i>Number of languages</i>
<i>Basic Facts about the United Nations</i>	40
<i>Charter of the United Nations</i>	32
<i>Declaration on the Rights of the Child</i>	27
<i>Everyman's United Nations</i>	3
<i>For Human Welfare</i>	3
<i>From Dependence to Freedom</i>	16
<i>Guide to the Charter of the United Nations</i>	4
<i>The International Court of Justice</i> ..	8
<i>Introduction to the Annual Report of the Secretary-General</i>	6
<i>Organizational chart: The United Nations and Related Agencies</i>	4
<i>Teaching Human Rights</i>	3
<i>Technical Assistance in Brief</i>	27
<i>The United Nations Family</i>	5
<i>The United Nations in Brief</i>	17
<i>The United Nations: What It Is, What It Does, How It Works</i>	47
<i>The United Nations: What You Should Know about It</i>	8
<i>The Universal Declaration of Human Rights</i>	54
<i>The Universal Declaration of Human Rights: A Standard of Achievement</i>	20
<i>United Nations Work for Human Rights</i>	10
<i>UNICEF: What It Is</i>	13
<i>UNRWA: What It Is</i>	8
<i>World Facts and Figures</i>	2
<i>Yearbook of the United Nations</i>	1

160. A particularly useful type of publication for schools and adult education programmes are the series of information leaflets (four to eight pages) which provide basic and current information on such matters as United Nations membership, the composition and work of the main organs and special bodies of the United Nations, and programmes of major importance, such as human rights, technical assistance and the United Nations Development Decade. There are now twenty-six such titles. They are generally issued in English, French, Spanish and Russian, but many have also been produced through the United Nations Information Centres in some twenty-six additional languages.

161. Two authoritative reference books on the United Nations and its related agencies are prepared by the Office of Public Information: the *Yearbook of the United Nations and Everyman's United Nations*.

162. The *Yearbook* presents a comprehensive account of the work of the United Nations and its agencies in a

given year, including summaries of the proceedings in United Nations organs and their subsidiaries. This annual series constitutes an indispensable reference source for advanced study. It is also widely used for such extra-curricular activities in schools and colleges as model United Nations sessions.

163. *Everyman's United Nations* presents in compact form a cumulative record of the activities of the Organization and its related agencies from 1945. The seventh edition of this handbook will appear in 1964.

164. A major part of the effort of OPI Publications Service was concentrated during 1963 on carrying out an intensive programme for the fifteenth anniversary of the Universal Declaration of Human Rights, in implementation of the Assembly resolution 1775 (XVII) and the Economic and Social Council resolution 940 (XXXV). The text of the Universal Declaration of Human Rights was printed in fifty-four languages and distributed throughout the world. In collaboration with UNESCO, OPI produced a revised edition of the handbook for teachers entitled *Teaching Human Rights* (English).

165. Another title specifically suggested in the Economic and Social Council resolution — *The Universal Declaration of Human Rights: A Standard of Achievement* — was published in twenty languages. The publication deals with the meaning and influence of the Universal Declaration.

166. Among other pamphlets issued in connexion with the fifteenth anniversary of the Universal Declaration were "United Nations Work for Human Rights," "Development of Human Rights" and "Declaration of the Rights of the Child". Plans are now under way to publish in some thirty-three languages the United Nations Declaration on the Elimination of All Forms of Racial Discrimination adopted by the General Assembly in 1963 (resolution 1904 (XVIII)).

167. A forty-seven-page booklet entitled *Apartheid in South Africa*, published in six languages, summarized the report to the General Assembly's Special Committee on the Policies of *Apartheid* of the Government of the Republic of South Africa.

168. Also, as in previous years, outside publishers have been assisted in preparing books and pamphlets about the work of the United Nations family. Many of these materials are designed for use by students at the various levels of education, such as the Oceania-United Nations Study Guide Series, cited earlier.

169. A particularly welcome development in this period has been the appearance of a number of books for younger children. Most of these have as yet been issued only in English. Examples of such publications include the following: *Faces Looking Up* (Harper and Row, 1960); *Let's Find Out About the UN* (Franklin Watts, 1962); *Let's Learn About the UN: A Coloring Book for Children* (Lothrop, Lee and Shepard, 1963); and four books on United Nations subjects in the Getting to Know Series published by Coward-McCann, respectively on UNICEF (1961), FAO (1962), WHO and UNESCO (1963).

170. Several books have also appeared in another much-needed category, i.e., material with fully accurate yet simply written text and many illustrations; which can be used for individual reading or in study programmes with young people, from middle-primary years on, and also by adults who are not experts in the subject. A few examples are *The First Book of the United Nations*, by Edna Epstein (Franklin Watts, 2nd revised ed., 1963) which has been translated and issued by Governments and/or commercial publishers in five languages (Hebrew, Hindi, Malayalam, Tamil and Nepali); *The First Book of International Mail: The Story of UPU* (also issued by Franklin Watts, 1963); and the United Nations booklet entitled *The United Nations: What You Should Know About It* (5th English ed., 1963), which has been translated and issued in some fifteen languages by commercial publishers in various countries. In the case of this last title, it may be of interest to note that it has been widely bought by Governments in several countries for use in adult literacy schemes and in various armed forces education programmes.

171. Copies of all books produced under the aegis of the Special Projects Section of the United Nations Publishing Division are sent as a matter of established practice to each of the forty-six United Nations Information Centres. This is done both to stimulate production or adaptation of the books in local languages and to augment the Centres' working reference collections of materials useful for teaching about the United Nations.

172. Also, basic articles are provided each year for a number of encyclopaedias and yearbooks which undoubtedly are used extensively in educational programmes at various levels and as reference material in libraries.

4. Radio

173. While the operations of the United Nations Radio are mainly directed to the attention of general listening audiences around the world, considerable and increasing use is being made of United Nations radio material in school broadcasts and also in school and adult education programmes. For example, in some countries, recorded feature or documentary programmes prepared by United Nations Radio are broadcast locally at the convenience of stations that carry them, after which the stations loan the recordings for off-the-air use to schools and often also to libraries and community organizations for use in adult education programmes. More commonly, many broadcasting organizations use United Nations radio material at such times and with such publicity as to assist its optimum availability to schools.

174. Meetings of United Nations organs, features and special documentaries form the basis of the radio programmes produced by the Office of Public Information. These programmes are recorded and made available without cost to broadcasting organizations in Member States and Territories.

175. The principal meetings of the General Assembly and Security Council are broadcast by short-wave to Latin America, Europe, the Middle East, Africa and

Asia. News programmes are produced daily during General Assembly sessions and weekly at other times. During the period under review, increased attention was given to the provision of news service to Africa, with daily and weekly broadcasts in English and French. In 1963, news in Swahili was instituted for East Africa.

176. Feature programmes produced by United Nations Radio deal with the major questions currently before the Organization, and the special documentary programmes provide information in depth on the more important projects and on subjects of wide-spread topical interest. For example, in December 1962, a special team was sent to West and Central Africa to cover the session of the Economic Commission for Africa and to record material in English and French for documentary programmes on African economic and social development. On invitation, two national radio organizations sent their own correspondents as members of this team. As a result of this tour, two half-hour documentaries in English were written and produced at United Nations Headquarters and distributed to all the English-speaking African countries. The series was entitled "Life More Abundant" and dealt with economic planning in Africa and African aspects of trade and commerce. Also at Headquarters a series of six fifteen-minute "Perspectives" in French on the same subject — African development — were written, produced and distributed to the French-speaking African countries.

177. For United Nations Day, 1963, a series of five documentaries was prepared by the Radio Features Service and widely distributed. They are as follows:

- "Eighteen Hundred Keys" — Introduction to the United Nations Conference on the Application of Science and Technology for the Benefit of Less Developed Areas, Geneva, 1963.
- "International Interim" — A report on the administration of West New Guinea (West Irian) by the United Nations Temporary Executive Authority.
- "The Child in a Changing World" — This programme, a round-table discussion, was produced for UNICEF by United Nations Radio.
- "Tomorrow Will Tell" — A documentary for United Nations Day, which reviewed the United Nations during 1963 and the change in the international climate following the Cuban crisis of 1962.
- "How High the Tide" — A documentary prepared especially for the fifteenth anniversary of the Universal Declaration of Human Rights in December 1963, which dealt with progress in human rights since the Universal Declaration was proclaimed in 1948.

178. In addition to its own productions, United Nations Radio further assists teaching about the United Nations through co-operation given to radio services of national, state and local education authorities, both through Headquarters and through the United Nations Information Centres. This includes consultation and collaboration in preparing programmes about the United Nations family suitable for school curricula; providing such producers with archives services, production assistance, research, etc. During the period under review

school radio broadcasts on the United Nations family were produced in this way by national or local radio services in a growing number of countries throughout the world.

5. Films

179. Films are widely used in school and adult education programmes on the United Nations in areas where projectors and other facilities are available.

180. During the period under review, United Nations Film Services produced fourteen new titles on the work of the United Nations family, on such subjects as the operation in the Congo and the Temporary Administration of New Guinea. These prints were issued in fifteen languages: Arabic, Danish, English, French, German, Hindi, Italian, Norwegian, Persian, Polish, Portuguese, Serbo-Croat, Spanish, Swedish and Swahili.

181. In this period also, a new Educational Film Series, comprising short basic documentaries on the purposes and work of the United Nations and its related agencies was initiated, and the first six films in the series were produced and distributed. The titles are: "The Charter", "The General Assembly", "The Trusteeship Council and system", "The Economic and Social Council", "The Security Council" and "The International Court of Justice".

182. Further films in this series are currently in progress. At the end of 1963, one on the World Meteorological Organization was in the final stages of completion, and rough assembly of a similar film on UNESCO had commenced. Research and scripting had also begun for a film on the International Telecommunication Union. The running time of each film is kept within thirteen to fifteen minutes, to fit easily into class schedules. The films are also suitable for use by adult study groups and are proving highly successful. Several hundred prints of each film are in circulation through the United Nations Information Centres, regional economic commissions, offices of the Technical Assistance Board, and through educational outlets in Member States. These films are generally available in Arabic, English, French, German, some of the Nordic languages, Portuguese, Serbo-Croat, Spanish and Swahili.

183. The Film Footage Library continues to provide to governmental and commercial producers raw material on United Nations subjects for their own national productions. Wherever possible, co-operation with local United Nations Associations and other non-governmental organizations is undertaken to further the distribution of educational films, both at Headquarters and through the efforts of regional visual information officers posted in various information and production centres.

184. With the growth of television in many developing countries, valuable new outlets for film showing are utilized.

6. Television

185. United Nations Television Services have continued to expand. In various degrees more than forty countries have received material or programmes from

the United Nations during the period 1960-1963. With the unprecedented growth of television also in developing countries, this medium has emerged as a most important outlet for educational visual materials. Programmes of an educational nature are being provided in fourteen languages at the request of television organizations.

186. Increasing use of United Nations films material and facilities is being made by television organizations in Member States in producing their own programmes about the work of the United Nations and specialized agencies.

187. The output in Latin America rose significantly by distribution of new series of thirteen programmes in Spanish entitled *Perspectiva internacional*. During 1963, television productions were also distributed in Arabic, Russian, Polish, Serbo-Croat, Finnish, French, German, Italian, Portuguese, Swedish and Dutch.

188. In the United States, the National Educational Television Network has continued to commission the production of a series of background news programmes, "The United Nations Review", covering the weekly highlights of the General Assembly in session. A similar weekly series is produced for the Canadian Broadcasting Corporation.

189. A special series of five fifteen-minute programmes was produced early in 1962 for the National Education Association of the United States: "UNESCO and Education", "FAO and Education for Freedom from Hunger", "The United Nations Special Fund and Education", "UNICEF and Health Education" and "Strengthening the United Nations through Education".

190. A separate series of documentary educational films was produced under the title "International Zone" and distributed to some sixty stations in Australia, Canada, Ireland, Kenya, Malta, the Netherlands Antilles, Nigeria, the Philippines, the United Kingdom, and the United States in English. Language adaptations are now in preparation to make this series available in additional areas.

7. Photographic features

191. The Photo Library has been continuously kept up to date with some 5,000 carefully selected photographs each year of the wide-spread field activities and meetings of the United Nations. During the period under review a United Nations photographer has been on special assignment in the Congo.

192. Duplicate photo libraries have been established in the European Office of the United Nations at Geneva and in the United Nations Information Centre in Mexico. In addition, photographs of general and regional interest are supplied to United Nations Information Centres on a regular basis. Three or four photo catalogues, illustrating the latest coverage available, are prepared each year and sent to Centres and to a selected list of editors and publishers for their use in ordering prints.

193. The photographs in the libraries also provide the basis for filmstrips, wall-sheets, exhibit prints and the annual poster display set which is currently printed in some thirty-three languages. A set of wallsheets on the

basic organs of the United Nations has been completed and brought up to date and distributed to the Centres. Wallsheets containing the Declaration on the granting of independence to colonial countries and peoples and General Assembly resolution 1698 (XVII) on racial discrimination in Non-Self-Governing Territories have each been printed in some twenty-seven languages and distributed.

194. In addition, photographs supplied by the libraries and United Nations Information Centres are widely used by governmental information services, newspapers, periodicals and publishers of educational books and encyclopaedias.

8. Filmstrips

195. During the period under review eight filmstrips were produced, bringing the total number of those currently available to thirty-five. Titles include "The United Nations General Assembly Meets" (colour), "The United Nations Security Council", "The International Trusteeship System", "Scientific Co-operation in the United Nations", "Community Development in Asia", "Co-operation in Central America", "The United Nations Economic Commission for Asia and the Far East" and "The United Nations and the Refugees". In most cases, background notes are prepared or explanatory United Nations information leaflets are distributed with the filmstrips.

196. In various Member States, ministries of education, national education authorities or United Nations Associations have taken over a number of United Nations filmstrips for translation, printing and/or distribution. Filmstrips are distributed commercially by educational publishers in Argentina, Canada, France, India, Italy, Sweden, the United Kingdom and the United States. A contract is under negotiation with a firm in Finland. Elsewhere filmstrips are available through United Nations Information Centres.

9. External Relations Division

197. The External Relations Division is responsible for the direction of the world-wide network of United Nations Information Centres. The Division's Overseas Briefing Unit keeps the Centres constantly informed of developments at Headquarters and during 1963 expanded its work to meet the regional and language needs of certain Centres more adequately. The Liaison and Special Projects Unit within the Division maintains contact with the specialized agencies on information programmes of joint interest and provides the secretariat of the Consultative Committee on Public Information. Liaison with non-governmental organizations serving as re-disseminators of information on the United Nations is a responsibility of this Unit, as are OPI's fellowship and interne programmes. In collaboration with UNESCO, it also maintains contact directly, and through the Information Centres, with ministries of education, educational authorities and individual schools, colleges and universities, with a view to encouraging teaching about the United Nations and the production of textbooks, audio-visual

aids and other materials on the United Nations for educational purposes. Planning of observances of United Nations Day and Human Rights Day is also done within the Division.

10. United Nations Information Centres

198. As of 31 December 1963, forty-six United Nations Information Centres were in operation throughout the world. This total includes the information officers assigned to the Economic Commission for Africa, the Economic Commission for Asia and the Far East and the Economic Commission for the Latin America.¹¹ During the period under review, the programme of opening new Information Centres has been planned in the light of the General Assembly resolution 1405 (XIV) which, *inter alia*, requested the Secretary-General "with the agreement of the Governments concerned, to establish such new information centres as appear necessary and practicable, particularly in those regions where mass information media are less developed...". In accordance with this policy new Information Centres have been established in Africa, Asia, Latin America and the Middle East.

199. The Information Centres undertake to promote study and teaching about the United Nations in a number of ways. They maintain contacts with educational authorities at the national, regional and local level to encourage the introduction of United Nations subjects and materials into the curricula of schools, colleges and universities. The Centres play an active role in planning and assisting in seminars on teaching about the United Nations and the specialized agencies. These seminars, which are held periodically on a regional or national level, are attended by teachers, educational officials and curriculum planners. The Centres are requested to provide speakers, printed materials, films and other services.

200. The Information Centres also maintain regular liaison with professional teachers' associations and with other educational bodies in order to encourage individual teachers to take a greater interest in the United Nations and its related agencies. Stimulation of the production of study materials on United Nations subjects either by national education authorities or by private publishers is a regular function of all the Centres.

201. Several of the Centres maintain regional radio-visual production units which undertake to provide fuller coverage of United Nations programmes and activities in the area, to assist productions by national radio, television and film organizations on United Nations themes, and to encourage the wider use of United Nations films, filmstrips and radio programmes.

202. The reference libraries maintained by the Centres containing the *Official Records*, substantive studies and reports, and the periodicals of the United Nations and the specialized agencies are used regularly by textbook writers, school librarians and teachers who seek materials for the preparation of study units and educational texts.

¹¹ Two new Information Centres were opened during the first quarter of 1964, at Dakar (serving Senegal) and Kathmandu (serving Nepal). Thus, as at 15 April 1964, forty-eight Centres were in operation.

203. Many schools, colleges and universities are the regular recipients of the weekly or bi-weekly newsletters which are produced by most of the Information Centres. The newsletters, which are supplemented by press releases and feature material, provide information on the current activities and programmes of the United Nations and the agencies. In some instances the newsletters are supplemented by bibliographies and reading lists of related official material.

204. Information materials, in the form of leaflets and booklets, are supplied by the Centres, within budgetary limits, to school, college and university libraries and to individual teachers for use in their course work. Many of the Centres undertake the regional adaptation and translation into local languages of such booklets and leaflets, which facilitates their use in educational programmes. In addition, some Centres also originate and issue booklets and other materials useful for teaching purposes in the country or region concerned, e.g., *Acción de las Naciones Unidas en México*, and a booklet in Durri on the activities of the United Nations in Afghanistan.

205. United Nations films, filmstrips, photographs and posters are also available, through the Centres, to educational institutions. In a number of cases the Centres operate a film-loan service themselves. In other areas this responsibility is given to a non-theatrical distributor who can best meet the needs of schools, colleges and universities wishing to make use of such visual aids. Many of the Centres have reported that during the period under review increasingly wide use has been made of United Nations films and filmstrips in the educational institutions of their areas.

206. The rapid growth of television services which has taken place in recent years in many areas of the world has afforded new opportunities for the utilization of this medium in teaching about the United Nations. The Information Centres maintain regular contact with the educational sections of the television services of their areas as well as with individual producers and writers in order to suggest topics for possible use and to provide background information or film footage. Similarly, in the field of radio, the Centres work closely with national radio organizations and with local outlets not only in supplying news, documentary and feature programmes but in encouraging the national and local outlets to produce their own programmes, which are frequently devoted to accounts of the activities of the United Nations and the agencies in the area concerned.

207. Special observances, such as United Nations Day and Human Rights Day, provide further opportunities for the introduction of United Nations subjects into the classrooms at all levels. The Centres undertake wide distribution to educational institutions of specially produced materials and work closely with the ministries of education in planning the observances. Frequently the Centre Directors and other staff members are called upon to speak to teachers and students in connexion with these observances.

208. Various United Nations conferences, such as the Conference on the Peaceful Uses of Atomic Energy and the Conference on the Application of Science and Tech-

nology for the Benefit of Less Developed Areas, afford unusual opportunities for relating technical activities of the United Nations to subjects being studied in schools, colleges and universities. Special pamphlet material and reports of the conferences are circulated by the Centres as widely as possible to educational institutions.

209. In accordance with the requests of the General Assembly, and in co-operation with national authorities, the Centres have also undertaken extensive distribution to schools, colleges and universities of pamphlets and wallsheets, in many languages, on the Declaration on the granting of independence to colonial countries and peoples and on General Assembly resolution 1698 (XVI) on racial discrimination in the Non-Self-Governing Territories.

210. The United Nations Development Decade and such related programmes as the FAO Freedom from Hunger Campaign have provided further opportunities for the Centres to relate the activities of the United Nations and the agencies to the lives of individual students; this is done through printed and visual materials outlining the objectives sought and the machinery of international co-operation that has been established to assist in realizing these objectives.

211. Of interest is an arrangement worked out with Thammasat University, in Bangkok, by the Information Service at the Economic Commission for Asia and the Far East (ECAFE). Beginning in June 1963, groups of university students, especially from the school of Journalism, have attended, as observers, selected ECAFE conferences as a recognized part of their training. Each group of some fifty students has been given pre-conference briefings by the Information Service and supplied with essential documentation. The students report on the conference to their faculty supervisor and are also encouraged to write short pieces for the Press under the guidance of the ECAFE Information Service. During 1963, such student groups observed three ECAFE meetings.

11. *Non-governmental organizations*

212. The Office of Public Information co-operates closely with non-governmental organizations (NGO's) whose assistance in developing a wider and deeper understanding of the United Nations has long been valued. Frequent briefings by senior members of the Secretariat of the United Nations and its related agencies are arranged for their representatives at United Nations Headquarters and a considerable volume of documentation, some of it especially prepared, is made available for their use. In turn, the NGO representatives re-disseminate information about the activities of the United Nations both to their members and the general public and often also to schools and adult education groups, through their newsletters, pamphlets and other publications as well as through a large number of group meetings of various types. In some cases, NGO's are able also to make use of the mass media, particularly radio and television.

213. An annual conference of non-governmental organizations, arranged in co-operation with the Office of Public Information, is held at United Nations Head-

quarters each spring. It is usually devoted to one or more themes of high topical priority which the organizations intend to stress in their information work in the year ahead, e.g., "The New Nations and the United Nations" (1960), "Some Problems arising from Industrialization and Urban Growth" (1961), and "Aspects of the Development Decade" (1962 and 1963). Special attention was given in 1963 also to human rights, in preparation for observances of the fifteenth anniversary of the Universal Declaration of Human Rights.

214. Liaison with thousands of national organizations, large and small, is further maintained by the United Nations Information Centres. United Nations publications, including brochures, leaflets, posters, reprints from the *United Nations Review* and the like are supplied in bulk to these organizations for distribution to their members and other outlets. In some countries NGO's have also formed national committees which, among other activities, help to plan and promote United Nations and Human Rights Day observances. Many organizations also provide vigorous support to such educational and action programmes as the work of UNICEF and the Freedom from Hunger Campaign launched by FAO.

215. It may be noted that many of the NGO's that work closely with OPI on the dissemination of information are also in consultative status with the Economic and Social Council or are national affiliates of such bodies.

12. *Fellowship and interne programmes of the Office of Public Information*

216. The fellowship and interne programmes of the Office of Public Information have been designed to provide opportunities for study, briefings and discussions of United Nations purposes and work for specific categories of participants who have a direct concern in the study and dissemination of information about the role of United Nations in world affairs. Three such programmes were conducted by OPI during the period under review, each held annually:

Senior Fellowship Programme

217. This programme was given a new orientation in 1961. In previous years, participants had been drawn from among educators, editors, representatives of non-governmental organizations, etc. In order to give a more sharply defined focus to the programme, it was decided in 1961 to restrict the participants to outstanding press, radio and television professionals at the policy-making level. Accordingly, thirteen senior fellows from all parts of the world were invited to spend up to four weeks at United Nations Headquarters during the sixteenth session of the General Assembly. In 1962, the programme was held in Geneva and took the form of an editors' round-table with twenty participants at the managing-director level from countries throughout the world. The meeting was planned to coincide with the summer session of the Economic and Social Council and was devoted to study of the aims and action programmes of the United Nations Development Decade. The 1963 programme was held at Bangkok from 25-30 November, in co-operation with

the Economic Commission for Asia and the Far East, as a regional round-table for twenty senior editors from the Asian area. Special attention was given to Asian development problems within the context of the Development Decade, with particular reference to the forthcoming United Nations Conference on Trade and Development, the Freedom from Hunger Campaign and the results of the United Nations Conference on Science and Technology held earlier in 1963.

Triangular Fellowship Programme

218. This programme, established in 1961, is designed to deepen the understanding of young journalists and broadcasters in world and regional problems in the economic and social fields, with special attention to the role of international co-operation in the development process. Participants are selected from countries which are members of the United Nations Economic Commissions for Africa, Latin America, and Asia and the Far East. During the first phase of the programme, the participants study the development problems and programmes of their own regions at the headquarters of their respective regional economic commissions. Following this, the groups assemble at United Nations Headquarters for a series of intensive briefings on current economic and social conditions and trends, technical assistance programmes, Special Fund projects, etc. During their stay at Headquarters, participants also attend meetings of the General Assembly and discuss ways and means of disseminating information on economic and social subjects in their own countries. Finally, the participants proceed to the European Office of the United Nations, in Geneva, to be briefed on the work of the Geneva-based agencies and of the Economic Commission for Europe. During the three years 1961-1963, forty fellowships have been awarded to participants from twenty-five countries.

Student Interne Programme

219. Two parallel interne programmes are held each year — one in its twelfth year at United Nations Headquarters, New York, and a second at the United Nations European Office in Geneva, which began in 1963 during the Economic and Social Council's summer session. Both programmes are held for four weeks during the university summer holidays. The programmes, which are operated without direct cost to the United Nations, are designed to provide college and university students who are specializing in international relations, political science, law, economics and related subjects, an opportunity for a month's intensive study and discussion of the work of the United Nations family. In 1963, the Headquarters programme had thirty-four participants from eighteen countries. The Geneva programme included fifty-two students from twenty countries.

13. *Public services*

220. During the period 1960-1963, more than a million visitors a year came to the United Nations Headquarters, took a guided tour and learned at first hand about the work of the Organization and its related agencies. Of this number, well over 30 per cent comprise groups of upper

primary and secondary school students, chiefly from North America. On advance notice, special programmes are arranged for students and for other groups. A typical schedule might include a guided tour, a briefing on a particular aspect of the work of the United Nations family in which the group is interested, attendance at a meeting of the General Assembly or other body currently in session, and lunch in the Delegates' Dining Room. In addition, public lectures and general briefings are given and United Nations films are shown at regular intervals throughout the day.

221. In 1963, for example, such programmes were arranged for 2,110 groups, totalling 116,520 persons. Briefings by members of the Secretariat and specialized agencies were arranged by the Visitors' Service for 540 of these groups, which included 34,232 persons. The topics most in demand were as follows: General United Nations aims and structure (93); UNICEF (62); UNESCO (38); Political affairs (35); Technical assistance (31); Economic and social affairs (27); WHO (24); Human rights (23).

222. Films on the work of the specialized agencies were again used by Visitors' Service for its public showings during the year. They included nine specialized agency films and ten produced by United Nations Television for the International Zone series. These films were shown to approximately 96,716 persons, an increase of nearly 16,000 over the 1962 figure.

223. Careful consideration was given during 1963 to the most effective way in which the Visitors' Service could meet the unique information opportunity provided by the New York World's Fair in 1964 and 1965. It was decided that guided tours will be given for the first time in the evening, Monday through Friday, from mid-May to mid-september in 1964 and 1965, in addition to the normal seven-day-a-week operation. The United Nations bookshop will also remain open during this period, as will the UNESCO and UNICEF counters in the concourse area.

224. During the period under review, more than 70,000 requests for information were handled each year by the Public Inquiries Unit at Headquarters. Of this total, approximately three fourths came from teachers and students in upper primary and secondary schools. The information requested most frequently was on the social and economic activities of the United Nations family, which tend to be emphasized in school study programmes. However, urgent political questions also evoked special interest as they came under active consideration by United Nations bodies.

14. *United Nations Office at Geneva*

225. Many visitors and study groups also come to the United Nations Office at the Palais des Nations, Geneva, particularly at the time of the meeting of the summer session of the Economic and Social Council, held each year during July-August. For example, during 1963, ninety-eight educational groups came to the Office for lectures, to attend meetings of United Nations bodies in session and see United Nations films. There were 2,750 persons from non-governmental organizations, univers-

ities and schools. Briefings were given in French, English, German, Italian and Spanish.

15. Depository libraries

226. The United Nations has established a network of depository libraries which receive its documents and publications free of charge and make them available for reference use. There are at present 252 depository libraries in eighty-nine countries and territories throughout the world. Some of these libraries also receive and service deposit collections of the documents and publications of other agencies related to the United Nations. These libraries are much used in study and teaching about the United Nations, particularly at the university level.

C. UNESCO PROGRAMME AND SERVICES

227. In pursuance of resolutions adopted by the General Conference of UNESCO at its eleventh and twelfth sessions in 1960 and 1962,¹² UNESCO has continued to encourage and assist teaching about the United Nations during the period under review.

228. The programme has comprised activities related to education in schools and other educational institutions, to the education of young people and adults out of school, and to the dissemination of information for the general public.

229. Methods of work have included the production of printed, visual and audio-visual materials; the organization of seminars and meetings; the promotion of special projects in school, teacher-training institutions and organizations; the provision of fellowships for travel and study; clearing-house services for the exchange of information; and other services. In a number of instances, projects have been carried out by UNESCO National Commissions or by non-governmental organizations with financial aid and other assistance from UNESCO.

230. Many of UNESCO's educational activities — especially those designed to promote better international understanding — contribute indirectly to the promotion of teaching about the United Nations by helping to create a favourable climate for understanding the role of the United Nations and its related agencies and the need for international co-operation in the solution of world problems. In the present report, however, only those activities which are related more directly to teaching about the United Nations are mentioned. They are grouped under four main headings: production of materials; seminars and meetings; other projects; special events.

1. Production of materials

(a) Materials for teachers

231. During the period under review, UNESCO issued publications and documents for use by teachers.

¹² See United Nations Educational, Scientific and Cultural Organization, *Record of the General Conference, Eleventh Session*, resolutions 1.1512, 1.1513, 5.201, 5.202, 5.211, 5.221, 5.232; and *ibid.*, *Twelfth Session*, resolutions 1.142, 1.143, 5.201, 5.211, 5.221, 5.2312.

232. In 1963, *Telling the United Nations Story: New Approaches to Teaching about the United Nations and its Related Agencies*, by Leonard Kenworthy (United States of America), was published in English, French and Spanish. This book, which is intended for use as an aid in both school and out-of-school educational programmes, draws to a considerable extent upon information gathered for the joint United Nations/UNESCO report on teaching about the United Nations presented to the Economic and Social Council in 1960 (E/3323 and Add.1-3). The greater part is devoted to practical ways of improving teaching about the United Nations at different levels of education, with particular attention to methods and resources. Among the appendices are excerpts from the Charter of the United Nations and the Constitution of UNESCO; the full texts of the Universal Declaration of Human Rights and the Declaration of the Rights of the Child and lists of sources of further information.

233. The UNESCO secretariat collaborated with the Secretariat of the United Nations in the preparation of a handbook for teachers and students entitled *How to Plan and Conduct Model United Nations Meetings*, which was published in English in 1961; and in the preparation of the revised edition of *Teaching Human Rights*, published in English, French and Spanish in 1963.

234. UNESCO also collaborated with non-governmental organizations in a number of publishing projects. Thus, with financial assistance from UNESCO, the World Federation of United Nations Association (WFUNA) published in English and French in 1961 a booklet for teachers, youth groups and adult groups entitled *If You Wish Peace, Cultivate Justice: The International Labour Organisation after Forty Years*, by Stuart Maclure (United Kingdom); and in 1962, another booklet, likewise in English and French, entitled *A Common Standard of Achievement: The Universal Declaration of Human Rights*, containing essays on different aspects of human rights by a number of specialists. In 1963, again with UNESCO's aid, WFUNA prepared a study guide on India which includes information on the activities of the United Nations and the specialized agencies in that country. The World Confederation of Organizations of the Teaching Profession, with financial and other assistance from UNESCO, continued in 1960 and 1961 a project for the production of materials at the national level in different countries. In this project the texts of four pamphlets on the United Nations for secondary schools and teacher-training institutions, and lesson notes and illustrative material for primary and middle schools, were prepared in Ghana; in Greece, an illustrated booklet on the United Nations and the specialized agencies, entitled *Towards a Better Life with the Help of the United Nations* was published; and in Korea a supplementary reader on the United Nations for use in primary schools was prepared. Also with financial and other assistance from UNESCO, WCOTF published an illustrated mail calendar, with texts in English, French and Spanish, dealing with the aims and work of the United Nations and the specialized agencies. In 1960, the Conference of Internationally-Minded Schools, with financial aid from UNESCO, published a booklet in English for teachers entitled *Experiments in International Education*, by

Elizabeth H. Maxwell (United Kingdom), containing practical suggestions based on the experience of schools affiliated with the organization.

235. Translation of the UNESCO publication *Education for International Understanding: Examples and Suggestions for Classroom Use*, issued in English, French and Spanish in 1959, were published in Italy, Japan and Sweden. This booklet contains separate chapters devoted to teaching about the United Nations and to teaching about human rights.

236. In addition to the materials cited above, the secretariat issued a substantial number of documents concerned *inter alia* with teaching about the United Nations — for example, reports of seminars for teachers, descriptions of special projects in schools, etc.

(b) *Material for the general public*

237. Most of the publications and other materials produced by UNESCO are also being used in teaching about the United Nations system in schools and other educational institutions as well as in youth and adult organizations. To a large extent UNESCO's information materials are being distributed through National Commissions for UNESCO, United Nations Information Centres, UNESCO field offices and international non-governmental organizations. The rest of the material is distributed directly to national and local groups, including women's and youth organizations, civic and service clubs, schools, libraries, etc. In recent years, UNESCO clubs were created in a number of countries and such clubs are now active in Cameroon, Ceylon, Finland, France, Gabon, Federal Republic of Germany, India, Israel, Italy, Japan, Luxembourg, Madagascar, Monaco, Panama, Poland, Senegal and Spain.

238. In the last few years a growing number of demands for information on the work of UNESCO and United Nations agencies came from individual students, indicating that in many Member States teaching on the United Nations has become part of the curriculum at schools and universities. Since 1960, 3.2 million items — poster sets, display sheets, manuals, booklets and reprints from magazines — describing the aims and activities of the United Nations and of UNESCO and the other specialized agencies have been produced and distributed.

239. UNESCO has continued to present basic facts about UNESCO and its programme in the form of information manuals. Revised editions of *Information Manual No. 1: What is UNESCO?* were reprinted repeatedly and in 1962 the new *Information Manual No. 4: International Aid for Progress* was issued, describing UNESCO's role in technical assistance and Special Fund projects. Among the booklets which have been widely distributed, the following brochures should be mentioned: *Africa Calls, Towards Equality in Education, Science and the Future of Arid Lands, Teaching about the Orient, Education and Progress, East and West . . . Towards Mutual Understanding* and *Encounters and Celebrations*.

240. The following photographic poster sets and photo features were produced: "Africa — Challenge for the

Future", "Building for the Future", "New Life for Arid Lands", "For All Children", "Going to School Around the World", "Fifteen years — UNESCO and Human Rights", "Information for All", "Secrets of the Sea", and "The Gift of Knowledge". Furthermore, a number of photographic exhibitions were produced for circulation in Member States.

241. UNESCO sponsored jointly with the United Nations the production of United Nations Study Guide Series, described earlier in this chapter under section A "Joint activities". The material for the series was partly assembled by the UNESCO Youth Institute in Gauting (Federal Republic of Germany).

National language versions of information materials

242. UNESCO has continued to stimulate the production of information materials in languages other than English, French and Spanish, with the aid of national commissions or national non-governmental organizations. Whenever necessary, UNESCO supplies not only visual materials without text for over-printing, but also assists financially in the cost of translating and printing.

243. Editions of UNESCO information materials have been published in the following languages: Arabic, Danish, Dutch, Esperanto, Finnish, German, Hebrew, Italian, Japanese, Korean, Norwegian, Russian, Serbo-Croat, Swedish and Urdu.

Periodicals

244. UNESCO periodicals, press releases and special publications have continued to diffuse information about the United Nations and its related agencies to a large audience.

245. The *UNESCO Courier*, published in Arabic, English, French, German, Italian, Japanese, Russian and Spanish editions, and with an average circulation of 375,000 copies, issues special numbers and publishes articles on the activities of the United Nations system of organization. To an ever-larger extent, this monthly periodical is being used as an aid to teaching in schools and other educational institutions. Particularly successful were a special double number (July/August 1962) entirely devoted to the international campaign against hunger, and a series of articles entitled "Aspects of Economic Development", based on a pamphlet produced by the United Nations, which appeared in serialized form in four issues (July/August 1962, September 1962, November 1962, March 1963). A combined reprint of these articles was also produced in English, French and Spanish. Mention should also be made of a double issue (July/August 1963) entirely devoted to the United Nations Conference on the Application of Science and Technology for the Benefit of Less Developed Areas, and of a special number (December 1963) on the fifteenth anniversary of the Universal Declaration of Human Rights. Individual articles on the work of United Nations organizations were regularly included in other numbers during the period covered by this report.

246. Information about the aims and work of the United Nations family is also provided in *UNESCO Features*, a press service of articles and news items now

distributed bi-monthly in some ninety countries and territories to newspapers, broadcasting stations and editors of non-governmental organizations. *UNESCO feactures* currently has a press run of 8,000 copies in French, English, Spanish and Arabic editions. A bulletin in Russian prepared by the secretariat, with a circulation of about 650, also includes *UNESCO Features* material. In addition, arrangements with various national organizations have been concluded for the regular publication of versions of *UNESCO Features* in Dutch, German, Hindi, Japanese, Norwegian and Urdu.

247. UNESCO also continues to publish its monthly summary of information about its own activities in the *UNESCO Chronicle*, currently published in some 15,800 copies, with English, French and Spanish editions. This publication is intended especially for official government services, national commissions and non-governmental organizations having consultative relations with UNESCO, but it has also proved to be of interest to teachers and educators.

Radio

248. More than 20,000 copies of radio programmes were made and dispatched to broadcasting organizations in 158 countries and territories, and nearly 1,000 new programmes were produced. These comprised documentaries, dramatized features, round-table discussions, weekly commentaries, interviews and reportages as well as programmes on musical topics and on folk music. Programmes were produced mainly in English, French, Spanish and, since 1963, Russian. Recordings for local distribution were also made in thirty-eight other languages.

249. Activities of the specialized agencies as well as such subjects as human rights were among the topics treated on these various programmes. Other subjects included the Nubian monument; campaign, modern techniques in education, science and technology for economic development, oceanography, man in space, protection of the cultural heritage of mankind, the interaction of information media, arid zone research, information processing and peaceful uses of nuclear energy.

250. Close co-operation with the United Nations radio services was maintained, and UNESCO programmes continued to be regularly included in United Nations broadcasts from New York and Geneva. The Paris United Nations Information Centre and the specialized agencies made extensive use of UNESCO radio studios and technical facilities, as did many national broadcasting organizations recording material about UNESCO for their own programmes. Recorded materials for inclusion in programmes produced locally in Member States have been supplied to an increasingly large number of national broadcasting services, most of this material being sent in response to specific requests.

Television

251. The installation of visual equipment, to complement existing sound facilities, for the filming and production of television programmes and programme

elements was completed. These have included documentaries, interviews and round-table discussions dealing with the activities of UNESCO and United Nations agencies. The Paris United Nations Information Centre has made extensive use of these facilities for the production of its own programmes, while other specialized agencies have been invited to produced programmes in UNESCO's television studio.

252. A notable success involving the joint use of the television facilities now available at UNESCO headquarters was the UNESCO co-production with the United Nations of three television documentaries on the United Nations Development Decade, entitled "The Flags are Not Enough", illustrating the possibilities for co-operative action to stimulate economic and the specialized agencies, and stressing the urgent need for greatly expanded efforts in the fields of education, science and technology for the benefit of the less developed countries. French, German and Italian versions were produced, as well as a special film adaptation in English for Africa. Co-production was also undertaken in 1963 of two documentary programmes, the first, with the United Nations, on education and teacher training; the other, with the World Health Organization, on education and health training. These programmes as well as others planned for 1964 deal with training in the various fields covered by the specialized agencies and are being produced in the framework of the United Nations Development Decade.

253. Other television films produced in UNESCO's studios include a programme on the protection of cultural property; a series of four programmes about UNESCO, entitled *La vanguardia del progreso* and intended for Spanish-language stations; and a round-table on UNESCO and education for distribution by the United Nations Television Service in Canada and the United States of America.

254. Headquarters news and special events coverage included UNESCO's participation in a United Nations television programme in memory of Dag Hammarskjöld, which was transmitted via the communications satellite Telstar on 17 September 1962. As part of the programme, which was broadcast live from Uppsala (Sweden), from United Nations Headquarters in New York and from UNESCO House in Paris, a tribute to Dag Hammarskjöld was paid by the Director-General of UNESCO, Mr. René Maheu. During the twelfth session of the UNESCO General Conference in 1962, seventy-two filmed statements, interviews or coverage of meetings in twenty-three languages were distributed to television stations in thirty-nine countries.

255. Technical facilities, documentation and film footage were also provided on many occasions to national television organizations wishing to produce programmes dealing with the aims and activities of the Organization.

256. A meeting on "Television in the Service of International Understanding," organized by UNESCO in July 1960, was attended by twelve directors of television programmes from eleven countries representing 92 per cent of the world's television viewers.

Films

257. During the period covered by this report, UNESCO, owing to budgetary limitations, has concentrated less on direct production and more on co-producing films with a number of national organizations. In this way, films have been produced on the following subjects: the Abruzzi pilot project in community education, with the Government of Italy; the fundamental education project in Sartano, southern Italy, with a Danish company; scientific research in Africa, with the French Centre national de la cinématographie; the Galapagos Islands and the Darwin Foundation, with a French film company; the evolution of information media (a colour cartoon), with the Romanian State Cartoon Studios; the history of mathematical sciences (a colour cartoon), with Hungarofilm; the International Indian Ocean Expedition — two films — with the Commonwealth Film Unit of the Government of Australia and Films Division, Government of India, respectively.

258. Contractual arrangements have also been made for the co-production of a film on seismology, with United Press International; and on the Enugu Public Library in Nigeria, with the Nigerian Film Unit, Eastern Region; and on East-West cultural influences, with Japan's NHK Broadcasting Organization.

259. An agreement has been concluded with the Films Division of the Government of India for the production of a shorter version of its film "Citizenship through Television".

260. The films were also co-produced with organizations in the United Nations system: "Water" (initiated by the World Health Organization), and "The International Atom" (initiated by the International Atomic Energy Agency). Technical facilities were provided to the United Nations for the production of French-language versions of three United Nations films, "The Charter", "The General Assembly" and "The Trusteeship Council".

261. A staff member was seconded to the United Nations to direct the production of three documentary films on the work of the United Nations organizations in South-East Asia. The films were produced by the Government Film Units of Ceylon, India and the Federation of Malaya under the supervision of the United Nations Visual Information Officer of Asia.

262. Direct film production activities were confined to covering events of UNESCO interest and supplying this footage to newsreels and television stations, and to completing the following films: "Orient-Occident", on the exhibition of Eastern and Western art held at the Cernuschi Museum in Paris; "Arid Lands", shot in Morocco, Israel and Pakistan; and "Tsin-Tsun-Tsan", on community development in the village of that name near Patzcuaro, Mexico. These films were produced in English, French and Spanish.

263. By the end of 1963, one or more of the thirty-three films (including television programmes) produced or co-produced by UNESCO were in use in ninety-two countries. Among these may be mentioned the films entitled "Fable for Friendship", which has been dis-

tributed in eleven languages, and "Arid Lands", of which five language versions prepared by various national organizations are now in circulation.

264. Liaison arrangements were maintained with newsreel and television companies for the coverage of events of UNESCO interest, such as conferences, official visits to headquarters and the openings of the eleventh and twelfth General Conferences. Footage was supplied on request to a number of outside organizations as well as to the United Nations Office of Public Information. Since the setting up of the UNESCO Stock Shot Library, there has been a continued demand for footage concerning education, science and culture for inclusion in films and television programmes. Footage has been acquired for this library on the Nubian monuments, oceanography, natural resources; and on science, technology and education in various countries of Africa — the latter in co-operation with the United Nations Office of Public Information. There is also a Film Reference Library which now comprises 1,311 films and 1,092 filmstrips on educational, scientific and cultural subjects, which are available for showing to experts and consultants and at meetings at headquarters.

265. In 1962 the first award of the Kalinga Prize for films, was made by an international jury at UNESCO headquarters for the Polish film "In the Bay of the White Bears." This prize is to be awarded every two years by UNESCO to the director of a film judged to contribute most effectively to public appreciation of an outstanding achievement in education, science or culture resulting from international co-operation.

Filmstrips

266. During the period under review, more than 8,000 prints of UNESCO filmstrips were distributed; by 1963, fifty-six filmstrips produced by UNESCO were in circulation in eighty-nine countries.

267. New filmstrips produced since 1960 include the following subjects: "Clouds and Meteors" (in collaboration with WMO); a filmstrip in colour on primary education in Latin America; "We and the UN" (how the United Nations enters into the life of a child); the preservation of wild life in Africa; oceanography; Nubian monuments campaign; the UNESCO Gift Coupon scheme; rights of the child; and five filmstrips in the UNESCO Fables Series, within the framework of the East-West Major Project. In 1958 UNESCO produced two black and white filmstrips, on oceanography and on UNESCO's work in education.

Photographs, posters, exhibits

268. Since 1960, the UNESCO Photo Library has acquired over 10,000 new negatives and distributed some 150,000 photos, the large majority of them in response to requests from newspapers and other publications, schools, libraries, national commissions and non-governmental organizations. One hundred eighty reportages were acquired in Member States, covering activities in the fields of education, professional training, natural sciences, community development, arid lands and soil

development, libraries, Nubian monuments campaign, industrial development, handicrafts and art. News coverage by staff photographers for distribution to the world's Press included many official ceremonies held at UNESCO headquarters.

269. Five photo exhibitions consisting of 142 panels were prepared for UNESCO national commissions. An exhibition on the Nubian monuments campaign was presented at UNESCO headquarters. Materials for numerous national exhibitions on the work of the United Nations were supplied to Member States.

270. In 1962 an international poster competition was organized to select designs for one or more posters making a striking appeal on behalf of international understanding and co-operation.

2. Seminars and meetings

271. UNESCO has continued to support the organization of seminars on education for international understanding and teaching about the United Nations for teachers, youth leaders and leaders of adult education. The general practice has been to give financial and other assistance to national commissions or non-governmental organizations for the arranging of national, regional or international seminars, and a representative of the Secretariat has taken part in many instances in their work.

272. The fourth and final meeting of the Sub-Group on Teaching about the United Nations, formed in 1956 by the Conference of International Non-Governmental Organizations approved for consultative arrangements with UNESCO, was held in April 1960. Representatives of twelve non-governmental organizations took part. The final report of the Sub-Group was subsequently presented to the 1960 Conference of Non-Governmental Organizations.

273. The UNESCO Institute for Education, in co-operation with UNESCO national commissions and with UNESCO itself, continued its series of annual seminars for young teachers on education for international understanding. Teaching about the United Nations formed one of the main subjects of study at these seminars. The 1960 seminar, on the theme of better East-West understanding, was held at Bursa, Turkey, and was attended by twenty-three teachers from twenty countries. The 1961 seminar, on the contribution of teacher-training institutions, was held at Viggbyholm, Sweden, and was attended by twenty-five young men and women engaged in teacher-training in twenty-four countries. The role of headmasters, inspectors and administrators was the subject of the 1962 seminar, which was held at Prague with the participation of twenty-seven educators from twenty-four countries. The 1963 seminar, attended by twenty-six participants from twenty-three countries, was held at Brussels and was concerned with the place of the school in community education.

274. As in previous years, regional seminars on teaching about the United Nations were organized by the World Federation of United Nations Associations, with financial

and other assistance from UNESCO. One, with thirty-eight participants from eight countries, was held at Armidale, Australia, in January 1961; another, with twenty-six participants from six countries, at Accra, Ghana, in August 1961; and a third at New Delhi, with forty-five participants from twelve countries, in October 1962.

275. In the field of adult education, education for international understanding and teaching about the United Nations received attention at seminars and meetings for leaders of adult education organized by non-governmental organizations, with financial and other assistance from UNESCO. They included a seminar on adult education and ways of living in East and West organized by the Pan-Pacific and Southeast Asia Women's Association (Canberra, Australia, January 1961; twenty-five participants from thirteen countries and territories); a seminar on the access of workers to education and culture (Tashkent, USSR, April 1961; forty participants from twenty-one countries); a regional European seminar on methods of workers' education organized by the International Federation of Workers' Educational Associations (Jagermayerhof, Austria, April-May 1962; twenty-three participants from twelve countries); a consultation on adult education organized by the World Young Women's Christian Association (Crêt-Bérard, Switzerland, June 1962; forty-five participants from thirty countries); a seminar on the individual and social development of women (Caracas, Venezuela, June-July 1963); and a seminar on the economic and social consequences of disarmament and peace research, organized by the Women's International League for Peace and Freedom (Denmark, July 1963).

276. Many meetings and seminars concerned with teaching about the United Nations were organized at the national level. As examples, the following might be mentioned: the Argentine United Nations Association organized in 1960, 1961 and 1963 a series of seminars and lectures on the United Nations and the specialized agencies; in 1961 the United Nations Association in Canada co-operated with the Canadian National Commission for UNESCO for the dissemination of information about UNESCO; the Congolese National Commission organized in Brazzaville, in 1963, a seminar for regional secretaries and school inspectors on the work of UNESCO; in France, regular annual meetings of the Federation of French UNESCO clubs dealing with various aspects of UNESCO and United Nations work were held, and the Development Decade was the theme chosen for the 1963 meeting; the Federation of German UNESCO clubs organized a series of seminars, in Gauting from 2 to 6 September 1960, on human rights and race problems, from 31 August to 5 September 1961, on problems of international understanding, and in Hanover in 1963, on technical assistance; in the United States, the Conference Group of the United States National organizations on the United Nations created in 1962 an *Ad Hoc* UNESCO Committee, aiming at the spreading of knowledge about UNESCO, promotion and distribution of UNESCO information materials, training of speakers, etc.

277. Seminars for teachers organized at the national, regional or international level in connexion with the

UNESCO Associated Schools Project in Education for International Understanding are mentioned under that heading.

3. Other projects

(a) *Associated Schools Project in Education for International Understanding*

278. The best instance of direct action by UNESCO to improve school education from the point of view of international understanding and to promote teaching about the United Nations is the system of associated schools projects set up by UNESCO in 1963.

279. The purposes of the project are to encourage and assist schools in different countries to carry out special activities designed to increase knowledge of world affairs and international problems and to develop international understanding. Particular emphasis has been placed on the aims and work of the United Nations and the specialized agencies and on the principles of the Universal Declaration of Human Rights.

280. The origins of the project and its development up to 1960 were described in previous joint reports to the Economic and Social Council (E/2837 and Corr.1 and 2, paras. 286-291; E/3322 and Add.1-3, paras. 215-234).

281. Since 1960 the number of participating institutions has further increased. By the end of December 1963, 289 secondary schools and teacher-training institutions in forty-three countries¹³ were taking part or making plans to do so.

Organization of projects

282. At the outset, representatives of participating institutions selected three general themes to be studied, with special reference to the work of the United Nations and the specialized agencies: other countries, the Universal Declaration of Human Rights, and the rights of women. Many schools have based their work on a combination of two or all of these subjects. Recently, at the suggestion of the secretariat, a considerable number have selected topics of study related to the objectives of the UNESCO Major Project on Mutual Appreciation of Eastern and Western Cultural Values.

283. Some of the most successful projects have been planned as so to fit into several courses of study in the school curriculum. In this way, many resources of the syllabus can be used, and the responsibility for building up a comprehensive programme is shared among several teachers. Projects have involved as many as five subjects and, in addition, some extra-curricular activities such as exhibitions, debates, dramatic shows, visits from foreign speakers, exchanges of correspondence and other materials, or a special celebration. This kind of event some-

times serves to familiarize parents and the general public as well as the school as a whole, with the aims of the special project.

284. The main work, however, is usually done in history and geography classes, through the adoption of a fresh approach and the introduction of new information, methods and materials.

285. The amount of time given to a project has varied from school to school, depending on the scope of the topic selected for study, the materials available, the age of the pupils and other factors. In some cases the work has been spread over one or two years, in others it has been concentrated into a few weeks. A typical programme is one in which four or five lesson periods a week are devoted to the special study for two or three months, complemented by some activities out of class.

286. One of the objectives of the scheme is to discover and make known effective methods and materials to be used in education for international understanding. To enable the work of the Associated Schools to have a wide influence and to point the way to new methods of teaching for international understanding, participating institutions have been encouraged to make some scientific evaluation of the results of their special studies. The secretariat has circulated documents containing observations and suggestions on techniques of evaluation and a number of schools have attempted with success to analyse and evaluate the results of their work.

287. A number of projects carried out by schools or teacher-training institutions in connexion with the programme were described in detail in the booklet *Education for International Understanding: Examples and Suggestions for Classroom Use*, published by UNESCO in 1959. This booklet, which is now out of print, will be superseded by a new publication based on the project which is to be prepared by UNESCO in 1964.

288. Printed or mimeographed reports on projects were issued in a number of member States in which there are Associated Schools, and the programme was the subject of articles in educational journals in different countries. In most of the countries where schools or teacher-training institutions take part in the project, the Ministry of Education or the National Commission for UNESCO has appointed a supervisor or a supervising committee to assist in planning and directing the schools' activities in the programme and to maintain liaison with UNESCO.

289. In some countries experience in the Associated Schools Projects has provided the basis for significantly intensified programmes of education for international understanding in schools and teacher-training institutions. An outstanding example is provided by India, where a greatly expanded project was launched with the aid of a UNESCO expert in 1962-1963.

Services of UNESCO

290. In co-operation with the supervisors, the secretariat acts as a link between participating schools in different countries and is responsible for the co-ordination of the programme as a whole. It regularly distributes posters, filmstrips, booklets and bibliographies published

¹³ Argentina, Austria, Belgium, Brazil, Burma, Canada, Ceylon, Chili, Cuba, Denmark, Ecuador, Ethiopia, Federal Republic of Germany, Finland, France, Ghana, Greece, Hungary, India, Indonesia, Israel, Italy, Japan, Jordan, Lebanon, Morocco, Netherlands, Norway, Pakistan, Peru, Philippines, Poland, Republic of Korea, Spain, Sweden, Switzerland, Syria, Thailand, United Arab Republic, United Kingdom of Great Britain and Northern Ireland, United States of America, Uruguay and Yugoslavia.

by the United Nations, UNESCO and other specialized agencies; supplies, on request, certain documentary materials needed for particular projects, and suggests other sources for obtaining materials. Since 1961, a circular for the Associated Schools entitled "International Understanding at School" has been issued twice yearly in English, French and Spanish. This document contains information on matters of general interest to participating institutions, articles by teachers or others co-operating in the work, detailed descriptions of individual projects (including many focussed on the work of United Nations organizations), reports of meetings and seminars and bibliographical notes.

291. The schools are encouraged to exchange correspondence and information about their projects with participating institutions in other countries and may call upon the secretariat for assistance in establishing contact with one another.

292. UNESCO also provides a limited number of fellowships for travel and study to enable teachers or others directly concerned with projects to visit participating institutions in other countries and to learn at first hand about the United Nations and the specialized agencies through study-visits to the headquarters of some of the organizations. The fellowships are usually of three months' duration. Since 1960, awards have been made to teachers or others responsible for projects in the following countries: Brazil, Finland, Hungary, Israel, Poland and the Republic of Korea.

293. UNESCO has also provided financial and other assistance for special programmes of research, for the production of teaching materials or reports and for the organization of seminars.

Seminars for Associated Schools

294. With financial aid and other assistance from UNESCO, two regional seminars attended by teachers from participating schools were organized. The first, organized by the Japanese National Commission for UNESCO, was held in Tokyo in November 1961. It was attended by seventeen participants from member States in South and East Asia where there are Associated Schools. The second, organized by the UNESCO National Commission of the United Arab Republic, was held in Cairo in March 1962. Sixty persons from nine Arabic-speaking member States of the region took part in the meeting.¹⁴

295. National seminars organized by UNESCO national commissions with financial and other assistance from UNESCO were held in India (1960), Japan (1960), the Republic of Korea (1962) and Thailand (1962).

296. At all these seminars, teaching about the United Nations and its related agencies was one of the principal subjects of study.

297. The year 1963 marked the tenth anniversary of the Associated Schools Project, and an event of special significance was planned on this occasion. An international meeting of representatives of Associated Schools

throughout the world was organized by the French National Commission for UNESCO, with financial and other assistance from UNESCO. Sixty experts from forty member States in which there were Associated Schools participated in this meeting, which was held in France in December 1963.

298. Working papers prepared for the meeting included a comprehensive study and evaluation of the project, a considerable part of which was devoted to the schools' experience in the field of teaching about the United Nations.

299. Among the recommendations of the 1963 international meeting were the following:

(a) The Associated Schools Project should be extended to member States not now taking part and to levels and kinds of education not now involved, especially primary education;

(b) Study of the United Nations and its related agencies should be one of the main themes of work in participating schools, and should deal with specific projects and problems as well as the structure and principles of the United Nations;

(c) Significant national projects of education for international understanding, based on the experience of Associated Schools, should be organized, the main effort being concentrated on teacher training and the production of new teaching materials.

300. The report of the meeting will be distributed to member States, national commissions and non-governmental organizations as well as to all Associated Schools.

(b) *Expert services in education for international understanding*

301. A significant result of the Associated Schools Project was the request of the Government of India that UNESCO provide the assistance of an expert for one year to help in the development of education for international understanding in Indian schools and teacher-training institutions. This request, the first of its kind received by UNESCO, was met under the organization's programme of participation in the activities of member States. The assignment was undertaken by the Chief of the Division of Human Rights and International Understanding in UNESCO's Department of Education, who was seconded to the Ministry of Education from October 1962 to October 1963.

302. Some 350 schools and teacher-training institutions in eighteen states were selected to take part in the programme. Planning committees were established in some states and the Indian National Commission, in co-operation with the United Nations Information Centre, undertook to provide materials, information on projects in other countries and practical suggestions. The National Commission also published a circular entitled "World in the Classroom", giving examples, suggestions and other information on programmes of education for international understanding and organized two four-day workshops, one at New Delhi and the other at Mysore

¹⁴ Earlier regional seminars were held in Europe (1956 and 1958) and Latin America (1959).

City, to make detailed plans for school projects. The workshops, each of which was attended by about thirty teachers, produced twenty-three draft teaching projects for consideration by participating schools. Of these, seven were concentrated primarily on the United Nations and the specialized agencies and an equal number on human rights, with particular attention to the Universal Declaration.

(c) *Associated youth enterprises*

303. An important part of UNESCO's work with youth has been the system of associated youth enterprises, conceived as an integrated programme of action which associates experimental projects clearly contributing to international understanding and co-operation or to the development of social responsibility among young people. The system has attracted wide interest on the part of Governments of member States, national commissions for UNESCO, and international youth organizations having consultative status with UNESCO. Since 1960 UNESCO has given assistance to forty new associated youth enterprises, most of which were concerned with education for international understanding and co-operation.

(d) *Study of measures designed to promote among youth the ideals of peace, mutual respect and understanding between peoples*

304. In response to two resolutions, one adopted by the General Assembly of the United Nations (1572 (XV)) and the other by the General Conference of UNESCO (11 C/Resolution 1.1531), a comprehensive report on measures designed to promote among youth the ideals of peace, mutual respect and understanding between peoples¹⁵ was prepared in 1961-1962 for transmission to the Economic and Social Council and the General Conference of UNESCO. One of the main sections of the report was concerned with teaching about the United Nations and its related agencies. The Council considered the report at its thirty-fourth session and transmitted it (resolution 895 (XXXIV)) to the General Assembly of the United Nations. The General Conference of UNESCO examined the report at its twelfth session and adopted a resolution on the subject (12 C/Resolution 1.143).

(e) *The UNESCO Gift Coupon programme*

305. The UNESCO Gift Coupon programme, through which individuals in schools, non-governmental organizations and other groups in nineteen countries donate funds to supply needed equipment to selected educational institutions and projects, has continued to prove effective as a means of promoting teaching about the United Nations family. Participating groups sponsor a wide variety of educational programmes in connexion with Gift Coupon campaigns, for which UNESCO supplies information and promotion materials. These include complete descriptions of the projects to which coupons may be sent, giving details of their relationship

¹⁵ UNESCO/ED/189. Transmitted to the Economic and Social Council under the Symbol E/3638.

to the aims and work of UNESCO and other members of the United Nations family.

306. During the period covered by this report, special efforts were made to promote projects jointly with various agencies, in particular FAO (World Seed Campaign, replaced in 1963 by Freedom from Hunger Campaign), the United Nations High Commissioner for Refugees (project for the benefit of European and Asian Refugees in Morocco), the United Nations Relief and Works Agency (after school and recreation programme for Arab refugees), WMO (meteorological training programme).

(f) *Fellowships*

307. The 1963-1964 programme of UNESCO provides for assistance to member States in developing national services concerned with international relations and exchanges in the fields of education, science and culture. Under this programme, a few fellowships will be granted to officials in member States to travel abroad and become acquainted with the structure and functioning of institutions for international relations and exchanges in other countries. In the context of programmes elaborated for these fellows, provision will be made for them to visit UNESCO headquarters and, whenever their itinerary makes it possible, to visit the United Nations or its specialized agencies in order to get a first-hand knowledge of their aims and machinery.

4. *Special events*

Turin exhibition, 1961

308. In close co-operation with the United Nations and other agencies, UNESCO assisted in the production of a United Nations exhibition on the occasion of the international labour exhibition in Turin (Italy) in 1961.

United Nations Postal Administration exhibitions

309. At UNESCO headquarters, a number of exhibitions were organized in collaboration with the United Nations Postal Administration, in order to present the work of the United Nations organizations to philatelists and visitors to the UNESCO building: World Refugee Year Day (1960), UNESCO Service stamps (1961) and United Nations Day (1962).

International school calendar

310. UNESCO assisted a Swedish publishing firm in the preparation of an international school calendar on the United Nations system of organizations to be used as an instrument for teaching on the United Nations; it will be published at the end of 1964. A certain number of copies of this calendar will be made available, free of charge, to UNESCO for free distribution to schools in developing countries.

Commemorative events

311. United Nations Day and Human Rights Day commemorations have continued to receive special attention. In addition to fulfilling requests for materials from

groups organizing programmes on those occasions, UNESCO has produced each year special Human Rights Day material and has organized meetings for Paris school children and UNESCO staff members at which United Nations films were shown.

312. For the commemoration of the fifteenth anniversary of the Universal Declaration of Human Rights, UNESCO produced a special photographic poster set and distributed 15,000 copies of a poster illustrating article 1 of the Declaration. National commissions and international non-governmental organizations were requested to commemorate the fifteenth anniversary.

D. PROGRAMMES AND SERVICES OF OTHER AGENCIES

313. In response to a request made through the Consultative Committee on Public Information (CCPI) for information concerning the efforts of other members of the United Nations family to promote and assist teaching about the United Nations in schools and other educational programmes, statements were provided and are given below from the following agencies: ILO, FAO, WHO, the World Bank and its affiliates IFC and IDA, ICAO, ITU, WMO, UNICEF and UNRWA.

1. *The ILO Workers' Education Programme*

314. The Workers' Education Programme of the International Labour Organisation (ILO) was launched in 1956 as a systematic effort to help workers and their organizations to acquire the necessary knowledge and understanding of the social and economic problems that confront them and thereby assist them to fulfil effectively their roles in modern societies. Since the ILO and its work have multiple impacts on the functions of workers and their representatives, teaching about the aims, structure, principles, and activities of the Organisation has formed a basic element of its Workers' Education Programme from the beginning.

315. This emphasis on teaching about the ILO and its work reflects fully the views of ILO's workers' representatives who, together with government and employer delegates, participate actively in the formulation of policies and decisions of the ILO. (The tripartite structure of ILO is, of course, unique among the agencies of the United Nations family.)

316. During the period under review the Programme has expanded almost three-fold, and is regarded as one of the main operational programmes of the ILO.

Seminars and courses

317. Every year since the inception of the Programme, ILO has organized regional meetings of workers' education leaders and specialists from the areas concerned (Asia, 1959; Latin America and the Caribbean area, 1960; Arab countries, 1961; East African countries, 1962; and French-speaking countries in Central and West Africa, 1963). The purpose of these seminars is twofold: to enable the participants to benefit at first hand from

ILO's experience in matters of primary concern to the labour movement, and to enable ILO to study regional and national needs with a view to providing improved training facilities specially adapted to each area.

318. In 1960 a workshop on teaching workers about the ILO was sponsored jointly by the Office and the Canadian Labour Congress. This meeting afforded a most profitable exchange of views between leading educational directors of trade union bodies in Canada and the United States on methods, study materials and audio-visual aids which might be used by them in planning and carrying out their own programmes designed to acquaint workers with the ILO and its work.

319. Through its Workers' Education Programme, ILO participates actively in the conduct of seminars, courses and study groups organized by national and international trade union confederations and workers' education associations whose programme covers, among other things, the impact of ILO in the different social and economic spheres. During the period 1960-1963, frequent talks have been given by ILO visiting lecturers at seminars held under the auspices of the International Confederation of Free Trade Unions (ICFTU), the International Federation of Christian Trade Unions (IFCTU), the World Federation of Trade Unions (WFTU), the International Federation of Workers' Educational Associations (IFWEA) and the World Assembly of Youth (WAY), as well as by various regional and national trade unions. In addition, in 1961 ILO collaborated with the Danish Committee on Technical Assistance in conducting a bilingual French/English seminar for selected participants from twenty-one African countries.

Advisory missions

320. Since 1960, some twenty-five advisory missions have been requested and implemented within the framework of the Programme in Africa, Asia, Latin America and the Middle East. These advisory assignments are generally carried out by experts of recognized competence in trade union and related matters, who extend aid and advice to teaching institutions, help lay the foundations for such institutions where they do not already exist, and provide accelerated training for key personnel holding positions of responsibility within the trade union movement of the country concerned. At the end of 1963 a group of these workers' education experts, who had participated in one or more such advisory missions, met at ILO headquarters to compare experiences and elaborate procedures for consideration in future projects.

Fellowships

321. During the period under review, over sixty fellowships have been administered under the Programme. The fellowships, of three months' duration on average, have been awarded to selected workers' educationists and trade union leaders from Africa, Asia, Latin America and the Middle East who had exhausted national training facilities and whose level of experience was such that they could draw profitable lessons from advanced training abroad in countries and institutions having recognized

traditions in the field of workers' education. The majority of the fellows have been trained in Europe, North America and in Scandinavia. An essential part of their fellowship programmes has been briefing at ILO headquarters in various subjects within the competence of the organization and having an important bearing on the proper fulfilment of their individual functions.

Publications and study materials

322. The Programme has made a major contribution to workers' education through a series of manuals which have been published on *Freedom of Association, Social Security, Collective Bargaining, Co-operation and Accident Prevention*. These manuals serve effectively as teaching guides in workers' education courses in both economically advanced and the developing countries.

323. Simplified booklets in languages used by workers in various regions, as well as films and filmstrips on labour subjects within the competence of ILO, have helped to spread knowledge and understanding about the ILO and its work among the rank-and-file members of workers' organizations throughout the world.

Teaching about the ILO

324. Educational programmes have been organized annually at ILO headquarters under the auspices of the Workers' Education Programme for a certain number of regular study groups. These programmes are intended to provide intensive on-the-spot study of ILO's structure, functions and objectives and of the role the ILO fulfils within the wider framework of the United Nations family.

325. Among the principal study groups are the Youth Section of the German Confederation of Trade Unions (DGB), the United Kingdom Workers' Education Association, and the Scandinavian People's Summer School, with participants drawn from Finland, Denmark, Norway and Sweden.

326. Theoretical knowledge gained through study and discussion with relevant ILO officials is reinforced whenever possible by practical observation of ILO technical committees and conferences at work; for example, the Scandinavian People's Summer School is held during the session of the International Labour Conference. Participants are thus enabled to follow the day-to-day deliberations in this unique world forum in which problems of social policy of universal interest are debated. Their studies are given a further stimulus through informal meetings and discussions with delegates to the Conference from both economically advanced and newly sovereign States, as also through field visits which bring the participants into personal contact with the European Office of the United Nations and other specialized agencies in the area.

327. On return to their respective occupational pursuits, study group participants make a practice of sharing their educational experiences with their fellow workers, through national publications, lectures, study circles and group meetings.

2. *Food and Agriculture Organization of the United Nations (FAO)*

328. Following the recommendations of the World Food Congress held in Washington in June 1963 and of the First Freedom from Hunger Campaign (FFHC) Conference which took place in Rome in November 1963, FAO is in consultation with UNESCO regarding ways and means of promoting the incorporation of appropriate subject-matter into curricula at all levels of education on the aims of the Freedom from Hunger Campaign.

329. Possible projects now being discussed by both organizations include the production of prototype teaching guides and manuals in all school and out-of-school disciplines in co-operation with non-governmental organizations and national Freedom from Hunger Campaign committees. The Sixth Session of the Advisory Committee of Non-Governmental Organizations participating in the Freedom from Hunger Campaign and the Fourth Meeting of the Freedom from Hunger Campaign European Committees, held in Rome in April of this year, both recommended the delineation of specific projects including a pilot project in Africa, under which methods of teaching and prototype material would be evolved through actual teaching experience in centres for the training of teachers and teacher trainees. It is also intended to seek the co-operation of organizations already engaged in teaching about the United Nations, particularly in Freedom from Hunger education programmes.

330. FAO is conscious of the potential value of teaching about its aims and work in schools and other educational institutions of its Member States. However the financial implication of producing materials on a sufficiently large scale have restricted FAO's public information work in this field almost entirely to an approach to individual countries to include teaching about FAO and its work in school curricula and to making samples of information material available for adaptation and reproduction by local authorities. In Asia this has brought encouraging results in several countries, most notably in Japan. In Latin America a standard lesson on the world food problem was produced for use in schools. It has received favourable acceptance, particularly in Mexico. In North America, where school curricula often allow for treatment of subjects outside the more formal limits of education, an illustrated ten-page pamphlet "Let There be Bread" describing the work of FAO was produced. This pamphlet, issued in English only, has now gone through a total printing of almost a hundred thousand copies, permitting its inclusion in basic information kits provided to schools. Two further examples of useful materials for school programmes concerning the Freedom from Hunger Campaign are the booklet *Man and Hunger in the World*, published by the Council on World Tensions/Fraternité Mondiale (Geneva, 1963, issued in English and French), which provides a series of two sets of lesson plans for use in schools (for students under and over 13 years of age) and a *Teaching Guide to the Freedom from Hunger Campaign*, issued by the Education Department of the United Kingdom Freedom from Hunger Campaign Committee (London, 1963, English only).

3. World Health Organization (WHO)

331. Two publications concerning international health activities and the work of WHO have been expressly designed for schools. One is *Mankind against the Killers*, by James Hemming, which was first published in 1956 in the United Kingdom (London, Longmans Green) and has since been translated into a large number of languages, including several Indian languages. It has gone into many editions and has been found very valuable for use in schools, particularly in countries of South-East Asia.

332. The second publication, *Toward Mankind's Better Health*, appeared in 1962, as volume three of the United Nations Study Guide Series issued by Oceana Publications, Dobbs Ferry, New York. A section of this volume has been reprinted as a separate pamphlet under the title "Fighting Disease". It has appeared in English only to date.

333. A thirty-minute school broadcast on WHO and international health work has recently been produced in collaboration with WHO by the Swiss Broadcasting Corporation for use in French-speaking countries. Requests for this programme have been received up to the end of 1963 from national or local broadcasting organisms in twenty-one countries in Europe, Africa and Asia. It is intended to repeat this successful project in English also.

334. WHO itself has not produced any publications specifically for use in schools, but its regular information materials are frequently requested by schoolteachers in a large number of countries. Special mention might be made of various schools in Nigeria, Australia and Wales, which use these materials regularly. Requests from students and teachers in North American schools and colleges are also very frequent. The monthly illustrated magazine *World Health*, which is issued in English, French, Portuguese, Russian and Spanish, is also widely used in educational institutions at various levels of learning and in many countries. Picture sets and other visual materials are also supplied to schools and other educational institutions, and to seminars, workshops and conferences in response to direct requests channelled through WHO's various regional offices. The magazine is also made available on a one- or two-year subscription basis, through the sales agents of WHO throughout the world.

4. Programmes and services of IBRD, IDA and IFC

335. The International Bank for Reconstruction and Development (IBRD) and its affiliates, the International Development Association (IDA) and the International Finance Corporation (IFC) have noted an increasing interest in their activities by schools, colleges, universities and adult education organizations during the period under review. This heightened interest has been manifest in a sharply rising volume of inquiries for publications in classroom quantity and for briefings at headquarters and in classrooms by members of the organizations' staff. North American schools account for the greater share of this inquiry, but European inquiries are rising in number. The Bank's Office of Information administers these activities for all three institutions.

Publications

336. It is estimated that well over half of the bulk distribution of publications by the Bank is accounted for by inquiries from schools and adult education groups. In greatest demand is a "student kit" made up of three publications: "What they Are," a leaflet describing the structure and activities of the Bank and IDA; "This Growing World," a pamphlet describing the work of the Bank published by the Public Affairs Press; and "Loans at Work," a photographic display of selected projects which have been assisted by Bank finance. This kit is offered to teachers in classroom quantity and was designed to be of interest to students in secondary schools. In addition, a poster set is offered to teachers and is widely used by them in United Nations Week and similar special observance activities. These publications and others are also ordered in volume by Councils on World Affairs, local United Nations Associations, and similar organizations for use in adult education programmes.

337. At the university and college level, the annual reports of the three institutions, economic surveys and other specialized publications are requested for use as study materials in classes concerned with economic development. There is also an increased interest in the field of activity of the institutions as the subject of theses by graduate students and a considerable co-operative effort is extended to assist in the research of such publications.

Briefings and lectures

338. For more than ten years, the Bank has conducted briefing sessions at its headquarters for college and university student groups interested in learning about its activities. The number of such meetings has grown appreciably in the period under review and several schools now schedule a Bank visit as a regular part of their scholastic year. In addition, staff members have been invited to serve as guest lecturers in classrooms and on other campus occasions by an increasing number of colleges and universities. The most recent development has been participation by teams of staff members in special seminars for faculty members teaching economics and political science. The organization of such meetings is a co-operative effort between the Bank and local World Affairs Councils and universities.

339. In addition to participation during the school year in classroom activities there has been a growing tendency to invite staff members to participate in teacher-training programmes during the vacation months. Most such programmes are for teachers in secondary schools, especially those teaching economics and social sciences.

340. While schools in North America have accounted for virtually all of the above activities, institutions in Europe, and especially in France and Germany, have recently displayed increasing interest in arranging for similar meetings. Personnel in the Bank's Paris office arrange to deliver general briefings and also schedule staff from headquarters to deliver specialized lectures when their travel schedules permit.

Adult education

341. A continuing liaison is maintained with officials of a broad range of organizations which maintain adult education programmes. Such groups as local United Nations Associations, World Affairs Councils, Committees on Foreign Relations and many others regularly seek staff members to participate in seminars, conferences and other gatherings in which the work of the organizations will be studied. These gatherings include special observance occasions such as United Nations Day and Week but also include many other occasions throughout the year. Participation ranges all the way from delivery of the featured address to serving as resource panel members for consultation by those attending the gathering. As part of such participation, it is not unusual for staff members also to appear on a television or radio programme sponsored by the local organization.

5. ICAO programmes and services

342. The International Civil Aviation Organization (ICAO) has not yet played any active part in the specific teaching role. However, the ICAO Council, in examining the policy of public information in this organization in December 1963, decided that the secretariat of ICAO should devote special attention to interesting young people in aviation generally and in the work of ICAO.

343. It has not yet been decided in detail just what programmes we shall carry out in this field. We do, however, expect to devote particular attention to the media of radio and television. In this regard, we have already prepared and placed a series of six radio programmes devoted to the elements of aircraft technology and aimed at the level of special science programmes for youth; by the end of 1963 this series had been carried by national broadcasting networks in twenty-five countries.

344. The organization is now working on a second series of this nature, as well as a half-hour television programme which will be made in at least three languages.

6. International Telecommunication Union (ITU)

345. The ITU, which only began to undertake regular public information work as from the end of 1960, does not specifically direct any of this work at educational institutions. However, much of the material produced — particularly the monthly *Telecommunication Journal*, issued in English, French and Spanish, the information leaflet "The International Telecommunication Union: What it is, What it does, How it works," and our new poster series — are used by teachers and students in school programmes. In addition, talks are given on request to groups of students visiting ITU headquarters in Geneva.

7. World Meteorological Organization (WMO)

346. In 1960 the Executive Committee of the WMO established an annual World Meteorological Day to be

celebrated on 23 March, the anniversary of the entry into force of the organization's Convention. This decision was taken in view of "the desirability of making... the activities of the World Meteorological Organization better known and appreciated by the public of all countries."

347. All national meteorological services have celebrated this yearly occasion, which has proved most successful, particularly for educational purposes. Schools and universities are encouraged to schedule visits of the national meteorological service during the yearly celebrations of this day, and are thus brought into contact with the international exchange of weather information, which constitutes the basis of all meteorological activities and also provides one of the most concrete examples of practical day-to-day international co-operation.

348. Two publications have been issued by the organization which are particularly intended for teachers, and the help of UNESCO was obtained for their distribution. Both publications, entitled respectively *Weather and Food* and *Weather and Man*, include a brief analysis of WMO's activities and structure, as well as of its role within the United Nations family of organizations. The preparation of a book about the organization, specifically prepared for young people, is under consideration in co-operation with the United Nations.

8. United Nations Children's Fund (UNICEF)

349. Educational and information materials produced by UNICEF Public Information are distributed through the UNICEF Field Offices, United Nations Information Centres, and the UNICEF National Committees throughout the world. Replies by these three groups to questionnaires concerning the distribution of UNICEF materials indicated that the major quantities were used by schools, libraries and the offices and their outlets, in the celebration of special occasions such as United Nations Day, UNICEF's anniversary, and Universal Children's Day. Staff of mother-child centres, government officials, and opinion leaders were the next leading recipients of materials.

350. A continued and increasing effort has been made to stress, in the materials distributed to these outlets, the necessity for viewing the child as a potentially valuable member of an adult society, emphasizing the correlation between a developing country's economic and social growth, and the physical and mental development of its child population. UNICEF's efforts to assist Governments in the establishment of conditions favourable to the growth of their children and youth have been explored through many information channels in order to stimulate teaching about its work.

(a) Publications

351. Perhaps the most important recent UNICEF publication is *Children of the Developing Countries*, issued in 1963 (New York, World Publishing Co.; Toronto, Nelson, Foster and Scott; London, Nelson, 1964). UNICEF's official report on its own activities examines the needs of children in the developing countries, how these needs can be met, and the relation of programmes

for children and youth to other economic and social development measures. Swedish, Spanish and Portuguese versions of this publication are in preparation. 168 pages, illustrated.

352. *Toward a Better World for Children: The Work of UNICEF* is a 64-page illustrated booklet belonging to the Oceana-United Nations Study Guide Series, especially designed for use by teachers. It provides a study of the work of UNICEF against a background of the reasons for its existence and the problems it seeks to solve. Discussion suggestions follow each chapter, and an excellent bibliography of relevant reading material for teachers and students is listed at the back. Issued only in English.

353. *The Needs of Children*, a detailed and somewhat technical 176-page study compiled from reports prepared by UNICEF and five United Nations agencies and edited by Dr. Georges Sicault, presents clearly the complex problem of providing for the needs of millions of underprivileged children in the developing countries.

354. *A Brief Look at the Needs of Children*, a booklet of photographs and text illustrating the needs of children growing up in the developing countries, is a pictorial supplement to studies on the subject. This publication is available in English and French, and a Spanish version, entitled *Un vistazo a las necesidades de los niños*, is in press. This 48-page booklet is of interest to all groups.

355. *The Current UNICEF Figures* sheet, published yearly, is an especially useful aid in teaching about the work of the organization. This statistical data sheet for ready reference is for the use of speakers and writers, as well as teachers.

356. Certain publications are intended especially for children, and are worth-while supplements to the instruction of the teacher. A series of nine children's stories, The Child of UNICEF Series, imaginatively describes instances of children benefiting from UNICEF-assisted programmes in their respective countries. Study notes on the history and geography of each country are found at the back of the pamphlets. *UNICEF's Children: Anecdotes* contains similar stories. In addition two children's brochures, one for children 4 to 9 years old, and the second for those 9 to 12 years old, have been proposed for 1964. The brochures will contain illustrations or sketches to enliven the explanations for children in these two age-groups of the work of UNICEF.

357. Teaching aids and planning materials for instruction about UNICEF are produced by several of the National Committees for UNICEF. Examples of materials in this category are the Elementary School Study Kits, the books in the Hi Neighbor Series and records produced by the United States Committee for UNICEF.

358. Various miscellaneous pamphlets such as "UNICEF: What it is", "Declaration of the Rights of the Child", and "UN Information Leaflet (UNICEF)" (OPI/116) provide excellent background material for teaching in their concise statement of the most important facts about the structure, aims, and projects of UNICEF.

(b) *Audio-visual materials*

Still photographs

359. Various posters and pictorial exhibits in colour are available for educational purposes. Photo wallsheets, which appear four times a year, illustrate UNICEF-aided projects and the needs of children. The first colour wall-sheet will appear this year. Also to appear in 1964 is the UNICEF Map of the World, a four-colour, Mercator-projection map which will be of special educational value. UNICEF giving and receiving countries will be designated, and the flags of the States Members of the United Nations will border the map.

360. UNICEF maintains an extensive library of approximately 5,000 black-and-white negatives, and 500 colour transparencies of still photos which are available for use in exhibits for schools or libraries. Used in conjunction with publications, photos are a vital means of stimulating teaching about UNICEF's role.

Films and television

361. A variety of films concerning the work of UNICEF are available, and new efforts are being made to increase activity in the production of films and filmstrips. Film projects have been initiated by various UNICEF National Committees using their own resources.

362. A recent black-and-white filmstrip, entitled "Children of the Developing Countries", was produced in co-operation with Visual Education Consultants, Inc. A French version has just been completed.

363. A series of filmstrips on the conditions of children in the developing areas is to be produced this year in a joint effort with the National Film Board of Canada, and adapted for use throughout the world. UNICEF will provide the research and photographs for the production of the series, which is designed for use primarily in schools.

364. The field of television affords increased opportunity to further instruction about UNICEF. A series of silent television sequences, each depicting a special problem in a given country, was made. Written commentaries and suggestions for use accompany the eight sequences, which deal with health services, milk conservation, community development, mother-child health, rural health, social services, tuberculosis and trachoma control.

Radio

365. A project to promote a school broadcast series, with children of the world as the subject, has been launched. The series will present general conditions of living in the developing countries and single out some of the special problems of children and youth. The British Broadcasting Corporation is scheduling four broadcasts in its series "People and Places" in the school year 1964-1965, and the Canadian Broadcasting Corporation will co-operate with UNICEF in the production of a trial series to be used in Ontario province in 1964-1965. If the Canadian Broadcasting Corporation's Ontario effort proves successful, the broadcast will be adopted

nationally in Canada. The secretariat of the World Confederation of Organizations of the Teaching Profession will announce the availability of the material to its member organizations. Certain assistance will be given by UNICEF in the adaptation of the materials into various languages.

(c) *Kits for exhibitions and celebration of special occasions*

366. UNICEF provides kits for the celebration of occasions such as Universal Children's Day, the Freedom From Hunger Campaign, and UNICEF's Anniversary. Materials contained in the kits include mimeographed texts prepared for the occasion, still photos, and selected publications.

(d) *Special projects*

367. Articles pertaining to specific problems, projects, or concerning the work of UNICEF in general are periodically submitted to magazines with national or world-wide circulation.

368. UNICEF frequently co-operate with the efforts of free lancers or outside companies, as it did in the recent production of "A Child's Introduction to Life in India and Indonesia" and "A Child's Introduction to Life in Japan and Burma", recordings made by Bill Grauer Productions, Inc.

369. In connexion with the UNICEF photographic exhibit at the New York World's Fair, a 64-page book of photographs will be produced, entitled *Each and Every Child*. The book will illustrate the universality of the child — his rights, his needs, his aspirations and his future, and will be based directly upon the exhibit.

9. *United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA)*

370. Responsibility for disseminating information about UNRWA, as about other organs of the General Assembly, devolves on the United Nations Office of Public Information. In view of the specialized nature of UNRWA's role and of the dependence of the Agency upon voluntary contributions, the Agency has its own Public Information Office, which works closely with OPI.

371. As a temporary organization — the Agency's present two-year mandate period extends to June 1965 — UNRWA has never felt justified in allocating funds specifically to promote understanding and appreciation of its work in schools, for the Agency cannot assume that it will continue in existence long enough to reap the benefit of such expenditure.

372. However, UNRWA's own information material although not directed to schools and other educational institutions, is distributed to United Nations Information Centres and to UNRWA Liaison Offices in New York and Geneva and is thus readily available to educational institutions on demand.

373. The United Nations Office of Public Information produces a basic information pamphlet on UNRWA entitled "UNRWA and the Palestine Refugees" and

includes information about UNRWA in its publications including the *United Nations Review*, *United Nations Yearbook* and *The United Nations Family*.

374. UNRWA's own information material, which is available to schools, is described below.

Films

375. UNRWA has four documentary films, made by the Agency, which have received, and are still receiving wide distribution. "Beneath the Bells of Bethlehem" (20 minutes, black and white) tells the story of the refugees, and of UNRWA's work, as seen from Bethlehem. "Tomorrow Begins Today" (15 minutes, colour) gives a general view of the refugees' plight and of UNRWA's efforts to assist them, with emphasis on the Agency's programmes of education and vocational training. "Journey to Understanding" (25 minutes, black and white) follows American television personality Hugh Downs and his family on a tour of UNRWA refugee camps and vocational centres and stresses the value of the Agency's training programme. "Your Friend, Omar" (27 minutes, black and white) contrasts the despair of camp life with life in an UNRWA vocational training centre, through the words of a refugee trainee writing to a pen-friend abroad. UNRWA will complete another documentary film in the spring of 1964.

Publications

376. During the period under review, UNRWA has issued a number of booklets, pamphlets and reports on various aspects of the Agency's work. The basic information pamphlet "UNRWA and the Palestine Refugees" was published in nine languages, in co-operation with OPI. The booklet *Blueprint for Opportunity* (in English, French, German and Arabic versions) gave details of and solicited support for, UNRWA's vocational training programme, as did the more recent booklet entitled *Opportunity*. Two leaflets, "What Lies Ahead?" and "Freedom From Hunger Campaign Aid" to the Middle East through UNRWA" dealt with specific aspects of the training programme. *UNRWA and the Palestine Refugees in Facts and Figures* is an annual publication giving a statistical review of UNRWA's work. *Journey Among the Homeless* was a personal record of a distinguished Canadian's visits to the Middle East at UNRWA's invitation. *Palestine Refugees Today*, first published in October 1960, is a monthly newsletter which reports on the Agency's current activities. In 1962 the Agency published *UNRWA Reviews*, a series of six background information papers, each dealing with one aspect of the Agency's work.

Press

377. Information about UNRWA's work has been disseminated through the Press, as a result of press releases and articles issued by the Agency and through contacts with journalists. UNRWA has sponsored the visits of groups of journalists and radio and television reporters to its area of operation, resulting in extensive press coverage.

Radio and television

378. Radio programmes were prepared by UNRWA, in both English and French, and broadcast in North America and Europe and over United Nations Radio. The Agency also provided, on request, recorded material for inclusion in radio programmes. Film footage, both sound and silent, was made available by UNRWA for television use. Major events, such as the opening of UNRWA training centres, were filmed by the Agency, and the film was made available to television services in the countries most concerned. Considerable use was also made of the Agency's film footage library for background film for inclusion in television programmes.

Visitors

379. UNRWA enabled many visitors to the Middle East to gain first-hand knowledge about the Agency's work by facilitating their visits to camps and training centres. The visitors included many students.

Other activities

380. An exhibit illustrating UNRWA's work in the United Nations Headquarters building in New York was seen by the estimated 2 million people who made the guided tour of United Nations Headquarters during 1962 and 1963. A large percentage of these visitors were students.

381. Visitors to the United Nations booth at Seattle World's Fair also saw an exhibit depicting various aspects of UNRWA's work, and had the opportunity of seeing some of UNRWA's documentary films.

382. UNRWA and other United Nations missions and agencies in the region co-operated with the Governments of Jordan, Lebanon, Syria and the United Arab Republic in promoting the celebration of United Nations Day in those countries. Government schools and colleges participated in the observance.

Schools

383. UNRWA differs from other United Nations organs in that it has responsibility for the administration and operation of an extensive school programme. In co-operation with UNESCO, UNRWA operates 403 schools (257 elementary and 146 preparatory schools) in Jordan, Lebanon, Syria and the Gaza Strip, to give education to refugee children. The schools currently have an enrolment of 157,385 refugees and the UNRWA-UNESCO education programmes provides an opportunity for teaching the young refugees about the United Nations.

384. The curricula of UNRWA's schools are the same as those of the countries in which they are located. It

follows, therefore, that both refugee and non-refugee pupils in each of the four countries receive the same amount and type of instruction about the United Nations.

385. In Syria and the Gaza Strip, refugee children in UNRWA elementary schools receive a brief introduction to the United Nations in their sixth, or final, year as part of a course that includes social studies. Students in the Agency's preparatory schools in Syria and the Gaza Strip learn in more detail about the United Nations and its major agencies in the civics course included in the curriculum of the third preparatory year (i.e. the ninth year of schooling).

386. In Jordan, study of the United Nations is included in the curriculum for the third year of secondary school (i.e. the twelfth year of schooling). Until the spring of 1962, UNRWA operated one secondary school in Jordan, but thereafter, the Agency offered secondary education to qualified refugees in Jordan — as it did in the other countries — by making grants-in-aid to government or private schools accepting refugee students. In the 1962-63 academic year, UNRWA assistance enabled 4,769 young refugees to attend secondary school in Jordan, during the course of which they were taught about the United Nations.

387. In Lebanon, there is no specific reference in the syllabus to teaching about the United Nations, although in most schools students learn about the United Nations during their courses in civics or history.

United Nations Day

388. United Nations Day is observed in most UNRWA schools. Teachers are encouraged to speak about the United Nations and its principles, and a certain amount of information material is distributed to the schools by UNRWA. Some schools organize special programmes or displays for United Nations Day, although this is left to the discretion of the principals and teachers. United Nations Day is also generally observed in the Agency's ten vocational and teacher-training centres.

Teacher-training

389. As with the Agency's schools, the four UNRWA training centres which offer teacher training (two in Jordan and one each in Lebanon and Syria) follow the curricula of the countries in which they are located, in agreement with the Governments of those countries. Young refugees training to be teachers in the fields of history and social studies have some study of the United Nations, although there is no special reference to teaching about the United Nations in their curricula.

DOCUMENT E/3951

Report of the Social Committee

[Original text: English]
[20 July 1964]

1. The social Committee, under the chairmanship of Mr. Abdelkader Chanderli (Algeria), Second Vice-President of the Council, considered, at its 488th to 492nd meetings held on 15 to 17 July 1964, item 33 of the Council's agenda (Teaching of the purposes and principles, the structure and activities of the United Nations and the specialized agencies in schools and other educational institutions of Member States), which had been referred to the Committee by the Council at its 1314th meeting, held on 13 July 1964.

2. In its consideration of this item, the Committee had before it a report by the Secretary-General of the United Nations and the Director-General of the United Nations Educational, Scientific and Cultural Organization (E/3875 and Corr.1 and Add.1-3) prepared on the basis of inquiries to Member States pursuant to Economic and Social Council resolution 748 (XXIX) of 6 April 1960. The Committee also took note of statements by the World Federation of United Nations Associations (E/C.2/619) and by the World Confederation of Organizations of the Teaching Profession (E/C.2/620).

3. During the consideration of this item a draft resolution was submitted by Argentina, Luxembourg and the United States of America (E/AC.7/L.434), which was subsequently revised by the co-sponsors (E/AC.7/L.434/Rev.1). Amendments to the revised draft resolution, submitted by Mexico and the United Arab Republic (E/AC.7/L.435), called for the insertion, after operative paragraph 4, of the following two new paragraphs:

"*Emphasizes* the importance of further efforts in the field of the production of teaching materials and audio-visual aids and assisting countries in this respect;

"*Requests* the Secretary-General to give a relevant importance in the preparation and distribution of materials in as many different languages as possible about the structure, goals and achievements of the United Nations and its specialized agencies".

4. During the discussion, the co-sponsors of the amendments orally revised the second paragraph of their amendments. First, they added the words "within the existing budgets" at the end of the paragraph—a change which, however, they subsequently modified, in accordance with an oral proposal made by the United Kingdom representative, so that the new phrase would be placed after the words "relevant importance" and the following word "in" would be changed to read "to". Secondly, the sponsors accepted a proposal made orally by the United States representative, to the effect that the words "and the executive heads of the specialized agencies" should be inserted after the word "Secretary-General".

5. The representative of the USSR orally proposed the addition of the words "and without detriment to normal programmes" following the words "within existing programmes and budgets" in operative paragraph 3 of the revised draft resolution (E/AC.7/L.434/Rev.1).

6. The oral amendment to operative paragraph 3 proposed by the representative of the USSR was adopted by 11 votes to 6, with 9 abstentions. Operative paragraph 3, as amended, as a whole, was adopted by 15 votes to none, with 10 abstentions. The amendments by Mexico and the United Arab Republic (E/AC.7/L.435), as orally revised, were adopted by 24 votes to none, with 1 abstention.

7. The revised draft resolution (E/AC.7/L.434/Rev.1), as amended, as a whole, was adopted unanimously.

8. The Committee therefore recommends the adoption by the Council of the following draft resolution:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1012 (XXXVII). Teaching of the purposes and principles, the structure and activities of the United Nations and the specialized agencies in schools and other educational institutions of Member States

The Economic and Social Council,

Recalling General Assembly resolutions 137 (II) of 17 November 1947 and 1511 (XV) of 12 December 1960 which recommended to Member States that measures be taken to encourage the teaching of the purposes and prin-

ciples, the structure and activities of the United Nations and its related agencies in schools,

Recalling also its previous resolutions on this subject and, in particular, resolution 748 (XXIX) of 6 April 1960,

Having considered the report (E/3875 and Add.1-3) prepared jointly by the Secretary-General of the United Nations and the Director-General of the United Nations Educational, Scientific and Cultural Organization, in accordance with Council resolution 748 (XXIX),

Noting with satisfaction that progress continues to be made in many Member States in developing facilities for teaching about the United Nations and its related agencies,

1. *Believes* that special attention should be given in teaching about the United Nations and its related agencies to the contributions being made by them to international peace and understanding and international co-operation and particularly to their achievements in the fields of economic and social development;

2. *Expresses its appreciation* for the valuable work done by non-governmental organizations in consultative status in helping to disseminate information about the United Nations and the specialized agencies, and expresses the hope that they will continue their efforts in this field;

3. *Invites* the Secretary-General of the United Nations and the Director-General of the United Nations Educational, Scientific and Cultural Organization to give appropriate consideration, within existing programmes and budgets and without detriment to normal programmes, to providing study grants to textbook authors, persons responsible for educational television and radio, and persons responsible for school curriculum development, for the purpose of spending time in the Headquarters of the United Nations or of the specialized agencies to become better informed concerning the achievements and activities of the United Nations, as well as its structure and principles;

4. *Requests* the Secretary-General, in collaboration with the Director-General of the United Nations Educa-

tional, Scientific and Cultural Organization and the executive heads of other interested specialized agencies, to compile a further report on teaching about the United Nations and its related agencies in schools, educational institutions and adult education programmes, on the basis of inquiries to Governments of Member States of the United Nations or members of the specialized agencies, for consideration by the Council in 1970;

5. *Emphasizes* the importance of further efforts in the field of the production of teaching materials and audio-visual aids and assisting countries in this respect;

6. *Requests* the Secretary-General and the executive heads of the specialized agencies to give a relevant importance within the existing budgets to the preparation and distribution of materials in as many different languages as possible about the structure, goals and achievements of the United Nations and its specialized agencies;

7. *Urges* Governments of Member States of the United Nations or members of the specialized agencies to furnish, in response to the inquiries addressed to them, full information in their respective countries, in the public and private sectors as appropriate, particularly as regards teaching about the role of the United Nations and its related agencies in furthering social and economic development for the benefit of mankind during the United Nations Development Decade.

1334th plenary meeting,
27 July 1964.

DOCUMENT E/3968

Report of the Social Committee

[Original text: English]
[7 August 1964]

1. The Social Committee, under the chairmanship of Mr. Abdelkader Chanderli (Algeria), Second Vice-President of the Council, considered, at its 506th meeting held on 7 August 1964, item 34 of the agenda of the Council entitled "International control of narcotic drugs". This item had been referred to the Committee by the Council at its 1314th meeting held on 13 July 1964.

2. The Committee had before it, during discussion of this item, the report of the nineteenth session of the Commission on Narcotic Drugs (E/3893), the report on the work of the Permanent Central Opium Board in 1963 (E/OB/19), and paragraph 72 of the report of the Technical Assistance Committee (E/3933), concerning the resolution proposed by the Nineteenth Session of the Commission on Narcotic Drugs on a survey of economic and social requirements of opium-producing regions in Thailand.

3. The Committee's consideration of the draft resolutions submitted by the Commission on Narcotic Drugs (E/3893, chapter XIV) is given below:

(a) Draft resolution A on the report of the Commission on Narcotic Drugs was revised to include the report of the Permanent Central Opium Board for 1963. This revised draft was adopted unanimously by the Committee.

(b) Draft resolution B on the question of Khat, which was adopted unanimously.

(c) Draft resolution C on the survey of the economic and social requirements of the opium-producing regions of Thailand was considered in the light of the recommendation (E/3933, para. 72) of the Technical Assistance Committee that the Council adopt the resolution transmitted by the Commission on Narcotic Drugs. This text was adopted by 24 votes to none with 2 abstentions.

4. The Committee therefore recommends the adoption by the Council of the following draft resolutions:

[Texts adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council".]

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1025 (XXXVII). International control of narcotic drugs

A

REPORT OF THE COMMISSION ON NARCOTIC DRUGS AND
REPORT OF THE PERMANENT CENTRAL OPIUM BOARD
FOR 1963*The Economic and Social Council*

Takes note of the report of the Commission on Narcotic Drugs (nineteenth session) and of the report of the Permanent Central Opium Board for 1963.

*1345th plenary meeting,
11 August 1964.*

B

THE QUESTION OF KHAT

The Economic and Social Council,

Recalling its resolution 667 D (XXIV) of 1 August 1957, by which it invited the World Health Organization to study the medical aspects of the habitual chewing of khat leaves and to submit a report thereon to the Commission on Narcotic Drugs,

Being informed that the Commission on Narcotic Drugs, at its nineteenth session, studied this report (E/CN.7/459/Add.1).

Noting that medical and social problems connected with the habitual and excessive chewing of khat leaves are confined at present to a limited number of countries in one geographical area,

1. *Thanks* the World Health Organization for its important contribution to the study of the medical aspects of khat-leaf chewing;

2. *Draws the attention* of Governments of countries

concerned to the report of the World Health Organization for any action they may consider necessary.

*1345th plenary meeting,
11 August 1964.*

C

SURVEY OF THE ECONOMIC AND SOCIAL REQUIREMENTS
OF THE OPIUM-PRODUCING REGIONS IN THAILAND*The Economic and Social Council,*

Having been informed that the Government of Thailand intends to undertake, with the assistance of the United Nations and other international organizations, a survey of the economic and social needs of its opium-producing areas with a view to facilitating the abolition of poppy cultivation and addiction by measures of economic and social developments offering the individuals affected alternative means of livelihood in industry, handicrafts and agriculture;

Considering that such measures of economic and social development in Thailand would be beneficial not only to Thailand but also to many other countries which would profit from a resulting reduction of the illicit traffic in opiates,

1. *Invites* the Secretary-General of the United Nations, the Food and Agriculture Organization, the World Health Organization and, in particular, the Technical Co-operation authorities of the organizations of the United Nations family to give favourable consideration to a request of the Government of Thailand for assistance in such a survey;

2. *Draws the attention* of the Secretary-General to the fact that arrangements could be made for the conduct of a survey, if requested by the Government concerned, to take the place of a contemplated project under normal re-programming procedures of the Expanded Programme, or by assignment to category II for implementation when possible.

*1345th plenary meeting,
11 August 1964.*

**Applications and re-applications for consultative status:
report of the Council Committee on Non-Governmental Organizations**

*[Original text: English]
[10 March 1964]*

A meeting of the Council Committee on Non-Governmental Organizations was held at Headquarters on 9 March 1964. The Committee elected Mr. Franz Weidinger (Austria) Chairman. It had before it document E/C.2/R.31. A summary record of the meeting is given in document E/C.2/SR.200.

The Committee, acting in accordance with Council resolution 288 B (X), paragraph 35 (a), recommended that the Council adopt the following draft resolution:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

**1031 (XXXVII). Non-Governmental Organizations:
applications and re-applications for consultative status**

The Economic and Social Council,

Having considered the report of its Committee on Non-Governmental Organizations (E/3865),

1. *Decides* to grant the request for Category B consultative status of the following organizations:

All African Women's Conference,
American-Hispanic-Portuguese International Law Institute,
Amnesty International,

International Federation of Disabled Workmen and Civilian Handicapped,
International Information Centre for Local Credit,
International Prisoners' Aid Association, The,
Latin American Iron and Steel Institute;

2. *Decides* to approve the re-application of the International Council of Jewish Women for Category B consultative status;

3. *Decides* that the following organizations be placed on the Register of the Secretary-General:

International Planned Parenthood Federation,
International Public Relations Association;

4. *Decides* to grant the request of the International Astronautical Federation for re-classification from the Register to Category B;

5. *Decides* that the International Union Against Alcoholism should retain its consultative status on the Register of the Secretary-General.

*1348th plenary meeting,
13 August 1964.*

DOCUMENT E/3980

Report of the Co-ordination Committee

*[Original text: English]
[13 August 1964]*

1. The Co-ordination Committee, under the Chairmanship of Mr. Daniel Cosío Villegas (Mexico), considered, at its 266th and 267th meetings held respectively on 11 and 12 August 1964, item 36 of the agenda: "Review of the pattern of Conferences and establishment of the Calendar of Conferences for 1965." This item had been referred to the Committee by the Council at the 1314th plenary meeting held on 13 July 1964.

2. The Committee had before it the following documents:

A memorandum by the Secretary-General (E/3950 and Add.1);

A note by the Secretary General (E/3939 and Add.1);

A paper on the financial implications of actions of the Council (E/3941, paras. 14-18);

Extracts from the seventh report of the Advisory Committee on Administrative and Budgetary Questions to the General Assembly at its nineteenth session (E/3944);

A report by the Council's Economic Committee (E/3959).

3. During the course of the debate the Committee adopted the following paragraph submitted by the delegation of the United States of America:

"The Co-ordination Committee recommends that the Council should decide to:

"(1) Advance its first session to January — early February, starting in 1966;

"(2) Advance its second session to the last week of June in Geneva;

"(3) Discontinue, as a general rule, its resumed session in December, starting in 1965;

"(4) Continue to convene on an annual basis the Social Commission, the Commission on Human Rights and its Sub-Commission on Prevention of Discrimination and Protection of Minorities, the Commission on the Status of Women and the Commission on Narcotic Drugs;

"(5) Continue to convene on a biennial basis the Population Commission and the Statistical Commission;

"(6) Continue to convene on an annual basis the Committee on Housing, Building and Planning and the Committee for Industrial Development; and

"(7) Schedule meetings of a limited number of commissions and committees in Geneva in the latter part of the year."

4. The Committee also approved a proposal by the delegate of Argentina to endorse the passage in paragraph 1 of the memorandum by the Secretary-General (E/3950/Add.1) dealing with "possible adjustments to be considered by the Council at its resumed thirty-seventh session, in the light of action taken by the General Assembly both on the recommendations of the United Nations Conference on Trade and Development and on the overall review of the pattern of conferences which the Assembly is to undertake pursuant to its resolution 1987 (XVIII)".

DOCUMENT E/3982

Report of the Secretary-General

[Original text: English]
[13 August 1964]

The Interim Committee on Programme of Conferences met on 13 August 1964 (E/C.4/SR.47), under the chairmanship of Mr. H. P. L. Attlee (United Kingdom), to consider the Calendar of Conferences for 1965.

The Committee, which had before it documents E/3950/Add.1 and E/3939 and Add.1, was informed that the recommendations made to the Council by the Co-ordination Committee at its 267th meeting on 12 August 1964, when it considered that part of item 36 of the Council's agenda which concerns the review of the pattern of conferences, were not in conflict with the tentative programme for 1965 presented by the Secretary-General in document E/3950/Add.1. It was also informed of the Co-ordination Committee's recommendation to the Council that it adopt its calendar of meetings for 1965, subject to possible adjustments to be made at the resumed thirty-seventh session, in the light of action taken by the General Assembly both on the recommendations of the United Nations Conference on Trade and Development and on the over-all review of the pattern of conferences which the Assembly is to undertake pursuant to its resolution 1987 (XVIII).

In the course of its discussions the Committee expressed the hope that it might be possible for the Executive Board of UNICEF to meet at such a time in June 1965 as to conclude its session before the opening on 29 June of the thirty-ninth session of the Council.

The Committee also considered the question of an overlap between the summer session of the Technical Assistance Committee and that of the Council. It agreed

that the dates tentatively proposed by the Secretary-General for the session of the Technical Assistance Committee should remain in the calendar, subject to review of the question at the resumed thirty-seventh session.

The Committee recommends to the Council:

(a) That the invitation of the Government of Iran to the Commission on the Status of Women to hold its eighteenth session in Teheran be accepted;

(b) That the review of the organizational arrangements for the Committee on Housing, Building and Planning provided for in Council resolution 903 C (XXXIV), paragraph 7, be postponed until the summer session in 1966;

(c) That, subject to (a) above, and to review at the resumed thirty-seventh session, the draft calendar contained in document E/3950/Add.1 be adopted;

(d) That the Secretary-General be requested to undertake a study of the measures which could be taken to alleviate the problems faced by the United Nations as a result of the ever-increasing number of meetings held each year.

The Committee was informed that the Secretary-General would submit to the Council at the resumed thirty-seventh session proposals regarding any consequential changes which might be required in the rules of procedure of the Council as a result of the proposed change in the dates of its sessions.

Report of the Economic Committee

[Original text: English]
[31 July 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President of the Council, Mr. Akira Matsui (Japan), considered at its 345th and 346th meetings on 29 and 30 July 1964, item 37 of the Council's agenda which had been referred to it by the Council at its 1314th meeting on 13 July 1964.

2. Following discussion of the questions involved, the Committee decided to recommend to the Council that it should not schedule a session of the Commission on International Commodity Trade for the Autumn of 1964 and that the question of the extension of the term of office of the members of the Commission should be postponed to the Council's resumed session.

8. Multiplicity of resolutions	988 (XXXVI)	—	—

^a Provision has been included in the initial budget estimates.
^b Estimates to be presented to General Assembly at its nineteenth session.
^c Further costs of \$43,000 to be included in the initial budget estimates for 1966.
^d To be provided for from savings in the relevant section of the 1964 appropriations.
^e Extra costs to the United Nations to be reimbursed by the Government of Iran.
^f To be provided from existing appropriations.
^g Preliminary estimates for preparatory work.

1. INDUSTRIAL DEVELOPMENT

A

The Council adopted resolution 1030 A (XXXVII), proposed by the Committee for Industrial Development at its fourth session in March 1964,¹ which recommends that adequate budgetary provision be made for the Industrial Development Centre so as to provide it with the necessary operational strength to fulfil the requirements of the dynamic programme outlined in that resolution. In response to the request for a dynamic programme and to General Assembly resolution 1940 (XVIII) of 11 December 1963, the Secretary-General made specific provisions in his budget estimates for 1965² for the new functions called for by the Committee for Industrial Development. These provisions, which will be considered by the General Assembly at its nineteenth session include, *inter alia*, 15 new professional posts and 15 new general service posts for the Centre in addition to its existing complement of 35 professional and 23 general service posts; and a total of \$285,000 to provide for panels of experts to cover all major sectors of industry, for *ad hoc* expert groups to study in depth specific technical problems, and for consultants' services from institutions and individuals. Furthermore, the current session of the Council, following the recommendation of the Technical Assistance Committee, adopted resolution 1008 (XXXVII) which endorsed the Secretary-General's proposals that \$750,000 be appropriated for industrial development activities in the United Nations regular programme of technical assistance provided for under part V of the regular budget estimates for 1965.

B

The Council by resolution 1030 B (XXXVII) declared there is an urgent need to establish a specialized agency for industrial development and requested the Secretary-General to prepare a study on the scope, structure and functions of this agency, to be submitted to the General Assembly at the nineteenth session. This study, to be prepared from the existing resources of the Secretariat, will provide the basis for submitting an estimate of the cost of the proposed specialized agency for industrial development to the General Assembly at its nineteenth session.

C

The Council adopted resolution 1030 C (XXXVII) which recalled the request contained in General Assembly resolution 1940 (XVIII) that the Secretary-General study and report on the advisability of holding, not later than 1966, an international symposium, preceded, as appropriate, by regional and sub-regional symposia relating to the problem of industrialization of developing countries. The Council resolution also endorsed resolution 1 (IV) of the Committee for Industrial Development

by which, in March 1964, it welcomed the suggestion of holding symposia on industrial development and regarded regional and sub-regional symposia as preliminary steps for holding the international symposium referred to in General Assembly resolution 1940 (XVIII). In compliance with the request contained in paragraph 5 of the Assembly resolution, the holding of regional symposia was considered and endorsed at the appropriate meeting of each of the regional economic commissions.

In the preparation for the regional seminars it will be necessary during 1965 to employ consultants and provide travel for regular staff members to assist Governments in the preparation of industry surveys of their countries, to prepare studies of main industries in the regions, and to prepare special studies on regional and institutional problems of industrialization. Such costs including the translation and reproduction of the studies are estimated at \$571,000 for 1965, made up of \$201,000 for the seminar to be served by the Economic Commission for Africa, \$238,000 for the Economic Commission for Asia and the Far East and \$132,000 for the Economic Commission for Latin America. Fuller details concerning the studies are set forth in the Secretary-General's report on international and regional symposia.³

The cost for servicing the meetings of the regional symposia can only be established on a firm basis after further consultations which are now taking place, with the regional commissions concerning such matters as the structure of the meetings, the type of records to be kept, the nature and extent of the published proceedings, the extent to which services can be provided by the regular staff, etc. These consultations will enable firm estimates to be submitted to the General Assembly at its nineteenth session for the costs of providing conference services at these regions.

Further, Council resolution 1030 C (XXXVII) requests the Secretary-General to prepare a report for one of the next sessions of the Committee for Industrial Development on the results of the regional and sub-regional symposia, together with any recommendations on the agenda for an international symposium which he finds to be appropriate; and requests the Committee for Industrial Development to report to the Council its recommendations with regard to an international symposium following review of the Secretary-General's report.

Accordingly, final estimates for the international symposium must be based on action to be taken by the Council in the light of the results of the regional symposia and the conclusions drawn there from by the Secretary-General and the Committee for Industrial Development. Nevertheless, as the symposia are planned as one overall operation to be carried out in stages, the Secretary-General considers it necessary to be able to commence the preparation during 1965 of the studies required for the international symposium to be held, in the terms of General Assembly resolution 1940 (XVIII), not later than 1966. It would be the Secretary-General's intention therefore, pending the study of the results of

the regional symposia, to request a supplementary provision of \$100,000 to commence in 1965 the studies relating to the international symposium to be prepared with the help of consultants as described in his report on international and regional symposia.

2. UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT

The United Nations Conference on Trade and Development met in Geneva from 23 March to 16 June 1964. The Conference was convened as a result of Council resolution 917 (XXXIV) as endorsed by the General Assembly in its resolution 1785 (XVII), which also enumerated the fundamental points for discussion.

The Conference carried out its work through five main committees, examining in detail various questions relating to international trade and to development. The fifty-nine recommendations of the Conference are contained in annex A of the Final Act of the Conference.⁴ The Conference has recommended institutional arrangements to implement the measures relating to the expansion of international trade. It has suggested that a conference on trade and development be held at intervals of not more than three years and has made provision for a Trade and Development Board of fifty-five members, as well as for certain subsidiary organs of the Board to deal with specialized fields such as primary commodities. These arrangements are contained in annex A.V.1 of the Final Act. The Conference in fact elected fifty-five members of the first Board whose terms will commence after the relevant resolution has been adopted by the General Assembly. The next Conference is expected to be held in 1966.

The Conference recognized the need for continuity in the activities of the United Nations in the field of trade and accordingly requested the Secretary-General of the United Nations to take appropriate measures, including the necessary financial provisions, in order that the work required for the implementation of the recommendations might be commenced. Provision, therefore, will need to be made during 1964 for the salary and allowances of the Secretary-General of the Conference and additional staff, which will consist of his personal assistant, two officers to deal with preparations for meetings of various subsidiary organs of the Conference, an administrative assistant, and three secretaries at a total cost of \$75,000.

The work of the Conference secretariat will be supplemented by the Department of Economic and Social Affairs and by the employment of some twelve consultants, together with eight secretaries, for an average period of three months at an estimated total cost of \$73,000. The consultants will prepare papers dealing with the means of carrying out the decisions of the Conference and undertake other preliminary work for subsidiary bodies that will be convened in 1964 and early 1965.

⁴ See *Proceedings of the United Nations Conference on Trade and Development*, vol. I, *Final Act and Report* (United Nations publication, Sales No.: 64.II.B.11).

In annex A.V.1 of the Final Act of the Conference a session in 1964 of a Special Committee, small in size, is called for, the terms of reference of which are also set out in the same annex. The members of the Committee would be appointed by the Secretary-General of the United Nations and would be representative of the main interests and trends of opinion; they would be selected on an equitable geographical basis, after consultation with their respective Governments. In the terms of General Assembly resolution 1798 (XVII) "travel and subsistence expenses shall be paid in respect of members of organs and subsidiary organs who serve in an individual capacity and not as representatives of Governments". The costs of travel and subsistence of members of the Special Committee would be \$23,000 on the assumption that it would have no more than twelve members and meet for a period of some four weeks at Headquarters.

The Final Act, in annex A.VI.1, calls also for a session in 1964 of a committee on the problems of landlocked countries and, in annex A.II.8, for a session early in 1965 of the *ad hoc* working party of government experts on commodity trade. It is also possible that a meeting might be held during 1964 of the committee called for in annex A.III.5 of the Final Act, to work out the best method of implementing preferences in favour of developing countries on the basis of non-reciprocity from the developing countries. As the members of these bodies will serve as representatives of Governments, there will not, under the terms of General Assembly resolution 1789 (XVII), be any cost to the United Nations for their travel and subsistence.

The Secretary-General of the Conference and certain members of the Conference staff will travel for consultations with governments in Africa, Asia, Europe and Latin America for which the cost of travel and subsistence is estimated to be \$10,000.

Thus the estimated expenditures during 1964 subsequent to the Conference, for which there is no appropriation, total \$184,000. To the extent that these direct expenditures cannot be absorbed in the regular budget for 1964, they will be included in supplementary estimates for that year to be presented to the General Assembly for its approval at its nineteenth session. Other costs for items such as communications, supplies, reproduction of documents, and other general expenses will be met, in so far as possible, from within the relevant existing appropriations.

The Final Act of the Conference, which will be before the Council and the General Assembly, sets forth the recommendations of the Conference on the institutional arrangements to be established. While it is not feasible at this time to estimate the cost of these arrangements in 1965, estimates will be available for consideration by the General Assembly at its nineteenth session.

3. SURVEY OF WORLD IRON ORE DEPOSITS

When the Council considered the programme for future work in the field of natural resources as set forth

by the Secretary-General in his report,⁵ it was informed that \$80,000 would be required for the project to bring up to date the *Survey of World Iron Ore Resources: Occurrence, Appraisal and Use*⁶ prepared in 1954. The Council was further advised that it would be impractical to rearrange priorities at the expense of other items within the programme and, consequently, the only possibilities open were to request the General Assembly to approve supplementary funds or to postpone the project until it was possible to incorporate it in the regular budget. The Council then recommended, in paragraph 3 of resolution 1033 C (XXXVII), that a high priority be assigned to bringing the survey up to date.

In these circumstances it would be the intention of the Secretary-General to advise the General Assembly that an upward revision of \$37,000 would be required in the budget estimates submitted for 1965, if he were to provide for two meetings during that year of an *ad hoc* expert group to prepare the revised survey. A further sum of \$43,000, required for the printing of the survey of the expert group in three languages, would be included in the initial estimates for 1966, the year in which it would be published.

4. ADVISORY COMMITTEE ON THE APPLICATION OF SCIENCE AND TECHNOLOGY TO DEVELOPMENT

A

The Council, in resolution 1047 (XXXVII) considers that the Advisory Committee on the Application of Science and Technology to Development should hold its second session before the end of 1964 and, in view of its heavy work programme, should meet twice in 1965 with such meetings of its sub-groups as may be required. On the assumption that the sub-groups to meet during 1965 would be the three regional reviewing groups, meeting at the headquarters of the respective regional economic commissions, and two of the functional groups, for example, the group on the possibility of an immediate world-wide attack on selected problems and the group on mobilizing efforts in the developed countries for co-operation with the developing countries, the costs would be \$29,000. This figure is based on the assumption that the meeting of each sub-group would last for one week and would be attended by three members in the case of the regional reviewing groups and eight members in the case of the functional groups. The necessary funds will be requested in revised estimates for 1965 to be submitted to the General Assembly at its nineteenth session.

The budget estimates for 1965 already provide for two meetings of the Advisory Committee on Science and Technology at New York during 1965. The \$26,000 required for holding an unbudgeted session of the

Committee at New York during 1964 will be met through savings arising in the relevant section of the 1964 appropriations.

B

By its resolution 1047 (XXXVII) the Council also agrees with the recommendations of the Advisory Committee on Science and Technology that there is need for a small secretariat and for focal points on science and technology within the regional economic commissions. The budget estimates for 1965 provide for such a secretariat at Headquarters and a staff member at each of the regional commissions has been designated as the central point for questions of science and technology.

5. ESTABLISHMENT OF THE CALENDAR OF CONFERENCES FOR 1965

The Council, in response to an invitation from the Government of Iran, provided in its calendar of conferences for the eighteenth session of the Commission on the Status of Women to meet in Teheran on the understanding that the Government would, in accordance with General Assembly resolution 1202 (XII), defray the added costs involved. The costs to the United Nations for holding the session of the Commission in Teheran from 1 to 19 March 1965 are estimated to total \$137,000 of which some \$21,000 is already included in the budget estimates for 1965 in respect of the travel of members of the Commission to New York. Accordingly, the Secretary-General would request the General Assembly to approve revised estimates of \$116,000 for the extra costs to be incurred in excess of the \$21,000 now provided in the budget estimates for 1965 in respect of holding the eighteenth session of the Commission. The reimbursement by the Iranian Government for the extra costs would be credited to the general income of the United Nations to be applied in reduction of the budget contributions of States Members of the United Nations.

The Interim Committee on Programme of Conferences has suggested that consideration be given to the possibility of the summer session of the Technical Assistance Committee being held concurrently with the Council instead of the two weeks prior to the opening of the Council session proposed by the Secretary-General in his memorandum on the calendar of conferences and meetings for 1965.⁷ The suggestion would require the scheduling of three meetings at a time (or six meetings a day) through the Council's session, and would consequently require an increase in conference servicing staff. The extent to which provisions already included in the 1965 budget for the TAC summer session could be taken in reduction of these additional requirements will need to be worked out in the light of the over-all conference programme for 1965. The Secretary-General would intend to work these out and to include the requirements as well in his statement on revised estimates for 1965 to be submitted to the General Assembly later in the year.

⁵ *Official Records of the Economic and Social Council, Thirty-Seventh Session, Annexes*, agenda item 14, document E/3904, paras. 70-71.

⁶ United Nations publication, Sales No.: 54.II.D.5.

⁷ E/3950/Add.1.

6. WORLD CAMPAIGN AGAINST HUNGER, DISEASE AND IGNORANCE

The Council by resolution 1038 (XXXVII) requests the Secretary-General to pursue as a matter of urgency the consultations with Governments, specialized agencies, and non-governmental organizations requested by General Assembly resolution 1943 (XVIII), on the feasibility of, and possible plans for, organizing and executing a world campaign against hunger, disease and ignorance and to report to the Council at its thirty-ninth session. As such discussions would need to take place at the highest level, it is considered that they should be carried out by an outstanding consultant who would need to be engaged for a period of about eighteen weeks. The cost would be \$6,000 for fees at \$50 a day and \$5,000 for travel or a total cost of \$11,000 of which \$3,000 would be required in 1964 and \$8,000 in 1965. It would be the Secretary-General's intention to provide the funds required during 1964 from existing appropriations and to submit revised estimates to the General Assembly at its nineteenth session for the sum required in 1965.

7. ADVISORY SERVICES IN THE FIELD OF HUMAN RIGHTS

The Secretary-General requested the guidance of the Council concerning the composition of the programme of advisory services in the field of human rights so as to remain within the total of \$180,000 recommended by the Technical Assistance Committee⁸ as the level for human rights advisory services in part V of the regular United Nations budget estimates for 1965. The Council responded in resolution 1017 (XXXVII) to recommend that the proposed seminars in Mongolia and

⁸ *Official Records of the Economic and Social Council, Thirty-seventh Session, Annexes*, agenda item 19, document E/3933, para. 70.

Yugoslavia during the year 1965 should be held as a matter of priority and, further, as an exceptional measure, that the programme of fellowships should be adjusted within the allocations made for the programme, taking into account the need to hold the aforesaid seminars. Thus the programme of advisory services in the field of human rights for 1965 has been established within the funds recommended by the Technical Assistance Committee to the General Assembly at its nineteenth session.

8. MULTIPLICITY OF RESOLUTIONS

The Council by resolution 988 (XXXVI) requested the Secretary-General to suggest methods for dealing with the problems arising from the multiplicity of resolutions on economic, social and human rights questions. The Council was informed at its thirty-seventh session that arrangements were being made for the United Nations Library to prepare indices of the resolutions adopted by each of the major organs of the United Nations in a manner similar to, but more detailed than, that used in the *United Nations Documents Index*. Such an index would include a list of the resolutions showing their number, title, date and document in which printed, followed by an analytical subject index arranged alphabetically to show the resolutions related to each subject and the nature of that relationship. The Council was advised that the work programme of the Library envisaged that an index of the resolutions of the Council would be prepared in that manner during 1966 for publication early in 1967. Any costs in connexion with the development of the normal indexing programme, as described in document E/3941, would be provided for in the initial budget estimates.

The Council noted that the index of its resolution would be scheduled for publication in 1967 and as a consequence there would be no need to submit revisions to the budget.

DOCUMENT E/3853

Note by the Secretary-General

[Original text: English]
[20 January 1964]

1. General Assembly resolution 1903 (XVIII), the text of which is attached as annex I, concerns twenty-one general multilateral treaties of a technical and non-political character concluded under the auspices of the League of Nations which by their terms authorized the Council of the League of Nations to invite additional States to become parties. Its purpose is to open these treaties for accession to new States which, due to the dissolution of the League of Nations, have been unable to become parties thereto through the lack of an invitation to accede.

2. By the above-mentioned resolution, the General Assembly decided that it was the appropriate organ of the United Nations to invite States to accede to the treaties in question and requested the Secretary-General to issue such invitations to States referred to in operative paragraph 4 of the resolution. However, under operative paragraph 3 (c) of the resolution, the Secretary-General was requested to consult, where necessary, with the States referred to in sub-paragraphs (a) and (b) of that paragraph, and with the United Nations organs and the specialized agencies concerned as to whether any of the treaties in question had ceased to be in force, had been superseded by later treaties, had otherwise ceased to be of interest for accession by additional States, or required action to adapt them to the contemporary conditions. Sufficient evidence exists that at least two of these treaties, namely, the Convention for the Suppression of Counterfeiting Currency and the Optional Protocol concerning the Suppression of Counterfeiting Currency, both done at Geneva on 20 April 1929, are fully operative and therefore no consultation in regard to these two instruments is necessary. In regard to the remaining nineteen treaties it is intended to proceed with consultation as provided in paragraph 3 (c) of the resolution. A list of the treaties concerned is attached as annex II.

3. As the Economic and Social Council appears to be the appropriate organ of the United Nations to be consulted in the matter, the Secretary-General has the honour to propose, under rule 13 of the rules of procedure, the inclusion of this question on the provisional agenda

of the forthcoming thirty-seventh session of the Council. It will be noted in this connexion that by resolution 1903 (XVIII) the General Assembly requested the Secretary-General to report to it on these matters at the nineteenth session and decided to place on the provisional agenda of that session an item entitled "General multilateral treaties concluded under the auspices of the League of Nations".

ANNEXES

Annex I

RESOLUTION ADOPTED BY THE GENERAL ASSEMBLY

1903 (XVIII). *Participation in general multilateral treaties concluded under the auspices of the League of Nations*

The General Assembly,

Having considered the question of extended participation in general multilateral treaties concluded under the auspices of the League of Nations, and the report of the International Law Commission thereon,¹

Noting that there are twenty-one such treaties of a technical and non-political character which by their terms authorized the Council of the League of Nations to invite additional States to become parties, and thus were not intended to be closed to new States,

Further noting that since the Council of the League ceased to exist a large number of new States have come into being and that many of them have been unable to become parties to the treaties in question through lack of an invitation to accede,

Recalling the recommendation made by the Assembly of the League of Nations at its final session, that its Members should facilitate in every way the assumption by the United Nations of functions and powers entrusted to the League of Nations under international agreements of a technical and non-political character,²

¹ *Official Records of the General Assembly, Eighteenth Session, Supplement No. 9 (A/5509), chapter III.*

² *League of Nations, Official Journal, Special Supplement No. 194, p. 57 (resolution of 18 April 1946).*

Further recalling that the General Assembly, in resolution 24 (I) of 12 February 1946, declared that the United Nations was willing in principle to assume the exercise of certain functions and powers previously entrusted to the League of Nations under international agreements,

1. *Decides* that the General Assembly is the appropriate organ of the United Nations to exercise the power conferred by multi-lateral treaties of a technical and non-political character on the Council of the League of Nations to invite States to accede to those treaties;

2. *Records* that those Members of the United Nations which are parties to the treaties referred to above assent by the present resolution to the decision set forth in paragraph 1 above and express their resolve to use their good offices to secure the co-operation of the other parties to the treaties so far as this may be necessary;

3. *Requests* the Secretary-General:

(a) As depositary of the treaties referred to above, to bring to the notice of any party which is not a Member of the United Nations the terms of the present resolution;

(b) To transmit copies of the present resolution to States Members of the United Nations which are parties to those treaties;

(c) To consult, where necessary, with the States referred to in sub-paragraphs (a) and (b) above, and with the United Nations organs and the specialized agencies concerned as to whether any of the treaties in question have ceased to be in force, have been superseded by later treaties, have otherwise ceased to be of interest for accession by additional States, or require action to adapt them to contemporary conditions;

(d) To report on these matters to the General Assembly at its nineteenth session;

4. *Further requests* the Secretary-General to invite each State which is a Member of the United Nations or member of a specialized agency or a party to the Statute of the International Court of Justice, or has been designated for this purpose by the General Assembly, and which otherwise is not eligible to become a party to the treaties in question, to accede thereto by depositing an instrument of accession with the Secretary-General of the United Nations;

5. *Decides* to place on the provisional agenda of its nineteenth session an item entitled "General multi-lateral treaties concluded under the auspices of the League of Nations".

*1259th plenary meeting,
18 November 1963.*

DOCUMENT E/3927

Communication from the Director-General of the United Nations Educational,
Scientific and Cultural Organization

[Original text: English]
[30 June 1964]

The Secretary-General has received from the Director-General of UNESCO a communication requesting the inclusion in the provisional agenda for the thirty-seventh session of a supplementary item entitled "World Campaign for Universal Literacy", together with the attached explanatory memorandum.

WORLD CAMPAIGN FOR UNIVERSAL LITERACY

1. The Economic and Social Council will recall that at its thirty-sixth session, it transmitted, under resolution 972 (XXXVI), to the General Assembly of the United Nations, the UNESCO report "World Campaign for Universal Literacy" together with the records of its discussion.

2. After a full debate in the Second Committee,¹ the General Assembly unanimously adopted resolution 1937 (XVIII) (annex I).

3. Since the eighteenth session of the General Assembly there has been increasing evidence of widespread popular interest in the idea of a world literacy programme. The United Nations Economic Commission for Africa (at its sixth session in Addis Ababa in February and March 1964) and the United Nations Economic

Commission for Asia and the Far East (at its twentieth session, in Teheran, in March 1964), expressed their conviction that the literacy programmes should be in accordance with the most urgent needs of social and economic development and a basis for further technical and vocational education or training (annexes II and III). The problem of illiteracy has naturally been discussed in a wide range of conferences organized within the framework of UNESCO's programme, in particular in the Conference of Ministers of Education of African countries held at Abidjan, Ivory Coast, in March 1964, which adopted an important resolution on the subject (annex IV).

4. In accordance with paragraph 5 of resolution 1937 (XVIII) of the General Assembly, consultations took place between the Secretary-General and the Heads of the United Nations agencies and programmes concerned. These consultations culminated at the meeting of the Administrative Committee on Co-ordination in Paris from 28 to 30 April 1964 (see E/3886, paras. 20 to 24).

5. The Executive Board of UNESCO, at its sixty-seventh session in May 1964, carefully considered proposals made by the Director-General in regard to a world literacy programme. Members expressed their deep satisfaction with the proposed plan, stating that they were moved by what may be one of UNESCO's most important undertakings which deserved their

¹ *Official Records of the General Assembly, Eighteenth Session, Annexes*, agenda items 12, 33, 34, 35, 36, 37, 39 and 76, document A/5653.

whole-hearted support. The Board adopted a resolution on this matter (annex V). This resolution endorses the Director-General's conclusions concerning the launching in 1966 of an experimental mass literacy programme and instructs the Director-General to bring these recommendations to the attention of the Economic and Social Council (annex VI).

ANNEX I

Resolution adopted unanimously by the United Nations General Assembly at its eighteenth session on 11 December 1963

1937 (XVIII). WORLD CAMPAIGN FOR UNIVERSAL LITERACY

The General Assembly,

Recalling its resolutions 1677 (XVI) of 18 December 1961 and 1710 (XVI) of 19 December 1961, and Economic and Social Council resolution 972 (XXXVI) of 31 July 1963 on co-operation for the eradication of illiteracy throughout the world,

Having considered with appreciation the report on the world campaign for universal literacy,^a called for by the General Assembly, which was approved by the General Conference of the United Nations Educational, Scientific and Cultural Organization at its twelfth session and transmitted to the Assembly through the Economic and Social Council,

Expressing its deep concern at the grave situation revealed in this report, which indicated that:

(a) According to the best available estimate, more than 700 million adults of fifteen years and over or more than two-fifths of the world's population, were illiterate in the mid-twentieth century;

(b) In many countries of Africa, Asia and Latin America, the percentage of adult illiterates is between 70 per cent and 90 per cent of the population and the rate of illiteracy among women is considerably higher, and that in the present circumstances, in these countries alone, approximately 20 to 25 million new illiterates will be added annually to the adult population in the next six or seven years,

Reaffirming its belief that the right to education is one of the fundamental rights of man, as set forth in article 26 of the Universal Declaration of Human Rights, and that mass illiteracy is an obstacle to social and economic progress during the United Nations Development Decade and thereafter,

Recognizing that, while the eradication of illiteracy is in the main a problem requiring national effort, intensified international co-operation also has an important role to play in the solution of this problem,

Noting the broad conclusions brought to the attention of the General Assembly by the General Conference of the United Nations Educational, Scientific and Cultural Organization in its resolution 1.2531 of 12 December 1962, adopted at its twelfth session,

1. Invites Member States in whose territories illiteracy is still widespread to accord appropriate priority to the eradication of illiteracy within their overall development plans and, where they deem it necessary, to establish national programmes for continuing education for adults, including governmental services to plan and execute such programmes;

2. Invites States Members of the United Nations and members of the specialized agencies, and in particular those States in whose territories mass illiteracy is no longer a major problem, to contribute technical and/or financial assistance, as appropriate, to national efforts for the eradication of illiteracy for the benefit of all in those countries where it is widespread;

3. Invites non-governmental organizations which are active or interested in the field of education to collaborate to the fullest possible extent in a world-wide action for the achievement of universal literacy as an essential element of social and economic progress in the United Nations Development Decade and thereafter;

4. Commends the United Nations Educational, Scientific and Cultural Organization on its activities in connexion with the eradication of illiteracy throughout the world and expresses the hope that it will pursue further its work in this field and continue to give due consideration to the methods of achieving this goal, including the planning, supervision and financing of pilot projects;

5. Invites the Secretary-General, in collaboration with the Director-General of the United Nations Educational, Scientific and Cultural Organization, the Managing Director of the Special Fund, the Executive Chairman of the Technical Assistance Board and the President of the International Bank for Reconstruction and Development and its affiliates, to explore ways and means of supporting national efforts for the eradication of illiteracy through a world campaign and any other measures, if appropriate, of international co-operation and assistance, both non-financial and financial, and to submit a report thereon, together with appropriate proposals, to the General Assembly at its nineteenth session.

ANNEX II

Resolution adopted unanimously on 2 March 1964 by the sixth session of the Economic Commission for Africa held at Addis Ababa

775 (VI). WORLD CAMPAIGN FOR UNIVERSAL LITERACY

The Economic Commission for Africa,

Noting resolution 1937 (XVIII) unanimously adopted by the General Assembly of the United Nations at its eighteenth session in December 1963 regarding a world campaign for universal literacy, which in operative paragraph 1, invited "Member States in whose territories illiteracy is still widespread to accord appropriate priority to the eradication of illiteracy within their overall development plans, and, where they deem it necessary, to establish national programmes for continuing education for adults, including governmental services to plan and execute such programmes",

Having considered the document on Adult Literacy and Economic and Social Development (E/CN.14/269) presented by the United Nations Educational, Scientific and Cultural Organization to the Commission,

1. Endorses the view that mass illiteracy is a grave handicap to social and economic development,

2. Expresses the hope that ways and means will be found to undertake a world campaign for universal literacy along the lines of the conclusions reported by UNESCO to the United Nations General Assembly at its eighteenth session which have led to the unanimous approval of resolution 1937 (XVIII);

3. Recommends Governments of its member and its associate member States:

(a) To include in their national plans of education and within the framework of their over-all development plans, provision for adult literacy and adult education programmes which will supplement measures for raising school enrolment and will achieve rapidly mass literacy;

(b) Within the final objective of the eradication of mass illiteracy to establish programmes in this field in accordance with the most urgent needs of social and economic development, and as a basis for further technical and vocational education or training;

(c) To take the necessary steps for the implementation of these projects.

^a E/3771.

ANNEX III

Resolution adopted unanimously on 17 March 1964 by the twentieth session of the Economic Commission for Asia and the Far East held at Teheran

55 (XX). WORLD CAMPAIGN FOR UNIVERSAL LITERACY

The Economic Commission for Asia and the Far East,

Having considered the report submitted by the United Nations Educational, Scientific and Cultural Organization on adult literacy and social and economic development (E/CN.11/654),

Noting with concern that of the world total of 700 million adults presumed to be illiterate at mid-century some 75 per cent lived in Asia and that, in spite of the expansion of the school system, the total number of adult illiterates in several countries of Asia was still increasing as a result of the accelerated population growth,

Convinced that education is a key factor of economic growth and social progress and, in particular, that a mass extension of literacy is a prerequisite for the successful implementation of national plans for economic development,

Recalling the conclusion reached by the Ministers of Education of Asian member States of UNESCO at the meeting jointly sponsored by ECAFE and UNESCO at Tokyo in 1962 that comprehensive plans for education in each Asian country should be integrated into national development plans,

Takes note of resolution 1937 (XVIII) of the General Assembly of the United Nations,

Expresses the hope that adequate means will be found by the United Nations and member Governments to launch a world campaign for universal literacy,

Recommends to Governments:

1. That, in addition to taking measures for the extension of school and higher education, they make adequate provision in their national development plans for the progressive eradication of mass illiteracy;

2. And that, to this end, they establish national literacy programmes with a view to improving education as well as intensifying technical and vocational training of adults related to the needs and priorities of social and economic progress.

ANNEX IV

Resolution on literacy programmes adopted at the Conference of Ministers of Education of African Countries held at Abidjan from 17 to 24 March 1964

With regard to literacy training for adults, the conference examined the recommendations of the final report of the Regional Conference on the Planning and Organization of Literacy Programmes in Africa (UNESCO/AFMIN/7), which was introduced by the Chairman of that conference. The Director-General of UNESCO stressed the importance of this document which — it was hoped — might be used as a basis for activities in Africa within the framework of a world campaign for universal literacy.

The Chairman recalled the meaning of such action. Literacy was not an end in itself but only part of the general educational process which, by appealing to appropriate motivations, aimed at making the individual more productive and integrating him into the economic development effort by preparing him for further training. Reference was made to the various types of strategy that might be used for literacy, either mass campaigns or action by sector. The financing of such programmes, even though it might require external aid, was basically the responsibility of the Governments concerned. The success of an enterprise of that nature depended upon the support of all the political and social forces and on the utilization of the teaching staff, volunteer instructors

and even, if necessary, children, as well as all the communication media. National action, however, must be seconded by international co-operation which can be furnished by UNESCO and which implies specifically the establishment of documentation centres, the exchange of specialists and the circulation of documents giving an account of the experiences of the different countries. The conference adopted, in this connexion, a draft resolution (UNESCO/AFMIN/DR.2) submitted by the Republic of Ivory Coast. The text of this resolution is as follows:

The Conference of Ministers of Education of African countries participating in the implementation of the Addis Ababa Plan,

Having examined the reports and resolutions of the Regional Conference on the Planning and Organization of Literacy Programmes in Africa,

Recalling the resolutions of the United Nations General Assembly and the General Conference of the United Nations Educational, Scientific and Cultural Organization concerning the world literacy campaign,

Considering that the high rate of illiteracy in Africa retards the development of the African continent in all fields,

Aware that literacy, which is the starting point for a minimum vocational training and the upgrading of workers, in the wider framework of continuing adult education contributes to productivity, the development of industry and consequently the better utilization of natural resources, and to prosperity in general,

Considering the need to undertake systematic literacy work at the level of organized production, where the fundamental motivations are strongest and most sustained,

Considering that progress at this level forms the basis for a constant effort aiming at the extension and development of literacy work,

Considering that the funds devoted to the execution of literacy programmes have so far proved inadequate for lack of a systematic study of ways and means of mobilizing them,

1. *Endorses* the recommendations and resolutions of the aforementioned conference;

2. *Recommends* that all States members undertake a rational literacy programme, giving due consideration to the economic system, the social context and the possibilities and needs of each country;

3. *Recommends* that the Governments of the African countries:

(a) In drawing up their economic and social development plans, determine the percentage of the national income to be allocated to education in general, including adult literacy work;

(b) Make such sacrifices as are necessary to increase to the greatest possible extent their budgetary allocations for the struggle against illiteracy;

(c) Devise methods by which public and private enterprises and co-operative organizations may make a greater contribution to literacy efforts among workers employed in these various sectors of activity;

(d) Envisage state aid, where necessary, for the implementation of literacy projects in factories and co-operatives, taking advantage of the stronger motivation for literacy and vocational training that exists among workers;

4. *Invites* the Economic Commission for Africa, in co-operation with the African Institute for Economic Development and Planning, to undertake a preliminary study of the best national methods of financing literacy work. This study, to be carried out in the light of the structure of African economies, should enable the active working population to become literate rapidly, both in public and private enterprises and co-operatives, without greatly distorting the economic development of the African States and taking full account of the need for African industry to be competitive;

5. *Appeals* to international organizations and Member States in which illiteracy no longer constitutes a serious obstacle to accord a high priority to literacy projects in technical assistance programmes and bilateral relations;

6. *Appeals* to UNESCO:

(a) To continue its studies on the strategy of the struggle against illiteracy, on costs and financing, and on the methods and means to be employed in work on literacy programmes and campaigns, at the national, regional and world levels;

(b) To increase its efforts to persuade governments and international organizations to place greater emphasis on literacy work in human and social advancement;

(c) To insist that material and financial means be co-ordinated and grouped in order to ensure the success of the undertaking;

7. *Recommends* that, to this effect, UNESCO should receive additional financial resources so that it may make a larger and more effective contribution to literacy work through multilateral international aid.

Literacy training in countries whose population is largely nomadic raised special problems. Assistance from UNESCO, in the form of personnel and equipment, was requested for this purpose.

ANNEX V

Resolution adopted by the Executive Board of the United Nations Educational, Scientific and Cultural Organization at its sixty-seventh session

The Executive Board,

Having considered the report of the Director-General on a world campaign for universal literacy (documents 67 EX/3 and Add.1);

Notes with approval the activities already undertaken or planned with a view to encouraging national literacy programmes;

Endorses the Director-General's conclusions concerning the launching in 1966 of an experimental mass literacy programme designed to pave the way for the eventual launching of a world campaign (67 EX/3, Add.2);

Instructs the Director-General to:

(a) Present these conclusions officially to the Secretary-General of the United Nations so that he may take them into account in the preparation of the report which he is required to submit to the XIXth session of the General Assembly in pursuance of resolution 1937 (XVIII);

(b) Bring these recommendations to the attention of the Economic and Social Council, which is to hold its next session in Geneva from 13 July to 15 August 1964;

(c) Submit these recommendations to the General Conference, at its thirteenth session, with a view to securing general approval and, in particular, adoption of the provisions necessary for launching the experimental programme in 1966 under the Organization's programme and budget for the next financial period, it being understood that the proposed activities would be financed by means of rearrangements of the draft programme contained in document 13 C/5, within the budget ceiling for the Education chapter, as well as by means of extra-budgetary resources;

(d) Invite the attention of Member States and Associate Members to his conclusions, set forth in document 67 EX/3 Add.II, as well as to the present decision of the Executive Board.

ANNEX VI

World campaign for universal literacy

CONCLUSIONS OF THE DIRECTOR-GENERAL OF THE UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANIZATION

1. In the light of the developments described in document 67 EX/3, and of the recent consultations held with the Secretary-

General of the United Nations on the occasion of the meeting of the Administrative Committee on Co-ordination, the Director-General submits the following conclusions to the Executive Board:

I. *A favourable situation*

2. The situation is characterized by the existence of powerful factors, both subjective and objective, whose impetus is in the direction of a systematic expansion and intensification of efforts to achieve mass literacy. The subjective factors comprise keen and infectious motivation. The objective factors arise out of the increasingly obvious relationship between literacy and development.

A. *Motivation*

3. In Member States where illiteracy is a major problem, there is a constant increase in the number of illiterate men and women who experience the need to learn to read and write. Since economic and social development require that the population should participate more actively in the civic and economic life of the nation, the individual motives which induce illiterates to attend literacy courses are growing both in intensity and in depth.

4. The Governments of these Member States are aware of the need to include programmes of literacy teaching in their national education and development plans. The relative priority which they accord to the literacy campaign is deemed necessary for economic development, social progress and greater independence. Furthermore, and for similar reasons, public and private bodies are becoming more and more interested in literacy work.

5. Generally speaking, the literacy campaign has made a great impact on public opinion throughout the world. International organizations — governmental and non-governmental — realizing that illiteracy is an obstacle both to the execution of their programmes and to general development on a world-wide scale, appear to be disposed to make a more effective contribution to the implementation of programmes of literacy teaching and continuing education for adults.

B. *The relationship between literacy teaching and development*

6. The objective importance of literacy teaching for development is becoming more and more widely recognized. Its role as a factor of development, already brought out in the resolution by which the United Nations General Assembly, at its eighteenth session, approved the principle of a world campaign for universal literacy, has been further emphasized by a number of conferences and meetings held during recent months:

Sixth session of the United Nations Economic Commission for Africa (Addis Ababa, 19 February to 3 March 1964);

Twentieth session of the United Nations Economic Commission for Asia and the Far East (Teheran, 2 to 17 March 1964);

Fourth Regional Conference of Asian National Commissions for UNESCO (Bangkok, 10 to 15 February 1964);

Fourth Regional Conference of Arab National Commissions for UNESCO (Algiers, 3 to 7 March 1964);

Regional Conference on the Planning and Organization of Literacy Programmes in Africa (Abidjan, 8 to 14 March 1964);

Conference of Ministers of Education of African Countries participating in the implementation of the Addis Ababa Plan (Abidjan, 17 to 27 March 1964).

7. The participants in these meetings, who had widely differing cultural, social and economic backgrounds, strongly recommended, in almost identical terms, that Governments should provide for programmes of literacy teaching and adult education in their national education plans, and accord suitable priority to the eradication of illiteracy in their plans for general development. They also recommended that literacy programmes should be integrated

into programmes for continuing education and, more particularly, that they should be linked up with programmes of technical and vocational training, since literacy teaching is a key factor of increased production, efficiency and economic growth.

8. The subjective and objective factors which govern the intensification of efforts to achieve mass literacy should be reflected in their entirety in UNESCO's action:

(a) At the level of programmes for the extension of universal primary education, so that the spread of illiteracy may be checked at its roots;

(b) At the level of educational planning activities, which should take more account than in the past of the importance and the role of literacy teaching and adult education and accord them their rightful place;

(c) At the level of activities directly concerned with the development of literacy teaching and the continuing education of adults.

9. As soon as literacy teaching takes its place among the priorities of national development, it should also become one of the key fields benefiting from bilateral aid and international assistance. So far as the latter is concerned, those countries which are prepared to conduct large-scale literacy campaigns linked directly to their development plans should be able, during the Development Decade, to count not only on assistance from UNESCO, but also on substantial support from the Expanded Programme of Technical Assistance and the Special Fund, not to mention UNICEF.

II. *An experimental programme*

10. In the light of this situation, the Director-General feels able, and, indeed, is duty bound, to set out hereunder the main lines of an experimental mass literacy programme designed to pave the way for the eventual launching of a world campaign which has already been approved in principle by the United Nations General Assembly.

11. This programme would begin in 1966 and last until 1968, and would be followed by a phase during which the activities conducted during the three years would be analysed and appraised. The appraisal, which would require approximately two years, might lead to a plan for the extension of the programme, or even to the preparation of a plan for a world campaign, which would be submitted to the General Conference in 1970.

12. In two senses, the approach to the experimental programme would be essentially selective.

(a) On the one hand, the programme would cover a small number of countries — eight at most — chosen from among those which had expressed willingness to take part in the literacy campaign, in accordance with the following criteria:

The scope of the action taken at the national level to eradicate illiteracy and to accord suitable priority to literacy programmes in the general education plan;

The economic situation and the level of development of the country in question;

The existence of plans and projects for relating literacy teaching to vocational and technical training and to plans for economic development; the percentage of illiteracy;

The existence of motivation in the organized sections chosen as bases for the proposed activities;

The existence of a suitable infrastructure (technical and administrative services).

(b) On the other hand, the tactics and strategy to be employed in the literacy campaign would in each case be adapted to the needs, human and material resources, structures, conditions and

potential of the chosen country. Accordingly, the literacy programmes should be carried out first of all in the organized sections of the economy, where motivations have greater vitality and stronger backing, for example in public or private businesses, co-operatives, trade unions and specific organizations, such as village councils or community development projects.

13. To reach the specific targets chosen for the three-year period, the experimental programme would concentrate on knitting together all the available resources, namely:

(a) National efforts, which should naturally outweigh all others and constitute at least three-quarters of the total resources enlisted;

(b) Bilateral aid, which should take account of the priorities selected by the interested States themselves;

(c) Mutual assistance at the regional level, wherever this is a practical possibility. Such assistance might take the following forms:

(i) Support for such regional institutions as the Arab States Training Centre for Education for Community Development (ASFEC) and the Fundamental Education Centre for Community Development for Latin America (CREFAL);

(ii) Participation of bodies which might be used at the regional level (planning centres, research institutes, centres set up by international organizations, etc), or, on occasion, the creation of new institutions;

(iii) Creation of regional solidarity funds to permit first, the earmarking of appropriations, either as subventions or loans, for national literacy programmes, and secondly, the financing of regional activities and the provision of common services in support of national literacy programmes.

(d) International aid administered by UNESCO.

14. Broadly speaking, this international aid would take the following forms:

(a) The eight countries chosen on the basis of the above-mentioned criteria would receive, for the implementation of specific literacy projects, up to \$8,000,000 per year from the Special Fund, this sum to be advanced on the basis of requests submitted by the Governments themselves.

Together with the regional inter-governmental economic bodies, UNESCO would be responsible for conducting surveys and appraisals on the basis of which pilot countries would be selected and projects prepared; they would be similar in kind but adapted to the conditions of each individual country.

(b) Up to \$2,000,000 a year would be provided under the Expanded Programme of Technical Assistance and the regular budget of UNESCO to existing or new regional bodies in Africa, Latin America, Asia and the Arab countries participating in the implementation of the experimental programme, to enable them to conduct such activities as exchanges of information and experience at the regional level; the training of certain categories of personnel; the organization of panels of travelling experts; the production of literacy material (where this would be more economical at the regional than at the national level).

(c) The implementation, in 1966, of the experimental programme will probably require an increase in the funds at present earmarked for literacy activities in the draft programme and budget (document 13 C/5). From these funds, a sum of \$300,000 might be allocated to surveys and research, documentation and the provision of personnel required for the execution of the experimental programme. If, in accordance with the initial estimates made, it should prove necessary to raise to \$1,000,000 the sums intended to cover surveys and research, the evaluation of national programmes, aid to non-governmental organizations, documentation and personnel costs, the difference of \$700,000 would have to be found by means of adjustments in the budget for the chapter on Education.

15. If the conclusions set out above should secure the approval and support of the Board, the Director-General could:

(a) Submit them officially to the Secretary-General of the United Nations, so that the latter could take account of them in preparing the report which he is to submit to the nineteenth session of the General Assembly in pursuance of resolution 1937 (XVIII);

(b) Bring them to the knowledge of the Economic and Social Council, which is to hold its next session in Geneva from 13 July to 15 August 1964;

(c) Submit them to the General Conference, at its thirteenth session, with the object of obtaining approval for them as a whole and, more particularly, the voting in the context of the programme and budget of the organization for the next budgetary period, of the measures necessary for the implementation of the experimental programme in 1966. The proposed activities would be financed by means of adjustments in the draft programme (document 13 C/5), within the limits of the budget relating to that programme.

DOCUMENT E/3973

Report of the Co-ordination Committee

[Original text: English]
[11 August 1964]

1. The Co-ordination Committee, under the chairmanship of Mr. Daniel Cosío Villegas (Mexico), considered, at its 262nd meeting held on 6 August 1964, item 44 of the agenda: "World Campaign for Universal Literacy". This item had been referred to the Committee by the Council at its 1314th plenary meeting held on 13 July 1964.

2. The Committee had before it the following documents:

A communication from the Director-General of the United Nations Educational, Scientific and Cultural Organization (E/3927);

The 29th Report of the Administrative Committee on Co-ordination (E/3886, paras. 20 to 24);

The report of UNESCO to the Economic and Social Council (E/3896, paras. 19 to 23).

3. The delegate of Algeria introduced a draft resolution on the subject (E/AC.24/L.239) sponsored by the delegations of Algeria, Argentina, Cameroon,

Chile, Columbia, Ecuador, Ghana, India, Iraq, Senegal, the United Arab Republic, the United Republic of Tanganyika and Zanzibar, and Yugoslavia. At a later stage the delegation of Indonesia was added as a co-sponsor.

4. Statements were by made the delegates of Indonesia, India, the United States of America, France, the United Kingdom, Senegal, Ecuador, Iran and Mexico, as well as by the Deputy Under-Secretary for Economic and Social Affairs and the representative of UNESCO.

5. In a short adjournment of the meeting the sponsors agreed to a revised text of the draft resolution, incorporating various oral amendments and suggestions which had been made during the debate. The revised draft resolution was adopted unanimously.

6. The Committee therefore recommends the adoption by the Council of the following draft resolution:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1032 (XXXVII). World Campaign for Universal Literacy

The Economic and Social Council,

Having considered the report² submitted to it by the Director-General of the United Nations Educational, Scientific and Cultural Organization pursuant to the instructions of the Executive Board of that Organization, and having studied with particular interest the world literacy programme outlined in annex VI of the report,

Noting further the resolutions adopted unanimously by the Economic Commission for Asia and the Far

East at its twentieth session³ (at Teheran) and by the Economic Commission for Africa at its sixth session⁴ (at Addis Ababa) inviting member States to make provision in their national plans of education and within the framework of their overall development plans for adult literacy and adult education programmes,

Recognizing that programmes for the eradication of illiteracy should be accorded appropriate priority within overall national educational and development programmes,

² Official Records of the Economic and Social Council, Thirty-seventh Session, Annexes, agenda item 44, document E/3927.

³ *Ibid.*, Supplement No. 2 (E/3876/Rev.1), part III, resolution 55 (XX).

⁴ *Ibid.*, Supplement No. 10 (E/3864/Rev.1), part III, resolution 115 (VI).

Welcoming the main lines proposed for the world literacy programme, which would include an experimental phase during which pilot projects would be carried out in a small number of countries, where literacy programmes would be applied in close liaison with economic development programmes and carefully appraised with a view to determining the feasibility and possible efficacy of a world campaign for the elimination of mass adult illiteracy;

1. *Recommends* that, in the light of the recommendations which the Secretary-General will be presenting in pursuance of General Assembly resolution 1937 (XVIII), of 11 December 1963, the General Assembly should give sympathetic consideration to this proposal and entrust

the United Nations Educational, Scientific and Cultural Organization with the task of promoting the programme and assisting in its execution;

2. *Expresses the hope* that the United Nations Technical Assistance Board, the Special Fund, the World Food Programme and the other competent international institutions will give every possible support to the programme in accordance with General Assembly resolution 1240 (XIII) of 14 October 1958 and Economic and Social Council resolutions 222 (IX) of 14 and 15 August 1949 and 735 (XXVIII) of 30 July 1959.

*1350th plenary meeting,
14 August 1964.*

CHECK LIST OF DOCUMENTS

NOTE. This check list includes the documents pertaining to agenda item 44 which are not reproduced in the present fascicle.

DOCUMENT E/3938

**Communication from the Permanent Representatives of Algeria,
Chile and Iraq to the United Nations**

*[Original text: Spanish]
[10 July 1964]*

On the instructions of our respective Governments, we have the honour to request your Excellency to include in the provisional agenda for the thirty-seventh session of the Economic and Social Council, in accordance with rule 13 of the rules of procedure, a supplementary item entitled "United Nations Disaster Fund".

In support of this request, we should be grateful if you would bring to the Council's attention the note dated 30 June, transmitted to you by the delegations of Algeria, Chile, Iraq, Jamaica and Trinidad and Tobago.

(Signed): Raouf BOUDJAKDJI,
Chargé d'affaires,
Permanent Mission of Algeria
to the United Nations

Carlos Martinez SOTOMAYOR,
Permanent Representative of Chile
to the United Nations

Adnan M. PACHACHI,
Permanent Representative of Iraq
to the United Nations

The note of 30 June reads as follows:

On the instructions of our respective Governments, we have the honour to request your Excellency to bring to the attention of the Economic and Social Council

at its thirty-seventh session the desirability of establishing a United Nations Disaster Fund.

The General Assembly has on previous occasions shown its willingness to extend its sympathy and support to countries struck by disaster, and Member States have frequently offered considerable assistance to those affected. As, however, there is no effective machinery for dealing with such situations, it is necessary, each time that such disasters occur and are brought to the attention of the United Nations, to initiate specific measures designed to cover each particular case.

It is therefore requested that the Economic and Social Council, at its thirty-seventh session, should consider the question of establishing a United Nations Disaster Fund with a view to making specific recommendations to that effect to the nineteenth session of the General Assembly.

We venture to suggest that in its deliberations the Economic and Social Council should consider the following factors:

(a) The willingness of Member States on previous occasions to extend their sympathy to countries struck by disaster;

(b) The lack of any machinery to deal with such situations rapidly and the desirability of establishing such machinery;

(c) The desirability of preparing a list of selected personnel from various agencies who could, at short notice,

be placed at the disposal of the countries struck by disasters, to assist them in the initial organization of relief measures. This task could perhaps be assigned to the Administrative Committee on Co-ordination;

(d) The desirability of obtaining voluntary contributions to the Fund, possibly by means of an annual pledging conference.

(e) The administration of the Fund. It could perhaps be placed at the disposal of the Secretary-General and some appropriate provisions worked out;

(f) All States would have access to the Fund.

of Jamaica
to the United Nations

Charles H. ARCHIBALD,
Deputy Permanent Representative
of Trinidad and Tobago
to the United Nations

DOCUMENT E/3983

Report of the Co-ordination Committee

[Original text: English]
[13 August 1964]

1. The Co-ordination Committee, under the chairmanship of H.E. Dr. Daniel Cosío Villegas (Mexico), considered, at its 267th and 268th meetings held on Wednesday 12 August 1964, item 45 of the agenda entitled: "United Nations assistance in cases of natural disaster". This item, under which the passages of the report of the Administrative Committee on Co-ordination relating to Emergency Action in cases of Natural Disaster were also to be considered, had been referred to the Committee by the Council at its 1314th plenary meeting held on 13 July 1964.

2. The Committee had before it the following: a communication from the Permanent Representatives of Algeria, Chile, and Iraq to the United Nations (E/3938); a communication from the Secretary-General of the League of Red Cross Societies (E/3948); the twenty-ninth report of the Administrative Committee on Co-ordination (E/3886 and Corr.1 and Add.1).

3. The delegate of Chile introduced a draft resolution on a United Nations Disaster Fund, sponsored also by

the delegations of Algeria and Iraq (E/AC.24/L.250). The delegation of Yugoslavia was later added to the list of sponsors.

4. In the discussion based on the above documents, statements were made by several representatives, as well as by the representative of the Secretary-General and by the Secretary-General of the League of Red Cross Societies.

5. Taking into account various suggestions presented during the discussion, the sponsors of the draft resolution made certain oral revisions in their text which was then adopted unanimously with 23 votes by the Committee.

6. The Committee therefore recommends the adoption by the Council of the following draft resolution:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1049 (XXXVII). Assistance in cases of natural disaster

The Economic and Social Council,

Noting that, as a result of natural disasters that have occurred during recent years in developing countries, the United Nations has received numerous appeals for assistance.

Recalling the various resolutions adopted by the General Assembly and the Economic and Social Council,

especially General Assembly resolutions 1882 (XVIII) of 14 October 1963 and 1888 (XVIII) of 1 November 1963 and Council resolutions 930 (XXXV) of 3 April 1963, 970 (XXXVI) of 20 July 1963 and 1014 (XXXVII) of 28 July 1964 calling *inter alia* on the Secretary-General to provide assistance to the stricken countries,

Recognizing that, while limited resources are available for such assistance to certain specialized agencies and operating programmes, the Secretary-General has no

funds at his disposal to offer assistance in case of natural disaster,

Recalling its request, at its thirty-sixth session,¹ that the Secretary-General should take the lead in establishing in conjunction with the specialized agencies and the League of Red Cross Societies, appropriate arrangements for assistance in rapid and concerted relief and construction in cases of natural disaster, and noting with approval the arrangements for inter-agency co-ordination in this field set out in the twenty-eighth² and twenty-ninth³ reports of the Administrative Committee on Co-ordination,

Taking note of the letter to the Secretary-General from the Secretary-General of the League of Red Cross Societies,⁴

¹ *Official Records of the Economic and Social Council, Thirty-sixth Session, Supplement No. 1* (E/3816), page 39.

² *Ibid.*, agenda item 4, document E/3765.

³ *Ibid.*, *Thirty-seventh Session, Annexes*, agenda item 6, document E/3886 and Add.1.

⁴ *Ibid.*, agenda item 6, document E/3948.

1. *Requests* the Secretary-General to study in consultation with the international organizations concerned:

(a) The types of assistance which it might be appropriate for the United Nations to provide;

(b) The order of magnitude of the resources that the Secretary-General might require for this purpose;

(c) Alternative methods of providing such resources, including the establishment of a United Nations fund for assistance in cases of natural disaster, financed through voluntary contributions;

2. *Requests* the Secretary-General to submit his report for consideration by the General Assembly at its nineteenth session;

3. *Also requests* the Secretary-General to consider possible improvements in the arrangements for co-ordinating international assistance and to report to the Council at its thirty-ninth session.

*1351st plenary meeting,
15 August 1964.*

DOCUMENT E/3940

**Letter, dated 10 July 1964, addressed to the Secretary-General
by the Permanent Representative of Chile to the United Nations**

[Original text: English/Spanish]
[11 July 1964]

Under instructions from my Government, I have the honour to request you to arrange for the inclusion in the provisional agenda of the thirty-seventh session of the Economic and Social Council, in accordance with rule 13 of the Council's Rules of Procedure, of a supplementary item "Emergency Aid to Costa Rica". In conformity with the rule referred to, I have the honour to attach the supporting statement appropriate to this request.

(Signed) Carlos Martínez SOTOMAYOR
Permanent Representative of Chile
to the United Nations

Supporting statement

An eruption of the volcano Irazú began at the beginning of March 1963, and has continued ever since. Irazú is situated in the central mountain range of Costa Rica and dominates the entire plateau of that area, which is the most densely populated region with the highest productivity.

The heavy rain of ashes, which has continued for more than a year, and the floods caused by the obstruction and dislocation of river beds, have upset the economy and general life of the country to an extremely serious extent.

The UNESCO emergency mission which recently visited Costa Rica came to the conclusion that there

was a covering of ash between three and ten inches thick which, during the rainy season, particularly in September and October, would be converted into what it described as a river of mud capable of uprooting trees, and of rocks and blocks of lava as big as houses, advancing at the speed of an avalanche. Several urban areas, including the third largest, Cartago, are in serious danger.

The Secretary-General of the United Nations, in response to a request formulated by the Government of Costa Rica, established on 30 April last, pursuant to article VI, 6.6, of the Financial Regulations of the United Nations, a Trust Fund entitled "Fund for Emergency Aid to Costa Rica" and authorized the acceptance of such voluntary contributions as might be made by States Members of the United Nations and by the United Nations specialized agencies, and as might be furnished from other, non-governmental sources. The Fund is to be used to assist in meeting the cost of the preventive measures necessitated by the present situation, in agreement with the Secretary-General of the United Nations.

The following countries have so far made or promised contributions: Spain, Venezuela, Israel, China, Bolivia, and the Federal Republic of Germany.

The seriousness of the situation (the volcano Irazú is still erupting intensely) renders it imperative that the Economic and Social Council should urge the States Members, the specialized agencies, and such non-govern-

mental organizations as are able to do so, to demonstrate their solidarity with the people of Costa Rica through contributions to the Fund referred to in the fourth paragraph of this statement.

For the foregoing reasons, the Permanent Mission of Chile to the United Nations requests that the item

“Emergency Aid to Costa Rica” should be included in the agenda of the thirty-seventh session of the Economic and Social Council, and feels certain that that Council will accord priority to the consideration of this question.

New York,
9 July 1964

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1014 (XXXVII). Emergency aid to Costa Rica

The Economic and Social Council,

Considering with concern the disastrous consequences of the eruption of the Irazú volcano which since 20 March 1963 has been continuously pouring over the central plateau of Costa Rica — the most thickly inhabited area and the one with the greatest productive activity — clouds of ash and sand that have altered the course of several rivers and thereby produced floods which have led to considerable loss of life and have caused very serious damage to the agriculture and the cities of Costa Rica, threatening to entail unforeseeable consequences for that country,

1. *Deplores* the tragic consequences which these unfortunate events are having for the population of Costa Rica;

2. *Expresses its deep concern* about the results connected with the continued activity of the Irazú volcano and accordingly deems it urgent that all possible assistance should be given to that country;

3. *Takes note* of the aid which it has been possible to give Costa Rica, within the narrow budgetary limitations of the United Nations, through technical assistance, the Special Fund, the World Health Organization, the Food and Agriculture Organization, the United Nations

Educational, Scientific and Cultural Organization and in particular commends the Secretary-General of the United Nations for setting up a voluntary emergency trust fund for that purpose;

4. *Invites* States Members of the United Nations which have not yet done so to join those which have contributed to that fund or to consider what further assistance they can offer to Costa Rica;

5. *Invites also* the specialized agencies and the non-governmental organizations to show their solidarity with the people of Costa Rica by contributing to the above-mentioned assistance fund;

6. *Recommends* that the Technical Assistance Committee, the Technical Assistance Board and the Executive Chairman of the Board should take account of the special needs of Costa Rica when considering their programmes for the biennium 1965-1966 and do as much as possible to meet them, without prejudice to the general level of the programmes envisaged for other countries;

7. *Requests* the Managing Director and the Governing Council of the Special Fund to give sympathetic consideration to requests which may be submitted by Costa Rica in connexion with the work of reconstruction and which can be adequately handled by the Special Fund.

*1335th plenary meeting,
28 July 1964.*
