THIRTY-SEVENTH SESSION

13 July - 15 August 1964

ANNEXES

UNITED NATIONS

Geneva, 1965

INTRODUCTORY NOTE

The *Official Records of the Economic and Social Council* include the records of the meetings, the annexes to those records and the supplements. The annexes are printed in fascicles, by agenda item. The present volume contains the annex fascicles of the thirty-seventh session.

* * *

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document.

LIST OF FASCICLES *

<i>Agenda item</i>	<i>Title</i>
{ 2.	Adoption of the agenda. ¹
{ 3.	Organization of work of the thirty-seventh session. ¹
4.	Report of the United Nations Conference on Trade and Development.
5.	World economic trends.
6.	General review of the development, co-ordination and concentration of the economic, social and human rights programmes and activities of the United Nations, the specialized agencies and the International Atomic Energy Agency as a whole.
7.	United Nations Development Decade: (a) Development plans and development planning institutes; (b) United Nations Training and Research Institute; (c) World campaign against hunger, disease and ignorance; (d) Functional classification of activities during the Decade.
8.	Economic and social consequences of disarmament. Conversion to peaceful needs of the resources released by disarmament.
9.	Economic planning and projections.
10.	Financing of economic development: (a) Acceleration of the flow of capital and assistance to the developing countries; (b) Promotion of the international flow of private capital; (c) Establishment of a United Nations Capital Development Fund.
11.	Activities in the field of industrial development.
12.	Training of national technical personnel for the accelerated industrialization of developing countries.
13.	The role of patents in the transfer of technology to under-developed countries.
14.	Development of natural resources: (a) Co-ordinated action in the field of water resources; (b) Progress report on new sources of energy; (c) Work in the field of non-agricultural resources.
15.	Permanent sovereignty over natural resources.
16.	Questions relating to science and technology.
17.	Reports of the regional economic commissions.
18.	Reports of the Governing Council of the Special Fund.
19.	Programmes of technical co-operation: (a) United Nations programmes of technical assistance; (b) Expanded Programmes of Technical Assistance; (c) Co-ordination of technical assistance activities.
20.	World Food Programme.
21.	Population growth and economic and social development.
22.	Social development.
23.	Report of the Committee on Housing, Building and Planning.

* No fascicle was issued on agenda item 1 (Election of President and Vice-Presidents for 1964), for which there were no documents. Items 41 (Confirmation of members of functional commissions of the Council) and 42 (Work of the Council in 1965 and disposal of items arising out of the nineteenth regular session of the General Assembly) were considered at the resumed thirty-seventh session.

¹ A single fascicle is issued for agenda items 2 and 3, which were considered together by the Council.

24. International co-operation in cartography:
 - (a) Report of the Secretary-General on the first United Nations Regional Cartographic Conference for Africa;
 - (b) Question of convening an international conference on the standardization of geographical names.
25. Question of procedures for the revision of the International Convention on Road Traffic and of the Protocol on Road Signs and Signals, done at Geneva, 19 September 1949.
26. Town twinning: means of international co-operation.
27. Report of the Commission on Human Rights.
28. Measures to implement the United Nations Declaration on the Elimination of All Forms of Racial Discrimination.
29. Advisory services in the field of human rights.
30. Slavery.
31. United Nations Children's Fund.
32. Report of the United Nations High Commissioner for Refugees.
33. Teaching of the purposes and principles, the structure and activities of the United Nations and the specialized agencies in schools and other educational institutions of Member States.
34. International control of narcotic drugs.
35. Non-governmental organizations.
36. Review of the pattern of conferences and establishment of the calendar of conferences for 1965.
37. Questions of a session of the Commission on International Commodity Trade in the autumn of 1964 and of the extension of the term of office of the members of the Commission.
38. Financial implications of actions of the Council.
39. Elections.
40. Arrangements regarding the report of the Council to the General Assembly.
43. Participation in general multilateral treaties concluded under the auspices of the League of Nations.
44. World Campaign for Universal Literacy.
45. United Nations assistance in cases of natural disaster.
46. Emergency aid to Costa Rica.

Interim Co-ordinating Committee for International Commodity Arrangements: 1964 review of international commodity problems

[Original text: English]
[29 May 1964]

Introductory note

This review was prepared by the Interim Co-ordinating Committee for International Commodity Arrangements (ICCICA), which was established in 1947 by resolution 30 (IV) of the Economic and Social Council. The responsibilities of this Committee are dealt with in Council resolutions 30 (IV), 296 (XI), 373 (XIII), 462 (XV) and 557 F (XVIII).

The Chairman of this Committee, Mr. S. A. Hasnie, was nominated by the Contracting Parties to the General Agreement on Tariffs and Trade (GATT), and Mr. R. Tetro, with Mr. P. Callanan as alternate, by the Food and Agriculture Organization of the United Nations (FAO). The Secretary-General appointed Mr. W. Miller as the member particularly concerned with non-agricultural commodities, and Mr. P. N. C. Okigbo as a person of wide experience in the problems confronting countries undergoing development whose economies are primarily dependent on the production and international marketing of primary commodities.

Letter dated 13 January 1964 addressed to the Secretary-General by the Interim Co-ordinating Committee for International Commodity Arrangements

The Interim Co-ordinating Committee for International Commodity Arrangements has the honour to submit its seventeenth annual report for transmission to the Economic and Social Council.

In submitting its last report¹ the Committee indicated that it planned to review post-war experience in connexion with inter-governmental commodity agreements. Accordingly, consideration is given in chapter II of the present report to experience in the preparation, negotiation, entry into force, operation and review of such agreements. This section of the report has been prepared earlier than customary and will be made available to the appropriate committee of the United Nations Conference on Trade and Development.²

Chapter III of the report contains information on the principal developments in inter-governmental consultation and action on individual commodities since the time of the Committee's last report. Trends in production, consumption, trade and market conditions are also considered in so far as they help in understanding inter-governmental action during the year.

As a result of this review of events during the past year, including the failure of the United Nations Cocoa Conference to reach agreement, the Committee has been led to emphasize again the need for continuity in efforts to develop stabilization agreements irrespective of the current market situation. A statement on this matter is made in the first chapter of the present report.

In carrying out its responsibilities under resolution 557 F (XVIII) of the Economic and Social Council of co-ordinating the activities of various inter-govern-

¹ *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 9, document E/3731.*

² Issued as document E/CONF.46/30.

mental commodity groups and councils, the Committee has continued to maintain close contact with these organizations. The Committee takes this opportunity to express its appreciation to the officers of these groups and councils for their co-operation with the Committee during the past year.

There have been significant changes in the structure of the trade in some of the primary commodities at present subject to agreement. These changes will no doubt affect the course of future negotiations. For instance, in a new sugar agreement an attempt will no doubt be made to devise machinery which would be more effective in reducing price fluctuations, because the mechanism of the Sugar Agreement failed to prevent either the sharp rise in prices which occurred in 1957 or the decline at the end of 1961. There have, of course, been even greater price fluctuations during the two years since the economic clauses of this Agreement were suspended.

It is also noted that the present International Wheat Agreement expires in July 1965. The consideration of future action will no doubt be affected by the significant changes which have occurred in wheat stocks, the fact that one important exporter under the Agreement is now importing substantial quantities and by developments in the agricultural policy of the European Economic Community. To allow discussion of these and other related problems by all importing and exporting countries, there may be an advantage in convening a wheat conference somewhat earlier than would otherwise have been necessary.

On the adjournment of the Cocoa Conference in October 1963, this Committee was given the responsibility of advising the Secretary-General of the United Nations in connexion with the resumption of the Conference. It will, as indicated in the appropriate section of chapter III, keep the cocoa situation under current review. The Committee is anxious to carry out its task in an impartial manner and to act without delay in

advising the Secretary-General when resumption is appropriate. Accordingly, the Committee invites all interested Governments to keep it advised of any developments considered relevant.

The Committee has continued to do its best to encourage appropriate inter-governmental activities particularly in commodities not at present subject to agreement. It will be noted that in 1963 the International Coffee Agreement came into operation and that there were important discussions on cocoa and tungsten. Furthermore, Governments have been approached regarding the question of consultation on copper. The Committee will continue to take an active part in stimulating activity in the field, and takes this opportunity to remind Governments of its availability to provide information regarding the steps that may be taken to sponsor inter-governmental consultations on commodities that are experiencing difficulties. The Committee cannot, of course, proceed any more quickly than the Governments concerned wish.

It is noted that there have been important changes in commodity markets during the year under review. Although at the time of writing this note of transmittal commodity prices on the average are somewhat higher than a year earlier, the need remains to develop stabilization machinery for a number of commodities.

The twenty-second session of the Committee, the only session held since the last report, was held in Karachi in January 1964. The Committee, which is most conscious of the importance of commodity problems to developing countries, found it useful to meet in a developing country to consider at first hand the relation between commodity trade and economic development. At its next session, the Committee should be in a position to consider its work in relation to relevant recommendations arising from the comprehensive review of commodity problems to be made by the United Nations Conference on Trade and Development to be held during the first half of 1964.

Chapter I. Continuity in commodity negotiations

1. A review of developments during the last year leads the Committee to refer to an earlier report in which it was stated that "The Committee draws attention to the fact that the process of developing and negotiating an appropriate agreement necessarily takes a long time, and emphasizes the point that interest in such negotiation should not be dependent on the current market situation".³

2. The tendency of discussions to be affected by the current market outlook was evident during negotiations in late 1963 for an international cocoa agreement. When a request for a conference was first made on 1 September 1962, the Committee suggested that there was a need for another meeting of the FAO Cocoa Study Group to advance the preparations for a conference

further. At this further meeting of the Group, the principally interested Governments revised the text of the draft agreement and confirmed their decision to request that a conference be held. The Conference met on 26 September 1963. In the first nine months of 1963 cocoa prices averaged almost 20 per cent above those of the corresponding period of the previous year. During the period of the Conference prices continued to rise and prices for futures were above current prices. As a result there was an expectation that the market would continue to improve and the need for an agreement appeared less urgent.

3. Unfortunately, the prevailing market situation has often affected the progress of negotiations on commodity agreements. For example, the first session of the United Nations Tin Conference held in 1950 shortly after the outbreak of hostilities in Korea adjourned without concluding an agreement largely because the price of tin increased by 80 per cent between June 1950 and November 1950, rising to a level which

³ Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes, agenda item 8, document E/3614, para. 4.

was not reached again until the end of 1963. At the 1950 session of the Conference the exporters considered that any price range which could be negotiated for inclusion in a long-term agreement would be much less than the current price so that a delay would be advantageous to them and the importers felt that it would be better for them to negotiate when the market prices were lower.

4. Improvement in some commodity prices during 1963 also seems to have slightly dampened enthusiasm for agreements in those commodities. The Committee notes, for example, that following a period of falling prices, the International Lead and Zinc Study Group had early in 1963 undertaken studies of the causes of instability in the lead and zinc markets and the possibilities of developing solutions to these difficulties. The trend of lead and zinc prices has been reversed recently and it would appear that there is less enthusiasm for continuing these studies.

5. Since the Committee has certain responsibilities in connexion with development of inter-governmental agreements to moderate price fluctuations in commodity markets, it feels obliged to urge that a long-term view be taken by all participants in the negotiations of commodity agreements.

Chapter II. Inter-governmental commodity agreements

A. INTRODUCTION

6. In recent years commodity agreements have received increased attention as an important instrument of international economic co-operation. In view of the fact that the United Nations Conference on Trade and Development is reviewing measures for stabilization of primary commodity markets at equitable and remunerative prices, including commodity arrangements, the Committee takes this opportunity to set out its experience in developing inter-governmental commodity agreements including agreed international prices.

7. In setting up the Committee in 1947 the Economic and Social Council⁴ requested it, in considering its advice to the Secretary-General on the convening of inter-governmental commodity conferences, to be guided by chapter VI of the Havana Charter, which refers to special difficulties in the international trade of some commodities which "may have serious adverse effects on the interests of producers and consumers, as well as widespread repercussions jeopardizing the general policy of economic expansion" and which may necessitate special treatment through international agreement. This review therefore is confined to a discussion of international primary commodity arrangements and does not, for instance, touch upon other arrangements such as the General Agreement on Tariffs and Trade cotton textiles agreement.

8. Information regarding the various commodity conferences convened under United Nations auspices, including references to the summary of proceedings which include the texts of the agreements is given in annex 1, table 1.

9. The Committee believes it would be useful to review its experience under the following headings, which parallel the step-by-step procedures followed for the convening of a conference to negotiate or to renew an agreement and its entry into force:

Preparation for a commodity conference;
Negotiation of agreements;
Period between conference and entry into force;
Operation of an agreement;
Steps for consideration and renewal of an agreement

B. PREPARATION FOR A COMMODITY CONFERENCE

10. Economic and Social Council resolution 296 (XI) states that a commodity conference may be requested by an appropriate inter-governmental body and that "there should be no procedural delays in the summoning of a commodity conference by the United Nations". Before recommending that a commodity conference be convened, the Committee must satisfy itself (a) that there is some assurance that an agreement is a possibility; and (b) that there has been adequate preparation of the necessary documentation.

11. The Council resolution provides that a request for a commodity conference shall be made only by a study group or an equivalent inter-governmental organization. The Committee believes that this is a wise precaution as it would, *per se*, be an indication that there is some assurance that an agreement is a possibility, provided the study group putting forward the request is representative of the principal producers and consumers. Only when there is a substantial measure of agreement within such a study group as to the nature of such an agreement would the Committee consider itself justified in recommending that a conference be held.

12. The fact that a request for a conference is made by a study group is itself an assurance that there have been preparations. Indeed, the establishment of a study group in itself frequently is the result of a number of earlier steps. This Committee has been given responsibility by the Economic and Social Council for the convening of commodity study groups. In fact, the normal procedure leading to a study group is as follows:

(a) A request is received from a Government concerned (e.g. on cocoa in 1955) or the Committee decides to seek the views of Governments concerned (e.g. its initiative on lead and zinc in 1958);

(b) Usually the Committee requests the Secretary-General to take soundings as to the views of the principal importing and exporting countries—using some objective basis as a criterion of interest;

(c) The convening of a "preparatory meeting" of Governments;

(d) In some cases Governments present at the "preparatory meeting" have considered it advisable to establish, on an *ad hoc* basis, a standing committee in order to prepare for the establishment of a study group on the commodity and to keep the situation under review. Examples of this are the Lead and Zinc Committee and the United Nations Committee on Tungsten;

(e) The terms of reference of this study group, prepared either by the preparatory meeting or by the appropriate standing committee, are circulated to Governments with a request to indicate whether they would be prepared to become members of a study group.

Of course, it is not necessary to follow every one of these steps and where the situation is urgent and adequate information is available, it is possible to proceed quickly to the establishment of a study group. However, the Committee cannot proceed more quickly than the interested Governments are willing to do.

⁴ Economic and Social Council resolution 296 (XI).

Assurance of possibility of agreement

13. While serious consideration is always given to a request from a study group, it is possible that a request from the group—particularly one based on a majority decision—may be too optimistic. There have been some occasions, therefore, when the Committee found it desirable to suggest that the group carry its work further or review its preparatory draft agreement before a conference is convened. At the same time the Committee recognizes, as stated in paragraph 22 below, that there is a point beyond which the preparatory work cannot be carried out in the study group.

14. In view of the current interest in exploring the possibility of concluding agreements for additional commodities,⁵ it may be useful to point out that the establishment of a study group for the commodity concerned is an important step towards the calling of a conference to negotiate an agreement and that, as indicated in the following paragraphs, a good deal of the preparatory work must, in fact, be done in the study group before a conference can be convened. Serious consideration should therefore be given to the desirability of setting up study groups on any additional commodities subject to serious fluctuations as a routine step towards exploring the possibility of additional agreements. In this connexion it will be noted that the Committee is expressly empowered in Economic and Social Council resolution 557 F (XVIII) to convene commodity study groups.

Adequate preparation

15. A description of the preparatory work required before a conference is convened and the negotiations during a conference will illustrate the complex nature of the task of concluding an agreement on a single commodity. Such details would also be useful in considering the feasibility of concluding one agreement for a group of commodities as has been suggested from time to time.

16. If a conference is to have the tools to carry out its work effectively, detailed studies and information on the economic factors governing international trade in the commodity concerned must be available. Consideration must also be given to the type of arrangement which could deal with the problems arising in the trade in that commodity. These preparatory studies can only be carried out by collaboration of Governments having important interests in the commodity. Consequently, this work is usually done through an international study group whose members are Governments substantially interested in the particular commodity. The work of such study groups was outlined in the Committee's 1963 report to the Economic and Social Council; to some extent it may be of a continuing nature (such as the collection and dissemination of statistical data) and, if considered desirable by its members, it is also directed towards the preparation of a draft agreement for the commodity concerned.

17. The statistical series collected should cover production, consumption, stocks, international trade and prices. It is, of course, desirable that such basic statistical information should be supplemented by information on productive capacity and prospective changes in productivity where this is available. When a study group

has been in operation for some time, much of this information would be readily available. It is recognized that while information may be available for individual countries, usually much work needs to be done in developing the data on a uniform basis.

18. At the conference itself, further statistical data relevant to the negotiations and to the mechanism of the proposed agreement is usually required. Particularly in cases where action is contemplated which would determine the price or the quantity of production or where export quotas are to be fixed, it would be necessary to have an indication as to the likely effects of such measures on prices and on consumption and supply. Consideration of possible action under an agreement necessarily involves some estimation of the likely supply and demand for the commodity, taking into account the possible use of substitutes for that commodity. Projections as to the likely trend of production of, and demand for, the commodity may be of help although their reliability depends partly on the nature of the commodity.

19. The Committee considers it essential that a draft agreement, which has undergone thorough consideration by the members of the study group, should be available as a basis for the work of the conference. Measures designed to achieve the objectives of a commodity agreement are necessarily specific to each commodity. Only after having gathered the basic information described in the preceding paragraphs would it be possible to form a judgement on the practicability of the mechanism of the proposed agreement. Since the study group provides a forum for international discussion of both the problems and of the suggested remedies, the group would be in a position to make recommendations on the type of arrangement which would best ensure an improvement in the trade in the commodity.

20. It is also important that any draft agreement receive publicity in advance of the conference, and on previous occasions the Committee has emphasized the importance of the provision in the Havana Charter relating to full publicity for contemplated agreements. Public examination in advance of a conference of the likely working of an agreement is helpful to delegations; in particular, detailed criticism at that stage can be useful in improving an agreement. It is recognized of course that as in the case of cocoa, publicity regarding a stabilization agreement may cause organized opposition from certain traders whose incomes are related to fluctuations in price.

C. NEGOTIATION OF AGREEMENTS

21. The great difference between the atmosphere at a negotiating conference and a meeting of a preparatory study group is not always recognized. Even at the last stage of the preparation of a draft agreement within the study group, delegations are still conscious that the draft is to be reviewed at a negotiating conference. When the conference itself is convened, the position is, of course, quite different. Delegations are then fully aware of the fact that they are no longer preparing a text for consideration but are deciding on the terms of an agreement which will involve commitments on the part of Governments. As a result, each article must be very carefully examined and the possible operation of the agreement analysed in detail. At the conference stage many amendments are usually suggested in a draft which was regarded by the study group as a satisfactory basis for discussion,

⁵ See Report of the Preparatory Committee for the United Nations Conference on Trade and Development, second session, document E/3799, para. 77 (iii).

22. Furthermore, at the study group level, representatives are naturally not prepared to discuss the more difficult and controversial questions such as those of prices and quotas. The negotiation of these questions also necessarily takes a long time. So, frequently, does the discussion of alternatives which have been left in the draft by the study group. When the United Nations Cocoa Conference in 1963 adjourned without settling prices, many delegations made it clear that the study group would not be an appropriate body to follow up this question.

Planning of a commodity conference

23. From the matters discussed in the two preceding paragraphs it is apparent that a commodity conference involves a considerable period of negotiation. In this connexion the Committee notes that the United Nations organs have generally recognized the great importance of commodity agreements to the economies of both exporting and importing countries and that, in particular, the financial authorities, including the Fifth Committee of the General Assembly and the United Nations Advisory Committee on Administrative and Budgetary Questions have fully recognized the impossibility of concluding a difficult agreement within a short time. The Committee considers that the commodity conferences convened have been organized on an efficient basis and have not been prolonged beyond the minimum time necessary.

24. Resolution 296 (XI) of the Economic and Social Council regarding the convening of conferences stipulates that the date and place of any commodity conference should be decided by the Secretary-General. This provision is essential because the Secretary-General is in a position to arrange for conferences to be held at a time when the necessary services would be readily available and at the least cost. This has become more important with the continual growth in the number of international meetings which are being held. On some occasions, however, the study group submitting the request for a conference has itself made suggestions regarding a particular date for the meeting. In these cases, this Committee, in submitting its advice to the Secretary-General, has generally suggested that full consideration be given, so far as possible, to the date proposed by the study group. Experience, however, suggests that such recommendations regarding the date of the proposed conference, which are sometimes based on the likely entry into force of an agreement before a given crop year, are often too optimistic as to the time likely to be required for negotiation and for the necessary constitutional action.

25. Commodity conferences have normally been held either at the Headquarters of the United Nations or at its European Office, although a limited number of commodity meetings have been held in national capitals. The holding of conferences at United Nations centres is not only economical but also provides a certain neutrality between the parties most vitally concerned. There appears to be a general consensus that a conference should not be held in a country which is either a very large producer or very large consumer. However, the Committee considers that there are occasions when it would be most useful to hold a conference in an important trading centre and in this connexion it draws attention to the fact that the headquarters of a large number of commodity councils are now in London. Suggestions have been made that

commodity conferences should sometimes be held at the headquarters of regional economic commissions besides the Economic Commission for Europe. For example, it may well be useful to hold the resumed session of the cocoa conference in Addis Ababa.

26. Pre-conference documentation for a commodity conference generally includes the agenda, draft rules of procedure and a draft agreement. The preparation of the agenda for each commodity conference is the responsibility of this Committee. Some guidance is provided by the basic resolution of the Economic and Social Council (resolution 296 (XI)) and the Committee has always endeavoured to make the agenda as simple as possible. Consequently, the items have usually been expressed in broad terms so that the conference can take up any related item. The Committee also drafts the rules of procedure for the conference.

27. As pointed out in paragraph 20 above, examination by qualified people of a draft agreement in advance of a conference is desirable. Within the Governments concerned such a draft agreement would, of course, usually be discussed at inter-departmental meetings so that all aspects would receive consideration. The publication of a draft agreement also makes possible discussions in trade circles and in the Press. In this connexion it would be helpful if economists and business interests were to publish their analyses of, and views on, any proposed agreement well in advance of a conference. The Committee takes this opportunity to stress its view that where a new agreement is under consideration the form of the agreement and the techniques to be used can be greatly improved by such wide considerations.

Representation at commodity conferences

28. An inter-governmental commodity conference brings together representatives of all the various interests. The Governments are often classified into mainly importing and mainly exporting countries but different interests within the countries may be represented on the delegations. In any case, it is usual for the delegation of a country with a substantial interest in a commodity concerned to have representatives of the principally interested departments, perhaps those of Foreign Affairs, Trade or Commerce, Treasury and Departments of Agriculture or Mines (depending on the subject under discussion). The head of the delegation is frequently a Minister or another policy-making officer. This wide representation appears to make for more prompt consideration after the conference and enables the Government concerned more easily to reach decisions as to the action to be taken. Delegations normally include experts from industry and trade advisers. Their presence at the conference is useful during the discussion of technical aspects of the agreement and seems to facilitate the subsequent public acceptance of an agreement, in that they are in a position to assure the other trade interests that the delegations have fought hard to promote the interests of the country concerned. Their attendance at the conference also enables them to see the point of view of other countries and recognize the need for a compromise in arriving at an agreement. The 1963 Cocoa Conference, for example, included advisers from the leading chocolate manufacturers as well as from firms interested in trade in cocoa.

29. Some countries are represented at commodity conferences by delegations as full members of the con-

ference, whereas others are represented as observers as provided in the rules of procedure. No delegation, whether a representative delegation or an observer delegation, is bound by the discussions at the conference; all have an equal opportunity to decide for themselves after the conference whether to ratify an agreement or not. The Committee considers that the interested countries should, as far as possible, come to a conference with an intention to participate fully in the drafting of the agreement.

30. The resolution of the Economic and Social Council (296 (XI)) regarding invitations to commodity conferences makes it possible for the Interim Co-ordinating Committee for International Commodity Arrangements to recommend that specialized agencies be invited to attend and this is usually done according to the interest of the specialized agency concerned. Normally the ICITO/Contracting Parties to the General Agreement on Tariffs and Trade, the International Monetary Fund, the International Bank for Reconstruction and Development, the International Labour Organisation and, where appropriate, the Food and Agriculture Organization of the United Nations are invited. Representatives of the specialized agencies usually only attend during the time of more general negotiation.

31. The question has sometimes been raised as to whether other inter-governmental and non-governmental organizations should be invited to attend commodity conferences. Under the present Economic and Social Council resolution, invitations cannot be extended to such bodies. On the whole, the Committee considers also that they have little direct interest in the detailed negotiations which take place and realizes that it might, in fact, be difficult to ask Governments to negotiate in the presence of observers from such organizations. The important thing is that the conference is not only inter-governmental in nature, but that the commitment under an agreement has to be accepted. The conference is, in fact, a series of detailed negotiations which must be carried on privately since the Governments concerned must make binding commitments when accepting an agreement. The steps in the negotiations are of little interest to organizations which neither buy nor sell the commodity under discussion.

32. However, it is recognized that there are some inter-governmental bodies which have an operational function on behalf of Governments and co-ordinate the policies of Governments, as in the case of the European Economic Community. To meet this situation, a technique has been evolved by which the conference gives to the Executive Committee the authority to invite representatives of a few such specific inter-governmental organizations to attend discussions in the Executive Committee of particular items on a consultative basis. This provides ample opportunity since the Executive Committee is the main operative body of the conference and the items on which these bodies are given consultative status are usually the most important items on the conference agenda.

Committee structure

33. Once a negotiating conference has been convened, the bargaining should be held in closed session and for this purpose the conference usually sets up an Executive Committee consisting of all Governments represented at the conference, meeting in closed session. During this stage of negotiation discussions are in private and this tends to reduce or eliminate specu-

lation which might be based on the bargaining position taken by the group at a given time. Particularly where prices are under consideration such discussions should not be allowed to influence the market.

34. The conference usually opens with general statements by delegations, some of which may be made in open, and others in closed, sessions. The Committee does not have any views as to which is the more desirable, except perhaps to point out the greater difficulty of changing during negotiations a course of action or a range of prices stated in a public meeting. It does, however, consider it important for the work of a conference that such opening statements should be directed to the specific business of the particular conference rather than deal in a general way with broader problems of stabilization. This is not to suggest that the work of a commodity conference is not related to the more general problems, but rather that it is essential to get to the specific problems as early as possible, since a negotiating conference necessarily takes a long time. The Committee notes with satisfaction that as commodity conference experience has developed there is, in fact, evidence that delegations wish to get down to business at an early stage.

35. In line with this desire to confine debate to matters essential to the development of an agreement, meetings are frequently adjourned when there is no further specific business. On the other hand, when delegations receive instruction on matters under negotiation, they will want immediately to discuss such matters thoroughly. This frequently makes the servicing of such conferences difficult. In this connexion the Committee would like to thank the language services of the United Nations for their interest and understanding and their endeavours to meet the needs of commodity conferences.

36. Since the work of the conference falls into two principal fields—economic and administrative—the Executive Committee usually sets up two principal committees corresponding to this division.

(a) The Economic Committee usually establishes a technical committee to deal with the technical aspects of economic problems such as price differentials for various qualities or grades, and a statistical committee. In some conferences the latter plays an important part in estimating the total world requirements in the first year of the agreement which, in turn, forms a basis of the total quotas to be set. It may also sometimes consider production or export data in relation to quotas.

(b) The second principal committee is usually the Administrative and Legal Committee, which has a most important function to fulfil since an agreement must carefully formulate the commitments by Governments and the terms of the agreement must be clearly defined. This Committee must also make arrangements for the entry of an agreement into force (see paras. 73 to 83 below) and for the setting up of machinery to administer the agreement.

37. In addition to the Economic and the Administrative and Legal Committees, a Steering Committee is generally established by the Executive Committee to give guidance to the Chairman and the Executive Secretary in organizing the work of the conference. Its membership usually consists of the Chairman and Vice-Chairmen of the conference and the chairmen of the principal committees. Sometimes the representatives of one or more very large importing and exporting countries are also added. Such a committee can be most helpful in reviewing from time to time the progress

made and, in particular, in dealing with problems which may be referred from one committee to another or on which joint action is required; it can also be particularly helpful in the closing stages of a conference when priorities must be given to particular questions.

38. As different issues of a complex nature are raised during the conference it is usual to set up working parties to deal with them. With a view to making progress, it has been found most useful to isolate in this way the separate issues for consideration by small groups. On some of the more difficult issues, such as those of prices, it is usually found desirable to have a very small working party, and quite frequently informal talks amongst one or two delegations are necessary.

39. There is usually a close interrelationship between the various provisions of an agreement. As a result, sometimes delegates at conferences find it difficult to know which subject should be taken at the beginning. This is a practical matter of some importance. As soon as a particular matter is raised at a conference some delegates may say, quite rightly, that it depends on another article. This can go on for some time, the conference finding it difficult to agree as to where to commence consideration. To overcome this, committees will usually agree to a "first reading" of each article so that an opportunity is given for later revision in the light of changes that may be made in related articles.

40. A rather important practical matter at a conference is the question of arranging separate group meetings for producers and consumers. On some occasions this has been discouraged on the grounds that it is unwise to make sharp distinctions between the interests of these groups and, in fact, in certain cases the interests of countries do not fall readily into such groups. For example, a large low-cost producing country has often a common interest with consuming countries in preventing prices from being too high, although the motivation may be different: in the case of the producing country it does not wish to stimulate production in higher-cost countries and in the case of consuming countries there is a desire to obtain the raw material or the commodity concerned at the lowest cost. On the whole, however, it has proved useful for the work of negotiating conferences to have separate meetings of these two groups and, in fact, it is possibly better if such committees are scheduled as a part of the conference committee structure so that certain matters can be formally referred to them and the scheduling of meetings and provision of conference services facilitated.

41. As a conference normally has three or four principal committees and something like ten working parties, it is desirable that delegations should be sufficiently large to provide representation at all the various committees and working groups in which the country is participating. The number of such bodies on which a country will wish to be represented will, of course, depend largely on the extent of its interest in the commodity concerned. The Committee draws attention to the fact that the work of a commodity conference can be seriously hindered if one delegation wishes to be a member of more groups than it can service with its available personnel and has in consequence to request postponement of meetings.

Voting

42. The question of voting arrangements at a commodity conference is a matter which presents some

problems since the extent of the interest of the various countries in the terms of an agreement differ considerably. After a Commodity Council has been set up, the various countries will have a voting strength as provided in the agreement. Usually this will be dependent on their interest as calculated on some basis such as imports or exports, production or consumption. However, such a system of weighted vote would introduce complications at the conference stage, especially as the basis of voting is itself a matter for discussion. The rules of procedure which this Committee has prepared for commodity conferences therefore confer one vote on each delegation. However, in the course of negotiations due account is necessarily taken of the views of Governments in accordance with their interest in the operation of an agreement. It would seldom happen that, at a particular commodity conference, the number of importing and exporting countries were equal and it would therefore be unreasonable to determine an important element such as price, for example, merely on a vote. Furthermore, quite small producers or consumers may outnumber those with vital interests in an agreement, and a vote could be taken in which the majority view represented a small proportion of the total trade in the commodity.

43. Under the rules of procedure which this Committee has framed, the Chairman is obliged in the ordinary course of business to "ascertain the sense of the meeting in lieu of a formal vote". It is the opinion of the Committee, in the light of experience, that the Chairman in determining "the sense of the meeting" is justified in taking into account the importance in the trade of the commodity of the various countries concerned. If it is impossible to ascertain the sense of the meeting, the issue is deferred to another time or referred to another group. A formal vote may be requested but, except where procedural matters are concerned, such a course of action is normally unwise, since the terms of an agreement must meet with almost unanimous approval by all the most important countries or the agreement will not be accepted or brought into operation. Consequently, this whole question of voting involves some degree of judgement. Delegates generally recognize the importance of the interests of countries particularly concerned and do not insist on proceeding to a vote where such action would make it impossible to continue the work of a conference. Countries with a very small interest in a commodity accept the position that the terms of an agreement cannot, in fact, be decided by a majority vote.

Process of negotiation

44. Commodity agreements contain a number of provisions such as voting in the Council established by the agreement, prices and quotas, which have to be decided during the conference by negotiation. The question of voting is sometimes related to quotas or is calculated on some objective basis usually with provision for minimum and/or maximum votes for all countries. The figures to be included in an agreement for prices and quantities are related in some way to the present situation or expected trends and this question of price determination is dealt with separately in paragraphs 49 to 65 below.

45. In the process of negotiation difficulties arise in a conference if any participating country seeks to get some special advantage over other countries rather than to work together to obtain reasonable prices or

quotas. In the case of negotiation on prices—taking the mid-point of the range for the sake of explanation—the representatives of consuming countries will no doubt have instructions as to the highest price they can offer and the representatives of the producing countries will probably be instructed as to the lowest price they can accept. If the highest price importers can offer under any circumstances is, in fact, below the lowest price exporters can accept, then no agreement is possible. In such cases it is necessary for delegations to seek further instructions and the conference sometimes adjourns to allow delegations to explain the situation in their capital cities.

46. Sometimes at the beginning of a conference producers ask for an unreasonably high price or consumers refuse to consider anything but an unreasonably low price. Some variation is recognized as part of the bargaining processes but experienced delegations realize that unreasonable bargaining techniques are seldom advantageous, since the ultimate price must be one which is reasonable to both sides. In its experience the Committee considers that the spirit in which the negotiations at a conference are carried out is very important. The conference enables delegates to obtain an appreciation of each other's point of view and a desire to reach a reasonable figure, bearing in mind long-term conditions.

47. A commodity conference involves negotiations on difficult matters of vital importance to the participating countries; one of these concerns the quotas for individual countries. Each exporting country, while considering that the total quotas allotted should be closely related to anticipated demand in order to maintain a reasonable price, will at the same time wish to ensure that its own quota is as large as possible so that its industry can be maintained or even expanded. Primary producing countries find it difficult to justify unemployment in an industry merely because quotas are imposed. The question arises as to how the quota for a given country should be determined. Sometimes this is done by the producers as a group themselves making an allocation of total quotas. Where this proves impossible one technique used is to set up a negotiating committee of about three individuals including the Chairman of the conference. Negotiations are conducted in close privacy, the negotiating committee being serviced only by the Executive Secretary of the conference. The usual technique is to interview each of the producer countries separately and to go over with them statistics relating to their own production and to the production of other countries. The latter is important since each representative of a producing country has to explain to his Government the relationship between his country's quota and those of other producing countries in a similar position.

48. There is, of course, a consumer interest in quotas. Consumers, while agreeing that quotas should be imposed to prevent prices falling to absurdly low levels, are not willing to have unreasonably low quotas imposed and extreme shortages used to raise prices artificially.

Determination of prices

49. The agreements on coffee, sugar, tin and wheat contain provision for price stabilization, as does the draft agreement on cocoa. The possibility of using provisions for economic measures under the International Agreement on Olive Oil for a similar purpose is presently under examination.

50. The objective of price stabilization through inter-governmental commodity agreements was considered in the Havana Charter. As indicated there, the purpose is "to prevent or moderate pronounced fluctuations in the price of a primary commodity with a view to achieving a reasonable degree of stability on a basis of such prices as are fair to consumers and provide a reasonable return to producers, having regard to the desirability of securing long-term equilibrium between the forces of supply and demand". No simple mechanism exists for translating such general guidance into specific prices for particular commodities. Rather, the conclusion of specific prices in an agreement results mainly from the relative bargaining strength of producers and consumers which, in turn, depends on the structural characteristics of production, trade and consumption in the commodity. During the negotiation of commodity agreements attention has been drawn to the deterioration of terms of trade for developing countries and the development needs of exporting countries.

51. As to the type of price provision, commodity agreements have generally adopted a range of prices rather than a single or pivotal price. This is the case in post-war agreements in sugar, tin and wheat. Within such a range, fluctuation of actual market prices is considered normal, but beyond the range, fluctuation is to be avoided. The agreement on coffee does not give specific prices but calls for "assuring that the general level of coffee prices does not decline below the general level of such prices in 1962".

(a) Influences in price determination

52. The Havana Charter explicitly recognized that the price levels negotiated cannot ignore the realities of present and expected conditions of supply and demand. The attempt to impose a price range at a low enough level to result in a condition of persistent excess demand is as unrealistic as an attempt to achieve a price range high enough to result in persistent excess supply. The essential problem, therefore, is to achieve some consensus as to what are at present, and are likely to be, the positions and shapes of supply and demand curves in relation to price. The Committee considers that, while appreciating the obvious limits of making projections, there is, in some instances, an insufficiency of analytical work in this strategic area.

53. It is recognized that not only does the degree of price inelasticity of demand differ from commodity to commodity, but also even for a particular commodity, the degree of inelasticity varies at different price levels. For some commodities, for example, it has been suggested that above a range of prices in which demand is fairly inelastic, demand conditions become considerably more elastic. In such cases, it has sometimes been urged that the ceiling price of the range be below this critical point. Changes in demand may of course result from the operation of other variables, such as changes in incomes, in tastes, and technological developments permitting the expansion in the production of substitutes, or from structural changes resulting from other provisions of the commodity agreement. Thus, with respect to the latter, if the agreement commits importing countries to the removal of obstacles to the expansion of consumption—through the reduction of customs duties and internal taxes—demand can be expected to rise. Given a broad agreement on the quantitative effects of such measures, the level of the price range might, accordingly, be adjusted upwards.

Similarly, assurance of access by exporting countries to the importers' markets are important, as in the case of the Wheat Agreement.

54. The shape, composition and position of the supply curve are equally important. Attitudes of different Governments to price levels have tended to differ according to costs within their countries. The Governments of producing countries where costs are generally high naturally find it difficult to accept a low level of prices. Shifts in the position of the supply curve often result from the operation of other provisions of the agreement. The possibility of such shifts would affect the course of negotiating price levels. Other things being equal, the greater the limitation placed by producers on their willingness to accept variations in quota controls—such as the limiting of cutbacks to 80 per cent of basic quotas—the lower will price levels have to be, if equilibrium conditions, rather than a condition of surplus supply, are sought.

55. The fixing of a price range at levels designed to secure long-term equilibrium does not necessarily imply a high degree of market competition for the commodity. Rather, in practice, the equilibrium sought has had to be one within a context of a complex framework of internal duties, tariffs, quotas and other policies of protection of domestic production.

56. It is natural that, during the discussion of the minimum and maximum prices to be written into an agreement, attention should be given to recent levels of market prices. This attitude may arise from the impossibility of foreseeing the relative changes in supply and demand over the life of the agreement. It may also arise from the fact that the authorities in exporting and importing countries called upon to ratify commodity agreements may find it difficult to agree to price levels significantly different from what they would be in a competitive market. Considerable problems have arisen on those occasions when there have been marked changes in prices in the period immediately preceding or during the negotiating conference.

57. It is sometimes argued that the price range should be related to costs of production. Views differ, however, on the concept of costs to be employed and the relevant base period. Costs are of course difficult to calculate, particularly as land values are themselves often the result of the price level and marginal costs are also determined by the price. Moreover, account must be taken of social as well as economic factors, and difficulties arise if the price level is established below average production costs of a sizable group of producers. In focusing on costs of production the social objective aimed at is the avoidance of mass unemployment. It has also been suggested that the concept of costs might include the cost of maintaining capacity and holding stocks against sudden increases in demand. As to the base period, an illustrative suggestion has been that it relate to costs over the past several years, but that it be adjusted for the rising cost of input factors during the life of the agreement.

(b) *Stabilizing action*

58. Another influence in determining prices acceptable to a Government is the specific character of the stabilizing action envisaged. A country may favour one level of prices if the form of action is limited to production or export quotas; another price level may be urged if there is to be resort separately or in addition to buffer stock action. A producing country to

which employment considerations are of paramount concern may only be prepared to undertake quota cutbacks when prices have fallen significantly. It may, however, consider that buffer purchases might be made at a less depressed price. The view has been expressed that the greater the proportion of the total burden of adjustment, through quota cutbacks, etc., which an individual producing country has to bear, the greater may be its need for a higher price. This might be so when an individual country considers that an agreement must assure it of a minimum revenue from the export of its product. It has also been suggested, from the producer's point of view, that the stronger, the speedier and the more certain the stabilization action at the minimum price level, the more a country may be inclined to accept a lower stabilization price level.

59. Structural characteristics, specific to the commodity under negotiation, also require examination in the deliberations on price levels. For example, the view has been expressed that the greater the proportion of total exports which a country sells on the free market with which the commodity agreement is concerned, and the smaller the proportion destined to protected or preferential markets, the higher will be the price level required by a country for its free market sales. Moreover, it is to be recognized that primary commodity trade is by no means limited to a flow from a group of less developed to a group of industrialized countries.

(c) *Review of price movements*

60. An indication of the price ranges which have, in fact, been adopted in commodity agreements and of the movements in actual market prices of commodities is shown in charts 1 to 5 in annex 2. The price ranges adopted for sugar, tin and wheat have, to a large extent, encompassed the trends in actual market prices. Partly, however, this result was the consequence of stabilizing action which was taken under the provisions of the commodity agreements.

61. In the more than seven years that a price range has existed for tin, the actual market price has only twice risen above the ceiling price stipulated in the Agreements. The first occasion occurred in the latter part of 1961, when no buffer stocks existed. In the latter part of 1963, actual market prices again rose above the higher ceiling then operative. Only for a very short period in September 1958 when buffer stock purchases had ceased, did prices fall below the floor price of the Agreement. The stabilization of prices within the agreed price ranges was achieved through cycles of purchases into, and sales from, a buffer stock and, in the period from December 1957 to September 1960, through the introduction and variation of export controls.

62. In the eight years (1954-1961) in which the price range was operative for sugar, it was widest during the early part of the 1953 Agreement when the limits were 4.35 and 3.25 cents per pound, the range being 1.1 cents per pound. Actual market prices, however, ranged from a high of 6.5 cents per pound, in April 1957, to a low of 2.2 cents per pound at the end of 1961. The sharp increases in prices, considerably above the ceiling of the Agreement, which occurred in the early part of 1957, was attributed to the coincidence of a number of factors which thus produced an aggravated effect.⁶ In addition to some crop failures

⁶ See *United Nations Sugar Conference, 1958, Summary of Proceedings*, United Nations publication, Sales No.: 60.II.D.2.

and the depletion of producers' stocks, there was a rise in demand. This increase reflected not only an increase in consumption, but also a building up of stocks by consumers as a result of the political uncertainties. The sharp decline in the market price of sugar in 1961 occurred at a time when relatively plentiful supplies, resulting from the record crops of 1960-1961, came on to the market. During 1961 there were also apprehensions as to the degree of future support that might be expected from the Agreement. In addition to this experience, market prices were below the minimum level of the range on several occasions in earlier years, and stabilizing action, in the form of quota controls, was undertaken. In the last ten years, market prices of wheat have been within floor and ceiling prices. Only in the years prior to 1953-1954, when the 1949 International Wheat Agreement was operative, and when supplies were relatively less abundant, were market prices above the price range.

Duration of commodity agreements

63. The Havana Charter stipulates that commodity control agreements, i.e., those with provisions for regulating supply or prices, should not extend beyond five years.⁷

64. The duration of an agreement is, in part, determined by the nature of the problem affecting the commodity. If the problem is one of pronounced fluctuation in prices, the agreement should at least encompass any cyclical movement to which the commodity is subject. If the problem is one of an existing burdensome surplus and of shifting resources away from, or at least limiting production of, the surplus commodity for a period, the agreement should be long enough to achieve this end, due regard being had to the desirability of providing for periodic reviews to correct possible changes.

65. Whatever their duration, all agreements, as the Preparatory Committee for the United Nations Conference on Trade and Development recognized, aim at continuing stability with arrangements for flexibility to meet changing conditions.⁸ During the term of an agreement, for example, conditions can change so that a controlling price range for a particular commodity or a series of export quotas fixed at the outset may produce imbalance or distortions of production and consumption. For particular commodities, their individual susceptibility to substitution has to be considered. Other things being equal, a relatively swift advance in the technique of producing or distributing the particular commodity the price of which is fixed may lead to surplus production. In this connexion, rates of development of production of the particular commodity are liable to vary in individual countries with differences in the rate of application of new techniques, especially since internal policies affecting them cannot be counted on to remain unchanged. The structure of a global export quota fixed at the outset would not reflect such developments.

66. Flexibility can be imparted to an agreement in a number of ways. First, the agreement can be of relatively short duration, as in the case of the five successive Wheat Agreements—the first for four years and those

succeeding for three years. An agreement of short duration may also be suitable where it is an innovation to the trade in a commodity, or where the terms of the agreement cannot be so drafted as to take account substantially of the repercussions of changing conditions where these are expected to emerge relatively rapidly. Secondly, flexibility may be ensured in an agreement through provision for periodic review and, if necessary, alterations to the terms of the agreement during its currency. In the case of the Sugar and Coffee Agreements, for example, provision is made for comprehensive review after three years and, in the case of the Tin Agreement, prices may be changed from "time to time".⁹ As might be expected, where agreements are of a long duration, the price range is usually wider.

Incentives to join an agreement

67. In giving attention to considerations which affect governmental attitudes toward participation in commodity conferences and agreements in general, the Committee noted, in 1961, that it was "not possible to associate attitudes of Governments toward agreements with any clearly defined characteristics of the economies or the economic institutions of the countries concerned... support for commodity agreements—under certain conditions—is expressed by countries which are representative of industrialized, under-developed and centrally planned economies".¹⁰ The Governments of countries dependent on international trade in primary commodities as well as in manufactures and other items clearly have a very real interest in commodity arrangements.

68. It may be assumed that a Government's attitude to an agreement is influenced by whether the country is interested as an exporter or importer of the commodity, and whether it can take internal measures to prevent fluctuations. In the case of a producing country, the attitude is likely to be influenced by the degree of predominance which the country has as an exporter of the particular commodity to the world market and whether, by an independent policy, it can achieve a better or similar result for itself. Where this is not the case, the importance of the export of the particular commodity to its economy may be a compelling reason for a producing country wanting to participate. In the case of importing countries also, predominance in the world market and the possibility of an independent policy will affect attitudes to a possible agreement. The import of a particular commodity is only in exceptional cases likely to assume such importance to the over-all economy of an importing country that the Government might feel constrained to seek an agreement on it. However, a particular sector, for example a specialized processing sector of the importing country's economy, may have a vital interest in such an agreement, and this, together with secondary benefits, may prove to be a compelling reason for an importing country wanting to participate. Governments of countries with no substantial or direct interest may support action to stabilize trade in a particular commodity because of the economic benefits accruing to trading partners or to neighbouring countries.

⁷ The International Agreement on Olive Oil, not being a control agreement, is not governed by these provisions.

⁸ *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 5 (part III), document E/3799.*

⁹ Article VI, paragraph 4 (a) of the International Tin Agreement (E/CONF.32/5).

¹⁰ *Official Records of the Economic and Social Council, Thirty-second Session, Annexes, agenda item 7, document E/3508, para. 45.*

69. The decision to participate in an agreement depends primarily on the terms which it proves possible to negotiate. Since an international commodity agreement is a binding instrument involving specific obligations and rights up to five years, official caution is understandable. Each Government will, before deciding to participate, endeavour to assess whether the effect of the proposed agreement on the market during the period is likely to be advantageous compared with the situation which it considers likely to develop in the absence of such an agreement.

70. Dissatisfaction on the part of exporters with a national quota or with a price range or arrangement has, on occasion, precluded Governments from signing an agreement; dissatisfaction with price provisions has also resulted in unwillingness of significant importing countries to participate in an agreement. In this connexion, the active participation of both importing and exporting countries in the negotiation of commodity agreements is very necessary. Otherwise, the terms, particularly the price range arrived at, may not be realistic and the objectives of the agreement may not be achieved. In the case of an export quota agreement, the co-operation of importing countries in limiting supply from non-participating countries may be an important factor in determining the participation of exporters.¹¹

71. Financial commitment may be a stumbling-block for some Governments although it may be noted that consuming countries are not usually called upon to contribute toward the financing of a buffer stock or publicity fund under an agreement. Administrative actions to secure implementation of the regulatory provisions of the agreement may also seem onerous to some Governments. On the other hand a Government's attitude to joining may be influenced by the prospective effectiveness of the measures taken, for example, in the enforcement of export quotas. The Council is also useful for collective negotiation, for example on stock-pile disposal.

72. Participation by Governments of consuming countries assures them of a voice along with Governments of producing countries in the Council administering the provisions of the agreement. This may be considered an advantage if the alternative is an unofficial cartel arrangement which producing countries among themselves might feel the lack of co-operation by consumers justified.

D. PERIOD BETWEEN CONFERENCE AND ENTRY INTO FORCE

Requirements for entry into force

73. Each inter-governmental commodity agreement contains provisions setting out the conditions under which it shall enter into force. These conditions relate to signature, ratification, acceptance, approval or accession by Governments representing a certain percentage of the exports/production and imports/consumption of the particular commodity (annex 1, table 3).

74. After the text is approved at a conference, the agreement is open for signature. The duration of this period is usually eight to ten weeks, though it has been

as short as three and as long as twenty-nine weeks. Whilst signature indicates expectation to participate, it is not legally binding until the Government has deposited an instrument of acceptance, approval or ratification in accordance with its constitutional procedures.

75. A much longer period is allowed for Governments to deposit their instruments of ratification, acceptance or approval, since, in some countries, such action may require the enactment of specific legislation. In these circumstances each agreement usually contains a clause which would allow it to enter into force provisionally upon receipt of the required number of ratifications or notifications of intention to ratify. For the purpose of provisional entry into force, a notification of intention to ratify containing an undertaking to seek ratification or acceptance in accordance with constitutional procedures as rapidly as possible on the part of the signatory Government is regarded as equal in effect to an instrument of ratification or acceptance, it being understood that a Government which gives such a notification will provisionally apply the agreement and be provisionally regarded as a party thereto until it deposits its instrument.

76. The conditions to be fulfilled to bring an agreement into force may be (i) a minimum percentage of world trade in the particular commodity covered by the participating countries (wheat, sugar); (ii) a minimum number of producing and importing countries (olive oil); or (iii) a minimum percentage of world trade in the commodity and a minimum number of exporting and importing countries (tin, coffee).

77. These conditions are framed in the light of the objectives and nature of a particular agreement. For instance, where an agreement is designed mainly to improve the conditions of international marketing of a commodity, as is the International Olive Oil Agreement, there is only need for a certain number of countries "substantially interested" in the trade and predominantly exporting countries.

78. Where, as in most cases, the agreement involves control of the trade in a commodity, it must cover a minimum percentage of the world trade in the commodity before it enters into force in order to assure participating countries of certain benefits. Wide participation would be a key requirement for the effective working of the agreement.

79. For multilateral contract types of agreement, such as have been evolved for wheat, it has been thought worth while, in the light of the total volume of trade involved,¹² to bring such agreements into force if countries accounting for two thirds of total guaranteed sales and purchases, or more recently, two thirds of total votes of exporting and importing countries, have become parties.

80. With other types of commodity control agreement, in order to ensure effective stabilizing action, the minimum participation requirements for entry into force are considerably higher, especially for exporting countries. Of the two quota type agreements participation requirements are notably smaller for sugar agreements than for coffee. This reflects the fact that for their effectiveness, sugar agreements could depend on

¹¹ Under recent International Wheat Agreements, each participating importing country undertakes that not less than a certain percentage of its commercial purchases will be taken from participating exporting countries. This percentage ranges between 30 and 100 per cent for individual countries.

¹² Under the International Wheat Agreement, 1956, guarantees did not discriminate as to types of transaction and prospective membership was limited, excluding the United Kingdom, the largest importer. In subsequent Agreements (1959, 1962), guarantees extended only to "commercial transaction", but prospective membership was wider.

consistent independent action of certain participating Governments which had other commitments of considerable magnitude in sugar trade to meet, especially on the import side. In the International Coffee Agreement of 1962, on the other hand, the main preoccupation was to discourage non-participation by many relatively small exporting countries and to achieve this by securing a high degree of co-operation from importing countries. Entry into force of the Coffee Agreement required the participation of at least twenty exporting countries accounting for 80 per cent of world exports of coffee and at least ten importing countries accounting for a similar percentage of world imports.

81. In contrast, the participation requirements for entry into force in the only buffer stock type agreement (which also has export quota provisions), the International Tin Agreement, are naturally very high for producing countries—six accounting for 95 per cent of the total votes of such countries—while consuming countries (nine) need only account for one half of the total votes of consuming countries. This reflects the relatively heavy obligations assumed by participating exporting countries for the effective working of the agreement including the financing of the buffer stock.

82. The drawing of too rigid a line in respect of participation requirements for the purpose of entry into force has been recognized as a drawback in some agreements. For this reason commodity agreements generally have a further clause which, whether or not the agreement has provisionally entered into force by a certain date, permits those Governments which have deposited instruments of ratification, approval or acceptance by that date to consult together to decide whether it shall enter into force among themselves or whether other action may be called for.

83. Each agreement also contains a clause which allows a Government which has not signed the agreement to accede to it on certain conditions.

Reservations

84. When signing or ratifying a commodity agreement, States sometimes attach statements to their signatures or ratifications. Such a statement may be a mere declaration clarifying the State's position, or it may amount to a reservation, intended to vary or exclude the legal effect of some of the terms of the treaty as adopted.¹³ Various Governments have made declarations or reservations in relation to inter-governmental commodity agreements now in force.¹⁴

85. Declarations clarifying their basic obligations under inter-governmental commodity agreements may be made by Governments where an agreement is, in their view, not completely explicit on a particular point. Such clarifications are essentially statements of interpretation of what certain provisions are taken to mean

¹³ The following definition is included in the draft articles on the law of treaties, part I, section I, article 1 (f). " 'Reservation' means a unilateral statement made by a State, when signing, ratifying, acceding to, accepting or approving a treaty, whereby it purports to exclude or vary the legal effect of some provisions of the treaty in its application to that State." *Report of the International Law Commission, Official Records of the General Assembly, Seventeenth Session, Supplement No. 9 (A/5209)*.

¹⁴ Declarations expressly provided for in the texts of agreements, for example, declarations under territorial application clauses or declarations of group membership under article 5 of the International Coffee Agreement, are not here under discussion.

by the signatory Government and, in this case, what that Government understands its obligations to be. Notable, for example, were declarations by some Governments¹⁵ in relation to provisions on classification and labelling in the International Olive Oil Agreement, that they were interpreted as not precluding the application of domestic laws and regulations where such provisions were stricter than those of the Agreement.

86. On the other hand, a statement which amounts to a reservation because it varies or excludes some of the obligations of the agreement may confer an advantage on the country making it in relation to other participants and might even reduce the effectiveness of operation of the agreement. Consequently agreements may contain provisions on how reservations are to be dealt with, and may give the Council the power to refuse to consent to reservations which would be harmful. This is done, for example, in the International Sugar Agreement, 1958.¹⁶ In this case, the Conference accepted in advance all reservations made to the earlier Sugar Agreement; Governments which were parties to the 1953 Agreement with reservations were entitled to make identical reservations to the 1958 Agreement, and any Government represented at the 1958 Conference could make reservations "in similar terms" to those reservations. Any other reservation, however, required the consent (by special vote) of the Sugar Council. This solution emerged after it became evident at the Conference that certain countries would continue to find difficulty in adapting their national institutions to certain of the international measures proposed. Notable in this connexion were reservations of countries with centrally planned economies on the applicability of provisions¹⁷ relating to subsidies, to adjustment of production in exporting countries and to levels of stocks. Reservations to these and to other provisions in the International Sugar Agreement have also been made by Governments on the grounds of compelling circumstances. Also, a reservation claiming relief from the rigid application of an established export quota in the initial year of the agreement was submitted on the grounds that a previous international commitment had not been completely discharged before entry into force of the agreement, but this reservation was eventually withdrawn.

Waivers

87. An alternative method for permitting variance from obligations of an agreement is that of waiver, or relief from obligations, which can be granted by the Council on certain grounds. For example, the International Coffee Agreement prohibits reservations, but provides that the Coffee Council (by a distributed two-thirds majority) may relieve a member of an obligation which on account of exceptional circumstances, *force majeure*, constitutional obligations or international obligations under the United Nations Charter for territories administered under the trusteeship system, either constitutes a serious hardship, imposes an inequitable burden or gives other members an unfair advantage. Similarly, the International Wheat Agreement, which does not provide for reservations, does, however, provide for adjustment of obligations for exporting countries in case of short crop, and for importing countries

¹⁵ France, Tunisia.

¹⁶ Article 45.

¹⁷ Articles 3, 10 and 13.

to safeguard balance of payments or monetary reserves and in case of critical need.

Appointment of depository

88. The Secretary-General may act in the capacity of a depository power for receiving signatures, instruments of ratification, approval or acceptance, or of notifications of intent to ratify, approve or accept. This is done through the facilities of the Treaty Section of the Legal Office of the United Nations. Alternatively, the conference may appoint a Government as the depository. As such the Government registers the agreement, signatures, ratifications, etc., with the Secretary-General under the terms of General Assembly resolutions 97 (I) and 482 (V). The cumulative list and effect of such actions in relation to required participation for entry into force of any agreement is of considerable interest to participating Governments and may be a spur to prospective participants. The Committee, in collaboration with the Commission on International Commodity Trade, arranges for its regular memoranda¹⁸ to contain, *inter alia*, information relating to the entry into force of commodity agreements.

E. OPERATION OF AN AGREEMENT

Constitution of commodity councils

89. Each inter-governmental commodity agreement provides for the establishment of a council, comprising all Governments participating in the particular agreement and entitled to vote, to administer the provisions of the agreement and to supervise its operations. Basic information regarding existing commodity councils is given in annex 4. The council is presided over by a non-voting chairman¹⁹ and a number of vice-chairmen generally elected annually.

90. Members of the council fall into one of two categories, mainly exporting (producing) or mainly importing (consuming) countries, each category holding in total an equal number of votes as stipulated for commodity control agreements in the Havana Charter. The Committee has kept this stipulation in mind and advised where it might not apply as, for example, where the economic provisions of the Olive Oil Agreement were modified²⁰ so that the Agreement could no longer be considered a commodity control agreement. In this particular case mainly producing countries have a preponderance of votes.

91. Each Government is assigned votes in the proportion which its exports or imports (alternatively production or consumption) of the particular commodity bear to the total world volume for that commodity, a minimum and maximum number of votes being usually set (annex 4). Decisions of the Council may be reached by either a simple or a distributed majority vote; in the case of more important decisions, a simple or distributed two-thirds majority vote is generally required. The circumstances requiring a two-thirds majority vote vary from one agreement to another. Thus a two-thirds majority is required in the Coffee Council to fix annual export quotas but such a majority

is required in the Sugar Council only if such quotas are to be reduced below 90 per cent of their basic level. The Tin Council requires a two-thirds majority to alter the price range within which the buffer stock operates. Councils generally require a two-thirds majority to delegate their powers and, in the case of Tin and Sugar Councils, such delegation may only be in relation to those questions which are settled by majority vote. Exceptionally the Coffee Council delegates on a simple majority vote, but the questions on which it may do so are strictly prescribed.

92. Agreements also generally provide for the establishment by the Council, either by election or appointment of an Executive Committee or Board to which the council may delegate its powers and functions,²¹ the scope of such delegation varies. The International Coffee Agreement, 1962, contains specific exclusions from the Executive Board's purview, while, under the International Wheat Agreement, the Executive Committee may be called upon to deal with any question which the Council may decide. The executive body is elected annually and has a non-voting Chairman. Its number is limited and composition determined by the terms of the particular agreement. As will be seen from annex 3 the maximum number is fourteen, even when it is related to an agreement whose administering council numbers as many as fifty-six. While there is generally a tendency to keep the membership of the executive body small, negotiating conferences have usually considered the question in relation to the numbers likely to join an agreement. If the membership is small it is not considered necessary to have an Executive Committee.

93. The executive body's membership is equally balanced between exporting and importing countries in numbers, as, for example, in sugar and coffee—where each member country has one vote—or, if not in numbers, in voting power, as in the case of wheat. In the Executive Board of the Coffee Council the distribution of votes within each category is determined by the casting of all of the votes of each Council member in each category in favour of a single candidate, the seven receiving the highest number of votes being elected and exercising all the votes cast in their favour. In the case of the Executive Committee of the Wheat Council the distribution of votes within each category is left to the elected members to decide but no country may have more than 40 per cent of the total votes. In both cases decisions of the executive body require the same majority of votes as the agreement prescribes for the Council when making a decision on a similar matter. For reasons specified earlier, the Olive Oil Agreement provides for a preponderance of representation of mainly producing countries on the Executive Committee as on the Council.

94. Agreements may provide for the establishment of other organs specifically designed to meet the need of particular kinds of operation. Important to the operations of the International Wheat Agreement, 1962, for example, is an Advisory Committee on Price Equivalents consisting of representatives from four exporting and four importing countries, the Chairman being appointed by the Council. The International Tin Agreement is exceptional in that it does not provide

¹⁸ *Recent Commodity Developments*, E/CN.13/SER.A/. . .

¹⁹ The Chairman of the Tin Council is appointed. He is responsible for the administration and operation of the Agreement; his term of office is not laid down in the Tin Agreement but is decided by the Council.

²⁰ United Nations publication, Sales No.: 56.II.D.1, annex.

²¹ Exceptionally, the International Tin Agreement, 1960, provides that the Council may establish such committees as it sees fit, and the Council has not established an executive committee or board.

for the establishment of an executive committee, but the Tin Council has power to establish such committees as it thinks fit.

95. Agreements require that councils meet, usually at headquarters, at least twice a year.²² In addition, they generally provide for council meetings at the request of the Executive Committee, at the request of a prescribed minimum number of countries or at the request of countries with a prescribed minimum voting strength.²³ At their statutory meetings the councils review any changes in membership and territorial application of the agreement, and approve any consequent redistribution of votes. At initial meetings the councils approve rules of procedure and provide for the appointment of executive and other statutory committees. Councils will frequently also establish other committees to take care of specific assignments, a finance committee being usually established to deal with the annual budget and accounts; and a statistical committee for various purposes, including a publications programme. They will also generally establish a preparatory committee in connexion with discussions relating to the renewal of the agreement.

Council staff

96. Agreements provide for the appointment of a chief executive officer and secretariat whose duties vary according to the kind of operations required by the particular agreement. The chief executive is responsible for the organization of the services required for the efficient performance of the council's functions in all respects and for the establishment and financial control. Financial resources for such administrative purposes are provided by contributions from individual member Governments of the council in proportion to the votes held by them (annex 4).

97. Staff is usually recruited on an international basis. Occasionally staff on temporary leave of absence from national civil services may be recruited. Members of the staff are not allowed to hold any office outside the organization nor to accept any other employment. A further condition of employment for the chief executive officer and secretariat is that they shall have no direct or indirect commercial or financial interests in the commodity concerned, or, if they have, that they shall renounce them.

98. The responsibilities of the director and the members of the secretariat are exclusively international in character. In discharging their duties, they must not seek or receive instructions from any Government or from any authority outside the council and must refrain from any action incompatible with their position as international officials. Governments participating in international commodity agreements undertake to respect the exclusively international character of the director and members of the secretariat and not to influence them in the discharge of their responsibilities.

99. Staff with a specialized knowledge of technical and economic aspects of the particular commodity is required. Sound knowledge of this kind, together with experience of the intricacies of marketing the particular commodity, are essential to successful operations, especially where a buffer stock or publicity fund is involved.

A common secretariat would therefore hardly be practicable but services in accounting, printing, legal advice, interpretation and conference facilities might to some extent be advantageously shared. In this connexion it may be noted that four councils have their headquarters in London and that three of them are accommodated in the same building and share conference facilities.

Council operations

100. Each council periodically reviews world supplies and requirements of the particular commodity with which it is concerned as a guide to action. Under agreements involving quotas this review is followed by Council decision on the level of quotas for a period ahead, quotas being mandatory under the International Coffee Agreement and having been operative under the International Sugar Agreement other than in exceptional circumstances. In the case of tin, the Council may not declare an export control or quota period unless it finds that a certain quantity of tin is held by the buffer stock.

101. Compliance with operative export quotas by participating Governments is reinforced by provisions in agreements specially adapted to conditions of supply of each particular commodity as envisaged at the time of negotiation. Thus in view of the varying supply situation in individual countries, assurance against over-all short-fall was given in the International Sugar Agreement, 1958, by provisions that exporting countries should hold a certain level of stocks.²⁴ It also provided that unused portions of quotas should be turned back to the Council during the quota period for reallocation.²⁵ The International Coffee Agreement, 1962, provides for Council supervision of compliance with quotas through a system of certificates of origin and re-exports,²⁶ and for the imposition of penalties by the Council when quotas are exceeded.²⁷

102. Under the Second International Tin Agreement, the Council in periods of export control keeps track of exports on the basis of provisions on the "circumstances in which tin shall be deemed to have been exported".²⁸ A very large supply of tin has in recent years been available for disposal from surplus strategic stocks²⁹ not subject to the provisions of the agreement. A substantial part of the Council's efforts has therefore been directed to seeking assurances that disposals take place in such a way as not to undermine buffer stock operations and the validity of the price range which the Council has established.

103. The whole area of trade arising from surplus disposals, i.e., "special transactions", are taken into account although not controlled by the International Wheat Council. Obligations to purchase and sell within, or in given circumstances, at the maximum of the price range under the agreement only extend to "commercial transactions". In order to assist the Council in deciding whether a particular transaction is special or not and thus facilitate proper accounting, guidance subsequently embodied in the Agreement³⁰ was given on "Classifications of transactions involving wheat" by

²² Four times in the case of the International Tin Agreement, 1960.

²³ The Chairman of the Tin Council may convene meetings at the request of any one participating country.

the United Nations Wheat Conference in 1962. The mechanism for securing fulfilment of obligations rests on a system of regular recordings of transactions which discloses outstanding obligations, and a formal Review of Performance which takes place at the end of each crop year.

104. With the advent of exceptional circumstances, a council may be required by the agreement to take special action to meet them. For example, under the International Tin Agreement the advent of a tin shortage would involve the Council in making allocations.³¹ In circumstances having only local significance, the Council may be called upon to waive or adjust the obligations of the country concerned. Notable in this connexion are the International Wheat Agreement provisions relating to adjustments in case of short crop, balance of payments difficulties or critical need.³²

Studies

105. One of the most important tasks delegated by the council to the secretariat relates to the collection and dissemination of statistical and other data relating to the particular commodity. In collecting such data the secretariat relies primarily on member Governments;³³ data in respect of non-member countries are derived from recognized international sources.

106. Each council is required by the agreement under which it operates to publish an annual review of its activities. Such a review normally includes an assessment of the market situation of the particular commodity.

107. The scope of other studies which may be undertaken by the council is generally wide. The Olive Oil Council, for example, may "draw up, prepare and publish any reports, studies, charts, analyses or other documents which it may deem useful and necessary". In the case of the Sugar Agreement specific reference is made, *inter alia*, to studies of the effects of taxation and restrictive measures on sugar consumption and of research into new uses of sugar with a view to expanding its consumption. Under the Coffee Agreement³⁴ the Council may promote studies of the economies of coffee production and distribution, and the import of governmental measures, opportunities for expansion of consumption. Moreover, the Council is required to carry out studies periodically on trends in, and projections of, coffee production and consumption. The study of consumption problems is also a function of the International Wheat Council.

Accession

108. All commodity agreements contain clauses providing for accession. The purpose of these clauses is to afford a means for participation in the agreements of two classes of States:

(a) States which were not able, under the provisions on signature, to sign the agreement, and were therefore unable to ratify; and

(b) States, which though able to sign, for any reason did not do so.

³¹ Article XIII.

³² Articles 9, 10 and 11.

³³ The Coffee Council may require members to furnish information and, in the event of failure to supply, may require the member concerned to explain the reasons for non-compliance.

³⁴ Article 59.

109. In all commodity agreements thus far concluded, the right to sign is restricted to States which participated in the conference (or sometimes to those invited to participate). Often some of the States which participated in the conference are not able to sign the agreement within the period provided for signature. Accession offers a means for these States or for others not able to sign to become parties.

110. When a State has not taken part in the negotiations at a conference, ordinarily it is not mentioned in the parts of the agreement dealing with specific countries (e.g. basic export limitations and provisions on votes), and on accession the Council takes no action with respect to basic figures to be established under the agreement (e.g. datum quantities under the Wheat Agreement). Therefore, before accession, these figures must be negotiated between the Council and the State desiring to accede, and the Council must establish the conditions of accession. Under some agreements all of the conditions of accession require a two-thirds majority vote of the importers and exporters, counted separately (e.g. the Coffee Agreement), while under others only some of the conditions require such a vote (e.g. establishment of basic quotas under the International Sugar Agreement, 1958).

111. Where a State has participated in the conference and is mentioned in the agreement, but seeks to accede instead of signing and ratifying, there is a difference among the various agreements as to whether the Council, in setting the conditions for accession, is allowed to depart from the terms negotiated at the conference. On the one hand, under the International Sugar Agreement of 1958, States mentioned in certain articles can only accede to the Agreement as it stands, and the Council cannot vary what is there laid down. On the other hand, the International Coffee Conference of 1962 adopted a provision whereby the Council could decide by a distributed two-thirds majority vote, in setting conditions for accession, on a different basic export quota than that provided in the Agreement. It was then felt that the requirement of a special vote was sufficient to prevent any distortion of the balanced result of the negotiations through conditions established for accession. The Coffee Council has in one case (Ethiopia) established a higher basic quota upon accession than was provided in the Agreement. A number of other countries have raised the question of waivers on their quota levels.

Succession

112. In recent years commodity conferences have encountered technical problems in regard to dependent territories, interested in the trade in the commodities in question, which were about to gain their independence. While, of course, it would be open to new States to go through the procedures this might involve some delays, and some legal discontinuity in the application of the agreements. Consequently in two agreements³⁵ there are special provisions on succession of States, whereby a new State may smoothly inherit the rights and obligations of its predecessor in respect of the agreement. Succession clauses, however, can operate only if all the necessary figures in respect of the dependent territories about to become independent are laid down in the agreement (as in the Tin and Coffee

³⁵ International Tin Agreement, 1960, article XXII (6) and International Coffee Agreement, 1962, article 67 (4).

Agreements), or some acceptable means of negotiating those figures is provided.

Withdrawal

113. All the commodity agreements contain provisions on voluntary withdrawal, which under certain circumstances entitle States, if they so desire, to cease to be parties before the agreements expire. These provisions vary in complexity, and in the relative ease or difficulty with which States can act under them. The simplest provision is in the International Coffee Agreement, 1962, which is to the effect that any party may withdraw by giving written notice effective after ninety days, at any time after 30 September 1963; this provision prevented any withdrawals during 1963, but thereafter makes withdrawals relatively easy. Likewise the International Tin Agreement, 1960, contains among other provisions one which allows withdrawal by giving twelve months' notice not earlier than one year after entry into force of the Agreement, and thus restricts the right during the first two years.

114. Other agreements contain more complicated provisions, intended to describe all the circumstances in which withdrawal might be reasonable, and sometimes providing for either approval by the Council, or at least consideration by it, before the withdrawal becomes effective. The most elaborate provisions are in the Sugar Agreement, 1958, which contains no less than nine separate paragraphs stating different circumstances in which withdrawal is permitted, in two cases with the agreement of the Council, in other cases only after consideration by the Council (but regardless of its decision), and in other cases apparently without any requirement of Council consideration; various time-limits are set for actions under the different paragraphs. The International Olive Oil Agreement, 1963, has six grounds for withdrawal, all of which, except one, require prior consideration by the Council, though not its agreement; one of the grounds, however, is very broad, so that the main limitation on withdrawal is the need for Council discussion. The provisions of the Tin and Wheat Agreements are somewhat simpler.

115. As for the grounds of withdrawal, three agreements (Sugar, Wheat and Olive Oil) provide such a right if a party considers its interests seriously prejudiced by the fact that another country, on whose participation it may have counted in ratifying, does not become a party, or makes serious reservations. Another ground (provided in the Tin, Wheat and Olive Oil Agreements) is that a party considers its interests endangered by an amendment to the agreement which it has not accepted. Other grounds provided are that the country concerned is engaged in hostilities, or that another country has withdrawn (in the Sugar, Wheat and Olive Oil Agreements). The Olive Oil Agreement provides that a State has the right to withdraw, after Council discussion, if it is unable to comply with the Agreement, but the Sugar Agreement requires the approval of the Council for withdrawal on such a ground. Various other special situations are stated in the Sugar Agreement to justify withdrawal.

116. In drafting withdrawal clauses of commodity agreements, various issues of policy arise. For the sake of effective operation of an agreement, the Committee doubts whether membership in the agreement should be capable of sudden reduction, through withdrawals, except for the most serious reasons. On the other hand, it must be examined in each case whether, if Govern-

ments wish for any reason to withdraw, they are likely, either voluntarily or on account of measures taken under the agreement, to continue to comply with its provisions; the effectiveness of the agreement could scarcely be promoted by obliging Governments to remain parties to an agreement if in doing so they merely enjoy the advantages of membership, without complying with the obligations. These various considerations have led to different provisions in the agreements and generally to some restrictions on withdrawal. If it is desired to restrict the right of withdrawal, this can be done by prescribing an initial period in which the right cannot be exercised, by requiring prior discussion of the Council (though such a provision may not be strictly necessary if the Council can in any case meet before a notice of withdrawal becomes effective), or by laying down in detail the conditions which justify withdrawal (though it may sometimes be difficult to foresee them clearly).

Amendment

117. In all inter-governmental commodity agreements, there are provisions governing amendment to the agreement after it has entered into force. These specify the procedure for proposing an amendment, the majority of participating Governments which have to accept before it can become effective and any period between such acceptance and its entry into force. Amendment may be proposed at any time on the initiative of any participating Government. Changes made in connexion with a general review of the agreement, as, for example, in the third year of the International Sugar Agreement and the International Coffee Agreement are of a different character.

118. Proposals for amendment generally have to be recommended by a certain majority of the Council before being placed before participating Governments. Mostly, a two-thirds distributed majority vote, that is, of both exporting and importing countries, is required, although the Wheat Council may make the recommendation on a simple majority vote. When making its recommendation, the Council will normally fix a time within which participating Governments are required to notify the depositary whether or not they accept the amendment proposed.³⁶

119. If, within the time fixed by the council for the notification of acceptances, all participating Governments accept the amendment, it normally takes effect on the receipt by the depositary of the last acceptance. If an amendment is not accepted by the required majority, it does not take effect.

120. If, within the period fixed by the council for notification of acceptances, the amendment is accepted by the required majority, but not by all participating Governments, subsequent action varies under the different agreements. In the case of the International Wheat Agreement, the amendment enters into force immediately for accepting Governments upon acceptance by the required majority, non-accepting countries being unaffected and withdrawing at the end of the crop year subject to the discharge of outstanding commitments. In the Olive Oil and Sugar Agreements an amendment enters into force for accepting countries at the beginning of the following crop year, non-accepting countries then being suspended automatically.

³⁶ Notice of acceptance is lodged with the depositary for the agreement concerned.

Under the provisions of the International Tin Agreement an amendment enters into force for the accepting Governments at the end of three months following receipt by the depositary of the last acceptance necessary to provide the majority required. Any consuming country which considers its interests adversely affected by an amendment may withdraw from the Agreement on the date the amendment takes effect. If the Council decides that an amendment is of such a nature that consuming countries which do not accept it should be suspended from the Agreement, such suspension takes effect on the date on which the amendment enters into force. Under the International Coffee Agreement an amendment accepted by the required majority becomes effective for accepting Governments 100 days after receipt by the depositary of the last acceptance providing the required majority. Countries which have not accepted an amendment by that date cease to be members of the Agreement.

121. The required majority vote for acceptance of an amendment varies from agreement to agreement: in no instance, however, is it less than two thirds of the votes of participating countries. Except in the case of the Olive Oil Agreement, separate majority votes for importers and exporters are required.

F. STEPS FOR REVIEW AND RENEWAL OF AN AGREEMENT

122. Commodity agreements remain in force for a given number of years,³⁷ at the end of which period, if they have served their purpose and if they are unlikely to be needed in the foreseeable future, they should lapse. Where the agreement is likely to continue to serve a useful purpose, arrangements need to be made for its renewal.

123. Each agreement provides that the council shall recommend to participating Governments whether it is considered appropriate and necessary for the agreement to be renewed and, if so, in what form. In the case of the Tin Agreement, the recommendation must be made not later than four years after entry into force of the Agreement. In other agreements the council is required to make the recommendation at such time as it considers appropriate. Since, however, renegotiation of an agreement requires a considerable time and since allowance must be made for the new agreement to enter into force on the termination of the old agreement, it is desirable for the council to make its recommendation for renewal not later than one year from the expected expiry date of the agreement.

124. In order to ensure an adequate period of time for renegotiation, certain agreements provide that the existing agreement may be extended. The International Tin Agreement, 1960,³⁸ for example, provides for its duration to be extended by a period not exceeding twelve months upon a decision taken by a distributed two-thirds majority vote. In the case of the International Coffee Agreement,³⁹ provision is made for its extension in the last year for such period as the Council shall determine.

125. The International Olive Oil Agreement provides a further example of the means by which the interval of time between the expiry of an agreement

³⁷ Certain agreements, e.g. the International Tin Agreement (article XX), provide for termination of the agreement at any time by a distributed two-thirds majority vote.

³⁸ Article XX.

³⁹ Article 71.

and the entry into force of its successor can be bridged. In this instance, if a new agreement has been negotiated and, before the expiry of the old agreement, has received a sufficient number of signatures to enable it to enter into force with the relevant provisions after ratification, acceptance or approval, and if the new agreement has not entered into force provisionally or definitively by the date of expiry of the old agreement, the old agreement may be extended until the entry into force of the new agreement, provided the period of such extension does not exceed twelve months.⁴⁰

G. CONCLUSION

126. In the opinion of the Committee, international trade problems of primary products are best solved by detailed consideration, commodity by commodity. As may be seen in the preceding review of post-war experience in the preparation, negotiation and bringing into force of inter-governmental commodity agreements, there is sufficient flexibility in the present procedures to enable the stabilization mechanisms to be adapted to varying conditions or circumstances. In particular the present conference procedure has provided a suitable mechanism for the negotiation of internationally accepted prices.

127. Various types of inter-governmental arrangements have already been adopted for different commodities. Regardless of the type of arrangement that is being considered for a commodity, the arrangement should continue to be negotiated at a United Nations conference convened on a broad basis, with representatives of the interested importing and exporting countries attending. The present system of Commodity Councils also provides the basis for the administration of more broadly based agreements.

Chapter III. Inter-governmental consultation and action during 1963 on problems of individual commodities⁴¹

BANANAS, CITRUS FRUIT

128. Following the adoption of a resolution on this subject in the preceding October at the first annual meeting at ministerial level of the Inter-American Economic and Social Council, the FAO Committee on Commodity Problems at its session in May 1963 considered the question of the establishment of a study group on bananas. The FAO Committee recognized

⁴⁰ Article 37.

⁴¹ This chapter is primarily concerned with inter-governmental consultation and action. It contains only the basic information required for the functions of the Committee, current market and other developments in the commodities concerned being considered mainly as background to such consultation and action. By resolution 691 (XXVI) of the Economic and Social Council, the United Nations Commission on International Commodity Trade has the responsibility for keeping under review the movements of world primary commodity markets. This chapter does not, therefore, review the commodity situation in any detail nor does it deal with all primary commodities. In this connexion reference may be made to commodity documents prepared by the Bureau of General Economic Research and Policies of the United Nations Department of Economic and Social Affairs, and by the Food and Agriculture Organization of the United Nations. Information on inter-governmental consultation and action subsequent to the preparation of this chapter will be found in the July 1964 issue of *Recent Commodity Developments, Memorandum No. 51* appearing in the series E/CN.13/SER.A. It will also contain references to other commodity documents.

that documentation on bananas was not yet completed. It requested the Director General of FAO to convene an *ad hoc* meeting which would review what further steps appeared necessary in the light of the work done and other relevant considerations. The *ad hoc* meeting is expected to be convened in the second half of 1964.

129. The FAO Group on Citrus Fruit held its third session in Rome from 17 to 22 June 1963. The Group had been established in 1959 primarily because studies indicated a prospectively swifter rate of increase in supplies than in demand. Although consumption has in fact increased since that date, there has been a significant fall in prices.

130. At this third session the Group considered some of the major problems confronting the world citrus industry including national citrus policies in producing and importing countries and developments in the European Economic Community. The Group agreed that despite the setback in production in 1962-1963, the longer-term outlook remained essentially unchanged. In view of the substantially higher supplies likely to be available by the end of the decade as a result of new plantings made in recent years, the industry's efforts would have to be concentrated on increasing citrus consumption.

131. The Group concluded that, in its future work, primary consideration should be given to the current situation and outlook with special emphasis on current trends and policies and their implications; the longer-term outlook for production and consumption with particular attention to the market for processed citrus fruit; and the feasibility of international market stabilization measures for perishable commodities such as citrus fruit.

COCOA

132. Following a request from the FAO Cocoa Study Group, the Secretary-General, on the advice of this Committee, convened a United Nations Conference which met in Geneva from 26 September to 24 October 1963. It was called to consider what inter-governmental action might be taken in connexion with international trade in cocoa. The Conference had before it a draft of an international agreement prepared by the Study Group.

133. The Conference was attended by countries representing more than 98 per cent of world exports and almost 90 per cent of world imports. Whilst there was a consensus as to the form which a cocoa agreement might take, the Conference adjourned without reaching conclusions on specific terms. The differences which were not resolved related particularly to the level of prices. At the conclusion of its deliberations, the Conference recognized that differences of views continued to exist among Governments and that further consideration by Governments was required. It requested the Secretary-General, acting in consultation with the Interim Co-ordinating Committee for International Commodity Arrangements, to keep under review further discussions including those which may take place within the FAO Cocoa Study Group and other developments relating to cocoa, and to invite States to come together for a further session of the Conference "when satisfied that the conditions for a resumption exist and facilities are available."⁴²

134. The Conference was convened against a background of advancing market prices for cocoa. In 1963 consumption of cocoa beans continued to increase and for the first time in six years was expected to exceed production, though it now appears that consumption and production were in approximate balance in 1962-1963. Moreover, the 1963-1964 crop was estimated to be 5 per cent less than the 1962-1963 crop due to unusually heavy rains in West Africa late last year. The price of cocoa which averaged 21.0 cents per pound (spot Ghana, New York) for 1962 as a whole, staged an advance toward the end of that year. Prices averaged around 22 cents in December 1962 and 28 cents in May 1963. They subsided to 24 cents in August but advanced again to 27 cents in October and fluctuated at about this latter level during the remaining months of 1963. Since January 1964 prices have again declined, reaching an average of 22 cents in April. A record crop is now expected in 1963-1964 which would bring production and consumption into approximate balance.

135. The draft agreement considered by the Conference⁴³ provided for operations on the international cocoa market through a system of export sales quotas which were to come into effect between certain price limits. It was left to the Conference to decide on these limits and whether they should be for the first year only, or for the duration of the agreement and possibly subject to review if the agreement exceeded three years. The draft provided for basic quotas to be assigned to each exporting member country. Such quotas were to be decided at the Conference but might also be made subject to review in the event that the agreement extended beyond three years.

136. The draft envisaged that, before 1 October each year, the administering International Cocoa Council would conduct an annual review of the market situation and prospects and, in particular, the import requirements of all importing countries, supplies from member and non-member exporting countries and the level of prices. In the light of this review the Council would decide whether to introduce annual sales quotas applying a percentage, the same for all exporting members, to their basic quotas. If the Council was unable to reach a decision on the level of quotas, they would be fixed at the level of the previous year, or if no quotas were in effect, at a percentage of basic quotas which remained to be negotiated at the Conference.

137. Both the minimum (B) and maximum (A) prices⁴⁴ as well as the price intervals between them remained to be negotiated. The draft envisaged two successive intervals above the minimum price ($B + x$ and $B + 2x$) and two below the maximum ($A - x$ and $A - 2x$), the first two not necessarily of the same magnitude as the last two. If the market price enters the interval immediately above the minimum price, quotas automatically come into force, and if it enters the interval immediately below the maximum price, they automatically cease to be in force. In the interval between $A - x$ and $B + x$, the Council may introduce

⁴³ In this context the draft as originally presented to the Conference. At the time of adjournment amendments submitted during the Conference had not been disposed of by its Committees.

⁴⁴ The draft specified a method for calculating the reference prices (based on New York Cocoa Exchange and London Terminal Market) but provided that the administering International Cocoa Council might at any time, by special vote, decide to use what it considered a more satisfactory method.

⁴² Resolution adopted at the fourth plenary meeting of the United Nations Cocoa Conference, 1963, see document E/CONF.49/4.

or remove sales quotas or vary the level of sales quotas at any time and below $B + 2x$ the Council must fix a level for quotas, even if they are not immediately introduced. Above A or below B special action was envisaged (see chart below).

Maximum price A	All available supplies and stocks put on market
A - x	At which any quotas in force automatically cease
A - 2x	At which market situation and level of quotas reviewed
B + 2x	Below which fixing of level of quotas mandatory
B + x	At which quotas automatically introduced
Minimum Price B	At which emergency action to reverse price trend

138. The annual quotas were to cover sales for export of both cocoa beans and cocoa products, exports of small producers and of fine or flavoured cocoa being normally exempt. The draft provided for some flexibility in the application of quotas. The Council might exempt certain sales on terminal markets, while keeping them under surveillance. Sales in one year for delivery in subsequent quota years up to 20 per cent of a country's basic quota, would be counted against the quota in the subsequent year. Shipment of surplus cocoa for storage in other countries for climatic or other technical reasons were on notification to the Council, not to be counted against quota until actually sold, and shipments for humanitarian or other special purposes might be exempt. Where no exemption existed, the draft provided for strict adherence to quotas, each exporting member country making regulations concerning the organization and regulation of export sales, for the control of exports and for reports to the Council in this connexion. Any excess over a sales quota would result in a reduction in the member's quota for the following year.

139. In order to prevent non-member countries from gaining undue advantage when quotas are in force, the draft provided for the Council to introduce limitations on imports by members from non-member countries. This was, however, contingent on member countries accounting for less than a certain percentage of total trade in cocoa. The percentage remained to be determined at the Conference as did also the basis for calculating the limitations.

140. With the object of keeping production in reasonable balance with consumption, the Council at its first session was required to take action to collect information needed to establish global productive capacity. A producing country might be required to develop a programme of production adjustment and to submit periodic reports to the Council in this connexion. Importing countries were to undertake to co-operate with producing countries, giving various forms of assistance to the latter in carrying out production and stock regulation programmes. Moreover, provision was made for the Council to review annually the level of stocks in member countries and to make recommendations. Member countries were to submit reports on measures taken to implement these.

141. In order to promote consumption and to assist producing members in meeting costs of holding stocks

the draft further provided for the establishment of an International Cocoa Fund. The income of the Fund was to be drawn from a limited levy on registered and imported sales, one half of the levy having been added to the price of the cocoa sold, the other half having been provided by the selling country. Measures aimed at the expansion of consumption related to the removal of, or counteraction to, obstacles such as custom duties, internal taxes and fiscal charges. They also included Council studies for promoting consumption, particularly in countries where consumption was low.

COCONUT AND COCONUT PRODUCTS

142. The FAO Group on Coconut and Coconut Products held its fifth session in Rome from 9 to 18 September 1963. In addition to reviewing the current situation in these commodities, the Group discussed the problems of expanding trade and stabilizing prices of coconut and coconut oil, the effects of competing oils on the coconut oil market and tariff and non-tariff barrier to trade in coconut and coconut oil.

143. In its review of the current situation, the Group noted that the volume of production and international trade in coconut and coconut products had increased during 1963, the volume of import into countries accounting for the bulk of world purchase being 13 per cent higher in the early months of that year. Moreover, international prices for these products in the first eight months of 1963 averaged 11 per cent higher than in 1962 and had been relatively steady. The higher prices, notwithstanding larger supplies of copra and coconut oil, reflected both the absence of any large increase in world supplies of all edible fats and oils and also stock replenishment of coconut oil.

144. Following an examination of long-term projections for all fats and oils, the Group agreed that they were extremely valuable as a guide to Governments in planning and many delegations urged that the work on projections be continued and intensified. Their usefulness could be increased by more detail on the position of individual commodities and countries. In regard to market access, the Group stated that price support policies for competing oil seeds and other fats as well as other national policy measures for competing edible fats and oils, would continue to be a matter of anxiety for exporters of coconut oil. The group also discussed import policies in industrialized countries and it was recognized that a problem existed in relation to tariffs frequently imposed on the processed products (coconut oil) since, as the exporting countries stressed, this retarded their industrial development. In connexion with price stabilization, the Group gave preliminary consideration to the possibility of some form of an international commodity arrangement for copra (dried coconut meat) and coconut oil and requested a number of studies to throw further light on the feasibility of such development or to clarify the features of an appropriate arrangement.

COFFEE

145. The International Coffee Agreement, 1962, which had been in effect provisionally since the preceding July, entered into force definitively on 27 December 1963, in accordance with article 64. Subsequently, the International Coffee Council resolved that signatory Governments, which by 31 December 1963 had not

deposited an instrument of ratification or acceptance, might accede to the Agreement under the same conditions established by the Agreement at the time of signing, provided they deposited the relevant instrument not later than 30 June 1964. After that date, conditions for accession of these countries shall be established individually in accordance with article 65. As of mid-April 1964, twenty-eight exporting and sixteen importing countries, accounting for 90 per cent of world exports and 86 per cent of world imports of coffee, had ratified or acceded to the Agreement.

146. The Secretary-General had convened the first session of the International Coffee Council in London from 29 July to 24 August 1963, when the Council had elected its Chairman, Executive Director and other officials as well as its Executive Board for the year ending 30 September 1964. The Council had also determined export quotas for the new coffee year which started 1 October 1963.

147. During this first year of the Agreement's existence a number of basic decisions relating to operations had to be made. The Executive Board, meeting for its first session in London from 16 to 20 September 1963, determined the type of statistical data to be collected from member countries and the form of an analysis of coffee prices requested by the Council. It also considered the preparation of a promotional programme for coffee. At the same time it appointed a group of experts on custom procedures to prepare a model of certificates of origin and re-export. The Council at its second session approved a resolution whereby no producing member would permit, after 1 April 1964, the export of any coffee grown in its territory unless this coffee was accompanied by a certificate of origin.

148. At its second and third sessions from 18 to 23 November 1963 and from 10 to 15 February 1964, both of them special sessions, the Council reviewed the market situation and at the same time gave consideration to proposals to raise the annual quotas for 1963-1964, as well as to petitions for waivers on quota levels presented by various producing countries. At the November session the Council postponed its decision on both these matters, maintaining that it would be difficult to come to conclusions at the time when the outcome of crops was uncertain. At its February session, the Council decided to raise the level of quotas for 1963-1964 from 99 per cent to 102.15 per cent of basic quotas, as well as to grant, under article 60 (waivers), permission to seven countries⁴⁵ to export coffee totalling about 948,000 bags in addition to their quota.⁴⁶ At the same time the Council requested its Executive Board to keep the market situation under review and, if necessary, arrange for a further session of the Council to consider remedial action if it decided that the situation so required. It also asked its Executive Board to prepare a set of rules for the consideration of requests for waivers in connexion with annual quota increases.

149. Notable changes in market prices for coffee began to take place in September 1963 on news of widespread damage to Brazil's crop by frost, drought and

forest fire. On average, prices for two of the three main types, Brazilian and Colombian, were little different in 1963 from 1962, the latter being a year when prices for all types were close to their lowest in ten years. Having fluctuated around 34 cents a pound for most of 1963, the price of Santos No. 4 (spot, New York) advanced to 37.5 cents in December. The prices of *robustas*, which had begun advancing in 1962, also turned strongly upwards. Fears of physical shortage of Brazilian coffee coupled with increased demand for other coffees brought about a further sharp rise in prices of all main types, the advance in Brazilian being such that by mid-January 1964 the usual premium paid for Colombian coffee had disappeared. At the end of February 1964, prices of Santos No. 4 reached 50 cents per pound, where they remained on average during March. With the exception of Colombian coffee, which was 25 per cent higher, most coffees were then about 50 per cent higher in price than in August 1963.

COPPER

150. Consideration was given by the Committee to the suggestion of the Inter-American Economic and Social Council that there be established an international study group on copper under the auspices of the United Nations. The proposal, which was advanced at the first annual meeting of the Council at the ministerial level, was reiterated in November 1963 at the second annual meeting of the Council at the expert level. Following consultations with interested Governments the Committee decided to keep the position under review, and to call a meeting of the Governments interested in copper production, consumption and trade as soon as support for such a meeting was indicated.

151. The world demand for copper outside the centrally planned economies continued to grow in 1963. It is estimated that consumption increased by more than 4 per cent between 1962 and 1963. This improvement in copper consumption reflected the general rise in output of metal-using industries: output of these industries in the first three quarters of 1963 was 4 per cent above that of the corresponding period of 1962. Whereas there was little change in the rate of copper consumption in the European Economic Community in 1963, there were marked increases in the use of copper in the United Kingdom and in the United States. Both countries increased their net imports and in the United States inventories, which had risen in 1962, were drawn down in 1963.

152. World production of copper, at mines, rose by about 1 per cent in 1963. The increase was held at this level in part through a series of voluntary restrictions on output undertaken by a number of major producers: some of these restrictions were on the basis of capacity levels which were being enlarged. Mine production of copper in 1963 fell in North America and showed little change in Europe. However, the rate of mined production increased by close to 4 per cent in Africa and Latin America.

153. The rising volume of activity in copper was accompanied by virtual stability of the major price quotations for the metal. The price on the London Metal Exchange remained at £234 per long ton until towards the end of 1963, and the price quoted by major producers in the United States remained at 31 US cents per pound. Early in 1964 prices in both markets moved upwards.

⁴⁵ Guatemala, Honduras, Peru, Portugal, Trinidad and Tobago, Uganda and OAMCAF (Organisation africaine et malgache du café).

⁴⁶ The total effect of raising the quotas and of the waivers was to increase the 1963/64 quota by 2.3 million to 48.1 million bags.

COTTON

154. At its twenty-second plenary meeting held in Bangalore, India, from 28 April to 8 May 1963, the International Cotton Advisory Committee (ICAC) approved the report of a group which it had established to evaluate its own activities and invited the attention of its Standing Committee to the question of procedures for consultations and the strengthening of co-operation between ICAC and other international bodies. At the same time ICAC decided that in addition to its specialized Committee on Extra-Long Staple Cotton, a Committee on Cotton Production Research should be constituted as a committee of its plenary meetings. It also recommended that its Standing Committee consider the desirability of convening before the twenty-third plenary session, a meeting of interested member countries and cotton organizations which would take up the question of additional promotion and market research. All these matters have been followed up by the ICAC Standing Committee, and the forthcoming plenary session commencing on 1 June 1964 in Frankfurt will be preceded by meetings of the committees on cotton production research and on extra-long staple cotton as well as by a special meeting on cotton promotion.

155. Following its regular annual review of the cotton situation at its twenty-second session, ICAC drew up a Statement on Cotton Policy which welcomed the reassurance that, in the operation of its cotton programmes, the United States would bear in mind the interests of other countries and seek to avoid disruption of the cotton market. It also referred to the relatively high domestic price of cotton in the United States, the failure of cotton consumption in that country to increase and the possibility of measures to remedy this situation. On the other hand, ICAC, considering various factors including competition from other fibres and the effect on cotton farmers' standards of living, was at that time unable to reach conclusions on the appropriate level of prices for cotton in the world market.

156. World prices of cotton, especially medium staples, have continued to move within relatively narrow limits. With stocks, especially in the United States, the major exporter, substantially larger at the opening of the 1963-1964 season and a larger crop being harvested, the price of United States middling 1" cotton (c.i.f. Liverpool) was lower at 26.6 cents per pound in September 1963 as compared with 28.0 cents a year earlier. In the following six months prospects for increased consumption, particularly in the United States, improved with passage of legislation bringing the price of cotton to domestic manufacturers more into line with the price of United States cotton to foreign manufacturers. The latter price changed little, the price of the above-mentioned quality being 27.0 cents in March 1964. Stocks of cotton in other exporting countries were lower at the beginning of the 1963-1964 season and an increasing demand for import and consumption has been reflected mainly in higher prices for longer staples. The price of Sudan Sakel G. 5S, which averaged 37.7 cents in September 1963 (as compared with 36.7 cents a year earlier), moved up to 40.8 cents by February 1964 and continued to advance in March.

DAIRY PRODUCTS

157. An FAO *ad hoc* working group on the Economic Problems of Dairy Products met in November

1962. The group reported that support, by one means or another, of producer prices of milk in many advanced countries, together with technological advances, has been reflected in a more rapid rise in production than in consumption, the appearance of burdensome surpluses and disturbances in the commercial trade in dairy products. The group noted that projections of the world dairy economy, made on the assumption of a continuation of present policies, indicate that the gap between production and consumption is likely to increase. The group recommended various means to increase consumption of dairy products particularly in advanced countries. In the likely event of these increases in consumption proving inadequate to correct the projected disequilibrium, measures to restrain production might have to be envisaged. These measures should aim at a gradual elimination of inefficient production. It considered that quotas distinguishing between production for domestic and production for export markets were undesirable. It further concluded that the adjustment required was primarily in the policies affecting production in advanced countries and stressed the relevance of the guiding principles recommended by FAO on national agricultural price stabilization and price support policies. As regards international trade, the group saw an urgent need for international co-operation in the field of dairy products and considered that an international agreement in this field might be an approach toward a suitable solution.

HARD FIBRES, JUTE

158. Following consideration of the report of the *ad hoc* meeting on hard fibres which had been held in the preceding March, the FAO Committee on Commodity Problems at its session in May 1963 endorsed the proposal to carry out a study of long-term prospects for hard fibres as well as other recommendations of the *ad hoc* meeting. The FAO Committee urged all countries of importance in the hard fibres market to co-operate fully in the collection and exchange of statistical and other information, so that it might re-examine at its next session the question of convening another *ad hoc* meeting on hard fibres.

159. At its May 1963 session also, the FAO Committee decided in the light of the report of the *ad hoc* meeting on jute which had been held in the preceding December in Bangkok, to proceed to the establishment of an FAO study group on jute, kenaf and allied fibres. The first meeting of the Study Group is scheduled to be held in Rome from 14 to 18 September 1964.

LEAD AND ZINC

160. The International Lead and Zinc Study Group held its seventh session in Geneva from 4 to 7 November 1963. It was preceded by meetings on 30 and 31 October of its Special Working Group which also met and reported during the session on possible inter-governmental arrangements for lead and zinc. The Study Group decided that this subject should be kept under review in the Special Working Group, due account being taken of the results of the continuing studies in this field.

161. The Group reviewed the current situation and the short-term outlook for lead and zinc. It was generally agreed that, in view of the satisfactory statistical position and of the improved market situation, the time was opportune for the liberalization of trade bar-

riers in lead and zinc. Concerning stockpile disposals, the United States reaffirmed the assurances given at the sixth session regarding prior consultations with the Study Group, should disposals be seriously considered.

162. A further review of the current situation conducted by the Group's Standing Committee on 28 February 1964 showed that in the year 1963 consumption of both lead and zinc had increased, the former by 4 per cent and the latter by 6 per cent during the year. Although metal production also expanded during the year, the increase was not sufficient to meet higher levels of demand and there was a continuous decline in producers' stocks. In lead new supplies composed of metal production and net imports⁴⁷ from centrally

⁴⁷ Special tables showing the direction of world trade in lead and zinc ores and metals are published on a quarterly basis by the International Lead and Zinc Study Group in its *Monthly Bulletin of Lead and Zinc Statistics*.

planned economies are estimated to have only very slightly exceeded consumption and in zinc they are estimated to have fallen significantly short of consumption. Small net (positive) changes in non-commercial stockpiles made little impression on the tightening supply situation.

163. The price of lead on the London Metal Exchange showed a continuous rise from the low point of £50.5 per long ton at the beginning of August 1962 through the rest of that year, during 1963 and the first two months of 1964, reaching £84 a ton at the end of February, an increase of almost 66 per cent since August 1962. During this twenty-month period world producers' stocks of lead fell by one half (see chart). By the end of February 1964, they had fallen to 172,200 metric tons, the lowest level since December 1957. During the first half of March the price of lead weakened to £79.8 on 16 March. In the latter part of

^a Monthly average of daily settlement price.
^b End of months.

the month it recovered to £82.4 on 31 March and fluctuated around this level until mid-April 1964.

164. The price of zinc followed a similar trend to that of lead. It rose from £63.8 per long ton at the end of September 1962 to £102.5 at the end of February 1964. World producers' stocks of zinc fell very steeply in the second half of 1963 and by the end of February 1964 had reached the low level of only 130,000 metric tons (see chart). During the first half of March the price of zinc declined. On 13 March it was £97.5 a ton. During the second half of March the price increased again, reaching £103.5 on 23 March. After fluctuating slightly during the last week of March and the first week of April, it continued to advance,

reaching £115 a ton on 10 April, an increase of 80 per cent over September 1962.

MEAT

165. Negotiations among member countries of the European Economic Community in December 1963 resulted in agreement on the regulations relating to beef. The import régime established under the above regulations will be applied beginning 1 July 1964. These regulations provide for import duties, "lock-gate" prices and levies which raise the unit cost of imports to the level of the guide prices in importing countries of the Community.

166. A multilateral conference opened on 27 January 1964 in London between the United Kingdom and that country's major suppliers⁴⁸ of meat. In the context of the United Kingdom's maximum meat requirements for the year commencing April 1964 and domestic production of beef, veal, lamb and mutton, it was planned to allot to each supplying country a market share and to arrange for a phasing of shipments to avoid seasonal shortage or glut. An agreement on these lines for the same period between the United Kingdom and its main suppliers of bacon had been reached earlier. This meat conference, however, concluded on 8 February without reaching agreement. Both Australia and New Zealand have unlimited access to United Kingdom markets under long-standing Commonwealth agreements which do not expire until 1967.

167. On 17 February 1964 an agreement was reached between the United States and its main beef suppliers, Australia and New Zealand, for a system of voluntary limitation of beef and veal exports to the United States. Under the agreement shipments from each of the supplying countries will be reduced 6 per cent in 1964 from the 1963 level. Starting with 1965, shipments will be permitted to increase by 3.7 per cent a year in line with the expected growth in the United States domestic market. Agreements similar to those concluded with Australia and New Zealand were reached with Ireland on 25 February and with Mexico on 14 May 1964.

OLIVE OIL

168. The International Olive Oil Council held its eighth session in Lisbon from 28 to 30 May 1963, when it dealt with financial, economic and technical matters relating to the operation of the International Olive Oil Agreement which was to be renewed in the following October. Need was stressed for maintaining and developing outlets for olive oil, ensuring regular supplies for foreign markets and avoiding restrictive measures on exports. In this connexion it was noted that restrictions sometimes applied by producing countries on exports in times of shortage, in order to meet domestic demand, could be compensated for by making maximum use of products of the same nature as olive oil, such as refined olive residue oils. Accordingly, the Council was requested to inform all participating countries, whose legislation did not yet allow the use of olive residue oil for human consumption, that not only were such oils considered as "olive oil" under the new agreement but that their use should be officially permissible.

169. At its ninth session, held in Madrid from 28 to 31 October 1963, the International Olive Oil Council announced that the new International Olive Oil Agreement, 1963, came into force provisionally on 1 October 1963. This was followed by a further announcement in April that, the necessary requirements having been met, the Agreement was definitively in force from 17 March 1964.

170. At both its eighth and ninth sessions the Council considered the problem of regularization of the international olive oil market and of the relationship between prices of agricultural and industrial products. At its ninth session, having considered olive oil balance sheets for 1962-1963 and a forecast of production and consumption for 1963-1964, it decided to set up a Com-

mittee of governmental experts from each member country or signatory of the Agreement, to report on economic measures to maintain normal conditions on the market during the 1963-1964 crop year. The Committee was also to undertake studies with a view to making recommendations to secure the long-term normalization of the olive oil market. It was asked to consider and determine minimum prices for olive oil that would allow producers adequate income and maximum prices to consumers which would be in line with the market prices of various other fats and oils. It was also to consider such measures as would ensure the regular supply of olive oil to consumers in the short, medium and long term, within the price limits envisaged. Continuing its work on these matters, the Committee met for a further session from 24 to 28 February 1964, in Madrid.

RUBBER

171. Since the last plenary meeting of the International Rubber Study Group in Washington in June 1962, the Management Committee of the Group, which between plenary sessions exercises the functions of the Group, has from time to time been reviewing the situation and short-term outlook as well as concerning itself with the longer-term prospects for natural and synthetic rubbers. At meetings in May and November 1963, the Management Committee examined the statistical position and made estimates for natural and synthetic rubber requirements and supplies during 1963.

172. Provisional estimates indicate that world consumption of both natural and synthetic rubber continued to increase in 1963, the increase being relatively large in the synthetic product. Natural rubber production is estimated to have declined slightly, falling short of consumption in 1963 as in the two preceding years. As the year progressed, estimates of natural rubber production in 1963 were reduced and estimates of deliveries from stockpiles were increased but the total new supply has again been scarcely sufficient to cover consumption. Synthetic rubber production has shown a further expansion and, as in the two preceding years, has exceeded consumption in 1963.

WORLD RUBBER PRODUCTION, CONSUMPTION AND STOCKPILE DELIVERIES
(1,000 long tons)

	Actual, 1961	Actual, 1962	Provisional estimate, 1963
<i>Natural rubber</i>			
Production	2,088	2,115	2,062
Stockpile deliveries	29	67	94
TOTAL, new supply	2,117	2,182	2,156
Consumption	2,132	2,187	2,210
<i>Synthetic rubber^a</i>			
Production	1,975	2,240	2,430
Consumption	1,920	2,170	2,340

^a Excluding production and consumption in centrally planned economies.

173. Market prices of natural rubber have continued to drift downwards since 1960. The price of natural rubber RSS3 quality in New York registered a low

⁴⁸ Australia, New Zealand, Argentina, Uruguay, Ireland and Yugoslavia.

point in September 1963 at 23.30 cents per pound which is closely in line with quotations for less expensive synthetic types. There followed a slight recovery in the following three months but by January 1964, the price of the quality mentioned was scarcely any higher than in the preceding September and the quality premium for RSS1 rubber had diminished to relatively small proportions.

174. Through its Management Committee the Group in November 1963 appointed a Working Party "to assess the prospective supply/demand position for rubber up to 1970 and to study the proposals contained in the Report of Sub-Committee 1 of the Preparatory Committee for the United Nations Conference on Trade and Development and to comment on them insofar as they are relevant to rubber".⁴⁹ Completed in February 1964, the report of the Working Party was considered in detail by the Group. In the light of this consideration the Group communicated its views to the United Nations Conference on the major issues concerning rubber.

175. The Group had made estimates of total demand for rubber (natural and synthetic)⁵⁰ and of natural rubber production capacity in 1970. It concluded that the latter would not be sufficient to permit any significant increase in the percentage usage of natural rubber over current levels. At the same time the Group noted that a decline in the percentage usage of natural rubber could result in surplus production capacity. Considering the implications, the Group concluded that should a significant surplus in natural rubber production capacity develop, it would be necessary to seek a positive course of action aimed at solving the problem of economic hardship in producing countries. The Group agreed that any scheme which had as its objective the maintenance of natural rubber prices above the competitive level of synthetic rubber prices would be impracticable, and expressed its belief rather in a comprehensive and co-ordinated series of measures contributing to the achievement of the agreed objective.

176. The Group accordingly made the following recommendations:

(a) Natural rubber producing countries should take concerted action to maximize efficiency and reduce costs of production and also to stimulate demand by improved marketing and presentation. They should also continue and expand the present exchange of information on replanting and new planting and other factors affecting production efficiency;

(b) Natural and synthetic rubber producing member countries of the Group should consider how more effective and continuous co-operation could be developed so as to make the best use of natural resources and avoid if possible wasteful competition;

(c) Producing and consuming countries should consult together to see whether practicable means can be agreed upon to reduce short-term price fluctuations and to reduce the impact of an excessive fall in the price of natural rubber on the economies of producing countries. They should also give particular attention to making as realistic as possible forward estimates of demand, production and production capacity, and keep these estimates under regular review;

(d) Countries holding stockpiles of natural rubber should continue and, if possible, develop consultation with producing countries on the disposal of surplus stocks.

177. The Group also decided to review its own organization to see how the further consultation and co-operation recommended in para. 176 (a) and (b) above (with respect to producing countries) can best be achieved. It also decided to consider how a comprehensive and detailed study of the effects of a substantial fall in the prices of natural rubber can best be undertaken. In that connexion it may be noted that the Group is scheduled to hold its next plenary session from 18 to 22 May 1964 in Tokyo.

SUGAR

178. The United Nations Sugar Conference, held in London on 3 and 4 July 1963 to consider action to be taken on the expiry on 31 December 1963 of the then current International Sugar Agreement, 1958, was attended by representatives from fifty-two countries and by observers from a further ten countries. The Conference adopted the text of a protocol⁵¹ to the Agreement extending the part of it at that time in force to 31 December 1965. The protocol was open for signature in London from 1 August to 30 September 1963. On 6 November 1963, the Council noted that fifty-five countries were members of the then current Agreement and that the Protocol extending the Agreement for a further period of two years (until the end of 1965) had been signed on behalf of Governments of thirty-three exporting and twelve importing countries.

179. The new protocol which entered into force on 1 January 1964 provides for the study by the International Sugar Council of the bases and framework of a new agreement to succeed the Agreements of 1958. It requires the Council, not later than 30 June 1964, to circulate a report to Governments, including recommendations in this connexion. During the fifteenth session held immediately following the Conference, the International Sugar Council therefore established a Preparatory Committee to make the study mentioned. At the same session, the Council gave consideration to the question of the preparation of a report regarding long-term production plans and consumption trends of sugar. At its sixteenth session in November, the Council received an interim report from the Preparatory Committee. The completed report of the Preparatory Committee will be before the Council at its seventeenth session in the spring of 1964.

180. At its sixteenth session also the Council adopted a first estimate prepared by its Statistical Committee of net import requirements for 1964 amounting to 11,430,000 metric tons (514,000 tons less than the last estimate for 1963), and noted that the import requirements of the United States from foreign sources were estimated at 3,540,000 metric tons (a reduction of 270,000 tons against 1963), making a total for the requirements of the world market of 14,970,000 tons (784,000 tons lower than in 1963). The Council considered this estimate against a first forecast of supplies available for world destinations in 1964 and noted that, taking the year as a whole, it appeared that requirements would again be considerably in excess of supplies. The Council also noted that, while there had been a marked reduction of stocks in exporting countries, there was

⁴⁹ See E/CONF.46/106.

⁵⁰ Excluding synthetic rubber demand in centrally planned economies.

⁵¹ See E/CONF.48/2.

evidence of some build up of stocks in importing countries.

181. The price of sugar (as calculated by the International Sugar Council) rose sharply during the first half of 1963, averaging 9.77 cents per pound in June as compared with 5.25 cents in the preceding January. During July and August, expectations of a better crop brought about some relaxation of demand and prices receded to an average of 6.41 cents per pound in August. Later, however, as news of destruction by hurricane of a considerable part of the crops in the Caribbean area reached the market, sugar prices again advanced sharply and in October 1963 averaged 10.45 cents per pound. At the beginning of November prices reached a peak of 12.32 cents per pound, but the averages for this month and the following two months were 11.53, 10.20 and 10.48 cents, while by the beginning of February 1964 the price had declined to 8.92 cents.

TIN

182. During the past year the International Tin Council has been continuously concerned with the question of release from governmental non-commercial stockpiles. Against a background of increasing release from the United States stockpile,⁵² the Council reviewed the current situation in tin at meetings held from 11 to 13 June 1963 (including meetings with United States representatives) and again from 8 to 10 October 1963. Following the later meeting the Council sent a mission to Washington to seek a firm understanding concerning plans for future disposals of tin. It also continued to develop an inquiry into future trends in world tin production with the aid of information supplied by both member and non-member countries.

183. A sharp advance in market prices for tin occurred in the last quarter of 1963 which the Council's buffer stock manager was powerless to arrest due to exhaustion of his relatively small stock of tin metal. The Council decided that from 5 December 1963, the floor and ceiling reference prices should be raised.⁵³ After a further review of the situation at a special meeting of the Council on 23 and 24 January 1964, a Council delegation proceeded to Washington in February to consult with the United States Government on the question of further stockpile disposals.⁵⁴ The delegation's report was considered at a meeting of the

⁵² Until 26 June 1963 offers for sale from the United States stockpile had been at the rate of 200 tons per week, the offer being made once a week. From the above date the rate was increased to 400 tons per week, and a month later the offers were put on a daily basis. Originally intended to be operative over ten weeks, release on the new basis was in September 1963, extended for a further period of six months. Before this latter period had expired, however, the rate was increased to 600 tons per week on 20 December 1963, but subject to an over-all maximum of 9,000 tons for the six months to March 1964. Total sales by the United States in 1963 were 9,320 tons, a further 1,300 tons being disposed of in other directions.

⁵³ The lower sector in which the buffer stock manager may buy is now from £850 to £900 per ton; the middle sector is from £900 to £950 per ton; and the upper sector in which the buffer stock manager may sell the supply is now from £950 to £1,000 per ton.

⁵⁴ The 600-ton weekly restriction on release was removed altogether on 20 February 1964. At that time 2,765 tons of tin out of the original 9,000 tons authorized for disposal in the six months period to March 1964 was available for sale. On 29 February an additional 5,000 tons were made available for sale by 16 March 1964.

Council held from 4 to 6 March 1964. At the same time a special committee consulted further with representatives of the United States Government on both short-term and long-term aspects of the disposals plan.

184. The United States Government on 20 March 1964 announced a long-range plan for the disposal of 127,000 tons of surplus tin over a period of six to eight years. (Of this quantity about 98,000 tons required Congressional authorization.) As part of this plan it was anticipated that about 20,000 tons would be disposed of in a first twelve-month period. The long-range plan is designed to permit eventual disposal of all the tin excess to United States Government strategic stockpile needs. The long-range plan had been prepared after thorough review of the current world tin situation. It took into account authoritative forecasts of anticipated production and the consumption trends expected during the next few years. Disposals took into account the criteria set out in the United States Executive Stockpile Committee report of 16 January 1963. Sales would be in amounts which could be absorbed by regular marketing channels without avoidable loss to the United States Government and without creating hardships in domestic or friendly foreign economies. Disposals should be made in a manner aimed at minimizing market difficulties and should take into account the effect on investment of capital in exploration and development of new supplies. The long-range plan was expected to meet the current abnormal shortage of new tin, compared with requirements, and would allow disposals to be so phased as to protect and foster the health and growth of the world's tin mining industry. It would be the policy to accept only offers which were reasonably consistent with prevailing market prices and to reduce or suspend sales during periods of significant relative price weakness. No major modification of the plan will be initiated without prior consultation with those interested. The International Tin Council noted that the two principles which the Council had put forward—first, that disposals should aim at meeting the needs of consumers for adequate supplies of tin and secondly, that disposals should be regulated in a way which will help to secure the adequate development and growth of a healthy tin mining industry—appeared to have been generally accepted by United States authorities.

185. At the March meeting the International Tin Council also decided to request the Secretary-General of the United Nations to convene in the spring of 1965 a conference to draw up a third International Tin Agreement which would come into operation in 1966 on the termination of the current Agreement. In this connexion, the Council established a preparatory committee.

186. The price of tin on the London Metal Exchange, in the second quarter of 1963 rose above the points at which the buffer stock might sell (£910). Most of the small stock was sold. In October the price advanced beyond the then ceiling (£965) and in December beyond the new ceiling (£1,000) of the International Tin Council. The advance continued in the following two months to a peak of £1,250 per ton (the highest figure since the Korean crisis) at the end of February 1964. The advance was stemmed from time to time as further tin from the United States stockpile became available. Following further announcements in this connexion and publication of information on United

Tin: weekly average cash price on London Metal Exchange, 1963-1964

States long-range plan for stockpile disposal, the price dropped back to around £1,050 per ton in March (see chart).

TUNGSTEN

187. Following up its initial meeting in June 1963, a second session of the United Nations *ad hoc* Committee on Tungsten was held in Geneva on 28 and 29 October 1963 just prior to the seventh session of the International Lead and Zinc Study Group. The Committee noted that the situation in tungsten was marked by a surplus of supplies, high levels of both commercial and non-commercial stocks and low prices, and also noted various factors affecting trade in the commodity. It recognized, however, that effective study and consideration of possible remedial action required further data, and recommended that data relating to production, consumption and trade in ferro-tungsten and tungsten products be sought and, also, that information on international trading arrangements, import duties, controls and quotas, development projects and domestic policies be compiled.

188. At its second session the Committee also considered the possibility of setting up a tungsten study group, but agreed that for the time being work should continue on the current basis, attention being directed to specific and immediate short-term action rather than to some form of international agreement. It decided in view of the gravity of the prevailing situation that a further meeting of the Committee should be convened on replies to the questionnaire on statistical and other matters being received and analysed by its Technical Working Group.

189. A third session of the United Nations *ad hoc* Committee on Tungsten was held in New York from 23 to 25 March 1964, when it reviewed the problems underlying the tungsten market on the basis of a report prepared by its Technical Working Group, and gave consideration to the desirability of further inter-governmental consultation or action on tungsten. The *ad hoc* Committee decided to submit its report to the Interim Co-ordinating Committee for International Commodity Arrangements with the request that it be

forwarded to the United Nations Conference on Trade and Development.⁵⁵

190. With regard to the present market situation in tungsten, the *ad hoc* Committee concluded that this remained depressed, notwithstanding recent price fluctuations. It considered that the major influences of varying importance which at present affected the market included changes in the geographical pattern of supplies of tungsten ores and concentrates, the structure of tariffs, and uncertainty with respect to sales from various stockpiles. The Committee considered that in some countries the level and structure of tariffs on tungsten impeded the flow of international trade in this commodity to the detriment of exporting countries. It appealed to those major consuming countries maintaining such tariff structures to reduce or abolish them either unilaterally or through the GATT. A number of delegations expressed the view that sales from various government stockpiles while market conditions were depressed would add to the difficulties of the market, and urged that no sales be made from stockpiles when the market situation was depressed.

191. In considering immediate short-term measures designed to alleviate the present depressed situation in tungsten, the *ad hoc* Committee examined tentative proposals submitted by a group of producing countries.⁵⁶ According to the sponsors the proposals aimed at rehabilitating a marketing situation where prices have so widely fluctuated as to limit producers and consumers alike. With prices below economic levels for a considerable period, existing mines have been working well below capacity; some have stockpiled part of their production and some have put their mines on a care and maintenance basis pending an improved market situation. It was stated that proposals were needed to provide for the organization of markets on a more rational and economic basis, but that due to the nature of the problem the producing member countries could not take action which would correct the market situation without the full co-operation of the importing member countries.

192. In a first proposal (proposal I) the sponsors considered that solutions should be sought in the direction of expanding international trade, and suggested that an institute for the investigation of ways and means of increasing consumption of tungsten be established, the cost being met by producers and consumers alike. Since a solution based on increases in consumption would take some time to be effective, the sponsors suggested (proposal II) that the urgent problem of bringing stability to the market at reasonable prices should be the subject of stop-gap measures. Importing member countries would specify minimum percentages of their total requirements for each year which they would obtain only from member countries exporting their own production and at prices at reasonable levels to be agreed upon by negotiation. It was also suggested that the commitments on market access and prices would probably need to be supported by an undertaking relating to the disposal of non-commercial stocks; and to give balance to the agreement there could be an undertaking by the exporting member countries that sufficient supplies would be offered to match import requirements of importing member countries.

⁵⁵ Tungsten/9/Rev.1.

⁵⁶ Australia, Bolivia, Republic of Korea, Peru and Portugal.

193. There was some additional support at the meeting for the proposals or at least their objectives. Several delegates considered, however, that no adequate solution would be found to the market situation in tungsten without the participation of all major producers, including those who are not members of the *ad hoc* Committee. Some delegates pointed out that arrangements of the nature outlined introduced serious difficulties for their Governments as regards principle, trading policy and productivity.

194. It was decided that for the present the *ad hoc* Committee should be maintained in its present form. As regards future activities, however, the *ad hoc* Committee decided to replace its Technical Working Group with an expanded Working Group to be determined by the Chairman, taking into account the need to ensure a balanced representation of producers and consumers. This Working Group will consider methods for dealing with the situation in tungsten and in this connexion is invited to prepare a report for consideration by member Governments before the *ad hoc* Committee's fourth session. This report will be based primarily on replies to a questionnaire to be sent to member Governments covering the following matters:

(a) Statistics on production, trade, consumption and stocks of tungsten ores and concentrates;

(b) Views on representative price quotations for tungsten ores and concentrates and on associated market structures and mechanisms;

(c) The existence of private and public bodies concerned with research in the application of tungsten and the expansion of consumption of the product;

(d) Views on feasible and short-term inter-governmental arrangements designed to improve the international trade position of tungsten with special regard to proposal II referred to in paragraph 192 above.

WHEAT AND OTHER GRAINS

195. The International Wheat Council held its thirty-seventh session in London from 18 to 21 June 1963. It considered a provisional report on the working of the grain regulations of the European Economic Community and arranged to make a fuller review of this subject in relation to the provisions of the 1962 International Wheat Agreement at a later session. The Council heard a statement from the United States representative regarding the implications of the vote in the recent wheat referendum. He confirmed that the United States would continue to play its full part in achieving the objectives of the Agreement especially with regard to prices. The United Kingdom representative made a statement on the proposed changes in British policy with regard to wheat and other cereals.

196. At its thirty-eighth session, held in London from 19 to 26 November 1963, the International Wheat Council, after reviewing the performance of member countries during the crop year 1962-1963, concluded that exporting member countries had fulfilled their obligation under the Agreement to make sufficient supplies available to importing member countries within the price range, and agreed that each importing country (apart from one country whose figures require further examination) had fulfilled its undertaking to buy from the exporting member countries not less than the percentage of its total commercial purchases specified in the Agreement.

TRADE IN WHEAT AND WHEAT FLOUR BY MEMBER COUNTRIES OF
THE INTERNATIONAL WHEAT AGREEMENT
(1959-1960 to 1962-1963)

Distribution of trade	1959- 1960 (million tons)	1960- 1961 (million tons)	1961- 1962 (million tons)	1962- 1963 ^a (million tons)
<i>Commercial transactions</i>				
Between member countries	16.3	18.2	19.7	16.2
With non-member countries	4.2	7.0	5.4	6.8

TOTAL, commercial and special transactions	30.7	39.0	41.3	39.4

SOURCE: International Wheat Council.

^a Includes the USSR as a member exporter.

197. Out of a global total of 43 million tons, trade in wheat and wheat flour in which members of the Agreement participated declined to 39.4 million tons in 1962-1963 from 41.3 million tons in 1961-1962 (see above table). The apparent decline of 1.9 million tons becomes twice as large when account is taken of the inclusion of the Soviet Union as a member country for the first time in 1962-1963. The decline reflects a reduction in commercial transactions between member countries, which fell from a relatively high level of 19.7 million tons in 1961-1962 to 16.2 million tons in 1962-1963, mainly as a result of larger domestic crops in Western Europe. Commercial transactions between member and non-member countries which increased from 5.4 to 6.8 million tons reflected larger commercial transactions with Mainland China and Eastern European countries. The volume of special transactions continued at the same high level in 1962-1963 as in 1961-1962, an increase between member countries— notably increased exports to India and Cuba—offsetting a decline between member and non-member countries.

198. Also at its thirty-eighth session the Council held its fifth review of the world wheat situation. Important elements in this review were the special studies of the market for wheat in Mainland China and of the working of the EEC grain regulations during their first year of operation. At the same time it considered applications from Italy and the Soviet Union for relief from their obligations as exporting countries for the 1963-1964 crop year. Pending the provision of further information, the Council delegated the matter to its Executive Committee for further examination and decision.

199. The Council noted that world wheat production (excluding Mainland China) in 1963-1964 was provisionally estimated at 215 million tons, about 19 million tons below the 1962-1963 record. A sharp decline in production in the Soviet Union, Eastern and Western Europe was partially offset by larger crops in North America, particularly in Canada. It was estimated that world trade in 1963-1964 would rise to about 50 million tons, about 2.5 million tons above the previous record of 1961-1962 and 7 million tons above the level of 1962-1963. This large increase in trade is due primarily

to heavy purchases made by the Soviet Union, normally a substantial exporter, but also reflects the increased requirements of western Europe and Japan.

200. The Council noted that although total supplies of wheat in four major exporting countries, Canada, United States, Argentina and Australia, were expected to be larger, carry-over stocks could very well decline (as a result of the expansion of trade) from 52 million tons to 44 million tons, a volume smaller than at any time since the beginning of the 1953-1954 season. The Council noted that these developments might have their effects extending beyond the current year, but was of the opinion that they did not in themselves signify a reversal of the long-term trends underlying the wheat situation for many years past.

201. The findings of the Council with regard to wheat confirmed those of the FAO Group on Grains which had met earlier in July 1963. Having reviewed the world situation and short-term outlook for the various types of wheat and coarse grains as well as trends and longer-term prospects, the Group felt that the basic factors responsible for the continuing imbalance in world grain markets in the main continued in operation but noted a growing desire among Governments for action to deal effectively with some of the causes of the disequilibrium. At the same time the Group drew up a list of technical and economic questions in need of further study in relation to any international scheme for coarse grains.⁵⁷

202. The FAO Group met again from 14 to 20 May 1964 when, among other matters, it gave attention to the question of national grains policies in relation to FAO guiding principles of national agricultural price stabilization and support policies, as well as various inter-governmental consultations and actions in the field of grains. At the same time the Group reviewed the current situation and short-term outlook, noting that while a major increase in the volume of international trade in grains had taken place in 1963-1964, international prices of both wheat and coarse grains which had been advancing in the second half of 1963 had weakened more recently.

203. The meeting of the FAO Group had been preceded by a joint meeting with the FAO Consultative Committee on the Economic Aspects of Rice which had reviewed the world situation of cereals and the interrelationship between grains and rice in international trade. An important feature which the joint meeting brought to light was a long-term tendency for the price of wheat to fall relative to that of rice in international markets to the point that commercial prices of wheat were halved in terms of rice over the last half century. A changing pattern of international trade might emerge from the fact that wheat flour is now cheaper to import than rice, and several countries were showing a preference for wheat imports.

204. Prior to the joint session the FAO Consultative Committee had held a meeting from 4 to 11 May 1964, when among other matters it had considered recent regional rice policies and the scope for expanding international trade in rice, possibly under formal trade arrangements between exporters and importers, particularly on a regional basis. The FAO Committee had also considered a project for an International Rice

⁵⁷ Since published in *FAO Commodity Policy Studies, No. 14, "The Stabilization of World Trade in Coarse Grains"*.

Year and had reviewed the current situation. It noted that the volume and value of international trade in rice in 1964 should remain well above the average of recent years, since world import demand was being sustained by a tendency for output to lag behind the

growth of consumption and reserve stocks were still inadequate. Contract prices between Governments for cheaper grades of rice had risen moderately, prices in private trade were expected to average last year's levels and those for round-grain rice had advanced.

ANNEX I

International Cocoa Agreement—negotiation	26 September-24 October 1963, Geneva		

^a In earlier years four inter-governmental conferences concerned with the negotiation of an agreement for wheat were held in March-April 1947 (London), January-March 1948 (Washington), January-March 1949 (Washington) and April 1953 (Washington). An agreement entered into force in 1949.

It was followed by another agreement in 1953.

^b Between first and second sessions, a Preparatory Committee met from 11 to 21 November and a Technical Committee from 18 to 20 November 1958, both in London.

TABLE 2. DURATION OF INTER-GOVERNMENTAL COMMODITY AGREEMENTS, 1949 TO 1962

Commodity (terminal date of Conference)	Date of entry into force	Duration of agreement	
<i>Wheat Agreements</i>			
23 March 1949 ^a	1 August 1949	4 years	
13 April 1953 ^a	1 August 1953	3 years

	(mainly producing)	(mainly importing)				
<i>Olive oil</i>						
1955	9	2	11	d	d	d
1963	7	4	11	d	d	d

^a Including two signatory countries which did not ratify the Agreement.

^b Excluding one country which has become independent since the Agreement came into force, and has still to notify its assumption of the rights and obligations of the Agreement.

^c No executive committee, but the Council has always followed the practice of appoint-

ing an equal number of representatives of consuming and producing countries to its subsidiary bodies.

^d With the Council numbering less than eighteen, the executive committee is composed of three fifths and two fifths respectively of mainly producing and mainly importing countries.

ANNEX 4

INTERNATIONAL COFFEE COUNCIL

Membership. Vote distribution as approved by Council on 20 November 1963

[22 July 1964]

The Economic and Social Council,

Having considered the Final Act and the Report of the United Nations Conference on Trade and Development (E/CONF.46/L.28 and Add.1),

Recognizing the importance of the economic development of the developing countries for the expansion of the world economy and the maintenance of international peace and security,

Realizing that economic and social progress throughout the world depends in a large measure on a dynamic growth of the trade of the developing countries particularly and of international trade as a whole,

Believing that adequate international machinery in the field of trade and development is essential for the accelerated growth of the developing countries and the expansion of the world economy,

Convinced that the United Nations Conference on Trade and Development marks the beginning of a new era in the evolution of international co-operation in the field of trade and development,

1. *Takes note with satisfaction* of the Final Act and of the Report of the United Nations Conference on Trade and Development;

2. *Expresses the belief* that the Conference is an important step towards a new and dynamic international trade and development policy;

3. *Notes the determination* expressed in the Final Act by States participating in the Conference to do their utmost to lay the foundations for a better world economic order and calls upon Governments to consider implementing the recommendations of the Conference in the various fields of their national and international programmes and policies;

4. *Resolves* to take into consideration the recommendations of the Conference so far as they relate to the work of the Council;

5. *Invites* the specialized agencies to take into account the recommendations of the Conference in preparing their work programmes;

6. *Transmits* the Final Act and the Report of the United Nations Conference on Trade and Development to the General Assembly at its nineteenth session for further action.

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1011(XXXVII). United Nations Conference on Trade and Development

The Economic and Social Council,

Having considered the Final Act and the report of the United Nations Conference on Trade and Development,⁵⁸

Recognizing the importance of the economic development of the developing countries for the expansion of the world economy and the maintenance of international peace and security,

Realizing that economic and social progress throughout the world depends in a large measure on a dynamic growth of the trade of the developing countries particularly and of international trade as a whole,

Believing that adequate international machinery in the field of trade and development is essential for the accelerated growth of the developing countries and the expansion of the world economy,

Convinced that the United Nations Conference on Trade and Development marks the beginning of a new era in the evolution of international co-operation in the field of trade and development,

1. *Takes note with satisfaction* of the Final Act and of the report of the United Nations Conference on Trade and Development;

2. *Expresses the belief* that the Conference is an important step towards a new and dynamic international trade and development policy;

3. *Notes the determination* expressed in the Final Act by States participating in the Conference to do their utmost to lay the foundations for a better world economic order;⁵⁹ and suggests that Governments, in accordance with the Final Act, consider taking further action on the recommendations of the Conference in the various fields of their national and international programmes;

4. *Resolves* to take into consideration the recommendations of the Conference so far as they relate to the work of the Council;

5. *Invites* the specialized agencies to take into account the recommendations of the Conference in preparing their work programmes;

6. *Transmits* the Final Act and the report of the United Nations Conference on Trade and Development to the General Assembly at its nineteenth session for further action.

1331st plenary meeting,
24 July 1964.

⁵⁸ E/CONF.46/139.

⁵⁹ *Ibid.*, Final Act of the Conference, para. 9.

DOCUMENT E/3880

Multiplicity of resolutions: report of the Secretary-General

[Original text: English]
[25 June 1964]

1. In its resolution 988 (XXXVI) the Economic and Social Council requested the Secretary-General "to examine the problems arising from the multiplicity of resolutions on economic, social and human rights subjects and to suggest methods for dealing with these problems, including the preparation of an annotated index or a compendium of resolutions on economic, social and human rights questions adopted by the General Assembly and the Economic and Social Council". The Secretary-General was asked to report to the Council at its 1964 session.

2. In the present document, the Secretary-General has confined himself to considering the specific methods for dealing with the problems arising from the multiplicity of resolutions referred to in the resolution, namely the preparation of an annotated index or compendium of resolutions adopted by the General Assembly and the Economic and Social Council. He has not attempted either to consider these problems in their wider aspects or to take account of similar problems facing other bodies. It should be borne in mind, however, that the subject has been raised in other organs, including certain subsidiary organs of the Council itself (e.g. the Economic Commission for Europe, which at its nineteenth session, in resolution 4 (XIX),¹ requested the Executive Secretary to prepare a compendium of its resolutions).

3. In view of the potential magnitude of an undertaking involving the 993 resolutions already adopted by the Council and the 468 resolutions adopted so far by the General Assembly on the recommendations of its Second and Third Committees, it was decided that it would be well to begin by preparing, as a pilot project:

(a) A compendium with three indexes, by subject, date and organ, of resolutions or extracts from resolutions on two selected topics; and

(b) Annotated indexes on the same topics.

4. It was felt that this exercise would serve to show the relative usefulness of the two forms of guide to resolutions and that it would also provide the basis for an estimate of the staff and time required for each of them.

5. The following topics, which are relatively self-contained and appear regularly on the Council's agenda, were selected for the pilot project:

(a) Community development, land reform and co-operatives, and

(b) Advancement of the status of women.

The result was two compendiums representing together approximately 160 standard pages and two annotated indexes amounting to about forty standard pages. The distribution to the Council in three languages of this additional volume of documentation was not attempted because of the workload involved.

6. The draft framework of functional classifications given in the twenty-ninth report of the Administrative Committee on Co-ordination (E/3886 and Add.1, annex I) lists the thirty-four groups of economic, social and human rights activities in which the United Nations is engaged. Taking this list as a basis, and bearing in mind, on the one hand, that some of the titles in it in fact cover two or more subjects and, on the other hand, that it does not include such subjects as co-ordination and the organization of technical co-operation programmes which account for a growing body of resolutions, it would seem reasonable to estimate that a complete compendium might be some twenty times the size of the pilot compendiums, or about 3,200 standard pages. Even this may be an under-estimate as many resolutions in the economic and social fields refer to a variety of questions very intimately related; to avoid arbitrariness, therefore, it would often be necessary

¹ See *Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 7, part III.*

to enter the same resolutions several times under various headings in the compendium and heavy reliance on cross referencing would not altogether obviate this need.

7. It thus appears that the preparation of a compendium of Council and General Assembly resolutions would be a major undertaking requiring special provision of staff time and financial resources estimated at \$70,000, not including the resources which would be needed on a continuing basis to keep the compendium up to date. Should such a compendium be produced, it is not certain that its use would greatly facilitate the research which delegations now find necessary in order to discover what resolutions have already been adopted on the particular subjects with which they may be concerned.

8. It might be suggested that an abridged compendium containing only resolutions or extracts from resolutions that are still valid or of continuing interest might be attempted; preparation of such an abridged compendium would, however, require interpretations and judgements which it might often be difficult for the Secretariat to make and which, in any case, would tend to be somewhat arbitrary as it can seldom be definitely said that one resolution supersedes another or makes it obsolete.

9. The Secretary-General would, therefore, like to have the guidance of the Council as to whether an annotated index would meet its needs. An annotated index would be both more economical to produce and

easier to use — although the collection of resolutions, as they are published year after year as a supplement to the Official Records of the General Assembly and the Economic and Social Council would have to be used in conjunction with it. It would also be easier and more economical to keep up to date.

10. For the information of the Council, the Secretary-General would like to mention that plans have been made for the issuance in 1966 of an annotated index of all resolutions adopted by the General Assembly from the first to the eighteenth session. This is to be followed in later years by similar indexes for the Economic and Social Council, the Security Council and the Trusteeship Council. In view of the importance attached also to Council resolutions, it could be envisaged to prepare the annotated index of the resolutions of the Economic and Social Council, from its first to thirty-sixth sessions, also for issuance towards the middle of 1966 in English, to be followed by other languages. This would require that provision be made within the 1965 budget for an amount estimated at \$18,000 to cover additional staff costs, and in 1966 for an amount of \$13,000 for staff and reproduction costs. It is felt that these annotated indexes, which would consist of a numerical list of resolutions and of an analytical subject index arranged alphabetically, would meet the immediate needs expressed by the Council in its resolution 988 (XXXVI). Furthermore, since the plans in question provide for the continuation of indexes on an annual basis (with five or ten year cumulations) their updating is assured.

II. Communication of the Administrative Committee on Co-ordination to the Advisory Committee on the Application of Science and Technology to Development	27
III. Co-operation in activities relating to the peaceful uses of atomic energy	35

I. Introduction

1. The Administrative Committee on Co-ordination (ACC) met at the headquarters of the United Nations Educational, Scientific and Cultural Organization, Paris, on 28 and 29 April 1964, under the chairmanship of the Secretary-General of the United Nations. Present at these meetings were the executive heads of the International Labour Organization (ILO), the Food and Agriculture Organization of the United Nations (FAO), the United Nations Educational, Scientific and Cultural Organization (UNESCO), the International Civil Aviation Organization (ICAO), the International Bank for Reconstruction and Development (IBRD) (including the International Finance Corporation (IFC) and the International Development Association (IDA)), the World Health Organization (WHO), the Universal Postal Union (UPU), the International Telecom-

munication Union (ITU), the World Meteorological Organization (WMO), the Inter-Governmental Maritime Consultative Organization (IMCO) and the International Atomic Energy Agency (IAEA) and a representative of the Managing Director of the International Monetary Fund (IMF).

2. The Managing Director of the United Nations Special Fund, the Executive Chairman of the Technical Assistance Board (TAB), the Executive Director of the United Nations Children's Fund (UNICEF), the Executive Director of the World Food Programme and other high officials of the United Nations and related organizations were also present.

3. In the course of a review of developments affecting co-ordination in the work of various organizations, the President of the IBRD referred to the recent agreements which the IBRD has entered into with UNESCO and FAO. These agreements, which call for a close assoc-

iation by IBRD with the two agencies to study and accelerate the financing of projects in technical education and agriculture, were, he considered, examples of good co-operation between members of the United Nations family. He added that conversations are presently going on to survey the possibility of having an arrangement with ILO to undertake programmes in the field of training which are within the scope of ILO.

4. The President of the IBRD also expressed appreciation of the assistance rendered by the United Nations through the regional economic commissions in making available to the IBRD facilities for meetings in Geneva, Santiago, Addis Ababa and Bangkok to discuss and explore with legal and governmental representatives of member countries of the IBRD, the possibility of establishing an entity for conciliation and arbitration to assist in the settlement of disputes between Governments and private investors. The IBRD feels strongly that the creation of such an entity could be of assistance to the flow of capital for development.

5. The representative of the Managing Director of the IMF informed the ACC of the creation of the Per Jacobsson Foundation, under the joint sponsorship of the IMF and the Bank for International Settlements, to finance a series of lectures in those fields of study in which the late Managing Director of the IMF had made his major contribution.

6. The Deputy Commissioner General of the United Nations Relief and Work Agency for Palestine Refugees offered to make available to other agencies its experience which, in such fields as hunger, disease and ignorance, might be of particular current interest, and expressed the hope that his agency might in future be more closely associated with the work of ACC.

7. Statements made by the Executive Directors of UNICEF and the World Food Programme are summarized later in this report (paras. 138-143).

II. Relations between the Administrative Committee on Co-ordination and the Economic and Social Council

8. In operative paragraph 1 of Council resolution 992 (XXXVI), the ACC was requested

“to study the possibilities for further enhancing its contribution to the work of the Council, by strengthening its secretariat, including the possibility of secondment of staff by the various organisations of the United Nations working together in the Administrative Committee on Co-ordination, and to report to the Council at its 1964 session on the results and to suggest in what manner the Council might assist in carrying out any necessary measures to this end”.

9. The Secretary-General has informed the ACC of the steps taken or proposed to strengthen somewhat its secretariat, both at United Nations Headquarters and at Geneva, to meet the constant increase in the range and volume of its work. The Committee intends to continue and develop the existing practice of mobilizing the assistance of different organizations to prepare

material, to make initial drafts for the ACC or the Council in respect of subjects in which these organizations have a special competence, and to provide the secretarial services for particular working groups. By this means, it should be possible to keep the secretariat of the ACC quite small. The loan of substantive staff by one Agency to another which has been increasingly practised recently has been found helpful in facilitating inter-agency co-ordination in particular fields and is more likely to be feasible than secondment direct to the ACC secretariat. If and when such secondment seems necessary, however, every effort will be made to arrange it.

10. A number of other steps have also been taken to improve the smooth functioning of the ACC machinery and thus help to enhance the ACC's contribution to the Council. These measures relate mainly to the servicing of the ACC and its Preparatory Committee, the timing of meetings and documentation and the relations of the ACC secretariat with the specialized agencies and IAEA. Furthermore, efforts have been made to develop more continuous and intensive inter-agency consultations on a very broad range of subjects as part of the everyday conduct of business, and apart from the occasional meetings of sub-committees and working parties.

11. In operative paragraph 2 of the Council's resolution, the Secretary-General was requested:

“as Chairman of the Administrative Committee on Co-ordination, to arrange for a meeting between the Administrative Committee on Co-ordination and the Officers of the Council and the Chairman of the Council's Co-ordination Committee to discuss practical and effective means to bring about a closer relationship between the two bodies”.

To give effect to this provision, the Secretary-General has been requested by his colleagues to invite the Officers of the Council and the Chairman of the Co-ordination Committee, to meet with the ACC at the thirty-seventh session of the Council if possible before the Council undertakes the general review of the economic, social and human rights activities of the United Nations system. Great importance is attached by the ACC to making this forthcoming meeting as fruitful as possible and it is hoped that the meeting will provide an opportunity for a full consultation on important current issues within the Council's purview which affect the United Nations family.

III. United Nations Development Decade

(a) PROGRESS REPORT 1965

12. Arrangements were made for close consultations between the United Nations Secretariat and all agencies concerned in the preparations of the progress report on the United Nations Development Decade which, under resolutions 916 (XXXIV) and 984 (XXXVI) of the Council, is to be submitted by the Secretary-General in time for the Council's summer session in 1965. This

progress report is conceived as a contribution to the International Co-operation Year and is to be prepared in the form of "a consolidated report, with special emphasis on those areas of activity which are of primary importance for the attainment of the objectives of the United Nations Development Decade, the inter-relationship within these areas of the programmes and activities of the United Nations family of organizations and on their combined impact".

13. In addition to the consolidated report on action undertaken by the United Nations family, it is contemplated that the policies directed in different parts of the world towards the economic objectives of the Decade, and the results achieved, would be the subject of the first part of the 1965 issue of the *World Economic Survey*. A corresponding study of plans and achievements in the social field would be contained in the *Report on the World Social Situation* to be furnished by the Secretary-General under General Assembly resolution 1916 (XVIII). It is also hoped that on the basis of the material contained in these various documents, it may be possible to prepare and issue next year a short popular account of the achievements of the Decade to date.

(b) DRAFT FRAMEWORK OF FUNCTIONAL CLASSIFICATIONS

14. In response to Economic and Social Council resolution 984 (XXXVI), the ACC has prepared a draft framework of functional classifications of the activities of the United Nations, the specialized agencies and IAEA related to the Development Decade (annex I below). This framework is based, in part, on that used in 1962² and in 1963.³ It is recognized that any framework of this sort is bound to be somewhat arbitrary and subject to revision in the light of experience as programmes and priorities change. Some of the limitations on the current draft are set forth in its foreword, and it is naturally not intended to replace the classification used by agencies in reporting to their own governing bodies for budgetary or other purposes. In view of the differing nature of the responsibilities of the organizations, as well as of their methods of operation, a classification of all their activities would be encyclopaedic and hence unwieldy and unusable for the purposes contemplated by resolution 984 (XXXVI). It is believed that the current proposal will, if it is approved in principle by the Council, enable the activity of the United Nations system under the Development Decade to be put into its "proper perspective of functional classifications" as contemplated by that resolution.

(c) UNITED NATIONS INSTITUTE FOR TRAINING AND RESEARCH

15. Last year the Secretary-General consulted with his colleagues of the ACC concerning the United Nations

² See *The United Nations Development Decade: Proposals for action* (United Nations publication, Sales No.: 62.II.B.2).

³ See *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes*, agenda items 4 and 6, document E/3788.

institute for training and research, on the feasibility and desirability of which he had been called upon by the General Assembly to report to the Council. The Council later endorsed the broad lines of his plans for the institute and the General Assembly, by resolution 1934 (XVIII), requested him to proceed to the establishment of the institute on the lines proposed. The ACC has now been informed of his current efforts to raise voluntary funds, from governmental and private sources, for the institute, which can be brought into existence only if the necessary financial support is forthcoming. Note was taken of the Secretary-General's information brochure issued on February 1964 which indicates tentatively the Secretary-General's thinking concerning the institute's possible programme, organization and budget.

16. The members of the ACC have recognized from the outset the importance of the contribution the institute might make and look forward to its early establishment. They welcome the Secretary-General's assurance that the institute will seek to develop and maintain close relations with the specialized agencies and the IAEA, to which its facilities for research, study and consultation, as well as for training, will be available. They are also glad to note that provisions will be made for appropriate consultation between the director of the institute and the directors of the other institutes which have been or are being established within the United Nations system. They look forward to further consultations with the Secretary-General as the project develops. It is important, in their view, that such consultations should be developed at the earliest stage, while the institute's programme and organizational arrangements are still in the process of formulation.

(d) WORLD CAMPAIGN AGAINST HUNGER, DISEASE AND IGNORANCE

17. The ACC welcomed the opportunity to discuss the action that might best be taken by the members of the United Nations family in response to resolution 1943 (XVIII) of the General Assembly on a world campaign against hunger, disease and ignorance. The Secretary-General had invited the views of Governments and non-governmental organizations as well as of specialized agencies on this matter and, in reporting to the Council on the feasibility of the proposed world campaign, he will naturally be guided by the replies that may be received. If the campaign is to be launched, it must clearly have good prospects of success, and such prospects would not exist unless there were quite positive replies from many Governments and many important non-governmental organizations, and unless the Governments were willing to co-operate with the non-governmental organizations in organizing the national campaigns. There are two further conditions, the Committee noted, that would certainly have to be met. The first of these is adequate financial provision to enable the United Nations itself and the specialized agencies concerned to make their appropriate contribution; the second is the assurance of really close co-operative arrangements among the United Nations

(including UNICEF) and the specialized agencies directly concerned, namely FAO, WHO, UNESCO and ILO.

18. The last consideration prompted the ACC to urge that, should such a new world campaign be undertaken, everything be done to build it around existing structures, adapted and expanded as necessary, and to use the machinery available to all of the specialized agencies concerned in their respective fields. In this connexion, the Secretary-General indicated his appreciation of the offer of the Director General of FAO to place at the disposal of the world campaign the experience, the machinery and the resources which have been built up in connexion with the Freedom from Hunger Campaign. It was noted that the Freedom from Hunger Campaign while concentrating on the major aspect of hunger, had co-operation and support from the other specialized agencies to the extent feasible. WHO, UNESCO, ILO and UNICEF similarly had relations with non-governmental organizations in their respective fields. It was also pointed out that the title of the new campaign would require careful consideration in order that the momentum of public interest created by existing campaigns in the fields covered is not lost.

19. In conclusion, the ACC would like to point out that, in mobilizing public opinion and public effort, non-governmental organizations have a significant role to play apart from what governments can do, and the General Assembly resolution is clearly designed to ensure that governmental efforts are fully backed by such public initiatives. At the same time, it should be recognized that no action on the part of voluntary agencies, non-governmental organizations or private groups can be a substitute for government action, or be successfully undertaken without governmental support. It wishes also to note that certain difficulties have arisen from the General Assembly resolution which might have been avoided had there been prior consultation with the specialized agencies concerned.

(e) WORLD CAMPAIGN FOR UNIVERSAL LITERACY

20. Under General Assembly resolution 1937 (XVIII), the Secretary-General has been invited "in collaboration with the Director-General of the United Nations Educational, Scientific and Cultural Organization, the Managing Director of the Special Fund, the Executive Chairman of the Technical Assistance Board and the President of the International Bank for Reconstruction and Development and its affiliates, to explore ways and means of supporting national efforts for the eradication of illiteracy through a world campaign and any other measures, if appropriate, of international co-operation and assistance, both non-financial and financial, and to submit a report thereon, together with appropriate proposals, to the General Assembly at its nineteenth session". On the occasion of the ACC session, the Secretary-General took the opportunity of consulting with the heads of these agencies and programmes referred to above about the implementation of the General Assembly resolution.

21. In the light of these consultations, the Director-General of UNESCO informed ACC that three regional meetings held under the auspices of UNESCO, as well as the Economic Commission for Asia and the Far East (ECAFE) at its twentieth session and the Economic Commission for Africa (ECA) at its sixth session had adopted strongly worded resolutions on ways and means of implementing resolution 1937 (XVIII). Furthermore, UNESCO had convened a committee of experts to take stock of the present position.

22. These meetings showed that strong motivations existed for a world-wide effort in favour of adult literacy. The time had now come for governmental action at the national, regional and international levels, which might more properly be called a "world programme" than a "world campaign" since much more than psychological and promotional work was involved. It was also clear that literacy was not regarded as an end in itself but had to be placed in the perspective of over-all development and linked with technical and vocational training.

23. He recalled that the report on the world campaign for universal literacy,⁴ which was approved by the General Conference of UNESCO at its twelfth session and transmitted to the General Assembly through the Economic and Social Council, had taken the form of an estimate of the scope and cost of a ten-year programme. It was now envisaged that a plan of action could be developed along the following lines:

(a) A progressive approach, consisting of several phases. First, an experimental phase for three years of intensive effort in a few countries; secondly, for a period of one or two years, analysis and evaluation of the results achieved during the first phase; and thirdly, an attack on the problem on a world basis.

(b) A selective approach, involving a few countries only, chosen according to specific criteria, including their expressed willingness to participate. It was proposed to select up to eight countries, and to concentrate on specific sections of the population, where suitable motivation and organization were known to exist.

(c) The budgetary aspect: it would be dangerous to raise false hopes. Adequate resources must be available if UNESCO were to launch a world programme. The experts had suggested that \$33 million would be needed for the initial three-year period, broken down as follows: \$8 million annually to assist the eight selected countries, \$2 million annually to strengthen regional training institutes, and \$1 million annually for the executing agency, i.e., UNESCO. If such a sum could be made available, UNESCO was ready to start work.

24. The Secretary-General, in welcoming this statement, expressed gratification that the Director-General of UNESCO had found it possible to work out, in the framework of the General Assembly's resolution, the outline of a concrete programme in harmony with the objectives of the Development Decade, which might be undertaken at a cost adapted to reasonable expecta-

⁴ E/3771 and Corr.1 and 2.

tions of the international resources that may be available. The Managing Director of the Special Fund was gratified that emphasis was now being placed on types of projects directly aimed at speeding development through programmes of adult literacy. He pointed out that the Special Fund could act only on high priority requests from Governments and could consider only projects to which Governments were willing to provide substantial support. He was ready personally to give sympathetic consideration to pilot projects meeting the above criteria. If interest in such projects to foster development were manifested by a number of Governments and if specific requests were made by them to the Special Fund, he would be prepared to raise before the Governing Council the question of the Special Fund entering this new field of activity. The Heads of the other agencies and programmes referred to in the General Assembly's resolution welcomed the statement of the Director-General of UNESCO and expressed their readiness to explore the possibilities of assistance which their respective organizations might be able to bring, at appropriate stages, to the programme, as now outlined.

IV. Expanded Programme of Technical Assistance and Special Fund

(a) REVIEW OF DEVELOPMENTS

25. The Managing Director of the Special Fund reported that 374 projects at the total cost of \$837 million had been approved by the Special Fund; \$335 million of that was being spent by the Special Fund and \$507 million by the recipient countries. The projects included 149 training institutes in sixty-eight countries and seventy-seven research institutes. He hoped that soon there would be 50,000 students enrolled in Special Fund-sponsored training institutes throughout the world. The projects were being executed by the specialized agencies with increasing efficiency and speed. The Managing Director expressed his hope that by 1965, the twentieth year of the United Nations, the Special Fund would have \$1 billion worth of projects.

26. The Executive Chairman of TAB said that the year 1963 had been one of consolidation with annual resources of \$51 million. Activities of the programme had been carried out in 122 countries and territories and over 3,000 experts had been sent on missions. The number of fellowships, however, had decreased but this was normal in the first half of the two-year programme.

27. Plans for the 1965-1966 bi-annum had been based on an estimated income of \$100 million which assumed a 10 per cent increase in voluntary contributions. The network of field offices had been extended in association with the Special Fund and the World Food Programme. There were now seventy offices with resident representatives.

28. The Executive Chairman introduced the annual report of TAB to TAC (E/3871/Rev.1) which was endorsed by the ACC.

(b) PROPOSALS FOR BRINGING TOGETHER THE SPECIAL FUND AND THE EXPANDED PROGRAMME OF TECHNICAL ASSISTANCE IN A NEW UNITED NATIONS DEVELOPMENT PROGRAMME

29. Extensive consultations were held in the latter part of 1963 and early January 1964 between the Secretary-General, the Executive Heads of the specialized agencies and IAEA, the Managing Director of the Special Fund and the Executive Chairman of TAB in connexion with the preparation of the report to be submitted by the Secretary-General under resolution 900 A (XXXIV) to the Economic and Social Council and its *ad hoc* Committee on the co-ordination of technical co-operation programmes (the *ad hoc* Committee of Ten). Such consultations were called for by the Council's resolution; they were also clearly necessary because the effective working of the United Nations technical co-operation programmes depends on the full and active participation of all the organizations concerned. The ACC is glad to record that on a matter of such major concern to each of the participating organizations, agreement was reached on the advantages of a merger of the Special Fund and the Expanded Programme of Technical Assistance (EPTA) at the inter-governmental, inter-agency and management levels, as well as on a series of proposals relating to the arrangements required. This agreement had been reached among the organizations, as noted by the *ad hoc* Committee in its report, "within the policies and guide-lines laid down by their own legislative bodies and constitutions" (E/3862, para.12). It was provided that further consultations would be held later on certain points of detail.

30. When the *ad hoc* Committee of Ten met in February 1964, these agreed proposals, embodied in part I of the report of the Secretary-General (E/3850), were supported by all the representatives of the participating organizations attending, as well as by the Managing Director of the Special Fund and the representative of the Executive Chairman of the TAB. In the resolution which it adopted on the subject (E/3862, para. 39), the *ad hoc* Committee expressed its conviction that the Secretary-General's proposals for bringing together the Special Fund and the Expanded Programme in a new development programme, "would go a long way in streamlining the activities carried on separately and jointly by EPTA and the Special Fund, simplify organizational arrangements and procedures, facilitate overall planning and needed co-ordination of the several types of technical co-operation programmes carried on within the United Nations system of organizations and increase their effectiveness". It added that "a reorganization is necessary to provide a more solid basis for the future growth and evolution of the assistance programmes of the United Nations system of organizations financed from voluntary contributions"; and it recommended — as the Secretary-General had proposed — that the special characteristics and operations of the two programmes as well as two separate funds would be maintained, and that contributions might be pledged to the two programmes separately as hitherto; also that the principles, procedures and

provisions governing EPTA and the Special Fund not inconsistent with this resolution should be reaffirmed.

31. The *ad hoc* Committee's specific recommendations regarding reorganization at the inter-governmental, inter-agency and management levels are, however, far more succinct than those contained in the agreed text presented by the Secretary-General. In some respects they appear to differ from some of the policies and guidelines laid down by inter-governmental legislative bodies of certain of the participating organizations. Some of the matters to which no reference is made in the *ad hoc* Committee's text are, in the ACC's opinion, of such importance to the successful working of the proposed United Nations development programme that they should, indeed must, be expressly stated in order to avoid any possibility of misunderstanding. In particular, the ACC trusts that the Council will endorse the following mutually complementary recommendations based on the Secretary-General's report:

(a) First, certain sentences contained in paragraph 11. It is there recommended that the Inter-governmental Committee (which has become the "Governing Council" in the *ad hoc* Committee's resolution) should exercise its functions "without prejudice to the responsibilities exercised by the governing organs of the specialized agencies and IAEA in their respective fields, and with the full participation of representatives of those agencies in accordance with the Charter, the relationship agreements and the Rules of Procedure of the Economic and Social Council. The appropriate organs of the participating organizations would be expected to continue to review the technical aspects of the programmes for which the organizations assume responsibility."

(b) Secondly, as regards paragraph 13 of the Secretary-General's report, that the Inter-Agency Advisory Board should "provide for the full participation [of its members] in the process of decision- and policy-making", and that the Board would meet "as often and for such periods as might be necessary to ensure that all aspects of the Programme and other relevant activities of the United Nations family were kept under continuous review".

(c) Thirdly, as regards paragraph 14, that before recommending for approval general policies for the programme as a whole or programmes and projects requested by Governments, the head of the programme would consult with the Board and would convey its views to the Governing Council, with any comments he may wish to make; and that the Board would similarly be fully consulted on the appointment of, and general policy relating to, field representatives. The Committee believes that a provision of this nature would assist the head of the programme in carrying out his task and regards such a provision as essential to secure the full co-operation of all the organizations on whose whole-hearted participation and technical contribution the success of the programme and its future development depend.

32. As regards the management of the programme, the wording of the recommendations of the *ad hoc*

Committee would, in the ACC's view, need some adjustment in order to achieve the aims which the executive heads of the United Nations organizations had in mind and which clearly motivated the *ad hoc* Committee itself. It is clear that the *ad hoc* Committee, in the interest of the best service to the developing countries, wished to maintain the separate identity of the programmes, while bringing about the greatest possible measure of administrative integration between them in order to ensure over-all planning and co-ordination and maximum efficiency. The Secretary-General has explained that he is committed to the same objectives, but considers that these would be better achieved by designating a head of the programme and a co-head as proposed in paragraph 14 of his report. The Secretary-General feels that this arrangement would at the same time ensure, the unity of direction which is so essential to effective operation. The ACC concurs in this view.

33. The overriding concern of all members of ACC is so to organize the operations of the United Nations family in the economic and social field that it will be well-prepared and in a position to meet its growing responsibilities for assisting the developing nations in speeding their development.

V. Evaluation of programmes

34. Economic and Social Council resolution 991 (XXXVI) requested the ACC to give further consideration to certain problems relating to evaluation and to report on the results of its consideration of this request to the 1964 session of the Council. The resolution distinguished clearly between (a) efficiency of operations; (b) technical soundness of programmes and methods; and (c) over-all impact on the development of a given country. The Council recognized that items (a) and (b) were the concern of the agencies concerned and requested them to intensify their efforts in evaluating efficiency of operations and technical soundness of programmes. This is a continuing process involving both the governing bodies and the secretariats who are aware of these needs and are intensifying their efforts on the lines mentioned.

35. The ACC was requested to address itself to paragraph 5 of the resolution, item (c), and therefore in its present report confined itself to the question of evaluating the over-all impact—the measurement of results—of the combined United Nations programmes on the development of a given country.

36. The discussions of ACC have served to underline the stress already placed by the Council in resolution 991 (XXXVI) on the fact that an evaluation of the developmental impact of United Nations programmes "can be achieved only on the basis of systematic efforts at evaluation by the Governments of these countries". This task is indeed challenging. Very few, if any, of either the under-developed or developed countries have yet succeeded in measuring with any satisfactory degree of precision the over-all developmental impacts of given programmes or given policies.

37. The ACC believes that a proper evaluation of the total developmental impact of United Nations programmes can be meaningful only in the context of the impact of the total resources at the disposal of Governments, including resources provided by bilateral programmes. In spite of this, however, the United Nations can make important contributions towards such over-all evaluations. In fact, much of the general advice which the United Nations family is giving, upon their request, to a number of countries on the formulation and implementation of development plans and policies, either over-all or in given sectors, involves precisely assistance with such an evaluation, with an emphasis on lessons for the future and improvements in policies and arrangements.

38. It is with such considerations in mind that the ACC presents its suggestions and the results of its consideration to the Council.

Problems of measuring the development impact of United Nations programmes

39. All Governments requesting assistance under the various programmes of the United Nations family have had to make judgements upon the probable value of each project before deciding to ask for it, and, in this way, all those which have been receiving assistance for some time have gained considerable experience in assessing the value of projects. Moreover, through matching counterpart expenditures, Governments back these judgements with their own resources. They have also had, from time to time, to reconsider projects in operation, with a view to seeing whether they should ask for their continuation, their extension or their modification. Thus all the countries involved have had to make some kind of evaluation of projects in action, even though it might often have been only on the basis of personal opinion and also of broad political judgements rather than on the grounds of precise studies and careful calculation. On the other hand, very few, if any of them, have attempted any evaluation of the over-all impact of the programmes.

40. When considering any evaluation by recipient Governments of the impact of the programmes of the United Nations and its related organizations, as proposed in Economic and Social Council resolution 991 (XXXVI), it must first be noted that the facilities available to Governments for that purpose vary greatly. The majority of recipient countries, indeed all of them, with perhaps two or three exceptions, are seriously short of manpower in the professional ranks of their civil service, while facilities for the collection of statistics, where reasonably adequate, are heavily taxed by urgent requirements. Any evaluation of the kind proposed in this resolution would be a very time-consuming and costly task, if results of value are to be obtained and, in addition, would call for highly skilled, experienced, well-trained men to carry it out. Particularly the collection, preparation and analysis of the multiplicity of data needed for a full and reasonably scientific analysis of development impacts could absorb considerable resources; this might even ultimately call

for computer analysis. To request, therefore, a full and careful evaluation of the total impact of the United Nations programmes in one of these countries, by the Government alone, might be to ask for a serious diversion of precious skills from other highly important tasks. For these reasons, some rather extensive technical assistance would usually be required by the evaluating Governments. Before going into the question of the kind of assistance needed, it may be useful to raise certain other questions.

41. Since resolution 991 (XXXVI) places the emphasis upon the evaluation of the over-all impact of the programmes, one must consider some difficulties which are inherent in an impact evaluation, in itself and in the best of circumstances, as distinct from the difficulties which might face recipient Governments, in practice, in making evaluations of this kind.

42. For the reasons which follow, it would seem that no over-all evaluation of the impact of the United Nations programmes on the economic, social and related fields can be expected to lead to precise results, in the sense that no financial or other statistical figures can be given in this respect, nor can any other precise measure of their impact be established. This statement is valid for any attempt at such an evaluation, no matter what skills are used, how much time may be devoted to it and how complete is the access to the relevant facts. It is not possible to isolate the impact of the programmes from the results of other and larger influences on the development of the recipient countries; and there are other serious problems of which one is that one of the most useful services rendered by experts of the United Nations group of organizations consists in advising against suggested actions, often quite informally and when they are first mooted. There is clearly no possibility of measuring the impact of such services, since it consists in the avoidance of the losses and waste of resources which would have occurred if the negative advice had not prevented the ill-conceived project or policy. However, this is not to say that an objective and reasonably accurate commentary upon the value of the impact of the programmes cannot be given by persons to whom all the relevant facts are available, and who have the experience and judgement required for the task.

43. It must also be recalled that the national efforts of practically all the lower-income countries towards their own advancement are several times, perhaps many times greater, when measured in terms either of money or of manpower, than the total efforts of all foreign assistance, bilateral and international, combined. For example, the total incomes of the countries to which EPTA is giving assistance is well over \$100,000 million per year. As against this, EPTA is planning at the moment on giving assistance at the rate of \$50 million per year, or less than half the one-thousandth part. If one adds the total cost of all the technical assistance programmes of all the organizations which are at present under consideration, the relative cash value of the combined assistance still remains small; the total value for 1964, including all activities of the Special Fund, is estimated

at only one third of 1 per cent of the total resources of the assisted countries. The essential value of these programmes is that they provide advice which leads to the better use of available funds, capital goods and manpower, and that they provide training which enables the recipient countries to increase their gross national products and advance their social systems through their own efforts. In certain cases, especially with Special Fund activities, they also lead to the provision of foreign capital, but this also is for the development of existing resources, including the better use of manpower.

44. Evaluation would raise special problems in the case of the financial agencies, in view, *inter alia*, of the confidential nature of many of the data. In this report, therefore, their activities are not being included in the ACC's consideration of the question. However, it may be noted that even in the case of the comparatively large loans made by the financial specialized agencies, the amount is small compared with the total capital assets of the countries concerned, and their importance derives from the fact that they are used at key points for which foreign exchange would not otherwise be available.

45. In short, trying to evaluate the impact of United Nations projects, even in the economic sphere, is really trying to judge the effectiveness of a trigger mechanism; the results made possible are not in proportion to the mechanism itself, and no measure of these results, however precise, is a true measure of the isolated value of the trigger.

46. There are certain exceptions to this. It is sometimes possible to say, with some confidence, that a particular development would not have taken place at all were it not for international assistance. This is the case, for example, with many projects of the Special Fund and of the World Food Programme, even though the main effort in these projects usually comes from the Government itself. It may also be safely said that certain large-scale projects for malaria eradication could never have been undertaken but for technical assistance given by WHO. In such cases, there is also the measurable result of the number of persons who are freed from the danger of infection, a result which has important economic consequences although it also has more direct social ones. The "impact" consists in making something possible which could not otherwise have been done.

47. However, in spite of these examples, it is usually no easy task to distinguish between results arising from multilateral aid and results flowing from other origins, and it may be added here that the problem is made all the more difficult by the existence of other important programmes of aids and this can be complicated still further in those cases in which the co-ordinated efforts of multilateral and bilateral assistance are aimed at the same targets.

48. The assessment of the role of a complex of factors on the growth of a living organism, and even more, on the development of a society, cannot be the subject of rigidly controlled scientific experiments, carried out according to well-known rules. Many factors besides

international assistance contribute to economic development, and such assistance cannot be granted or withheld for purposes of comparison. Comparisons can only be made between the development of two countries with very similar economic structures, or between advances in one part of a country and those in other, closely alike parts of a country, although where this is feasible, conclusions of an economic nature must be drawn with considerable caution.

49. Apart from the difficulties relating to the evaluation of their impact in the economic sphere, a large part of the programmes undertaken by the United Nations and its related organizations leads to results which cannot be measured financially, as they are social rather than economic. For example, most activities in the field of education have both social and economic results and, while many of them lend themselves to fairly precise measurement by means of education statistics, this is a measure of their benefit in purely human terms; the precise economic benefit is difficult to measure, although economists have recently made considerable progress in this subject.

50. Again, although the impact of some projects can be evaluated, at least to a limited extent, there is no one convenient measure which can be applied to compare all projects with each other. It is impossible, for example, to evaluate the exact relative merits of three projects, one of which lies in the field of industrialization, another in the field of health, and the third in community development, as the main measure in one case is financial, in the second lies in health statistics and in the third lies in difficult psychological studies. Such comparisons must always be mainly a matter of judgement, since there is no system of precise measurement, which can be applied to all of them.

51. It is true that certain aspects of the programmes are suited to quantitative measurement, quite apart from any attempt to calculate their economic effects. It is possible to ascertain the proportion of fellows who have continued to be employed on tasks in which their training was of value. A chapter in the annual report of TAB to TAC for the year 1962 attempts such a statistical analysis of those EPTA fellows whose fellowships were awarded in 1958 or 1959 and who had returned home for not less than two years by 1 July 1962. The result of this exercise showed that 91 per cent of the fellows who replied were still engaged in their home countries on work related to their field of study.⁵ However, this kind of analysis is not possible in the case of the advice of experts, the provision of equipment or the provision of capital funds, although efforts can be made, and are made, by the organizations of the United Nations family, to evaluate the efficiency of their own operations of these kinds.

Approaches to evaluation

52. So far the difficulties inherent in any attempt at impact evaluation of the combined United Nations

⁵ *Official Records of the Economic and Social Council, Thirty-sixth Session, Supplement No. 5, paras. 613-615.*

programmes have been discussed. This was necessary because all these difficulties represent problems which have to be considered and solved in devising a reasonable and practicable approach to the problem. The report will now turn to the preliminary steps and to the approaches which may in time possibly help to survey the inherent problems. In doing so approaches that seem immediately practicable and useful have been stressed leaving aside such more distant possibilities as may open up, once the volume of information available has been vastly increased and its quality vastly improved, as well as the capacity of handling such information with the use of up-to-date techniques.

53. In most cases, the closest approximation to a measurement of the impact of international assistance in any sphere of human activity would be to assess the total progress made in that sphere by a given country in a certain period of time, and then to evaluate the degree to which the international programmes contributed to the final result, upon the basis of human judgement resting on the widest possible knowledge of all the relevant facts. The accuracy with which this could be done would vary greatly according to the circumstances.

54. The procedure to be followed in making the evaluations would have to be flexible, on account of the different conditions which prevail in different countries, but the general method of approach might be to select those aspects of the national life which have received substantial assistance under any of the programmes of the United Nations family. The first step would be for the Government to attempt an assessment of the progress which the country has made in each of these fields within a given period; the second step would be for them to assess the value of the contribution of the programmes to such progress. In assessing progress made in any sphere, care should of course be taken to relate results to assistance over an appropriate period of time, as these results may become apparent only progressively, and as the true value of assistance may be fairly assessed only in the light of its cumulating impact, both positive and negative, which is far from immediate. For example, an assessment can easily be made of a country's progress in the manufacture of textiles in terms of the annual value of the national product; but an evaluation of the contribution of the United Nations family to the textile industry should not ignore the value of capital furnished for a mill which is not yet in operation, nor the value of advice on productivity which has not had time to make itself fully felt in economic terms, for these two activities would undoubtedly have their "impact" in the sense which it is intended to have in the resolution. Even the fact that advice has been given and accepted should be considered, although little may yet have been done to implement it. Further, a pre-investment project of the Special Fund may undoubtedly have already made some impact of value, even though it has not yet led to any actual investment, nor even to a firm undertaking to make one.

55. In making their studies, the government officers concerned would use whatever information might be

at their disposal, including information which could properly be supplied by the organizations of the United Nations family in addition to data in government records and other material available locally. This could be supplemented by information obtained through questionnaires, first-hand observation and by interviews with officials and others who have useful personal knowledge or experience, including technical assistance experts, past and present.

56. The United Nations and the agencies are prepared to help the Governments to carry out this responsibility. They could loan planning and technical personnel, give advice on methodology, act as a clearing house for exchange of experience in different countries, and co-operate through the regional institutes of economic and social development. The secretariats of the regional economic commissions of the United Nations might be able to offer specially valuable information and assistance and almost all the other organizations of the United Nations family would also be able to contribute in their various technical fields. In this connexion, the Secretary-General has suggested in his information brochure issued in February 1964 on the United Nations Training and Research Institute that "the Institute could be of great assistance, in co-operation more particularly with the Technical Assistance Board and the Special Fund, in working out more adequate techniques for evaluating the efficiency and impact of United Nations field programmes and in arranging for actual case studies to be undertaken in agreement with the organs and countries concerned".

57. Evaluation in respect of each country would perhaps best be formed of a series of limited studies, each dealing with assistance programmes capable of evaluation by a common standard. In addition to economic standards applicable in a number of cases, economically significant, though not directly measurable, economic effects could be assessed through the use of health or literacy statistics, or more elaborate yardsticks, combining available hard facts with the indispensable measure of experienced judgement. As such limited reports would not, by themselves, yield a balanced and comprehensive view of the situation, they could with advantage be supplemented by a general assessment of that situation prepared by the Government concerned. This would necessarily involve the application of informed judgement to partly inadequate data without which no account of the total impact of programmes, not to speak of action, would be possible.

58. It has already been pointed out that the evaluation could only be attempted by most Governments concerned if they receive substantial assistance from outside, in addition to the effort and expense to themselves which will also be involved. It is presumed that the Economic and Social Council, having regard to the importance of making as accurate evaluations as possible, would regard expert aid to recipient countries in this respect as a form of technical assistance which might well be furnished, perhaps with funds provided under the Expanded Programme; although it would have to be made clear to any such experts that the

evaluations would be essentially those of the Governments and that their function would only be to assist in and advise on the collection of data, the methods to be used, and the most satisfactory way of presenting the conclusions reached. The Council may wish to draw the attention of Governments concerned to this opportunity of availing themselves of technical assistance in evaluation studies which they may wish to carry out in their country. One or two of the largest countries in which United Nations programmes have been operating are in a position to undertake an evaluation without much assistance. These might agree to make their own evaluations, with little or no outside assistance, but along the same lines as those which would be laid down by the Economic and Social Council for the evaluation exercises in which assistance would actually be given.

59. It would seem to the ACC that it would not be enough for each country to have the help of the Resident Representative of TAB and Director of Special Fund Programmes already assigned to it. In the first place, the Resident Representative/Director is closely concerned with the programmes of certain international organizations, notably the Special Fund, organizations participating in EPTA and the World Food Programme, while he is not directly concerned with the operations of others, such as the financial specialized agencies, and has no detailed knowledge of them; nor is he directly concerned with UNICEF. Secondly, any official who has served a long time in a country would probably have preconceived notions about such matters as the impact of programmes, before a start is even made upon any analytical study, and somebody not himself associated with past programmes is therefore to be preferred. In the third place, there are obvious arguments for the desirability of having an economist as one of the advisers, and the Resident Representative/Directors, while experienced in public affairs, are generally not trained economists. Finally, the task of these advisers to the Governments would be a full-time job, and each Resident Representative/Director is already fully occupied with his normal tasks; nor would it be possible for him to divest himself entirely of these responsibilities as long as he remains in the country of his assignment. The desirable role for the Resident Representative/Director in his own country of assignment would therefore be to give support to the team of advisers, as to other experts of the United Nations family, and not to play an expert's role himself. Yet he could be of great service in helping to marshal information, especially from the United Nations family, and his personal experience could also be heavily drawn upon.

60. The next question which arises concerns the nature of the teams of advisers and the qualifications of the persons who should be asked to undertake the task of assisting the Governments in these evaluations. It would be difficult for anybody who is not a professional economist to advise on how to make a clear assessment of the economic results which are being considered, and staff and experts with field experience from the United Nations (including the regional eco-

conomic commissions) and certain other agencies might be specially suitable for this purpose. On the other hand, the programmes of the United Nations family are by no means exclusively economic but have their impact on other aspects of the national life, such as public administration, health, scientific advancement, education and other fields whose economic impact is only felt after a long time and is not necessarily measurable. In addition to experienced economists, therefore, senior persons with broad general experience in several countries and with mature judgement, would be suitable.

61. The difficulty which would face any very small team of this nature is the enormous range of fields which is covered by the operations of the United Nations family. Even the most highly qualified two-man team of this kind would, themselves, probably require technical advice on topics ranging from forestry to atomic energy and meteorology and from civil aviation to labour laws and telecommunications. No doubt some of this could be obtained from technical assistance experts serving in the country, but it would hardly be likely that they would be able to cover the whole range required, except in those projects which would actually be in operation and in which the experts themselves might be more wisely regarded as informants than as technical advisers. The organizations concerned would wherever practicable be willing to send a certain number of technicians from their own headquarters and regional offices to give advice, as necessary, and the regional economic commissions of the United Nations might also be able to give support in certain fields.

62. This raises the question of the most effective size of evaluation teams. Clearly, the larger teams would allow a broader coverage of facts in range and depth. It must be remembered, however, that the major part of the expense would normally be upon the Government itself. In view of the heavy over-all costs involved greater returns might be gained through the use of small teams of two or three carefully selected persons, which would cost less while still affording useful, if more limited results.

63. As it may be difficult, even if small teams are used, to carry out evaluations in a large number of countries within a limited period of time, it may be preferable deliberately to select a limited but effective target: a survey limited to, say, four countries in different regions of the world but at different stages of economic development might with advantage be selected for pilot projects. In order to obtain the best results, these pilot projects should be conducted in countries in which the task would be comparatively simple and where, for that reason, distortions due to unavoidable lack of experience would be reduced to a minimum. Partly because the number of projects assisted by the United Nations family might not be too large, and partly because their economic structure might not be too complex, fairly small countries would appear particularly suitable for the first experiments. A substantial part of the cost of these pilot projects might be borne by the international organizations in view of their experimental interest.

64. Whichever course is decided upon, the exercise is likely to concern the majority of the organizations comprised in the United Nations family, and they all should be consulted on the choice of persons to assist Governments with expert advice. The drawback to having an outside body, such as a university or foundation assist in evaluation exercises would be that it would not have an international character, a disadvantage which would apply to most organizations outside the United Nations family. For these reasons, it might be desirable for the Executive Chairman of TAB to be entrusted with selecting the teams in consultation with the executive heads of the organizations represented on the ACC. As to finances, provision might be made for a certain sum to be allocated from the Special Account for the purpose, or for authorizing the Executive Chairman to regard the operations as administrative as, indeed, it is, as far as EPTA is concerned. Apart from financial problems, other matters such as the terms of reference of the team, the duration of their work, etc., could best be settled by inter-agency consultation.

65. Unless the pilot studies provide the type of information which is found suitable to both the countries which contribute most to technical assistance funds and the recipient countries, there would be no point in extending the exercise to anything beyond the pilot studies. Therefore, the question of extended studies or the establishment of "permanent evaluation machinery" should be reserved until a proper assessment has been made of the value of the pilot studies undertaken.

VI. Economic and social consequences of disarmament

66. The Secretary-General and the executive heads of the specialized agencies and the IAEA have consulted together concerning the action which they should take in response to Economic and Social Council resolution 982 (XXXVI) and General Assembly resolution 1931 (XVIII) which invite the specialized agencies concerned and the International Atomic Energy Agency to co-operate with the Secretary-General in advancing studies, within their fields of competence, of various problems concerning international economic and trade relations relevant to the economic and social aspects of disarmament. They have noted that the Economic and Social Council has been requested by the General Assembly to consider at its thirty-seventh session all pertinent aspects of the question of conversion of resources released by disarmament to peaceful uses and to report thereon to the General Assembly, and that resolutions calling for action in the matter have also been adopted by a number of the other organizations constituting the United Nations family.

67. Members of the ACC recognize the far-reaching importance of this problem. A number of them are bound by resolutions or other decisions of their governing bodies stressing the responsibility which rests upon them to respond to the request of the General Assembly in a manner which, without prejudicing in any way the outcome of the discussions now taking place concerning the political and military aspects of disarmament,

assists Governments in framing generally acceptable plans to deal with the economic and social consequences of such measures of disarmament as may be agreed. The utilization of part of the savings from disarmament for expanding aid to developing countries will require extensive research, studies and planning. In this connexion, plans to ensure the maintenance of the high level of economic activity necessary to permit the diversion of resources to new peaceful needs, and studies of the problems which may arise in relation to primary commodities are of particular urgency. In these circumstances, the members of the ACC concerned have agreed that:

(a) The Secretary-General of the United Nations will act as the central point of co-ordination in respect of all studies of the economic and social aspects of disarmament;

(b) All of the organizations of the United Nations family proposing to undertake such studies will co-operate with the Secretary-General in the preparation of concerted programmes of work within the general framework of which such studies will be undertaken;

(c) The ACC will set up a committee of agency representatives to co-operate with the Secretary-General in developing such a programme.

68. The members of the ACC concerned recognize the importance of any studies being realistic in the sense of being based on facts. They therefore suggest that the Council may wish to give further consideration to the hope expressed by the General Assembly that Member States significantly involved will continue, in the light of developments bearing on disarmament, to pursue studies and activities relating to the economic and social consequences of disarmament, to the problems which it will entail for them, and to means of dealing with those problems. The extent of the contribution which can be made by the member organizations of the United Nations family will depend in large measure on the extent of the response made by Member States to this request of the General Assembly. The first step necessary is that all or as many as possible of the States significantly involved should make appropriate national arrangements to collect and make available the relevant factual data; these arrangements will need to contain provision for an economic early warning system to enable the authorities responsible for economic and social policy to take appropriate action to deal with the consequences of important cuts in defence spending.

VII. Science and technology

(a) REPORT TO THE COUNCIL OF THE ADVISORY COMMITTEE ON THE APPLICATION OF SCIENCE AND TECHNOLOGY TO DEVELOPMENT

69. The Council in resolution 980 A (XXXVI) decided to establish an Advisory Committee on the Application of Science and Technology to Development. The Council envisaged that this Committee would work in close co-operation with the ACC in reviewing the scientific and technological programmes and activ-

ities of the United Nations and related agencies. Accordingly, on the basis of recommendations of the newly constituted Sub-Committee on Science and Technology of the ACC, the Secretary-General and his colleagues approved a communication of the ACC to the Advisory Committee (annex II below) which became the main basis for the Advisory Committee's discussions at its first session in New York, 25 February - 6 March 1964.

70. The ACC welcomes the report of the Advisory Committee (E/3866) which attests the valuable beginning the Committee has made and the energy with which it approaches its tasks.

71. While for obvious reasons it would be impracticable to recite the many points on which the ACC itself is in agreement with the judgements that have been expressed by the Advisory Committee, two specific agreements of views may be cited here. The Advisory Committee states: "The main scientific and technological resources of a country lie in its trained people" (*ibid.*, para. 52). Of this there can be no doubt. The Committee also states that it "is firmly convinced that recipient Governments should establish one national central co-ordinating agency to deal with the whole problem of technical assistance, including bilateral assistance, as well as assistance from international and regional organizations. This agency should be connected closely with the development planning machinery" (*ibid.*, para. 28(a)). The ACC is happy to note this concurrence by the Advisory Committee in a policy which has been many times advocated by the organizations of the United Nations family, more especially as the quoted statement envisages including bilateral assistance within the framework of these arrangements.

72. The ACC has given consideration to the Advisory Committee's proposal for a system of reporting (*ibid.*, paras. 31-32) whereby the organizations of the United Nations family would help the Committee to discharge its assignment of keeping progress in the application of science and technology under review. The Advisory Committee has asked whether its proposal is acceptable and, if so, when such reports might begin to become available to it. The ACC envisages that the reports in question can begin to be provided before the Committee's session early in 1965 and that the reporting system may take the following form: (i) selected pertinent publications of the organizations concerned would be sent to the members of the Committee on a current basis; (ii) the organizations concerned would also periodically (e.g. once a year) prepare for the use of the Committee a report, which in most cases is expected to be developed as a section in their annual report to the Council. Under the latter type of reporting a limited selection of important topics would be examined with a view to indicating progress, including where possible promising lines of incomplete research in the fields in question, the difficulties being encountered in applying available methods in the developing countries, and the related current and intended programmes of the organization itself.

73. The ACC has taken note of the general observations of the Advisory Committee in chapter III of its

report on the subject of inter-agency co-ordination. The ACC will continue to keep the matter under constant review.

74. The ACC has also noted the questions raised by the Committee in chapter V of its report with respect to particular ways in which present methods of clearing scientific and technological information might be improved. The replies to these questions — which relate to the development of special publications, to national and regional information centres with related specialized personnel, and to wide dissemination of the results of case studies of success and failure in the application of science and technology to development — must await careful study. As regards the question of national and regional centres for information on science and technology, something is, of course, already being done in a number of fields (agriculture, health, meteorology, manufacturing, etc.) by the agencies concerned. Mention should be made, for example, of the experience gained by UNESCO during recent years in the establishment of scientific and technical documentation centres. Such centres were created or are being created in Brazil, Mexico, United Arab Republic, India, Pakistan, Yugoslavia, Philippines, Indonesia, Thailand and Cuba. They do not function only as libraries but play an active role in abstracting, translation and bibliography and use modern techniques for supplying scientific and technical data to meet the needs of research and training as well as of applied technology. They also train the national personnel necessary for operating them.

75. The ACC is glad to find that the Advisory Committee in chapter VIII of its report takes an affirmative view of the possibility of an immediate world-wide attack on a limited number of especially important problems of research or application which was raised in the ACC communication to the Committee (annex II, paras. 49-52 and appendix 1). Of course, this should not be allowed to detract from intensification of efforts on many other important problems as well; rather it should serve to spearhead an advance in the science and technology sector all along the line. The Advisory Committee will, no doubt, as it proceeds sharply delineate certain specific problems or aspects that lend themselves to appraisal and attack. Control of the tsetse fly, a specific problem on which the ACC itself has had an exchange of views in this connexion and on which action could be initiated quickly, would be an example meriting consideration.

76. In regard to the proposals of the Advisory Committee in chapter IX relating to its future organization and pattern of work, the ACC wishes to emphasize the importance of having the Advisory Committee and its sub-groups maintain close direct contacts with the individual agencies concerned through visits to their headquarters, which will also help to keep requests for additional written reports within manageable limits.

77. The Advisory Committee discusses the crucial question of finance in the following terms:

"... Science and technology offer the promise of new and better ways of achieving economic develop-

ment, but achieving such development requires great human and material investment. The cost of applying the methods found through science and technology is large compared to the cost of the research and development needed to discover new methods. Yet small investments in research and development may yield solutions which greatly increase the return from large capital investment.

“Unless the cost of economic development can be financed, the existence of new or better methods may be of little use. Presently available resources within and beyond the United Nations are inadequate to the need. Moreover, financial needs will increase with the growing capacity of developing countries in terms of trained manpower and specialized institutions and as science and technology provide new solutions to major problems of development.” (E/3866, paras. 16-17.)

Here again it seems advisable to state explicitly that the Secretary-General and his colleagues in the ACC agree with the view expressed by the Advisory Committee. As the Committee points out, the financial question pervades every aspect of the subject under discussion. Results cannot but depend on how this question is faced.

(b) EFFECTS OF ADVANCES IN SCIENCE AND TECHNOLOGY ON THE ADMINISTRATIVE STRUCTURES OF THE UNITED NATIONS AGENCIES

78. In paragraph 8 of Council resolution 910 (XXXIV), to which the ACC made brief reference in its twentieth report,⁶ the Council requested the ACC to submit its comments on the effect which the problems arising out of the evolution of science and technology as related to economic and social progress are having on the administrative structures of the various agencies of the United Nations system.

79. In reviewing the situation in this regard, the ACC notes that a distinction must be drawn between the basic position for the organizations of the United Nations family and the latest modifications of that position, for example since the holding in early 1963 of the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas (UNCSAT). Some of the organizations exist very largely in order to help apply modern science and technology for purposes of economic and social progress. Virtually all of them consider that to be an important integral aspect of their technical co-operation or other work. Hence their administrative structures have been from the beginning substantially affected by and adjusted to the problems to which paragraph 8 of this resolution refers, namely those arising out of the evolution of science and technology as related to economic and social progress. On the other hand, in most cases their administrative structures have thus far shown no distinguishable new effects in consequence of UNCSAT or other recent related events, and only a marked enlarge-

ment of the resources placed at the disposal of the agencies concerned would be likely to change this situation appreciably.

80. The most striking new effects on administrative structures are those under way in UNESCO. In October 1963 the Director-General submitted to the Executive Board at its sixty-sixth session, and the Executive Board adopted as a basis for the preparation of the Programme and Budget for 1965-1966, proposals for an increase of over 50 per cent for programme activities in the field of science and technology. It is now proposed at the General Conference at its thirteenth session (November 1964) to raise the budget provision for this part of the programme from \$4,765,000 in 1963-1964 to \$7,469,000 for 1965-1966. As a consequence, and in view of the anticipated increased number of projects in this field to be undertaken under EPTA and the Special Fund, the secretariat of UNESCO has been reorganized. In addition to the existing Department of Natural Sciences, whose activities are being strengthened, a second department, concerned with the application of science and technology to development, has been established, and both will be placed as from 1964 under the supervision of an Assistant Director-General in charge of the programme in science and technology.

81. In the United Nations Department of Economic and Social Affairs there has been, in consequence of UNCSAT, first, some modification of the administrative structures of the Centre for Industrial Development and the Resources and Transport Division. The Centre, concerned, *inter alia*, with the transfer of industrial technology, its adaptation or development to local needs and the strengthening of local institutions in the developing countries for obtaining and applying suitable technology in manufacturing industries, has established a Technological Division to deal with certain aspects of this work. The former Resources and Transport Branch has enlarged its staff of resources experts and engaged additional specialist technical advisers, has been reorganized as a Division, and has acquired a special section charged, among other responsibilities, with reviewing technological developments in natural resources and transport. Second, a Special Adviser on Questions relating to Science and Technology has been appointed in the Office of the Under-Secretary for Economic and Social Affairs. In April 1964 his staff was functioning as secretariat to the Advisory Committee with three professional posts; a limited expansion of this unit, probably through consultants, was anticipated in the light of discussions at the Committee's first session. Third, each of the regional economic commissions has appointed a senior officer to serve as a focal point within that region for matters relating to the application of science and technology to development.

82. Most of the agencies with a substantial interest in applying science and technology for the benefit of developing countries have no recent changes of administrative structure relating to that activity to report. This is true in the case of the ILO, FAO, WHO, the IBRD and its affiliated organizations, ICAO, ITU, WMO and IAEA. The situation in the Special Fund

⁶ *Ibid.*, *Thirty-sixth Session Annexes*, agenda items 4 and 6, document E/3765, paras. 42-43.

may be cited as being characteristic of many United Nations bodies. The Special Fund, for example, is directly engaged in investigating how new techniques and modern methods could be applied to promote economic development in a pre-investment framework. Like all United Nations agencies and offices concerned with economic and social development it seeks to keep abreast of scientific and technological progress, to disseminate such knowledge, and above all to apply the results through assisting Member States. Its Research Division in particular is obligated to give continually increasing attention to these objectives to the extent that funds permit. Obviously the workload—as for other United Nations bodies—continues to grow, and the handling of this growing workload, together with the need to keep up with additions to knowledge and to bring new knowledge to bear on the daily tasks, eventually necessitates some additional staff or consultants. The main effect of science and technology on the administrative structure is thus seen not as a revision of the structure but as an influence which is joined to other influences making for gradual expansion which, however, can only occur to the extent that added resources are provided.

(c) CENTRALIZATION AND EXCHANGE OF
INFORMATION ON RESEARCH WORK

83. In paragraph 2 of the same Council resolution 910 (XXXIV), the ACC was requested to submit to the Council "detailed observations on the nature and extent of the problem presented by the centralization and exchange of information on research work in progress or contemplated" in accordance with one of the recommendations in the survey of *Current Trends in Scientific Research*.⁷

84. In view of changed circumstances since this question was raised (August 1962), in particular the action taken by the Council in 1963 to establish the Advisory Committee on the Application of Science and Technology to Development, and the events and new outlook stemming from that and reflected in the Advisory Committee's report which is discussed in paragraphs 69-77 above, the ACC is of the opinion that no useful purpose would be served by formulating the detailed observations originally contemplated. The need remains, however, to make as full use as possible, in the interests of the developing countries, of available knowledge concerning important scientific and technological research which is under way. For the present, in this connexion, the ACC considers that the proposed reports of organizations of the United Nations family on progress in the application of science and technology to development which are referred to in paragraph 72 above could provide a useful means of bringing together information on promising lines of incompleting research as well as on new advances in science and technology already achieved.

⁷ Pierre Auger, *Current Trends in Scientific Research* (United Nations, New York and United Nations Educational, Scientific and Cultural Organization, Paris, 1961). Circulated as document E/3362/Rev.1.

VIII. Industrial Development

85. The ACC has noted with satisfaction the growing measure of interest in and support for the expansion of activities of the United Nations and its related agencies in the field of industrial development, in which the United Nations Centre for Industrial Development is playing an increasingly important role. This development has brought with it an enhanced need for inter-agency co-operation and co-ordination in particular areas and in various stages of work.

86. In this connexion, the ACC took special notice of resolution 2 (IV) on United Nations machinery in the field of industrial development, adopted at the fourth session of the Committee for Industrial Development (see E/3869). Operative paragraph 1 (i) of that resolution underlines the need for effective co-ordination by the United Nations system of its activities in the field of industrial development, and the role to be played by the Centre for Industrial Development, particularly in following closely the activities of the various organizations, undertaking joint projects and making arrangements for adequate reporting to the Committee for Industrial Development and the Economic and Social Council.

87. The ACC is fully alive to the fact, underlined in a statement made on behalf of the Secretary-General, that to develop contacts at the working level and, in general, to discharge effectively its specific responsibility for co-ordinating action, the Centre for Industrial Development would have to devote adequate resources to that task, which is fully reflected in the above-mentioned resolution, and in particular in operative paragraph 3 thereof. The ACC would welcome the adoption of the measures necessary for the implementation of the co-ordinating responsibilities of the Centre.

88. Both formal and informal consultation, and a growing degree of active collaboration among the organizations concerned have made a solid contribution to the achievement of these objectives but there remains considerable room for improvement particularly as regards consultations at the planning stage of projects as well as concerted activities. Contacts both at Headquarters and at the regional and local level for purposes of inter-agency co-operation and co-ordination should therefore, be further encouraged and they should continue to be of an *ad hoc* character, among officials of particular pairs or groups of agencies interested in particular issues or projects. At the same time, the periodic inter-agency meetings among representatives of all United Nations organizations concerned with industrial development, which were initiated by the ACC five years ago, have served a useful purpose, and the ACC considers that the time may now have come to give these meetings a somewhat more formal status as part of the regular mechanism of co-operation under the ACC. To this effect, the Commissioner for Industrial Development will consult with the other agencies with a view to submitting, if appropriate, concrete proposals.

89. The ACC has noted resolution 3 (IV) of the Committee for Industrial Development concerning

United Nations machinery in the field of industrial development which refers to the establishment of a specialized agency for industrial development (*ibid.*). The ACC has previously referred to this matter.⁸ It will follow with interest developments in this connexion in the Economic and Social Council and other United Nations bodies, and in the event of the Council addressing a request to the Secretary-General to prepare the study envisaged in the above-mentioned draft resolution on the scope, structure and functions of a new organization, would appreciate it if full consultations with members of the ACC could take place. The aim would be to devise arrangements and procedures conducive to the development of dynamic and well-articulated proposals which, without duplicating existing facilities and arrangements, would enhance the effectiveness of the total effort of the United Nations system in the field of industrial development.

90. The ACC took note of General Assembly resolution 1940 (XVIII) which requested the Secretary-General to consult with "States Members of the United Nations and members of the specialized agencies, with the specialized agencies and the International Atomic Energy Agency, the regional economic commissions and with the Committee for Industrial Development, on the advisability of holding, not later than 1966, an international symposium, preceded, as appropriate, by regional and sub-regional symposia, relating to the problems of industrialization of developing countries, and to report to the Economic and Social Council at its thirty-seventh session and to the General Assembly at its nineteenth session".

91. The ACC noted that the response of the agencies to this proposal has been generally favourable and welcomed the steps being taken to invite the collaboration of the United Nations family of organizations.

IX. Education and training

92. The ACC has already reported to the Council that earlier confusions and overlaps in education and training have been removed. It is happy to say that collaboration in this field continues to be good. There are, however, some questions of co-ordination that cannot be settled once and for all by some one decision, but need almost daily exercise of the habit of working sensibly together. In education and training this applies particularly to joint participation in missions, and to collaboration in the various institutes and centres created by the United Nations and the specialized agencies. There are also topics concerning education and training that the ACC (through its Sub-Committee or by discussions between groups of agencies) must review frequently, and sometimes in greater detail than has yet been possible. These include agricultural education and training, white collar unemployment in relation to education, and health and nutrition as factors in education and training.

⁸ *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda items 4 and 6, document E/3765, para. 133.*

93. The ACC has found that imperfect knowledge of the language of instruction not only limits the possibility for placement of fellows but frequently leads to wastage in training itself, or to imperfect assimilation. Modern devices exist for the rapid learning of languages, particularly in the technical context, and UNESCO has produced a paper on this for the guidance of all organizations. The ACC has given preliminary consideration to this through its Sub-Committee, but fuller discussions are yet to be held.

94. General Assembly resolution 1824 (XVII) on training for accelerated industrialization clearly called for the collaboration of many members of the United Nations family. The ACC Sub-Committee on Education and Training agreed that existing inter-agency machinery could be adapted for the purpose of preparing the report requested in the resolution. Several agencies obtained the approval of their governing bodies to deploy staff for the preparation of the report. A series of Working Groups (sometimes meeting jointly) agreed on editorial responsibility for various sections of it. At every stage of preparation there was detailed exchange of experience. The resulting material was again reviewed by the Sub-Committee and by the ACC itself. Thus although the final editing and responsibility for the report belonged to the Secretary-General, it represented a considered statement by all the organizations jointly on a most important aspect of education and training within the limitations described in the report itself.

X. Water resources development

95. The ACC noted the Secretary-General's proposals for a priority programme of co-ordinated action in the field of water resources within the framework of the United Nations Development Decade, which had been drawn up in consultation with the interested specialized agencies in pursuance of Council resolution 978 (XXXVI).

96. In this connexion, the ACC was led to review the recent experience of co-operation through the United Nations Water Resources Development Centre. It recognized the positive role played by the Centre in recent years in focusing attention on the co-ordinated approach to the development and utilization of water resources and in carrying out a number of studies of related problems which concern several of the participating organizations. The Centre has been assisted in this task by technical staff seconded for varying periods by FAO, WMO and WHO. However, practical difficulties encountered in the functioning of the Centre, as well as the rapid growth of the programme and of regional activities within it, have led to the conclusion that the Water Resources Development Centre as hitherto conceived is no longer the best machinery to deal with the co-ordination problems involved.

97. It was the unanimous view that effective co-ordination is of fundamental importance in all aspects of water resources development, and that particular efforts are required in the case of large-scale multi-purpose development schemes and water resources development in international river basins, where a large number of

very important projects have been initiated or planned. It was also considered that the co-operative relations which have developed through the Inter-Agency Meeting on Water Resources and the United Nations Water Resources Development Centre should be preserved and reinforced without recourse to new machinery.

98. The ACC recommends that the focal point for co-ordination among the participating organizations should henceforth be provided by the Inter-Agency Meetings on Water Resources Development, functioning as a Sub-Committee of the ACC and supplemented by *ad hoc* consultations on important projects and continuing exchange of information at a technical level. The ACC itself will devote to the water resources programme all the attention that may be required, and has made specific arrangements to facilitate the task of co-ordination. It was noted that this shift of emphasis could be effected without prejudice to the role of the United Nations Centre in the United Nations programme of water resources.

XI. Social questions

(a) HOUSING, BUILDING AND PLANNING

99. The ACC has given careful consideration to a number of matters arising from the report of the Committee on Housing, Building and Planning on its second session (E/3858), as well as to the international programme on housing, building and planning proposed for the second half of the Development Decade.

100. In the report on co-ordination and organization of existing and increased international assistance in the field of housing, building and planning,⁹ after extensive investigation at the Headquarters of the United Nations and the specialized agencies and taking into account field activities, the conclusions are reached that:

(a) Notwithstanding the importance of housing as a part of widely differing international activities directed towards economic and social progress, work in this area could not be considered to represent a well-organized programme in housing that was likely to meet the massive needs during the Development Decade;

(b) There was nothing in the nature of the housing problem which required or justified the establishment, for an expanded programme in this field, of co-ordination machinery fundamentally different from that which already existed;

(c) The solution lay in a fuller understanding and use of existing arrangements combined with improved arrangements at the regional and national level, which are dealt with below:

⁹ The report was prepared by Mr. George F. Davidson, Deputy Head, Bureau of Government Organization, Privy Council Office, Ottawa, pursuant to Economic and Social Council resolution 976 G (XXXVI), and was transmitted by a note of the Secretary-General to the Committee on Housing, Building and Planning (E/C.6/24).

(d) The economic aspects of the housing programme suggest that the international programme should be more closely related to activities of the United Nations and specialized agencies in the field of economic development.

101. The ACC endorses these conclusions and notes that the Committee on Housing, Building and Planning has recommended the development of a broad programme of activities under the leadership of a reorganized Centre for Housing Building and Planning within the secretariat of the United Nations. This Centre would both administer the specific activities of the United Nations in the field of housing and provide a focal point for the development of a broad co-operative programme of activities.

102. The members of the ACC concerned look forward to providing the Housing Centre with fullest co-operation and support. The ACC decided to simplify and consolidate its machinery for the co-ordination of this programme by combining two working groups which had been concerned with housing and related community facilities and with urbanization. The terms of reference of the single working group are co-extensive with that of the Committee on Housing, Building and Planning. It welcomed the increased in the number of technical staff for housing and related fields which the United Nations, ILO and WHO have assigned to regional posts. It noted that the regional advisers of the two specialized agencies are co-operating closely with the regional economic commissions and that they, as well as members of UNESCO's staff, will take part as appropriate in multi-disciplinary missions and housing and pilot projects. The ACC believes that these arrangements add significantly to the resources for co-operation at the regional and national level.

103. In view of Council resolution 975 F (XXXVI) and resolution 1917 (XVIII) of the General Assembly on housing, building and planning in the Development Decade, the ACC decided to give detailed consideration in the coming year to the international programme in this field, which will be before the Council at its thirty-ninth session.

(b) PROGRAMMES AFFECTING YOUTH

104. In its twenty-sixth report¹⁰ to the Council, the ACC drew attention in paragraph 155 to the experience being accumulated by the United Nations and some of the specialized agencies concerning the needs of children and young people and suggested that close co-operation between those organizations should be developed in connexion with training programmes for national, family, child health and welfare personnel.

105. Since that report was presented, there has been continued collaboration with special reference to the basic needs of youth in matters of health, nutrition and welfare, preparation for working life, cultural and leisuretime activities; instruction in regard to respon-

¹⁰ *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes, agenda item 3, document E/3625.*

sibilities connected with participation in social and civil life, including participation in national development, and preparation for better international understanding.

106. Inter-agency discussions are being undertaken in specific fields — in particular, the position of young people in rural areas, the adjustment of young people migrating from rural to urban areas to new conditions arising out of industrialization, urbanization, etc., and the preparation of girls and young women for adult life.

107. The ACC noted that arrangements were made for full participation in the UNESCO international Conference on Youth to be held at Grenoble from 23 August to 1 September 1964.

XII. Atomic energy

(a) THIRD INTERNATIONAL CONFERENCE ON THE PEACEFUL USES OF ATOMIC ENERGY, 1964

108. The ACC was informed of the arrangements for the Conference to be held in Geneva at the end of August 1964 in response to General Assembly resolution 1770 (XVII); it noted that questions of a policy or political nature are the responsibility of the Secretary-General, IAEA is dealing with the scientific aspects, the specialized agencies are being consulted on matters of concern to them, and the European Office of the United Nations is handling the over-all Conference administration and the organization of the scientific exhibition to be held in conjunction with the Conference. The ACC was satisfied that the preparations for the Conference were proceeding in a satisfactory manner.

(b) CO-OPERATION IN ACTIVITIES RELATING TO THE PEACEFUL USES OF ATOMIC ENERGY

109. The activities of members of the United Nations family relating to the peaceful uses of atomic energy were reviewed by the ACC for the fourth time in April 1964 pursuant to Economic and Social Council resolution 799 B III (XXX). This year, in response to the invitation contained in Council resolution 986 (XXXVI), the ACC gave particular attention to aspects of the work of IAEA and the specialized agencies in regard to which questions of co-ordination may arise.

110. The Council's resolution was considered by the General Conference of IAEA at its seventh regular session in October 1963; by the Conference of FAO in December 1963; by the Executive Board of WHO in January 1964; and, subsequently, by the World Health Assembly in March 1964 (annex III, appendix 1).

111. Pursuant to the resolution adopted by the General Conference of IAEA, the Director-General of IAEA arranged for personal consultations in the succeeding months with the Directors-General of WHO and FAO.

112. The Directors-General of WHO and IAEA met at WHO headquarters at the end of November 1963 to discuss policy aspects of the work of the two agencies relating to atomic energy applications in medicine and

questions of radiation protection, as well as more effective arrangements for co-operation. At this meeting and in the course of subsequent consultations which are continuing, it was agreed to strengthen the direct contacts between the technical staff of the two agencies, especially at the formative stage of projects or programmes of mutual interest. For this purpose each organization will appoint a technical liaison officer on a trial basis at the other's headquarters. It was also agreed that there should be a joint approach to projects of mutual interest, in particular scientific meetings and, in appropriate cases, to advisory bodies such as expert committees and panels; for administrative simplicity the main executive responsibility would be assigned in each case to one or the other organization. Agreement was also reached regarding the arrangements for WHO's scientific participation in the third International Conference on the Peaceful Uses of Atomic Energy.

113. The Directors-General of FAO and IAEA met at FAO headquarters in February 1964, when they discussed future arrangements for co-operation between the two organizations in the application of atomic energy in food and agriculture. It was agreed that both organizations would study the practical problems involved in establishing a joint division, consisting of members of both secretariats, as soon as possible after 1 July 1964. It was further agreed that the joint division would be located in Vienna and that FAO would be responsible for appointing a Director acceptable to both organizations. As a first step, technical liaison officers have been appointed by both organizations to serve at the headquarters of each other. They are assisting in the studies of the respective responsibilities of the two organizations with regard to the food and agricultural applications of atomic energy at present dealt with by the IAEA. It was also agreed that every measure would be taken by both organizations to avoid administrative difficulties and delays in operating such a joint division.

114. In late February 1964, the Director-General of IAEA subsequently consulted the Board of Governors of that agency regarding the general principles of co-ordination of atomic energy activities and the practical steps taken to achieve better co-ordination at the secretariat level, and in particular the arrangements being made with the Directors-General of FAO and WHO. The Board agreed with the Director-General's view that a personal consultation between the executive heads of the agencies was essential to clarify policy aspects; with the need for the closest possible contact between the responsible scientists and technicians in the organization concerned; and with the desirability of keeping as simple as possible the administrative arrangements for joint projects by entrusting to one of the sponsoring agencies the main executive responsibility for the project. The Board endorsed the arrangements made with FAO and WHO and agreed that further practical steps should be taken on these lines.

115. In February 1964, sections of the draft programme for 1965-1966 of IAEA were sent in tentative

form to ILO, FAO, WHO and UNESCO for comment before being issued as a document for consideration by the Board of Governors of IAEA in June 1964. Consultations on this programme, on the programmes of ILO and WHO, and on other matters, took place on 23 and 24 March 1964.

116. The first meeting of the inter-secretariat working group established between UNESCO and IAEA took place in November 1963. It reviewed in particular the arrangements for co-operation in research, training and scientific abstracts between the two organizations. Consultations are taking place regarding the form of UNESCO's participation in the International Centre for Theoretical Physics being established by the IAEA in Trieste.

117. The ACC believes that the progress already achieved by the Directors-General of FAO, WHO and IAEA, in making practical arrangements to ensure closer co-ordination, as well as the existing arrangements with ILO and UNESCO, are important steps towards solving the problems referred to in the Council's resolution. Again, the ACC would draw attention to the importance here, as in other activities, of Governments ensuring that co-ordinated policies are followed by national delegations in their relations with the agencies.

Co-operation in energy and power matters

118. Co-operation between the United Nations and IAEA in energy and power matters is being intensified. Major advances in reactor technology and in nuclear power development are being reviewed at the third International Conference on the Peaceful Uses of Atomic Energy.

119. In early 1963, a member of the IAEA staff was outposted to work with the Energy and Electricity Unit of the United Nations Resources and Transport Branch, an arrangement which has proved to be of considerable advantage to both organizations. In addition, a United Nations expert has participated in an IAEA mission to study future needs for electric power and of possibilities of nuclear power in the Republic of Korea, and an IAEA expert co-operated with a United Nations mission to Tunisia regarding water resources and means of meeting water requirements. At the African Electric Power Meeting, held under the auspices of the United Nations in Addis Ababa in October 1963, questions relating to the use of atomic energy were considered and a paper on the subject was submitted by IAEA.

120. The IAEA is studying the possible role that nuclear energy may have in desalting water, including the use of dual purpose plants. Consultations are taking place with the United Nations which has undertaken studies on the use of conventional energy in desalination and with UNESCO.

121. With regard to the Special Fund project for a pre-investment study on power, including nuclear power, in Luzon in the Philippines, for which IAEA is the Executing Agency; the United Nations is the

sub-contractor for those aspects of the project relating to the investigation of coal deposits, geo-thermal energy resources and oil prices.

122. The General Conference of IAEA at its seventh regular session adopted resolution GC (VII)/RES/155 on co-operation with the United Nations in matters of energy and power. In implementation of this resolution the texts of resolutions GC (VI)/RES/128 and GC (VII)/RES/155 and a progress report on co-ordination in power questions were transmitted to the Secretary-General for the attention of the appropriate organs of the United Nations (annex III, appendix 2.).

Work of the United Nations Scientific Committee on the Effects of Atomic Radiation

123. The programme of work of UNSCEAR was approved by the General Assembly in resolution 1896 (XVIII). Accordingly, the Committee met in Geneva in February/March 1964 and discussed environmental contamination from nuclear explosions and the induction of cancer by ionizing radiation. At the request of the Committee, FAO is collecting information on radio-active contamination of food. Also at the request of the Committee, WMO organized a symposium on atmospheric transport and removal of radioactive materials that was held during the thirteenth session of the Committee so as to enable Committee members to discuss the meteorological aspects of environmental contamination with leading experts. IAEA collaborated in the symposium and presented a paper on radio-active contamination of oceans.

WMO draft plan for world-wide measurement of radio-activity

124. In a letter dated 11 September 1963, the Secretary-General of WMO sent Member States and organizations concerned the final version of the WMO plan for world-wide measurement of atmospheric radio-activity, which was drawn up in implementation of General Assembly resolution 1629 (XVI) in consultation with UNSCEAR and IAEA. Members were requested to inform the WMO secretariat of their plans for implementing the scheme and, periodically, of developments, and were informed of the possibility of requests for necessary expert advice and equipment being met by WMO and IAEA. (For information on the plan which was attached to the letter from the Secretary-General of WMO, see annex III, appendix 3.).

Follow-up of the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas

125. Questions relating to atomic energy are being considered within the over-all study of problems relating to science and technology by the newly created ACC Sub-Committee on Science and Technology and also by the Advisory Committee on the Application of Science and Technology to Development, established under Economic and Social Council resolution 980 A (XXXVI).

Technical work of interest to more than one organization

126. The ACC also reviewed the co-operation achieved in certain specific programmes, namely: scientific meetings and training courses (already held or planned for 1964) — dealing with the peaceful uses of atomic energy (see annex III, appendices 4 and 5); research — projects undertaken in 1963 (*ibid.*, appendix 6) and the results of earlier work which had been published; developments in health and safety codes and standards (*ibid.*, appendix 7); and relevant publications issued in 1963 or in the course of preparation.

XIII. Emergency action in cases of natural disaster

127. In its twenty-eighth report,¹¹ the ACC suggested that the Economic and Social Council might wish to draw the attention of member Governments to the delays and difficulties caused by the absence of national co-ordinating machinery to help in determining the degree and character of the relief required and in making *ad hoc* arrangements to give unified direction to relief operations.

128. Notwithstanding the handicaps resulting in certain cases from the absence of such national co-ordinating machinery, the arrangements for exchange of information between the Secretary-General and the executive heads of the interested international organizations of the United Nations system have worked in a reasonably satisfactory manner in such recent disasters as the earthquake in Skopje, Yugoslavia, the volcanic eruption at Bali, Indonesia, the earthquake at Barce, Libya, floods in Morocco, and the devastation caused by Hurricane Flora in a number of Caribbean countries.

129. The Council has requested the Secretary-General “to take the lead in establishing, in conjunction with the specialized agencies and the League of Red Cross Societies, appropriate arrangements for assistance in rapid and concerted relief and construction in cases of national disaster”.¹²

130. In conformity with this request consideration has been given to possible measures which might be adopted separately, but not in isolation, in the following fields:

(i) Arrangements for the exchange of information within the United Nations systems of Headquarters and at the country level;

(ii) Consultation and contact with non-governmental organizations, in particular the League of Red Cross Societies.

In each case separate consideration is called for in regard to:

(a) Immediate relief to cope with hunger, disease, lack of shelter, clothing, sanitary arrangements, etc.,

(b) Long-term rehabilitation and reconstruction to restore normal conditions of living.

The former calls for the utmost speed, the latter for comprehensive and mutual adjustment. It is recognized that any co-ordination arrangements must avoid procedures likely to affect the flexibility of operations of agencies concerned to provide as speedily as possible help to those desperately in need.

131. The Secretary-General proposes to strengthen existing arrangements in New York and Geneva by the designation of officers in each place to maintain the necessary contacts. These two officers will, so far as possible, serve as a point of information on action being planned or taken.

132. At the country level it is important for the United Nations system to designate a “focal point” for the exchange of information on the plans and activities of the Governments and of the various agencies (inter-governmental and voluntary). The officer occupying the national “focal point” should normally be the Resident Representative of TAB and the Special Fund. Local representatives of the international organizations as well as special officers sent out by those organizations (individually or jointly) to assess the scale of relief needed and to arrange for its provision and distribution would keep in close touch with the “focal point” officer.

133. In disasters where the relief required is predominantly the concern of one agency the representative of that agency might, by common agreement, be regarded as the “focal point” representing all members of the United Nations system which might have only a marginal interest in the relief and reconstruction involved. In special cases it might be necessary to appoint a special representative or make other *ad hoc* arrangements.

134. The role of the Red Cross — particularly the League of Red Cross Societies and the International Committee of the Red Cross — which is particularly equipped to provide certain types of immediate relief, needs no emphasis. While existing arrangements between the Red Cross and certain individual organizations are working satisfactorily and effectively, tentative discussions have already taken place with the object of developing closer co-operation in certain respects. The Secretary-General will continue to keep the League of Red Cross Societies informed of any appeals he may receive which appear to require emergency assistance, and will also exchange information on the aid planned and provided. The ACC is conscious of the importance of voluntary national organizations capable of undertaking relief programmes. In countries where no such organizations exist, there would seem to be a great advantage if national Red Cross or Red Crescent Societies could be established.

135. In cases of natural disasters Governments themselves often directly offer aid to the affected countries. There are special fields in which donor Governments can often be particularly helpful — e.g. the loan of helicopters, landing craft from some nearby location, the provision of shipping space to carry supplies, the

¹¹ *Ibid.*, Thirty-sixth Session, Annexes, agenda items 4 and 6, document E/3765.

¹² *Ibid.*, Thirty-sixth Session, Supplement No. 1, p. 39.

loan of motor transport within the devastated country to distribute supplies, the assignment of technical personnel. Government missions, as well as international organizations, having transport in a country, intended for other purposes, could deploy it temporarily for relief purposes. It is hoped that such possibilities will be reported to the United Nations "focal point" in the country involved.

136. Apart from the over-all arrangements for immediate relief outlined above, rehabilitation efforts are being pursued within the normal procedure for co-operation and co-ordination. As an example, the United Nations is actively studying emergency and reconstructive activities in the field of housing, building and planning following natural disasters. In those activities, ILO, FAO, WHO, UNESCO as well as UNICEF and the World Food Programme are participating at the technical level. In other fields also similar co-operation exists among agencies.

137. In its twenty-eighth report, the ACC proposed the collection and collation of information regarding the type of assistance and the conditions governing its provision which organizations comprising the United Nations system are in a position to provide. Such a document is being prepared and it is proposed to make it widely available in due course to all international bodies, Ministries and Departments of Governments, voluntary organizations.

XIV. The United Nations Children's Fund and the World Food Programme

138. The ACC took note of a statement of the Executive Director of UNICEF who reported that UNICEF is currently working in 115 countries and territories on projects in the implementation of which close co-operation with WHO, FAO, ILO, UNESCO and the United Nations Bureau of Social Affairs was being maintained.

139. In 1963, 117 Governments made voluntary contributions to UNICEF and total new resources accruing in 1963 amounted to the equivalent of \$32 million. Approximately 20 per cent of these resources represented contributions from individuals as compared with less than 5 per cent ten years ago. This indicates the steadily increasing interest in UNICEF on the part of the general public.

140. In 1963, the expenditure of UNICEF had been \$38 million and for 1964 it would probably be \$40 million. Now that regular contributions were assured, UNICEF was able to spend more rapidly, for the present, using part of the resources previously held in reserve. It was paying increasing attention to encouraging Governments in their national planning to look ahead to provide not only for the development of material resources but also the development of human resources through all possible preparation of the rising generation for normal healthy and productive life. The first week of April 1964 there had been held in Bellagio, Italy, under the sponsorship of UNICEF, a meeting on the subject of planning for the future needs of children. This meeting

had been attended by a number of senior government planning officials from different parts of the world, along with officials of the United Nations and the specialized agencies and a number of other persons competent to give advice on the subject of the preparation of the coming generation. It is the intention of UNICEF to hold a series of regional seminars on the subject of planning for the needs of children. Such a seminar would be held in Asia one year from now and in Latin America probably in the latter part of 1965. A similar regional conference would be planned for Africa in 1966.

141. The ACC took note of a statement by the Executive Director of the World Food Programme on the present stage of development on the Programme. The contributions pledged had reached \$91 million and were now only \$9 million short of the initial \$100 million target. Out of the \$91 million pledged, \$22 million were being earmarked for emergency assistance — of which \$9.4 million had already been committed or spent in twelve cases of emergency — and \$5 million more were earmarked for administrative expenses. Thus \$64 million were available for special feeding and for economic and social development projects.

142. The Programme had already received 134 requests for such projects involving a total of \$71 million. Of these requests, forty-five — involving a total of \$28 million — had been approved. Even allowing for the fact that some of the remaining requests would not mature into projects, the Programme had reached a stage where all its resources were being earmarked, little room being left for new requests. Some 62 per cent of the requests received were in the field of agriculture, while special feeding projects covered some 15 per cent of the total cost of the requests. Other requests concerned industrial projects, housing, area planning, mining, construction of secondary roads, and other public works.

143. The Programme had now to show its ability to carry out efficiently its operational tasks, namely the shipping of its commodities and its supervisory functions in the execution of projects. The Programme had also to arrange for an evaluation of its operations. Five broad studies on various problems connected with the work of the World Food Programme were under way. In the course of next year, before the end of the experimental period, decisions would have to be taken concerning the future of the Programme. If it were decided to continue the Programme beyond 1965, co-operation of all members of the United Nations family would remain essential in all stages of the activities of the World Food Programme.

XV. Co-ordination and co-operation in other areas

(a) PUBLIC ADMINISTRATION PROGRAMMES INCLUDING OPEX

144. Economic and Social Council resolution 907 (XXXIV) had stressed the importance of co-ordination, not only in implementing, but also in planning assis-

tance to countries in the field of public administration. The survey submitted to the Council at its thirty-sixth session and which appears as annex I to the twenty-eighth report of ACC¹³ reviewed the existing programmes in public administration and underlined the administrative requirements of planning and development. This refers to the Government machinery called upon to translate the plan in terms of the nation's everyday life in particular sectors such as education, transport, housing, agriculture, medical and social services and also to the basic part of the administration whose general competence exceeds that of the individual sectors.

145. The conclusion was reached that each of the various stages of economic and social development provided for in plans or programmes based on the reports of the international agencies or of their experts must necessarily include an institutional section dealing with different aspects relating to public administration techniques.

146. The survey was endorsed by the Council in resolution 987 (XXXVI), which noted with appreciation the progress made in the various fields mentioned in resolution 907 (XXXIV) and considered that this effort should be continued and developed within the framework of closer co-ordination between the United Nations, the specialized agencies and the Governments, inter-governmental and non-governmental organizations concerned.

147. The need for close co-ordination has consequently been a constant preoccupation in programming and carrying out technical assistance in public administration. It may be noted that no need was felt for a permanent co-ordinating machinery to supplement present methods. Relations between the services of the respective headquarters and the appointment of a full-time consultant to serve as liaison and to develop joint projects, have given during the last year very satisfactory results.

148. Although this co-operation calls for further expansion, it has already involved a number of specialized agencies and all of the fields singled out in the Council's resolutions. They cover, for instance, the fields of training of the national administrative personnel, government organization for planning, specialized fields such as agricultural, medical services, local government, as well as regional, sub-regional and country studies. Various recent examples of co-operation in these fields which may be of interest to the Council are described below.

149. Following a request by the fifth session of the Economic Commission for Africa (ECA) a working party was convened in Paris from 14 to 17 May 1963 to discuss regional and sub-regional support of national efforts to improve public administration and to develop training activities in this field in Africa. The meeting included participants from the United Nations, UNESCO, ILO, ECA, and also from those bilateral agencies that

have extensive programmes of training in the field of public administration in Africa. The purpose of the meeting was to identify possible regional approaches to training problems and to discuss technical matters of survey methodology and resources available for surveys and training programmes in the sub-region.

150. The United Nations is presently engaged in the preparation of a handbook on public personnel administration, basic principles and current practice, which will endeavour to offer civil service commissions and personnel officers an inventory and description of the several basic elements of a comprehensive system of personnel administration and present the basic features of a programme of personnel administration. Research is also being conducted in the field of training and institutes of public administration, with a view to producing a guide for establishing or strengthening training programmes for civil servants, and presenting in a concise form the basic features of a training programme, its organization and methodology. ILO and UNESCO are closely associated with these projects, while UPU, whose field of activities is connected with organization of large bodies of personnel by its member countries, is also deeply interested.

151. An experts meeting is being organized in Paris in June 1964, on the administrative aspects of national development planning, to which participants have been invited from selected countries in Africa, Asia, Europe and Latin America, as well as participants from the United Nations, FAO, IBRD, ILO, UNESCO, WHO and UNICEF.

152. The United Nations and FAO have co-sponsored a workshop on the organization and administration of agricultural services in the Arab States, held in March 1964. The United Nations has collaborated with WHO in developing and carrying out projects on the administration of health services in the Americas. Further collaboration is envisaged, to be extended to other regions.

153. The joint efforts included a workshop on administrative problems of rapid urban growth in the Arab States held in Beirut in March 1963, with the United Nations Bureau of Social Affairs, WHO and UNESCO; a seminar on central services to local authorities in New Delhi in collaboration with the Eastern Regional Organization for Public Administration, ECAFE, FAO, UNESCO and WHO, and the United Nations Intermunicipal Technical Assistance Programme in collaboration with the International Union of Local Authorities at the Hague.

154. Another example of co-operation at the regional level was the seminar on urgent administrative problems of African Governments, held in Addis Ababa in October 1962. There were participants from seventeen African countries and representatives of the following international organizations: United Nations, FAO, ICAO, ILO, UNESCO and WHO. The International Union of Local Authorities was also represented. Based on the recommendations made at this conference, and by the fifth session of ECA, plans were developed to assist the countries in their effort to improve public admini-

¹³ *Ibid.*, *Thirty-sixth Session, Annexes*, agenda items 4 and 6, document E/3765.

stration training on a national level by providing additional facilities on a regional and sub-regional level. For example, UNESCO undertook on behalf of ECA a survey of the needs and resources in the field of training of personnel in Algeria, Morocco and Tunisia and submitted a report on this subject to ECA. This report will provide a basis for the development of sub-regional training programmes as the Governments may request. Stemming from the seminar of October 1962, a conference of directors of central personnel agencies (or civil service commissions) and directors of public administration institutes in Africa will be held in Addis Ababa from 18 to 29 May 1964 to discuss the development of institutes of public administration and ways and means for strengthening civil service systems. The United Nations and the specialized agencies concerned will be represented at this meeting.

155. At a sub-regional level, the United Nations has been consulted by ILO on the development of an institutionalized programme for officials of Labour Ministries in South America (Inter-American Centre for Labour Administration). Public administration advisers at ECA have collaborated in a sub-regional programme developed by ILO in East Africa.

156. A study has recently been undertaken to evaluate specific requirements of a particular country for the purpose of helping it to shape a comprehensive training programme. The United Nations, the Special Fund, ILO and UNESCO have sponsored a joint mission to Niger with a view to examining in broad terms the needs of the country in various types of technical and administrative training. This mission is an example of an inter-disciplinary approach to the problem of training of middle-level personnel, in the spirit of Council resolutions 907 (XXXIV) and 987 (XXXVI) and also a model of concerted action between the United Nations and the specialized agencies when various aspects such as education, manpower, public administration and training are involved.

157. The experts in public administration have increased in number over the past years to meet the various needs to which attention was drawn in Council resolutions 907 (XXXIV) and 987 (XXXVI). From 112 experts in 1960, their number rose to 172 posts in the present 1964 programme. The regional distribution of these posts is as follows: Africa 86, Latin America 43, Asia 22, Middle East 10, Europe 4, inter-agency 7. Seventy-one posts are financed out of the regular budget, 80 out of EPTA, 15 by extra-budgetary operations and 6 by the Special Fund. In 1963 there were seventy-nine OPEX experts in the field for all or part of the year.

(b) OCEANOGRAPHY

158. A close relationship has now been established among the agencies, particularly between FAO and UNESCO, in this field where a number of delicate problems had arisen in the past. This successful experience, in the view of ACC provides an example of co-ordination efforts undertaken to adjust the many interests of the agencies concerned, which progressively evolved into a continuous and fruitful co-operation.

(c) PEACEFUL USES OF OUTER SPACE

159. In its twenty-eighth report, the ACC stated its intention of keeping the question of inter-agency co-operation and co-ordination in this field under careful review. It noted at the same time that the expansion of the activities of certain agencies called for an intensification of appropriate consultation among them at the secretariat level. Since then an inter-agency working group has been established for this purpose.

160. The working group held its first meeting in March 1964. A useful exchange of information took place and decisions on concerted action were taken. Measures were envisaged to avoid overlapping in reports which agencies have to submit to various bodies. Arrangements were made for the preparation of a compact, current and comprehensive survey of the programmes, interest and resources of the various United Nations agencies and other bodies concerned with outer space matters.

(d) INTERNATIONAL CO-OPERATION YEAR

161. Under resolution 1907 (XVIII) the General Assembly has designated 1965, the twentieth year of the United Nations, as International Co-operation Year. The ACC was given a review of the work of the Committee for the International Co-operation Year established under the same resolution, including a number of plans and projects recommended or under consideration by that Committee. The ACC was informed about the arrangements for the Year that are going ahead not only at the international but also at the national level, national committees for the International Co-operation Year being in process of establishment in a number of countries. The Year is expected to focus particular attention on international co-operation for economic and social development.

162. The members of the ACC wish to contribute as fully as possible to the preparations for and the celebration of International Co-operation Year, in response to the request of the General Assembly and its Committee. They took the opportunity to have a first consultation as to the nature of the contributions that could best be made.

(e) PUBLIC INFORMATION

163. The ACC reviewed arrangements made for co-operation in presenting to persons attending the New York World's Fair information on the activities of the United Nations family of organizations. It also agreed to make a study of the possibility of pooling more fully the organizations' existing public information resources and manpower. In a discussion of the three Editors' Round Tables convened by the United Nations Office of Public Information in Europe, Asia and Latin America over the past two years, it was agreed that they had been of value in obtaining recognition amongst information media at a policy-making level, of the importance of the economic and social work of

all of the international institutions. The next such Round Table is scheduled to be held in Africa in 1965.

(f) ASIAN ECONOMIC DEVELOPMENT INSTITUTE

164. In the past two years, the ACC has considered the methods by which the resources and experience of the specialized agencies can be best made available to the Asian Economic Development Institute. In its twenty-sixth report, it expressed the view that provisions should be made "for regular consultations on the preparation and the implementation of the institutes' programmes".¹⁴ In its twenty-eighth report, it observed "that consultation and co-operation, to be continuous and effective, should be based on standing institutional arrangements" and it felt it important that provision should be made for the setting up of "a suitable advisory or consultative committee which would include representatives of substantially interested specialized agencies".¹⁵

165. The arrangements for consultation which have been developed between the Director of the Institute and officers of certain specialized agencies have, on the whole, been working smoothly and have proved helpful. It is felt, however, that these arrangements do not represent a fully satisfactory substitute for the "standing institutional arrangements" which had been recommended by the ACC. It is hoped that the Governing Council of the Institute will study with the Executive Secretary of ECAFE and the Director of the Institute the best means of giving early effect to the ACC's recommendations in this matter.

XVI. Administrative and financial questions

166. Arrangements were concluded for a session of the International Civil Service Advisory Board (ICSAB) in summer of 1964. The revised terms of reference for ICSAB as proposed by ACC in 1963, which broaden the scope and authority of the Board, had been endorsed by the United Nations General Assembly (resolution 1981 B (XVIII) and other legislative bodies. ICSAB will have before it a report by the organizations seeking advice from the Board on the question of career expectations in the international civil service.

167. The terms of a revision of the 1949 inter-organization agreement on transfer, secondment and loan of staff came into effect for most organizations as from 1 January 1964.

168. Some of the major components in the allowance and benefits structure of the Common System continued under study; in particular, the assignment allowance and related benefits and certain of the entitlements payable on separation from service.

169. Pursuant to the request of TAC in its report on its meetings held in November-December 1963

¹⁴ *Ibid.*, *Thirty-fourth Session, Annexes*, agenda item 3, document E/3625, para. 177.

¹⁵ *Ibid.*, *Thirty-sixth Session, Annexes*, agenda items 4 and 6, document E/3765, para. 136.

(E/3849 and Corr.1, paras. 38-43) the ACC has made arrangements to assure the completion, through normal inter-agency machinery, of a comparative study of experts' emoluments. The ACC is also giving attention to the question of adequate living arrangements and minimum amenities for field experts in certain special cases.

ANNEX I

Draft framework of functional classifications for the activities of the United Nations, specialized agencies and the International Atomic Energy Agency in economic, social and human rights fields related to the United Nations Development Decade

The following classification is suggested as a guide for the manner in which activities of the United Nations, specialized agencies and IAEA, related to the objectives of the United Nations Development Decade, might be reported. It does not attempt to list specific projects or to cover the many activities of these organizations unrelated to these objectives. Nor does it reveal the comprehensive treatment given by certain agencies or groups of agencies to some complex subjects—e.g. preparation of young people for later responsibilities and certain aspects of scientific research. While some flexibility may be necessary in using this classification in making the special progress report called for by Economic and Social Council resolution 984 (XXXVI) part I, it is believed that it will provide an orderly, comprehensible basis for preparation of the material requested in that resolution.

I

A. BROAD ISSUES AND TECHNIQUES RELATING TO DEVELOPMENT

1. Development trends and projections of development requirements and possibilities
2. Planning and programming
3. Institutional and administrative development
4. Adaptation and transfer of knowledge, methods and techniques
5. Development and provision of basic statistical information
6. Trade expansion
7. Development assistance (including provision of development finance, assistance in the improvement and application of methods and techniques for the mobilization of domestic and foreign capital, public and private; and food aid)
8. International co-operation in the monetary field

B. DEVELOPMENT AND UTILIZATION OF HUMAN RESOURCES

1. Control of diseases and raising of health standards
2. Formulation and implementation of schemes and measures against famine, malnutrition and food deficits
3. Education and fostering of scientific and cultural development
4. Social welfare and security
5. Employment, organization and training
6. Rural and community development, including co-operatives
7. Social protection

C. DEVELOPMENT AND CONSERVATION OF PHYSICAL RESOURCES

1. Development of food and agriculture
2. Industrial development
3. Energy development

4. Water resource development
5. Mineral resource development
6. Housing, building and physical planning

D. DEVELOPMENT OF ESSENTIAL SERVICES

1. Development of transport
2. Development of communications, including postal services and telecommunications
3. Meteorology
4. Surveying and mapping

II

PROMOTION AND PROTECTION OF HUMAN RIGHTS

1. Collection, examination and publication of information
2. Elaboration of principles
3. Preparation of international instruments and measures of implementation
4. Development of human rights advisory services programme
5. Prevention of discrimination, and protection of minorities and refugees
6. Advancement of the status of women
7. Education of public opinion

III

SPECIAL PROBLEMS

1. Natural disasters
2. Narcotics control

ANNEX II

Communication of the Administrative Committee on Co-ordination to the Advisory Committee on the Application of Science and Technology to Development^a

1. At its session in May 1963, the Administrative Committee on Co-ordination considered the follow-up action required by the organizations of the United Nations family in order to achieve in the Development Decade the goals to which the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas (UNCSAT) had pointed. The ACC decided to establish a Sub-Committee on Science and Technology. It also suggested that the Economic and Social Council might wish to establish an Advisory Committee on Science and Technology.^b On 1 August 1963 the Council in resolution 980 A (XXXVI) decided to establish an Advisory Committee on the Application of Science and Technology to Development. (Background information is given in appendix 2.) The Council envisaged that the Advisory Committee would work in close co-operation with the ACC in reviewing the scientific and technological programmes and activities of the United Nations and related agencies. As a first step in this co-operation, the ACC submits the following information and suggestions for the consideration of the Advisory Committee.

2. The Advisory Committee is charged with studying and reporting to the Council on matters of the greatest importance. A vast potential undoubtedly exists for making modern science and technology the servants of the developing countries in their struggle for accelerated development. This field is by no means being neglected even today. As regards the organizations of the United Nations

family, they have been working in their respective parts of this field for some years. Nevertheless it is necessary to try to come closer to realizing that full potential.

3. The basic problem of financial resources cannot, practically speaking, be avoided. It has two aspects — applicable not only to international assistance but of course to national expenditures as well and to the aggregate of all expenditures. First, when any proposal for new work on for the intensification of existing work on behalf of the application of science and technology for the benefit of the developing countries is under consideration, one must be prepared to estimate what it will cost and whether the same investment might not yield a greater return if applied in other directions. Second, in general and in the aggregate, there is no doubt that considerably larger financial resources are needed for this work than it has commanded in the past. This remains true in spite of substantial offsets that should not be overlooked, notably the expenditures not needed for buying less modern equipment when more modern equipment is bought instead, and the savings, by way of avoidance of soon-obsolete investments, which can result from the making of well-chosen investments in various types of research.

4. The problems before the Advisory Committee form a complex network, and exactly where the emphasis should first be put is a matter of judgement. Two points in particular have to be clarified: first, how broadly or narrowly science and technology should be defined for the purposes in view, and secondly, within that definition, what aspects especially need the attention of the Advisory Committee, due account being taken of the activities already under way in the various fields of competence of the organizations of the United Nations family. As to the first point, while a very broad definition could be justified in principle and also by reference to the subjects discussed at UNCSAT, it would clearly be uneconomical for the Advisory Committee to go deeply into matters such as training in general, economic development planning, various aspects of industrial development, etc. already under active study by other bodies within the United Nations system. As to the second point, there is again the practical consideration that the Advisory Committee will wish to put its time to the best use and minimize its preoccupation with such activities as it finds to be proceeding satisfactorily in any case under the various going programmes.

5. With these considerations in mind, it is suggested that the following matters are among those meriting consideration by the Advisory Committee, once the Committee has acquainted itself with the work of the United Nations family of organizations in the field of the application of science and technology to development:

(1) Methods of keeping progress in the application of science and technology under review;

(2) Improved clearing (collection, retrieval, dissemination) of scientific and technological information needed for development;

(3) The possibilities of mobilizing the efforts of scientific and technological institutions of the developed countries for active co-operation with the developing countries;

(4) The structure of institutions required for a nation's scientific and technological development and their integration into over-all social and economic policies:

(a) The structure in general,

(b) National, regional and international research and training institutes;

(5) The possibility of an immediate world-wide attack on a limited number of especially important problems of research or application.

Some comments on these numbered items are presented *seriatim* below, beginning with paragraph 8.

^a Originally circulated as document E/AC.52/L.2, dated 22 January 1964.

^b *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda items 4 and 6, document E/3765, paras. 38-41.*

6. At an early stage, the Advisory Committee will no doubt wish to consult with representatives of the various organizations of the United Nations family regarding the work of their respective organizations in the field of the application of science and technology to development. In the meantime the organizations concerned have individually transmitted to the members of the Advisory Committee, through the Secretary-General of the United Nations, summary reports which it is hoped will provide a useful introduction to the subject.

7. The general view of the organizations on their need "to discharge more effectively their growing responsibilities" in this field and on "the elimination of duplication" — subjects referred to in paragraphs 3 and 4 (b) of Economic and Social Council resolution 980 A (XXXVI) — may be briefly stated here. First, it is felt that the gaps are far more of a problem than the overlaps, particularly since much of the significant contemporary work in science and technology is inter-disciplinary in nature, making some overlapping of work essential. Second, it is felt that the main gaps are not inter-agency omissions but result from the fact that none of the agencies concerned commands the resources needed if its full job is to be done.

ITEM 1. METHODS OF KEEPING PROGRESS IN THE APPLICATION OF SCIENCE AND TECHNOLOGY UNDER REVIEW

8. The Economic and Social Council in paragraph 4 (a) of its resolution 980 A (XXXVI) has made it the first function of the Advisory Committee "to keep under review progress in the application of science and technology and propose to the Council practical measures for such application for the benefit of the less developed areas". The effective discharge of that review responsibility will presumably necessitate developing a system or methodology that would permit answers to be given — not just once but periodically — to the following questions:

(1) What is the present state of scientific and technological knowledge in the various relevant fields (excluding from consideration knowledge which is not applicable, or is only remotely applicable, to development) ?

(2) To what extent is the applicable modern knowledge being, in fact, applied in the developing countries?

(3) In the light of research under way or planned, what anticipated future progress in scientific and technological knowledge needs to be taken into account for purposes of present development planning?

9. The answer to (2) of course immediately leads to a further question as to why some of the applicable scientific and technological knowledge is not being applied: is it that necessary adaptations have first to be worked out? that the developing countries, or some of them, are not ready to put modern equipment or techniques to use in some sectors or generally? that the transfer is being delayed by lack of funds and/or experts? that restrictive practices, e.g. under patent procedures, are at fault? that significant possibilities are simply being overlooked?

10. Similarly, question (3) invites attention to the possibility that, in some cases, it may be cheaper to invest even substantial sums for obtaining a technological solution to a key problem within a predictable time period than to incur the wastes engendered by uncertainty, i.e. the wrong spending or the delays in right spending under "blindfold" development planning. (In this connexion, see item 5 below.)

11. The needed review methodology will presumably have two aspects. Systematic, comprehensive analyses in published form are required by researchers and other specialists. Quickly available reports highlighting the most significant new innovations and research under way, together with newly observed deficiencies in the application of modern knowledge, are required by the Eco-

nomics and Social Council or other bodies concerned with over-all current appraisal.

12. As regards formal reports, the ACC at its session in May 1963 considered the steps that should be taken to keep up-to-date the information contained in the survey of Current Trends in Scientific Research.^c Its conclusions were that:

"... it would be most difficult, if not totally impossible, to mobilize a sufficient number of specialists to provide completely up-to-date and balanced information required for a report equally complete regarding all the fields of scientific and technological research.

"... If new similar studies should be undertaken it seems that they should be carried out in defined fields selected either for the variety of methods and trends of research, for the importance of the applications derived from the research activities, or for the utilization of new methods that should be made known to the specialists in these and/or related fields.

"This would appear to be, from a scientific point of view, the most commendable action to be undertaken as a follow-up of the Survey. In this eventuality, contracts might be established, as appropriate, with non-governmental organizations working in the fields of science and technology, to prepare a number of specialized reports based on the general lines of the 'survey' but adapted to particular fields of research for which more detailed and precise information may be provided."^d

In the Co-ordination Committee of the Council, which accepted these conclusions, the hope was expressed that the question would be referred to the Advisory Committee for observations.

13. To meet the need for reports that would be available to the Council on a more current basis, there might be developed a system of "built-in" or institutionalized reporting procedures. Each agency with the help of its scientific and technological advisers might as a routine matter report at stated intervals on pertinent new developments in each of its fields of competence. The Advisory Committee may wish to consider the features that such a reporting system should have in order to serve its intended purpose.^e

14. It goes without saying that the introduction of such a system would be likely to necessitate the establishment by certain of the organizations or combinations of organizations in the United Nations family of additional groups or panels to advise them, and that it would place additional responsibilities on advisory groups, panels, etc. already in existence. The administrative and financial implications would certainly be considerable. As was indicated in paragraph 8, it would be necessary to keep track — within such limits as may be imposed by governmental and commercial secrecy — not only of scientific and technological progress already made but also of research under way and planned, and not only of the moving frontier of discovery but also of the moving frontier of application in the developing countries.

ITEM 2. IMPROVED CLEARING (COLLECTION, RETRIEVAL, DISSEMINATION) OF SCIENTIFIC AND TECHNOLOGICAL INFORMATION NEEDED FOR DEVELOPMENT

15. The notion of a central "clearing house" for all scientific and technological information has many attractions, but the practical problems of establishing one that would be capable of

^c Pierre Auger, *Current Trends in Scientific Research* (United Nations, New York and United Nations Educational, Scientific and Cultural Organization, Paris, 1961). Circulated as document E/3362/Rev.1.

^d *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes*, agenda items 4 and 6, document E/3765, paras. 45-47.

^e IAEA has indicated a reservation regarding such built-in reporting procedures. IAEA doubts the value of additional routine reports of this kind and suggests instead, as noted in its own report, that the Advisory Committee might ask the competent agency for a spot report on progress and planned research in a particular field or project.

coping with the enormous flow of such information and of sifting out masses of irrelevant material so as to meet quickly and simply the actual needs of the developing countries defy easy solution. Present methods clearly need to be improved; care has to be taken, however, not to defeat the purpose by creating procedures that are too cumbersome to use.

16. In 1962 UNESCO prepared a comprehensive survey on the organization and functioning of abstracting services in the various branches of science and technology[†] which reviewed possible means of rationalizing and simplifying existing practices in the publication of scientific documents. The Council considered and approved this survey in 1963 (resolution 980 B (XXXVI)). A more recent UNESCO statement concerning additional efforts required by UNESCO and other organizations of the United Nations family is presented below in considerably abridged form (for example, reference to numerous specific aspects of UNESCO's own work programme is here, for brevity, omitted):

(1) *Bibliography.* Bibliography is relatively successfully organized for the basic sciences (mathematics, physics, chemistry and biology) but the bibliography of scientific publications related to the different branches of engineering and other applied sciences is much less developed and has far to go to cover existing subjects and growing requirements. Special organizational and financial facilities should be created.

(2) *Abstracting.* The abstracting Board of the International Council of Scientific Unions, sponsored and supported by UNESCO, has elaborated a system of measures aimed at the rationalization of publishing and abstracting in the fields of mathematics, physics, chemistry and biology. The abstracting of the tremendous volume of material published in different branches of the engineering sciences has practically never been considered from the point of view of rationalization, improvement and meeting the requirements of the developing countries. This task should now be organized, at least in a selected branch of the engineering sciences. Facilities open for abstraction and bibliography through the application of electronic computers should be utilized. FAO notes that, in developing abstracting services in the agricultural field, existing facilities provided by institutions such as the Commonwealth Agricultural Bureau would need to be fully explored.

(3) *Multilingual glossaries and dictionaries.* There are different glossaries covering some fields of basic and applied sciences but, in general, engineering and technology are not covered by this type of scientific information.

(4) *Periodic review of the level of knowledge and trends of scientific and technological progress.* The 1961 *Survey of Current Trends in Scientific Research* (referred to in paragraph 12 above) stressed the importance of periodic review of knowledge and new tendencies of research, as well as of new opportunities for economic and practical utilization. UNESCO and FAO as well as the United Nations have carried out such reviews in several fields of applied sciences, e.g. utilization of saline water, evaporation and measures of control. Many specialized reviews have been published by the IAEA, WHO and WMO in their respective fields of interest. However, the field of modern engineering sciences and technology remains, in effect, uncovered by this type of activity. That is why it is important to arrange on a regular basis for the preparation and publication in three or four languages every 3-5 years of a comprehensive review of progress and advances made in engineering and applied sciences.

(5) *Year books (or almanacs) of the most promising discoveries and inventions in science and technology.* It would be very useful for mankind to have on a regular basis the most reliable reviews of scientific discoveries, inventions and technological advances of exceptional importance for progress in the near future. There

is an example of such a publication in the Russian language, but on an international basis, undertaken by the Academy of Sciences of the USSR, entitled *Science and Humanity*. Utilizing this experience, UNESCO and the United Nations might set up a four-language year book under the title "Science, Technology and Humanity" devoted to these subjects. The most eminent engineers, university professors and research workers of the various countries should participate in compiling this year book.

(6) *Problem of translation.* Some attempt to rationalize translations has been started in Europe (into German), in the United States (into English) and in the USSR (into Russian). But in many countries there still exists a great deal of duplication and parallelism. The cost of translation is high and the quality sometimes poor. Information on translated material is lacking, or is not reaching the developing countries. In this connexion, it would be important to outline and to consider for the future two groups of questions:

(a) Possible rationalization of translation into four of the official languages of the United Nations (English, French, Russian and Spanish);

(b) Possible creation in the future of an international centre for machine translation of scientific publications, utilizing electronic computers and similar devices. The Advisory Committee might discuss this matter and a decision could be reached to set up a large United Nations-UNESCO project for the creation of an international centre for machine translation of important publications in science and technology.

(7) *Network of centres and clearing house for scientific and technical documentation.* UNESCO has experience in the creation of centres of scientific documentation in Brazil, Mexico, United Arab Republic, and India, equipped with modern techniques for copying, microfilming, etc. Such types of scientific documentation centres should be established in each country. In the areas of the small developing countries, centres of scientific documentation could be created on a regional and sub-regional basis. The Advisory Committee might consider the question of the creation of international centres covering not only the exact, earth and life sciences, but particularly the main branches of the engineering and other applied sciences to serve the interests of all the Member States of the United Nations.

(8) *Refresher training courses.* The United Nations, the specialized agencies and the IAEA regularly organize so-called training and refresher courses for scientists, engineers and other technical personnel on a regional and sometimes on an inter-regional basis — for instance, in methods of amelioration of saline and water-logged soils, in methods of prospection of underground water resources, in the field of ore dressing, in the chemical technology of cellulose, in earthquake engineering and others. This form of dissemination of the most modern knowledge should be reinforced and expanded, both as regards the network of courses and the subjects.

17. Some other current ideas on various aspects of the problem of clearing scientific and technological information so as to make such information more readily available to the developing countries may be briefly mentioned here. In the Secretary-General's report to the Council on UNCSTAT it was suggested that:

"An effort can already be made at the country level where, as also at regional and headquarters levels, the various agencies of the United Nations family will necessarily have a special responsibility for information in the scientific and technical areas of their competence. The field offices of the Technical Assistance Board and the Special Fund can play an important supporting role as a local channel and a focal point for referring inquiries to the primary sources of detailed information. In one direction would flow information on available techniques;

[†] E/3618.

in the other, information on problems requiring technical solutions that may be known elsewhere or may be obtainable through further research that can feasibly be undertaken.”⁸

18. In the United Nations Special Fund the conviction is growing that something must be done to reduce the waste from not using developmental experience already gained in many parts of the world. Enormous effort and billions of dollars have been spent to improve knowledge and techniques for raising the productivity of human and physical resources in the developing countries. Unfortunately, the lessons of this work and the benefits of this experience are not very widely shared. Thus, expert findings provided to one country are usually not made available to other countries, even where technical conditions may be similar. Hence work may have to be unnecessarily duplicated. This waste is all the more intolerable today when modern methods of information storage, retrieval and dissemination make the widespread diffusion of knowledge both more easy and less expensive. The United Nations Special Fund, eager to get “maximum mileage” from surveys and reports of projects it assists, is examining ways and means of having most of these project findings reproduced on microcards or microfilm for the use of various interested governments and parties. It would wish, however, to make this material available as part of a larger system for the convenient storage, retrieval and effective distribution of information useful in accelerating development.

19. As regards industrial technology, particular attention is being given in the Centre for Industrial Development to the means whereby the flow of needed information could be increased by strengthening the transmission mechanism at the demand end. Some designated person in each developing country should know where to obtain the most reliable information about existing and approved techniques and how to keep himself informed of new techniques as they evolve. This problem might be solved if there were to be established an international service of high-level technological information officers, staffed with personnel from the developing countries themselves, who could, if desired, be attached to technological or industrial research institutes or other governmental agencies. Their training might be provided or arranged for by the Centre. In addition, the Centre hopes to establish a system for clearing information and providing periodic reports on programmes of industrial development in developing countries and the assistance being rendered in that field by the various agencies concerned.

ITEM 3. THE POSSIBILITIES OF MOBILIZING THE EFFORTS OF SCIENTIFIC AND TECHNOLOGICAL INSTITUTIONS OF THE DEVELOPED COUNTRIES FOR ACTIVE CO-OPERATION WITH THE DEVELOPING COUNTRIES

20. General Assembly resolution 1944 (XVIII), adopted on 11 December 1963,

“Requests the Advisory Committee on the Application of Science and Technology to Development to examine, in keeping with its terms of reference, the possibility of establishing a programme on international co-operation in science and technology for economic and social development in which scientists and technicians of the highly developed countries would, as a matter of priority, help to study the problems of the developing countries and explore suitable solutions, having regard to limitations upon the material resources and trained personnel currently available to the developing countries” (operative paragraph 3). The resolution further:

“Recommends that the Advisory Committee should envisage, in connexion with such a programme, the possibilities of:

“(a) Mobilizing the efforts of universities and scientific and technological institutions of the developed countries for active participation in such a programme;

“(b) Creating and strengthening, with the aid of the highly developed countries, national and regional institutes for scientific and technological research and training in the developing areas of the world;

“(c) Obtaining the human, technical and financial resources required for the execution of such a programme” (paragraph 6).

21. The scientific and technological institutions whose co-operation should be sought would include governmental institutions, non-governmental organizations and, in appropriate cases, the scientific and technological services maintained by industry.

22. In the execution of such a programme and in reference particularly to paragraph 6 (a) of the resolution, due attention should certainly be given to utilizing the experience and the established contacts of the specialized agencies. For instance, UNESCO has close ties with many international scientific non-governmental organizations. It grants annual subventions to non-governmental organizations in the order of \$250,000 and contracts in the order of \$150,000 annually. It maintains especially close relations with the strongest international scientific body, the International Council of Scientific Unions (ICSU), which co-ordinates the activities of the most important fifteen international scientific unions, including many associations and federations acting in mathematics and in pure and applied physics, pure and applied chemistry, geology, geophysics, geodesy, hydrology, seismology, etc. UNESCO is permanently in touch also with the Union of International Engineering Organizations. It has a permanent consultative relationship with the International Association of Universities, and, acting with the assistance of this Association and in close co-operation with the European universities, it has set up a long-term project entitled “Post-Graduate University Training Course in Science and Technology” under which universities have organized a number of training courses for the gifted youth of the developing countries. With regard to semi-governmental and governmental organizations, the Natural Sciences Department of UNESCO has permanent contacts and works in close co-operation with national academies and central research organizations in many countries (a number of which have their own UNESCO committees), and is thus in close touch with authoritative scientific opinion in Member States.

23. The ILO has a unique relationship with industry and labour and a wide range of contacts with bodies involved in the practical application of science and technology for purposes of economic development.

24. The FAO has made arrangements for consultation with 105 international non-governmental organizations, to secure expert information and advice and technical co-operation and assistance from them. In some instances they assist in carrying out some of FAO's technical activities. FAO has also obtained the collaboration of individual scientists and technologists in their personal capacity through the World Food Congress, held in Washington in June 1963, and this collaboration is expected to be continued through the calling of periodical food congresses.

25. The WHO has since its inception given great emphasis to its relationship with international non-governmental organizations in the whole field of health. At the end of 1962, the Executive Board of the Organization had admitted fifty-six such organizations into what is known as official relations, and more recently it approved a resolution which would intensify further the mobilization of the technical resources of the non-governmental organizations in the field of health.

26. The WMO has for many years had formal working arrangements with ICSU and the International Union of Geodesy and Geophysics (IUGG). In accordance with these arrangements all research activities of WMO, organization of symposia etc. are closely co-ordinated with similar activities of ICSU, IUGG and their subordinate bodies. The members of the newly created WMO Advisory Committee were selected in consultation with ICSU,

⁸ Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 15, document E/3772, para. 237.

and the interest of ICSU is strongly represented on the Committee. In the field of atmospheric sciences existing arrangements provide convenient machinery for mobilizing the activities of universities, academies, etc.

27. The IAEA maintains close relations with ICSU and sometimes provides financial support to non-governmental organizations whose work is closely connected with atomic energy, such as the International Commission on Radiological Protection and International Commission on Radiological Units and Measurements and industrial atomic forums.

28. Similar indications could be given for the other organizations of the United Nations family. For example, the United Nations itself — to mention one section of its programme — co-operates closely with the World Power Conference, the World Petroleum Conference and similar organizations in the fields of water, mineral and energy resources, as well as transport and cartography.

29. The Advisory Committee is not requested to report to the Economic and Social Council under the above resolution of the General Assembly until the Council's summer session in 1965. Some thought on the subject this year appears advisable, however. This would assist the ACC in its own consideration of the matter.

ITEM 4. THE STRUCTURE OF INSTITUTIONS REQUIRED FOR A NATION'S SCIENTIFIC AND TECHNOLOGICAL DEVELOPMENT AND THEIR INTEGRATION INTO OVER-ALL SOCIAL AND ECONOMIC POLICIES

(a) *The structure in general*

30. Virtually all the developing countries have found it necessary to apply some form of planning to their economic and social development. Clearly, a short-term and long-term outline of the scientific progress desired, as well as a system of national measures for the application of science and technology to development, should constitute an integral part of governmental economic and social planning. In order to achieve this, each country requires its own national structure for the elaboration and execution of a national policy in science and in its application. This structure will naturally vary according to the context, i.e. the stages of economic and social development already achieved and the other conditions prevailing within particular countries. Ultimately it may become very comprehensive and many-sided. From a long-term point of view UNESCO has concluded that a structure along the following lines may often be desirable — of course supplemented as necessary by structures in special fields (health, agriculture, meteorology, hydrology, etc.):

(1) A Committee of scientific advisers to the Chief of State, attached to his office or to the office of the Prime Minister.

(2) A parliamentary group, committee or panel for science, responsible for discussing, outlining and obtaining decisions on the most important trends of national scientific and technological progress as well as necessary budgetary allocations.

(3) A State committee for science, or national science policy council, or ministry for scientific and industrial research.

(4) A national centre or centres of scientific and industrial research, or national academies of science, with responsibility in setting up a network of scientific institutions, laboratories, important inter-disciplinary projects and practical evaluation of the recommendations presented to Governments.

(5) A network of universities, of polytechnic schools and research laboratories, and of applied research laboratories linked with industry. (Some could be organized on a regional or sub-regional basis.)

(6) Organizations for geodetic, geophysical and geological field surveys for mineral, water, soil and wild-life resources.

31. It should be particularly emphasized here that scientific and technological planning should be organized within the framework of the arrangements of the State concerned for the consideration of matters of general economic and social policy, and should include provision for full consultation with those whose co-operation will be required for the practical implementation of the proposed plans.

32. A reasonable balance (depending on conditions of a given country) between (i) basic research, (ii) oriented research, (iii) applied research and (iv) development work and studies will need to be defined by each country in accordance with local conditions and economic trends. One must take into account the fact that national budgetary allocations for science will have to be particularly large when it comes to financing research devoted to application and development. In relation to national income, the experience of the advanced countries suggests that the total allocation for national scientific and industrial research in the civilian field should be between 1 and 2 per cent.

33. In the course of the past three years UNESCO has completed a world survey of existing governmental institutions and organs responsible for national policy in science, including the organization and planning of scientific and industrial research. As reported in their special document, about seventy member States of UNESCO either have very rudimentary organs responsible for these functions, or have none at all. The IAEA has found that as many as fifty countries have an Atomic Energy Commission, while a survey by WHO has revealed that only forty-two countries have some sort of a central medical council or academy.

34. As regards training institutions, it is clear that a most important and most difficult task in connexion with the application of science and technology to development will be the continuation and the considerable intensification for several generations of the education and training of skilled specialists — engineers, university professors and research workers — belonging to the developing countries. Also needed is much fuller provision for the training of the industrial management, technicians and skilled workers necessary for the practical application of new processes and techniques.

35. Some impression of the magnitude of the task is given in an estimate, by UNESCO, based on the experience of the highly industrialized countries, that, for each one million people, 5,000-10,000 engineers and other highly qualified technical personnel (including doctors, agronomists, etc.) are required, and 500-1,000 research scientists on the average.

36. Specific targets for several generations need to be developed for the education of scientists and technicians, and for the creations of a network of hundreds of universities and institutes of technology which will in the best of circumstances take something like 30-40 years. As is indicated elsewhere, all agencies are now carrying out a broad programme for the creation of national and regional training centres as well as institutions for research and development. For the additional effort necessary, however, large financial resources will be required, and urgent and sustained organizational efforts at national, bilateral and international levels. Certainly all the existing scientific, technological and other institutes, universities and laboratories must be carefully preserved, reinforced and made part of an expanded network of national scientific institutions.

(b) *National, regional and international research and training institutes*

37. Research institutes, a vital part of the structure of institutions required for a nation's scientific and technological development, call for special attention. The problem is to find ways of strengthening existing national institutes in the developing countries, establishing others, and probably establishing additional institutes

on a regional or even an international basis — an undertaking which admittedly sometimes presents special difficulties of financing, etc. This will require a considerable investment of resources, but the ultimate returns are likely to justify the costs.

38. While it is vitally important that research institutes in the technologically advanced countries should devote more attention to the problems of special interest to the developing countries (see discussion under item 5 below), this cannot take the place of the establishment of more and stronger research as well as training institutes in the developing countries themselves. The developing countries need such institutes in order to build their own scientific and technological capacity. Moreover, problems such as those of tropical medicine and tropical botany have to be investigated in tropical countries, and for many other problems, although the investigations can be largely conducted in the advanced countries, the final stages at least need to be carried out under conditions that will assure successful local adaptation of the findings.

39. A substantially strengthened system of regional research institutes could in principle supplement national efforts in a very useful manner. Some might be formed by a suitable strengthening and broadening of institutes originally established on a national basis, while others might be regional from the start. Money and skilled manpower would be economized by such a pooling of efforts, and findings used more widely. The countries least able to do research on their own would be especially benefited. The regional institutes could provide a "half-way station" for persons trained abroad and not yet able to find use for their newly acquired skills at home; thus the present inordinate loss of such persons through their failure to return to the developing countries would tend to be cut down.

40. Research institutes may need to be organized on an even broader geographical basis, as inter-regional or fully international institutes. Problems such as those common to all humid areas of the tropics or to all arid areas, for example, clearly know no regional boundaries. A useful link is being established between regional, interregional and national institutes by the collaborative or co-operative research programmes of certain agencies. Regional and national institutes agree to work on different problems and then exchange results or in other cases, where technically desirable, agree to follow parallel or co-ordinated lines of investigation. At the same time, certain scientific and technological problems do not lend themselves to adequate study by national or regional effort, or even by collaborative programmes. The possibility of promoting specialized international research institutes is therefore under consideration by various organizations of the United Nations family. Thus, for example, WHO is actively exploring at present the possibility of promoting an international research institute to deal with certain aspects of biomedical research.

41. With more than ten years of experience in the creation of institutions for training and research on the national, regional and international levels (Bombay Polytechnic, Latin American centres for basic and applied mathematics, International Computation Centre in Rome, European Organization for Nuclear Research, and others), UNESCO has worked out detailed specifications for the institutions that are required on all three of these levels for the world of the developing countries. In recent UNESCO statements the view has been expressed that the most urgent priorities in the broad spectrum of interests are related to cartographic services, the agrarian economy, mining, and specialized fields of technology that will vary with the economy of the particular country. UNESCO has also concluded that education, basic research, applied research and the training of advanced scientists and engineers are inseparable and must be foreseen in the activities of any institution — naturally in proportions governed by human and economic conditions in the country concerned.

42. The FAO also has a long history in the promotion of regional and national research centres as well as in co-ordination of research

in existing laboratories and institutes. Some institutes originally established as an FAO project have now been handed over to the national authorities, as in the case of the Latin American Forest Research and Training Institute in Mérida, Venezuela. Co-ordination is exemplified in the Near East Animal Health Institute, linking the laboratory research of several countries in the region, the East African Marine Laboratory which promotes the research in marine sciences in that region, and the Near East wheat and barley project undertaken with the help of the Rockefeller Foundation. FAO has also strengthened national research centres such as the fisheries research institutes in several Latin American countries. In other cases, FAO promotes or strengthens applied research in technological institutes such as the Food Processing Institute in Syria or research institutes in individual commodities (the Hide, Skin and Leather Institute in Khartoum, the Wood Institute in India, the Cotton Research Institute in Cairo, etc.). On the other hand, FAO is using under special contracts the research facilities provided by institutes of world repute such as the Pasteur Institute in Paris for Sunn Pest, and the Anti-Locust Research Centre in London, and it enters into arrangements with universities like the University of California for the secondment of scientists to carry out studies on water and irrigation problems. In addition to providing support to specific research institutions and programmes, FAO has a substantial programme for improving over-all national organization of food and agricultural research so as to ensure that research resources are directed to problems the solution of which is urgently required in the implementation of development plans and that an organizational link is established between applied research and the education, advisory and other developmental services and institutions essential for the application by farmers, foresters and fishermen of the findings of research.

43. For the last twelve years WHO has been promoting international and regional research centres. The main approach used is the designation of an existing laboratory or institution as a centre to perform a specified function — such as the standardization of nomenclature, technics and methods; the production and distribution of standard reagents, sera or bacterial cultures; or the raising of certain types of laboratory animals — where this function cannot be adequately performed at the purely national level but is essential for the development of research at both national and international levels. These centres are known as the WHO reference centres and are assisted financially by the Organization. They also facilitate the exchange of scientific and technical information and are used as training centres for national research workers. The network of WHO reference centres by the end of 1963 consisted of 31 international, 45 regional and 29 other collaborating laboratories; one international centre and 21 regional centres were set up jointly by WHO and FAO. Another principle used by WHO is the creation of research centres for fields not covered by existing institutions or in order to meet special needs. The Nutrition Institute for Central America and Panama, the Insecticides Testing Unit in Lagos and the Filaria Research Unit in Rangoon are typical examples of this approach.

44. A number of national institutes have been created by or with the assistance of ILO in order both to perform specific specialized functions and to make available the scientific and technological knowledge required for the achievement of their immediate aims. In the field of productivity and management development, national productivity centres have been launched or assisted in thirty-five countries in Asia, Africa and Central and South America. In all these cases, close contact with industrial and managerial circles has been not only a condition for the effective functioning of the productivity centres, but also a valuable source of guidance in bringing scientific and technological knowledge to bear on practical problems or determining the lines along which further research would prove most fruitful. In the field of small industries development, institutes have been established or assisted in Ceylon, Malaysia, Thailand, United Arab Republic and Morocco, and play an important role in identifying, clarifying and expressing

the needs for scientific and technological innovations or improvements of the industries concerned and in disseminating and assisting in the application, for the benefit of small undertakings, of the results of research undertaken on the basis of their specifications. Whether actual research is carried out in specialized sections of the institutes themselves or is entrusted, sometimes on a fee basis, to academic or governmental institutions depends essentially on local facilities. Similar functions are being performed in the field of industrial safety by the Dhanbad Central Mining Research Station and by the regional labour institutes in Calcutta, Kanpur and Madras. In general, as regards the fields of interest of ILO, there would appear to be real scope for regional clearing houses. Their success would, however, continue to depend on maintaining close links between industrial needs and existing or planned research facilities rather than on creating new autonomous and largely self-inspired research and development schemes.

45. The WMO considers that there is an urgent need for further research in tropical meteorology. The Organization is therefore in various ways assisting research institutes for this purpose. The WMO is also the executing agency for some Special Fund projects in support of meteorological research institutes such as the Meteorological Institute in Israel and the Tropical Research Institute in India. It has also prepared a detailed plan for meteorological training institutes in Africa.

46. Both regional and international centres have been established under the auspices of the IAEA: for research and training in Cairo for the Arab countries, for Theoretical Physics in Trieste. Other regional centres are being considered in Africa, Asia and Latin America, as well as arrangements for sister relationships between laboratories in highly advanced centres and institutes in developing countries.

47. If, in addition to various national institutes to which United Nations help has already been given, regional research institutes were to be established in the areas of work for which the United Nations is responsible, they should be linked in some manner to the regional economic commissions. They might also be brought into relationship, as appropriate, to the specialized agencies and the IAEA. In delimiting the scope of their programmes, reference could be made to the following guidelines among others:

(1) Their greater suitability for applied research and for development (practical testing in pilot plants or otherwise) than for pure or fundamental research;

(2) The growing emphasis on industrial development, and hence on the problems of establishing manufacturing industries, in the work of the United Nations;

(3) The desirability of utilizing these institutes in connexion with "especially important" problems of research or application assuming a decision to establish a list of such items (see item 5 below);

(4) The nature of the substantial number of more purely technological projects presently being carried on by the regional commissions themselves;

(5) The need for such institutes to avoid accumulating permanent interests in particular lines of research which would prevent them from transferring their interests at a certain stage to other suitable research organizations, thus freeing themselves to begin new pioneering activities.

48. Of the many aspects of the question of how the already existing research institutes can best be added to and strengthened, two are perhaps especially in need of consideration by the Advisory Committee. One relates to the identification of, and criteria for distinguishing, research problems and functions suitable for regional or international institutes from those better dealt with in national institutes. The other relates to phasing: on the basis of relative need on the one hand, and the resources that might reasonably be brought into play on the other, what practical conclusions should be drawn on the sequence of steps to be taken?

ITEM 5. THE POSSIBILITY OF AN IMMEDIATE WORLD-WIDE ATTACK ON A LIMITED NUMBER OF ESPECIALLY IMPORTANT PROBLEMS OF RESEARCH OR APPLICATION

49. It has been suggested by the Secretary-General of the United Nations that there might be established an agreed list of especially important problems of research or application, including new inventions, adaptations or cost-reductions having each a potential development effect of extraordinary dimensions, directly or through its ultimate repercussions. The Secretary-General has expressed the belief that, were such a list to be established, it would be possible, in addition to bilateral governmental and United Nations resources, to obtain the support of foundations and similar private institutions to bring the research tasks having that kind of priority rating to a successful conclusion. He has also indicated that he would be willing to lend his full support to seeking such additional assistance.

50. The criteria on the basis of which a list of especially important research projects might be compiled should include: (a) on the demand side, the degree of need as judged by the expected benefits, and also the degree to which the allocation of scarce resources under development planning would be assisted, and aggregate costs in the long run reduced, by minimizing the uncertainty as to when the improved technique could become available; (b) on the supply side, the estimated time and money required to achieve a break-through.

51. Much of the research work on the items in question would undoubtedly have to be done in the economically and technologically advanced countries. Sometimes indeed a pooling of the efforts of several of the advanced countries might be essential. But the developing countries would have a vital complementary part to play in helping to determine relative needs, in deciding on technical specifications, and in carrying out the final stages of research and field testing so as to make adaptation and acceptability an integral part of the technical solution itself.

52. The Advisory Committee could, it is suggested, render a valuable service by helping to decide on the feasibility and advisability of establishing such a list of especially important research items or projects and, assuming a decision in favour, by drawing up an actual list for recommendation in that sense to the Council. A rather lengthy list of items which have been given preliminary attention by the ACC and from which a selection might be made is appended below (appendix 1). The ACC has in mind the importance of solving not only problems to which no answers exist anywhere as yet, and which may perhaps arise only or chiefly in the developing countries, but also problems of adapting existing equipment and processes to the conditions governing their application in the developing countries, including projects for self-maintaining equipment and the introduction of intermediate technology. However, if certain problems are to be designated as "especially important" in an over-all sense, with a view to launching world-wide attacks upon them and supporting those attacks with resources on a scale adequate to obtain the needed solutions quickly, the list of problems so designated at any one time will undoubtedly have to be short.

Appendix 1

PRELIMINARY LIST FROM WHICH A SELECTION MIGHT BE MADE FOR THE PURPOSE OF ESTABLISHING A LIST OF "ESPECIALLY IMPORTANT" PROBLEMS OF RESEARCH OR OF APPLICATION IN DEVELOPING COUNTRIES^a

A small energy unit for village use

A wheeled vehicle or hover-craft tailored in price, durability and other specifications to the needs of the developing countries

^a Originally circulated as document E/AC.52/L.2, annex I.

Economical desalinization plants for areas short of fresh water

New telecommunication procedures for accelerating education and training

Development of new and traditional forms of acceptable protein food on a mass scale to combat malnutrition

Solutions for problems of human reproduction

Solutions to medical problems largely centered in the developing countries, particularly parasitic diseases

Solutions to universal medical problems, particularly cancer, cardiovascular disease and mental health

Methods of overcoming the genetic and toxic effects of environmental pollutants and the side-effects of therapeutic and prophylactic substances

Improvement of biomedical research communication

Completion of monographic reviews of the natural resources of Asia, Africa and Latin America on a continental or sub-continental basis

Preparation of global reviewing maps of geological and mineral deposits, particularly maps showing metallogenic concentration and potential location of petroleum fields

Development of improved practices for the optimum use of water in agriculture

Prevention and liquidation of waterlogging and salinity of irrigated land

Restoration of fertility of eroded laterites

Adequate supply of plant food, particularly chemical fertilizers, at low cost

Improved cheap farm implements suited to local conditions

Tsetse control and trypanosomiasis eradication

Economical means of introducing synthetic fibres for fishing nets and handlines

Exploitation of potential yields from fishery resources

Measures for minimising loss in storage of food for human consumption, and development of food processing and utilization of perishable foods

Improved short- and long-range weather forecasting

Weather modification and control

Forecasting of earthquakes and improvement of anti-seismic construction

Further development of various types of largely self-maintaining equipment

Development of intermediate technological tools: an intermediate stage between the hand-loom and the power-loom; powered but non-automated machine-tools (such as lathes and grinders); improved kilns and ovens, for the production of bricks and tiles; simple but accurate gauges and measuring equipment for the chemical industry

Improved manual earth-moving equipment including wheelbarrows, pick-axes, spades and shovels

Training in all fields and at all levels

Appendix 2

BACKGROUND INFORMATION REGARDING THE ESTABLISHMENT OF A PROGRAMME ON INTERNATIONAL CO-OPERATION IN SCIENCE AND TECHNOLOGY FOR ECONOMIC AND SOCIAL DEVELOPMENT^a

1. The United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas

^a Originally circulated as document E/AC.52/L.2, annex V.

(UNCSAT), which for practical purposes constitutes the starting point for the present intensified effort, was of course not an isolated event but was rather the logical culmination of a fairly lengthy series of steps. In response to various resolutions of the United Nations General Assembly and the Economic and Social Council,^b the United Nations Scientific Conference on the Conservation and Utilization of Resources took place as early as 1948; Conferences to discuss the Peaceful Uses of Atomic Energy were convened in 1955 and 1958; the International Atomic Energy Agency itself was established in 1957; the survey of Current Trends in Scientific Research^c was undertaken under the joint auspices of the United Nations and UNESCO in 1958-1960; the United Nations Conference on New Sources of Energy was held in 1961; and attention has been increasingly directed to the value of international scientific and technical co-operation and exchange of experience. UNESCO under its charter has for years been active in the field of natural science. The application of science and technology to development has figured prominently in the work of all the specialized agencies, the IAEA and the United Nations itself, constituting indeed in the case of some agencies the essence of the work.^d

2. In February 1963 UNCSAT was convened in Geneva. Its deliberations covered an extremely wide range of subject matter in natural science and in certain areas of social science as well. Nearly 2,000 technical papers were accepted. These, together with composite digests of their contents prepared by the Conference Secretary-General and his staff and digests of the oral discussions prepared by the rapporteurs, constitute the technical record of the Conference in the strict sense. The proceedings and the substance of the written and oral discussions are summarized more broadly in the report on the Conference by the Secretary-General of the United Nations,^e and especially in the eight-volume narrative report, *Science and Technology for Development*.^f

3. Any detailed findings aside, the main conclusions emerging from UNCSAT were that the effective application of modern science and technology can contribute enormously to the acceleration of the development of the less-developed countries; that vigorous follow-up action to the Conference is essential; and that this will entail the focusing of substantially larger resources — both in scientific brains and in money — than those problems have ever had directed to them to date.

4. Figuring prominently in informal discussions during the Conference was a query as to the adequacy of the existing international machinery for promoting the application of science and technology to development. Many persons present felt that this machinery needed to be strengthened. Some felt that consideration should be given to establishing a new agency.

5. In April 1963, the President and Secretary-General of UNCSAT and representatives of the fifteen Governments that had had Vice-Presidents at the Conference consulted informally with the Secretary-General of the United Nations in New York regarding the nature of the follow-up action required.

6. In May 1963 the Secretary-General of the United Nations and the Executive Heads of the specialized agencies and the IAEA

^b The relevant resolutions include: General Assembly resolutions 810 (IX); 1043 (XI), 1164 (XII), 1260 (XIII), 1429 (XIV) and 1512 (XV); Economic and Social Council resolutions 32 (IV), 695 (XXVI), 804 (XXX), 829 (XXXII), 910 (XXXIV) and 911 (XXXIV). UNCSAT itself was authorized by Council resolution 834 (XXXII), adopted on 3 August 1961.

^c Pierre Auger, *Current Trends in Scientific Research* (United Nations, New York and United Nations Educational, Scientific and Cultural Organization, Paris, 1961). Circulated as document E/3362/Rev.1.

^d A number of relevant resolutions of the specialized agencies and IAEA are referred to in the reports which have been prepared by them for the Advisory Committee.

^e *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 15, document E/3772 and Add.1.*

^f United Nations publications, Sales Nos.: 63.I.21 to 63.I.28.

discussed the same subject in Geneva in the course of their consideration of various matters in the ACC. (For the conclusions of ACC, see annex II, paragraph 1 above.)

7. In the light of the foregoing consultations the Secretary-General presented his preliminary views to the Economic and Social Council at its thirty-sixth session in Geneva. Those views are set forth in part Three of his report^e and in his address to the Council on 8 July 1963.^g As regards the question of organizational structure referred to above, his view (as also that of his colleagues in the agencies) was and remains that the establishment of a new agency for science and technology would not be desirable; rather, the possibilities of utilizing the existing agencies should be developed to the fullest extent, with due attention to strengthening them individually and, as necessary, strengthening their co-ordination arrangements as well.

8. The importance which the Council attached to finding practical ways to promote wider application of science and technology to development is sufficiently indicated by its resolution 980 A (XXXVI) of 1 August 1963 which established the Advisory Committee on the Application of Science and Technology to Development.

9. In April-May 1963, the Director-General of UNESCO submitted to the Executive Board of the Organization at its 65th session a report on the Conference together with proposals for future action. The Executive Board adopted a resolution (65 EX/Decision 4.3.1) which noted in particular that "by virtue of Article IV.B.5 of its Constitution, UNESCO is charged with advising 'the United Nations Organization on the educational, scientific and cultural aspects of matters of concern to the latter'", and which approved in principle the Director-General's proposal "that scientific questions be accorded an importance in UNESCO's programme similar to that given to education". Accordingly, the Director-General submitted to the Executive Board at its 66th session, and the Executive Board adopted as a basis for the preparation of the Programme and Budget for 1965-1966, proposals for an increase of over 50 per cent (from \$4,775,000 to \$7,455,000) for programme activities in the field of science and technology. As a consequence, and in view of the anticipated increased number of projects in this field to be undertaken under the Expanded Programme of Technical Assistance and the Special Fund, the secretariat of UNESCO has been reorganized. In addition to the existing Department of Natural Sciences, whose activities are being strengthened, a second Department, concerned with the application of science and technology to development, has been established, and both will be placed as from 1964 under the supervision of an Assistant Director-General in charge of the programme in science and technology.

10. A resolution adopted by the IAEA (GC/VII/Res 153) gives special emphasis in the Agency's long-term plan to projects of particular importance for the transfer of science and technology to the developing countries within four of the five priority areas suggested by the Special Committee on Co-ordination and endorsed by resolution 984 (XXXVI) of the Economic and Social Council on the Development Decade, i.e. industrial development, development of human resources, development of agricultural production and development of natural resources.

11. On 11 December 1963, the General Assembly adopted resolution 1944 (XVIII), which envisages the establishment of a "programme" of international co-operation in science and technology for economic and social development.

12. Finally, in early January 1964, the ACC considered the programmes of the United Nations family of organizations in this field and exchanged views on further action to be taken.

^g Official Records of the Economic and Social Council, Thirty-sixth Session, 1271st meeting.

ANNEX III

Co-operation in activities relating to the peaceful uses of atomic energy

Appendix 1

RESOLUTIONS ADOPTED BY ORGANIZATIONS IN RESPONSE TO ECONOMIC AND SOCIAL COUNCIL RESOLUTION 986 (XXXVI)

A

RESOLUTION GC(VII)/RES/149 ADOPTED BY THE GENERAL CONFERENCE OF IAEA ON 1 OCTOBER 1963

Co-ordination of atomic energy activities

The General Conference

1. Takes note of resolution 986 (XXXVI) on co-ordination of atomic energy activities adopted by the Economic and Social Council of the United Nations at its thirty-sixth session, and in particular of the affirmation by the Economic and Social Council that the Agency

"should act as the primary sponsor, in co-operation, where appropriate, with the interested specialized agencies, of activities in which atomic energy or research relating thereto forms the major part of the subject matter".

2. Affirms the Agency's readiness in accordance with the resolution of the Economic and Social Council to co-operate fully with the United Nations and the specialized agencies in seeking more effective co-ordination;

3. Requests the Board of Governors and the Director General to take such further steps as may be necessary to ensure co-ordination at the earliest possible stage in the development of Agency programmes and projects; and

4. Requests the Director General to circulate the text of the Economic and Social Council resolution to all Member States.

B

RESOLUTION 27/63 ADOPTED BY THE CONFERENCE OF FAO ON 4 DECEMBER 1963

Co-operation between FAO and other Members of the United Nations system

The Conference,

Considering the importance of ensuring co-ordination of the steadily expanding activities of the organizations of the United Nations system,

Anxious to avoid duplication of effort and to ensure appropriate inter-agency co-operation in all cases affecting more than one organization,

Conscious of the need to use the limited financial resources of United Nations bodies to the maximum benefit of countries requesting assistance,

Noting with concern the problems of duplication discussed during the Eleventh and Twelfth Sessions, in particular as regards the United Nations, the International Atomic Energy Agency, UNESCO and the International Labour Organisation, and

Noting also resolution 986 (XXXVI) of the Economic and Social Council concerning work in the field of atomic energy,

Confirms the willingness of FAO to conform to the terms of that resolution and to co-operate with other international agencies in the field of atomic energy activities in order to prevent duplica-

tion of work, taking into account, however, that FAO has responsibility for the use of nuclear science techniques in applied research and development in agriculture, food, fisheries and forestry;

Supports the Director-General in his efforts in the Administrative Committee on Co-ordination to reach satisfactory inter-agency co-operation and co-ordination in fields where difficulties are experienced;

Expresses appreciation of the action of the Economic and Social Council in keeping these matters of co-operation and co-ordination under continuing review;

Recommends Member Governments to increase their efforts to ensure full co-ordination of the views expressed by their delegates at meetings of the governing bodies of the various inter-governmental organizations.

C

RESOLUTION EB33.R50 ADOPTED BY THE EXECUTIVE BOARD
OF WHO ON 24 JANUARY 1964

Co-ordination with the International Atomic Energy Agency

The Executive Board,

Having considered the report of the Director-General on co-ordination with the International Atomic Energy Agency;

Taking into account resolution 986 (XXXVI) adopted by the Economic and Social Council of the United Nations at its thirty-sixth session;

Cognizant of the constitutional obligations of WHO;

Recalling the previous resolutions of the Executive Board and the World Health Assembly, including resolutions WHA11.50 and WHA13.56;

Recognizing the importance of the consultations between the Director-General of the International Atomic Energy Agency and the Director-General of WHO; and

Considering the need for fruitful collaboration among WHO and other interested agencies in radiation health,

1. *Reaffirms* the responsibility of WHO at the international level for any activities in the field of health involving ionizing radiation, including protection from radiation hazards and the medical uses of radiation and radio-active isotopes;

2. *Calls* the attention of Member States and Associate Members to the responsibilities of their national health authorities in the protection of the population from radiation hazards and in the medical uses of radiation and radio-active isotopes;

3. *Considers* that WHO should assist countries at their request for technical assistance projects in the field of radiation health, collaborating as appropriate with the International Atomic Energy Agency in this work; and

4. *Requests* the Director-General to continue to take every possible step to ensure the closest and earliest collaboration between WHO, the International Atomic Energy Agency and other agencies concerned in the development of projects and in the organization of meetings of mutual interest.

D

RESOLUTION WHA17.47 ADOPTED BY THE WORLD
HEALTH ASSEMBLY ON 19 MARCH 1964

Co-ordination with the International Atomic Energy Agency

The Seventeenth World Health Assembly,

Having considered the report of the Director-General on co-ordination with the International Atomic Energy Agency;

Having considered resolution EB33.R50 of the Executive Board;

Taking into account resolution 986 (XXXVI) adopted by the Economic and Social Council of the United Nations at its thirty-sixth session;

Cognizant of the constitutional obligations of WHO;

Recalling the agreement between the International Atomic Energy Agency and the World Health Organization and, in particular, Article 1 setting out the basis for co-operation and consultation;

Recalling the previous resolutions of the World Health Assembly, including resolutions WHA11.50 and WHA13.56;

Recognizing the importance of the consultations between the Director-General of the International Atomic Energy Agency and the Director-General of WHO; and

Considering the need for fruitful collaboration among WHO and other interested agencies in radiation health,

1. *Congratulates* the Director-General on the measures that he has taken to develop close co-operation between the World Health Organization and the International Atomic Energy Agency and in particular on the progress made in this direction through his discussion with the Director-General of the International Atomic Energy Agency;

2. *Reaffirms* the responsibility of WHO at the international level for activities in the field of health involving ionizing radiation, including protection from radiation hazards and the medical uses of radiation and radio-active isotopes;

3. *Invites* again the attention of Member States and Associate Members to the responsibilities of their national health authorities in the protection of the population from radiation hazards and in the medical uses of radiation and radio-active isotopes; and

4. *Endorses* the request of the Executive Board that the Director-General continue his efforts to ensure the closest and earliest collaboration between WHO, the International Atomic Energy Agency and other agencies concerned in the development of projects and in the organization of meetings of mutual interest.

Appendix 2

CO-OPERATION IN ENERGY AND POWER MATTERS

A

RESOLUTION GC (VI)/RES/128 ADOPTED BY THE GENERAL
CONFERENCE ON IAEA ON 26 SEPTEMBER 1962

Co-ordination of power questions

The General Conference,

(a) *Conscious* of the important role that power is destined to play in economic progress and in industrialization of the developing countries, particularly during the Development Decade,

(b) *Taking into account* the gradually growing share that will fall to nuclear power in that development, and

(c) *Noting* the need for increased attention by the United Nations, the specialized agencies and the International Atomic Energy Agency to problems of power in general,

1. *Urges* the Board of Governors and the Director General to take steps with a view to exploring ways and means of establishing a closer co-operation between the Agency, the United Nations, the specialized agencies and the World Power Conference

in matters of power in general and of economics of power in particular, so as to achieve by joint effort a higher degree of co-ordination and efficiency in these important fields; and

2. Requests the Board and the Director General to submit to the General Conference at its seventh regular session a report on the progress achieved in that direction.

B

JOINT PROGRESS REPORT BY THE BOARD OF GOVERNORS AND THE DIRECTOR-GENERAL OF IAEA ^a

Power development: co-ordination

Introduction

1. This progress report is submitted under resolution GC (VI)/RES/128 which calls for closer co-operation between the Agency, the United Nations, the specialized agencies and the World Power Conference in matters of power, "so as to achieve by joint effort a higher degree of co-ordination and efficiency".

2. The General Conference by its resolution GC (VI)/RES/128 has recognized that the industrialization of developing countries will depend largely on their ability to produce plentiful and cheap electric power, and nuclear energy will provide a gradually growing share of their power needs. A country's plans for expanding the production of electricity must be based on assessments both of the energy resources of all kinds that would be available to it and of the expected growth in the demand for electricity. The international organizations dealing with this subject should therefore be in a position to arrange, on request, for comprehensive studies of a country's energy resources and future power needs; they should also be able subsequently to help with the making first of preliminary, and then of detailed estimates of the costs of alternative ways of meeting these needs. The desiderata require a higher degree of co-ordination between the international organizations concerned. Besides the Agency, the organizations in the United Nations family that deal at present with power to any large extent are the United Nations itself, which is concerned principally with conventional energy resources, and the International Bank for Reconstruction and Development (IBRD).

3. In the context of its work on the preparation of a long-term programme for the Agency's activities, the Scientific Advisory Committee (SAC) has made several recommendations about the responsibilities of the Agency in connexion with energy and power. Amongst them are that the Agency, while retaining its special interest in nuclear power, should be equipped to give competent advice on all power development schemes including those for power networks that are to be supplied with energy generated by different means. It should continue to employ specialists in power engineering and economic development in its surveys, arranging for the participation in such surveys of experts from other organizations. The Agency should both acquire a staff of leading nuclear power economists and also engage experts in conventional power. SAC also considered the Agency should, to the appropriate extent, seek participation with IBRD in surveys and assessments of progress.

Co-operation with the United Nations and the specialized agencies

4. Resolution GC (VI)/RES/128 was brought to the notice of the Secretary-General of the United Nations and, as a result of subsequent consultations with the United Nations Secretariat, a power economist from the Agency's staff has been seconded to the Resources and Transport Branch of the Department of Economic and Social Affairs at United Nations Headquarters, in

order to enable the Agency to become completely familiar with the work done by the Branch.^b

5. The responsibilities of the regional economic commissions of the Economic and Social Council of the United Nations in the domain of energy and power have grown in recent years, and it is expected that they will grow further during the United Nations Development Decade. The Agency has previously co-operated with the Economic Commission for Europe (ECE) in parallel studies of methods of estimating the generating costs of nuclear and conventional power (IAEA publication STI/DOC/10/5); the possibility is being considered of extending this co-operation by inviting ECE to join in a study that the Agency is planning to make of the economics of integrating nuclear power stations into electric power networks. The Agency also contributed a technical paper to the symposium on the covering of peak loads, held by ECE in May 1963. The Agency and ECE are each represented at most of the other's panels and similar meetings on the economic or technical aspects of energy and power, and there is close co-operation at the secretariat level.

6. Several nuclear power projects are planned or under way in the region covered by the Economic Commission for Asia and the Far East (ECAFE), and the 1963-1964 programme of ECAFE provides for a regional study of power demand, including the contribution that nuclear power might make to meet it. The Director General has offered the Secretariat's co-operation in this study and broader arrangements for closer co-operation with ECAFE are being considered.

7. The Agency presented a paper on nuclear power costs and their trends to the seminar on electric power held by the Economic Commission for Latin America (ECLA) in Mexico in August 1961, and the Chief of ECLA's Programme of Energy and Water Resources spent a month at the Agency's headquarters that year to study the Agency's programmes. The work of the Economic Commission for Africa (ECA) on energy and power started relatively recently; arrangements have been made for the Agency and ECA to keep each other informed of their work on these subjects.

8. It is now the practice of the Agency to include conventional as well as nuclear power experts in its missions to Member States, such as the preliminary assistance mission to Africa in 1962 and the special missions sent in that year and early 1963 to the Philippines^c and Thailand.

9. By the end of June 1962 IBRD had made loans to the value \$US2,214 million to finance numerous conventional power plants and one nuclear power plant in its Member States; this sum represented 34 per cent of the \$US6,544 million that IBRD had lent for all purposes by that date. The Agency has not concluded a relationship agreement with IBRD, but satisfactory working arrangements have been made for the briefing of experts sent out by the Agency to study individual power projects.

Co-operation with non-governmental organizations

10. The World Power Conference, which has had consultative status with the Agency since July 1959, collects and publishes much material on energy resources and their utilization, and holds plenary international conferences at six-yearly intervals to review all aspects of the development and use of energy resources; it also holds "sectional conferences" on individual subjects at frequent intervals. It is regularly represented at the General Conference and is invited to attend technical meetings of the Agency

^b The Agency also contributed a paper entitled *Prospects and Problems of Nuclear Power in Developing Areas* to the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas. One of the conclusions of the paper was that "The question of introducing nuclear power reactors for developing countries with limited resources of conventional energy is therefore beginning to change from one of principle to one of suitable timing. . . . The problem of timing is, however, of fundamental importance and the best possible investment of large capitals depends on its correct solution . . ." (United Nations document E/CONF.39/A.103, para. 70 (d) and (e)).

^c The Philippines has since submitted a request to the Special Fund for a "pre-investment study on power, including nuclear power, in Luzon".

^a Prepared in response to IAEA resolution GC (VI)/RES/128 and circulated as IAEA document GC (VII)/229, dated 6 August 1963.

that are of interest to it, such as the Panel on Economic Aspects of the Integration of Nuclear Power Plants in Electric Power Systems, which met in April 1963. The Agency's representative at the plenary conference of the World Power Conference in Melbourne in 1962 was chairman of the sessions that dealt with nuclear fuels and nuclear energy.

11. Another non-governmental organization having consultative status, the Union of Producers and Distributors of Electric Energy, has offered its support in achieving the objects of resolution GC (VI)/RES/128.

Conclusions

12. The assignment of a power economist to the United Nations Secretariat may be regarded as a first step towards the closer administrative integration of the work of the United Nations and the Agency on energy and power. The General Assembly itself has recently considered the desirability of integrating the responsibilities of various members of the United Nations family for this and other aspects of industrial development; in December 1962 by its resolution 1821 (XVII) it recommended that the Advisory Committee set up Economic and Social Council under resolution 873 (XXXIII) to examine what organizational changes would be needed to intensify "the United Nations effort for industrial development", to take account of the question "whether it is advisable to deal with problems of industrial development, natural resources, energy and possibly other related fields, within the framework of one organizational structure". The Advisory Committee's views will be submitted to the Council and the General Assembly this year.

13. The Board and the Director General consider that as far as energy and power are concerned, appropriate joint arrangements between the Agency and the United Nations (including its regional economic commissions) could go far towards meeting the desired concentration of responsibility. Hence they believe that closer substantive and organizational co-operation with the United Nations in matters of energy and power, and in particular the economics of power, should be promoted. It would also be timely to recall to the attention of the General Assembly resolution GC(VI)/RES/128, the steps taken since that resolution was adopted and the views of the Board and the General Conference on further steps for the closer integration of the work of the Agency and the United Nations. They accordingly recommended the General Conference to consider the adoption of the draft resolution set out below.

[The draft resolution was adopted by the General Conference on 1 October 1963. For the text, see below "resolution GC (VII)/RES/155".]

C

RESOLUTION GC (VII)/RES/155 ADOPTED BY THE GENERAL CONFERENCE OF IAEA ON 1 OCTOBER 1963

Co-operation with the United Nations in matters of energy and power

The General Conference,

(a) *Having received* from the Board of Governors and the Director General the progress report on co-ordination in power questions which it requested in resolution GC (VI)/RES/128,

(b) *Noting* that the General Assembly of the United Nations has been concerned with this matter in the context of industrial development, and has asked the Advisory Committee established by the Economic and Social Council under resolution 873 (XXXIII) to take into account the recommendations it has made in resolution 1821 (XVII), and

(c) *Recalling* that the Agreement Governing the Relationship Between the United Nations and the International Atomic Energy Agency provides that the Secretary-General of the United Nations and the Director General of the Agency may enter into such arrangements for the implementation of the Agreement as may be found desirable in the light of the operating experience of the two organizations,

1. *Strongly recommends* a closer co-ordination of the Agency's activities in matters of energy and power, in particular its studies of the comparative economics of conventional and nuclear power and the complex economic analyses which it makes with those of the United Nations including its regional economic commissions and of interested inter-governmental organizations having relationship agreements with the United Nations or the Agency;

2. *Requests* the Board of Governors and the Director General to take action to this end in consultation with the Secretary-General of the United Nations; and

3. *Requests* the Director General, as a first step, to transmit to the Secretary-General, for the attention of the appropriate organs of the United Nations, the texts of resolution GC (VI)/RES/128, of the progress report in document GC (VII)/229 and of the present resolution.

Appendix 3

MEASUREMENTS OF ATMOSPHERIC RADIO-ACTIVITY

A

WORLD METEOROLOGICAL ORGANIZATION. PLAN FOR THE IMPLEMENTATION OF GENERAL ASSEMBLY RESOLUTION 1629 (XVI)

Introduction

1. At its sixteenth session the General Assembly of the United Nations adopted resolution 1629 (XVI), part II of which was addressed to WMO. A first plan for implementing this resolution was prepared by WMO in consultation with IAEA, the United Nations Secretariat, the presidents of technical commissions and the WMO Panel of Experts on the Meteorological Aspects of the Peaceful Uses of Atomic Energy. This first plan was based on the assumption that the purpose of the General Assembly resolution was to introduce a system whereby every country would be able to receive speedily standardized measurements of atmospheric radio-activity from a world-wide network of stations and the parameter to be measured was proposed to be the concentration of gross beta radio-activity in surface air.

2. Taking into account the comments of UNSCEAR at its March 1962 meeting, the Panel of Experts of WMO prepared a second plan which was submitted to the General Assembly of the United Nations at its seventeenth session.^a This plan was based on the view that the measurements of radio-activity in samples of air and precipitation be made by procedures which would provide information on the different components of the fission product mixture.

3. At its seventeenth session, the General Assembly adopted resolution 1764 (XVII), part II of which was addressed to WMO. In the light of this resolution the WMO second plan was commented upon by UNSCEAR at its January 1963 session.

4. At its fourth session the WMO Congress was informed of the developments which had taken place since the adoption of resolution 1629 (XVI) by the General Assembly of the United Nations. In brief, Congress preferred the second plan (see para. 2 above) but felt it required further revision in the light of the comments received from UNSCEAR (see para. 3 above). Congress

^a *Official Records of the General Assembly, Seventeenth Session, Annexes, agenda item 30, document A/5253, appendix.*

also considered that it was not necessary to use meteorological telecommunication channels for transmission of the data. It was decided that the revised plan should be transmitted to Members inviting them to implement it and to be prepared to exchange the data by air mail on a regular basis upon receipt of a request from any Member desiring these data.

5. The present plan has been prepared along the lines indicated by Congress, taking into account the comments received from UNSCEAR.

Observational programme

(a) Air

6. Samples of surface air should be taken through consecutive periods of twenty-four hours each. The sampling instruments should consist of a pump drawing air through a fixed filter. It is rather difficult to give specific details regarding the filter diameter, filter paper and the volume of air to be sampled. Provided adequate corrections are made for filter diameter, it does not seem necessary to specify this parameter. For the volume of air, it is desirable to take daily samples of the order of 3,000-5,000 cubic metres. This will greatly simplify gamma spectrometry.

7. The measurements of air concentration of radio-activity are more valuable if undertaken as part of a programme of physical and environmental investigation at qualified research laboratories, especially those concerned with such subjects as food chain and soil contamination. These air concentration measurements need to be co-ordinated in these laboratories with other radio-activity and meteorological observations.

8. Analysis of the air samples should consist of:

(i) A measurement of the gross gamma activity above 1 MeV threshold energy. This measurement should be carried out on individual daily samples, preferably five days after the end of the collection period. Counters should be standardized. It is recommended to use Ba^{140} - La^{140} as standard.

(ii) A determination of individual nuclides of importance to health physics such as the following: Sr^{89} , Sr^{90} - Y^{90} , Zr^{95} - Nb^{95} , Cs^{137} . This determination should routinely be carried out on monthly composited samples, using gamma spectrometry and/or radio-chemical techniques, as applicable. Determinations of I^{131} and Ba^{140} - La^{140} are also of value if carried out on samples from shorter sampling period. In the event of unusually high daily gross gamma counts, determinations of the individual nuclides may have to be made daily. In the case of unusually high single observations, gross gamma counts may also be supplemented by autoradiography to detect the possible presence of highly radio-active individual particles.

(b) Measurements of deposition

9. Measurements of deposited radio-activity should be taken. The analyses of deposited radio-activity should include such nuclides as: Sr^{90} , Sr^{89} , Zr^{95} and Cs^{137} . For short sampling periods the analysis should also include I^{131} and Ba^{140} . The choice of the collection systems is left to the participating country.

10. The period of sample collection should preferably be monthly, but not longer than quarterly.

11. In view of the fact that the analyses of radio-nuclides indicated in paragraph 9 above are rather difficult, they should be carried out in well-qualified laboratories. The scientific procedures involved in sampling should be determined by these laboratories. New analytical laboratories should thoroughly intercalibrate with well-established laboratories to assure comparability of data.

12. For countries not having laboratories sufficiently well-equipped for dealing with these samples, arrangements may be made for the measurements to be carried out at the laboratories of IAEA or of several Member States who have volunteered to accept samples for analysis.

Network and location of stations

13. It is recommended that members desiring to operate new stations should take into consideration the existing national networks and programmes for collecting and sampling by air filtration and deposition techniques. UNSCEAR considers that the present estimates of the inventory based on existing stations and the observed variation with latitude is probably accurate enough. However, the existing network would be further improved if measurements from high seas and land areas not already covered could be obtained. The placement of additional stations should have due regard for areas of high population density, areas of large scale food production, and different meteorological régimes.

Storage and publication of data

14. In accordance with resolution 12 (EC-XIV), the Secretary-General of WMO is already endeavouring to arrange for a member to accept responsibility for the central collection and publication under WMO sponsorship of certain atmospheric radio-activity data, including monthly mean data on the gross radio-activity of surface air. It is recommended in the same resolution that the corresponding daily values should be collected and published locally.

15. Members are urged to arrange for the permanent storage of all their atmospheric radio-activity data and to exchange them on a regular basis by air mail upon request.

B

RESOLUTION 25 (CG-IV) ADOPTED BY THE WORLD METEOROLOGICAL CONGRESS ON 27 APRIL 1963

Measurements of atmospheric radio-activity

The Congress,

Noting:

- (1) United Nations General Assembly resolution 1629 (XVI),
- (2) Abridged report of the fourteenth session of the Executive Committee, general summary, paragraph 5.5,
- (3) United Nations General Assembly resolution 1764 (XVII),

Having examined the reports by the Secretary-General on the action taken by the World Meteorological Organization in implementing the above-mentioned resolutions and the draft plans prepared in consultation with the International Atomic Energy Agency (IAEA) and the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR),

Approves the second plan on the understanding that the meteorological telecommunication channels are not to be used for transmission of the data and also that the plan may be revised in the light of further comments received from the United Nations Scientific Committee on the Effects of Atomic Radiation;

Directs the Secretary-General:

- (1) To revise this plan, incorporating the comments offered by the United Nations Scientific Committee on the Effects of Atomic Radiation during its twelfth session;
- (2) To take into account results of further consultation with the United Nations Scientific Committee on the Effects of Atomic Radiation;
- (3) To transmit the plan to the permanent representatives of Members of the World Meteorological Organization;

Invites Members:

- (1) To assist in implementing the plan;
- (2) To exchange the data by airmail on receipt of requests from Members desiring these data.

Appendix 4

SCIENTIFIC MEETINGS DEALING WITH THE PEACEFUL USES OF ATOMIC ENERGY — 1964

<i>Date</i>	<i>Subject</i>	<i>Place</i>	<i>Sponsor</i>	<i>Organizations invited to participate</i>
6-8 January	Sub-Committee on Science and Technology of the Administrative Committee on Co-ordination	Paris	United Nations	ACC representatives
13-17 January	International Nuclear Data Scientific Working Group	Vienna	IAEA	—
20-24 January	Panel on Co-ordination of National Research Projects in Radio-active Waste Management	Sarclay, France	IAEA	—
10-14 February	Panel on Basic Requirements of an Adequate System for Personnel Dosimetry for Radiation Workers	Vienna	IAEA	United Nations, ILO, WHO, UNESCO
17-21 February	Panel on the Application of Mineral Reactions in Radio-active Waste Treatment	Vienna	IAEA	FAO, WHO, UNESCO
17-21 February	Panel on the Preparation of Tests and Calculative Methods for Approving Packaging for Radio-active Materials	Vienna	IAEA	—
24 February-6 March	Thirteenth session of UNSCEAR Symposium on Atmospheric Movements of Radio-active Materials	Geneva	United Nations	} FAO } WHO } IAEA
24-25 February			WMO	
25 February-6 March	Advisory Committee on the Application of Science and Technology to Development *	New York	United Nations	All ACC members
9-13 March	Panel on Reactor Shielding	Vienna	IAEA	United Nations, ILO, WHO, FAO, WMO
16-20 March	Panel on Thermodynamic Properties of Nuclear Materials	Vienna	IAEA	United Nations, UNESCO
16-20 March	Study Group Meeting on Radioisotope Economics	Vienna	IAEA	United Nations, ILO, UNESCO, FAO
23-26 March	Panel on Analytical Chemistry of Nuclear Materials	Vienna	IAEA	—
6-10 April	Working Group Meeting the Co-ordination of Hydrology Programmes	Vienna	IAEA	WMO
7-17 April	Inter-Governmental Meeting of Experts on Scientific Hydrology (in connexion with the International Hydrologic Decade) *	Paris	UNESCO	United Nations, FAO, WHO, WMO, IAEA
13-18 April	Standing Committee on the Vienna Convention on Civil Liability for Nuclear Damage	Vienna	IAEA	—
20-24 April	Symposium on Medical Radioisotope Scanning	Athens	IAEA	United Nations, WHO, UNESCO
21-28 April	Expert Committee on the Technical Basis for Legislation on the Wholesomeness and Microbiological Safety of Irradiated Foods	Rome	FAO, WHO, IAEA	—
27-30 April	Panel on the Use of Nuclear Energy in Saline Water Conversion	Vienna	IAEA	—
11-16 May	Symposium of the Assessment of Radio-active Body Burdens in Man	Heidelberg, Federal Republic of Germany	IAEA, ILO, WHO	United Nations, FAO
25 May-1 June	Technical Meeting on the Use of Induced Mutations in Plant Breeding	Rome	FAO, IAEA, WHO, in co-operation with the European Association of Plant Breeders	

<i>Date</i>	<i>Subject</i>	<i>Place</i>	<i>Sponsor</i>	<i>Organizations invited to participate</i>
1-5 June	Nuclear Materials Management Panel	Vienna	IAEA	
1-5 June	Panel on Co-ordination of Research Contracts on Isotopes in Tropical Medicine	Vienna	IAEA	WHO
7-9 June	International Conference on the Use of Isotopically Labelled Drugs in Experimental Pharmacology	Chicago	Organized by Department of Pharmacology, University of Chicago; supported by the Agency	
24 June-1 July	Standing Committee on the Brussels Convention on Liability of Operators of Nuclear Ships	Vienna	IAEA	
2-8 July	<i>Congrès international de physique nucléaire</i>	Paris	Initiated by the <i>Association F. et I. Joliot-Curie</i> ; IUPAP, UNESCO, <i>Société française de physique</i> ; and supported by IAEA	
13-17 July	Panel on Pile Dosimetry	Vienna	IAEA	
20-24 July	Panel on Advances in Insect Population Control by the Sterile Male Technique	Vienna	IAEA	FAO, WHO, regional commissions, Special Fund
27-31 July	Panel on Isotopes and Radiation in the Study of Soil Moisture and Irrigation	Vienna	IAEA	United Nations, FAO regional commissions Special Fund
3-7 August	Panel on the Application of Food Irradiation in Developing Countries	Vienna	IAEA	United Nations, ILO, FAO, WHO, special Fund, regional commissions
31 August-9 September	Third International Conference on the Peaceful Uses of Atomic Energy	Geneva	Organized by United Nations in co-operation with IAEA	Invitations to be sent the United Nations
8 September	Panel on the Use of Nuclear Energy in Saline Water Conversion	Geneva	IAEA	United Nations
15-19 September	Scientific Meeting on Methods of Radiochemical Analysis	Geneva	WHO, FAO, IAEA	
4-9 October	Panel on the Application of Chemical Engineering Processes in Waste Treatment	Vienna	IAEA	
5-7 October	Panel on Equipment for Radiochemistry and Nuclear Physics Training Laboratories	Vienna	IAEA	UNESCO
12-16 October	Panel on a World-wide Survey of the Concentration of Hydrogen and Oxygen Isotopes in Precipitation	Vienna	IAEA	United Nations, WHO, ILO, FAO, WMO, UNESCO

7-11 December	Panel on the Use of Plutonium for Power Production	Vienna	IAEA	
15-19 December	Panel on Planning of Radiotherapy Departments	Geneva	IAEA, WHO	
End 1964	Seminar on Public Health Programmes in Radiation Protection	Manila	WHO	IAEA

* At which questions relating to nuclear techniques are considered.

Appendix 5

TRAINING COURSES DEALING WITH THE PEACEFUL USES OF ATOMIC ENERGY — 1964

IAEA

Inter-Regional Training Course on the Maintenance and Repair of Nuclear Electronic Equipment
(University of Ceylon, Colombo 13 January-12 June 1964)

WHO

Training Course in Radiation Health for Public Health Administrators
(Santiago, Chile: 30 March-17 April 1964)

IAEA

Regional Training Course on the Use of Research Reactors for the Production of Radioisotopes and Activation Analysis (Trombay Establishment, Bombay, India: 28 September 1964 for eight weeks)

IAEA/UNESCO

International Refresher Course on Nuclear Physics for University Teaching Staff in Developing Countries
(Copenhagen, Denmark: 4 May 1964 for five months)

IAEA

Advanced Inter-Regional Training Course on the Cellular and Molecular Aspects of Radiobiology
(Radioisotope Training Centre, Rehovoth, Israel, 20 April 1964 for seven weeks)

IAEA

International Advanced Summer School on Reactor Physics
(Zakopane, Poland: 14-29 September 1964)

IAEA

Regional Training Course on the Application of Radio-active Isotopes in Soil-Plant Relations
(Piracicaba, Brazil: 15 September 1964 for two months)

IAEA

Regional Training Course on the Application of Radioisotopes in Medicine
(Athens, Greece: 31 August 1964 for eight weeks)

IAEA

Regional Training Course on the General Applications of Radioisotopes
(Japan: 13 August 1964 for eighteen weeks)

UNESCO/IAEA

Orientation Course on Scientific and Technical Documentation
(Buenos Aires, Argentina: September 1964 for six weeks)

IAEA

Regional Training Course on the Application of Radioisotopes in Medicine
(Philippines: 19 October 1964 for two months)

UNESCO/IAEA

International Seminar for Research and Education in Physics *
(University of Uppsala, Sweden)

Appendix 6

SUMMARY OF RESEARCH BEING SUPPORTED BY THE UNITED NATIONS FAMILY

The different organizations are concerned with research to meet different needs and it is carried out in different ways including contractual arrangements with other organizations or institutes. In the case of IAEA, research is also carried out in its own laboratory near Vienna and in its laboratory of marine radio-activity in Monaco.

A summary of the subjects on which research is being supported by the United Nations family is described under the following main headings:

A. Health physics and radiation protection

The WHO continues to provide support to ICRU for studies in the development of basic standards and units for the measurement of ionizing radiation, and to ICRP for the collection of fundamental data on the effects of radiation, and for studies and recommendations on radiation protection and maximum permissible doses.

* A sequence of courses, each of a year's duration, is being organized, which deal in part with theoretical and experimental physics, closely linked with nuclear physics and an approach to atomic energy problems.

The IAEA has awarded technical contracts to ICRU and ICRP to support that part of their work which has a direct bearing on IAEA's activities.

In addition, IAEA has awarded or renewed twenty-four research contracts on subjects coming under this heading.

B. Radioisotope applications in agriculture

The IAEA has awarded or renewed research contracts dealing with twenty-one aspects of the application of radioisotopes in agriculture.

C. Radioisotope applications in medicine

The IAEA has awarded or renewed twenty-two research contracts.

D. Radioisotope applications in hydrology

There is one continuing joint WMO/IAEA project.

The IAEA has awarded or renewed six research contracts.

E. Radiobiology

The IAEA has awarded or renewed sixteen research contracts.

F. Radio-active waste management and environmental research

The IAEA has awarded or renewed fourteen research contracts.

G. Studies involving the use of reactors

The IAEA is organizing regional study groups for research on reactors and has awarded or renewed three research contracts.

In addition to the studies under the above main groupings, IAEA has renewed a research contract on phosphate metabolism of *Escherichia coli*, and another on ion exchange separation of uranium and thorium in non-aqueous and mixed media.

The IAEA has also awarded or renewed four research contracts on safeguard methods which are of concern only to IAEA.

Appendix 7

HEALTH AND SAFETY CODES AND STANDARDS

1. A number of international codes and standards have been formulated which apply to different groups of people exposed to ionizing radiation. Since ACC last reported on this subject^a there have been the following developments in the work of United Nations organizations.

Basic safety standards

2. The basic safety standards of IAEA, which were approved by its Board of Governors in June 1962 as a first edition, were published in IAEA's Safety Series (IAEA publication No. STI/PUB/26).

Transport of radio-active materials

3. The IAEA Regulations for the Safe Transport of Radio-active Materials (IAEA publication No. STI/PUB/40) were reviewed by a panel of experts in March 1963. Groups of consultants were subsequently convened in October and December 1963, to prepare packaging tests and design criteria for incorporation into a final draft of the Regulations which has been revised in the light of

comments received from Member States and international organizations concerned.

4. The Working Party on the Transport of Dangerous Goods of the Inland Transport Committee of the ECE at its fifteenth session in November 1963, reviewed progress made in the revision of the IAEA Regulations. In this regard, the Working Party was informed of relevant action arising from the Vienna Convention on Civil Liability for Nuclear Damage of 21 May 1963, in the event of damage occurring in the course of transport governed by the Convention on the Contract for the International Carriage of Goods by Road (CMR) and by the European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR). The Working Party accordingly decided to ask Governments to communicate to the ECE secretariat their views on the desirability of amending the CMR or other conventions drawn up under the auspices of ECE's Inland Transport Committee, in order to make them consistent with the new principles laid down in the Vienna Convention.

5. Preparations have been made by UPU, in consultation with IAEA, for the next Congress of UPU beginning in May 1964 in Vienna, to consider draft regulations for the control of the transport of radio-active materials by post. IMCO is preparing a code on the transport of dangerous goods by sea, which will contain a chapter on the transport of radio-active materials.

Protection of workers against ionizing radiations

6. The ILO is preparing for publication in 1964 parts III, IV and V of its *Manual of Industrial Radiation Protection*, on which IAEA has been invited to comment.

7. These parts of the Manual will take the form of illustrated guides: part III will give fundamental "do's" and "don'ts" of radiation protection for all applications of ionizing radiations, and particularly on those having a bearing on industry; part IV will deal specifically with radiation protection in industrial gamma and X-ray radiography and fluoroscopy; and part V will be devoted to the radiological protection of workers using luminous compounds (dial painting etc.).

Control and treatment of radio-active waste

8. The report of the Panel on the Legal Implications of Disposal of Radio-active Waste into the Sea, which met for the fourth time in January 1963, was sent to Member States and interested inter-governmental organizations for comment in June. It is foreseen that the question of waste disposal into the sea will be discussed during the course of 1964 by the Board of Governors of IAEA in the light of the observations received.

Civil liability

9. In April/May 1963 IAEA convened an international conference which adopted the Vienna Convention on Civil Liability for Nuclear Damage. The Standing Committee on the Brussels Convention of 25 May 1962 on Liability of Operators of Nuclear Ships, held its first meeting in October 1963 in Monaco, when it discussed the following questions referred to it: the establishment of an international compensation fund; the establishment of an international procedure to determine the competent court in cases of dispute; and the conditions to be fulfilled by international organizations before they could accede to the Convention for the purpose of acting as a licensing authority.

Emergency assistance

10. In June 1963, the Board of Governors of IAEA reviewed the question of the provision of emergency assistance in the event of a radiation accident, and at that time authorized the Director

^a See *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes*, agenda items 4 and 6, document E/3765, para. 151 and annex II.

General to sign the Nordic Mutual Emergency Assistance Agreement in connexion with Radiation Accidents concluded with the Governments of Denmark, Finland, Norway and Sweden. At the same meeting, the Board also reviewed a draft model bila-

teral agreement for use between a State requesting aid and a State offering assistance. Both agreements are intended to obviate the need for hasty negotiations of the conditions under which assistance might be offered and accepted should an emergency arise.

DOCUMENT E/3928

Work programme in the economic, social and human rights fields: report of the Secretary-General

[Original text: English]
[26 June 1964]

1. At its thirty-sixth session in 1963, the Council had before it a document¹⁶ in which an attempt was made to present the consolidated list of projects and activities submitted pursuant to Council resolutions 742 (XXVIII), 909 (XXXIV) and 936 (XXXV) in the form of a classification of those projects and activities, according to their intended contribution to progress in the various priority areas identifiable in the light of the objectives of the United Nations Development Decade. The Council, in resolution 990 (XXXVI) expressed the view that such an attempt was an important first step towards the aim of formulating priorities, towards the mutual adaptation of budgetary resources and programme requirements and towards establishing a sound basis for controlled expansion of the economic, social and human rights work of the Organization; it requested its subsidiary bodies "with the help of the suggestions of the Secretary-General, to formulate their programmes of work in terms of priority requirements within their respective sectors in a manner facilitating a uniform presentation to the Council, along functional lines, of an integrated programme of work and activities in the economic, social and human rights fields" including information "on the nature, duration and scheduling of each project, together with as detailed information as possible on budgetary implications"; and it requested the Secretary-General to present a work programme accordingly to the 1964 session of the Council and its summer sessions in subsequent years, together with his observations regarding priorities within the different functional sectors of the programme.

2. The present work programme, which is intended to meet the latter request, represents, it is believed, an improvement upon last year's submission.¹⁶ Projects and activities are classified according to the draft framework of functional classifications for the activities of the United Nations system in the economic, social and human rights fields during the United Nations Development Decade (E/3886 and Add.1, annex I), which has been developed by the Administrative Committee on Co-ordination pursuant to Council resolution 984 (XXXVI). Their presentation has been made somewhat more uniform, their identification somewhat easier and each entry makes it possible better than last year to see how a given project or activity, described in more

detail elsewhere in the documentation of the Council, stands within the context of the other projects and activities undertaken in the same functional sector.

3. While the present work programme thus affords to a greater extent than heretofore some of the perspective which is indispensable for a review of priorities, it remains far from having become the tool envisaged by the Council in resolution 990 (XXXVI). There are still considerable variations in the form and substance of the entries which, in many cases, are not fully indicative of the results which will be achieved in the current year or in the following one. Moreover, although the projects and activities entered are only those which were labelled priority once and have been confirmed as such by the various subsidiary bodies concerned or the Council itself, it would be exaggerated to say that, in each functional sector, the picture provided by the entries listed is always one which conveys the impression of a maximum concentration of resources on an optimum number of especially significant projects or activities.

4. Reviewing and streamlining work programmes is an undertaking which can only progress by stages and it is only gradually, year after year, that the subsidiary bodies of the Council can be expected to achieve significant results. Experience has shown that a review of priorities can seldom be a sweeping one and that the adoption of new priorities does not always go with the abandonment of old ones. Should the Secretary-General attempt to stimulate the review of priorities by asking each body at the end of each session to downgrade or abandon at least one project aside from adopting new ones, there may be cases in which it would not be easy to make a token gesture without doing violence to work programme and a thorough review of priorities indeed often leads to additions more than to subtractions. It should be observed, however, that, like its building up, the trimming down of a programme can most of the time be done effectively only project by project.

5. By continuing to ask each year each subsidiary body of the Council to bring its work programme closer to the standard pattern being evolved with respect to terminology and presentation, the Secretary-General hopes not only to achieve greater uniformity and comparability of the composite product constituting the work programme of the Council but also to facilitate

¹⁶ Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda items 4 and 6, document E/3788.

and promote the review of priorities both at the sectoral and at the global levels. At the present juncture and in the prevailing circumstances, the Secretary-General believes that the following presentation reflects fairly well the scale of priorities which emerges from the growing body of General Assembly and Council resolutions in the economic, social and human rights fields and he would now like to limit his specific observations to one particular project.

6. The publication entitled *Current Economic Indicators* (entered under the heading "A. Broad issues and techniques relating to development", sub-heading "5. Development and provision of basic statistical information") has been issued quarterly since 1959 pursuant to Council resolution 690 C (XXVI) concerned with the assessment of the short-term outlook. This year, however, it will not be possible to bring out the third and fourth issues of the 1964 volume, as a result of the concentration of resources on work more directly related to the United Nations Conference on Trade and Development. Taking into account that, since 1959, United Nations analyses in the economic field, especially the *World Economic Survey*, have become more prospective in character, the project will be re-examined with a view to determine whether, in the future, the data assembled and presented as *Current Economic Indicators* can be issued early enough to have the indicative value which should attach to a quarterly bulletin. On the basis of the results of this re-examination the Secretary-General will next year submit to the Council his views regarding the continuation of the publication in question.

7. As last year's, the classification which follows attempts to present projects under way or to be undertaken which involve substantive (research) work on the part of the Secretariat, and, among those projects, the ones which do not involve the production of reports and studies for examination by inter-governmental bodies or expert groups have been left out. Thus, the classification does not purport to reflect the administrative servicing or operational responsibilities of the Secretariat except, with respect to the latter, for seminars or workshops of an inter-regional or regional character. Also, it has been attempted to make only one entry for projects which involve not one but a series of reports and studies as long as such reports and studies deal with various

aspects of the same question. And while the nature of numerous projects is such as to warrant their inclusion in several categories, every effort has been made to avoid double counting at the expense of some arbitrariness in borderline cases.

8. No information is given in this paper in response to the Council's request that it be provided with as detailed information as possible on the budgetary implications of the work programme in the economic, social and human rights fields. Each year the Secretary-General provides the General Assembly with a statement of the estimated cost of the main fields of activity, but the limitations of manual analysis preclude this statement from showing an adequate breakdown within the economic and social field. However, the budget estimates for 1965 contain a provision for the installation of an electronic computer system which, if approved, would enable the 1966 expenditures to be classified, without significant added expense or effort, down to the smallest organizational unit.

9. Attention must be called to the fact that, even after the installation of an electronic computer, the functional classification of the work programme will not easily lend itself to the budget analysis called for in resolution 990 (XXXVI). In practical terms, the computer is limited to compiling expenditures by organizational units, while the work programme is classified into subject headings that may include, within a single heading, contributions from various organizational units. It will therefore be feasible to relate budget and programme only in so far as the functional classification of the work coincides with the organizational pattern of the staff employed to carry it out; otherwise, the cost of the programme cannot be compiled without entering into cost accounting which would be neither economical nor suited to an organization such as the United Nations. It is hoped, however, that computer exploitation of the significant amount of parallelism which already exists and can further be developed between a more refined programme of work and the budget, supplemented to the maximum possible extent by rough calculations intended to indicate orders of magnitude and approximate proportions of programme costs will make it possible to relate more closely programme and budget policy.

ANNEX

Draft functional classification for the activities of the United Nations in the economic, social and human rights fields

I

A. Broad issues and techniques relating to development

1. DEVELOPMENT TRENDS AND PROJECTIONS OF DEVELOPMENT
REQUIREMENTS AND POSSIBILITIES

BGERP	Survey of progress in the economic and social fields towards the target set for the United Nations Development Decade (1965) Report on trade needs of developing countries (1963 and 1964) Study on aggregate models for projecting growth of world economy (1964) Extrapolations of economic growth rates (1964) Preparation of manuals on techniques for projections of interrelated economic variables (1964-1965) Studies on the implications of the results obtained from aggregate models on the structure and growth of major economic sectors (1964-1965) Continuing studies in projections of total output by major productive sectors, investment requirements, consumption demands and domestic savings (1964-1965) Continuing studies in projections of export earnings, import requirements, the inflow of long-term funds into less developed countries, and the balance of payments gap (1964-1965) Projections of commodity production and trade (1964-1965) Projections of demand and supply for primary non-agricultural commodities (1964-1965) <i>World Economic Survey</i> , annual (1964) Reporting on economic and social aspects of disarmament (1964)
RTD	Review and evaluation of activities in the field of non-agricultural resources (1964)
FFB	Techniques of government revenue forecasting (1964)
CID	A study of economic integration and industrial specialization among the member countries of the Council for Mutual Economic Assistance A study of methods of analysis of projection of demand for industrial goods: (a) demand for industrial consumer goods; (b) demand for producers' goods
BSA	<i>International Social Development Review</i> (annual) (replacing <i>International Social Service Review</i> ; <i>Housing, Building and Planning</i> ; and <i>Population Bulletin</i>)
BSA-ILO-WHO- FAO-UNESCO	Report on the World Social Situation (1963-1964)
BSA	<i>Determinants and Consequences of Population Trends</i> , revised (1963-1964) Manual on methods of estimating fundamental demographic variables (1964-1965) Manual on methods of projecting rural-urban population (1963-1964) Manual on methods of projecting number of households (1964-1965) Manual on methods of projecting economically active population (1964-1965) Standards for national programmes of population projections, Revised (1964-1965) Surveys of the world demographic situation: Surveys of fertility and of urban and rural population (1963-1964) Demographic pilot studies: <i>Population Growth and Manpower in the Sudan</i> (1963-1964) <i>Future Growth of World Population</i> , revised (1963-1964)
BSA-ECA-ECLA- ECAFE	Collaboration with and support of regional demographic training and research centres and collaboration with the regional economic secretariats on demographic programmes (1962-1964)
BSA	<i>Determinants and Consequences of Population Trends</i> , revised (1963-1964) Preparation of technical materials relating to population projections (1963-1964)
BSA-UNESCO- WHO	Co-operative studies on relationship of fertility, mortality and population growth to needs for investments in education and health facilities (1964-1965)
BSA-UNESCO	Manual on methods of projecting school enrolments with special reference to developing countries (1964-1965)
BSA	Manual on methods of evaluation and analysis of population census data (1964-1965) Inquiry among Governments on problems resulting from reciprocal action of economic development and population
ECE	Continuing review and analysis of European economic development and problems
ECAFE	<i>Economic Survey of Asia and the Far East</i> (annual) <i>Economic Bulletin for Asia and the Far East</i> (quarterly)
ECAFE-BGERP	Studies of projections and programming for economic development
ECAFE	Study of consumption trends and future demand for metals and light engineering goods in ECAFE countries Demographic aspects of economic and social development

ECAFE-FAO	Market analysis of selected products in the ECAFE region
ECLA	<i>Economic Survey of Latin America</i> (annual) <i>Economic Bulletin for Latin America</i> (biannual) Economic development of the region as a whole Economic growth in individual countries in the ECLA region Over-all studies on development policy in the ECLA region Analysis of economic policy by countries Inflation and growth in Latin America Studies on income distribution in the Latin American countries Studies by the Latin American Regional Centre for Economic Projections Trends of urban and rural population Country studies of economic development in the region Analysis of economic development and projections for the Central American region as a whole (1964) Economic development of British Honduras or Belize (1964)
ECLA-FAO	Study on long-term prospects for domestic demand and supply in respect of agricultural commodities (1964-1965)
ECA	Planning techniques and projections for Africa Studies of demographic levels, trends, and projections (1964-1965) <i>Economic Bulletin for Africa</i> (biannual) <i>Economic Survey of Africa</i> (annual) Analysis of development problems and policies (1964-1965)

2. PLANNING AND PROGRAMMING

BGERP-BSA	Study of the methods of determining social allocations Study of the inter-relationships between social and economic targets in development planning
BGERP	Study of sectoral allocation of investment Special chapter of the <i>World Economic Survey</i> on planning in the developing countries (1964) Study of criteria for the selection of projects Study of planning of the external sector (Seminar, 1965) Study of the use of inter-industry analysis in planning
BGERP-BSA-UNESCO-ILO	Study of educational and manpower planning
BGERP	Periodic surveys of development plans and their fulfilment (First survey to be included in the <i>World Economic Survey</i> , 1964) Studies of key problems in economic development and planning Study of macro-economic balances
FFB-ECA-ECE-ECAFE-ECLA	Interregional Workshop on Problems of Budget Reclassification and Management to be held in Copenhagen at the end of August 1964
FFB-ECAFE	Preparation for the fourth ECAFE Workshop on Problems of Budget Reclassification and Management (1965-1966)
FFB	Annual Review of Developments in the Budgetary Field in the ECAFE Region (1964) Integration of Tax Reform with Development Planning (1964)
CID	Analysis of information provided by governments in reply to the questionnaire on industrial planning and development A study of basic principles and experience of industrial planning in centrally-planned economies
BSA	National programmes of analysis of population census data as an aid to planning and policy-making (1963-1964)
BSA-ECA-ECE-ECAFE-ECLA	Preparations for Second World Population Conference (1963-1965)
BSA	Meeting of <i>ad hoc</i> group of experts to advise on long-range work programme in the field of population (1964)
BSA-ILO-WHO-FAO-UNESCO	Co-ordination of policy and action in the social survey, research and development field (1963-1964)
ESA-ECAFE-ECA-ECE	Measurement of levels of living (1963-1964)
BSA	Balanced social and economic development (1963-1964) Study of feasibility of electronic computers in analysis of demographic data (1963-1964)

DPA-BGERP-BSA- ECLA-ECAFE	Administrative aspects of national development planning (1964)
ECE	Economic planning techniques in European countries (1964) Meeting of Senior Economic Advisers to discuss "Problems of Regional Economic Planning and Development" (1963-1964) Problems of incomes policies in European countries (1965)
ECAFE	Studies and surveys of economic development and planning
ECAFE-FAO	Studies of agricultural development and planning
ECAFE	Programming of housing with special reference to efficient and economic implementation Social development planning and research (1964-1966)
ECLA	Analysis of plans drawn up by countries in Latin America The problem of integrating economic and social objectives and targets into a single pattern of development planning Studies of planning of development in the ECLA region
ECLA-UNESCO- WHO	Techniques and methods of planning in the various social sectors (1964)
ECLA-LAFTA	Co-ordination of national development programmes at different levels
ECLA-OAS-IDB- BTAO	Planning of economic development for Central American countries
ECLA	Collaboration with the Latin American Institute for Economic and Social Planning
ECA	Conference of African planners, first session (1964)
ECA-FAO	Examination of plans and of measures to promote agricultural development and increase productivity in agriculture

3. INSTITUTIONAL AND ADMINISTRATIVE DEVELOPMENT

(i) *General public administration*

DPA	Organization and administration of public services (1964-1965) Guidebook on government manuals (1964-1965)
DPA-ECAFE	Working party on Urgent Administrative Problems of Asian Governments (1964)
DPA	Evaluation of the results of providing Operational, Executive and Administrative Personnel (OPEX) as a guide to future use of this assistance
ECA-DPA	A preliminary survey to be made in a number of African countries on the legal and administrative relations between State and public autonomous institutions and corporations

(ii) *Administrative structure and methods*

DPA-ECLA-ECA- ECAFE	Government purchase and supply (1964)
DPA-ECLA-FFB- ILO-SO	Utilization of automatic data processing in government operations (1964)
DPA-CID-ECLA	Management of public enterprises (1964-1965)
DPA	Study of organization and methods agencies and their functioning (1964-1965)
BSA	Administrative assessment of the organizational arrangements for the United Nations social defence programme (1963-1964)
ECA-DPA	Organize for government officers a seminar on legislation and public administration of water resources development
FFB-DPA	Manuals for the administration of selected taxes (1964)

(iii) *Personnel Systems and Training*

ECLA-DPA	Assistance to the Advanced School of Public Administration for Central America (ESAPAC)
ECA-DPA-ILO- UNESCO	Preparation for 1964 Conference of directors of public administration institutes in Africa, and directors of other interested agencies
DPA-ILO- UNESCO	Preparation of handbook on civil service laws, and public administration personnel: basic principles and current practice (1964 and 1965) Training and Institutes of Public Administration: A Guide for National Training Programmes and Institutes (1964 and 1965)

- DPA A guide for the formulation of a series of basic in-service training courses in the field of Public Administration: staff services and functional services of Governments (1964-1965)
Grading and remuneration systems in the public service: a handbook on principles and methods (1964-1965)
- BGERP-BSA-ILO Study on the institutional factors affecting the supply and productivity of labour with different types of skills
- ECA-DPA-UNESCO-ILO Sub-regional meeting of experts on personnel administration and training (Tangier, September 1964)

(iv) *Local government and other forms of decentralized administration*

- DPA-ECA-BSA-UNESCO-FAO-WHO Seminar on Central Services to Local Authorities in Africa (1964)
- DPA Guides for drafting organic legislation for local authorities (1964-1965)
- FFB-DPA Study of local government taxes and their administration (1964-1965)
Study of credit institutions for local authorities (1964-1965)
- DPA-ECA Local Government training institutions (1964-1965)

4. ADAPTATION AND TRANSFER OF KNOWLEDGE, METHODS AND TECHNIQUES

- RTD-ECE-ECA-ECLA-ECAFE Interregional seminar on transfer of new techniques of mineral resources development to developing countries (1965)
- FFB The role of patents in the transfer of technology to under-developed countries (1964)
- CID Manuals on industrial technology: fertilizer industry, machine tools industry, and iron and steel industry
- ECE Exchanges of technical information and experience related to agricultural economy
Co-operation in exchanging economic, technical and scientific experience and information
Exchanges of abstracts in the field of applied economics
Exchanges of information and experience related to coal
Technical co-operation and development of all-European contacts in the electric power field
Exchange of technical information and experience related to gas
Technical co-operation and all-European contacts in relation to steel
Technical co-operation and contacts in relation to timber
Distribution of bibliographical indexes published by certain countries in the electric power field
- ECAFE Dissemination of information on technical and economic aspects of selected techniques in the iron, steel and other metal and engineering industries of interest to ECAFE countries
Dissemination of information relating to methods of exploration, exploitation and processing of minerals, and technical studies on selected minerals
- ECLA Assistance to Central American Research Institute for Industry (ICAITI)

5. DEVELOPMENT AND PROVISION OF BASIC STATISTICAL INFORMATION

(i) *General statistics*

- SO-FFB *Statistical Yearbook*
Monthly Bulletin of Statistics
Current Economic Indicators (quarterly)
World Energy Supplies (annual)
Compilation of commodity balance sheets for raw materials and their simplest products. They have been made for some years for energy materials and appear in *World Energy Supplies* (1963-1965)
Sample Surveys of Current Interest (description of plans for and execution of sample surveys in various countries) (1964)
Statistical Notes: current events in international statistics (1964)
A Short Manual on Sampling, vol. II (1964 and 1965)
Supplement to the *Monthly Bulletin of Statistics*, fifth issue (1964)
- SO-ECLA-IASI Seminar on Basic Statistics for Economic and Social Development, sponsored by IASI, to be held in 1965

- SO-IMF-FAO-
WHO-ILO-
GATT-
UNESCO
- Consultation with specialized agencies concerning the long-term plans for work in statistics. A meeting was held in New York on 11-12 May 1964
- ECE
- Improvement and standardization of national statistics and promotion of international statistical co-operation
European forest and forest products statistics
Timber Statistics for Europe (quarterly)
Quarterly Bulletin of Coal Statistics for Europe; Monthly Coal Statistical Summary
Annual Bulletin of Transport Statistics
Collection, improvement, standardization and distribution of statistics on transport and their place in the economy
Annual Statistics of Road Traffic Accidents in Europe
- ECAFE-SO
- Study of *Statistical Methods and Standards*
Development of statistics, censuses, sample surveys and training programmes for the use of less developed countries in programmes of economic and social development
Statistical compilation for ECAFE countries
- ECAFE
- Inland Waterway Statistics* (1964-1965)
- ECA-ECE
- Study tour on relation of statistics to planning (1964)
- ECA-SO
- Fourth Conference of African Statisticians (1965)
Seminar on distribution statistics and use of sampling techniques in surveys of small scale enterprises (1965)
- ECA
- Meetings for sub-regional consultations of heads of Statistical Offices, West Africa (1964), North and East Africa (1965)
Meeting of Directors, Statistical Training Centres (1965)
Working group of statisticians and planners on programming statistical development in Africa (1965)
Statistical Newsletter (quarterly)
Statistical handbooks: assembly, evaluation, analysis and publication of methodology and practical experiences in specific fields adapted to African conditions; household surveys (1965), analysis of food consumption surveys results (1965)
Preparation of a detailed account on current and future statistical manpower budgets for African statistical offices
- ECLA
- Development of basic statistical series in the Latin American countries
Preparation of statistical series and data for research divisions and for the *Statistical Bulletin for Latin America* (biannual, vol. I, No. 1, March 1964)
- (ii) *International trade statistics*
- SO
- Yearbook of International Trade Statistics*
Commodity Trade Statistics (1964)
Development of annual index numbers of unit price and volume by large commodity class and by direction (1964)
Preparation of a handbook on generalized computer programmes used by the International Trade Statistics Centre (1964)
Preparation of the French and Spanish edition of the *Commodity Indexes for the Standard International Trade Classification (SITC)*, revised for reproduction
Preparation of a key between the commodity classification for external trade of the Comecon (Council for Mutual Economic Assistance) countries and the SITC, revised (1964)
- SO-CCC-FCA
- Meeting of statistical and customs experts on the international exchange of external trade statistics, Paris, 8-12 June 1964
- ECE
- Comparability of external trade statistics
- ECA
- African Trade Statistics*: Series A, direction of trade (quarterly); Series B, trade by commodity (biannual)
Compilation of special basic series on African trade; including volume and unit indexes for individual countries and for sub-regions, imports by end-use at current and constant prices and patterns of imports and exports of African countries
- (iii) *National accounts, finance and price statistics*
- SO
- Yearbook of National Accounts Statistics*
Index numbers and other statistics of producer (wholesale) prices (1964)
National Accounting Practices in 60 Countries; Supplement to the Yearbook of National Accounts Statistics (1964)
Comparative study of national plans, practices and experiences with regard to accounts on transactions in and holdings of financial assets and liabilities (1964)

- SO *A System of National Accounts and Supporting Tables*, revised (1964)
 Study of the structure and concepts of national accounts (1964)
 Study of the main requirements for and uses of estimates of capital formation (1964)
 Preparation of an inventory, comparison and analysis of methods of converting the main aggregates of national accounts to a common basis of valuation and effective coverage (1964-1965)
 Preparation of a manual on gathering and compiling statistics of the distributive and relative service trades (1964)
 Study of the distribution of household and personal income statistics (1964-1965)
 Preparation of a document for the Conference of Asian Statisticians' Seminar on National Accounts (1964)
- SO-ECA Participation in the editing of the report of the Conference of African Statisticians' Working Group on an Interim System of National Accounts for African Countries and of a technical manual based on the report (1964)
- ECE-SO Preparation for the Conference of European Statisticians on comparisons between the system of national accounts in use in countries with centrally planned economics and the United Nations System of National Accounts (to be held in Geneva 19-23 October 1964)
- FFB *Manual on Governments Accounts* (1964)
A simplified Economic Functional Classification of Government Transactions
 Public Finance Statistics of Selected African Countries (1964)
- ECA Technical meeting on the results of experimentation with adaptation of national accounts systems in Africa (1964)
- ECA-SO Seminar on statistics of national accounts at constant prices and price and production indices (1965)
- ECA Handbook on national accounts in Africa
 Methodological Manual on the proposed intermediate system of national accounts for Africa
 Assembly, evaluation and analysis of data on government accounts in Africa

(iv) *Industrial statistics*

- SO *The Systems of Industrial Statistics of Five Highly Industrialized Countries*, revised (1964)
 Study of the industrial statistics of selected countries in Asia, Latin America and Africa (1964)
 Preparation of the French edition of *Indexes to the International Standard Industrial Classification of All Economic Activities* (1964)
 Comparative study of input-output techniques (1963-1964)
 Collection of statistics on consumption of electricity and energy by industrial branch (1964-1965)
 Study of the problems of and suitable concepts, methods and techniques for gathering data on construction (1964)
 Investigation of the major uses of and requirements for industrial statistics (1964-1965)
Industrial Censuses and Related Enquiries, revised (1964 and 1965)
 Preparation of a key between the *International Standard Industrial Classification* and the *Standard International Trade Classification*, revised (1964)
The Growth of World Industry, 1938-1961: International Analyses and Tables (1964)
- ECE *Quarterly Bulletin of Steel Statistics for Europe*
Quarterly Bulletin of Electric Energy Statistics for Europe
Annual Bulletin of Electric Energy Statistics for Europe
Annual Bulletin of Gas Statistics for Europe
- ECA Compilation and analysis of data on the production of agricultural, mining and manufacturing industrial commodities in African countries for an annual bulletin on industrial statistics
 Preparation for the establishment of basic series on energy statistics in Africa

(v) *Demographic and social statistics*

- SO *Demographic Yearbook* (1964)
Population and Vital Statistics Report (quarterly) (1964)
 Preparation of a technical manual entitled *Methods of Estimating Housing Needs* (1964)
 Revision of a technical manual on the methodology of continuous population registers (1964)
- SO-ILO-FAO-UNESCO-WHO *Handbook of Household Surveys: A Practical Guide for Inquiries on Levels of Living* (1964)

SO	Methodological study of housing census methods (1964) Methodological study of population census methods (1964)
SO-ECE-ECAFE- ECLA-IASI	Preparation of the 1970 World Population and Housing Programme (1964-1966)
SO	Methodological study of civil registration and vital statistics systems throughout the world (1963-1965) Methodological study of national household surveys in respect of demographic and housing characteristics of population (1964-1965)
SO-ILO	Proposal for a standard international classification by socio-economic characteristics of population (1963-1964)
SO-ECLA- USAID	Preparation for Workshop on Techniques of Household Surveys for Latin America to be held in 1965, sponsored by the United States Agency for International Development (USAID)
BSA-SO	Housing statistics, censuses and sample surveys (1964-1965)
ECAFE-SO	Study of statistical personnel requirements in ECAFE countries, and of training and other needs related to the fulfilment of these requirements
ECE	Methodology, collection and publication of housing and building statistics Regional statistical seminar on the Organization and Conduct of Population Censuses in ECE countries (1965) <i>Quarterly Bulletin of Housing and Building Statistics for Europe</i>
ECLA	Compilation of available population estimates and projections Preparation of compendia of demographic data, estimates and projections for each country in Latin America Distribution and concentration of population in Central America (1964 and 1965)
ECLA-SO-WHO- IASI-IIN-AIRC	Second Inter-American Seminar on Civil Registration, Lima, Peru, 30 November-11 December 1964
ECLA	Study of demographic movements in the metropolitan areas of El Salvador (1964)
ECA	Revision and extension of report on population censuses in Africa Study of demographic inquiries on a sub-regional scale in Africa Study of problems of enumerating nomadic populations Seminar on retrospective sample surveys in the demographic field (1964-1965) Preparation for the establishment of basic series on social statistics in Africa
ECA-ILO	Seminar on Labour Statistics in Africa (1964)

6. TRADE EXPANSION

BGERP-CID-FFB- SO-ECE-ECAFE- ECA-ECLA- FAO-ILO-GATT	Preparation of documentation for topics included in the provisional agenda of the United Nations Conference on Trade and Development as suggested by the Preparatory Committee for the Conference (1963-1964) Assistance in servicing of the United Nations Conference on Trade and Development, held in Geneva from 24 March to 21 June 1964 Follow-up on the United Nations Conference on Trade and Development (1964-1965)
BGERP	<i>Commodity Survey</i> (annual) Studies of compensatory financial measures to offset fluctuations in the export income of primary producing countries (if requested by the Conference) Report on the current market situation in tungsten (1964) and servicing of <i>ad hoc</i> Committee on Tungsten Continuing statistical and other studies on the international trade of lead and zinc, and servicing of the Lead and Zinc Study Group (1964) Financing for the expansion of international trade (1964)
ECE	Co-operation with under-developed countries particularly on the question of trade promotion Studies and measures to facilitate the import and export of agricultural commodities by European countries Standardization of contract practices in engineering Improvement of Customs facilities for the crossing of frontiers by transport equipment, passengers and goods Review of developments in intra-European, especially East-West, trade Consequences for intra-European trade of efforts to achieve a greater degree of economic integration on a sub-regional basis in Europe Preparation of recommendations for the removal of the economic administrative and trade-policy obstacles to the development of trade between member countries of ECE

ECE	<p>Consultations of experts on intra-European, especially East-West, trade</p> <p>Improvement of payments arrangements</p> <p>Simplification and standardization of external trade documents</p> <p>International commercial arbitration</p> <p>Standardization of general conditions of sale for selected commodities</p> <p>Problems of insurance</p> <p>Problems of trade in machinery and equipment</p>
ECAFE-GATT	Development of trade and trade promotion services
ECAFE	<p>Study of methods of expanding international trade</p> <p>Regulations, procedures and practices concerning the conduct of international trade</p> <p>Study of commercial arbitration facilities</p> <p>Promotion of tourism and international travel</p>
ECLA	<p>Studies of economic development trade and integration</p> <p>Trade between Latin America and the rest of the world, discussed periodically in the <i>Economic Bulletin for Latin America</i> (1964)</p> <p>Study of changes in the composition of Latin American imports from industrialized countries. A Study on Brazil will be published in volume IX, No.1 of the <i>Economic Bulletin for Latin America</i></p> <p>Studies of the terms of trade and their influence on the rate of economic development. This subject is discussed periodically in the <i>Economic Survey</i> and the <i>Economic Bulletin</i></p> <p>Regional Advisory Group on Trade Policy</p> <p>Seminars and special training courses in trade policy (1964)</p>
ECLA-LAFTA	<p>Studies on the Latin American Common Market and on integration</p> <p>Alternative ways and means of intensifying the integration process of States Members of CAIP (1964)</p>
ECLA	<p>Studies on Central American trade</p> <p>Study of Central American customs union</p> <p>Trade policy and links between Central America and the rest of the world</p> <p>Analysis of the possibilities for trade in manufactured goods in the ECLA region (1964)</p>
ECLA-FAO	<p>Study on the terms of trade for agricultural commodities within each country in Latin America (1964-1965)</p> <p>Expansion of trade in agricultural products (1964-1965)</p>
ECA	<p>Studies of problems and prospects of an African common market</p> <p>Proposals for the establishment of an African payments union (1964)</p> <p>Studies of invisible trade of African countries</p> <p>Trade information and intelligence: publication of <i>Foreign Trade Newsletter</i></p> <p>Report on trade promotion in Africa (1964)</p> <p>Study of transit problems in West Africa (1964-1965)</p> <p>Study of frontier traffic problems in West Africa (1964-1965)</p> <p>Assistance to African countries with the conversion of their tariffs to the Brussels Tariff Nomenclature (1964-1965)</p>
ECA-GATT	Courses in foreign trade and commercial policy
ECA-FAO	<p>Examination of possibilities of expansion of intra-African specialization and trade in agricultural products</p> <p>Investigation into the nature, organization and operations of national marketing organizations</p>

7. DEVELOPMENT FINANCING (INCLUDING PROVISION OF DEVELOPMENT FINANCE, ASSISTANCE IN THE IMPROVEMENT AND APPLICATION OF METHODS AND TECHNIQUES FOR THE MOBILIZATION OF DOMESTIC AND FOREIGN RESOURCES, PUBLIC AND PRIVATE; AND FOOD AID)

FFB-CID-ECE-ECA-ECAFE-ECLA	<p>Capital and financial requirements of specific types of industries (1964-1965)</p> <p>Inter-regional Seminar on Financing Industrial Development (1965)</p>
FFB	United States Income Taxation of Private United States Investment in Latin America (second supplement to 1953 publication: 1964)
FFB-ECAFE-ECE-ECA-ECLA	Measures for the promotion of the flow of foreign capital to developing countries (1964)
FFB-CID	Export credits for the financing of capital goods requirements of developing countries (1964)
FFB-OECD	External sources of finance for developing countries: methods and institutions (1964-1965)

FFB-CID-ECE- ECA-ECAFE- ECLA	Instrumentalities and techniques in developing countries for channelling investment capital into development projects (1964-1965)
FFB	<i>International Tax Agreements</i> , published in two volumes: <i>Texts of New Agreements</i> (three supplements in 1964); <i>World Guide to International Tax Agreements</i> (one supplement in 1964)
BGERP	Report on the international flow of long-term capital and official donations, 1960-1962 (1964) The concept and measure of the flow of capital to less-developed countries (1964-1965) Surveys of international assistance Comparative study of programmes for the creation, mobilization and channelling of domestic saving for productive investment embodied in national plans
ECLA-IDB-OAS	Country studies carried out under the Joint Tax Programme
ECLA	Study of the Brazilian fiscal system (1964) Financing of economic development Domestic financing of development The role of external financing in Latin America's economic development (1964) Studies on fiscal policy of Central American countries (1964) Problems of financing industry in Latin America (1964)
ECA	Study of the problems of financing industry in Africa (1964-1965) Studies of revenue and expenditures of African Governments with special reference to the mobilization, allocation and efficient use of resources for economic development Reports on bilateral and multilateral assistance to African countries and territories Study of the problems of inflation and savings particularly with a view to mobilizing potential financial resources, such as hoarded funds, for economic development in African countries Assistance to the African Development Bank, expected to be established in 1964 following the Agreement reached by the Conference of African Finance Ministers held in Khartoum in August 1963 A study of the contribution which national development banks could make towards the promotion of economic development in African countries and territories
8. INTERNATIONAL CO-OPERATION IN THE MONETARY FIELD	
ECLA-IMF- CEMLA	Studies on payments and preparations for the third session of the Central Banks Working Group (1964)
ECA	Studies on the various monetary systems used in Africa with reference to their impact on intra-African trade in particular and on problems of African economic development in general Survey of monetary and banking institutions in Africa (1964) Meeting of African governmental monetary authorities (1964)

B. Development and utilization of human resources

1. CONTROL OF DISEASES AND RAISING OF HEALTH STANDARDS

[No United Nations projects in this field]

2. FORMULATION AND IMPLEMENTATION OF SCHEMES AND MEASURES AGAINST FAMINE, MALNUTRITION AND FOOD DEFICITS

[No United Nations projects in this field]

3. EDUCATION AND FOSTERING OF SCIENTIFIC AND CULTURAL DEVELOPMENT

BSA-UNESCO- ECLA-ESOB	Continuation of participation in the two UNESCO regional training centres for education for community development in Mexico (CREFAL) and United Arab Republic (ASFEC)
--------------------------	---

4. SOCIAL WELFARE AND SECURITY

BSA-ILO-WHO- FAO-UNESCO- UNICEF	Inter-agency meeting on the rehabilitation of the handicapped and issue of summary of information on rehabilitation projects of the United Nations, specialized agencies and interested non-governmental organizations (1964)
---------------------------------------	---

BSA	Studies on various aspects of rehabilitation of the handicapped (1963-1964) Preparation and publication of monographs on basic equipment for rehabilitation centres (1963-1964) <i>Ad Hoc</i> Working Group on Social Welfare (1964-1965)
BSA-ILO-WHO- FAO-UNESCO	Continuing co-ordinated international action, technical co-operation with UNICEF, and <i>ad hoc</i> inter-agency meeting on youth
BSA	Study of role of industrial social services in relation to integrated national social services
BSA-ILO	Study of relationship between social security and social services (1963-1964)
BSA	Studies, seminars, and study tours of various aspects of planning, organization and administration of social services (1963-1964) Preparation of fourth international survey of training for social work (1963-1964) Study of training for senior social welfare personnel (1963-1964) Development of social welfare training materials and organization of training programmes (1963-1964) Preparation of guidelines for use in developing comprehensive national child welfare programmes (1963-1964) Study of the types of social services needed and most effective methods to assist rural migrants to cities (1963-1964) Social aspects of migration (1963-1964)
BSA-ILO-WHO- UNICEF- UNESCO	Studies and seminars on family and child welfare (1963-1964)
ECAFE-BSA- UNICEF	Social welfare aspects of development
ECE	Problems of air pollution arising from various domestic, commercial and industrial sources
ECLA	Social significance of the distribution of income (1964-1965) Role of social services in the context of economic and social planning (1964)
ECA	Survey on programmes of rehabilitation of the handicapped in Africa (1965)
ECA-ILO- UNESCO- UNICEF	Preparation of concerted action programme to meet specific needs of African children and youth
ECA	Survey of family, child and youth welfare services in Africa (1964-1965)
ECA-BSA	Workshop on Organization and Administration of Family, Child and Youth Welfare Services in Africa (1965)
ECA	Publication of directory of social welfare activities in Africa (1964) Preparation and publication of monograph on patterns of social welfare organization and administration in Africa (1964) Survey of health, nutrition and other facilities for pre-school children in Addis Ababa (1964-1965) Meeting of Group of Experts on social development to consider social welfare work programme and priorities for 1965-1970 (1965)
ECA-BSA- UNICEF	Appraisal of social work training facilities in seven selected schools of social work in Africa (1964)
ECA-UNICEF	Training course for social work educators in Africa (1965)
ECA	Preparation and publication of monograph on social work training facilities in Africa (1964-1965)

5. EMPLOYMENT, ORGANIZATION AND TRAINING

CID	Methodology and techniques for assessing requirements for trained personnel Preparation of a list of qualified training institutions in selected fields of industrial development In-plant training of graduate engineers in developing countries (1964) Preparation of teaching materials
BSA	Training for community development
ECAFE	Survey facilities for industrial training
ECAFE-ILO	Regional training, research and advice
ECAFE	Survey of technical training facilities in the field of mineral resources development Organization of training courses in trade promotion
ECLA-ILO	Studies of employment, productivity and training in Latin American countries

ECLA	Trends in the composition of Latin American manpower
ECLA-ILO	Study of labour productivity and income distribution in Central American countries (1964)
ECA-CID-UNESCO-ILO	Preparation for the development of technological education and training
ECA-UNESCO-WMO-FAO-IAEA-CCTA	Investigation of requirements of sub-regional training programmes for technicians in the field of hydrology and arrangement for such training programmes
ECA	Preparation for the setting up of regional or sub-regional centres for the interpretation of aerial surveys and training in photogrammetry and airborne geophysical surveys Study of replies received from Governments and preparation of a report on the question of establishing joint centres for specialized services on a regional or sub-regional basis Consultations with universities, research institutions and other appropriate organizations in Africa regarding arrangements for the training of African staff Collating and evaluating all requests for fellowships in fields of training not already covered by awards through the United Nations and its specialized agencies Organization of training courses in customs administration
ECA-DPA	A short course in English to last six weeks would be organized in 1964 and directed to senior and upper middle class levels engaged in organization and methods work A short course in French to last six weeks would be organized in 1964 and directed to senior and upper middle class levels engaged in organization and methods work
ECE	In-service training programme for economists and statisticians from ECE, ECA, ECAFE and ECLA countries

6. RURAL AND COMMUNITY DEVELOPMENT, INCLUDING CO-OPERATIVES

BSA-ILO-WHO-FAO-UNESCO	Concerted international action in the field of community development (1963-1964)
BSA	Review of the principles and concepts of community development in the light of national and international experience through the follow-up of the Report of the <i>ad hoc</i> Group of Experts on Community Development (1963-1964) Planning, organization and administration of community development programmes (1963-1964) Economic aspects of community development (1963-1964) Field study on the role of co-operatives in community development (1963-1964) Popular participation in community development (1963-1964)
DPA-FAO	Workshop on the organization and administration of agricultural services in Arab States (1964)
ECAFE-ILO-DPA	Community development and economic development: (a) assistance by governments; (b) collection and dissemination of information; (c) undertake studies; and (d) organize seminars.
ECLA	Rural settlement patterns and community organization (1964) Seminar on rural and community development (1964) State and trends of community development in Latin America Content and objectives of community development programmes in the general process of development planning
ECA-FAO-WHO-ILO-UNICEF	Preparation of manual of guiding principles on the development of rural life and institutions to meet contemporary needs and possibilities
ECA-FAO	Survey of problems and prospects in the rural development of Mali, Niger and Upper Volta (1964-1965) Evaluation of community development and social welfare programmes in Ethiopia (1964)

7. SOCIAL PROTECTION

BSA-ILO-WHO-FAO-UNESCO-UNICEF	Continuing co-ordinated international action, <i>ad hoc</i> Inter-Agency Meeting on Juvenile Delinquency, its Prevention and Related Youth Policy
BSA	<i>Ad hoc</i> Advisory Committee of Experts on the Prevention of Crime and the Treatment of Offenders United Nations Consultative Group on the Prevention of Crime and the Treatment of Offenders National correspondents in the field of prevention of crime and treatment of offenders

BSA	<i>International Review of Criminal Policy</i> (annual) Programmes for the prevention and treatment of crime by young adult offenders (1963-1964) Studies and preparation and distribution of materials on treatment of offenders (1963-1964)
BSA-ECAFE	Regional institutes for the prevention of crime and the treatment of offenders for Asia and the Far East
BSA	Methods used for the prevention of juvenile delinquency (1963-1964) Prevention of types of criminality resulting from social change (1963-1964) Factual review of various aspects of the question of capital punishment (1963-1964)
BSA-ILO-WHO- FAO-UNESCO	Third United Nations Congress on the Prevention of Crime and the Treatment of Offenders (1965)
DPA-BSA-ILO	Special administrative and local government problems involved in extending services to nomadic and other special ethnic (tribal) groups (1964)
ECA	Regional Expert Group Meeting on Social Defence in Africa (1964) Training Course on Institutional Treatment of Juvenile Offenders (1964)
ECA-University of Addis Ababa	Study of the penal system in Ethiopia (1964)
ECA	Preparation of monograph on programmes for the prevention and treatment of juvenile delinquency in Africa (1965); (including country studies of Tanganyika, Northern Rhodesia, Mali and Senegal)

C. Development and conservation of physical resources

1. DEVELOPMENT OF FOOD AND AGRICULTURE

ECE-FAO	Review of the present situation of agriculture and the outlook for production and trade Exchange of technical information and experience on agricultural problems
ECE-FAO-ILO	Increased efficiency in forest operations
ECE-FAO	General conditions of sale for timber Review of timber market for Europe Reappraisal of European timber trends and prospects
FFB-FAO	Fiscal and financial aspects of land reform (1964-1965)
DPA-BSA-FAO	Administrative aspects of land reform programmes (1965)
BSA-ILO-FAO- FFB	Fourth progress report on land reform (1963-1964)
ECAFE	Review of current development in the field of food and agriculture in Asia and the Far East
ECAFE-FAO	Agricultural financing and credit Studies of food and agricultural price policies
ECLA-FAO- LAFTA	Studies of the agricultural sector to serve as a basis for complementary agreements within the framework of LAFTA (1964)
ECLA-FAO	Activities carried out in connexion with agricultural development in Central America and Panama Present conditions of agriculture in Central America and future prospects Agricultural commodities and free trade Foreign trade policy and agricultural development in Central America The role of agriculture and its prospects within Central American economic integration Demand for agricultural commodities and possibilities for import substitution in Central America Land use in Central America
ECLA-ILO-FAO	Study of land tenure and agricultural working conditions in Central American countries (1964)
ECLA-FAO	Principal physical agricultural inputs and their relationship to agricultural productivity within the framework of regional integration (1963-1965) Study of the existing agricultural research (both technical and economic) and extension facilities in Latin America (1964-1965) Study of the patterns of consumption of agricultural commodities in Latin America (1964-1965) Study of factors affecting the development of live-stock products in Latin America (1964-1965) Problems of the agricultural sector and land reform in Latin America (1964-1965)

- ECA-FAO Review and analysis of current progress in the field of food and agriculture in Africa
 Studies of demand and consumption levels for food and other agricultural products and participation in the activities of the World Food Programme for the utilization of food surpluses for assisting in economic development
 Assembly, analysis and dissemination of information on agricultural products processing
 Seminar on the marketing of staple foodstuffs (August 1964)
 Expert meeting on government measures to promote the transition from subsistence to market agriculture (May 1964)
 Examination of institutional factors in agricultural development including land tenure, credit, co-operatives and extension services
 Studies on economics of fertilizers and other technical inputs in African agriculture
 Study on African timber trends and prospects (November 1964)

2. INDUSTRIAL DEVELOPMENT

- CID Evaluation of projects in centrally-planned economies
Bulletin on Industrialization and Productivity (two issues in 1964)
 Study of maturation period of investment in manufacturing industries in Japan, India and the United States of America
 Pre-investment data on the aluminium industry (economic and technical aspects)
 Pre-investment data on food processing industries (economic and technical aspects)
 World survey of the development of the petrochemical industry (1964) to be presented at the Conference on the Petrochemical Industry
 World production, consumption, trade and future trend in selected petrochemical products (1964) to be presented at the Conference on the Petrochemical Industry
 Study of economic characteristics of small-scale industries
- CID-ECE-ECAFE-ECA-ECLA Editing of report on Inter-regional Symposium on the Application of Modern Technological Methods in the Iron and Steel Industry
- CID Studies of industrial standardization, and of in-plant standardization for the benefit of developing countries (1964)
 Studies of technological and industrial research institutes
 Study of use of second-hand machinery
 Manufacture of industrial machinery and equipment in developing countries
 Interregional Seminar on Technological and Industrial Research Institutes (to be held in Beirut, November-December 1964)
- CID-ECE-ECAFE Interregional Seminar on Industrial Complexes for Industrial Development (to be held in Tashkent in October 1964)
 Interregional Conference on Petrochemical Industries based on Natural Gas (to be held in Tehran in 1964)

DOCUMENT E/3946 *

Report of the Special Committee on Co-ordination

[Original text: English]
[13 July 1964]

1. At its resumed thirty-sixth session the Council elected the following States as members of the Special Committee on Co-ordination to serve for a term of office of one year (1964): Algeria, Argentina, Austria, Denmark, France, Japan, Netherlands, Union of Soviet Socialist Republics, United Kingdom of Great Britain and Northern Ireland, United States of America and Yugoslavia.

2. The Committee met at the European Office of the United Nations on 9 to 13 July 1964. Mrs. Nonny Wright, of Denmark, was re-elected Chairman and Mr. Gert Heible, of Austria, was elected Rapporteur. Representatives of specialized agencies and the International Atomic Energy Agency (IAEA) participated in the work of the Committee.

3. The Committee was originally scheduled to meet for a period of two weeks in May at United Nations

* Incorporating document E/3946/Corr.1.

Headquarters in New York. Because of the United Nations Conference on Trade and Development and other conference pressures, the Committee had to content itself with a three-day session in Geneva just prior to the opening of the thirty-seventh session of the Council.

4. As a result of the circumstances referred to above, the Committee found itself unable to consider fully and report on the various matters that fall within its terms of reference. The Committee decided therefore to confine its report this year to identifying — in the light of the reports of the Administrative Committee on Co-ordination (ACC), the specialized agencies and the IAEA, as well as other documents before the Council — and commenting briefly on a number of issues and areas of activity to which the Council might wish to devote special attention at its thirty-seventh session.

5. The Committee was specifically requested by the Council in its resolution 920 (XXXIV) to take into account the activities of the *ad hoc* Committee of Ten. The Committee had before it that Committee's report (E/3862) as well as the Secretary General's proposals (E/3850, E/3851, and E/3899) and the recommendations of the ACC on the same subject (E/3886 and Add.1). The Committee, in view of the circumstances referred to in paragraph 3 of this report, did not find it opportune to go into the substance of the proposals for bringing together the Expanded Programme of Technical Assistance and the Special Fund into one United Nations Development Programme. It does, however, attach great importance to this issue because of its significance in the context of the United Nations Development Decade and because of the many co-ordination aspects involved. As regards procedure, the Committee recommends that the item be considered in the first instance in the Co-ordination Committee of the Council.

6. The Council has before it the Final Act and Report of the United Nations Conference on Trade and Development.¹⁷ The recommendations of the Conference, especially those concerning the establishment of the new institutional machinery in the field of trade and development, have a profound and direct bearing on the structure and *modus operandi* of the United Nations in respect of wide areas of economic and social activities, and will undoubtedly give rise to additional problems of co-ordination meriting the Council's closest attention. The Committee wishes, therefore, to express the hope that, when the detailed arrangements to give effect to the Conference's recommendations are considered, the utmost care will be taken to ensure:

(a) A rational and clearly defined distribution of work among the different organs concerned; and

(b) The further development of the system of close co-operation and co-ordination through consultation among members of the United Nations family which has been built up over the years under the Economic and Social Council in virtue of Article 63 of the Charter.

7. A considerable part of the Council's machinery has remained virtually unchanged since 1946 and 1947 when the nature and scope of United Nations activities

were very different from what they are now. It would seem opportune, in the light of the requirements of the Development Decade and in view of the factors referred to in the preceding paragraph, for this whole machinery to be looked at in a somewhat broader framework. The Council may wish to consider the advisability of arranging for such a re-appraisal to be undertaken of the adequacy and the effectiveness of the economic and social structure of the United Nations, with due regard to ensuring the good functioning of the agreements between the United Nations and the specialized agencies and IAEA.

8. Council resolution 991 (XXXVI) requested the ACC to give further consideration to certain problems relating to evaluation and to report on the results of its consideration of this request to the thirty-seventh session of the Council. The Committee studied with great interest the detailed comments and recommendations of the ACC contained in paragraphs 34-65 of its twenty-ninth report (E/3886 and Add.1). After elaborating extensively on the many difficulties and problems involved in evaluating the over-all impact of the programmes of the United Nations family, the ACC has presented in paragraphs 52-65 certain concrete proposals as to how in its opinion a process of evaluation should be set in motion. Most members of the Committee, while recognizing the many implications of the matter, feel that there is perhaps a disproportionate emphasis in the ACC report on the obstacles which stand in the way of a meaningful and effective evaluation. Other members of the Committee, while attaching importance to the question of evaluation, consider that the ACC's report maintains a judicious balance between the practical obstacles in the way of effective evaluation on the one hand and the ACC's practical proposals for pilot studies in four countries at different stages of economic development on the other. They favour a policy of hastening slowly in the field of evaluation. The Committee is of the opinion that a great deal of discussion on the importance and the problems of evaluating the over-all impact of United Nations programmes has already taken place and that it would now be desirable to concentrate constructive efforts on the implementation of concrete proposals for action so as to achieve as soon as possible some first tangible, if limited, results. The suggested idea of conducting pilot projects was felt to be a pertinent approach. Most members of the Committee are of the opinion that the Resident Representatives should be full members of the proposed evaluation teams. Other points that would, in the view of the Committee, deserve a careful consideration by the Council are the degree of independence with which these teams should be endowed and the desirability of conducting further studies as to ways and means in which an evaluation machinery on a permanent basis could be established. The Committee concurred also in the view that the collection of information on as wide a basis as possible would be a step of foremost importance that could be undertaken as a preliminary measure independently of the pilot projects mentioned. This collection of data should be conducted in such a way as to concentrate at one

¹⁷ United Nations publication, Sales No.: 64.II.B.11.

point all the relevant information concerning a specific country, so as to obtain an over-all view of the activities of the United Nations family in that country.

9. The Committee underlines the need for including full budgetary information in the annual work programme of the United Nations in the economic, social and human rights fields. In this regard, the Committee recalled General Assembly resolution 1797 (XVII) on an integrated programme and budget policy, and Economic and Social Council resolution 990 (XXXVI) under which the Council decided "to consider at its 1964 session the revision of the Council's procedures for discussing financial implications of its actions". It was noted that much preparatory work was already being done and that the Council at its thirty-seventh session, pursuant to its resolution 990 (XXXVI), would be presented by the Secretary-General with a work programme framed within the functional classification of the activities of the United Nations family in the economic, social and human rights fields. The Committee is of the opinion that the ECOSOC should give consideration to the establishment of a procedure for screening the United Nations work programme in the economic, social and human rights fields in relation to its budgetary implications. The establishment of such a procedure would imply that the Secretary-General would have to present to the ECOSOC, at a timely stage of the calendar year, an integrated draft programme and budget. This would be a practical step of considerable importance on the road towards a clearly defined budget cycle for the United Nations programmes in question, with the result, first and foremost, that

the General Assembly would be much better placed when taking decisions on the annual budget of the Organization. On the basis of the foregoing considerations, the Committee recommends that the Council give particular attention to the desirability of establishing such procedure under its over-all co-ordinating authority.

10. The Committee suggests that the Council should give special attention to the first report of the Advisory Committee on the Application of Science and Technology to Development (E/3866) and to the relevant remarks in the twenty-ninth report of the ACC (E/3886 and Add.1), so that the work in this field for the benefit of the underdeveloped countries may be advanced as rapidly as possible.

11. The Committee noted the Secretary-General's reports on relations among planning institutes and on the United Nations Training and Research Institute (E/3923 and E/3924). It attaches great importance to the establishment and consolidation of these institutes in the framework of the Development Decade, as well as to the arrangements—which appear to be well in hand—for ensuring full consultation and co-ordination among them, especially in the pre-programming stage.

12. The Committee felt that the points outlined above were of such importance that in view of the short time available the discussion of any other items did not seem advisable. It is, however, aware of the fact that there are several other areas that involve important aspects of co-ordination to which the Council will undoubtedly wish to give its attention.

DOCUMENT E/3948

Note by the Secretary-General transmitting a letter from the Secretary General of the League of Red Cross Societies

[Original text: English]
[15 July 1964]

The Economic and Social Council at its thirty-sixth session asked the Secretary-General to take the lead in establishing, in conjunction with the specialized agencies and the League of Red Cross Societies, appropriate arrangements for assistance in rapid and concerted relief and construction in cases of natural disaster.¹⁸ In the course of the discussions following this request the Secretary-General received a letter from Mr. Henrik Beer, Secretary General of the League of Red Cross Societies, which is herewith circulated for the information of the Members of the Council.

LETTER DATED 11 MARCH 1964 FROM THE SECRETARY
GENERAL OF THE LEAGUE OF RED CROSS SOCIETIES
TO THE SECRETARY-GENERAL OF THE UNITED NATIONS

At its thirty-sixth session, the Economic and Social Council adopted an annex to the resolutions concerning

"Emergency action by United Nations organizations in cases of natural disaster". This annex reads as follows:

"In view of the recent disaster at Skopje, special attention was directed to the passages in the twenty-eighth report of the Administrative Committee on Co-ordination dealing with emergency action by United Nations organizations in cases of natural disaster. The Committee noted the work being done in this field by the Administrative Committee on Co-ordination and expressed the hope that the Administrative Committee on Co-ordination would hasten its studies with a view to adopting agreed procedures, whereby assistance by the United Nations and related agencies, as well as the Red Cross, might be rendered in an effective and well co-ordinated manner. The Secretary-General was asked to take the lead in establishing, in conjunction with the specialized agencies and the League of Red Cross Societies, appropriate arrangements for assistance in rapid and concerted relief and construction in cases of natural disaster."

¹⁸ *Official Records of the Economic and Social Council, Thirty-sixth Session, Supplement No. 1*, p. 39.

Long before this text was established, the United Nations and the specialized agencies, on one side, and the International Red Cross, represented in disaster relief by the League of Red Cross Societies, on the other, have collaborated closely in international disaster relief actions.

Disaster relief, being one of the basic activities of National Red Cross Societies and their federation, the League, has grown in importance during the post-war era. You will find enclosed a list of Red Cross relief actions, co-ordinated by the League during the post-war period, which shows the increasing frequency of international relief actions and their expanding amplitude.¹⁹ This basic activity of the Red Cross was discussed at the Centenary Congress of the International Red Cross in Geneva in September 1963. The Council of Delegates adopted the following resolution confirming the role of the League:

" II. Relief actions on behalf of the victims of natural disasters

" The Council of Delegates,

" Notes with satisfaction the increasing role of the National Societies in relief actions undertaken on behalf of victims of natural disasters;

" Congratulates the National Societies and the League of Red Cross Societies for their activities in this field;

" Reaffirms that it is the vocation of the Red Cross to come to the help of all who are afflicted by these disasters;

" Recalls the role played by the League as a co-ordinating institution of international relief actions;

" Invites the National Societies to make this role better known both to government authorities and the general public."

Even if the basic work of preparation and organization for emergency relief actions is executed within the Red Cross, it is quite clear that some disasters have such dimensions that it is impossible for the Red Cross to handle more than a limited part of the actions concerned, notably the emergency phase and, within this phase, questions of feeding, emergency housing, medical and social care. On occasions, where the willingness of the public to collaborate has been so great that extra resources have been created, it has been possible for the Red Cross to take a large part in the reconstruction and rehabilitation phase after a disaster, but there are some fields which need a broader base than the Red Cross alone can offer. That is why the Red Cross has been grateful for the willingness shown by both the United Nations and the specialized agencies concerned to take their part. Without formal agreements, a close collaboration has been established with the United Nations, both through the New York office and the regional offices concerned, and with the interested branches of the organization, such as the United Nations

High Commissioner for Refugees and the United Nations Children's Fund, such an informal collaboration has likewise been established with, primarily, the World Health Organization and the Food and Agriculture Organization.

These contacts have been established not only by an exchange of information and division of work and mutual aid during the actual operation of relief actions, but also by consultations on principles and preparations for future disasters.

All interested parties have surely been aware of the interest of the general public, and also of governments and various organizations, in problems of organizing and co-ordinating relief after disasters of dimensions which cannot be handled nationally. Special difficulties have often arisen due to the fact that the disaster-prone areas of the world are in many instances the same as those areas where countries are in the development stage and not well prepared to organize relief actions themselves, or even to receive foreign aid. Inevitably, active discussions during or immediately after relief actions have been coloured by the special circumstances pertinent to the actual disasters. There are, however, common experiences which should be taken into account in planning for the mitigation of the consequences of future disasters. That is why the League finds it of the greatest importance that discussions on co-ordination with interested representatives within the United Nations family will continue and certainly will lead to results which will be of benefit to our common efforts.

It seems well established in the public mind that the duty of arousing interest and obtaining spontaneous contributions from the populations which have resources to give, for the humanitarian side of a relief action, should be that of the non-governmental organizations. The National Red Cross, Red Crescent and Red Lion and Sun Societies, co-ordinated by their federation, the League, have here one of their most important duties, with the League serving as an information centre, adviser and co-ordinator.

It also seems generally accepted that the long-range problems of re-establishment and reconstruction are of such a nature and demand such effort and co-ordination on the Government level that their solutions go far beyond the resources of the Red Cross and other volunteer organizations, and are a natural activity for international organizations like the United Nations and the specialized agencies.

It is very difficult, however, to create definite rules on paper, drawing the demarcation line between the emergency stage in a relief action and the secondary stages. It is likewise a fact that every new relief situation has such special characteristics that the necessary actions could not be formalized beforehand. That is why it seems necessary, notably, to establish formal agreements but also to continue to establish possibilities, in time of need, for day-to-day contact and co-ordination between the United Nations and the Red Cross, especially in the first stages of a disaster relief situation.

¹⁹ The list, covering the period 1919-1963, is on file in the archives of the Secretariat.

This contact has already in principle functioned satisfactorily both at the central, policy-making level and in the field.

Concerning the central co-ordination within the United Nations family, the League has noted with great interest the resolution quoted in the first paragraph of this letter and wishes to declare its willingness to collaborate with the United Nations in its application. It will, in a very positive way, study those suggestions that might be made by the Secretary-General as a result of the resolution quoted. We would like to mention that the Relief Advisory Committee of the League, and its Executive Committee, will meet in September 1964 and that these meetings would be the forum for a further discussion of concrete proposals on the organization of this collaboration.

Concerning co-ordination in the field, experience has shown that the problems are usually more complicated than on the central level, especially during and after disasters in countries which have not been able to organize an efficient disaster scheme themselves, either on the governmental or the non-governmental level. Criticism of the execution of international disaster relief actions has mostly concerned problems posed by the need of co-ordinating international help in the field. International organizations, on both governmental and non-governmental levels, have a great task to accomplish, not only in order to co-ordinate the efforts within their respective "families", but also in relation to bilateral relief actions which inevitably take place and which often bring, if not chaos, grave structural and technical difficulties both for the recipient and the co-ordinating agencies. It is the responsibility of the League to see that co-ordination between collaborating Red Cross/Crescent Societies functions as well as possible and, within its competence, to accomplish the same task on the side of the non-governmental organizations. Within the United Nations family, it would seem to be of great value if a Resident Representative of the United Nations, or an officer specially appointed and with the necessary competence, has enough authority to be able to speak and act for the whole United Nations family.

In this connexion, the League of Red Cross Societies would like to mention some other problems of a different character, but pertinent to disaster relief actions. All aspects of a certain type of relief action, for instance,

after earthquakes or great floods, do not seem to be adequately covered by the resources of humanitarian organizations, perhaps not even by the United Nations and the specialized agencies. Questions concerning medical care, food and temporary housing seem to be relatively well covered. There has been, however, some lack of preparation in the purely technical field of emergency transportation (helicopters, landing-craft, etc.) and also when it concerns technical material needed for examination of destroyed or damaged buildings after earthquakes. It seems to be quite clear that material of this type, expensive and demanding specially trained personnel, cannot be stored or put at the permanent disposal of the interested organizations. One has to use existing organizations and institutions, like military establishments, transport and shipping agencies, construction firms, etc. Methods of making this aid more efficient than hitherto should, therefore, be investigated. The League is now initiating a modest study of experience in these fields and would welcome further consultation and collaboration with the United Nations, in order to make these preparations as efficient as possible.

A similar field, where some efforts have already been made but have to be expanded, concerns registration and training of personnel from different countries in preparation for specialized tasks during a relief action. The specific knowledge acquired within the Red Cross might well be combined with the vast experience of training for work in foreign countries acquired by the United Nations, and it seems that this is also a field for further collaboration.

To sum up, the League of Red Cross Societies is also interested in every step that can be taken for more efficient co-ordination of relief actions in the field.

Finally, the League of Red Cross Societies is interested in further contact with the United Nations bodies concerned in the field of research and planning of the whole spectrum of disaster relief, and registration and training of personnel for these purposes.

With deep appreciation of your interest in and comprehension of the role of the Red Cross in the field of relief, accept, Sir, etc.

(Signed) Henrik BEER

Secretary General of the League
of Red Cross Societies

DOCUMENT E/3979

Report of the Co-ordination Committee

[Original text: English]
[13 August 1964]

1. The Co-ordination Committee, under the chairmanship of Mr. Daniel Cosío Villegas (Mexico), at its 257th to 264th, 266th and 268th meetings, held respectively on 31 July, 4 to 7 and 10 to 12 August 1964, con-

sidered item 6 of the Council's agenda (General review of the development, co-ordination and concentration of the economic, social and human rights programmes and activities of the United Nations, the specialized

agencies and the International Atomic Energy Agency as a whole), which had been referred to the Committee by the Council at its 1314th meeting held on 13 July 1964.

2. The Committee had before it the following documents: report of the Special Committee on Co-ordination (E/3946 and Corr.1); twenty-ninth report of the Administrative Committee on Co-ordination (E/3886 and Corr.1 and Add.1); annual reports of the ILO (E/3877), FAO (E/3909 and Add.1 and 2), UNESCO (E/3896), ICAO (E/3891), WHO (E/3872 and Add.1 and 2), UPU (E/3867), ITU (E/3890 and Add.1), WMO (E/3874), IMCO (E/3892) and the IAEA (E/3878 and Corr.1); report by the President on the meeting held on 20 July 1964 between the Administrative Committee on Co-ordination, the Officers of the Council and the Chairman of the Council's Committee on Co-ordination (E/3957); report of the Secretary-General on multiplicity of resolutions (E/3880); report of the Secretary-General on the work programme in the economic, social and human rights fields (E/3928); reports of the regional economic commissions and of other subsidiary organs of the Council which had met in 1964, and of UNICEF were also available as background documentation.

3. After various general statements had been made on item 6, the Committee considered a number of draft resolutions. The representative of the United States of America introduced a draft resolution on evaluation of programmes, sponsored also by Austria and Mexico (E/AC.24/L.241). The Committee was informed of a few drafting changes in the text. The sponsors accepted oral amendments suggested by Italy, the United Kingdom, Indonesia and the Union of Soviet Socialist Republics. The Committee adopted the revised draft resolution by 23 votes to none, with 1 abstention.

4. The representative of Australia introduced a draft resolution sponsored also by Algeria, Japan and Mexico on the subject of "meetings between the Administrative Committee on Co-ordination, the Officers of the Council and the Chairman of the Council's Committee on Co-ordination" (E/AC.24/L.242). During the course of discussion on the draft, the sponsors accepted an oral amendment submitted by France to the last operative sub-paragraph. The Committee then adopted the revised text unanimously.

5. The representative of France introduced a draft resolution also sponsored by Argentina, Australia, Austria and Japan entitled "Preparation and submission of the budgets of the specialized agencies" (E/AC.24/L.245). During the course of discussion, the representatives of several specialized agencies made statements to the Committee. The draft resolution was adopted by the Committee by 17 votes to 2, with 4 abstentions.

6. The representative of France also introduced a draft resolution submitted by Chile, Colombia, Ecuador, France, Italy and Mexico on the "Centenary of the International Telecommunication Union" (E/AC.24/L.246). After the sponsors had accepted two oral amendments suggested by the representative of the Secretary-General, the Committee adopted the revised draft unanimously.

7. The representative of Luxembourg introduced a draft resolution sponsored also by France and the United States of America entitled "Work programme of the United Nations in the economic, social and human rights fields" (E/AC.24/L.247). The sponsors accepted a proposal to delete the sixth operative paragraph, as well as a change in the last preambular paragraph. The Committee adopted the revised draft resolution unanimously.

8. The Committee approved the proposals made by the Secretary-General in his report on multiplicity of resolutions on the understanding that the relevant index would be prepared in 1966 for publication in 1967 and that there would be no additional financial implications.

9. The Committee discussed a draft resolution on water resources development (E/AC.6/L.301/Rev.1) transmitted to it for comments by the President at the request of the Economic Committee. The Committee decided to send a summary of its debates on this subject to the President for transmission to the Economic Committee.

10. At the 1326th meeting of the Council the Secretary-General had recommended a review and reappraisal of the functions and machinery of the United Nations in the economic and social fields, and in particular of the Economic and Social Council. At the 258th meeting of the Committee, the Under-Secretary for Economic and Social Affairs expounded in greater detail what the Secretary-General had had in mind (E/AC.24/L.240 and Add.1). The representative of Iraq introduced a draft resolution on the subject, sponsored by Algeria, Cameroon, Chile, Ghana, India, Indonesia, Iran, Iraq, Senegal, the United Arab Republic, the United Republic of Tanganyika and Zanzibar and Yugoslavia (E/AC.24/L.252). The representative of the United Kingdom introduced another draft resolution on the same subject, sponsored by the United Kingdom of Great Britain and Northern Ireland and the United States of America (E/AC.24/L.249). After the representatives of Yugoslavia and of the United States had spoken in favour of the respective draft resolutions of which they were co-sponsors, the representative of India proposed that the Committee close the debate on the subject and recommend to the Council to include it on its agenda for the thirty-eighth session. This proposal was adopted unanimously. The Co-ordination Committee, therefore, recommends to the Council to include this subject on the agenda of its thirty-eighth session.

11. The Committee therefore recommends to the Council the adoption of the following draft resolutions:

A

REPORT OF THE ADMINISTRATIVE COMMITTEE ON CO-ORDINATION

[Text adopted by the Council without change. See below "Resolutions adopted by the Economic and Social Council", resolution 1040 (XXXVII).]

B

REPORTS OF THE SPECIALIZED AGENCIES AND
THE INTERNATIONAL ATOMIC ENERGY AGENCY

[Text adopted by the Council without change. See below "Resolutions adopted by the Economic and Social Council", resolution 1041 (XXXVII).]

C

EVALUATION OF PROGRAMMES

[At its 1351st meeting the Council decided to amend draft resolution C by inserting the words "if practicable" after the words "to be chosen" in operative paragraph 2. See below "Resolutions adopted by the Economic and Social Council", resolution 1042 (XXXVII).]

D

MEETINGS BETWEEN THE ADMINISTRATIVE COMMITTEE ON
CO-ORDINATION, THE OFFICERS OF THE COUNCIL AND
THE CHAIRMAN OF THE COUNCIL'S COMMITTEE ON
CO-ORDINATION

[Text adopted by the Council without change. See below "Resolutions adopted by the Economic and Social Council", resolution 1043 (XXXVII).]

E

PREPARATION AND SUBMISSION OF THE BUDGETS
OF THE SPECIALIZED AGENCIES

[Text adopted by the Council without change. See below "Resolutions adopted by the Economic and Social Council", resolution 1044 (XXXVII).]

F

CENTENARY OF THE INTERNATIONAL
TELECOMMUNICATION UNION

[Text adopted by the Council without change. See below "Resolutions adopted by the Economic and Social Council", resolution 1045 (XXXVII).]

G

WORK PROGRAMME OF THE UNITED NATIONS
IN THE ECONOMIC, SOCIAL AND HUMAN RIGHTS FIELDS

[Text adopted by the Council without change. See below "Resolutions adopted by the Economic and Social Council", resolution 1046 (XXXVII).]

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

**1040 (XXXVII). Report of the Administrative
Committee on Co-ordination**

The Economic and Social Council,
Having considered the twenty-ninth report of the
Administrative Committee on Co-ordination (E/3886),
Takes note with appreciation of the report of the
Administrative Committee on Co-ordination.

1351st plenary meeting,
15 August 1964.

**1041 (XXXVII). Reports of the specialized agencies
and the International Atomic Energy Agency**

The Economic and Social Council,
Having considered the annual reports of the special-
ized agencies²⁰ and the International Atomic Energy
Agency,²¹

²⁰ International Labour Organisation, *Eighteenth Report of the International Labour Organisation to the United Nations* (Geneva, 1964).

"Report of the Food and Agriculture Organisation of the United Nations to the Economic and Social Council at its thirty-seventh session" (Rome 1964); "The Work of FAO 1962-63: report of the Director-General" (C 63/2); and *Resolutions adopted by the FAO Conference at its Twelfth Session, 1963*.

"Report of the United Nations Educational, Scientific and Cultural Organization to the Economic and Social Council".

Takes note with appreciation of the annual reports of
the specialized agencies and the International Atomic
Energy Agency.

1351st plenary meeting,
15 August 1964.

1042 (XXXVII). Evaluation of programmes

The Economic and Social Council,
Recalling its resolution 991 (XXXVI) of 2 August 1963,
which requested the Administrative Committee on

World Health Organization, *The Work of WHO, 1963: Annual Report of the Director-General to the World Health Assembly and to the United Nations (Official Records of the World Health Organization No. 131)* (Geneva, 1964); and "Supplementary Report".

International Civil Aviation Organization, *Annual Report of the Council to the Assembly for 1963* (Doc. 8402 A15-P/2, April 1964).

Universal Postal Union, "Report on the Work of the Union — 1963" (Berne), transmitted to the Council by a note of the Secretary-General (E/3867).

Report on the Activities of the International Telecommunication Union in 1963 (Geneva 1964); and *Third Report by the International Telecommunication Union on Telecommunication and the Peaceful Uses of Outer Space* (Geneva, 1964).

Annual Report of the World Meteorological Organization, 1963 (WMO — No. 148. RP. 55). (Geneva, 1964).

"Annual Report of the Inter-Governmental Maritime Consultative Organization, 1964" (London).

²¹ Annual Report of the International Atomic Energy Agency to the Economic and Social Council for 1963-64".

Co-ordination to give further consideration to the problem of evaluation to be undertaken in co-operation with Governments,

Having considered the report of the Administrative Committee on Co-ordination which *inter alia*, suggests that evaluation in respect of individual countries " would perhaps best be formed of a series of limited studies, each dealing with assistance programmes capable of evaluation by a common standard " (E/3886, para. 57) and that therefore pilot projects of evaluation should be undertaken in a limited number of countries in different regions of the world at different stages of economic development,

Being aware that the Technical Assistance Board during 1964 intends to take steps, in co-operation with Governments concerned, to study the functioning of the programme in a limited number of countries,

Noting the observation of the Special Committee on Co-ordination that " it would now be desirable to concentrate constructive efforts on the implementation of concrete proposals for action so as to achieve as soon as possible, some first tangible, if limited results, " (E/3946, para. 8),

Reiterating the importance attached to systematic and objective evaluation of the impact and effectiveness of programmes undertaken by the United Nations as well as by the specialized agencies and the International Atomic Energy Agency towards the advancement of economic and social progress of the developing countries,

1. *Recognizes* that any evaluation of the impact of the technical co-operation programmes and activities of the United Nations and its related agencies on the progress of the developing countries is of primary concern to these countries and can be achieved only with the co-operation of the Governments concerned;

2. *Requests* the Secretary-General, in co-operation with the Managing Director of the Special Fund and the Chairman of the Technical Assistance Board, and in consultation with the executive heads of the specialized agencies concerned and the International Atomic Energy Agency, to proceed, as promptly as possible with arrangements for undertaking pilot evaluation projects in a limited number of countries, to be chosen if practicable from among the same countries selected by the Technical Assistance Board for study of the functioning of the Expanded Programme of Technical Assistance; such arrangements should make the fullest possible use of the resident representatives and the regional economic commissions concerned and should include:

(a) The establishment of procedures for the collection of relevant information on a country-by-country basis;

(b) The selection and briefing of small teams to co-operate with the Governments of the selected countries in the evaluation of the overall impact and effectiveness of the combined programmes of the United Nations system of organizations, in terms of performance and results achieved and, whenever feasible, in the light of the goals to be achieved through the economic and social development plans of these countries;

3. *Invites* the executive heads of the agencies concerned, and other bodies participating in the programmes, to lend their full co-operation in the execution of these pilot evaluation projects;

4. *Requests* the Secretary-General to submit to the thirty-ninth session of the Council a report on as many of the selected pilot evaluation projects as possible, together with observations regarding continuing evaluation machinery, based on the experience gained in the course of these pilot evaluation projects.

*1351st plenary meeting,
15 August 1964.*

1043 (XXXVII). Meetings between the Administrative Committee on Co-ordination, the Officers of the Council and the Chairman of the Council's Committee on Co-ordination

The Economic and Social Council,

Recalling its resolution 992 (XXXVI) of 2 August 1963, in which it requested the Secretary-General, as Chairman of the Administrative Committee on Co-ordination, to arrange for a meeting between the Administrative Committee on Co-ordination, the Officers of the Council and the Chairman of the Council's Co-ordination Committee to discuss practical and effective means to bring about a closer relationship between the two bodies:

1. *Notes with satisfaction:*

(a) The arrangements which were made for an informal meeting between the members of the Administrative Committee on Co-ordination, the Officers of the Council and the Chairman of the Council's Co-ordination Committee on 20 July 1964;

(b) The report of the President of the Council²² on this meeting and the comments in the report that the meeting was useful as an exploratory talk and that there was a consensus regarding the desirability of closer co-operation between the Administrative Committee on Co-ordination and the Council;

2. *Welcomes* the general agreement at the meeting that there should be further informal meetings between the Administrative Committee on Co-ordination, the Officers of the Council and the Chairman of the Council's Committee on Co-ordination in the future; that the next meeting should be held in the Spring of 1965, and meetings thereafter as may be mutually agreed;

3. *Agrees* with the suggestions of the President that:

(a) The informal atmosphere of the first meeting should be retained;

(b) Such meetings, while not a substitute for the Council's existing machinery and procedures for co-ordination, may supplement this machinery and procedures and, through informal discussion, help them to work more smoothly and more effectively;

(c) If such meetings are to be held in future on a regular basis, this should be taken into account when

²² E/3957.

considering the calendar of conferences for 1965 so that the officers of the Council can be elected and have time to make full preparation in advance of the next meeting;

(d) It would be useful if the Co-ordination Committee, other Committees of the Council and, where appropriate, the Special Committee on Co-ordination would draw attention to any major issues of co-ordination that they would like to be given a priority in such informal discussion with the Administrative Committee on Co-ordination at such meetings.

*1351st plenary meeting,
15 August 1964.*

1044 (XXXVII). Preparation and submission of the budgets of the specialized agencies

The Economic and Social Council,

Conscious of its responsibilities in the field of co-ordination under Article 63 of the Charter,

Noting the steady and at times empirical increase in the activities of the specialized agencies and the International Atomic Energy Agency,

Considering that it would be highly desirable, in order to permit of more effective co-ordination between the specialized agencies and in the interest of those agencies themselves, if comparative appraisals could be made between their respective budgets, particularly with a view to determining the main trends in the activities of the specialized agencies and setting forth certain common principles,

Noting that at the present time the breakdown of expenditure and appropriations in those various budgets differs from one agency to another, thus rendering the desirable comparisons difficult,

1. *Requests* the Administrative Committee on Co-ordination to consider, in consultation with the Advisory Committee on Administrative and Budgetary Questions, to what extent the specialized agencies and the International Atomic Energy Agency could be requested to use a uniform lay-out for the preparation and presentation of their respective budgets;

2. *Requests* the Administrative Committee on Co-ordination to submit to it an initial report on this question at its thirty-ninth session.

*1351st plenary meeting,
15 August 1964.*

1045 (XXXVII). Centenary of the International Telecommunication Union

The Economic and Social Council,

Noting with keen interest that the International Telecommunication Union, which was founded consequent to the signature of the first International Telegraph Convention at Paris on 17 May 1865, is to celebrate its

centenary in 1965, International Co-operation Year, thus providing an example of a century of uninterrupted international co-operation,

Considering that it would be desirable to associate the United Nations, the specialized agencies and the International Atomic Energy Agency with the celebration of this centenary,

1. *Offers* its heartiest congratulations to the International Telecommunication Union on the occasion of its centenary;

2. *Invites* the United Nations, the specialized agencies and the International Atomic Energy Agency to participate to the fullest possible extent in the celebrations which will mark the centenary of the International Telecommunication Union, and should constitute an important contribution to International Co-operation Year.

*1351st plenary meeting,
15 August 1964.*

1046 (XXXVII). Work programme of the United Nations in the economic, social and human rights fields

The Economic and Social Council,

Recalling General Assembly resolution 1797 (XVII) of 11 December 1962 in which it was recognized that the objectives of the United Nations Development Decade require the maximum concentration of efforts and resources in selected areas where there are the greatest needs and opportunities for United Nations action,

Recalling further its own resolution 990 (XXXVI) of 2 August 1963 on the work programme in the economic, social and human rights fields,

Having considered the Secretary-General's report on this work programme (E/3928) which, although constituting an improvement upon last year's submission,²³ remains far from providing the tool envisaged in resolution 990 (XXXVI),

Convinced that in the interest of clearly defining the United Nations programmes in the economic, social and human rights fields the Council should be provided more systematically and at a timely stage of the calendar year with the budgetary implications of such programmes, closely related to each of the major areas of work,

1. *Endorses* the conclusion of the Special Committee on Co-ordination in its report (E/3946, para. 9) that a procedure should be established for screening the United Nations work programme in the economic, social and human rights fields in relation to its budgetary implications;

2. *Welcomes* the statement²⁴ made by the Under-Secretary for Economic and Social Affairs before the Co-ordination Committee on 4 August 1964, referring *inter alia* to the intention of the Secretary-General to

²³ *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 4, document E/3788.*

²⁴ E/AC.24/L.240 and Add.1.

present to the Council in due course a model of a work programme of the United Nations together with its budgetary implications in each major area of work;

3. *Underlines* the necessity for the Council, in order to ensure the maximum of efficacy in the work of the United Nations in the economic, social and human rights fields, to proceed each year to a careful analysis of the United Nations work programme in relation to its budgetary implications;

4. *Requests* the Secretary-General to report to the Council at its thirty-eighth session on the progress made towards the presentation to the Council at its thirty-ninth session of a work programme of the United Nations in the economic, social and human rights fields together

with adequate information on its budgetary implications for 1966 in each major area of work, together with the advice of the Advisory Committee on Administrative and Budgetary Questions on such a procedure;

5. *Requests* the Secretary-General, in order to ensure the flexibility necessitated by the existing divergency between the programme and budget calendars, to study, in consultation with the Advisory Committee on Administrative and Budgetary Questions, the possibility of presenting the work programme on a biennial basis, and to report on the results of that study to the Council at its thirty-eighth session.

*1351st plenary meeting,
15 August 1964.*

CHECK LIST OF DOCUMENTS

NOTE. This check list includes the documents pertaining to agenda item 6 which are not reproduced in the present fascicle.

<i>Document No.</i>	<i>Title</i>	<i>Observations and references</i>

DOCUMENT E/3911

World campaign against hunger, disease and ignorance: report of the Secretary-General

[Original text: English, French and Spanish]
[22 June 1964]

INTRODUCTION

1. The proposal for launching a world campaign against hunger, disease and ignorance was put forward in the General Assembly's Second Committee during the course of the eighteenth session. Introducing a draft resolution on behalf of a group of sponsors, the representative of the United Kingdom stated that the proposal reflected the desire of the Governments concerned to call on the help of the private organizations for a fruitful partnership towards achieving the purposes of the Development Decade and was inspired by the success of both individual non-governmental organizations and also two international campaigns, namely the World Refugee Year and the Freedom from Hunger Campaign. Support for the draft resolution was expressed by a number of speakers and it was unanimously approved at the 943rd meeting of the Second Committee on 3 December 1963. On 11 December 1963, it was unanimously adopted by the General Assembly as resolution 1943 (XVIII). The text is attached as annex I.

2. In paragraph 3 of its resolution the Assembly:

“ Requests the Secretary-General to consult with the Governments of Member States and the specialized agencies as well as with non-governmental organizations in consultative status, and to report to the Economic and Social Council at its thirty-seventh session on the feasibility and the methods of stimulating such a campaign of non-governmental organizations under the auspices of the United Nations, bearing in mind the following considerations:

“(a) The value of closer contact between peoples and non-governmental organizations in the developed and in the developing countries in order to improve understanding between them;

“(b) The desirability of developing more active methods of co-operation between the United Nations, including the specialized agencies, and non-governmental organizations, designed to extend non-governmental participation in the progress of the Decade, particularly in the fields of food, health and education;

“(c) The need to ensure that such a campaign is conducted under conditions which are acceptable to, and receive the approval and support of, the Governments of the countries concerned.”

3. In accordance with these provisions, the Secretary-General despatched a note to the Governments of Member States together with an aide-mémoire, the text of which appears as annex II, containing tentative suggestions on certain aspects of the proposed campaign. Addendum 1 (E/3911/Add.1) reproduces the substantive comments contained in the replies received by the time this report was drafted.

4. The views of the specialized agencies were also sought and the subject was included in the agenda of the recent session of the Administrative Committee on Co-ordination. The views of the Committee (see E/3886, paras. 17 to 19) are analysed later in this report.

5. Consultations also took place with representatives of the non-governmental organizations principally concerned. A formal communication, including the Secretary-General's aide-mémoire, was sent to all organizations likely to be directly concerned with the proposed campaign. In view of their number and volume, the replies from the organizations have not been reproduced in this document. They are, however, analysed in paragraphs 11 to 13 below and are available with the Secretariat for consultation by delegations in their original language. The Council will moreover have an opportunity, in the course of the thirty-seventh session, of consulting with representatives of a number of the organizations concerned if it so desires.

6. The present report has been prepared in the light of views expressed by Governments, specialized agencies and non-governmental organizations, either in the formal communications referred to above or in the course of less formal consultations. It is submitted to the Council in accordance with paragraph 3 of the General Assembly's resolution.

7. It will be noted that the General Assembly refers to the “feasibility” of such a campaign and the “methods of stimulating” it. These two questions must be considered separately.

FEASIBILITY OF A WORLD CAMPAIGN

8. The question of the feasibility of a world campaign has been touched on in many of the communications from Governments and non-governmental organizations. It has also been discussed with the specialized agencies directly concerned with problems of hunger, disease and ignorance and especially FAO, which has a particular interest in view of the continuation of activities under the Freedom from Hunger Campaign beyond the original termination date in 1965. The report of the Administrative Committee on Co-ordination to the Council on the question sets out what would seem to be the major conditions to be fulfilled:

“If the campaign is to be launched, it must clearly have good prospects of success, and such prospects would not exist unless there were quite positive replies

from many Governments and many important non-governmental organizations, and unless the Governments were willing to co-operate with the non-governmental organizations in organizing the national campaigns. There are two further conditions, the Committee noted, that would certainly have to be met. The first of these is adequate financial provision to enable the United Nations itself and the specialized agencies concerned to make their appropriate contribution; the second is the assurance of really close co-operative arrangements among the United Nations (including UNICEF) and the specialized agencies directly concerned, namely FAO, WHO, UNESCO and ILO.” (E/3886, para. 17).

9. At the time of drafting this report, substantive comments on the proposed World Campaign and the suggestions contained in the Secretary-General's aide-mémoire, have been received from only twelve Governments.¹ While this is too low a number for any final conclusions to be drawn, it may be noted that every reply indicates that the Government concerned is anxious to support the world campaign and to encourage participation in it. It should also be pointed out that these replies come from a wide variety of regions, and include countries in North America and Latin America, Western Europe, Africa and Asia. Any further replies that may be received by the time the Council meets will be reproduced as further addenda to this document.

10. Some of the Governments have made clear their intention to participate actively in the campaigns organized in their respective countries — a factor to which much importance is attached by many of the non-governmental organizations. How far other Governments supporting the world campaign are prepared to take such action is clearly a matter which must be carefully considered by the Economic and Social Council.

11. Since the world campaign would depend primarily on the efforts of non-governmental organizations, the Council will no doubt wish to give considerable weight to the views expressed by organizations in consultative status. As of 10 June 1964, substantive comments had been received from forty-one organizations. A number of other organizations replied without commenting on the substantive issues involved or stated that the matter was being referred to their governing bodies.

12. Of the forty-one organizations concerned about half gave unqualified support to the proposed campaign and indicated that they would participate. The other half — including most of the larger organizations — expressed reservations on various aspects of the proposal for the campaign. There were many references to the absence of consultation with the non-governmental organizations before the resolution on a world campaign was adopted by the General Assembly. Some organizations were apprehensive that participation in a world campaign would overstrain their limited resources. Others took the view that they were already doing their utmost to meet their responsibilities in combating hunger,

¹ Canada, China, France, Guatemala, Jamaica, Kenya, Pakistan, Panama, Thailand, Uganda, United Kingdom, Yugoslavia.

disease and ignorance and they did not see what more they could accomplish through a world campaign. In other cases, concern was expressed lest confusion should be created in the public mind through a proliferation of campaigns and similar undertakings sponsored by the United Nations. Particular concern was expressed in some instances as to the possibility of confusion between the world campaign and the Freedom from Hunger Campaign. Finally, certain organizations pointed out that participation in the world campaign should not affect their freedom to decide on their own activities. Despite these reservations, no organization raised any basic objection to the campaign and it appears likely that they would all participate in the campaign if the Economic and Social Council were to make appropriate arrangements for launching it.

13. Some organizations felt doubts about the proposed title for the campaign. This aspect is also mentioned by the Administrative Committee on Co-ordination in its report to the Council, which states: "It was also pointed out that the title of the new campaign would require careful consideration in order that the momentum of public interest created by existing campaigns in the fields covered is not lost" (E/3886, para. 18). It has been informally suggested that instead of a negative title (against hunger, disease and ignorance) the campaign should have a positive one (e.g. for food, health and education).

14. Concerning the first of the two conditions listed by the Committee, and quoted in paragraph 8 above, the Secretary-General feels that a world campaign against hunger, disease and ignorance under United Nations auspices, covering as it would the spheres of competence of several specialized agencies and United Nations programmes, would require central co-ordination and leadership by the United Nations in association with its sister agencies. The United Nations has neither the staff nor the other resources (notably funds for travel and special publicity material) that would be required for this purpose. The annual budget of the FAO Freedom from Hunger Campaign exceeds \$400,000. Taking into account the assistance that might be expected from FAO and other organizations, the Secretary-General does not believe that the financial implications of the world campaign for the United Nations budget need approach this figure; they would, however, still certainly be substantial. Detailed estimates will be submitted to the Council separately.

15. The assurance of the essential co-operation among the United Nations (including UNICEF) and the specialized agencies directly concerned is related to the point discussed in the preceding paragraph. Amplifying its remarks on this subject, the ACC urges that:

"should such a new world campaign be undertaken, everything be done to build it around existing structures, adapted and expanded as necessary, and to use the machinery available to all of the specialized agencies concerned in their respective fields. In this connexion, the Secretary-General indicated his appreciation of the offer of the Director-General of FAO to place at the disposal of the world campaign the exper-

ience, the machinery and the resources which have been built up in connexion with the Freedom from Hunger Campaign. It was noted that the Freedom from Hunger Campaign, while concentrating on the major aspect of hunger, had co-operation and support from the other specialized agencies to the extent feasible. WHO, UNESCO, ILO and UNICEF similarly had relations with non-governmental organizations in their respective fields." (E/3886, para. 18.)

16. How best to ensure a high degree of integration between the world campaign and the FAO Freedom from Hunger Campaign has already been explored in a preliminary way by the Secretary-General and the Director-General of FAO. It is felt that the Council may wish to devote particular attention to this question which has been referred to by several Governments in their replies.

17. It will be recalled that on 5 December 1963 the FAO Conference adopted resolution 4/63 in which it agreed "that the Freedom from Hunger Campaign activities under the sponsorship of FAO should be continued beyond 1965" and requested the Director-General to present a report to the thirteenth session of the Conference, to be held in 1965 "in order to make it possible at that time to decide on the future orientation to be given the campaign both generally and within the framework of FAO". Activities of the Freedom from Hunger Campaign are now being developed in accordance with this resolution.

18. Although the proposed world campaign covers a considerably wider field, it would, in the Secretary-General's opinion, be unthinkable at this stage to launch it except in active association with the Freedom from Hunger Campaign, and under conditions ensuring that the Freedom from Hunger Campaign would be a major element in any new world campaign and play a major role in its organization. The whole question of relationships with the Freedom from Hunger Campaign is one which should be clarified before any final decisions are taken on the launching of the world campaign. Pending such clarification, the Secretary-General has felt that detailed discussion of administrative arrangements and arrangements for policy co-ordination among the United Nations and the specialized agencies concerned would be premature.

19. In assessing the feasibility of a world campaign, the Council will also wish to bear in mind the possible results that it might achieve. It seems to be widely felt, on the one hand, that a world campaign against hunger, disease and ignorance might help to produce an atmosphere in which a solution for these problems could more easily be found and might thus make a useful contribution to the United Nations Development Decade. In the developed countries public opinion is still far from a universal acceptance of the principle of foreign aid. To draw public attention to the human predicament behind what are often considered to be abstract issues would no doubt be of assistance to the cause of economic development and might, in some cases, help to explain the activities of Governments to their own populations. In the developing countries, a contribution

towards progress could be made by emphasizing, through suitable publicity material, the compelling need for an all-out national effort to increase national production and raise living standards. It is also pointed out that a World Campaign could greatly facilitate the direct participation in the Development Decade of many national organizations and even of individuals.

20. On the other hand, there appears to be a general feeling among the non-governmental organizations that spectacular results should not be expected, for the organizations most directly concerned are already devoting considerable efforts towards achieving the objectives now proposed for the campaign. In material terms it is not clear that the launching of a world campaign could lead to a large-scale increase in their resources and results; while even in the most favourable circumstances, it is likely that the resources available to non-governmental organizations will remain marginal in relation to the efforts required from Governments in an all-out attack on hunger, disease and ignorance. In other words, a world campaign of the type proposed can publicize these problems, but its contribution towards solving or even alleviating them is bound to be quite modest.

METHODS OF STIMULATING A WORLD CAMPAIGN

21. The organization of a world campaign is a task the magnitude of which must not be underestimated. Fortunately, there are precedents — such as the World Refugee Year and the Freedom from Hunger Campaign — providing much useful experience. In his aide-mémoire (annex II) the Secretary-General put forward certain broad suggestions on methods of stimulating and carrying out the proposed campaign. These suggestions have received general support, and little adverse comment, from Governments and non-governmental organizations. Together with certain points that have been made in the various replies, they form the basis of the paragraphs that follow.

Purposes

22. In the light particularly of comments from non-governmental organizations, the Secretary-General wishes to emphasize the overriding importance attached to the public information activities, as opposed to the fund-raising efforts, that might be carried out under the world campaign. As was stated in the aide-mémoire, the world campaign is conceived in the first place as serving, through the efforts of non-governmental organizations, to bring home to the peoples of the participating countries the urgency and the scope of the problems of hunger, disease and ignorance that still plague two-thirds of our fellow men. It would emphasize, in the case of developed countries, the need for sacrifices and concessions to aid development and, in the case of developing countries, the vital importance of self-help. In the second place, the campaign should stimulate an intensification of the flow of assistance from developed to developing countries through the channel of non-governmental organizations. While participation in the campaign

would not necessarily involve fund-raising, it is expected that many non-governmental organizations would wish to find additional resources for assistance to developing countries. In determining the form and direction of such assistance, the participating organizations would have wide discretion; it would be hoped, however, that they would, in many cases, wish to support activities under programmes sponsored by the United Nations family such as the Freedom from Hunger Campaign, the world campaign for universal literacy (resolution 1937 (XVIII) of the General Assembly), and programmes sponsored by UNICEF.

Participation

23. The campaign would by its nature be decentralized: it would be carried out by the non-governmental organizations which decided to participate in it. International non-governmental organizations and national organizations established in the developed countries which participate in the campaign would be expected to devote a reasonable proportion of their activities to assisting developing countries. National non-governmental organizations established in the developing countries would participate both by promoting the efforts of their peoples to achieve economic and social progress and by acting, if so requested and as far as this may be practicable, as a channel for assistance from non-governmental organizations in the developed countries. It is envisaged that all participating organizations would be asked to accept one or two minimum conditions, such as the obligation to report on their activities under the world campaign either to their national committee or to the co-ordinating secretariat. Recipient non-governmental organizations would naturally be expected to account to donor organizations for the use of any funds and supplies received under the campaign. It is hoped that a prominent part could be played in the campaign by the various non-governmental organizations and national bodies associated with the work of the United Nations itself, including UNICEF, and with the specialized agencies directly concerned, particularly FAO, UNESCO and WHO. The United Nations clearly could not take responsibility for the activities of individual national organizations under the world campaign. The Secretary-General believes that such responsibility should rest with the national committees referred to below.

National Committees

24. In the light of various comments, the Secretary-General is convinced that the creation of national committees in countries participating in the world campaign is virtually indispensable. Since the campaign would be carried out by non-governmental organizations, the national committee should of course be representative of such organizations. On the other hand, in a campaign initiated by Governments and sponsored by them through the United Nations, the national committees should at least be formed in agreement with the Governments concerned; and in certain cases, particularly in develop-

ing countries, the Government may well have to play the leading role in their formation. As proposed in paragraph 9 of the aide-mémoire, the national machinery "could be based on that already created for the Freedom from Hunger Campaign, or on that being developed for the International Co-operation Year. In some countries it may, of course, be necessary to establish an entirely new Committee." The arrangements to be made in individual countries would be decided upon by the interested non-governmental organizations in consultation with the Governments. It is envisaged that the co-ordinating secretariat of the world campaign would deal directly with the national committees where authorized to do so by the Governments concerned. The national committees would receive reports from individual participating organizations, and would forward to their Government and to the co-ordinating secretariat of the campaign consolidated reports on activities in their country.

Link with FAO Freedom from Hunger Campaign and International Co-operation Year

25. The question of relationships with the Freedom from Hunger Campaign has been discussed in paragraphs 16 to 18 above, and, so far as concerns national committees, in paragraph 24. In the replies received from Governments and non-governmental organizations there was general support for the suggestion that any major overlap with International Co-operation Year should be avoided and that the world campaign, if decided upon, might be launched on 24 October 1965, which is United Nations Day and the twentieth anniversary of the United Nations. The world campaign would thus endeavour to continue and develop in certain major fields the impetus created by International Co-operation Year.

International machinery

26. The campaign would clearly call for an inter-secretariat co-ordinating committee of the United Nations and the specialized agencies concerned within the framework of the Administrative Committee on Co-ordination. Some of the non-governmental organizations suggested that some form of international committee, on which the major participating organizations could be represented, would also be required. The Council may wish to consider, finally, whether it would be necessary to designate or establish some machinery at the inter-governmental level to supervise and facilitate the arrangements for the campaign.

27. In this report the Secretary-General has endeavoured to set forth the principal comments and suggestions received so far from Governments and non-governmental organizations concerning the character and the functioning of a world campaign against hunger, disease and ignorance and has also analysed various conditions which in his view — and in that of the Administrative Committee on Co-ordination — are essential if such a campaign is to be successfully undertaken. It is for the Economic and Social Council to decide whether these

conditions can be met. If the Council decides to launch the campaign, the Secretary-General will naturally do everything in his power, in co-operation with Governments and non-governmental organizations as well as the executive heads of the international agencies directly concerned, to ensure that it makes a maximum contribution to the objectives of the United Nations Development Decade, of which it would be an integral part.

ANNEX I

General Assembly resolution 1943 (XVIII) of 11 December 1963 on a world campaign against hunger, disease and ignorance

The General Assembly,

Recalling its resolution 1710 (VXI) of 19 December 1961, which established the United Nations Development Decade,

Convinced that the achievement of the objectives of the Decade requires investment in human resources by a world-wide effort against hunger, disease and ignorance,

Recalling that 1965 has been designated International Co-operation Year by the General Assembly in its resolution 1907 (XVIII) of 21 November 1963,

Recognizing the great contribution made by non-governmental organizations to international co-operation and to furthering the objectives of the United Nations,

Believing that wide-spread support can be engendered for a concerted effort to combat hunger, disease and ignorance to mark the second half of the Decade,

1. *Appeals* to all non-governmental organizations to put their increased enthusiasm, energy and other resources into a world campaign in the basic human fields of food, health and education, including training, to start in 1965 and to continue for the remainder of the United Nations Development Decade;

2. *Urges* States to facilitate in all appropriate ways the efforts of their non-governmental organizations taking part in such a campaign in the fields of food, health and education and contributing to the achievement of the objectives of the Decade;

3. *Requests* the Secretary-General to consult with the Governments of Member States and the specialized agencies as well as with non-governmental organizations in consultative status, and to report to the Economic and Social Council at its thirty-seventh session on the feasibility and the methods of stimulating such a campaign of non-governmental organizations under the auspices of the United Nations, bearing in mind the following considerations:

(a) The value of closer contact between peoples and non-governmental organizations in the developed and in the developing countries in order to improve understanding between them;

(b) The desirability of developing more active methods of co-operation between the United Nations — including the specialized agencies — and non-governmental organizations, designed to extend non-governmental participation in the progress of the Decade, particularly in the fields of food, health and education;

(c) The need to ensure that such a campaign is conducted under conditions which are acceptable to, and receive the approval and support of, the Governments of the countries concerned;

4. *Invites* the Economic and Social Council to consider the Secretary-General's report at its thirty-seventh session, and to take such action as it may deem appropriate.

ANNEX II

Aide-mémoire

WORLD CAMPAIGN AGAINST HUNGER, DISEASE
AND IGNORANCE*Origin and purposes of the campaign*

1. On 11 December 1963, the United Nations General Assembly unanimously adopted resolution 1943 (XVIII) on a world campaign against hunger, disease and ignorance to be carried out by non-governmental organizations (see Annex I). The draft resolution was introduced in the Second Committee on behalf of the sponsors by the representative of the United Kingdom, who expressed the hope that the proposed campaign would usefully supplement the efforts which Governments were making to achieve the aim of the United Nations Development Decade.

2. The purposes of the world campaign are envisaged as several. In the first place, it would serve through the exertions of non-governmental organizations to bring home to the peoples of all participating countries the compelling importance of the problems faced by the developing countries. It would impress the urgency of action and emphasize, in the case of developed countries, the need for sacrifices and concessions to aid development and, in the case of the developing countries, the vital importance of self-help. In the second place, the campaign should stimulate an intensification of the flow of assistance from developed to developing countries through the channel of non-governmental organizations. While participation in the campaign would not necessarily involve fund-raising, it is expected that many non-governmental organizations will attempt to find additional resources for assistance to developing countries. In determining the form and direction of such assistance, the participating organizations would have wide discretion; it may be hoped, however, that they would, in many cases, wish to support activities under programmes sponsored by the United Nations family such as the Freedom from Hunger Campaign, the world campaign for universal literacy (resolution 1937 (XVIII) of the General Assembly), and programmes sponsored by UNICEF.

Non-governmental structure of the campaign

3. The campaign would by its nature be decentralized to the non-governmental organizations which decided to participate in it. International non-governmental organizations and national organizations established in the developed countries and participating in the campaign would be expected to devote a reasonable proportion of their activities to assisting developing countries. National non-governmental organizations established in the developing countries would participate, both by promoting the efforts of their peoples to achieve economic and social progress and by acting on request as a channel for assistance from organizations in the developed countries. It is envisaged that all participating organizations would be asked to accept one or two minimum conditions such as the obligation to report on their activities under the world campaign either to their national committee or to the international committee referred to below. Recipient non-governmental organizations would be expected to account to donor organizations for the use of any funds and supplies received under the campaign.

4. It is hoped that a prominent part can be played in the campaign by the various national bodies associated with the work of the United Nations itself and UNICEF, and with the specialized agencies directly concerned, particularly FAO, UNESCO and WHO.

National committees

5. In order to ensure a minimum of coherence at the national level, the non-governmental organizations in most countries would

probably find it expedient to operate the world campaign through some form of national committee. National committees could, among their other functions, act as a channel for publicity material emanating from the United Nations family, and could also receive reports from individual organizations on world campaign activities.

Link with FAO Freedom from Hunger Campaign

6. The FAO Freedom from Hunger Campaign already covers one of the specific areas, namely, hunger, that fall within the scope of the proposed world campaign. Where national Freedom from Hunger Campaign committees exist, they might participate in the national committee for the world campaign or they might be designated to act as the national committee. The arrangements to be made in the individual countries concerned would be decided upon by the interested non-governmental organizations in consultation with the Governments of those countries. At the Secretariat level, appropriate arrangements could be made between the United Nations and the FAO to avoid any duplication of efforts.

Link with International Co-operation Year and timing of the world campaign

7. Under resolution 1907 (XVIII) the General Assembly has designated 1965, the twentieth year of the United Nations, as International Co-operation Year. Under the aegis of the General Assembly's Committee for the International Co-operation Year, arrangements for its celebration are going ahead at the international and national levels. It is understood that national committees for International Co-operation Year are being established in a number of countries. It also appears likely that the main focus of the Year will be on international co-operation for economic and social development. The objectives pursued by the International Co-operation Year and the world campaign against hunger, disease and ignorance are sufficiently close for the Secretary-General to recommend a direct link between the two.

8. In particular, the Secretary-General believes that it would be inadvisable for the United Nations to advocate the simultaneous establishment in 1965 of two overlapping international campaigns and two separate sets of national committees, one for the International Co-operation Year and the other for the world campaign against hunger, disease and ignorance. The tentative view of the Secretary-General is that, while individual countries will wish to make their own arrangements, the major part of 1965 might be devoted on the one hand to the celebration of the International Co-operation Year and, on the other hand, to the preparation for the world campaign, which would be formally launched on 24 October 1965 — United Nations Day, and the twentieth anniversary of the United Nations. In 1966 and subsequent years, the world campaign would thus be able to maintain in certain major fields the impetus created by International Co-operation Year.

Summary of organizational arrangements

9. It follows from what has been said above that the national machinery to be established for the world campaign could be based on that already created for the Freedom from Hunger Campaign, or on that being developed for the International Co-operation Year. In some countries, it may, of course, be necessary to establish an entirely new committee. No general principle can be laid down; the solution adopted will necessarily vary from country to country.

10. On the international level, the United Nations will seek the active co-operation of the staff of FAO, UNESCO, WHO and UNICEF. Detailed arrangements may be worked out after discussion in the Administrative Committee on Co-ordination and in the light of the plans of the NGOs, which have not yet crystallized.

DOCUMENT E/3923

Relationships among planning institutes: report of the Secretary-General

[Original text: English]
[19 June 1964]

A. INTRODUCTION

1. At its thirty-sixth session, the Council stressed the importance of a concerted collective approach to the tasks of the United Nations Development Decade and adopted resolution 984 (XXXVI) in part III of which it:

“ 1. *Recommends* to Governments Members of the United Nations and the agencies that they should stimulate sound and co-ordinated development plans at the country level;

“ 2. *Calls the attention* of Governments to the potential contributions to such planning of world-wide and regional development institutes functioning within the framework of the United Nations system and of inter-agency development planning teams, which should work in co-operation with the resident representatives;

“ 3. *Urges* Member Governments, the appropriate bodies of the United Nations and the agencies concerned to promote close inter-relationships among the various world-wide and regional planning institutes, so as to ensure complementary action and avoid undesirable overlapping and competition in the planning and operations;

“ 4. *Requests* the Secretary-General, assisted by the regional economic commissions and in co-operation with the specialized agencies, and the International Atomic Energy Agency, to report to the 1964 session of the Council the degree to which these objectives are being met.”

2. In the progress report on the Development Decade which he is to submit to the Council in 1965, International Co-operative Year, the Secretary-General hopes it may be possible to reflect the developments resulting from action taken by Member Governments along the lines suggested by the Council. In the present report the situation is reviewed with respect to the efforts made on the international plane towards meeting the objectives set forth in paragraph 3 of the above-mentioned resolution.

3. For the preparation of this review, the staff at Headquarters co-operated with that in the four regional secretariats and benefited from the information supplied in response to an inquiry from the Secretary-General by the secretariats of the agencies making up the United Nations family of organizations.

4. The reference in the Council's resolution to “the various world-wide and regional planning institutes” was interpreted in the broadest possible manner so as to encompass in the inquiry, not only the institutes and comparable entities exclusively or primarily con-

cerned with planning problems as such, but also those whose activities aim to solve problems of development which involve consideration of, or recourse to, planning and programming processes and techniques. In the paragraphs that follow, a distinction is made, however, between institutes dealing with one particular aspect of economic and social development questions and those which have been set up to promote planning for global strategy. For each category, indications are given as to the situation with respect to the establishment and promotion of “close inter-relationships” by means of institutional arrangements and contacts maintained by correspondence, exchange of data and visits, meetings and joint projects.

B. INSTITUTES PRIMARILY CONCERNED WITH PLANNING AS A GLOBAL APPROACH TO DEVELOPMENT

5. This category consists essentially of the Latin American Institute for Economic and Social Planning, which started functioning in 1962, the Asian Institute for Economic Development and Planning, which began its activities this year, and the African Institute for Economic Development and Planning, which is still at the embryonic stage. Each of these three institutes has been set up under the auspices of the regional commission concerned and benefits from the close relationships between and among the regions and headquarters within the United Nations Secretariat. There are of course variations from region to region in the contacts that can be maintained between the institute and the regional commission under whose auspices it has been set up as exemplified by the difference between the case of Africa, where the institute is located some thousands of miles from the seat of the regional secretariat, and that of Latin America, where the institute is not only located in the same city as the regional secretariat but also headed by the first Executive Secretary of the Commission. The relations are nevertheless maintained very closely in all instances.² The meeting of Executive Secretaries, which is held each year in Geneva prior to the summer session of the Council discusses, *inter alia*, the problems of the regional institutes, and is an important factor of the maintenance and promotion of inter-relationships among them. Such inter-relationships will also be fostered by the work on planning and projections which the Secretary-General was requested to organize and develop by General Assembly resolution 1708 (XVI) of 19 December 1961.

² For all three institutes, the Secretary-General is represented in the Governing Council of the Institute; the Institute is assisted in administrative matters by the Administrative Division of the regional secretariat and the staff of the latter, especially the research staff, maintains close contacts with the staff of the former.

6. The extent to which these special institutional arrangements translate themselves actually into close inter-relationships depends, however, upon the degree in which the various elements involved have had the time and resources to unfold their activities and assert their influence. In this respect, the variations are considerable and roughly correspond to the differences in age of the institutes. So far, direct contacts between the institutes have been mainly through correspondence, communication of work programmes and teaching materials. Obviously, it would now be premature to schedule regular meetings of the Directors of the regional institutes, but once all three institutes are fully staffed and fully in operation, it is intended to have periodic meetings of this kind in conjunction with the work conducted by the Secretariat on planning and projections at Headquarters and in the regions. So far the Secretariat resources mobilized at Headquarters to give effect to General Assembly resolution 1708 (XVI) have been concentrated upon giving impetus to work on projections but it is intended now to apply more resources and increase activities on the side of development planning and programming, so as to provide, *inter alia*, the means of assisting and projecting in a world-wide perspective the efforts of the regional planning institutes.

7. In addition to exchanging among themselves information and experience directly or through the United Nations Secretariat, the regional institutes have established relationships with the specialized agencies which assist in providing for the sectoral content of their research and training activities. The question of such relationships has been considered on a number of occasions by the Administrative Committee on Co-ordination which, in its twenty-eighth report in 1963, expressed the view that "consultation and co-operation to be continuous and effective should be based on standing institutional arrangements".³ In the case of the African Institute for Economic Development and Planning, the advisory board on studies and research is to include representatives from specialized agencies. In the case of the two other regional institutes, the relationships are on a less formal basis. The Latin American Institute for Economic and Social Planning has set up its Education Planning Section with the help of UNESCO and has also on its teaching staff an FAO agricultural economist. The Asian Institute for Economic Development and Planning has a manpower expert seconded from ILO for two years, a central banking expert seconded from IMF for three months, a health expert from WHO for six months and will have the assistance of IBRD staff for the conduct of seminars. Plans have also been made by the specialized agencies concerned to assist in a similar fashion the African Institute for Economic Development and Planning and the pre-institute activities in Dakar already involve staff provided by specialized agencies such as FAO and UNESCO.

³ Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda items 4 and 6, document E/3765, para. 136. The question is also dealt with in the twenty-ninth report of the Administrative Committee on Co-ordination, with special reference to the Asian Institute for Economic Development and Planning (see E/3886, paras. 164 and 165).

8. The regional institutes set up under United Nations auspices are also developing direct relationships with institutes having common interests with them within their respective regions and beyond, within and without the United Nations family. The Latin American Institute has established especially close relations with the International Institute for Educational Planning (IIEP) newly established under the auspices of UNESCO (see para. 10 below) with which it has an institutional arrangement, the Director of the Latin American Institute in Santiago being one of the five *ex officio* members of the Governing Board of the IIEP in Paris. The Asian Institute has also relationships with the IIEP and with the Regional Centre for the Training of Educational Planners, Administrators and Supervisors established in New Delhi, which has put a lecturer at its disposal. The regional institutes also have relations with, and obtain assistance from, the Economic Development Institute (see para. 13 below) and are in contact with the Development Centre of OECD which is organizing meetings of world-wide scope for the directors of training institutes.

9. The machinery of the United Nations Secretariat will be a major instrument for the establishment and maintenance of close relationships between, on the one hand the regional institutes and, on the other, the two new institutes of world-wide scope which will soon start functioning under United Nations auspices. Admittedly, development planning and programming is only one among the preoccupations of the United Nations Research Institute for Social Development which is about to begin operations in Geneva, and the proposed United Nations Training and Research Institute will have other subjects of importance to deal with in the political, legal and administrative as well as in the economic and social field. Because of the significance of planning and programming, however, such questions are bound to be of concern to the two new United Nations institutes, with the concomitant need for co-operation and co-ordination to foster concerted action. Contacts have already been established between the United Nations Secretariat and the directors of the regional planning institutes to ascertain their interest and obtain their suggestions regarding the future activities of the new world-wide institutes.

C. INSTITUTES CONCERNED WITH PLANNING AND PROGRAMMING IN PARTICULAR SECTORS

10. The specialized agencies of the United Nations have been concerned for some time with planning and programming problems in their respective fields and, accordingly, the institutes which have been or are being set up under their auspices are bound to give considerable attention to these problems and to attach importance to relationships with other institutions concerned with them. Special mention must be made in this respect of the International Institute for Educational Planning (IIEP) which was established in 1963 under UNESCO auspices. With the help of the UNESCO secretariat acting as a clearing-house for both training and research activities, IIEP co-operates through the provision of staff and equipment and the exchange of reports and

studies with the United Nations regional planning institutes and with the centres for the training of planners and educational personnel which have been set up in Beirut and in New Delhi. A second international course in agricultural programming will be held by FAO in 1965, which hopes to establish, in the near future, an international agricultural development institute as recommended by the World Food Congress in 1963 and also a near east agricultural development institute as recommended by the Sixth FAO Regional Conference for the Near East in 1962 to carry out training activities and serve as a research centre for the newly established Near East Commission on Agricultural Planning. The intention is to arrange for close co-ordination between the United Nations regional planning institutes and the proposed FAO institutes when they come into being.

11. Inter-relationships among the institutes established under the auspices of United Nations specialized agencies are fostered by those maintained among those agencies through the Administrative Committee on Co-ordination and on a bilateral basis. They are also accompanied in a number of instances by institutional arrangements such as those which provide for the representation of the organizations mainly concerned on the Governing Boards of the ILO International Institute of Labour Studies, the UNESCO International Institute for Educational Planning and the United Nations Research Institute for Social Development.

12. Several specialized agencies, it should be observed, are active in fields where development planning as such is not a subject for consideration but part of the context in which they must operate and maintain relations with other organizations. Thus, the IAEA co-ordinates its work and prospective studies with those of the European Nuclear Energy Agency (ENEA), the European Atomic Energy Commission (EURATOM) and the Inter-American Nuclear Energy Commission (IANEC) with which it has relationships formalized by agreements in the case of ENEA and IANEC.

D. THE ECONOMIC DEVELOPMENT INSTITUTE

13. The Economic Development Institute (EDI), which has now been in operation for several years under the auspices of the International Bank as a staff college for senior officials from less developed countries in the economic and financial field, has, over the years, accumulated experience in the preparation, selection and use of source material on problems of economic development and planning, including material on project preparation and evaluation. Much of this material has been made available to the Latin American Institute for Economic and Social Planning, to the Asian Institute for Economic Development and Planning, to the Development Centre of the OECD, as well as for the courses offered jointly by the Inter-American Development Bank and the Centre for Latin American Monetary Studies and for courses offered each year to African economists at United Nations Headquarters since 1957. The staff of the EDI has frequently been consulted by the staff of those institutes and courses regarding the organization

and presentation of teaching materials and this has resulted in the establishment of close working relationships. Several staff members of the United Nations Secretariat have conducted seminars at various EDI courses in Washington and during regular visits of the participants in the EDI courses at United Nations Headquarters in New York. The Executive Secretaries of ECLA and ECE have been guest speakers at the EDI and, in 1963, a senior staff member of the Latin American Institute for Economic and Social Planning was seconded to the EDI to assist in conducting a project evaluation course. The latest meeting of directors of training institutes in the field of economic development organized by the Development Centre of OECD, in which the United Nations regional planning institutes have been invited to participate, was held at the EDI in Washington in September 1964.

E. CONCLUSIONS

14. Except for the Economic Development Institute, the various world-wide and regional centres and institutes of the United Nations family concerned with development planning problems, processes and techniques are of very recent origin and many of them are still at the experimental or initial stage of operation. It is hardly surprising therefore that there does not yet exist an extensive network of sustained relationships among them. The fact is encouraging that their inter-relationships evidence concern for co-operation and mutual assistance between the most recently established ones and those which have already begun to gather experience. Looking ahead, much reliance can probably be placed in the natural development of exchanges of information, views and visits, joint meetings and joint projects according to the requirements of work programmes, as momentum is gathered in the progress towards the common objective, i.e. the transfer, adaptation and improvement of planning and programming techniques through research and training. In a dynamic and growing family of institutions dedicated to international co-operation for economic and social development, the pattern of relationship is bound to evolve according to pragmatic considerations rather than along pre-determined lines.

15. Care must be taken, however, not to let the work programmes and activities of the increasing number of institutes and entities involved develop haphazardly, lest there should be the "undesirable overlapping and competition in the planning and operations", which the Council asked all concerned to guard against in resolution 984 (XXXVI). It can safely be said that the best assurance of co-ordination among the planning institutes and similar entities operating within the United Nations family of organizations is, and will continue to be, provided by the well-established inter-relationships which obtain among their parent organizations. Proper co-operation and co-ordination among the regional planning institutes and between them and the institutions conducting similar activities at the world-wide level under United Nations auspices may be viewed as a natural corollary of a proper functioning, within the

United Nations Secretariat, of the Economic Projections and Programming Centre at Headquarters in conjunction with the similar centres in the region. Likewise, proper co-operation and co-ordination among the various institutes concerned with planning questions which have been set up under the auspices of United Nations specialized agencies and between those institutes and the ones established under United Nations auspices can be expected to be a reflection of a proper functioning of the Administrative Committee on Co-ordination.

16. However important co-ordination can be, it should also be observed that the usefulness and effectiveness of the work — which concerns the various in-

stitutions and entities recently created, or about to be brought into existence, as a result of the increasing interest in, and preoccupation for, development planning — is contingent upon the major set of inter-relationships which each institute will be able to develop with national planning agencies, development boards and comparable agencies. Without close and intimate relationships with those who face planning problems *in concreto* in a variety of specific contexts, work at the international level would run a serious risk of becoming sterile. Such basic connexions are a prerequisite, whether the institute or centre is operating at the world-wide or at the regional level, and their establishment in the form of sustained, mutually stimulating and profitable relationships can take several years.

DOCUMENT E/3924

United Nations Training and Research Institute: progress report by the Secretary-General

[Original text: English]
[19 June 1964]

1. In its resolution 1934 (XVIII) of 11 December 1963, the General Assembly requested the Secretary-General "to take the necessary steps to establish the [United Nations training and research] institute" and "to continue to explore possible sources, both governmental and non-governmental, of financial assistance to the institute with a view toward its establishment during the first half of 1964, if feasible". The Assembly also requested him to submit a progress report to the Economic and Social Council at its resumed thirty-sixth session and to the General Assembly at its nineteenth session.

2. A few days later, at its resumed thirty-sixth session, the Council received an oral progress report in the form of a statement by the Under-Secretary for Economic and Social Affairs (E/L.1050) concerning action which the Secretary-General had taken or proposed to take under the above resolution, and it asked the Secretary-General to submit a further report on the matter to its thirty-seventh session. The present document is submitted in compliance with that request.

3. On 17 December 1963 the Secretary-General wrote to the Governments of States Members of the United Nations and members of the specialized agencies, drawing their particular attention to resolution 1934 (XVIII) and requesting that "serious and urgent consideration" be given to the possibilities of contributing towards the institute. He subsequently prepared and circulated to Governments, specialized agencies and a number of foundations and other non-governmental organizations a note restating briefly the purposes, character and general functions of the institute, as approved by the Council and the General Assembly, and outlining his preliminary thinking on the Institute's organization and programme.

4. It is clearly of the utmost importance to ensure that the institute's work will be well co-ordinated with, and benefit fully from, existing programmes, both national

and international, for training and research in related fields. In the past few months consultations for this purpose have been undertaken with a number of institutions, particular importance being attached to co-operation with the regional economic commissions, the specialized agencies and IAEA. In this connexion attention is called to the following statement contained in the latest report of the Administrative Committee on Co-ordination:

"The members of the ACC have recognized from the outset the importance of the contribution the institute might make and look forward to its early establishment. They welcome the Secretary-General's assurance that the institute will seek to develop and maintain close relations with the specialized agencies and the IAEA, to which its facilities for research, study and consultation, as well as for training, will be available. They are also glad to note that provisions will be made for appropriate consultation between the director of the institute and the directors of the other institutes which have been or are being established within the United Nations system. They look forward to further consultations with the Secretary-General as the project develops. It is important, in their view, that such consultations should be developed at the earliest stage, while the Institute's programme and organizational arrangements are still in the process of formulation." [E/3886, para. 16.]

5. The question of finance is crucial, since the institute depends entirely on voluntary contributions and can be brought into existence only if the necessary funds are forthcoming. During the past few months financial support for the institute has been actively sought by the Secretary-General in accordance with the General Assembly's directive. His personal representative — whose appointment was reported to the Council at its resumed thirty-sixth session — has consulted with a

large number of national missions at United Nations Headquarters and has visited thirty countries for discussions with Governments and private sources of funds. He will visit some fifteen other countries during the summer and early autumn.

6. The response to these approaches has been remarkably favourable and positive. Certain hoped-for contributions are not yet in sight, but pledges have already been received from fourteen Governments and a considerably larger number of Governments are understood to have set in motion the constitutional procedures required for allocating a contribution to the institute. Firm pledges from Governments amount at present to \$737,415, while pledges of \$52,000 have been received from private foundations, making a total of \$789,415. A break-down of these figures is given in the annex.

7. From the indications already received of the intentions of other Governments and institutions, the Secretary-General looks forward with confidence to a total sum being subscribed or pledged within the next few months not far short of the amount considered necessary to bring the institute into being. If this occurs, and there are good prospects of further support, the Secretary-General proposes before the end of the year — and possibly before the opening of the nineteenth session of the General Assembly — to nominate and call a first meeting of the board of trustees of the institute with a view to appointing an Executive Director and formulating and launching the institute's initial programme.

8. The Secretary-General reiterates his hope that the great majority of States Members of the United Nations and members of the related agencies will find it possible to contribute to the institute; and he wishes to state

once again his conviction that the institute can make a most important contribution, not only towards achieving the targets of the United Nations Development Decade, but also to the promotion of world peace.

ANNEX

United Nations Training and Research Institute

LIST OF CONTRIBUTIONS PLEDGED

(positions as of 17 June 1964)

<i>Governments</i>	<i>\$US or \$ equivalent</i>
Cyprus	100
Dominican Republic	2,000
Holy See	1,000
India	50,000
Jordan	10,000
Kuwait	50,000
Libya	15,000
Liechtenstein	2,315
Norway	56,000
Pakistan	20,000
Thailand	20,000
Tunisia	5,000
United Kingdom	500,000
Venezuela	6,000
TOTAL FROM GOVERNMENTS	737,415
<i>Private sources</i>	
Joseph Rowntree Charitable Trust	42,000
Compton Trust	10,000
TOTAL FROM PRIVATE SOURCES	52,000
GRAND TOTAL	789,415

NOTE: Some of the contributions are subject to certain conditions. Pledges made on an annual basis are calculated for a six-year period.

DOCUMENT E/3976

Report of the Co-ordination Committee

[Original text: English]
[13 August 1964]

1. The Co-ordination Committee, under the chairmanship of Mr. Daniel Cosío Villegas (Mexico), considered, at its 249th, 250th, 260th and 263rd, to 265th meetings held respectively on 27 July, 5, 7 and 10 August 1964⁴, item 7 of the agenda:

“United Nations Development Decade:

“(a) Development plans and development planning institute;

“(b) United Nations Training and Research Institute;

“(c) World campaign against hunger, disease and ignorance;

⁴ See provisional summary records E/AC.24/SR.249, 250, 260 and 263 to 265.

“(d) Functional classification of activities during the Decade.”

This item had been referred to the Committee by the Council at its 1332nd plenary meeting held on 25 July 1964.

2. The Committee had before it the following documents:

A report by the Secretary-General on relationships among planning institutes (E/3923);

A progress report by the Secretary-General on the United Nations Training and Research Institute (E/3924);

A report by the Secretary-General on the proposed world campaign against hunger, disease and ignorance (E/3911 and Add.1 and 2);

The twenty-ninth report of the Administrative Committee on Co-ordination (E/3886 and Corr.1 and Add.1);

The second report of the Special Committee on Co-ordination (E/3946 and Corr.1).

3. The delegate of Austria introduced a draft resolution on the relationships among planning institutes, sponsored by the delegations of Austria, India and the United States of America (E/AC.24/L.233). He informed the Committee of a verbal change in the text of the draft resolution. After two oral amendments proposed by the delegates of Senegal and Indonesia respectively had been accepted by the sponsors, the Committee adopted the revised draft resolution unanimously.

4. The delegate of India introduced a draft resolution on the United Nations Training and Research Institute, sponsored by the delegations of India, Senegal and Yugoslavia (E/L.1060). The delegations of the United Arab Republic and the United Kingdom were added to the list of sponsors. Taking into account a relevant oral amendment proposed by the delegate of Italy, which was later withdrawn, the Deputy Under-Secretary for Economic and Social Affairs declared that information on the development of the Secretary-General's thinking as regards the Institute's organization and programme could be made available to interested governments, on request. An oral amendment proposed by the delegate of Indonesia was also withdrawn. The sponsors accepted with a minor change an oral amendment proposed by the delegate of Iran for an addition to the fourth operative paragraph. The Committee adopted the revised draft resolution with 25 votes in favour, none against and one abstention.

5. The delegate of the United Kingdom introduced a draft resolution on the proposed world campaign against hunger, disease and ignorance, sponsored by the delegations of Argentina, Austria, Chile, Ecuador, Ghana, India, Iran, Luxembourg and the United Kingdom

(E/AC.24/L.243). He informed the Committee of a few drafting changes in the text of the draft resolution. The sponsors accepted some further changes in the text on the basis of suggestions made by the delegate of Australia. The revised draft resolution was adopted by the Committee with 19 votes in favour, none against and two abstentions.

6. The delegate of India introduced a draft resolution on the Freedom from Hunger Campaign, sponsored by the delegations of Algeria, Cameroon, Colombia, Chile and India and United Republic of Tanganyika and Zanzibar (E/AC.24/L.243). He informed the Committee of a minor drafting change in the text of the draft resolution. The sponsors accepted an oral amendment to the first operative paragraph proposed by the delegate of France and an addition to the second operative paragraph proposed by the delegate of Italy. Two other amendments suggested by the Italian representative were withdrawn. The Committee adopted the draft resolution with 20 votes in favour, none against and two abstentions.

7. The Committee endorsed in principle the draft framework of functional classifications of the activities of the United Nations, the specialized agencies and IAEA related to the Development Decade, contained in annex I to the 29th report of the Administrative Committee on Co-ordination (E/3886/Add.1). The Deputy Under-Secretary for Economic and Social Affairs had earlier informed the Committee about certain changes in the section relating to promotion and protection of human rights. He also had assured the representative of France that the suggestions concerning the framework put forward by the latter would be taken into account during the further consideration of the matter by the ACC.

8. The Committee therefore recommends to the Council the adoption of the following draft resolutions.

[*Texts adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council".*]

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1036 (XXXVII). Relationships among planning institutes

The Economic and Social Council,

Having considered the report of the Secretary-General on relationships among planning institutes,⁵

Considering that the planning and development institutes established under the United Nations assist Governments of Member States, in particular those of the developing countries, in the preparation of their development plans,

1. *Notes with satisfaction* the initial steps already taken to establish close inter-relationships among the various world-wide and regional planning institutes;

2. *Stresses* the importance of establishing close working relationships between the various regional planning institutes of the United Nations and specialized agencies and national planning organizations for their mutual benefit;

3. *Requests* the Secretary-General to prepare, for the thirty-ninth session of the Council, a paper containing a clear and concise description of the terms of reference and of the spheres of activities of the various institutes established or to be established in the near future by the United Nations or related agencies, including a commen-

⁵ *Official Records of the Economic and Social Council, Thirty-seventh Session, Annexes, agenda item 7, document E/3923.*

tary on those aspects of their respective work which, in his view, might lend themselves to concerted activity or give rise to special problems of co-ordination;

4. *Requests* the Administrative Committee on Co-ordination to include in its annual report to the Council a section on co-ordination and co-operation between the various institutes concerned with planning and research.

*1351st plenary meeting,
15 August 1964.*

1037 (XXXVII). United Nations Training and Research Institute

The Economic and Social Council,

Bearing in mind the provisions of General Assembly resolution 1934 (XVIII) of 11 December 1963 in which the Secretary-General was requested, *inter alia*, to take the necessary steps to establish the United Nations training and research institute and to continue to explore possible sources, both governmental and non-governmental, of financial assistance to the institute with a view towards its establishment during the first half of 1964, if feasible,

1. *Notes with appreciation* the progress report by the Secretary-General;⁶

2. *Welcomes* the pledges already made by some Governments and private sources towards the financing of the Institute;

3. *Appeals* to Governments and private sources that have not yet made pledges to the Institute to do so at an early date;

4. *Requests* the Secretary-General to continue to seek further financial support for the Institute and to report the results of his efforts to the Council at its thirty-ninth session;

5. *Expresses the hope* that the Secretary-General will be in a position to establish the Institute before the end of 1964.

*1351st plenary meeting,
15 August 1964.*

1038 (XXXVII). World campaign against hunger, disease and ignorance

The Economic and Social Council,

Having regard to General Assembly resolution 1943 (XVIII) of 11 December 1963 proposing a five-year campaign in the fields of food, health and education, including training,

Recognizing the great potential value of this proposal to the purposes of the United Nations Development Decade and the important contribution which the non-governmental organizations can make,

Welcoming this proposal for awakening public support for a concerted effort to combat poverty,

Taking account of the positive comments made by a number of Governments of States Members of the United Nations as well as by non-governmental organizations,

1. *Takes note with appreciation* of the Secretary-General's report⁷ on the feasibility and methods of stimulating such a campaign;

2. *Accepts* the view of the Secretary-General that the relationship of the proposed World Campaign and the Freedom from Hunger Campaign requires further clarification;

3. *Notes* the view of the Secretary-General that a World Campaign would require the active participation of the specialized agencies concerned and the co-ordination and leadership of the United Nations;

4. *Requests* the Secretary-General:

(a) To bring the views of the Council to the notice of the Administrative Committee on Co-ordination together with the views communicated by the individual Governments and non-governmental organizations with a view to making a further effort to implement General Assembly resolution 1943 (XVIII);

(b) To pursue as a matter of urgency the consultations with Governments, specialized agencies and non-governmental organizations requested by General Assembly resolution 1943 (XVIII) on the feasibility of, and possible plans for, organizing and executing a World Campaign;

(c) To report to the Council at its thirty-ninth session.

*1351st plenary meeting,
15 August 1964.*

1039 (XXXVII). Freedom from Hunger Campaign

The Economic and Social Council,

Recalling its resolution 743 C (XXVIII) of 31 July 1959 on a freedom from hunger campaign,

Noting with satisfaction the success so far achieved by the Campaign and the contribution it is making towards the objectives of the United Nations Development Decade by stimulating public and private action in the developed and developing countries towards solving the pressing problems of hunger and malnutrition,

Realizing the magnitude and long-term nature of the task of securing adequate nutrition for all people in all lands,

1. *Urges* that Governments of Member States of the United Nations, or member states of the specialized agencies, or of the International Atomic Energy Agency, non-governmental organizations, the United Nations and the specialized agencies participating in the Campaign intensify their efforts against hunger in order to promote all appropriate initiatives within the United Nations Development Decade;

2. *Invites* the Director-General of the Food and Agriculture Organization to continue to keep the Council informed of the progress achieved in developing further the Freedom from Hunger Campaign.

*1351st plenary meeting,
15 August 1964.*

DOCUMENT E/3898/REV.1 **

Report by the Secretary-General

[Original text: English]
[7 October 1964]

1. This report has been prepared for submission to the Economic and Social Council at its thirty-seventh session and to the General Assembly at its nineteenth session, pursuant to General Assembly resolutions 1837 (XVII) and 1931 (XVIII) and to Economic and Social Council resolutions 891 (XXXIV) and 982 (XXXVI). Under these resolutions, the Governments of Member States are called upon to conduct any studies that may be needed for making economic and social adjustments in the event of disarmament, and the Governments of developing countries are invited to intensify their efforts to establish and implement soundly-conceived projects and well-integrated development plans the implementation of which may be accelerated as part of an economic programme for disarmament. Also under these resolutions, the Secretary-General is requested to undertake related supporting activities and to keep under review the basic economic and social aspects of disarmament, including, *inter alia*, those related to international economic relations; and the specialized agencies, in particular the United Nations Educational, Scientific and Cultural Organization (UNESCO), the International Labour Organisation (ILO), the World Health Organization (WHO), the Food and Agriculture Organization of the United Nations (FAO) and the International Atomic Energy Agency (IAEA) are invited to co-operate with the Secretary-General in this connexion.

2. To facilitate the review of national and international studies and activities from a substantive point of view, the present report sets forth the available information within a framework designed for that purpose. It is envisaged that this framework, subject to any necessary revision, may also be used in future reports on the subject.

3. With respect to national studies and activities the report is based on information supplied by Governments in response to invitations by the Secretary-General. Information supplied in response to the most recent *note verbale* of the Secretary-General¹ is contained in addenda to the present report. Other information supplied by Governments was reproduced in addenda to previous reports by the Secretary-General.² A comprehensive list of Government replies is given in annex II.

4. With respect to international studies and activities the report is based on the work programmes of the United Nations Secretariat and on information supplied by the specialized agencies and the IAEA. Emphasis is placed on existing projects and on suggestions for relevant projects that could be undertaken at an appropriate time — mainly the latter, since there are at present not many economic and social projects under

¹ The *note verbale* is reproduced in annex I.

² United Nations publication, Sales No.: 62.IX.1, document E/3593/Rev.1 and *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes*, agenda item 7, document E/3736.

** Document E/3898 dated 3 July 1964 was submitted to the Economic and Social Council at its thirty-seventh session.

way which are concerned primarily with disarmament. However, some reference is also made to existing projects established for other purposes but which will contribute to the effectiveness of future economic and social programmes for disarmament; these references are brief, since other documents at the disposal of the Council and the Assembly contain comprehensive summaries of the economic and social programmes of the United Nations and of the specialized agencies and the IAEA.

5. The Secretary-General wishes to draw particular attention to recent decisions of the Administrative Committee on Co-ordination (ACC) concerning co-operation among members of the ACC regarding work programmes concerned with the economic and social aspects of disarmament. Recognizing the far-reaching importance of the subject, and in accordance with various resolutions and decisions of their governing bodies, the members of the ACC agreed that:

“(a) The Secretary-General of the United Nations will act as the central point of co-ordination in respect of all studies of the economic and social aspects of disarmament;

“(b) All of the organizations of the United Nations family proposing to undertake such studies will co-operate with the Secretary-General in the preparation of concerted programmes of work within the general framework of which such studies will be undertaken;

“(c) The ACC will set up a committee of agency representatives to co-operate with the Secretary-General in developing such a programme.” (E/3886, para. 67.)

In view of the necessity for relevant factual data if studies are to be realistic the ACC also suggested “that the Council may wish to give further consideration to the hope expressed by the General Assembly that Member States significantly involved will continue, in the light of developments bearing on disarmament, to pursue studies and activities relating to the economic and social consequences of disarmament, to the problems which it will entail for them, and to means of dealing with these problems”. The ACC also noted that “the extent of the contribution which can be made by the member organizations of the United Nations family will depend in large measure on the extent of the response made by Member States to this request of the General Assembly” (*ibid.*). A first exploratory meeting of the Committee of agency representatives is scheduled for the end of October 1964.

6. It should be mentioned in this connexion that the governing bodies of several agencies have made decisions which call for action on the subject. Such decisions by ILO and UNESCO were included in communications from these organizations appended to the Secretary-General's report to the Economic and Social Council at its thirty-sixth session.³ The Secretary-General now wishes to draw the attention of the Council and

the Assembly to a resolution of the World Health Assembly, adopted on 19 March 1964, and to a resolution of the Board of Governors of the IAEA, adopted on 1 October 1963. These resolutions, reproduced in annex III, express formally the concern of the organizations with the need for co-operative action regarding the economic and social aspects of disarmament.

National and international studies and activities regarding economic and social aspects of disarmament

I. STUDIES AND ACTIVITIES RELATING TO OVERALL PLANNING OF CONVERSION OF MILITARY EXPENDITURES TO PEACEFUL USES

National

7. The Governments of the two States most significantly involved in military expenditures, the Union of Soviet Socialist Republics and the United States, have indicated that they have under way substantial and continuing programmes of study. The Soviet Union, in its 1964 reply,⁴ lays stress on the desirability, for all countries concerned, of placing the formulation of an economic programme for disarmament on a broad footing immediately, without awaiting the conclusions of a treaty on general and complete disarmament. The reply also notes that, apart from its intrinsic importance, this work will help to advance the cause of disarmament itself and that compensatory programmes of peaceful development would eventually provide a possible basis for an indirect economic method of controlling the implementation of a disarmament agreement.

8. Within the Soviet Union, the pertinent national and international problems are being systematically studied by the Academy of Sciences and other scientific institutions, and the amount of research being carried out and the number of works being prepared for publication are increasing at a considerable rate. For example, the Institute of World Economics and International Relations of the Academy of Sciences of the USSR has established a department to deal with the political and economic problems of disarmament, and has prepared a monograph for publication in 1964 entitled *The Effect of Disarmament on the Economy*. A bibliography of books and pamphlets published in the Soviet Union on disarmament problems is annexed to the 1964 reply.

9. Regarding overall planning for the use of liberated resources in the world as a whole, the 1963 reply offers the suggestion that during the initial period of disarmament, about one-third of the released funds might be allocated to tax reduction, about one-third to national programmes of economic and social development, about one-sixth to international programmes of scientific, technological and economic development, and about one-sixth to economic assistance to the developing countries. It is recognized that deviations might

³ See E/3736/Add.3.

⁴ Documentary references for government replies are omitted in the following text, but may be found in annex II.

be required at the country level, owing to differences in the needs of individual States.

10. In the United States, the Arms Control and Disarmament Agency of the United States Government was established in September 1961 to formulate policy and conduct research on the various aspects of disarmament, responsibility for research on the economic and social aspects being assigned to an Economics Bureau within the Agency. A research programme has been organized, in co-operation with other government agencies and other bodies, and a report entitled *Economic Impacts of Disarmament* was published in 1962. The research programme includes a variety of studies concerned with tracing the industrial and geographical impacts of military expenditures and with developing methodologies for predicting important economic impacts resulting from anticipated changes in the level and composition of defence expenditures, in order to facilitate advance planning in the establishments and communities most affected. The extensive statistical data regarding the impact of military expenditures on the economy included in the Government's 1962 reply are being updated and will be transmitted to the Secretary-General in due course. To strengthen co-ordination among the federal agencies concerned a high-level interdepartmental Committee on the Economic Impact of Defense and Disarmament was formed in December 1963 to investigate not only industrial conversion problems and other adjustments to changes in military spending but also the question of related tax and expenditure adjustments.

11. State and local governments in the United States have also been intensifying their activities regarding the economic and social aspects of disarmament. In addition, private studies have been undertaken, some of which have been completed and published. A selected bibliography on the economic aspects of disarmament, 1961 to March 1964, and a bibliography of publications and studies in progress on arms control and disarmament generally were appended to the 1964 reply.

12. Economic and social preparations for disarmament by the Governments of the Netherlands and the United Kingdom have included statistical analyses of the industry-by-industry impact of disarmament and of possible compensatory expenditures. These studies are reviewed in the 1962 replies of these Governments. The United Kingdom subsequently indicated in 1963 that further developments have not yet suggested a need for revision of the analytical framework. The Government also indicated in 1964 that, in overall planning for disarmament, reliance would be placed on the development of existing machinery, notably the National Economic Development Council, established in 1962, and the current procedures for programming public expenditure several years in advance. The Netherlands, in its 1964 reply, indicates that plans are now being made to initiate a study in depth of the possible economic and social impacts of disarmament, especially on industry and business.

13. Some other Governments, while less specific regarding the nature of the studies that have been com-

pleted, have indicated that close attention has been paid to the question. Canada, Denmark and Israel report their active concern with overall economic and social planning for disarmament and their conviction that disarmament would have great economic and social benefits. The Governments of several countries having centrally planned economies, including Bulgaria, Czechoslovakia, Hungary, Poland, Romania and Yugoslavia, have reviewed the recent history of their planning achievements, indicating that disarmament would be taken into account in their usual planning procedures and would facilitate an increase in their rates of economic growth. Bulgaria, for example, cites the favourable experience resulting from reductions of the annual forces in 1955 and 1958, while Hungary points out certain similarities between the economic problems successfully solved in recent years and those which would be posed by disarmament. New Zealand, Norway and Sweden have reported that the adjustments required by disarmament would be relatively minor in scope and readily accommodated. France (1963) and Italy (1964) refer to the general surveys of the question included in their 1962 replies, and state that so far as their own economies are concerned, special studies regarding the economic and social aspects of disarmament will not be required until fresh information becomes available regarding the features of an eventual agreement on disarmament. Belgium states that precise information or strong presumptions regarding the process of disarmament itself will be required before the Government can make a soundly based evaluation of the economic and social aspects. Albania expresses the view that studies on the economic and social consequences of disarmament will be appropriate only after a disarmament agreement has been achieved and is being implemented; earlier studies might only serve to raise false hopes.

14. Among developing countries, Chad, Laos and Trinidad and Tobago have pointed to the beneficial results that would follow from disarmament, while Jamaica, Kenya, Nigeria and Uganda have stated that so far as their domestic economies are concerned, military expenditures are inconsequential and that the question of internal adjustments therefore does not arise.

International

15. Regarding overall planning for the conversion process, the Secretariat can assist national Governments by facilitating the international exchange of information regarding planning techniques applicable to the conversion period. To some extent this function has already been performed in the reports made in the last three years to the Council and to the Assembly. This work could be extended through the compilation of a selected, annotated, international bibliography of pertinent studies.

16. Regarding overall planning of the uses to which liberated resources might be allocated in the long run, practically all international activities in connexion with the United Nations Development Decade are directly

or indirectly relevant in some degree, especially with respect to economic and social progress in the developing countries. The activities of the United Nations Secretariat in these fields are undertaken in accordance with various resolutions of the General Assembly and the Economic and Social Council pertaining to the United Nations Development Decade, to the promotion of economic and social planning through the establishment of institutes and centres and the intensification of related Secretariat work programmes, and to the provision to the developing countries of technical assistance in these fields. It may be recalled, for example, that General Assembly resolution 1708 (XVI) referred to the "urgent need of the less developed countries to establish and implement national, all-inclusive and well-integrated development plans to build up their societies in accordance with their own individual precepts" and that in accordance with this resolution, development planning institutes have been established in developing regions, and that an Economic Projections and Programming Centre has been established at Headquarters along with corresponding regional centres in the regional economic commissions. The support lent by such activities as these to overall development planning, especially in the developing countries, will facilitate the revision of national and international targets in the second half of the Development Decade and will lend support to national planning efforts in this period. Concerning the social aspects of development it is worth noting that General Assembly resolution 1916 (XVIII) calls for a study of targets of social development in the second half of the Development Decade (1965-1970), and that the setting of these targets would undoubtedly be affected by any plans or projected arrangements whereby resources from disarmament would be made available for social development.

II. STUDIES AND ACTIVITIES RELATING TO THE PROMOTION OF NECESSARY ECONOMIC AND SOCIAL READJUSTMENTS DURING THE PERIOD OF CONVERSION

(a) *Possible transfer to peaceful purposes of specialized military personnel and associated military facilities*

National

17. The question of using military property for peaceful purposes during the conversion period has been the subject of a study by the Historical Institute of the Academy of Sciences of the USSR, the Government states in its 1964 reply. With reference to the reduction in military expenditures during the second half of the nineteen fifties, the Government reports that military facilities and supplies were effectively transferred to civilian use; for example, some military buildings were transferred to educational institutions, and ammunition was used in earth and rock-moving work.

18. The question of the re-establishment of soldiers in civilian life is mentioned in a number of replies. Czechoslovakia, Laos and the Soviet Union (1963) point out that in their countries the skills of most military personnel will find a ready use in civil pursuits.

The Soviet Union (1964) notes that this view is confirmed by experience with reductions in military expenditures in the latter half of the nineteen fifties, when demobilized soldiers were readily re-employed, contributing, for instance, to the development of the eastern regions and to the housing-construction programmes.

International

19. An exploration of the potential benefits which may be derived, especially in the developing countries, from the conversion of military personnel and facilities to peaceful uses might usefully be made the subject of an international study.

20. Such a study might have special relevance for the rural sectors, as is indicated in the following observations received from the FAO.

"... Both military personnel awaiting demobilization as well as some types of military equipment could be used to promote agriculture. In the developing countries the lack of economic infrastructure such as rural roads, bridges, etc. frequently constitutes one of the principal obstacles to agriculture. This could easily be remedied by using military engineers and equipment. Similarly, transport equipment, e.g. trucks, jeeps, etc. would be of special benefit in improving agricultural marketing. Military personnel in the developed countries could, in addition, be formed especially during the transition phase into a United Nations Development Force, supplementing thereby the scarce skills in the developing countries.

"Within the developing countries themselves, military personnel tend to be better trained and educated than the bulk of the population. Demobilization will probably result in an influx of large numbers to rural areas owing to the slow growth of employment opportunities in the non-agricultural sectors. They could, through a re-training programme, become the new village leaders, infusing fresh ideas and progress into the relatively stagnant rural environment. Such an effect has already been reported in some African countries, as well as in Nepal on the return of Gurkha troops after service.

"The availability of training facilities in the military establishment of these countries also presents an excellent opportunity to expand the cadre of trained personnel, particularly those of the middle-grades. The relative scarcity of such skilled men tends to hold back agriculture which in the course of development becomes increasingly dependent on non-agricultural inputs. These facilities, instead of being dismantled, could be used to train people in those skills which are useful in peacetime and also conform to the development programme of each country."

Regarding the special question of land settlement and land reform, the FAO also notes that there are serious pitfalls to be avoided, but that the possibilities for placing demobilized men in regional labour groups or co-operatives may be worth investigation. Regarding

agricultural co-operatives, the FAO suggests the advisability of considering the transfer to them of military buildings, vehicles and other equipment.

(b) *Transfers of manpower between industries and occupations*

National

21. Specialized study of the question of labour mobility in the context of disarmament is under way in the United States (1964). The Department of Defense and the Arms Control and Disarmament Agency are reported to be arranging with the State of Washington Bureau of Employment Security for a study tracing the movement and re-employment activities of workers released from employment with an establishment producing military aircraft. The purpose of the study is to obtain data which would be useful in formulating future policies regarding labour mobility. In November 1963, the Sub-Committee on Employment and Manpower of the Committee on Labor and Public Welfare of the United States Senate gave specific consideration to the training and utilization of military and defence-associated manpower. It is expected that some of the material prepared for these hearings will be made available to the Secretary-General. Legislation to facilitate the formulation of appropriate public policies is being considered.

22. Canada (1964), Norway (1962) and Sweden mention the applicability during the conversion period of existing manpower policies, especially employment services and re-training facilities. The United Kingdom (1964) refers in a similar context to the increasing attention being devoted by the Ministry of Labour to medium- and long-term manpower trends, and notes that the country has had recent experience with sharp decreases in manpower associated with military expenditures resulting from the contraction of the armed services on the termination of conscription.

International

23. The Secretariat of the Economic Commission for Europe (ECE) has begun work on a study of the impact of demobilization on civilian employment in the ECE region.⁵ In recognition of the fact that the maintenance of high levels of domestic demand for goods and services is necessary but in itself insufficient to ensure a smooth transfer of manpower to peaceful pursuits, the study is designed to examine the additional requirements for a rapid and efficient re-allocation of manpower. The study examines first, the incidence of defence employment; secondly, its adaptability to civilian occupation and thirdly, the problems of re-training. Arrangements are being made with the ILO concerning preparation of the third part of the study. Preliminary results concerning the first part of the study indicate that "the reservoirs of potential civilian manpower immobilized in the armed forces of many

ECE countries are quite considerable, and that their importance is of qualitative as much as — perhaps even more than — quantitative in nature". It is suggested that future work should include examination of the employability of the various categories constituting defence employment in the wider sense of the concept.

(c) *Economic problems affecting particular enterprises and localities*

National

24. The replies of several Governments state that in their respective countries the conversion of specialized productive capacity built in connexion with the support of military programmes can, generally speaking, be achieved without great difficulty. The Soviet Union (1963), for example, notes that many of the plants engaged in the production of tanks, military tractors and armoured carriers can quickly be converted to the production of agricultural and transport machinery, there being a considerable need for these products in the Soviet Union. A similar situation is reported to prevail with respect to a sizable number of aircraft, ship-building and electronics enterprises. Sweden notes that arms, vehicles and ship-building capacity can be switched from military to peaceful production, the principal question being whether there is a demand for additional civil output in these lines of production.

25. Concerning specific studies of the problems affecting particular enterprises and localities, Czechoslovakia (1962) reports favourable experience in three case studies, concerning the conversion of an aircraft factory from military production to the production of medium trucks, concerning the conversion of a factory from tank production to production of diesel locomotives, caterpillar tractors and compressors, and concerning the conversion of a factory from the production of military radio equipment to the production of television sets. The 1964 reply states that the Czechoslovak Society for International Relations published a prize-winning booklet on the city of Olomouc, explaining what disarmament could mean for that city. The United States (1964) indicates that the Atomic Energy Commission has commissioned a number of reports on industrial diversification possibilities at community sites of Commission facilities. Copies of these studies have been transmitted to the Secretary-General. The National Aeronautics and Space Administration is likewise studying the economic effects of the civilian space programme, and the Arms Control and Disarmament Agency is planning studies of possibilities in the electronics industry for shifting output to non-military items, and of the problem of regional readjustments during the conversion period.

International

26. International activities concerning economic problems affecting particular enterprises and localities during the conversion period have thus far been confined to the dissemination of information supplied by Governments.

⁵ A preliminary report on the subject was presented to the Commission at its nineteenth session (E/ECE/522/Add.1).

(d) *The possibilities for undertaking an international study of the problems that might arise in relation to primary commodities for which the demand would be significantly affected during and immediately following the transition period*

27. In resolution 982 (XXXVI) the Economic and Social Council requested the Secretary-General to make an adequate survey of this question and to report his findings to the Council at an early session. To determine whether the data necessary for a meaningful survey of the kind mentioned could be obtained, if requested, the Secretary-General invited Governments to indicate whether certain specified types of data could be provided, if requested.⁶ The United States has replied that, in general, the necessary data could be provided with respect to the seventy-six commodities which have been the object of stockpiling and also with respect to petroleum, steel and uranium. However, no other Government has thus far indicated that it would be in a position to supply information of this kind,⁷ and until most of the Governments significantly involved are able to do so it would appear that a specific and concrete study of the question would not be feasible. Should additional information be forthcoming concerning the availability of data, however, the Secretary-General would be prepared to review the question, and the FAO has indicated its readiness to co-operate regarding agricultural foodstuffs and raw materials.

28. With respect to the general principles that might govern international co-operation in this field during the conversion period it should be noted that a considerable measure of agreement exists. The most recent United Nations activities in this connexion have taken place in the United Nations Conference on Trade and Development, where it was recognized that future international co-operation in trade and development will need to take into account any opportunities arising from disarmament. Among other international activities, it may be useful to draw attention to a 1955 resolution of the Contracting Parties to the General Agreement on Tariffs and Trade (GATT) concerning the liquidation of non-commercial stockpiles, which recommended that wherever practicable forty-five days' prior notice should be given of intention to liquidate a substantial quantity of strategic stocks and that consultations should be carried out on request.⁸ Since that time there has been increasing interest in the subject and in the question of the adequacy of measures for dealing with it. Recently, at the twenty-first session of

⁶ The Secretary-General's request was contained in his *note verbale* of 6 March 1964, and elaborated in the annex to the provisional outline appended to the *note verbale*. See annex I below.

⁷ New Zealand (1964) and Norway (1964) have indicated that their own use of primary commodities in connexion with military expenditures is insignificant, while Canada (1964) reports that its military use of domestically-produced primary commodities is not significant but that Canadian exports might be affected. Among developing countries, the Congo (Leopoldville), Ghana, Jamaica and Kenya have indicated their interest in the question as primary exporters.

⁸ General Agreement on Tariffs and Trade, *Basic Instruments and Selected Documents*, Third Supplement, Sales No.: GATT/1955-2, p. 51.

the Contracting Parties, in March 1964, it was noted that although Governments disposing of non-commercial stockpiles appear, in fact, to have been concerned not to disrupt the market, the Interim Co-ordinating Committee for International Commodity Arrangements (ICCICA) proposes to consider whether improvements may be made to the existing arrangements.

(e) *Social problems arising during the conversion period*

National

29. The replies of Governments do not draw attention to special studies concerned with this field.

International

30. The Secretary-General and the agencies concerned (notably FAO, ILO, WHO and UNESCO) stand ready to co-operate in the preparation of such studies as may be required. Relevant questions are, for example, the impact of disarmament on individual and group tensions caused by the threat of annihilative war resulting from the armament race, and on the extent of additional leisure time that would be afforded by the transfer to peaceful economic activities of manpower currently engaged in armament production and deployment, and the resulting possibility of a marked reduction of daily hours of work. The FAO notes that sociological problems of helping people to adjust to new ways of living have been the concern of the FAO since its inception and that the experience achieved in past work in this field should prove useful on connexion with the study of disarmament problems.

III. STUDIES AND ACTIVITIES RELATING TO THE LONGER-TERM USES OF LIBERATED RESOURCES FOR ACCELERATING ECONOMIC AND SOCIAL DEVELOPMENT WITHIN NATIONAL ECONOMIES

31. The replies of a number of Governments draw attention to long-run national objectives in the economic and social field and to the fact that disarmament would make possible the more rapid achievement of these objectives. For example, the replies of the Soviet Union and the United States make extensive references to this topic. The replies of the Soviet Union refer to the favourable effects of disarmament on the achievement of planning targets for the installation of new capacity in industry, transport and agriculture, on the rate of completion of additional regional power and metallurgical complexes, and on the rates at which educational and health services are expanded, pensions are increased, and working hours reduced. The 1962 reply of the United States includes a systematic examination of the relation of disarmament to the satisfaction of domestic needs in the fields of residential construction, urbanization, natural resources, educational and health services, social security and social welfare.

32. The purely domestic aspects of these long-run questions open up very broad fields of study, the relationship of which to disarmament, although vitally

important, is in many instances general rather than specific and may not call for specialized studies. Thus, the replies of Governments do not generally include material of a specific nature regarding these questions, and section III of this report is restricted to international activities closely related to disarmament and designed to facilitate the achievement of national objectives in these fields.

(a) *Advancement of scientific and technological research for peaceful purposes*

33. The UNESCO reports that plans are being made for a study of the means of ensuring a continuous advance in scientific and technological research for development purposes, irrespective of any reduction of such research for military purposes. A study group is being formed for the examination of this problem. Nine natural scientists and three social scientists will be appointed to serve in this group, which is likely to meet at the end of 1964 or early in 1965.

34. The IAEA has submitted a short paper, reproduced in annex IV below, on recent developments in the field of atomic energy as they relate to the economic and social aspects of disarmament. Three nuclear powers have announced reductions in the production of fissile material for military purposes, and the IAEA is considering what may be done to take advantage of these developments in order to encourage the peaceful uses of atomic energy. Questions under investigation include, *inter alia*, the development of plutonium technology for peaceful applications, and of technology for utilizing depleted uranium stockpiles. Attention is also drawn to the possible value of a study of the problems of absorbing nuclear scientists into civilian industries. Other subjects for possible study are the conversion of military reactors to civil use, the use of plutonium reactors for the production of isotopes for industrial and other peaceful uses, the use of nuclear explosives for peaceful purposes, and of nuclear energy for the desalination of sea water.

35. In connexion with the application of science and technology to agriculture, the FAO draws attention to the need for technology for the desalination of water at an economic cost, for the application of atomic energy to agriculture, and for cheaper and safer measures of pest and disease control.

36. In view of the setting up this year of the Advisory Committee on the Application of Science and Technology to Development, appointed under Economic and Social Council resolution 980 A (XXXVI), the Secretary-General will bear in mind the possibility of drawing to the Advisory Committee's attention, at an appropriate time, the question of utilizing the scientific and technological manpower and resources released by disarmament.

(b) *Improvement of education, training and the supply of manpower*

37. Under this heading it may be noted that the ILO is keeping under constant consideration the aspects

of the economic and social consequences of disarmament within its competence, in accordance with a request by its Governing Body.⁹ A study of the means of increasing the transfer from the developed to the developing countries of resources for education which would become available as a result of disarmament is being planned by UNESCO. Four national studies will be initiated in 1964 in countries where the economic consequences of disarmament would be particularly relevant. Contracts for carrying out these studies are being concluded with qualified institutions in France, the Soviet Union, the United Kingdom and the United States.

(c) *Increasing productivity in agriculture and forestry*

38. Under this heading the FAO has submitted the following observations. "There is now an increasing awareness that agriculture in the developing countries has failed to advance at the requisite pace and that it has, in fact, held up the achievement of a higher overall rate and a more balanced pattern of growth. The time would therefore seem to be propitious to divert a significant proportion of the additional resources released through disarmament and made available as assistance, to accelerate agricultural development and to make the required structural transformation in these countries smoother."

39. "It is clear that reconversion on the scale justified by total disarmament cannot be left to haphazard forces but would have to be programmed in some detail, taking account of the inter-dependencies between countries and sectors. Since the repercussions of disarmament would be universally felt, an equally comprehensive plan would be needed. In this connexion the FAO Conference supported the recommendation of the World Food Congress that FAO should formulate a world plan for agricultural production, trade and development with an indication of adequate nutritional standards for the nutritionally deficient areas and measures needed to attain such standards. In the course of this study the Organization will endeavour to indicate how resources released through disarmament could assist in achieving these objectives."

40. The FAO also notes that it could participate in a study of the possible uses of the capital, human and natural resources released by disarmament in the production of agricultural commodities for peaceful purposes, in the light of long-term projections. The FAO also draws attention to the importance of rural electrification as a possible use for resources liberated by disarmament.

(d) *Development of communications, transport, energy and natural resources, and the acceleration of the growth of industry*

41. The International Telecommunication Union (ITU) suggests that in view of the need for improvements in world telecommunications the manpower and produc-

⁹ See E/3736/Add.3.

tive facilities now employed in manufacturing and operating telecommunications equipment for military purposes should be retained and re-allocated to civil telecommunications.

42. The World Meteorological Organization (WMO) refers to Economic and Social Council resolution 829 B (XXXII), which recognizes the basic importance of having a world-wide network of meteorological observing stations in view of the important applications of meteorology in such fields as agriculture, transport and resource development. The Organization suggests that in the event of disarmament both technical manpower and other resources should be utilized to remedy present deficiencies in the global meteorological network.

43. In connexion with atomic energy, reference may be made to paragraph 34 above. In connexion with the work of the United Nations in the fields of transport, energy and natural resources, and in the field of industrial development reference may be made to other documents before the Council and the Assembly concerning work programmes in these fields.

(e) *Promotion of health and nutrition, the provision of adequate housing, the intensification of rural and urban planning, and the promotion of social welfare*

44. In pursuance of the resolution adopted by the 17th World Health Assembly (see para. 6) the Executive Board of the World Health Organization will consider at its forthcoming session in January-February 1965, the recommendations of the Director-General for action deemed suitable for WHO to undertake. Previous communications to the Secretary-General¹⁰ have indicated the lines along which work will be conducted. These include promotion of work undertaken in connexion with the United Nations Development Decade with special emphasis on:

- Improving facilities for medical rehabilitation and occupational health;
- Assistance in establishing national industrial plants for manufacturing biological, minor pharmaceutical and medical (including dental) equipment;
- Improvement of national health laboratory services;
- Priority will be given to projects for the control and eradication of communicable diseases and to other projects of benefit to masses of people;
- Training of local auxiliary health personnel to provide basic health services in rural areas under appropriate guidance;
- Projects of community water supply, waste and sewage disposal and drainage;
- Environmental health activities for the reduction and prevention of the pollution of air, water and any other pollution resulting from increased urbanization and industrialization accompanying economic and social development;

Institution of school health services;

Assistance in solving the housing problem and for the provision of healthy housing facilities.

Pending a decision on this question, WHO is taking part in the work of the ACC committee to which reference is made in paragraph 5 above.

45. Regarding nutrition, reference may be made to the appeal by the Director-General of the FAO to the Heads of Governments participating in negotiations for a nuclear test ban for the establishment of a world disarmament fund "devoted to the world-wide achievement of freedom from hunger and want in our time". Activities of the FAO in connexion with a world plan for agriculture and nutrition are referred to in paragraph 39 above.

46. Concerning housing, it may be recalled that a recent examination, in another context, of the problem of priorities in the social field, has led the Secretary-General to conclude that housing was among the lagging components of development, particularly in economically less developed countries. This situation, as well as the strong impact of activity in the housing sector on employment, may justify the consideration of the need to prepare a study of the ways in which housing activity in both developed and developing countries may be stimulated through the use — whether through direct transfer of materials, conversion or financial re-allocation — of resources released by disarmament.

47. So far as it can be assumed that disarmament will release large volumes of capital resources that could be used for accelerated development in developing countries, it seems probable that many Secretariat activities in the social field will prove fruitful in connexion with disarmament. For example, the following possible studies could be considered:

(a) A study aiming at the compilation of an up-to-date inventory of those needs and requirements in the social field that are potentially capable of being satisfied through an alternative use of resources released by disarmament, especially non-monetary resources. It is widely believed that a significant part of the existing needs in the social field could be satisfied through a diversion of some of the resources now used for military purposes. A compilation of more specific information on this topic would place prospects for social development in a more realistic light, at least to the extent to which a possible alternative use of such resources is contemplated;

(b) The inventory contemplated under (a) could be supplemented by a study of the actual transferability and convertibility, for use in the social field, of resources now applied to military programmes, taking account of potential political and technical limitations on such convertibility. A study of this kind would constitute primarily an attempt to identify the various resources capable of being directly and immediately transferred to uses in the social field, and more generally the human, material and financial resources that could ultimately be redeployed for such uses through conversion. It would also address itself to the problem of meshing

¹⁰ See E/3593/Rev.1/Add.1, United Nations publication, Sales No.: 62.IX.2, and E/3736/Add.3.

social development with the process of disarmament, in the sense of scheduling specific social development programmes in relation to a schedule of the resources made available through disarmament. This is important, given the assumption that disarmament will be implemented in stages, and that successive stages of disarmament will be characterized, *inter alia*, by varying qualitative and quantitative emphases;

(c) A study aiming at the determination of the type of "social" use of released resources with the highest maximization and multiplier effect. Considering the limited extent of resources which may become available for use in the social field, at least in the early stages of the disarmament process, it would appear advisable to determine alternative uses within this field, taking account of potential preventive or compensatory objectives related to undesirable side-effects created by disarmament (for example, on employment and on population centres previously specializing in armament production and deployment), as well as of the effects of such uses on other fields of human endeavour.

As an illustration of Secretariat activities at the regional level, the following existing and possible projects of the Economic Commission for Africa (ECA) may be cited:

(1) The re-formulation of community development and social welfare policy this year to concentrate on planning, organizational and operational problems encountered by national Governments in the development of their urban and rural social services programmes, with increasing emphasis on giving assistance to national Governments;

(a) In the planning of social programmes needed to accelerate economic development, including the determination of needs and priorities in the formulation of social development objectives and policies, the development of planning methods and programming techniques in the social sectors and the evaluation of the implementation of social programmes;

(b) Through specific studies of ways and means of developing human resources for economic and social development and of dealing with the social aspects of urbanization and industrialization;

(c) In the organization of social welfare services for the family, the pre-school child, the school child, the youth, the aged and the handicapped, within a professional framework of national and local governments;

(d) In the development of rural life and institutions to meet contemporary needs and possibilities; and in the stimulation of community action, of local voluntary initiative and participation in development.

(2) The monograph on social aspects of economic development prepared by ECA in 1960.

(3) The workshop on urbanization held in Addis Ababa in 1962 under the joint auspices of specialized agencies, which was attended by representatives of twenty-three Governments in Africa and for which ECA prepared two reports analysing problems consequent upon rapid urbanization.

(4) The recommendation of the 1962 urbanization workshop that international assistance should be given to governments to formulate national policies on urbanization, within the context of overall development plans and designating or establishing organizations as national centres for the study of such questions as:

(a) Evaluation of existing urbanization programmes;

(b) Recommendations regarding appropriate action programmes;

(c) Provision of extension or advisory services;

(d) Promotion of training for the technical and administrative personnel required;

(e) Organization, conduct or sponsorship of research and surveys on different aspects of urbanization and metropolitan planning and development;

(f) Clearing-houses for information on practical experience and research on these subjects.

(5) Intensification of studies in demographic aspects of urbanization with direct assistance to governments to improve their urbanization system and to carry out a fuller analysis and utilization of data derived from surveys and censuses.

IV. STUDIES AND ACTIVITIES RELATING TO THE LONGER-TERM USES OF LIBERATED RESOURCES FOR EXPANDING THE TOTAL FLOW AND IMPROVING THE EFFECTIVENESS OF FINANCIAL AID AND TECHNICAL ASSISTANCE TO DEVELOPING COUNTRIES

48. About half the replies received from Governments have referred to the question of devoting a portion of the savings from disarmament to expanding assistance to the developing countries, and the Governments concerned have been unanimous in supporting the principle of using liberated resources in this manner. Among developing countries, Ceylon, Laos, Nigeria, Sudan, Tanganyika and Trinidad and Tobago refer in their replies to the beneficial results that such a use of liberated resources would have for their economic and social progress.

49. International action through the United Nations family can prepare the way for such an expansion of aid in two ways. One is by assisting the Governments of developing countries, upon their request, in preparing projects and plans the implementation of which can be accelerated in the event of disarmament. A second way is by facilitating the formulation of international aid-giving policies and the development of aid-giving channels and machinery.

50. Concerning the preparation of projects and plans, it is apparent that there is scarcely a project of the United Nations Development Decade that could not conceivably benefit from disarmament if liberated resources were allocated to it. The important question, therefore, is to determine and to promote those projects peculiarly capable of absorbing the specific types of resources most likely to be liberated as well as those projects of a bold and far-reaching nature that deserve a high priority which they have not received in the past owing

to the burden imposed by military expenditures. Projects of both types have been mentioned in sections II and III above, and it is the Secretary-General's intention, in co-operation with the specialized agencies concerned and the IAEA, to give increasingly close attention in the future to these aspects of the work programme in the economic and social fields for which he is responsible.

51. With respect to the formulation of international aid-giving policies and the development of aid-giving channels and machinery, the Secretariat's work programme can take into account the potentialities afforded by disarmament in various ways. Investigations of the present position and future prospects of the developing countries with respect to their trade and aid needs and the actual flow of capital and assistance can be enlarged in scope to take into account the various opportunities disarmament would afford. Such research might well provide a basis for the formulation, at an appropriate time, of concrete proposals regarding future links between aid and disarmament. Regarding the question of channels and machinery the Secretariat will bear in mind, in any work undertaken in this area, the possible implications of progress toward an arrangement on general and complete disarmament.

ANNEX I

Note verbale dated 18 March 1964 by the Secretary-General

The Secretary-General of the United Nations presents his compliments to the Minister for Foreign Affairs of and has the honour to enclose a copy of General Assembly resolution 1931 (XVIII) of 11 December 1963 on the conversion to peaceful needs of the resources released by disarmament. This resolution is being transmitted to the Governments of Member States of the United Nations in accordance with a decision of the Economic and Social Council taken on 17 December 1963 at its resumed thirty-sixth session. The Secretary-General wishes at the same time to recall that a number of resolutions on different aspects of the question of the economic and social consequences of disarmament have been adopted on earlier occasions by the General Assembly, by the Economic and Social Council and certain of its functional and regional commissions, as well as by the governing organs of certain of the specialized agencies.

The resolutions adopted by the organs of the United Nations request, *inter alia*, that the Secretary-General, in co-operation with the regional economic commissions, the specialized agencies concerned and the IAEA, keep under review the economic and social aspects of disarmament and the problems arising therefrom on the national and international plane, and give intensified support to the establishment and implementation of development projects and plans the implementation of which may be accelerated as part of an economic programme for disarmament.

Several of these resolutions also call for studies and actions by the Governments of Member States, urging that any necessary studies be made of the economic and social consequences of disarmament with a view to developing relevant information, plans and policies, and that efforts be intensified to establish and implement development projects and plans to form part of an economic programme for disarmament.

In accordance with his responsibilities in these fields, the Secretary-General prepared two reports in 1963. A progress report on activities regarding the economic and social consequences of disarmament (document E/3736) was submitted to the Economic

and Social Council at its thirty-sixth session and subsequently transmitted to the General Assembly at its eighteenth session. A preliminary report on development plans and projects for an economic programme for disarmament (document A/5538) was submitted to the General Assembly at its eighteenth session. Concerning the social consequences of disarmament, an oral statement was presented to the thirty-sixth session of the Economic and Social Council, at the 482nd meeting of the Social Committee, regarding possible future studies in this field.

In 1964, pursuant to his obligation to report further on these matters, the Secretary-General proposes to prepare a single document for submission both to the Economic and Social Council at its thirty-seventh session and to the General Assembly at its nineteenth session. This report would summarize national and international studies and activities in these fields and consider the scope for further possible activities in the future. A provisional outline of the proposed report, designed to cover pertinent studies and activities of the United Nations, the specialized agencies and the IAEA, as well as of Governments of Member States, is enclosed.

In this connexion, the Secretary-General has the honour to invite Governments of Member States to supply the following information with respect to each topic in the outline in which they have an interest: (1) descriptions of studies already completed, currently under way, or under consideration for possible future implementation, together with summaries of the relevant information; and (2) information relating to the preparation, adoption and implementation of development plans and projects which form part of an economic programme for disarmament. It is further requested that copies of pertinent studies and reports, legislation, administrative instructions, and similar documents be submitted together with these replies.

Governments which have responded to previous invitations to supply information, expressed in the Secretary-General's notes of 22 September 1961 and 23 January 1963, may find that they have already provided data concerning some of the topics included in the outline. If so, these Governments may wish, so far as these topics are concerned, merely to supplement or bring up to date their earlier submissions, and to devote their replies mainly to topics not previously dealt with. (The information already supplied by Governments has been reproduced in document E/3593/Rev.1/Addenda 1-5 and in document E/3736/Addenda 1-2 and 4-9).

Particular interest attaches this year to the special annex to the outline, dealing with a "survey of the possibilities for undertaking an international study of the problems that might arise in relation to primary commodities for which the demand would be significantly affected during and immediately following the transition period accompanying disarmament". This survey of possibilities for a study has been requested by the Economic and Social Council in Council resolution 982 (XXXVI), paragraph 5, and the Council's resolution has been endorsed by the General Assembly resolution 1931 (XVIII). The possibilities for undertaking a meaningful study of the kind envisaged — one which would provide a concrete basis for future action — depend on whether relevant information can be obtained regarding the extent to which individual primary commodities would be released for peaceful purposes in the event of disarmament. The Secretary-General accordingly has the honour to invite Governments to indicate whether relevant information regarding the use of primary commodities for military purposes, as set forth in the annex to the attached provisional outline of the Secretary-General's proposed report, could be obtained if requested.

To enable the Secretary-General's report to be prepared in time for submission to the Economic and Social Council at its thirty-seventh session, it would be appreciated if information supplied by Governments could be received in triplicate at Headquarters in New York by 8 May 1964.

ECONOMIC AND SOCIAL CONSEQUENCES OF DISARMAMENT

CONVERSION TO PEACEFUL NEEDS OF THE RESOURCES RELEASED BY DISARMAMENT

PROVISIONAL OUTLINE OF SECRETARY-GENERAL'S REPORT ON NATIONAL AND INTERNATIONAL STUDIES AND ACTIVITIES

Explanatory note

Pursuant to General Assembly resolutions 1931 (XVIII) and 1837 (XVII), to Economic and Social Council resolutions 982 (XXXVI) and 891 (XXXIV), and to Social Commission resolution 4 (XV), the Secretary-General proposes to prepare a single report for submission to both the Assembly and the Council in 1964, summarizing national and international studies and activities regarding the economic and social aspects of disarmament. The provisional outline appearing below is being circulated to inform Governments and international agencies of the topics on which they are invited to provide information regarding studies and activities already completed, currently under way, or under consideration for possible future implementation. It is hoped that such information will include (1) descriptions of studies already completed, currently under way, or under consideration for possible future implementation, together with summaries of the relevant information; and (2) information relating to the preparation adoption and implementation of development plans and projects which form part of an economic programme for disarmament. It is further requested that copies of pertinent studies and reports, legislation, administrative instructions, and similar documents be submitted together with these replies. To enable the Secretary-General's report to be prepared in time for submission to the Economic and Social Council at its thirty-seventh session, it would be appreciated if the information requested could be received in triplicate at Headquarters in New York by 8 May 1964.

Provisional outline. National and international studies and activities regarding economic and social aspects of disarmament

- I. Studies and activities relating to overall planning of conversion of military expenditure to peaceful uses:
 - (a) For facilitating the process of conversion so as to take advantage of opportunities to transfer resources to peaceful uses with minimum delay and minimum cost;
 - (b) For ensuring the optimum reallocation of resources so as to obtain the most favourable possible impacts on production, employment, and economic growth and development.
- II. Studies and activities relating to the promotion of necessary economic and social readjustments during the period of conversion, especially with respect to:
 - (a) Possible transfer to peaceful purposes of specialized military personnel and associated military facilities;
 - (b) Transfers of manpower between industries and occupations;
 - (c) Changes in the industry-by-industry pattern of industrial production and capacity;
 - (d) Economic problems affecting particular enterprises and localities;
 - (e) Problems that might arise in the field of international trade during the conversion period;
 - (f) Social problems arising during the conversion period.

III. Studies and activities relating to the longer-term uses of liberated resources for accelerating economic and social development, including:

- (a) National uses for:
 - (i) Advancement of scientific and technological research for peaceful purposes;
 - (ii) Improvement of education, training and the supply of manpower;
 - (iii) Increasing productivity in agriculture and forestry;
 - (iv) Development of communications, transport, energy and natural resources.
 - (v) Acceleration of growth of industry;
 - (vi) Promotion of health and nutrition;
 - (vii) Provision of adequate housing and intensification of rural and urban planning;
 - (viii) Promotion of social welfare.
- (b) Uses in expanding the total flow and improving the effectiveness of financial aid and technical assistance to developing countries:
 - (i) At the country level;
 - (ii) At the regional level;
 - (iii) At the interregional level.

APPENDIX

SURVEY OF POSSIBILITIES FOR AN INTERNATIONAL STUDY OF PROBLEMS IN RELATION TO PRIMARY COMMODITIES

In resolution 982 (XXXVI) the Economic and Social Council requested the Secretary-General to survey "the possibilities for undertaking an international study of the problems that might arise in relation to primary commodities for which the demand would be significantly affected during and immediately following the transition period". To enable the Secretary-General to determine whether the data necessary for a meaningful survey of the kind mentioned could be obtained, if requested, the Secretary-General has the honour to invite Governments to list the primary commodities the use of which is significantly dependent, directly or indirectly, on their military expenditures. Governments are also invited to indicate, for each of these commodities, whether it would be possible to provide, if requested, statistical estimates based on the experience of recent years of:

- (a) The average annual quantities and values of primary commodities that, in the event of general and complete disarmament under effective international control, would be released (i) from direct purchase by the government for military purposes and (ii) from use in the production of other goods and services purchased by the government for military purposes;
- (b) The proportions of the quantities and values in (a) above that are imported (i) from the rest of the world and (ii) from developing countries;
- (c) The quantities and values of commodities that would be released from (i) public and (ii) private inventories.

ANNEX II

Comprehensive list of replies of Governments

The following table indicates the documents in which the replies of Governments have been published in 1962, 1963 and 1964. If a reply exists, the applicable addendum number is given. Instances in which no reply exists are indicated by three dots.

ANNEX III

Resolutions of the World Health Organization and the International Atomic Energy Agency

RESOLUTION 17.45 OF THE WORLD HEALTH ASSEMBLY

Decisions of the United Nations, specialized agencies and the International Atomic Energy Agency affecting WHO's activities

The Seventeenth World Health Assembly,

Recalling General Assembly resolution 1931 (XVIII) and Economic and Social Council resolution 982 (XXXVI) on conversion to peaceful uses of resources released by disarmament,

Convinced that economic development will open sound perspectives for the solution of the fundamental problems which beset universal conscience today, providing all the peoples of the world with the effective possibility of access to adequate levels of health, and

Aware of the fact that the solution of such problems must be envisaged from a global point of view which takes into account the intimate relationship existing between development and international peace and security,

1. Takes note with deep appreciation of the reductions in the military budgets already officially declared by the two main armed powers — the Union of Soviet Socialist Republics and the United States of America — and of the proposals put forth before the Conference of the Eighteen-Nation Committee on Disarmament with a view to effecting even more substantial cuts in the years to come;

2. Requests the United Nations to urge the Conference of the Eighteen-Nation Committee on Disarmament to give close and speedy consideration to the proposals submitted to it recommending the application of the resources released by way of reductions in military budgets in projects leading to the conversion of an economy of war into an economy of peace and in projects aimed at developing economically and socially all countries and all regions and areas markedly affected by poverty and by under-development, thus enabling them to attain a state of complete physical, mental and social well-being;

3. Requests the Director-General to consider the studies recommended in the resolutions and to report to the Executive Board his recommendation for any action he may deem it suitable for WHO to undertake; and

4. Requests the Director-General to transmit this resolution to the Secretary-General of the United Nations.

*Twelfth plenary meeting,
19 March 1964.*

RESOLUTION 160 OF THE GENERAL CONFERENCE OF THE INTERNATIONAL ATOMIC ENERGY AGENCY

*Action pursuant to resolution 982 (XXXVI) of the
Economic and Social Council of the United Nations*

The General Conference,

(a) Recalling its resolution GC (VI)/RES/130 of 26 September 1962,

(b) Noting resolution 982 (XXXVI) of the Economic and Social Council of the United Nations which, *inter alia*, invites the specialized agencies and the Agency "to co-operate with the Secretary-General in advancing their studies and activities designed to contribute to international action for dealing with the economic and social problems" that would be involved in the conversion to peaceful needs of the resources released by disarmament,

(c) Noting with deep satisfaction the Treaty signed on 5 August 1963 banning nuclear weapons tests in the atmosphere, in outer space and under water and in which the Parties proclaim

"as their principal aim the speediest possible achievement of an agreement on general and complete disarmament under strict international control in accordance with the objectives of the United Nations . . .",

(d) Noting also with deep satisfaction that there are already a large number of signatories to this Treaty, and

(e) Aware that the Original Parties have described this Treaty as "an important initial step towards the lessening of international tension and the strengthening of peace" and "have expressed their hope that further progress will be achieved toward that end",

1. *Reaffirms* its request that the Director-General give the fullest co-operation to the Secretary-General of the United Nations in the fulfilment of the task entrusted to him by resolution 982 (XXXVI) of the Economic and Social Council and inform the Board of Governors and the General Conference of the steps taken; and

2. *Requests* the Director-General to bring this resolution to the attention of the Secretary-General of the United Nations.

*Eighty-second plenary meeting,
1 October 1963.*

ANNEX IV

Communication from the International Atomic Energy Agency

It may be timely to recall that one of the main concepts that led to the creation of the IAEA was the desire to have international machinery that could be used to divert nuclear materials and technology from military to peaceful ends. This concept was expounded in the proposals put before the United Nations on 8 December 1953 for the establishment of the Agency and is implicit in its Statute.

Several interesting developments have taken place during the past few months which have pointed towards the bearing that certain aspects of disarmament may have on the peaceful uses of atomic energy.

Three nuclear powers have announced cuts in the production of fissile material for nuclear weapons. The United States of America has declared that it is closing down four of its fourteen plutonium production reactors^d and is willing to permit international inspection of one of them.^e In a subsequent statement^f the United States further declared that over a four-year period an overall decrease in the production of plutonium by 20 per cent and of enriched uranium by 40 per cent will be effected.^g

At the same time the USSR announced^h that it has resolved to discontinue the construction of two large new reactors for the production of plutonium, and that in the next several years it will reduce substantially the production of U-235 for nuclear weapons, and accordingly will allot more fissile material for peaceful purposes.

This coincided with an announcement by the United Kingdomⁱ that it had already stopped the production of weapon grade U-235 and was gradually terminating production of military plutonium.

The possibility of a role for the International Atomic Energy Agency has been suggested for verifying an agreed halt in the production of fissile material for nuclear weapons.^j In accordance with its statutes, the International Atomic Energy Agency is playing a growing role in helping to ensure that any transfer of fissile material, equipment or information is only for peaceful purposes. For instance, the United States has announced its intention of placing its 175 MWe Yankee Atomic Power Station under the Agency's inspection.

In the paper submitted by the IAEA to the Secretary-General last year^k it was estimated that the plutonium and U-235 stockpiles in the world might be of the order of 2,300 tons. No new information is available to change this figure radically. It is difficult

to estimate what proportion of this is in the form of U²³⁵ or Pu²³⁹. It appears likely that about one-fifth may consist of plutonium and the rest of U²³⁵.

Adequate information regarding the use of U²³⁵ as a reactor fuel is already available, and the existing stocks of this material could readily be used in different types of enriched reactors for power production. But the use of plutonium to fuel power reactors is not so simple. So far, only limited experience has been gained in this regard; its physical and metallurgical properties are not well known and several technical problems in connexion with the fabrication of plutonium fuel elements have yet to be resolved. Since the existing stocks of plutonium are quite large and more of this material will continue to be produced in power reactors, it is important to develop plutonium technology as rapidly as possible. The International Atomic Energy Agency is following closely the technical developments regarding the use of plutonium as power reactor fuel. A panel of experts is being convened in December 1964 to advise the Agency concerning the programme of activities which could help in the development of plutonium technology for peaceful applications.

Another matter which concerns the Agency is the utilization of depleted uranium stockpiles. In the United States, the stock piles of depleted uranium (with enrichment of 0.2 per cent of U²³⁵ or less as compared with 0.7 per cent in natural uranium) may be of the order of 248,000 tons. The world stockpiles of this material may total 400,000 tons. Depleted uranium is fertile material and if converted into plutonium it could supply a great deal of energy, for instance, 400,000 tons of depleted uranium if converted into plutonium would have an energy content of 1,000 billion tons (10)¹² equivalent of coal.¹ This implies that due emphasis should be placed on the development of breeder reactors as well as seed and blanket type of reactors to make use of these extensive stockpiles. The International Atomic Energy Agency is studying the development of technology for such reactor systems.

As mentioned in last year's report^m the present estimate stockpiles of 2,300 tons of U²³⁵ and plutonium would be sufficient to initially fuel power reactors having the same output as all the conventional power stations in operation throughout the world at the present time. From another point of view, a stockpile of 2,300 tons of these materials at \$10/gm would be worth \$23 billion. The inventory charges alone on this amount would exceed over a billion dollars per year.

In the paper previously submitted by the IAEA, it was estimated that there were over 23,000 highly-qualified scientists and engineers working on defence aspects of atomic energy. These scientists, if transferred to civilian work, could lend considerable support to the development of nuclear power. For example, the announcement of the United States Government of its intention to shut down four plutonium production facilities, releasing several hundred scientists, may present the elements for an interesting study of the problems of absorbing nuclear scientists into civilian industries.

The statements of the United Kingdom, the United States and the Union of Soviet Socialist Republics presage a substantial reduction in the output of U²³⁵. Normally this would affect the unit cost of the product concerned and it will be interesting to observe the effect of any substantial reduction in the world's output of U²³⁵.

The possibility of converting certain plutonium production reactors, which are expected to be closed down, into power reactors is under consideration in the United States. The conversion of a military reactor into a civilian reactor could be the subject of a useful study.

¹ In comparison, the total estimated recoverable reserves of fossil fuels in the world amount to 3.5×10^{12} tons equivalent of coal, as reported in the *Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva, 1955*, United Nations publication, Sales No.: 56.IX.1, Vol. 1.

^m Document E/3736/Add.3.

^d Statement by President Johnson, 20 January 1964.

^e Statement by United States representative at the Geneva Disarmament Conference, 6 February 1964.

^f Statement by President Johnson, 20 April 1964.

^g This implies 40 per cent decrease in power consumption in diffusion plants, which stood at about 5,000 MW in 1964, according to Forum Memo of February 1964.

^h Statement by Premier Khrushchev, 20 April 1964.

ⁱ Statement by the Prime Minister, Sir Alec Douglas-Home, 21 April 1964.

^j Statement by United States representative on 6 February 1964 at the Geneva Disarmament Conference.

^k Document E/3736/Add.3.

It might also be worth while to study the technical and, particularly, the economic feasibility of using the existing plutonium production reactors as a means of producing cobalt-60 and other radioisotopes which, in turn, could be employed to carry out food sterilization and other important activities.

Under international supervision the use of nuclear explosives for civilian purposes might become a factor in the development of transportation and navigation facilities.

It is also noteworthy that under certain conditions nuclear energy may be economic for large-scale desalination of sea water, and this important peaceful application of atomic energy has been mentioned in recent statements.²¹

²¹ Statement by President Johnson of 6 February 1964; and statement by Premier Khrushchev of 6 April 1964.

At the Third International Conference on the Peaceful Uses of Atomic Energy, which was held in Geneva from 31 August to 9 September 1964, information was exchanged on the technical and economic status of nuclear power. A report, evaluating the work of the Conference, is being submitted separately by IAEA to the Secretary-General of the United Nations. In view of the encouraging developments in nuclear power, it is expected that this Conference will serve to stimulate nuclear power programmes in various countries of the world.

Note

The data contained and the conclusions reached in the preceding paper by the secretariat of the IAEA are based upon material in the published reports of various national atomic energy authorities and other information in the public domain.

DOCUMENT E/L.1059

Colombia and United States of America: draft resolution

[Original text: English]
[27 July 1964]

The Economic and Social Council,

Recalling General Assembly resolutions 1378 (XIV), 1516 (XV), 1837 (XVII), 1931 (XVIII), and Council resolutions 891 (XXXIV) and 982 (XXXVI),

Taking into account the recommendation of the UNCTAD on "Elaboration of trade aspects of the economic programme of disarmament" (Final Act, annex A.VI.10), that in pursuing studies and working out proposals within the United Nations framework on the economic and social consequences of disarmament due attention be paid to the trade aspects of the economic programme of disarmament,

Noting with interest the Secretary-General's report (E/3989) on "Economic and social consequences of disarmament", continuing his review of national and international studies and activities relating to the conversion to peaceful uses of the resources which would be released by disarmament,

Having considered the recent discussions of the Administrative Committee on Co-ordination (ACC) (E/3886, section VI) resulting in agreement among its members regarding co-operation in their work programmes concerned with the economic and social aspects of disarmament, under the central co-ordination of the Secretary-General, to which the Secretary-General in his report draws particular attention,

Having considered also, in accordance with General Assembly resolution 1931 (XVIII), whether it would be desirable to establish an *ad hoc* group to accelerate activities in this field of study,

Constantly aware of the benefits mankind would enjoy through the achievement of general and complete disarmament under effective international control and, in particular, the possibilities this would afford for accelerating economic and social progress in the world,

1. Expresses its appreciation to the Secretary-General for his informative report;

2. Welcomes the co-operation of Governments, particularly of those significantly involved, in responding to the Secretary-General's request for pertinent information;

3. Notes, however, the Secretary-General's finding, that, without additional information from a number of Governments, which does not at present appear to be forthcoming, it would not be feasible for him to undertake a meaningful study of the effects of disarmament in relation to primary commodities;

4. Welcomes the agreement by members of the ACC that in respect of all studies by organizations of the United Nations family of the economic and social aspects of disarmament the Secretary-General will act as the central point of co-ordination, that the organizations concerned will co-operate with the Secretary-General in the preparation of concerted programmes of work, and that, in this connexion, they will establish a committee of agency representatives to co-operate with the Secretary-General;

5. Finds, in the light of the replies of Governments, the Secretary-General's report, the above-mentioned agreement by members of the ACC, and other pertinent considerations, that no present need exists for the establishment of the *ad hoc* group envisaged in General Assembly resolution 1931 (XVIII) and so reports to the Assembly at its nineteenth session;

6. Requests the Secretary-General to continue to keep under review progress made in studies and activities relating to the economic and social aspects of disarmament and to report thereon to the Council as new developments warrant but not later than its 41st session.

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL**1026 (XXXVII). Economic and social consequences of disarmament****Conversion to peaceful needs of the resources released by disarmament**

The Economic and Social Council,

Recalling General Assembly resolutions 1378 (XIV) of 20 November 1959, 1516 (XV) of 15 December 1960, 1837 (XVII) of 18 December 1962, 1931 (XVIII) of 11 December 1963 and Council resolutions 891 (XXXIV) of 26 July 1962, and 982 (XXXVI) of 2 August 1963,

Fully sharing the hope expressed by the General Assembly and by the recent United Nations Conference on Trade and Development that the Governments of all States will intensify efforts to achieve an agreement on general and complete disarmament under effective international control,

Having considered the work already accomplished and now going forward, both nationally and internationally, bearing on the economic and social consequences of disarmament,

1. *Expresses its appreciation* to the Secretary-General for his informative report;¹¹
2. *Further expresses its appreciation* for the co-operation of Governments, particularly of those significantly involved, in responding to the Secretary-General's request for pertinent information;¹²
3. *Deems it necessary* that the activities within the framework of the United Nations, including those of the regional economic commissions and of the specialized agencies and the International Atomic Energy Agency, relating to the economic and social consequences of disarmament as called for by resolutions of the General Assembly, the Council and the governing bodies of the specialized agencies, and the International Atomic Energy Agency, be continued and accelerated as far as possible;
4. *Welcomes* in this connexion the recent agreement by the Secretary-General and the Directors General of the specialized agencies and of the International Atomic Energy Agency in respect of all studies of the economic and social aspects of disarmament and that the agencies and the International Atomic Energy Agency will co-operate with the Secretary-General in the preparation of concerted programmes of work, and for this purpose will establish a committee of agency representatives;
5. *Recognizes* that at a later time establishment of a new *ad hoc* group, such as that envisaged in General Assembly resolution 1931 (XVIII), may be advantageous;
6. *Requests* the Secretary-General to submit to the Council at its thirty-ninth session a further progress report on the question of the economic and social consequences of disarmament.

*1345th plenary meeting,
11 August 1964.*

Report of the Economic Committee

[Original text: English]
 [13 August 1964]

1. The Economic Committee, under the chairmanship of the first Vice-President of the Council, Mr. Akira Matsui (Japan), considered at its 354th, 355th and 357th meetings on 10, 11 and 13 August 1964 (E/AC.6/SR.354, 355, 357) item 9 of the Council's agenda which had been referred to it by the Council at its 1314th meeting on 13 July 1964 (E/SR.1314).

2. The Committee had before it the following documents: E/3842, E/3919 and A/5533/Rev.1.¹

3. The Committee also had before it a draft resolution submitted by the delegations of Czechoslovakia, Union of Soviet Socialist Republics and Yugoslavia (E/AC.6/L.308) in connexion with its consideration of this item.

4. The Committee approved this draft resolution by twenty-three votes to none, with no abstentions, and therefore recommends to the Council the adoption of the following text:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1035 (XXXVII). Economic planning and projections

The Economic and Social Council,

Recalling General Assembly resolutions 1708 (XVI) of 19 December 1961 and 1939 (XVIII) of 11 December 1963 and Council resolution 979 (XXXVI) of 1 August 1963,

Taking into account particularly the views expressed in General Assembly resolution 1939 (XVIII) as to the importance for rapid economic and social development of economic planning adapted to the specific conditions and needs of each developing country.

Taking into account further the measures approved by that resolution for intensifying progress by the regional

economic commissions, the Economic Projections and Programming Centre, regional planning institutes and other United Nations bodies concerned in making available for the guidance of the developing countries the knowledge and experience which may best help them in making and carrying out programmes and plans (especially long-term plans) of development.

1. *Takes note with appreciation of the Report of the Group of Experts on Planning for Economic Development;*

2. *Looks forward to the publication of the complete report prepared by the Economic Projections and Programming Centre, including the studies by consultants*

submitted to the Committee of Experts on long-term economic projections;

3. *Requests the Secretary-General to consider in due course as the work of United Nations bodies on planning and projections progresses the possible usefulness of establishing a group of experts-specialists in planning theory and practice that would work as a consultative body on the problems of economic planning and projections within the United Nations.*

*1351st plenary meeting,
15 August 1964.*

Foreword

The present report on the promotion of international flow of private capital has been prepared in pursuance of Economic and Social Council resolution 922 (XXXIV) of 3 August 1962. The report is the fourth in the current series begun in 1958 in response to General Assembly resolution 1318 (XIII) of 10 December 1958.

This report continues the studies on economic, legal and administrative means for promoting the flow of private capital to the less developed countries. In response to the growing interest shown by Governments in the provision of more comprehensive analysis and information on sources and methods of development financing, extended attention is given to the multi-lateral and national, public and private financial institutions concerned with facilitating and channelling foreign private capital for financing of industrial and/or investment projects in the developing countries.¹

In the Secretary-General's proposals on the United Nations Development Decade special emphasis is given to undertaking studies along these lines. These proposals also contemplate an intensification of the work of the United Nations in facilitating access of the developing countries to external sources of capital chiefly through a programme designed to provide information on external sources of financing, advisory services and training in the field of development financing.²

In this context, General Assembly resolution 1715 (XVI) specifically requested the United Nations Special Fund to "consider the desirability of establishing a service to provide developing countries, upon request, with information and guidance concerning the policies, rules regulations and practices of existing and future sources of development capital and assistance necessary to enable the less developed countries to determine for themselves the most appropriate sources to which they may turn for assistance as needed". In response to this resolution the Special Fund undertook a series of inquiries on existing and contemplated activities in this field and reported on the results of its inquiries to the Governing Council. At its eleventh session the Governing Council, after reviewing the report of the Managing Director before it³ decided, *inter alia*, to request the

"Economic and Social Council to consider, as a vital activity of the United Nations Development Decade, the intensification of the United Nations programme of work (i) in the study, collection and dissemination of information on sources and conditions of external finance so as to provide a service which will enable developing countries to have prompt and systematic access to needed information in this field, giving due regard to the financial implications of providing such a service".⁴

The questions of the promotion of the international flow of capital and of information on sources of financing and related advisory and training services were also considered in the successive sessions of the Committee for Industrial Development which emphasized the need for such studies and activities especially in reference to industrial development in the developing countries. The Committee stressed the close relationship between external and domestic financing of industrialization and called for wide distribution of relevant studies for the benefit of the developing countries.⁵

The present report represents an attempt to provide an initial survey of the subject matter taking into account the various desiderata expressed in the above-mentioned recommendations. A special effort has been made to provide, (as much as possible at this stage of the study) information on the sources, methods, and operations of institutions involved in the channelling of foreign private capital and the financing of private enterprises in developing countries. As the study proceeds, it is intended to expand the data and analysis included herein in coverage and depth. It is hoped that this work, which will continue to be carried forward in consultation with the competent organizations and agencies will permit the completion, in the course of 1965, of a fuller report which can be issued in printed form for wider distribution.

As the present report indicates, the external and domestic aspects of development financing are closely interrelated. The distinction between public and private financing also loses some of its significance under the impact of the emerging institutions and techniques for joint financing and for mixed development enterprises. Many problems of industrial financing are akin to those experienced in the broader field of development financ-

ing. The Fiscal and Financial Branch, which is entrusted with the study of promotional and institutional aspects of development financing, includes in its work programme a number of studies in these areas. With respect to external financing close co-operation is maintained with multilateral, regional and national financial institutions and it is hoped that the studies under preparation will provide the basis for building up an information service on external sources of capital within the framework of the Development Decade and in line with General Assembly resolution 1715 (XVI) and the recommendations of the Governing Council of the Special Fund. In reference to domestic aspects of development financing, primary reliance is placed on the contributions of the Regional Economic Secretariats in the study of the needs and conditions of development financing and the evaluation of the experience of the developing countries with various measures and institutions designed to promote external and domestic capital flows into investment projects.

In view of the interest shown by the various United Nations organs including the Committee for a United Nations Capital Development Fund⁶ in different aspects of the financing of economic development, it is proposed to submit periodic progress reports on the Secretariat activities in these fields to the Council which may wish to review these along with the studies on the promotion of international flow of private capital, on external sources of development financing and other related subjects as they can be completed with the available resources.

The designations employed and the presentation of the material in this document do not imply the expression of any opinion on the part of the Secretariat concerning the legal status of any country or territory or of its authorities, or concerning the delimitation of its frontiers.

Chapter I. Major trends and developments in the international flow of private capital

1. The need for expanding the international flow of private capital to the developing countries remains in the forefront of interest. A significant development is the increasing attention given in the developing countries to the establishment or strengthening of institutions concerned with development financing. In the course of the last few years development banks and finance companies, established with or without government participation, have been designed to provide an effective instrument for mobilizing domestic and foreign capital for investment in industrial and other developmental projects. The experience of the major international financial institutions in serving as channels for mobilization of foreign private capital for developing countries is also a development of increasing significance in the international investment field. The emergence and

growth of this new institutional approach to the flow of foreign private capital to developing countries, especially through the promotion of portfolio investment, but also through the mobilization of joint financing and consortia, has assumed greater significance in view of the inadequate growth, and in some cases a reverse trend, which has been experienced in the flow of direct foreign private investment to these countries.

2. The available data on the flow of foreign development capital indicate a steady increase in the aggregate volume of external funds received by the developing countries in the form of official donations, official development loans and long-term private capital. But the increase in the total flow reflects a sustained growth in official financial assistance which has so far offset the decline in the flow of foreign private capital. Investment from the latter source in the developing countries failed to increase, while it expanded appreciably among the developed countries.

3. The greater part of foreign private capital investments in the developing countries has taken the form of direct investment, in which the investors maintain a degree of managerial control or participation. Such investments have been primarily directed to resource development fields and less to manufacturing. The geographical distribution of foreign private capital follows an uneven pattern resulting from concentration of the bulk of direct investments in a few primary producing countries and manufacturing activities to the more advanced developing countries. Reinvested earnings constitute a large component of increment in foreign private investments in the developing countries and the actual flow of fresh investment funds has declined in relative importance.

4. The flow of private capital from the United States constitutes by far the major part of the total, and other major capital exporting countries include the United Kingdom, France, the Federal Republic of Germany, Switzerland, Italy, the Netherlands and other Western European countries and also Japan. The pattern of flow from the above countries to the developing countries reflects traditional preferences of their private investors in terms of countries and regions of destination and also their specialized fields of investment activities. The bulk of United States investments is concentrated in Latin America, especially in a few countries where resource development opportunities exist and the advanced stage of the economy and the size of the market offer an attraction for manufacturing. The United Kingdom investments follow the historical pattern of British investment into the Commonwealth countries. France has kept its investment interests primarily in African countries adhering to the franc area. The investments of other capital exporting countries, which have no specific traditional attachments, show a less discernible pattern in general and indicate less concentration in terms of geographical area or fields of activities. Yet, new trends are emerging, partly in response to the broadening interest of governments in extending the geographical scope of such investment activities as observed in the case of their public assistance.

⁶ See *Official Records of the General Assembly, Eighteenth Session, Annexes*, agenda items 12-33-34-35-36-37-39-76, document A/5536.

5. The interest of the developing countries in attracting foreign private investment is reflected in their legislative and administrative measures designed either to remove the obstacles in the way of foreign private investment activities or to provide positive incentives for their promotion. These measures serve to supplement those introduced to this end in the capital supplying countries and also at the international level. At the present time, more than one hundred countries and territories have enacted specific laws and administrative regulations providing investment protection guarantees, tax incentives and other facilities to foreign private investors. The governments of the capital supplying countries have also enacted measures for similar purposes. At the international level, advisory services and training in investment promotion fields have been supplemented by the search for new international schemes for investment, guarantees and protection, particularly through the creation of international facilities for the adjudication of investment disputes.

6. The volume of foreign business activities does not so far show a necessary correlation and response to the promotional efforts made in this connexion. Numerous surveys and interviews made with corporation officials and businessmen concerned with foreign direct investment indicate the complexity of factors which enter into the policy-making process of a firm and its investment decisions. The continuous search for legislative, administrative and financial devices in investment promotion fields during the last decades has, however, led to the formulation of a number of techniques on the guarantee of foreign investment against non-business risk and for granting of concrete tax advantages to investors. In view of the necessary limitations of unilateral incentive measures, bilateral and multilateral arrangements are being considered in order to attain the intended objective.

7. Direct investment is associated with the transfer of technological and managerial know-how. The current trend indicates a preference for those forms of direct investment which provide for local participation in terms of ownership and management. Joint ventures, business association and partnerships of various forms between foreign and domestic concerns are becoming increasingly popular in both developed and developing countries. Such joint ventures serve to allay political apprehension on the part of both Governments and investors in addition to business advantages that they offer to foreign enterprises as well as to the emerging domestic entrepreneurs.⁷ The degree and form of domestic participation is determined by a number of considerations peculiar to the field of industry and to other business and legal requirements. Even in those cases where domestic association is limited to capital participation, the venture can assist in mobilizing private savings and furthering the formation of investment habits in the private sector as a precondition for the development of the necessary money and capital markets and related financial institutions.

8. The preoccupation with the promotion of foreign controlling activities for the purpose of industrialization and development of natural resources in the developing countries seems to have overshadowed the important contribution that portfolio investment has made in the historical process of development financing and can make under present conditions. This type of investment has in many instances filled the financing gap which could not be covered by direct investment. Historically, the capital markets of Europe financed important private ventures and also public undertakings in such fields as transportation, utilities, mining, building of dams, land reclamation and agricultural settlements. Portfolio investment in the post World War II period has increased significantly among the developed countries and the trend shows an upward movement in this direction. As already indicated, the search has begun at the international and national level for development of instrumentalities and techniques enabling the developing countries to share in and tap the growing financial resources being made available in the investment markets of the developed countries. In the present report, specific references are made to the records of international financial institutions, namely the International Bank for Reconstruction and Development and the Inter-American Development Bank, in securing funds from United States and European capital markets through sale of bonds and portfolio loans. Information is also provided on the efforts of the International Finance Corporation and the Inter-American Development Bank and the success already achieved in interesting foreign investors in participating in the Finance companies established through their assistance. The growing preoccupation of the Governments of the capital receiving countries with institutional aspects of development financing and the resulting creation of financial institutions and legislative measures for formation or strengthening of capital markets are likely to increase their ability not only to mobilize more effectively domestic savings, but also to utilize such channels for the attraction of a greater flow of foreign private capital under more favourable terms. At the same time where foreign technical and managerial know-how is also needed, resort can be had to a wide range of contractual devices which have been developed in recent years.⁸

9. The success of a proposed investment project (whether in the public or private sector) depends, aside from the consideration of market and other economic conditions, upon realistic financial planning, covering not only the initial investment needs and methods of financing but also the operational and working capital requirements in the successive phases of its implementation. Sound appraisal of technical and financial requirements of the projects and their proper formulation facilitate access to external sources of capital, sought

⁸ See *Official Records of the Economic and Social Council, Thirty-second Session, Annexes*, agenda items 2-5, "The promotion of the international flow of private capital", document E/3492, chapter 1. ⁷ Document E/3665/Rev.1, chapter II.

through foreign business association, portfolio investment or direct lending. Many industrial enterprises in the developing countries suffer from a low ratio of equity to investment capital which has compelled them to meet their loan repayment obligations too early in the stage of operation. Their resort to short-term credit for investment purposes has hampered their financial management and their ability to finance sales and inventories and to maintain an adequate level of reserves. The inadequate development of the money market severely limits the supply of funds and thereby increases the cost of capital in these countries. In addition, there is the need for consideration of working capital requirements at an early stage of financial planning, since securing funds for capital investment and access to equipment and machinery may not always ensure the financial success of an enterprise. Advisory and training programmes offered through multilateral and bilateral programmes are being developed to serve these needs. The provision of information on external sources of financing and on methods and conditions for their acquisition contemplated by General Assembly resolution 1715 (XVI)⁹ would complement these services offered at an international level and would enable the Governments and enterprises concerned to determine the appropriate sources of financing most applicable to their needs.

10. The credits provided under commercial terms or through bilateral arrangements for financing of import of capital goods constitute another important source of external capital for the developing countries. The magnitude, the forms and the terms under which export credits have been granted have undergone significant changes in the course of the last few years. A host of measures introduced in this field, dealing with the marshalling guarantee, insurance and reinsurance of such credits and with the requisite institutional arrangements, have been influenced partly by the need to improve the competitive position of export industry in the capital supplying countries. Such measures have also benefited the developing countries which are dependent on the import of increasing amounts of equipment and machinery and of materials for capital goods production as their pace of industrialization is being advanced. A growing portion of development assistance provided under bilateral programmes is taking the form of financial and development credit and this can be observed in the pattern of aid provided by the centrally planned economies as well as in the case of other capital exporting countries. The difficulties experienced by the developing countries in their balance of payments positions are to some extent exacerbated by undue reliance on credits of relatively short maturities. There is, however, a trend towards the lengthening of such credits under more liberal terms and there are also signs of wider recognition of the need for a more judicious utilization of such credits in the developing countries with due regard to their over-all foreign debt service capacity. The export credit systems, taking the above factors into account, can serve, as in the past, as an important channel for

the financing of the high import component of capital formation in the developing countries.

11. The following chapters will examine in more detail the issues and trends discussed above. Chapter II provides a summary of the various projections made on the capital needs in the developing countries from the particular point of view of the contribution from foreign private sources of capital. The discussions included in this chapter will point out that while capital for investment in infrastructure is increasingly sought from public sources, industrialization in most countries is primarily dependent upon domestic and foreign investment in the private sector. Chapters III, IV and V review the international and national financial institutions involved in this flow and examine the increasing access of these institutions to foreign private capital. A selected list of existing specialized development institutions in developing countries is included in the appendix to chapter V. Chapter VI is devoted to the discussion of export credit as a growing source of the financing of capital goods (equipment and machinery) for developing countries. Chapter VII examines the measures introduced at the national level (in capital supplying and receiving countries) and at the international level for the promotion of private investment; lists of relevant laws and treaties are included in the annexes to chapter VII.

Chapter II. Needs and availabilities of foreign private capital for developing countries

A. NEED FOR FOREIGN PRIVATE CAPITAL FOR DEVELOPING COUNTRIES

12. The concern over development financing is the logical corollary of the economic planning process which gained momentum among the developing countries during the last decade, leading to successive implementation of a number of national economic plans. The bulk of development outlays in these countries has been directed toward the building of the necessary economic and social overhead facilities and services. These were primarily financed from budgetary appropriations, official donations and loans provided either directly under bilateral and multilateral programmes or through national, regional and international institutions. The current experience of the developing countries in economic planning clearly indicates the need for an expansion of these activities, which must be financed by the Government at an increasing rate, far exceeding the current and anticipated domestic resources available to them.

13. In the majority of the economic plans the private sector is given a significant role in the economic development of the country. In the case of many Governments this development has been favoured by a consistent policy of limiting direct Government participation in industry except for those fields which were considered strategic to the national interest. Most Governments have, however, pursued a positive policy of seeking to influence the direction of investment into desirable

⁹ See Foreword.

industrial undertakings through a series of measures, financial, credit and administrative facilities.

14. Various attempts have been made to evaluate quantitatively the external financial resources required to bring about a significant rise in the economic development of the developing countries. The estimate and projection of such needs are limited in scope and accuracy and must of necessity be based on a number of assumptions regarding the basic variables and arbitrary targets on the required rates of economic growth. General conclusions emerging from these studies point to the need of the developing countries for substantial volume of additional capital from external sources. According to one estimate, in order to double in the nineteen sixties the annual rate of growth of income *per caput* of about one hundred countries and territories, additional external capital of the order of \$30,000 million is needed above the 1959 level. It was expected that about \$10,000 million would be provided through normal increases in volume of capital inflow, thus leaving a gap of \$20,000 million. This magnitude of funds, according to the projection, was considered essential to meet the minimum financial requirement for infrastructure projects alone in these countries.¹⁰ This is expected to raise the 1 per cent annual rate of growth *per caput* which occurred in the nineteen fifties to 2 per cent in the sixties. According to other projections the annual additional foreign capital required in the nineteen sixties would amount to \$3,000 million.¹¹ It should also be mentioned that the minimum external capital requirements of the developing countries have been estimated as high as \$13,000 million a year excluding China (Mainland) and \$19,000 million including that country.¹²

15. For the region of Latin America, the Organization of American States put the minimum need for external resources at \$20,000 million over the next ten years.¹³ Regarding Asia and the Far East the need is estimated to amount to an annual flow of \$2,600 to \$3,000 million.¹⁴ Data on the need for external sources of development capital are included in an increasing number of national economic plans. The Indian Third Five-Year Plan (1961-1966) envisaged a total net investment equivalent to \$22,000 million of which \$5,500 million was estimated to be received from abroad. This figure compares with about \$2,000 million received during the Second Plan.

16. The experience of the developing countries has shown that import component of capital formation is high and in many countries the ratio of import of capital

goods and materials for capital goods to gross capital formation has increased steadily, accounting for over 40 per cent in many countries in recent years. The foreign exchange component of planned outlays shows a tendency to exceed 30 per cent in many countries. These proportions increased substantially when data are confined to capital formation in the industrial sector. According to one estimate, the total annual capital import needs of the developing countries will increase from \$3,500 million in 1957-1959 to about \$9,300 million in 1980 (out of total imports needs of \$22,500 and \$60,000 million respectively).¹⁵ It has also been estimated that the acquisition of industrial equipment for manufacturing industries by all the developing countries accounted for \$3,200 million in 1958. These countries produced \$200 million of these requirements and the remainder (\$3,000 million) was covered by import of capital goods from the developed countries. The projected needs in 1975 show a rise to the level of \$8,000 million a year and it is expected that developing countries will be able to produce domestically about one fourth of the above needs. The need for capital import will thus increase substantially, reaching \$6,000 million at the end of the period.¹⁶ According to IBRD data, out of the Bank aggregate cumulative loan disbursements of \$5,425 million, as of 30 June 1963, \$4,134 million or over 75 per cent were used by the borrowers for import of capital goods, which in the initial years, were primarily purchased in the United States but are now imported from a greater number of countries exporting capital goods.¹⁷

17. In most developing countries the higher ratio of capital goods imports to their total imports has been primarily attained by a reduction in the importation of consumer goods rather than through an increase in the overall level of imports. This trend is indicative of genuine efforts on the part of the developing countries to speed the pace of development in the face of continuing deterioration in their terms of trade which has adversely affected their export earnings and import capacity. For the developing countries of Asia and the Far East imports of capital goods accounted for 40 per cent of total imports in 1958-1960 period. For the region as a whole, total imports increased by 11 per cent in the nineteen fifties while imports of capital goods rose by 65 per cent and imports of materials for capital goods by 45 per cent.¹⁸ In 1958, imports of machinery and equipment by the regions of Latin America, Middle East, Africa and Asia and the Far East, constituted respectively 34, 27, 26 and 22 per cent of their total imports in that year.¹⁹ The foreign currency required to finance the widening import gap of developing coun-

tries with respect to industrial equipment and other capital goods may be obtained by allocation of a greater part of export earnings, by drawing on reserves or through continued growth of inflow of funds. Although these countries are making increasing efforts to expand their exports and develop import substitutes, it would appear that in the foreseeable future a rising flow of financing from the developed countries will remain strategic to the fulfilment of industrial development schemes. The prevailing system of export credit, financed primarily through private capital, has supplemented the other sources of financing of imports.

B. BASIC TRENDS IN INTERNATIONAL CAPITAL MOVEMENTS ²⁰

18. The gross international flow of long-term private capital has consistently increased in the course of the recent years, currently reaching the level of \$6,000 million ²¹ or three-fold the annual average in the early nineteen fifties. ²² The movement of private funds has shown increasing concentration among the developed, capital-exporting and importing, countries but the volume of capital transactions with the rest of the world has declined in relative terms, reaching 19 per cent of the total in 1960 as compared with 34 per cent in 1958. ²³ The net flow of foreign private long-term capital to the developing countries reached the level of \$1,000 million in the late nineteen fifties. In 1960 it registered a rise to \$1,127 million but declined to \$984 million in 1961 and \$877 million in 1962. There are indications of further decline in 1963, although positive developments have occurred in specific investment fields and in certain countries.

19. The total net flow of public and private long-term capital and official donations to the developing countries increased from \$5,176 million in 1960 to \$5,742 million in 1961 and \$5,894 million in 1962. These compare with annual averages of \$3,300 million for 1951-1955 and \$4,900 million for 1956-1959 periods. These countries also received commitments of bilateral economic assistance from the centrally planned economies amounting to \$1,136 million and \$933 million in 1960 and 1961.

20. The increases in the total net flows to the developing countries in recent years are attributed to the rapid rise of official long-term development loans to the developing countries and to a lesser extent to the growth in the official donations. The net flow of private long-term capital has followed a declining trend in its relative significance constituting 15 per cent of the total in 1962 as compared with 22 per cent in 1960. Official

donations and official long-term capital have contributed in about equal proportion to the total external capital receipts of the developing countries.

21. The supply of guaranteed export credit of medium and long-term maturities from the OECD member countries to the developing countries has averaged around \$400 million. International transactions in short-term funds have increased considerably between the United States and Western European countries (\$600 million in 1958 and \$2,400 million in 1960). In the absence of comprehensive data, it could only be assumed that the volume of commercial credit to the developing countries has moderately increased.

22. Net disbursements of loans and development grants from multilateral agencies amounted to \$204 million and \$444 million in 1961 and 1962 and allocations of United Nations technical assistance and relief agencies accounted for \$197 million and \$196 million in the above two years. ²⁴ In the period 1960-1962 Asia (West Asia and the Far East) and Africa received respectively about 45 per cent and 33 per cent of the total net flow of long-term capital and official donations and Latin America's share was around 22 per cent. This region, however, received between 55 and 66 per cent of the total private long-term capital. During this period the total net flow of long-term capital and official donations contributed over one fifth of the total foreign exchange receipts of all the developing countries. For the region of Latin America the contribution from this source amounted to 12 per cent of the total, one half of which accounted for inflow of private capital. In Africa, on the other hand, receipt from the above source constituted 30 per cent of its total foreign exchange revenue out of which only 2 per cent was of private origin.

23. The steady increase of the external indebtedness of a great number of developing countries in recent years and the difficulties experienced in meeting their debt service payments have prompted the adoption of a more cautious and systematic approach to external financing and payment problems. It may briefly be indicated that, according to a recent study, the total external debt of the nineteen Latin American countries increased from \$3,600 million at the end of 1955 to over \$8,000 million at the end of 1961, and service payments of this debt rose from about \$500 million to \$1,100 million during this period. The study adds that "some further deterioration in the structure of debt occurred as a result of medium-term credits and other relatively short-term debt having become a greater part of the total over the period considered: this is reflected in a rise in the ratio of service payments to debt disbursed and outstanding from some 15 per cent in 1956 to around 19.5 per cent in 1961." ²⁵ In the case of eight countries of the ECAFE region, the deterioration in the balance of their current accounts during 1953-1955 and 1959-

²⁰ For more detailed information on the flow of long-term funds, their source, composition, direction and distribution, see Report entitled: "International Flow of Long-term Capital and Official Donations, 1960-1962" submitted to the Thirty-seventh session of the Council, document E/3917.

²⁵ International Bank for Reconstruction and Development, *Recent Changes in the External Public Indebtedness of Latin American Countries*, October 1963 (Report No. EC-120), p. 1.

1960 periods was partly offset by the inflow of long-term capital and official donations. But net interest and dividend payments rose from \$154 million to \$236 million in the above periods and the proportion of such payments to total export earnings rose from 4.2 per cent to 5.8 per cent and further increases are expected in subsequent years.²⁶ In Latin America, the proportion is around 16 per cent on the average, it does not exceed 1 per cent for Africa and the average percentage for all the developing regions is about 12 per cent.

24. The relative size of profit and dividend payments are high in the case of a number of countries where foreign investments are relatively significant. In Mexico, the ratio of service payments on all fixed interest debt to receipts from export of goods and services was 19 per cent in 1962, while the ratio of the above payments, including profits and dividends on all foreign capital, to receipts from export of goods and services, accounted for 28 per cent in that year. These ratios were in the case of Brazil 31 and 36 per cent (1961), for Argentina 13 and 16 per cent, for Ecuador 9 and 21 per cent and Colombia 14 and 39 per cent respectively.²⁷ These data provide only a partial indication of the relative impact of direct and portfolio investment in the developing countries. Disinvestments of capital (as have recently taken place in some Latin American and Asian countries, mostly in the oil industry) have had strong impacts on the balance of payments of the countries concerned. In reference to external borrowing, the distinction between the hard and soft loans is significant in terms of cost and period of amortization. The soft loans granted under more liberal terms and for a long maturity period, sometimes accompanied by an initial grace period, allow the investment project in the recipient economy to complete its gestation period. The payment impact of equity investment on the exchange accounts of the capital receiving countries is not immediate as profits and dividends accrue, or are expected to accrue, when investment activities come to fruition. Historically, many types of direct investment which are export oriented contribute a great deal to the exchange earnings of the country, offsetting the profit and dividend payments abroad. The same effect is obtained indirectly through import-substituting capital goods or consumer goods industries which cause economy in the country's foreign exchange expenditure. In the case of foreign-financed industries which have reached the stage of operation, the outflow of funds in the form of profit transfers and capital repatriation is subject to fluctuation. This element of uncertainty further emphasizes the need for a better and more effective foreign exchange planning and budgeting which already results from the fact that the schedules of amortization in more than twenty major developing countries call for payment of more than 40 per cent of the total outstanding debt over the next five years. Obviously the soft loans, taken individually, entail less drain on external payment accounts in the early years, but their combined amorti-

zation effect in the future years may create difficulties similar to those being experienced at the present time owing to the concentration of individual payment schedules within a short span of years.

25. Economic growth and a better mobilization and utilization of resources through the mechanism of savings and investment determine the ability of an economy to meet its past external payment obligations and contract new ones. In the process of development, the savings-investment gaps are likely to be reduced leading to decline in the relative significance of foreign investment to total investment in the economy.

Chapter III. The contribution of international and regional financial institutions to channelling external private capital into developing countries

26. With the breakdown of the foreign securities markets in the early thirties an era of intensive international private investment activities came to an end. At the end of World War II, there was a pressing need for financing of post-war development but the financial markets of the world were inactive and the traditional private lenders in Europe and the United States were reluctant to venture into the area of foreign security underwriting and transactions. The establishment of the International Bank for Reconstruction and Development (IBRD) in the early post-war period was followed in the subsequent decades by a number of other multilateral and governmental institutions designed to supplement international private investment.

27. In the early stage of operation, these financial institutions depended on member governments' subscriptions as the main source of financing. But in recent years, efforts have been made to resort to the capital markets in obtaining the additional resources needed for financing of economic development in the developing countries. The growing success attained in this connexion is indicative of both the willingness of the capital markets in re-entering the foreign investment field and also the suitability of these multilateral institutions as an intermediary channel between the foreign investors and users of funds in the developing countries.

28. The International Bank for Reconstruction and Development (IBRD) and its affiliate, the International Finance Corporation (IFC), and the Inter-American Development Bank (IDB) are resorting to the capital markets in securing funds through issue of bonds and sales of loan portfolio to supplement their resources. These institutions also undertake the financing of private development projects in the developing countries directly and in co-operation with domestic and foreign private investors. These functions are performed through a wide range of financial methods, techniques and instrumentalities to which references are made in the following pages. The present chapter also provides brief information on the African Development Bank which is expected to begin operation shortly. It should also be mentioned that the establishment of a Development Bank for Asia and the Far East is also under considera-

²⁶ *Economic Survey of Asia and the Far East, 1962*, United Nations publication, Sales No.: 63.II.F.1.

²⁷ *Economic Growth and External Debt*, United Nations publication, Sales No.: 64.II.B.15.

tion by the governments of the region under the auspices of the United Nations Economic Commission for Asia and the Far East. Major international institutions for financing of development in the developing countries also include the International Development Association (IDA), the Development Fund for the Overseas Countries and Territories, the European Investment Bank and the United Nations Special Fund, which is concerned with financing of pre-investment projects. Since these institutions and agencies deal with development financing in the public sector they will be covered in the studies contemplated by the Secretariat on the external sources of financing as referred to in the Foreword.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT (IBRD)

29. Article I(ii) of the Articles of Agreement of the International Bank for Reconstruction and Development calls on the Bank "To promote private foreign investment by means of guarantees or participations in loans and other investments made by private investors; and when private capital is not available on reasonable terms, to supplement private investment by providing, on suitable conditions, finance for productive purposes out of its own capital, funds raised by it and its other resources." Article I(iv) also specifies as one of the major purposes of the Bank "To arrange the loans made or guaranteed by it in relation to international loans through other channels so that the more useful and urgent projects, large and small alike, will be dealt with first."

30. The records of the operation of the Bank are indicative of its efforts towards the attainment of the above objectives. As explained in the following pages the Bank has relied heavily on the capital markets for securing funds to supplement its own available resources from the issue of Bank bonds and notes and the sale of portion of loans from the Bank portfolio. The Bank has also been instrumental in promoting international flow of investment capital by interesting foreign investors in participating jointly with the Bank or independently in a number of national and regional public and private development projects.

31. The aggregate funds available for loans up to 30 June 1963 amounted to \$7,033 million of which \$1,690 million, \$558 million and \$655 million represented funds available respectively from capital subscriptions, operations and principal repayments. The remainder is derived from \$2,524 million IBRD bond issue and \$1,605 million from IBRD loans sold and agreed to be sold. The latter two sources of funds (i.e., \$4,129 million) account for close to 80 per cent of the IBRD loan disbursement of \$5,425 million as of 30 June 1963. The amount of loans, guarantees and participation of the Bank, according to its Articles of Agreement, should not exceed the total of its subscribed capital, reserves and surplus. The resources on 30 June 1963 amounted to over \$24,062 million.

Sales of IBRD bonds and notes in the capital markets

32. The IBRD bonds and notes constitute its direct obligations and they are issued by public offering or private placement in capital markets of the United States and other countries. Until 30 June 1963 the IBRD marketed forty-one issues consisting of sixteen in the United States, eleven in Switzerland, four in the Netherlands, three each in Canada and the United Kingdom, and one each in Austria, Belgium, Germany and Italy. As of 30 June 1963, the aggregate principal amount of IBRD bonds and notes that had been sold in the investment market amounted to nearly \$4,000 million which has been reduced by about \$1,500 million by redemption and retirement through sinking-fund and purchase fund operations. The outstanding funded debt of the Bank thus amounted to the equivalent of \$2,500 million.

33. Obligations of the IBRD presently outstanding bear interest rates ranging between 3 to 5 per cent. The IBRD bonds have been for terms of 10 to 25 years and notes for periods of 2 to 5 years. The bonds in most cases contain sinking-fund provisions and are usually subject to redemption prior to maturity at the option of the Bank. The IBRD issues do not enjoy any general tax exemption but special tax treatment and rulings have been granted in the United States as well as in other countries in favour of these obligations.

34. The investment market for the IBRD issues has expanded progressively since its first offering of \$250 million bonds on 15 July 1947 in the United States capital markets. The development of the market for the IBRD obligations was facilitated by government actions in the United States and subsequently in other countries by adoption of legislative and administrative measures on the eligibility of these obligations for institutional investors and such issues were also made exempt from certain restrictive requirements of the securities exchange regulations.

35. The Bank in its initial offerings in the United States relied on such methods as agency basis and competitive bidding but it subsequently resorted to negotiated underwriting method with syndicates of investment banking firms and commercial banks which proved to serve as a more satisfactory means for continuous market operation.

36. As of 30 June 1963, the Bank's outstanding funded debt, consisting of bonds and notes, stood at \$2,525 million, of which outstanding borrowings in currencies other than United States dollars amounted to \$620 million. According to estimates over 56 per cent of the Bank's funded debt (including obligations in dollar or in other currencies) is held by private investors and central banks and other government institutions in over forty countries. In the United States institutional investors, namely life insurance companies, savings banks, pension and trust funds and commercial banks hold the bulk of United States holdings of IBRD obligations. In the Federal Republic of Germany the Bundesbank (the Central Bank) has an investment of

more than \$600 million in IBRD bonds and notes issued in United States dollars, Deutsche marks and in other currencies.

Sales of IBRD portfolio loans to other investors

37. In addition to selling its own bonds and notes, the Bank also sells, in the capital markets, loans made to its borrowers. Through this operation, the Bank replenishes its commitments and adds to its available financial resources, as such sales will release funds obligated by the Bank for such loans. Once the sale of a Bank loan to a new investor is consumated, the Bank's responsibility and functions vis-à-vis the investor will be reduced to those of a fiscal agent who will ensure the servicing of the obligations subject to the agreed transaction.

38. The Bank makes sales to investors either at the time when it enters into the contract with the borrower or subsequently thereto. Sales under the second type amounted to \$1,247 million, of which \$270 million were purchased by United States investors. The first method resulted in sales of \$358 millions of borrowers' obligations, of which United States investors — commercial banks, savings banks, insurance companies — bought \$277 million. The aggregate sales from both sources amounted to \$1,605 million as of 30 June 1963 and were increased to \$1,755 million as of 31 March 1964. As shown in Table 1, the yearly sales of World Bank loans reached their peak year total of \$319 million in 1961/1962. The total annual sales of the Bank's loans, as a percentage of total IBRD annual loans, has gone up from slightly over 14 per cent in 1957 to 61 per cent in the fiscal year ended 1963.

Joint financing arrangements

39. In conformity with its Articles of Agreement, the IBRD in its relations with the loan applicants has endeavoured to seek private investors willing to provide investment capital for development purposes. In the case of such joint Bank-market arrangements, the IBRD loan is made to coincide with securing additional capital by public offering of the borrower's bonds, or by private placement with institutional investors, or both. This operation began in 1954, when an IBRD loan of

Table 2. Joint Bank-Market Operations to 30 June 1963

(In US dollars)

Year	Country	World Bank loan	Bond or note Issue	Total financing

SOURCE: Policies and Operations of the World Bank, IFC and IDA, op. cit.

^a Does not include a loan of \$20,000,000 to the Cassa per il Mezzogiorno (Italy) by the European Investment Bank, made at the same time as the World Bank loan and the public offering of the Cassa's Bonds on the United States investment market.

\$20 million was combined with \$30 million additional capital from the capital market for financing of a large port and waterways development programme in Belgium. As of 30 June 1963, fifteen such joint financing operations were undertaken for public and private agencies. Two of these operations were related to projects in the developing countries, namely India and the Federation of Rhodesia and Nyasaland. As seen in table 2, the total funds raised amounted to \$562 million of which \$252 million accounted for IBRD loans.

Financing of development in the private sector

40. The IBRD development financing activities began in 1948 for Latin America and by 1950 they were extended

to Asia and the Middle East and Africa. As of 30 June 1963, development loans to the above regions amounted to \$1,739, \$2,355 and \$917 million respectively. As shown in table 3, the IBRD loans have covered development projects in the fields of electric power, transportation and communications, industry and agriculture and forestry.

41. It is estimated that close to \$1,000 million of IBRD loans have been made to private borrowers with government guarantees.²⁸ Financing of industry by IBRD includes a number of loans made directly to private industrial projects. The Bank has also made a total

of \$225 million loans to the private development banks in the developing countries for the purpose of relending to industries and other production enterprises and ventures. Among the developing regions Asia and the Middle East was the recipient of most of the IBRD loans to industries. These include loans to leading private steel producers in Japan (\$155 million) and India (\$157 million). Industrial loans were also made for the manufacture of paper products in Pakistan and Chile, the development of manganese in the African Republic of Gabon and of iron ore in Mauritania.

42. The IBRD normally provides borrowers with the foreign exchange they need for paying for the goods and services they will use for the special project for which a loan has been granted. The borrower would normally be required to make repayments either in the currency provided to him by the Bank or in the currency with which the Bank purchased for the borrower the currency it needed. Repayments normally begin after a period of grace. Loans made by the Bank are normally medium or long-term ranging between 10 to 25 years. The Bank is currently considering a lengthening of its lending periods and in February 1964 made a \$45 million loan to Colombia for a period of 35 years. The extension of loan maturity is in response to the new policy adopted by the Bank for easing its lending terms in order to make use of its large reserves and surpluses for the purpose of reducing the heavy external debt burden of less developed countries. Apart from the modification of the length of its loans already pointed out, the IBRD is considering lengthening the grace period to allow the project it aided in financing to gestate well. Rates of interest charged have ranged between 4 per cent and 6-1/4 per cent, and are based on the rate at which the IBRD borrows from the capital market to which 1 per cent annual commission charge has been added and one quarter of 1 per cent to enable the Bank to meet its administrative expenses. In the industrial field, IBRD intends to concern itself more closely with the financing of individual industrial projects and to help develop new industries in under-developed countries through technical assistance. It should be noted that the proposed United States interest equalization tax on purchases of foreign securities has already started to have some effect on the United States investors interested in IBRD loans. In two recent almost identical loans, of \$32.5 million, and \$30 million for power to New Zealand and Nigeria respectively, all the eleven banks that participated in the loan to New Zealand were European and Canadian whereas in the loan to Nigeria nine of the twelve banks participating were American.

INTERNATIONAL FINANCE CORPORATION (IFC)

43. The International Finance Corporation was established in July 1956 as a separate entity but an affiliate of IBRD with an authorized capital of \$100 million which was increased to \$110 million in September 1963. It is designed to promote economic development through the financing of productive private enterprises parti-

cularly in the developing countries. According to article I of its Articles of Agreement the Corporation shall:

“(i) In association with private investors, assist in financing the establishment, improvement and expansion of productive private enterprises which would contribute to the development of its member countries by making investments, without guarantee of repayment by the member government concerned, in cases where sufficient private capital is not available on reasonable terms;

(ii) Seek to bring together investment opportunities, domestic and foreign private capital, and experienced management; and

“(iii) Seek to stimulate, and to help create conditions conducive to, the flow of private capital, domestic and foreign, into productive investment in member countries.”

44. International Finance Corporation activities supplement those of IBRD. As already indicated, the Bank is prohibited by its Articles of Agreement (article III, section 4(i)) from lending without the guarantee of the Government or the central bank or some comparable agency of the member country which is acceptable to the Bank. The IFC can grant loans to private enterprises without having to obtain any government guarantee of repayment. By an amendment of its Charter which took place in September 1961 the Corporation was also permitted to invest in equity capital of such enterprises. The Corporation now offers in association with private investors, long-term financing through subscriptions to capital stock, through a combination of stock subscription and loans.

45. Government participation in an enterprise does not preclude IFC investment provided the enterprise retains its private character. The Corporation normally undertakes its investment activities through or in cooperation with development finance companies with which IFC has relations and no investment is made in a country if the government objects. Ordinarily also, IFC does not require guarantees of repayment by banks or parents of affiliated companies but may request such guarantees in certain cases.

46. While IFC initially concentrated in the financing of manufacturing activities, its field of investment has gradually expanded to other productive enterprises such as agricultural or service projects contributing to the growth of manufacturing. Generally, there is no limitation to the size of IFC investments but its participation has averaged \$1.25 million.

47. From the beginning of its operations to 30 June 1963, IFC has been able to increase its available resources by additional funds consisting of \$16.9 million through sales of its investments, \$16.1 million from earnings, \$9 million from profits on sales of investments and \$3.7 million from repayments on investment capital. The funds available to IFC for its operational activities including its capital subscriptions were thus increased to \$135.8 million.

48. During its operation IFC's total commitments including standby and underwriting commitments reached \$90.6 million of which \$80.0 million consisted of net

commitments. As of 30 June 1963 the uncommitted funds available for investment amounted to \$55.8 million. Annual investments increased from \$5.3 million in 1957 to \$21.7 million in 1960 and has remained at about that level except for 1961 when the rate of new investment declined to \$6.2 million.²⁹

49. Up to 30 June 1963, fifty-nine enterprises in twenty-four countries received capital from IFC. Latin America's share in the IFC total volume of investment accounted for 65 per cent and Asia and the Middle East and Africa received respectively 16 and 9 per cent. Argentina, Brazil, Chile, Colombia, India, Peru and Mexico have been the recipients of the bulk of IFC investments. Steel and steel products industries, cement, paper and pulp, electrical and fertilizers industries attracted the greater part of IFC investments. IFC has also financed a number of other industries such as manufacture of automobiles or parts, mines and smelting plants, petrochemical, textile manufacture and others.

50. An example of international co-operation in the investment field can be given in reference to a recent

financial venture in Mexico. On 7 January 1964 the IFC and the Inter-American Development Bank announced that they were participating with Mexican and French investors in providing loan and equity capital to Industria del Hierro S.A. of Mexico, a manufacturer of heavy construction equipment. The undertaking is reported to have been sponsored by Ingenieros Civiles Asociados S.A., known as the ICA group, a leading Mexican construction and engineering firm which in the past had participated in a number of major Mexican construction projects both in the public and private sectors. The financing plan included an Inter-American Development Bank loan of \$3 million equivalent from its ordinary resources, an IFC investment equivalent of \$1.6 million in 20,000 shares of the company's stock, a \$1.2 million investment by Nacional Financiera, a Mexican government financing agency in 15,000 shares, and an investment of \$400,000 each by the Banque Nationale pour le Commerce et l'Industrie (BNCI) and Establishments Neyrpic of France, each subscribing to 5,000 shares. In addition, Nacional Financiera was expected to guarantee repayment of up to \$4 million of supplier's credits.

^a Four IBRD loans, excluding three loans to Austria and one to Finland.

51. Since the beginning of 1962 the IFC has become increasingly active in facilitating the formation of private development banks and finance corporations in countries where the growth of private sector is encouraged and there is an actual need for medium and long-term loans and equity capital to entrepreneurs which cannot be obtained from other sources. The Corporation's activities supplement IBRD and IDA's lending to public and private development banks and corporations engaged in development financing.

52. As shown in table 4, the IFC made equity investment totalling \$14.1 million in nine development banks and finance institutions in under-developed countries. In addition to the provision of funds IFC has been able to offer assistance and advice in drafting the charter, in marshalling sponsors, in clearly defining and formulating investment policies and in the actual operation of its business such as project appraisal through provision of services of skilled and experienced staff.

INTER-AMERICAN DEVELOPMENT BANK (IDB)

A. *The Bank's own resources and access to the capital markets*

53. The Inter-American Development Bank whose Articles of Agreement were signed on 8 April 1959, began operations on 1 October 1960. Article I, section 2 (a) (iii) of the Articles of Agreement expressly states it to be one of the Bank's functions "to encourage private investment in projects, enterprises, and activities contributing to economic development and to supplement private investments when private capital is not available on reasonable terms and conditions". Specifically, the Bank is ready to guarantee loans by private lenders and to grant financial assistance to private enterprises, including those in which foreign investors have an interest. While the Bank may not undertake equity investments and is not likely to cover more than 50 per cent of the cost of any project, it retains considerable leeway, since it may act without requiring a government guarantee (though not over the government's objection). The Bank also provides technical assistance, to both public and private agencies, in the preparation, financing and implementation of constructive projects.³⁰

Ordinary capital resources

54. The IDB's authorized capital stock which originally amounted to \$850 million was increased to \$2,150 million at the beginning of 1964 to enable it to increase its reserves and "triple its current capacity for bond placements in the private capital markets".³¹ Of this, \$475 million is in paid-in capital which is payable 50 per cent "in gold and/or dollars and 50 per cent in the currency of the member" (article II, section 4 (a) (i)); \$1,675 million constitutes the callable portion of the

capital (article II, section 2 (b)), and serves as a guarantee for the Bank's obligations. In order to enable the Bank to borrow in the capital markets, payments on the callable portion are to be made by members, at their option, "...either in gold, in United States dollars, or in the currency required to discharge the obligations of the Bank for the purpose for which the call is made" (article II, section 4 (a) (ii)).

55. The ordinary capital of the Bank (consisting of the paid-in portion of the capital subscriptions, of interest realized from borrowings and of reserves or undistributed surplus), is used to make loans on normal banking terms, which are in principle repayable in the currency loaned. The rate of interest in 1963 was 5.75 per cent (plus a — 0.75 per cent commitment fee on undisbursed balances) and the length of the loans varied between 6 and 20 years.

Special resources

56. In addition to the ordinary capital, members also subscribed to a Fund for Special Operations, whose resources serve "...for the making of loans on terms and conditions appropriate for dealing with special circumstances arising in specific countries or with respect to specific projects" (article IV, section 1). To this end, loans from the Fund may be made "on terms which may include lower interest rates and longer maturities than those from the ordinary resources, and may be repaid in local currency".³² In fact, loans authorized during 1963 carried interest at 4 per cent annually, and ran for periods up to 25 years.

57. It is noteworthy that a number of the loans even from this "soft loan" Fund went either directly to private enterprises or to development banks — both national and sub-regional (i.e., the Central-American Bank for Economic Integration) — for relending to private enterprises. The Fund was initially established with resources of \$150 million (of which \$146.3 million was actually contributed); effective 28 January 1964, members' quotas were increased by 50 per cent, thus bringing total resources up to just under \$220 million, as against total loan commitments up to 31 December 1963 of slightly over \$120 million. Members' contributions to the Fund are payable one-half in gold or dollars and one-half in their own currency (article IV, section 3 (d) (iii)).

Social Progress Trust Fund

58. The Bank's scope of action is further enhanced by its availability for managing external resources entrusted to it for the financing of particular programmes or projects. Of these, the most important is the Social Progress Trust Fund. This Fund was established by the United States Government under an agreement with the Bank of 19 June 1961, with an initial allocation of \$394 million. The Fund's purpose is to provide financial and technical assistance to both public and private recipients in Latin American countries for the purpose of advancing social development (along with economic

³⁰ Inter-American Development Bank, First Annual Report, 1960, p. 2.

³¹ *Ibid.*, "Summary of Activities as of August 31, 1963", p. 13.

³² *Ibid.*, Fourth Annual Report, 1963, p. 54.

development) especially in housing, land use, water supply and education.

59. Interest rates on loans from the Social Progress Trust Fund have ranged from 1.25 per cent to 2.75 per cent, plus a 0.75 per cent annual service charge on principal amounts outstanding. Except for this service charge, principal and interest are payable in local currency. The length of the loans, with very few exceptions, has varied between 13 and 30 years. By the end of 1963, the initial resources of the Fund having been almost exhausted with the approval of 73 loans totalling over \$367 million, and of technical assistance projects totalling nearly \$3.5 million, the U.S. Congress authorized an additional \$131 million for the Fund.

60. At the fifth meeting of the Bank's Board of Governors in April 1964 agreement was reached on a proposal by the United States to close down the Social Progress Trust Fund and instead to integrate its functions with those of the Fund for Special Operations so "that the Bank, in deciding upon particular projects for financing, will increasingly take into account both economic and social considerations and not just one or the other".³³ Correspondingly the resources of the Fund for Special Operations would be expanded by an additional \$900 million over the next three years — \$750 million to be provided by the United States and \$150 million by the other member countries, all in national currencies.

Bond issues

61. Apart from the above, IDB has, in keeping with the provisions of its Articles of Agreement,³⁴ raised funds in financial markets by the floatation of bonds and by securing the participation of private institutions in its loans.

62. The IDB made two bond issues totalling approximately \$100 million in 1962, and a third bond issue in the amount of \$50 million in 1964. The first bond issue was made in Italy in April 1962 or 15 billion freely convertible lire (\$24.2 million) at 5 per cent and for a 20-year term, was arranged and underwritten by a syndicate of six leading Italian commercial banks headed by Banca d'Italia and organized by Mediobanca. All of the proceeds have now been loaned in the American Republics at 6 3/4 per cent interest.

63. In December of 1962, the IDB successfully floated in the United States a public issue consisting of \$75 million of 20-year 4 1/4 per cent bonds. This issue was purchased 25 per cent by insurance companies, 26 per cent by commercial banks, including trust departments, and 26 per cent by state or municipal pension funds with other institutional investors (savings banks, corporations, investment trusts, etc.) and individuals purchasing the remainder. One hundred and two commercial

banks and investment banking firms located throughout the United States³⁵ formed the syndicate that purchased these bonds under the leadership of Lazard Frères and Company, Lehman Brothers and Blyth and Company, all of New York City.

64. The third bond issue floated by IDB was in the amount of \$50 million, also in the United States. That \$50 million public offering of IDB's 4 1/2 per cent 20-year bonds, was made through a syndicate of 102 commercial banks and investment banking houses throughout the United States under the joint management of Lehman Brothers, Blyth and Company, Inc., and Lazard Frères and Company.

65. Bonds of the IDB enjoy many privileges in the United States similar to those enjoyed by IBRD bonds (see paras 33-34 above) and in addition enjoy some special privileges in certain Latin American countries.

Private participations

66. As mentioned, private capital is also mobilized by the IDB through participations in its loans. To this end, IDB has established a close working relationship with the banking community. The number of participating banks in the United States, Europe and Canada has now reached a cumulative total of fifty-two. These sales of participations in the Bank's loans from its ordinary resources doubled in 1963 to a total of \$7.38 million, from \$3.28 million in 1962. Three commercial banks in the United States, two in Canada, two in Belgium, two in the United Kingdom and one in Switzerland purchased participations from the Bank without its guaranty in 1963. In addition sales from the Bank's portfolio in that year amounted to \$30,000. As of 31 December 1963, the cumulative number of private participations in IDB loans was 175 amounting to some \$15 million.³⁶

B. Support of the private sector:

Assistance in the development of financial institutions

67. Corresponding to its efforts to mobilize private foreign capital for its operations, through the sale of its bonds and the encouragement of private participations in its loans, the Bank considers that "one of its primary objectives has been to strengthen and encourage the spirit of enterprise within the region".³⁷ As of 31 August 1963, the Bank had channelled almost one half of its operations from its own resources to private enterprises, by providing 54 loans amounted to \$203.4 million.³⁸

68. It is the Bank's policy to lend directly to the large-scale industrial enterprises, while funds destined to small and medium-sized firms are channelled through national or regional, public or private development

³³ Statement by Mr. Douglas Dillon, United States Secretary of the Treasury, at the fifth annual meeting of the Bank's Board of Governors, at Panama on 14 April 1964. United States Department of State Bulletin, vol. L, No. 1297, 4 May 1964, p. 719.

³⁴ "In carrying out its functions, the Bank shall co-operate as far as possible with national and international institutions and with private sources supplying investment capital" (article I, section 2 (b)).

³⁵ Only 3.21 per cent, that is \$2.4 million of this \$75 million in bonds sold, was bought by investors from Western Europe and other foreign companies.

³⁶ Inter-American Development Bank, Fourth Annual Report, 1963, p. 15.

³⁷ *Ibid.*, "Summary of Activities as of 31 August 1963", p. 11.

³⁸ *Ibid.*

institutions, by means of over-all loans. Thus in 1963 ten of the loans made from the Bank's ordinary resources, amounting to \$20.3 million were granted to private firms in such varied fields as petrochemicals, cotton textiles, meat processing etc., while eight loans totalling \$55.8 million were made to development finance institutions for relending to private enterprises. Similarly, two of the loans totalling \$7.0 million made in 1963 from the Fund for Special Operations went to development banks for the same purpose. Cumulatively, as of 31 August 1963, the IDB has made 54 loans amounting to \$203.4 million for the benefit of private enterprise, of which 29 loans, amounting to \$61.4 million had gone directly to private enterprises, while 25 loans, totalling \$142 million went to industrial and agricultural development institutions for relending to private firms. It is noteworthy that one third of the latter amount was provided out of the Bank's Fund for Special Operations.³⁹

69. In addition, the Bank has taken an active interest in promoting savings and loan institutions and services in Latin America. Out of the resources of the Social Progress Trust Fund, at least a total of \$8.2 million consisted of capital contribution to savings and loan associations in Bolivia, Chile, Guatemala, and Peru. Early in 1963, the Bank took the leadership in sponsoring the first inter-American meetings on savings and loan programmes at Lima, Peru. Through such financial support and through its technical assistance, the Bank seeks to buttress the role which existing institutions can play in mobilizing foreign and domestic, public and private resources for the financing of worthwhile private undertakings and to promote the creation of new institutions. In this latter connexion, the Bank's latest Summary of Activities points to the example of its close collaboration with the Atlantic Community Development Group for Latin America (ADELA), a private multinational investment corporation formed by North American, European and Japanese interests, in April 1963, as a result of resolutions adopted by the Conference of NATO Parliamentarians, for the purpose of supplying venture capital to high priority enterprises in Latin America.⁴⁰ It is reported that the Group has before it a proposal to establish an international consortium of private investors for participation in an investment plan amounting to \$200 million. The consortium is expected to contribute \$40 million (\$20 million by U.S. and Canadian investors and \$20 million by Western European and Japanese members), another \$40 million would be made available by the Latin American countries and the rest (\$120 million) would be provided by the IDB. Recently, the Interim Organizing Committee of ADELA arranged through one of its sponsoring companies to subscribe 5 million Colombian pesos in shares of Forjas de Colombia, Sociedad Anónima, a company formed to build and operate a new plant for the production of steel forgings in Colombia in collaboration with the IFC which will invest Col.\$10 million in the company's shares. The underwriting and placement of the

capital stock of the company with investors inside and outside Colombia will be undertaken by the IFC and two Colombia finance institutions (Corporación Financiera Colombiana of Bogota and Corporación Financiera of Medellin).

70. In a broader context, reference should be made to the Bank's major role in the financial implementation of the Alliance for Progress. Specifically, the Bank has undertaken, at the request of the Government of Ecuador, to act as its financial agent in mobilizing the external resources needed to finance its proposed ten-year development plan. The Inter-American Development Bank also continued to act as agent for mobilizing resources for the first stage of Bolivia's development plan, according to the joint financing plan agreed with the United States Agency for International Development in 1962. In 1963, the Bank joined in the advisory group of international financial institutions and leading capital-supplying countries organized by the World Bank for Colombia's national development plan.⁴¹

71. The export credit scheme launched by the Bank in 1963, for the financing of Latin American exports is discussed in chapter VI.

CENTRAL AMERICAN ECONOMIC INTEGRATION BANK

72. The Central American Economic Integration Bank was established by an Agreement of 13 December 1960 subscribed to by Guatemala, El Salvador, Honduras and Nicaragua.⁴² On 23 July 1962 Costa Rica ratified the Treaty and joined the Bank. It is the financial arm of the Common Market which is being established by these countries. The Integration Bank is designed primarily to provide financing for public and private projects which serve "the economic integration and balanced economic development of the member states".⁴³

73. The Bank had an initial capital of \$16 million which was to be supplemented by funds from other foreign and international sources and alternately from the capital markets (article 6). Its total resources now amount to close to \$40 million. At the meeting of its Board of Governors held in March 1962 in Tegucigalpa, Honduras, plans were discussed under which the Bank would handle Alliance for Progress funds allocated to the Central American area either directly or through the Inter-American Development Bank.

74. The Bank "will also serve as a means of channeling domestic savings and foreign credit into economic integration activities" especially regional industries to be established for the Common Market area as a whole. It will also provide the countries concerned with the means of organizing a capital market which today does not exist at a national level.⁴⁴

75. The Bank's first loans have gone to industrial enterprises in Guatemala and El Salvador. Up to 30 November 1962 the Bank had granted loans for an equivalent of \$4.2 million for the development of industrial enterprises.⁴⁵ At present the Bank has many regional projects under study.

AFRICAN DEVELOPMENT BANK

76. The agreement establishing the African Development Bank was adopted at Khartoum on 4 August 1963 by a Conference of African Finance Ministers. The Conference was convened by the United Nations Economic Commission for Africa (ECA) and had the endorsement of the Addis Ababa Meeting of African Heads of States. A special ECA Committee of Nine had drafted the Articles of Agreement of the Bank on the basis of extensive consultations carried on by members of the Committee in all African capitals as well as in most financial centres outside Africa. All but three of the independent African Governments qualified for membership in the Bank had signed the Agreement by the 31 December 1963 deadline. Ratifications may be deposited up to 31 July 1965. By 15 May 1964 nine Governments had done so and six more Governments had completed part of the deposit procedure. It is therefore expected that the conditions for the Agreement entering into force will be fulfilled within the near future: these are, that ratifications of the Agreement shall have been deposited by twelve Governments whose total subscriptions comprise not less than 65 per cent of allotted capital of \$127,280,000.

77. As in the case of the Inter-American Development Bank the purposes of the African Development Bank are set out in broad and flexible terms in its Agreement. Article 1 states "that the purpose of the Bank shall be to contribute to the economic development and social progress of its members — individually and jointly", though priority is to be given to projects of benefit to more than one member country (article 2 (1) (a)).

78. The similarity between the two regional development banks extends also to the range of financial assistance they may provide: in addition to the conventional type of development financing, the Bank may accept special funds under terms which could enable it to re-lend these resources on "soft" terms. Unlike the case of the Inter-American Development Bank, however, no part of the subscribed capital of the African Development Bank is allocated to such special funds.

79. The Agreement also provides for the Bank's participation in the development of the private sector of the African economies. Thus, *inter alia*, it is "to promote investment in Africa of public and private capital, in projects and programmes designed to contribute to the economic development or social progress of its members". The Bank may provide equity as well as loan financing to private undertakings within member countries. While it may do so without the need of a

government guarantee, it is enjoined from providing financing for any project to which the member country concerned objects. The authorized capital of the Bank is \$250 million, half of which will be paid in and the remainder on call, all in convertible currency. In addition to its share capital, the Bank will be able to borrow local currency from its members up to an amount equal to their subscriptions. This provision is intended not only to increase the Bank's resources, but also to promote the use of African products and services in the carrying out of development projects sponsored by the Bank.

80. The Bank is authorized to raise additional resources by borrowing or by the sale of its securities as well as by selling holdings from its own portfolio (article 23). In fact with the limited amounts initially available to the Bank from its members, it will be necessary for the Bank to rely heavily on funds to be secured from non-African Governments and institutions and made available either for the general purposes of the Bank — e.g. through the establishment of Special Funds — or for the financing of specific projects sponsored by it.

ASIAN DEVELOPMENT BANK

81. The possible establishment of a regional development bank for Asia and the Far East has recently come under study by the Economic Commission for Asia and the Far East in connexion with the efforts towards promoting economic co-operation in the region. On the basis of recommendations originally prepared by a Working Group of Experts on Regional Economic Co-operation for the ECAFE region, the Ministerial Conference on Asian Economic Co-operation, which convened under ECAFE auspices in Manila in December 1963, agreed, *inter alia*, that an *ad hoc* Committee "be convened as soon as feasible to undertake the necessary studies, . . . and to recommend the institutional arrangements that would have to be made in order to implement . . . the establishment of an Asian Development Bank".⁴⁶ It is expected that the Committee of Experts will hold its first session in August 1964.

Chapter IV. Specialized financial institutions in selected capital-supplying countries concerned with financing of development in the developing countries

82. Specialized national financial institutions have been created or strengthened during the last two decades in the major capital-supplying countries in the same way as the international and other multilateral financial agencies, in response to the impetus given to economic development and the growing need for development financing. In this chapter an attempt is made to provide information on some of these institutions with particular emphasis on those aspects of their financial operations which are relevant to (a) the provision of public and private capital to the private sector in the developing countries, and (b) the channelling of private capital

⁴⁵ Economic Commission for Latin America, *Report of the Central American Economic Co-operation Committee*, United Nations publication, Sales No.: 63.II.G.12, p. 3.

⁴⁶ Resolution IV of 6 December 1963, United Nations publication, Sales No.: 64.II.F.14.

to these countries for the financing of public as well as private investment projects. As will be seen, aid agencies and other governmental financial institutions (e.g. export credit institutions) in capital-supplying countries provide medium and long-term funds and credit to private industries and other productive enterprises in the developing countries and do so in a growing number of cases through joint or "parallel" financing—similar to the functions increasingly performed by the international and regional agencies. In a number of countries, particularly in Western Europe, new institutions have come into existence which are financed jointly by public and private funds and administered as mixed enterprises. Private investment houses, banks and other financial institutions have also been responding increasingly to the new trend and are forming consortia, syndicates and agencies specialized in meeting specific investment needs of the private and public sectors in the developing countries.

83. As indicated in the foreword, the further studies under preparation will give extensive coverage on the institutions engaged in the provision of investment capital and on their terms, conditions and requirements for development financing in the developing countries, including specific and up-to-date information on foreign—domestic joint ventures, contractual services and other emerging international investment patterns many aspects of which were examined in the earlier reports of the Secretariat.⁴⁷

UNITED STATES

84. In the United States both government and private financial institutions play a significant role in the financing of development in the public and private sectors of the developing countries. The United States Government institutions principally involved are the Agency for International Development (AID) and the Export-Import Bank of Washington. The private financial institutions include a number of banking and finance corporations specially established for operations in foreign (though not necessarily or even primarily in developing) countries and a number of investment houses active in the international finance field and operating primarily through the United States and other international capital markets. United States corporations engaged in direct investment abroad through branches, subsidiaries and joint ventures, normally rely on their own capital resources and earnings for investment purposes. As in the case of other capital-supplying countries, reinvested earnings of these corporations constitute a major source of financing for their new investment or the expansion of their existing investment undertakings in the developing countries.

A. Public Financial Institutions

The Agency for International Development (AID)

85. The Agency for International Development (AID) is a bilateral aid agency which was set up within the

Department of State in November 1961 under the Foreign Assistance Act of 1961. From that date, the predecessor International Co-operation Administration and the Development Loan Fund were terminated and their functions transferred to AID, as was the Export-Import Bank's special loan programme, provided under the so-called "Cooley Amendment". The AID also administers United States financial support to the Alliance for Progress, which was established by the Charter of Punta del Este of 17 August 1961.

86. The financial assistance provided by AID consists of dollar development loans, development grants, special local currency loans and grants, payment of part of the cost of conducting surveys of investment opportunities, supporting assistance and aid in development research. The responsibilities of AID also include administration of the United States investment guaranty programme.⁴⁸ The Office of Development Finance and Private Enterprise established in AID assists the promotion of private investment activities in the developing countries. The total AID commitments in the fiscal year 1963 amounted to \$2,432 million as compared with a total of \$2,539 million in fiscal 1962.⁴⁹ In 1963, AID loans amounted to \$1,288 million of which Alliance for Progress loans accounted for \$532 million or about 40 per cent. Supporting assistance (including re-obligations of prior years' funds) accounted for \$431 million; development and Alliance for Progress grants, including grants under the Social Progress Trust Fund of the Inter-American Development Bank (including re-obligations of prior years' funds) accounted for \$357 million; and contributions to international organizations amounted to \$149 million.⁵⁰

The dollar development (section 201) loans

87. Section 201 (b) of the Foreign Assistance Act of 1961 authorized AID to make developmental loans repayable in United States dollars under the terms and conditions most likely to "promote the economic development of less developed friendly countries and areas, with emphasis upon assisting long-range plans and programmes designed to develop economic resources and increase productive capacities". The Agency extends development loans to foreign governments, American and foreign private firms, public, semi-public and private development banks and development finance corporations. Extension of loans to private firms, individuals or groups (the only ones with which the present report is concerned) requires the consent of the government of the country in which the borrower wishes to expand existing industries or to establish new ones. To be eligible the applicant for AID's dollar loans need not be a resident of the country in which the project is to be located. The applicant must, however, be able to show that he has no other sources of financing,

⁴⁸ As described in chapter VII.

⁴⁹ Agency for International Development, *Operations Report*, 1962. The total for 1962 excludes \$244 million commitments from Act of Bogota funds allocated to the Treasury Department for loans through the Inter-American Development Bank.

⁵⁰ *Ibid.*

⁴⁷ See documents E/3492, chapter I and E/3665/Rev. 1, chapter II.

private and other, available to him on reasonable terms before he can get AID dollar loans.⁵¹ Agency for International Development loans to private borrowers are usually made with the specification that both principal and interest are repayable in dollars. It could be arranged, however, to have the private borrower repay both the principal and interest to the national government concerned in local currency, and the latter in turn to pay AID dollars. The project for which the borrower is to be granted dollar loans must not compete (as provided by section 620 (d) of the Foreign Assistance Act of 1961, 22 U.S.C. section 2370 (d)) with United States business.⁵² Loans by AID to private borrowers bear 5.75 per cent interest rate and should generally be used to finance the dollar costs of the project. Procurement with the dollar loan must with a few exceptions be limited to goods and services originated in the United States.

88. Loans have become the major instrument of AID assistance and their share of the total is increasing. In the fiscal year 1964, it has been estimated that developmental loans will constitute 64 per cent to the total AID assistance as compared with 58 per cent in 1962 and 35 per cent in 1961.⁵³ In the fiscal year 1963, the development loan commitments administered by AID, including Alliance for Progress loans, totalled \$1,288.0 million of which \$780.0 million were absorbed by the Near East and South Asia, \$343.0 million by Latin America, \$98.0 million by Africa and \$67.0 million by the Far East.⁵⁴ Of the total new development loan project authorizations of \$756.0 million in fiscal 1963, industry and mining accounted for \$372.8 million; transportation, \$141.5 million; food and agriculture, \$83.2 million; health and sanitation, \$48.3 million and miscellaneous operations and others accounted for \$62.7 million.⁵⁵

Development grants

89. Development grants are made by AID pursuant to Section 211 of the Act for International Development of 1961 which authorizes the President "to furnish assistance on such terms and conditions as he may determine in order to promote the economic development of less-developed countries and areas, with emphasis upon assisting the development of human resources". The grants may also be used under certain conditions to finance the development of overhead projects in less-developed countries or to pay for the services of experts needed in drawing up economic plans, conducting resource surveys and appraising specific capital project possibilities. In the fiscal year 1963, AID's expenditures

⁵¹ These sources include the "Edge-Act Corporations" (see below), investment banks and private long-term lending financial institutions that engage in granting long-term dollar loans to foreign borrowers. Failing these, the Export-Import Bank of Washington, IFC, IBRD, IDB and also local Development Banks deriving investment funds from AID could be consulted.

⁵² There are exceptions to this requirement.

⁵³ *The Budget of the United States Government*, Fiscal Year ending 30 June 1965, p. 83.

⁵⁴ Agency for International Development, *Operations Report*, data as of 30 June 1963, pp. 4, 24 and 30.

⁵⁵ *Ibid.*, pp. 44 and 45.

on development grants including the programme for social progress totalled \$330.9 million as compared with \$227.9 million in the fiscal year 1962.⁵⁶

Local currency loans and grants

90. United States food assistance to developing countries is given basically through the sale of surplus agricultural commodities against local currencies. Section 104 (e), Title I of Public Law 480, the Agricultural Trade Development and Assistance Act of 1954, authorized the Export-Import Bank of Washington to use up to 25 per cent of these local currencies in making loans (called "Cooley loans" from the Cooley Amendment which inserted this authority in the original law) to United States private enterprises or their foreign affiliates, subsidiaries, or branches, to enable them to develop or expand their activities in foreign countries. Under section 104 (a), "Cooley loans" can be made to United States or local firms if by their activities they would contribute to the development of "new markets for United States agricultural commodities on a mutually benefiting basis". Under section 104 (e) and (g), grants and loans can be made to foreign governments for economic development purposes.

91. "Cooley loans" are extended by AID to businesses located in the countries where United States has sold surplus agricultural commodities. The borrower must use the currencies in financing the local costs of expanding his business such as buying plant and acquiring land. In Colombia, for example, where the United States had sold surplus food commodities for pesos, AID loaned pesos to a firm half owned by a United States company, which used the borrowed pesos to build low-cost homes. In India, a "Cooley loan" of \$2.5 million was made in 1962 to the Arbor Acres Farm, an affiliate of IBEC (International Basic Economy Corporation, a United States corporation) for the purpose of improving poultry production. Cooley loans may be used to meet most of the other kinds of normal cost of operating business including the training of personnel. The Agency may not make Cooley loans to firms intending to manufacture products to be exported to the United States, or for the local production of agricultural commodities to be sold in the local market in competition with agricultural commodities originating from the United States.

92. Interest rates charged by AID for its "Cooley loans" are usually comparable to the rates charged by local development banks, and maturities of these loans often depend on the nature and purpose of the business done by the borrower. Repayments must be made in the currency borrowed and maintenance of the value of the currency is not required. There may be cases where AID would require a government guaranty of loan repayment. Loans may be granted by AID according to priorities which it would normally set up in countries where there are limited Cooley funds to meet the demand. Up to 30 June 1963, financial assis-

⁵⁶ *Ibid.*, p. 46.

tance under section 104 (a), (e) and (g), Title I, of Public Law 480, amounted to \$3,746.5 million.⁵⁷

Investment surveys

93. The Agency for International Development may further promote the flow of United States investment to economically less-developed countries through sharing with United States private enterprise the cost of surveys undertaken to identify specific investment opportunities in those countries. Section 231 of the Foreign Assistance Act of 1961 authorizes AID to pay up to 50 per cent of the costs of approved investment surveys. The potential investor should repay AID the amount it contributed towards the investment survey after setting up the business. Should it fail to set up the business, the survey will become the property of the Government of the United States. The fact that AID is participating with a potential investor in an investment survey does not obligate AID to provide the potential investor with further financial assistance beyond the amount it undertook under the investment survey agreement. Only United States citizens and corporations, partnerships and other associations substantially owned by United States citizens are eligible to apply for AID participation in their investment surveys. Investment surveys must be likely to lead to actual investment and must be consistent with the development plans of the recipient countries.

Supporting assistance

94. Under Title V, section 401, supporting assistance is normally extended to countries in situations where United States national security and foreign policy considerations make it necessary "in order to support or promote economic or political stability" of the recipient country. Also, where meeting development criteria cannot be adequately assured to warrant assistance under any of the titles of the Foreign Assistance Act of 1961, supporting assistance may be extended. Some of this supporting assistance, however, may go to private enterprises. Thus, while in the fiscal year 1963, AID project supporting assistance amounted to about \$76 million, as compared to a total of \$94 million in

⁵⁷ Eighteenth Semi-Annual Report of the Activities Carried on Under Public Law 480, 83rd Congress, dated 21 August 1963, pp. 19-25.

The total consists of:

	<i>\$US million</i>
Section 104 (e) Cooley loans to private enterprise (only from 13 August 1957)	149.5
Section 104 (e) Grants to Governments (from the beginning of Programme to 30 July 1963)	1,700.0
Section 104 (a) Marketing Research Grants to Foreign Institutions (from the beginning of Programme to 30 July 1963)	977.3
Section 104 (a) Utilization Research Grants to Foreign Institutions (from the beginning of Programme to 30 July 1963)	9.7
Section 104 (g) Economic Development Loans (from 1 July 1962 to 31 December 1962)	910.0
TOTAL	3,746.5

1962, \$8 million was absorbed by industry and mining in 1963 as compared to \$4.4 million in the fiscal year 1962.⁵⁸

Development research

95. Development research assistance is provided for the purpose of undertaking intensive studies of problems encountered in economic planning and programmes of the developing countries. The aim is to find ways and means of securing the most efficient use of aid resources. The Agency for International Development would, however, like actual research to be carried on in private institutions and laboratories under grants and contracts rather than by the Government itself.

Other assistance by AID

96. The Office of Development Finance and Private Enterprise was established as a point of contact with private *entrepreneurs* desiring to invest in foreign countries. This Office co-operates closely with the United States Department of Commerce and meets with both business groups and individual *entrepreneurs* for the purpose of explaining the assistance AID can give them and to establish working relationship between them and AID missions in developing countries. As an example it may be noted that in April 1963, thirty executives of leading United States corporations accompanied by the Under-Secretary of Commerce, Mr. Franklin Roosevelt, Jr., attended a series of meetings in India to confer with Indian Government authorities regarding investment opportunities in India. The conference was arranged by the Business Council for International Understanding (a private United States Group) in co-operation with the Indian Investment Centre, New York, and supported by AID and the Department of Commerce.

97. The Agency maintains a punch-card catalogue of investment opportunities, which currently provides detailed information on some one thousand specific projects in more than eighty developing countries; interested investors can secure AID financing for up to 50 per cent of the costs of feasibility studies for these or other promising ventures.

*The Export-Import Bank of Washington*⁵⁹

98. The Export-Import Bank of Washington (Eximbank) shares with the Agency for International Development (AID) the administration of the United States aid programme to foreign countries. Eximbank is a government agency created by Executive Order on 2 February 1934 under the authority of the National Industrial Recovery Act to facilitate trade between the United States and foreign countries. Its degree of autonomy varied from time to time,⁶⁰ until 1945 when it became an independent Federal Government Agency

⁵⁸ Agency for International Development, *Operations Report*, 1962, pp. 23, 27 and 31; *ibid.*, 1963, p. 48 (see footnote (b) also).

⁵⁹ See also chapter VI for discussion of export credit systems.

⁶⁰ Eximbank was successively under the Federal Loan Administration, the Office of the Secretary of Commerce, the Office of Economic Welfare and the Foreign Economic Administration.

administered by a five-man board of Directors appointed by the President of the United States. The Board is at present assisted by a nine-member Advisory Committee composed of representatives of the different sectors of the national economy, namely industry, commerce, finance, agriculture and labour.

99. The Eximbank's authorized lending capacity was relatively modest (\$200 million) until September 1940 when it was raised to \$700 million. By the Export-Import Bank Act of 1945, the Eximbank's lending authority was increased to \$3,500 million. Subsequent increases in the Bank's lending authority occurred periodically up to 1958 when the lending authority was raised from \$5,000 to \$7,000 million. Eximbank's capital amounted to \$1,000 million subscribed by the United States Treasury and the Bank was authorized to issue for purchase by the Secretary of the Treasury notes and other obligations up to an additional \$6,000 million. This borrowing is carried out by means of securities issued under the Second Liberty Bond Act; the rate of interest on new borrowing is fixed every month by the Secretary of the Treasury on the basis of the average rate for seven-year United States bonds on the last day of the preceding month. According to Public Law 88-101 of 20 August 1963, the loans, guarantees and insurance which the Bank may have outstanding at any time must not exceed \$9,000 million. This law therefore extended the Export-Import Bank's lending authority by \$2,000 million from \$7,000 million.

100. Over the years, the range of Eximbank's activities has been extended and today it has three main functions: it grants long-term project loans to public and private foreign purchasers of United States goods and services for projects in developing countries; it provides medium-term export credit guarantees to commercial banks; it assists in providing export credit insurance in the short and medium-term fields. The Eximbank's loans must be in the national interests of the United States and are granted only where there is found to be "reasonable assurance of repayment". Such loans are designed "to supplement and encourage, and not compete with, private capital". In the follow-

ing table, the financing activities of the Eximbank have been set forth by functional categories:

101. Credits for development projects on essentially commercial terms have been the major item, usually accounting for about one-half of the total credits authorized. Individual credits range from a few thousand dollars to many millions (as high as \$100 million) and may involve a maturity of up to twenty-five years and even more. The amount of the loan is not to exceed the amount of financing required by the dollar import requirements of the projects. Projects likely to be financed are those considered as productive projects although the Bank has recently financed social overhead projects in Peru and Colombia. The borrowing country's capacity to service additional debts is an important factor in assessing the "reasonable assurance of repayment". The Bank in its evaluation of this capacity considers: (a) the ratio of debt service payments to foreign exchange income; (b) the expected foreign exchange earnings; (c) the over-all economic and financial situation; (d) the degree of political stability.

102. Negotiations concerning credits for development projects are conducted directly between Eximbank and the foreign borrower. The latter may be a foreign government or a foreign private firm with or without United States interest. Eximbank is not required to have the guarantee of the government or a bank of the country in which the private firm operates. The borrower is expected to provide part of the financing of the project and if he is a private borrower, usually about half of the cost, domestic and foreign. Interest rates are determined according to the cost of funds in the money market.

103. A comparison of "Exporter credits" (item 2 of table 5 below) with "Exporter guarantees" (item 3) and Export Insurance (FCIA) (item 4) indicates the declining importance of the Eximbank's export financing function and the increase of its guarantee and insurance activities. United States suppliers wishing to obtain medium-term export credit assistance may choose between two main types. The supplier can obtain an export

SOURCE: Export-Import Bank.

credit insurance from the Foreign Credit Insurance Association (FCIA), an association of over seventy private insurance companies and then seek financing from a commercial bank. Commercial risks are insured by the FCIA and the Eximbank in a fifty-fifty partnership while political risks are underwritten entirely by the Eximbank. Under a second type of arrangement, the supplier can seek non-recourse financing from his bank which in turn seeks a guarantee by Eximbank. Eximbank since October 1961 has provided guarantees to commercial banks for medium-term transactions financed on a non-recourse basis. These guarantees are available in the form of advance commitments and become effective when the financing institution purchases the foreign buyer's promissory notes from the United States exporter.

104. Commodity export credits are credits extended to foreign countries for purchases of United States agricultural products. These credits usually involve a maturity of twelve to fifteen months and were mostly granted to private textile mills in Japan for purchase of cotton.

B. Private financial institutions

Edge Act banking and finance corporations

105. The development of large-scale international operations on the part of United States banks dates back to the commencement of operations of the Federal Reserve System in 1914 which authorized and encouraged the member banks to establish branches abroad. In 1919 an amendment to the Federal Reserve Act, called the "Edge Act", provided for the organization of so-called Edge Act corporations⁶¹ for "the purpose of engaging in international or foreign banking or other international or foreign financial operations" either directly or through the agency, ownership or control of local institutions in foreign countries. Prior to September 1963, the Edge Act corporations were required to operate either as a "banking corporation"⁶² or as

⁶¹ Also called "agreement" corporations according to a 1916 enactment requiring authorization of the Federal Reserve Board through signing of an "Agreement".

⁶² The Edge Act Banking Corporations include :

The Bank of America (International), owned by the Bank of America National Trust and Savings Association, San Francisco, California;

The Bankers International Corporations, owned by the Bankers Trust Co., New York, New York;

The Chase Manhattan Overseas Banking Corporation, owned by the Chase Manhattan Bank, New York, New York;

The Chemical International Banking Corporation, owned by the Chemical Bank New York Trust Company, New York, New York;

The Continental Bank International, owned by the Continental Illinois, National Bank and Trust Company, Chicago, Illinois;

The First Bank of Boston International, owned by the First National Bank of Boston, Massachusetts;

The Manufacturers Hanover International Banking Corporation, owned by the Manufacturers Hanover Trust Company, New York, New York;

The Morgan Guaranty International Banking Corporation, owned by the Morgan Guaranty Trust Company, New York, New York;

The Western Bancorporation International Bank, owned by the Philadelphia National Bank, Philadelphia, Pennsylvania.

"financing corporation".⁶³ But according to recent changes in the governing regulations, the formal distinction between these types of corporations is considerably reduced. As of 31 March 1964, thirty-one Edge Act corporations were active in the international field, fourteen of which were originally established as banking corporations and seventeen as financing corporations.

106. While Edge Act corporations are active chiefly in developed countries, they have provided development capital to industrial and commercial borrowers in developing countries through equity participation or by extending loans. They have purchased the shares of a number of development banks and other public and private development finance companies in the developing countries engaged in productive activities. The equity investment of these corporations is seldom for the purpose of acquiring control and the main objective is to supply investment capital in the initial stage or for an important investment activity pursued by a promising enterprise. Loans and equity investment of these corporations cover a number of development fields but manufacturing is of special interest to them. Portfolio investment of Edge Act corporations is distributed over most regions, and about 40 per cent has been absorbed by the developing countries.

C. Capital market institutions

107. As shown in the following table, the United States purchase of new foreign capital issues from all countries has grown over the years, and has reached the level of \$1,294 million in 1963. In 1962, the International Bank for Reconstruction and Development floated issues totalling \$95 million and the Inter-American Bank \$75 million on the United States market. Also in 1963 and again in 1964, Mexico floated issues totalling \$65 million on the New York market.

⁶³ The Edge Act Financing Corporations include :

The Bamerical International Finance Corporation, owned by the Bank of America National Trust and Savings Association, San Francisco, California;

The Bankers International Financing Company, owned by the Bankers Trust Company, New York, New York;

The Boston Overseas Financial Corporation, owned by the First National Bank of Boston, Boston, Massachusetts;

The Chase International Investment Corporation, owned by the Chase Manhattan Bank of New York, New York;

The Chemical International Finance Ltd., owned by the Chemical Bank of New York Trust Company, New York, New York;

The Continental International Finance Corporation, owned by the Continental Illinois National Bank and Trust Company of Chicago, Illinois;

The First National City Overseas Investment Corporation, owned by the First National City Bank, New York, New York;

The First Pennsylvania Overseas Finance Corporation, owned by the First Pennsylvania Banking and Trust Company, Philadelphia, Pennsylvania;

The Manufacturers Hanover International Finance Corporation, owned by the Manufacturers Hanover Trust Company, New York, New York;

The Morgan Guaranty International Finance Corporation, owned by the Morgan Guaranty Trust Company, New York, New York;

The Philadelphia International Investment Corporation, owned by the Philadelphia National Bank, Philadelphia, Pennsylvania.

^a Preliminary figures.

108. The United States capital market can serve as a growing source of capital for the developing countries, especially as far as foreign bond issues are concerned. The United States capital market is characterized by a diverse and wide ownership and active trading. It is a broad and responsive market with an absorptive capacity higher than that of any other existing capital market. This is shown by the fact that the foreign obligations with maturities of more than one year floated in the United States and outstanding at the end of 1962 was \$920,000 million. The corresponding combined total for the six Common Market countries, Sweden and the United Kingdom account for \$300,000 million or less than one-third of the figure for the United States. While in Europe public and quasi-public institutions currently play a dominant role in mobilizing and allocating investment funds, in the United States these functions are performed primarily by private institutional investors.

109. In addition to drawing on domestic savings, underwriting syndicates can tap foreign markets for the benefit of the borrowers. The history of many successful floatations, local or foreign, in the New York market indicates clearly that foreign investors have been very active participants in that market. It is especially noteworthy that in some past years most of the foreign demand for loans floated in New York originate from the borrowing country.⁶⁴ The advantages of such "indirect" investment by foreign investors in bonds of their own country lie in the very fact of these being United States dollar bonds, in possible interest differentials, and last but not least in the anonymity which the borrower achieves through channelling his domestic investments through a foreign capital market.

110. The growing concern over the United States balance-of-payments deficits in recent years led to the proposal of an interest equalization tax as a measure to discourage recourse to the United States market by the developed countries. The exemption of transactions

with the developing countries from this tax can serve as an incentive for investment in these countries and also in securities issued by multilateral agencies for such purposes.⁶⁵

111. The flow of private capital from all the United States financial sources represents about two-thirds of the total international flow of foreign private capital and in 1961 reached a peak of \$4,150 million. This rate constituted an increase of around 30 per cent over the 1956-61 average and more than four times the 1950-55 annual average. The outflow in 1962 declined to \$3,273 million. The developing countries were the recipients of slightly over one-fourth of the United States private capital whereas financial assistance from official sources exceeded \$3,000 million in that year. Latin America absorbed the greater part of private capital outflows. In 1961 and 1962 investment in this region amounted to \$400 million each year (excluding Venezuela where a net reduction of \$250 million occurred owing to large net outflows from petroleum and other investments from that country). The bulk of these investments was made in manufacturing facilities in Argentina and to a lesser extent in Brazil. Only a small part was in the form of fresh capital flows. Investments in other developing countries amounted to about \$450 million in each of the above two years. Direct investment in manufacturing in these countries was nominal, while the bulk of such investment in oil was chiefly in the nature of a shift in its direction, especially to North Africa. The United States Census of Direct Foreign Investments undertaken in 1957 indicates that close to one-fifth of all recorded United States direct investments were of the joint-venture type. In 1957, 17 per cent of United States investors in developing countries were engaged in joint-ventures as compared with 11 per cent in 1950. Comparable figures for industrialized countries were 31 and 22 per cent for 1957 and 1950 respectively.⁶⁶

UNITED KINGDOM ⁶⁷

112. In the United Kingdom there is no single government-aid financing agency as comprehensive in scope as the Agency for International Development in the United States or the Caisse Centrale de Coopération Economique in France (see France below). There are, however, a number of governmental and semi-governmental institutions which channel financial assistance to developing countries. The Commonwealth Development Corporation and Commonwealth Development Finance Company are two institutions specially concerned with the provision of investment capital to these countries. These institutions supplement the financing functions traditionally provided by the British investment and banking institutions directly or through the London capital markets.

A. Public and semi-public financial institutions

Commonwealth assistance loans

113. In 1958, the Commonwealth Assistance Loans, made under Section 3, of the Export Credit Guarantees Act, 1949 (as amended) were introduced to aid the Commonwealth ⁶⁸ countries after they attained independence. These loans are, however, tied to the purchase of British goods, though not necessarily in connexion with particular projects. Normally they are long-term, usually for a 30-year period, with a grace period recently extended to from seven to ten years, though at a rate of interest equal to the rate at which the Government borrowed the money plus 1/4 of 1 per cent. In certain cases there may be a waiver of interest and service charges with repayment of capital deferred for the grace period.⁶⁹

⁶⁷ A comprehensive study on the institutions and methods concerned with the flow of investment capital and export credits from the United Kingdom to the Developing Countries of the Commonwealth and others is under preparation.

⁶⁸ Commonwealth countries attaining independence on or after 11 February 1948, i.e., the "new" Commonwealth countries and India and Pakistan are eligible for Commonwealth Assistance loans. India and Pakistan are, however, not eligible for investment by the Commonwealth Development Corporation according to the Amending Act of 1963.

The Export Credits Guarantee Department

114. The Export Credits Guarantee Department (ECGD) is a government department whose operations are conducted on business lines without direct government finance. It gives neither direct financial aid to exporters nor credit to importers. Its main function is to provide insurance both against the risk of financial loss involved in carrying on foreign trade and against risks not normally coverable from regular commercial insurers to exporters, or to banks that provide finance to exporters to enable them to supply foreign buyers with goods on credit.⁷⁰ The ECGD as a matter of policy adheres to the usual commercial rules applicable to regular insurance business. Six Export Guarantee Acts passed between 1949 and 1961 provide the legislative basis under which the ECGD operates. To accommodate the developing countries ECGD has developed a new type of insurance which is suitable for large and high cost development projects. The new system works like this. First, one of the four institutions (excluding the ECGD) that participate in the British export credit system grants a loan to a foreign importer to enable him to pay cash to his British exporter. Then without recourse to the British exporter, financial guarantee is given. Actually what this means is that the British bank or other credit institution involved has, as in any other creditor-borrower operation, given a loan to the foreign importer, the guarantor of repayment being the ECGD. This type of long-term export credit insurance has so far been granted in ten cases. As seen in the following table the volume of export insurance has steadily increased since 1957 and in 1962 about 23 per cent of United Kingdom exports were thus insured.

115. The ECGD normally underwrites two types of credits — namely medium-term credits of up to five years carried under Section 1 of the main Act and long-term credits (granted under Section 2 of the main Act). The first type is by far the largest, though in recent years the second type has increased substantially since the end of 1960 (as table 7 indicates) as a result of the fact that a number of other governments have extended export credit insurance guarantees to their exporters beyond five years.

⁷⁰ See also chapter VI.

SOURCE: Data provided by the United Kingdom Government.

The Commonwealth Development Corporation — formerly known as the Colonial Development Corporation

116. In 1948, the United Kingdom Government established the wholly government-owned corporation known as the Colonial Development Corporation. This corporation was renamed the Commonwealth Development Corporation in 1963 when the Commonwealth Development Act was passed. Under the 1963 Act, the CDC was authorized to serve as a channel for providing financing on a long-term basis to public and private business ventures in the independent economically under-developed Commonwealth countries which had achieved independence since CDC was established in 1948 (i.e., excepting India and Pakistan) as well as the still dependent territories under United Kingdom administration.

117. The Corporation performs the functions of formulating and implementing projects that entail commercial risk in these countries. It may do this alone or in partnership with foreign government enterprises, mixed enterprises or private businesses. It may sell its interest in a joint venture to private investors, once the project it sponsored becomes a going concern. The CDC invests in development projects either through loans, equity investments or a combination of both. As an investment bank, which is what it is in effect, it is run strictly on commercial terms, and also it must earn its current operating expenses.

118. The CDC derives its finance mainly from the United Kingdom Exchequer, from which it can borrow on medium and long terms up to £150 million and short-term funds up to £10 million. Loans up to £130 million may be outstanding at any one time from the United Kingdom Exchequer. In addition, CDC has the authorization to borrow up to £20 million from private sources.

119. The rate of interest it charges on its loans is linked with the rate it pays to the United Kingdom Exchequer from which it draws almost all its resources. The Exchequer's charge is in turn also linked to the rate which the Government has to pay on the London capital market.

120. The outstanding liabilities of CDC at the end of 1962 were £83 million and these mainly consisted of long or medium-term advances. Only a small portion of this was borrowed from non-governmental sources during the year. During the past few years however, due to the fact that CDC has been having increasing surpluses and a rising rate of loan repayments, it now finances a rising portion of its new investments from its own resources. Also, it has succeeded in selling off some of its investments and, from the proceeds, it now makes new investments.

121. The CDC invests in enterprises it wholly owns such as the Dominica Electricity Services in the West Indies and the Kulai Oil Palm Estate Ltd., Malaysia. It also invests in enterprises it jointly owns with government corporations (e.g. Borneo Development Corporation Ltd.) or those it owns jointly with private enterprises such as Jamaica Pottery Ltd., and Caribeach

Ltd. in the Bahamas. Also CDC invests in enterprises such as Kilomber Sugar Co. Ltd., in Tanganyika, the shareholders of which are NOFC (a Netherlands financial institution) UKCM (a Netherlands financial institution which acts as managing agent for the enterprise) the Standard Bank, the International Finance Corporation and Tanganyika residents. Two other examples are: the Nigerian Housing Development Society Ltd., a housing finance institution which CDC, the Federal Nigerian Government, the Eastern Nigeria Government, Small Savings Organizations and Nigerian residents helped to finance; and the Nigerian Cement Co. Ltd., controlled by the Eastern Nigerian Government, which was financed by the following shareholders: CDC, the Nigerian Federal Government, the Tunnel Portland Cement Company which manages the enterprise, F.L. Smith and Co. Ltd., and 2,000 individual stockholders, most of them Nigerians.

122. At 31 December 1962, CDC had outstanding capital commitments of over £117 million. Of this total, £15.8 million was invested in industries in the Caribbean; £20.6 million in the Far East; £23.6 million in East Africa; £22.6 million in Central Africa; £21.3 million in the High Commission Territories of Basutoland, Bechuanaland Protectorate and Swaziland, and £13.3 million in West Africa.

123. About 50 per cent of CDC's funds have been invested in plantations and small farming, factories and building societies, with the rest distributed among public utilities, especially electricity generation and distribution, mining, hotel business and other enterprises.

*Commonwealth Development Finance Company Ltd.
(CDFC)*

124. The Commonwealth Development Finance Company Ltd. was established on 25 March 1953 with a capital of £15 million of which £4.2 million was paid up. The equity was divided into two classes of shares, one class of shares held by commercial companies and the other subscribed by the Bank of England. In 1962, the total authorized capital was increased to £30 million of which £7.3 million was paid up. The CDFC's investment activities are co-ordinated closely with private investors and it serves as a catalyst in promoting the flow of private capital to Commonwealth countries. On 15 November 1963, CDFC arranged for £7.5 million of 5 1/2 per cent debenture stock 1983-1986 to be issued for public subscription, the price being £96 per £100 nominal. The CDFC has no direct projects of its own; it does not, except in special cases, provide finance for social facilities or public utilities or for development projects controlled by governments. While it provides access to a wide range of advisory services, it is not itself equipped to provide management on any scale although it has, in practice, sometimes had the task thrust upon it.

125. The finance of CDFC is normally available for a project which satisfies the following conditions: (a) private enterprise conducts the project; (b) the project will make a timely contribution to economic develop-

ment in the country concerned; (c) the project will be commercially viable; (d) expert management will be available to run the project; (e) the sponsors of the project will themselves provide a reasonable proportion of the finance; (f) the project will be assured of continued association with the sponsors and management; (g) the borrower can be shown to have raised as much of the necessary finance as it is practicable through the normal channels.

126. Investments by CDFC take a number of forms. While it has subscribed directly for shares, it has also invested in medium or long-term loans, frequently combined with conversion rights, option warrants or other rights to acquire equity. The CDFC also requires security or the right to call for security for the full amount of its loans in the tradition of strict commercial banking. Interest rates are geared to the rates which CDFC itself has to pay in London plus the margin for CDFC's tax liability. Its loans have in effect carried interest at 7 to 8 per cent. The CDFC has also subscribed directly for shares and considers proposals for underwriting or other forms of financial assistance. Fixed interest loans are normally made in sterling, but CDFC's money (like CDC's money) is not tied to spending on British goods. CDFC now prefers individual investments of the £250,000—£500,000 range so as to permit itself to spread its development assistance more effectively over a range of industries.

127. Like CDC, CDFC operates in association with other development bodies including CDC itself—these two institutions have joined in promoting local development corporations in the Commonwealth countries themselves. The CDFC also works with the World Bank (IBRD) with which it has joined in such projects as Sui Gas Transmission in Pakistan, the Kariba Power in the former Central African Federation, electricity in Malaysia and the financing of the development finance corporations of India, Pakistan and Ceylon. Its other ventures include a loan stock subscription to a private rubber plantation in Eastern Nigeria; a direct investment in the expansion of a major jute mill in Pakistan. The Company has also subscribed to part of a Mortgage Debenture Stock issue of Jamaica Electric Utility Company.

128. An example of the breadth of CDFC's interests in the development fields in one country is provided by the case of India. Direct investments and commitments in that country by CDFC include the manufacture of aluminium and its products, fertilizers, intermediates and fast colour bases for dyestuffs, electric cables, electricity service meters, industrial gases, paper, plastics, steel and non-ferrous tubes, high-tensile wire rod, railway rolling stock and general mechanical engineering products. In addition, as mentioned, it has contributed to the capital resources of the Industrial Credit and Investment Corporation of India Ltd. (ICICI) through which in turn it provides financing for a broad range of ventures. Investments and total commitments by CDFC of over £25 million have been spread over forty-six projects and fourteen countries in the Commonwealth.

129. In the financial year ended 31 March 1963, the tenth year of its operation, the CDFC had its most active year (more active than the financial year 1961) so far, having accepted ten new commitments involving an investment of nearly £3.5 million, while negotiations nearing completion extend to seven more projects, involving a further investment of about £2 million. The seventeen projects are spread over eight Commonwealth countries.⁷¹ The above compares with the financial year ended 31 March 1962 when CDFC undertook new commitments totalling somewhat over £2 million in eight projects, compared with new commitments totalling £3.7 million in nine projects in a former peak financial year 1961. In the financial year ended 31 March 1964, CDFC accepted thirteen new commitments totalling £3.7 million in ten new projects, spread over eight different countries. This brought outstanding CDFC's commitments to £28 million.

B. *Private financial institutions*

Barclays Overseas Development Corporation (BODC)

130. The Corporation is a wholly-owned subsidiary of Barclays Dominion, Colonial and Overseas (DCO) (which in turn is a partly-owned subsidiary of Barclays Bank) founded after World War II to provide finance for constructive investment outlays to enterprises that lack a regular source of financing such investment. The loans must involve "a measure of development". Construction of a new factory or commercial building will be eligible but not purchase of existing property. Barclays DCO has put up £6 million of ordinary capital for BODC which has in addition raised £1 million in unsecured loan stock on the market. Barclays Overseas Development Corporation has been able, since it was formed, to put out £28 million in the form of medium-term finance to businesses in countries overseas.⁷² As of the end of September 1962, it had made 382 commitments.

131. The Corporation prefers to lend in amounts of between £5,000 and £25,000 with a maximum of £100,000, though it has gone into bigger projects such as afforestation in Swaziland together with Baring Brothers, London merchant bankers. It has gone into hotel development in the West Indies with the then Colonial Development Corporation. Barclays Overseas Development Corporation's activities are spread over industry, commerce, building developments, public works, agriculture and forestry and other areas including co-operatives and educational groups. Some of its commitments are for periods over 15 years, but most are in the "five years and under" and "over five years up to ten years" ranges. It has also made some equity investment.

National and Grindlays Finance and Development Corporation

132. The National and Grindlays Finance and Development Corporation is a subsidiary of National and

⁷¹ Commonwealth Development Finance Company Ltd., *Tenth Annual Report and Accounts Year Ended, 31 March 1963*.

⁷² These include countries in East, West and Central Africa, the West Indies and the Mediterranean.

Grindlays Bank, which operates in East Africa, the Persian Gulf and the Indo-Pakistan Sub-continent. The Corporation, which grew out of the bank's function as banker to the territorial governments of Aden, Kenya, Uganda, Zanzibar and other territories, was set up soon after World War II. Its operations are on rather a modest scale with loans outstanding of around £2 million. Finance is provided mainly for building extensions to factories, construction of offices, shops and even clubs. The Corporation works in conjunction with local authorities and co-operates in some projects with the Commonwealth Development Corporation.

The CBI Development Corporation

133. The CBI Development Corporation is a wholly-owned subsidiary of the Chartered Bank (formerly called the Bank of India, Australia and China) which operates mainly in the Far East. It has no separate staff and operates with a paid-up capital of only £500,000. Its loans are normally for between three and ten years; fixed interest loans are made in sterling and there is also provision for equity allocations or equity options.

The Standard Bank Finance and Development Corporation

134. This is a subsidiary of the Standard Bank (a London Bank) and has concentrated so far on East Africa. It has given assistance towards agricultural development, the building and equipping of factories for processing primary products and conducting other business. As a general rule, an adequate proportion of "risk" capital is found by the borrower, but the Corporation has power to subscribe to or underwrite equity issues.

C. Capital market institutions: new capital issues by non-residents — Capital Issues Committee (CIC) and the Bank of England

135. The Capital Issues Committee, an official committee advising the Treasury, controls new issues and their placing on the London market by overseas borrowers. The Capital Issues Committee has taken into consideration the state of United Kingdom balance of payments and the needs of domestic industry before granting access to the London market.

136. The Bank of England seeks to accommodate issues in London by public bodies, domestic as well as Commonwealth, by marshalling their access to the London market in accordance with its strength (which at times in the recent past has been limited). A special consideration is normally given to those issues needed to re-finance maturing loans. Amounts over £50,000 can only be borrowed with the consent of the Capital Issues Committee. Such consent is, however, no longer required of British registered companies, except for amounts earmarked for use abroad, especially as it is recognized that many parent companies act as an important channel for the flow of United Kingdom private direct investment to Commonwealth countries.

Table 8. Loans issued on the London Market by Commonwealth public bodies: net new issues

Year	Amounts (£ million)	Year	Amounts (£ million)
1951	29.8	1959	13.6
1952	33.4	1960	15.2
1953	40.9	1961	19.7
1954	35.1	1962	10.9
1955	17.5	1963	39.5
1956	13.8		
1957	13.0		
1958	48.7		331.1

SOURCE: Midland Bank, United Kingdom.

137. The CIC applies the same principles of scrutiny as the Bank of England applies to applications for issues by Commonwealth bodies. It takes account of the United Kingdom's undertakings to provide finance for the needs of the overseas Commonwealth; it is instructed to give particular favour to projects which appear likely to contribute materially to the improvement of the sterling area's balance of payments with the non-sterling world.

138. The emphasis of CIC has been on issues destined for overseas banks and primary production-mines and plantations. As shown in table 8, total net new issues aggregated £331.1 million in the period 1951 to 1962, or an average of just over £24 million a year. These figures would be lower after deduction of redemptions. It may be noted that the figures in the first four years of the period, 1951-1954, were consistently above this average, while those of 1959-1962, were all below it. This and the thinning out of the list of borrowing Governments reflects in large part the changes in the market appeal of the under-developed areas of the Commonwealth, at least at the interest charge they might be prepared to accept (see table 9). It is not likely that issues with lower yields could be successfully offered in New York or in the newly opening-up continental financial centres, even though their basic interest rates (if not necessarily their issuing costs) are below those of the London market.

139. There are other less formal ways of raising capital in London without an open market issue. The most important of these are the arrangements between the merchant banks to organize finance for long-term export credits. These are chiefly: Hambros Bank Limited; Baring Brothers and Co., Limited; N.M. Rothschild and Sons; Lazard Frères et Cie; S. G. Warburg and Co. Limited; Kleinwort, Benson, Limited; Samuel Montagu and Co. Limited; Brown, Shipley and Co. Limited and others. These investment houses organize consortia consisting of other interested merchant banks and the big deposit banks and insurance companies. A major such operation was the provision of £11 1/2 million over some eight years for the Dungapur steel project in India, for which Lazard brought in Lloyds, Barclays, Martins, the District and Glyn Mills. This private money was

Note: Those yields undoubtedly underestimate the yields at which a new issue would have to be placed, for dealings in these issues are now very small and the market is narrow.

additional to the funds made available directly by the United Kingdom Government.

140. The big British insurance companies which are among the most important backers of new issues on the London capital market also play an important part in providing capital in the overseas countries in which they operate, especially reinvesting (as a matter of policy or of local statutory requirement) at least part of their premiums in the countries in which they have collected them.

141. The flow of private capital from the United Kingdom was severely curtailed in the post World War II years on account of the pressing need for the maintenance of adequate sterling reserves. However, since 1953, the outflow of private capital to the developing countries followed an upward trend and for the 1956-1957 period it averaged about \$200 million a year. The volume of private investment to developing countries continued to increase and, in 1960, it amounted to \$350 million. In 1961, it declined to \$240 million and in 1962 the net United Kingdom private investment was reduced considerably owing to disinvestments in the oil industry. Official financial assistance, however, remained at about \$400 million in recent years. The volume of guaranteed private export credit increased to \$42 million mostly for maturities between 1 and 5 years.

FRANCE ⁷³

142. French development capital and credits have been made available to the developing countries through a number of public, semi-public and private financial institutions. The funds which have flowed through these channels for financing private investment projects have supplemented the French direct investment including an increasing number of joint ventures in Africa and other developing regions. Government financial assistance to developing countries is provided by the Caisse Centrale de Coopération Economique (CCCE), while financial institutions such as investment banks and export credit agencies provide the bulk of development financing derived from private sources.

⁷³ A comprehensive study on the institutions and methods concerned with the flow of investment capital and export credits from France to the developing countries of the French Area and others is under preparation.

A. Public Financial Institutions

Caisse Centrale de Coopération Economique (CCCE)

143. Since its reorganization in 1958, CCCE has assumed increasing responsibilities in the financing of development in the developing countries. This agency currently performs two basic functions. As an administrative instrument of the Government, it is charged with the execution of the French bilateral aid programmes. As an autonomous financial agency, it enters into development financing activities on its own behalf. In the former capacity, CCCE operates within the framework of the Special Funds established under the French aid system for specific countries or groups of countries or for specific fields of activities.

144. These funds include the Fonds d'aide et de coopération (FAC), established in 1959 to provide financial aid as well as cultural, social and technical assistance to the newly independent countries of French expression in Africa south of the Sahara and to Madagascar; the Fonds d'investissement pour le développement économique et social des territoires d'Outre-Mer (FIDES), extending financial aid to the African territories which remained French after 1959; and the Fonds d'investissement des départements d'Outre-Mer (FIDOM), financing development projects in the overseas departments of France. The CCCE also administers two *Fonds* operating in the territories and departments for specific economic purposes, namely the Fonds national de régularisation des cours des produits d'outre-mer (for price stabilization of overseas commodities) and the Fonds de soutien de textiles d'outre-mer (for support of overseas textiles).

145. The *Fonds* are financed through budgetary appropriations and distribute their resources almost exclusively in the form of grants. Up to December 1962, CCCE's financial operations on account of FAC, FIDES, and FIDOM activities, amounted to 9,000 million French francs. These operations included in a number of cases the entire capitalization of state-owned or state-controlled public companies. In these instances, CCCE administers the company by appointing the board of directors and also provides the needed technical assistance services.

146. In the performance of further responsibilities entrusted to it by the Government, CCCE, in joint

operations with the Compagnie Française d'Assurance pour le commerce extérieur, administers export credit guarantees for the exportation of machinery and equipment as discussed in chapter VI.

147. Up to 1962, the financial operations of CCCE as an autonomous agency accounted for approximately 3,000 million francs, as against the 9,000 million francs of grants extended by the *caisse* on behalf of the Government. The CCCE provided a total of 1,140 million francs to 349 private enterprises operating in the field of agriculture, forestry, mining, industry and tourism. The majority of these enterprises (265) were located in Africa and Madagascar and the remainder mainly in the French Overseas Departments. About 70 per cent of CCCE's financial assistance was provided in the form of long-term loans, about 25 per cent in medium-term loans and only a small proportion (25 million francs) through equity financing. Interest charges on these loans averaged 5.5 per cent.⁷⁴

148. As a general rule, CCCE provides 50 per cent of the sum required by private enterprises for the implementation of development projects. But CCCE's contribution has considerably increased in recent years in order to facilitate projects of particular economic interest. The extent of financial assistance provided in these cases is based on the capital structure of the recipient enterprise and its earning and loan repayment capacity. The extra funds required to carry out CCCE's new commitments are supplied through a mechanism of *jumelage*, according to which the long-term loans extended by the Caisse Centrale are combined with medium-term credits granted by investment banks, chiefly the Compagnie Française d'Assurance du commerce extérieur, and rediscounted at the Central Bank. The combined loans by CCCE to the private sector have served the financing of small and medium-size companies and occasionally large-scale enterprises. Out of 349 enterprises financed by CCCE, nine constituted large-scale projects such as the exploitation of iron ore deposits at Fort Gouraud in Mauritania (which required the establishment of a 650 km railway) and the exploitation of manganese deposits in Franceville, Gabon, the establishment of an aluminium company at Edea, Cameroon, and the construction of an oil refinery at Dakar. These enterprises absorbed around 50 per cent (531 million francs) of all CCCE's loans to the private sector.

B. Private and semi-public financial institutions

The Banque Française du Commerce Extérieur (BFCE)

149. French capital for financing industries abroad, particularly those outside the franc area is available mostly in the form of export credits⁷⁵ The BFCE, which started operations on 1 October 1947, shared with the Crédit National the principal role in the French export credit system. The major part of its assistance to French exporters is granted in the form of guarantees (*aval*)

on export bills. It also encourages exports by means of acceptances, discounts and the provision of short and medium-term credit. Prefinancing facilities are made available, in the form of a revolving credit line with maturities not exceeding twelve months for regular export contracts, and in the form of special credits with a maximum two-year maturity for large-scale capital projects costing at least 3 million French francs.

150. The capital of BFCE has increased from an initial 5 million French francs to its present amount of 15 million francs subscribed by the Banque de France (25 per cent), the Caisse des Dépôts et Consignations (25 per cent), the Crédit National (16 per cent), the Caisse Nationale de Crédit Agricole (10 per cent), the Crédit Lyonnais (6 per cent), the Société Générale (6 per cent), the Banque Nationale pour le Commerce et l'Industrie (6 per cent), and the Comptoir National d'Escompte de Paris (6 per cent).

The Crédit National

151. The creation of the Crédit National dates back to 1919 and its original name was "Le Crédit National pour faciliter la réparation des dommages causés par la guerre". As the name indicates, the Crédit National was to finance the reconstruction of war damages and assist enterprises which, owing to their limited size, did not have access to the capital market. According to a subsequent amendment to its charter, the Crédit National is permitted to refinance medium and long-term loans for its own account or on behalf of the State. The Crédit National was founded by important private French banks and industrial concerns and all its capital was subscribed by them. However, owing to the special functions that it performs and the role and operations assigned to it by the Government, it has acquired a semi-public character. The resources available to this institution, other than its own capital and reserves, include funds raised by public issues guaranteed in many cases by the State. The Crédit National is active in financing of export credits and performs a significant portion of rediscounting operations for export bills in France.

Investment banks — (banques d'affaires)

152. There are approximately forty French *banques d'affaires* (investment banks) which may take the forms of limited liability companies, private companies or partnerships, and are defined by law as institutions designed to promote the formation of new ventures or the expansion of existing ones. They usually perform this function by organizing consortia to underwrite and distribute new issues of securities and sometimes by acquiring shares with the intention of reselling them to investors at a later date. No time-limit is imposed on the credits they grant to the enterprise in whose capitalization they participate. The *banques d'affaires* supplement their own funds (capital and reserves) with funds raised on the capital markets, deposits received on individual or business accounts. In export financing, these institutions may discount export bills in the case of deposit banks and they play an active part in the formation of consortia for providing export credits

⁷⁴ Dunod, *Les banques de développement dans le monde*, Paris, 1964.

⁷⁵ See also chapter VI.

for large-scale projects. They also assist foreign purchasers and French suppliers in negotiating export contracts and related settlement arrangements. These banks have been credited with the successful conclusion of important contracts for the export of French capital goods and equipment to developing countries.

153. Among the important investment banks in France we may cite the Banque de Paris et des Pays-Bas, the Banque de l'Indochine, the Banque de l'Union Parisienne, the Union Européenne Industrielle et Financière (Schneider Group), the Union des Mines and among the partnerships Worms et Cie, Lazard Frères et Cie and De Rothschild Frères.

C. Capital market institutions

154. On the French capital market no bond issues by countries outside the franc area have taken place since the end of the war. Borrowing on that market by members of the franc area is not subject to restrictions other than those applying to metropolitan residents. Issues by companies operating in the overseas countries of the franc area (other than oil companies) are relatively small and amounted to 140 million French francs in 1957, 25 million francs in 1958, 20 million francs in 1959 and nil in 1960. In April 1962, measures were adopted which restored free and complete interchange between French and foreign stock markets for both French and foreign securities. Under a general authorization of the Direction des Finances Extérieures of the Ministry of Finance, residents may buy and sell foreign securities, including French securities quoted on foreign markets, provided that the securities are listed on a recognized stock exchange and the transaction is carried out through the intermediary of an authorized French institution.

155. Currency needed to buy foreign securities is freely available at the official rates. Foreign exchange obtained from the sale of foreign or French securities must be reinvested or repatriated within three months of its acquisition.

156. As a result of the upwards shift in the demand of raw materials by industrial countries and the increased interest demonstrated by these countries in establishing commercial links with some of the African nations of the franc zone, there has been a significant increase in joint ventures, especially for the implementation of mining and industrial projects. In the majority of the cases, the capital of the company is controlled by French interest, as in Mauritania, where the 375 million francs capital of the Mines de Fer de Mauritanie is controlled (51 per cent) by a pool of French financial interests and the remainder of the stocks is held by a Canadian company (Frobisher Ltd.) and a British importer of mineral ore the British Iron and Steel Corporation (B.I.S.C.); or in the case of the Compagnie Minière de l'Ogooue established in 1952 for the exploitation and transportation of manganese ore, by a French controlling group (51 per cent) and an American metallurgical company (United States Steel). Sometimes the joint venture does not have a controlling party, as in the case of the Société Civile des Bauxites de Guyane, formed in 1956 with a

90 million francs capitalization subscribed by the Caisse Centrale, French aluminium producers and two American mining enterprises.

157. The interest in joint venture operations between French and foreign capital in the franc zone may increase considerably in the future in view of the increasing exports of raw materials from this zone. It has been estimated that more than one-half of the iron production of Fort Gouraud will be exported, especially to Great Britain, a considerable part of the bauxite produced in Guinea will be conveyed to Canadian mills, more than four-fifths of the alumina produced in Guinea will be sold to Canadian, British and American enterprises and the aluminium production of Guinea will find its markets in Canada, Germany, Italy, Switzerland and the United States.

158. In recent years, efforts have also been made to form joint companies between French and African capital. But experience in this field is too recent and the cases still few in number.

159. The net outflow of private investment from France to the developing countries (mostly African countries of the franc area) accounted for slightly over 20 per cent (\$268 million) of total official and private flow from that country (\$1,148 million) in 1962. Direct investments constituted the bulk (over 80 per cent) of total volume of private capital flows. The net outflow of private capital in 1962 was considerably below the 1961 level (\$319 million) and that of previous years. Portfolio investment which was negligible before 1960 accounted in 1960, 1961 and 1962 for \$9 million, \$5 million and \$11 million respectively. Guaranteed private medium and long-term export credits are increasing at a rapid rate, reaching \$150 million in 1961, the last year for which data are available.

FEDERAL REPUBLIC OF GERMANY ⁷⁶

160. A major part of the aid provided under the German bilateral programmes to the developing countries and also of the private capital flow to these countries consist of credit extended for the purchase of equipment, machinery and other capital goods. The institutions handling export credit financing include the Kreditanstalt für Wiederaufbau (KW) (Reconstruction Loan Corporation), which is a government corporation, and the Ausfuhrkredit-AG (AKA), which is financed by a number of private and public financial institutions. German financial institutions and investment firms are active in international consortia and joint ventures. As indicated in chapter III, the Federal Republic of Germany is an important holder of IBRD bonds and notes issued in the German or in other capital markets.

A. Public and semi-public financial institutions

161. The Kreditanstalt für Wiederaufbau (KW) (Reconstruction Loan Corporation), is to-day the govern-

⁷⁶ A comprehensive study on the institutions and methods concerned with the flow of investment capital and export credits from the Federal Republic of Germany to the developing countries is under preparation.

ment's principal channel for development aid. Many functions performed by this institution are similar to those carried out by the Export-Import Bank of Washington and the French Caisse Centrale de Coopération Economique. KW is a government corporation which was originally created by a law of 5 November 1948 for the purpose of providing financial assistance for post-war reconstruction. In 1961, its capital was increased from DM 1 million to DM 1,000 million (of which 15 per cent is paid up), the Federal Republic subscribing to the extent of 80 per cent and the state governments contributing 20 per cent. Successive modifications of its statutes have enlarged KW's activities, which according to the latest amendment 18 October 1961, are as follows:⁷⁷

- (1) "Granting loans, in so far as other credit institutions are unable to raise the necessary funds, for the reconstruction or assistance of the German economy;"
- (2) "Granting loans in connexion with export transactions of enterprises in the Federal Republic;"
- (3) "Undertaking guarantees within the framework of sub-paragraphs 1 and 2 above."

The Corporation is also entrusted with the function of granting loans for financing of development projects in foreign countries or for funding foreign debtors' liabilities to creditors in the Federal Republic. The Kreditanstalt is authorized to purchase and sell claims and securities but does not accept deposits and is not permitted to conduct current account business or to deal in securities on the account of others.

162. Originally, KW was the major source of medium-term export credits but in 1952 the government decided to increase the role of the banking system in this field, which led to the creation of the AKA. As the export credit side of KW's activities decreased, KW moved to the long-term financing field and assumed a leading role within the framework of the government's programme of development aid. The Kreditanstalt currently administers the Federal Republic's aid to developing countries under the guidance of the Inter-ministerial Committee on Development Policy which deals with basic policy issues and also decides on projects of special importance to the government bilateral programmes.

163. In 1962, total sources of funds available to KW totalled DM 2559.8 million, of which 63.1 per cent, or DM 1614.6 million, was accounted for by government funds and the remainder (DM 945.2 million) was derived from KW funds. This can be compared with a total of DM 2496.3 million in 1961, consisting of DM 1389.4 million or 55.7 per cent public funds and DM 1106.9 million or 44.3 per cent KW funds. In 1962, funds from the Federal Government and the Länder made available to KW of the amount of DM 1614.6 million were financed partly through budget appropriations and partly through the allocation of about DM 1200 million from the proceeds of a DM 1500 million, 5 per cent development aid bond issue of the Federal

Republic of Germany subscribed by German private investors.⁷⁸ In addition to resources derived from repayments on previous lendings and increase in its reserves, KW funds included DM 279.1 million derived from bonds issued in the German market.

164. In 1962, KW used a total of DM 2559.8 million for (a) investment loans and other transactions totalling DM 576.5 million to domestic industries (as compared to DM 789.0 million out of a total of DM 2496.3 million in 1961; (b) for capital aid and export financing to German exporters and foreign purchasers totalling DM 1983.3 million (as compared to DM 1707.3 million out of a total of DM 2496.3 million in 1961).⁷⁹

165. Over the years, KW's development finance operations have covered a wide range of projects. In 1959, a DM 62 million loan was accorded to the Government of India for the Rourkela Iron and Steel Works. Several loans were granted within the framework of general credit lines for development projects (e.g., a development loan of DM 25 million to the Sudan which was not tied to German exports), and other loans were made for the payment of past or future debts to German exporters, (e.g., DM 168 million to India, DM 12.8 million to Liberia, DM 50 million to Chile). Of special interest may be the credit of DM 67.2 million (\$17 million) to Argentina which was granted by German private banks which were represented by KW. This credit represented the German banks' contribution to the \$75 million contributed by 52 European banks to the International Currency Stabilization Loan to Argentina to which the International Monetary Fund contributed a further \$100 million and a group of United States private banks \$75 million.⁸⁰

166. The 1960 loans of KW included a loan of DM 66.7 million to the Nacional Financiera S.A. of Mexico for the construction of a power station; a DM 55.2 million to the Pakistan Water and Power Development Authority for the enlargement of the Multan power station; a DM 14.6 million to Chile for the construction of a cellulose and paper factory; and DM 11.2 million to a Greek sugar factory and DM 7.2 million to a Spanish steel mill. These credits run for an average of ten years and bear interest from 5 3/4 to 7 per cent. The KW also subscribed \$60 million in bonds as the German share in the international consortium for the financing of a \$200 million iron ore mining venture in Liberia. Although this loan was not expressly tied to German exports, it is being used in part for that purpose. The following table includes information on KW's lending operations according to major types of activities during 1959, 1960 and 1961.

The Ausfuhrkredit-AG (AKA)

167. The AKA, which started operations on 1 April 1952, was established for the purpose of discounting

of the Kreditanstalt für Wiederaufbau

(Millions of DM)

Nature of the credits	1959	1960	1961
Domestic investment	1,555	1,005	750
German exporters	140	110	105
Investment abroad	640	775	1,605
Other purposes	325	195	40

SOURCE: Compiled from annual reports of the Kreditanstalt.

export bills, by a consortium composed by the "Big Three" private banks (Deutsche Bank, Dresdner Bank and Commerzbank), nine other private banks and eleven regional, state and local government banks. In addition to its capital of DM 20 million, the AKA's resources include a DM 1 billion A-line credit from the consortium of members, and a DM 300 million B-line credit, which is a rediscount ceiling with the German Bundesbank.

168. The AKA grants export credits on conditions which vary depending on whether the funds are to be provided from the resources of the member banks of the consortium or the fund provided by the Bundesbank. Under the A-line and B-line credits, exporters are required to put up 15 to 20 per cent and 40 per cent of the credits respectively. For the A-line credits, AKA charges interest rates that are normally 3.5 per cent above the discount rate charged by the Deutsche Bundesbank. For B-line credits, the rate of interest is usually 1.5 per cent above the central bank's discount rate. Maturities range between 4 to 8 years, and AKA normally decides which line of credit it would make available to the exporter. B-line credits are primarily for exports to developing countries. Although interest rate on the A-line credits is higher, this type of credit seems to be more attractive to exporters because of its lower participation requirements. The following tables provide information on the volume of AKA credits and their geographic distribution.

Table 11. Ausfuhrkredit-AG export credits
compared with total value of orders placed and
the total value of exports — 1952-1963

(In millions of DM)

Year	Total AKA export credits (all types)	Total value of orders placed	Total value of exports
1952	659	1,402	17,008
1953	453	856	18,653
1954	466	848	22,035

B. Capital market institutions

169. The emergence of the Federal Republic of Germany as an important international financial centre dates from 1958 when convertibility was introduced and capital market regulations liberalized. The German capital market is freely accessible to foreign borrowers; however, in order to maintain orderly conditions on the market, a commission of bank and Government representatives has been set up to review all projects for new issues. The expansion of the German market in recent years has led to the organization of an increasing number of investment funds primarily for Western European enterprises. German firms participate in inter-European investment funds organized in other countries (such as EURO-UNION, incorporated in Luxembourg), and play an active part in German and international syndicates engaged in industrial and other development projects in Latin America, Asia and Africa.

Table 12. Geographical distribution of AKA export credits — 1958-1963

(Percentages)

	1958	1959	1960	1961	1962	1963
Europe	36.86	40.36	37.65	40.54	34.00	20.56
Africa	9.78	13.69	23.56	15.58	9.65	11.17
Asia	30.06	28.35	25.83	18.71	17.82	20.37

170. German institutional investors have subscribed to securities issued in the German capital market by IBRD. These included a DM 200 million loan sold at par at 5 per cent on 7 April 1959 and maturing in 15 years through a syndicate of over seventy German banks (headed by the Deutsche Bank as the principal manager and the Dresdner Bank as the co-manager). As indicated in chapter III, the Federal Republic of Germany has been among the largest providers of funds for IBRD operations. In July 1961, part of the DM 12 million loan by the Republic of Argentina was sold on the German capital market. Yields of foreign issues floated on the German capital market are as much as a full percentage point above those for comparable German issues.⁸¹

171. Direct investment and export credits constitute the two major sources of private capital outflow from the Federal Republic of Germany. In 1959 the latter source accounted for over one half of the total private capital flow amounting to close to \$500 million. Export credits were granted with a maturity period not exceeding five years which are becoming gradually due for repayment. The volume of guaranteed private export credits in recent years has declined to below \$200 million and they may be granted on longer terms. The net flow of private and official flows to the developing countries exceeded \$600 million in 1962 but this was considerably lower than the total in 1961 and 1959.

ITALY

172. In Italy a number of specialized financial institutions which are classified as autonomous government agencies provide export credits and investment capital to developing countries. Their main concern has been the provision of medium and long-term funds for financing industrial development in Italy, but in recent years they have become interested in development financing abroad, including the developing countries. Medium-term financing is, in practice, extended also by the main commercial banks (Banca Commerciale Italiana, Credito Italiano, Banco di Roma, etc.) to some developing countries of Africa. The short-term credits granted by these institutions acquire the character of medium-term financing under the prevailing commercial banking practice of renewing the loans on a continuous basis. With the approval of the Ministry of Foreign Trade the bank branches operating in the developing countries are permitted to charge interest rates lower than those required in the Italian market. The experience gained in assisting the economically depressed southern part of the country, has to some extent guided the policy of the Italian government in reference to the developing countries. The bulk of loans granted to these countries is administered by public institutions, i.e., those specializing in medium-term financing (e.g., I.M.I. Centrobanca and Mediobanca)

⁸¹ Joint Committee Print, United States Congress, Economic Policies and Practices, Paper No. 3. *A Description and Analysis of Certain European Capital Markets*, January 1964, p. 158.

and government financial holdings (especially Istituto Ricostruzioni Industriali, (IRI), and Ente Nazionale Idrocarburi, (ENI)).⁸²

A. Specialized public institutions primarily concerned with provision of export credit

The Istituto Mobiliare Italiano (I.M.I.)

173. The most important of these institutions is the I.M.I., a government credit institution created in 1931 with the main object of taking over from the commercial banks in the field of medium and long-term financing. Its capital, which at present amounts to 20,000 million lire, has been subscribed primarily by savings banks and insurance institutions. Other resources are derived from foreign loans markets. I.M.I.'s present functions include a wide range of domestic and foreign activities.

174. Of primarily relevance in the present context is the fact that I.M.I. has provided the bulk of medium and long-term industrial financing, with a record of \$1,800 million loans outstanding as of December 1962. In order to assist the export of Italian capital goods abroad, it concluded several financial co-operation agreements for the extension of long-term financing with credit institutions in countries undergoing industrialization, namely Argentina, Brazil, Mexico and Yugoslavia. Recently, Mexican enterprises have received \$75 million from I.M.I. to finance purchases of capital goods in the Italian market. The I.M.I. also occasionally takes participations, along with other foreign and international institutions, in development banks as in the case of the Banque Nationale pour le développement économique in Morocco. The I.M.I. assists foreign potential investors and buyers through a special department, the "Ufficio Informazione Investimenti". Its loans range between 5 and 20 years. On a normal ten-year investment, the bank charges interest rates of 7 per cent to 7 1/2 per cent per year, it normally supplies one-third of the applicants' total investment needs and requires a first claim on the industrial plant of the borrower, and in the case of loans to developing countries, the guarantee of the government.

The Banca di Credito Finanziario (Mediobanca)

175. This institution was established in April 1946 as a joint-stock company with an initial capital of 4,000 million lire which was increased to 6,000 million lire in 1956. The capital was subscribed by the so-called "banks of national interest" (Banca Commerciale Italiano, Credito Italiano and Banco di Roma). Other resources for the Mediobanca financing of operations are derived from medium-term savings accounts, the issue of bonds and rediscounting with the Mediocredito (see below). One of the main functions of Mediobanca is the provision of medium-term credits through the discounting of bills on Italy or foreign countries. Mediobanca participates in the equity financing of

⁸² Ente Nazionale Idrocarburi, Export Credit contributions in 1963 amounted to around \$70 million or more than 50 per cent of the whole Italian contribution in this field.

industrial, financial and commercial firms in developing countries. It has contributed to the capital of the Industrial and Mining Development Bank of Iran, and it owns the entire capital stock of the Liberian Trading and Development Company, Ltd. (Tradevco) of Monrovia.

*Banca Centrale di Credito Popolare (Centrobanca),
Ente Finanziamenti Industriali (Efibanca)*

176. On the same pattern of Mediobanca a group of banks and insurance companies established the Banca Centrale di Credito Popolare (Centrobanca) in 1946 and the Ente Finanziamenti Industriali (Efibanca) in 1949. The latter bank was initially established in 1939 as a joint stock company but later reorganized with a capital of 2,000 million lire (subsequently increased to 3,000 million lire) contributed by banks, industrial and insurance companies. (The Efibanca and Centrobanca provide funds to developing countries mainly under the form of export credits and derive their operating funds through the issue of interest-bearing bonds, accepting medium-term savings deposits and rediscounting of commercial papers with the Mediocredito (see below).

Istituto Nazionale delle Assicurazioni (INA)

177. In the field of export credit, the Istituto Nazionale delle Assicurazioni (INA) insures credits for capital and consumer goods' exports to the extent of about four-fifths of the granted credit. The guarantee period is of 4 years and premium rates are set between a minimum of 2 per cent and a maximum of 2.5 per cent of the sum insured, which is rarely applied.

The Istituto Centrale per il Credito a medio termine alle medie e piccole industrie (Mediocredito)

178. The Mediocredito is a chartered public corporation created in 1953 to serve as a rediscounting agency for medium-term credit institutions. In addition to funds contributed by the Government, the Mediocredito can secure new funds by issuing loans on foreign capital markets or by borrowing from some government trust funds or private insurance institutions. The Mediocredito has so far floated on foreign markets only one bond issue of an amount of 100 million Swiss francs in 1954. The institution is granted a government subsidy of 1.5 per cent of the balance of loans outstanding over the preceding twelve months.⁸³

179. The Mediocredito is the key institution in the export credit system, being the only rediscounter and the lender of last resort. As already stated, its facilities are provided in the form of rediscounting and advances at preferential rates. The refinancing thus accorded may not exceed 75 per cent of the total invoice value. If, for lack of liquidity, the institution is unable to refinance to this extent, it may provide as little as 25 per cent and reimburse to the financing institution the

difference between the cost of obtaining money on the market and the price charged to the borrower. During the period July 1954 to December 1961, the Mediocredito refinanced an export of special supplies for an amount of 88,000 million lire. The funds allocated by the Treasury to the Mediocredito for refinancing exports amounted to 107,000 million lire of which 60,000 million lire had been paid out by the end of 1961.

180. Giving effect to the economic measures recently approved by Parliament in order to decrease the deficit in the balance of international payments, the Italian Government has allocated to Mediocredito 50,000 million lire to be used exclusively for the direct financing of exports on medium and long-term credits.

*B. Specialized institutions concerned with
the provision of investment capital*

181. Direct public participation in developing countries is mainly undertaken by the two largest government holdings Istituto Ricostruzioni Industriali (IRI) and Ente Nazionale Idrocarburi (ENI), either through participation with local companies or by providing the entire capital for the new undertakings. The IRI was formed in 1933 to support the banking system by taking over their industrial holdings which were in financial difficulties. Two-fifths of IRI's investments are channelled by law into the southern part of the country where, in partnership with the Cassa per il Mezzogiorno (a specialized government financial institution for the development of the south), it is assisting the industrialization of the region. The IRI is becoming increasingly active in extending its investment activities to developing countries.

182. In recent years the Ente Nazionale Idrocarburi (ENI), has undertaken a number of activities in the field of oil exploration and production in developing countries. In Argentina, in collaboration with Yacimientos Petroliferos Fiscales, it has drilled 600 exploration wells and it is now constructing the Santa Cruz-Buenos Aires 1,716 km. pipeline. Recently ENI has signed agreements to build up oil refineries at Porto Alegre and Belo Horizonte (Brazil), and in China (mainland). In the period 1960-63, ENI has undertaken development projects, mainly through joint venture operations, for an amount of 320,000 million lire in Yugoslavia, Poland, Spain, Greece, India and Iraq and in 15 African countries.

C. Capital market

183. Semi-public institutions, financed mainly through capital markets and government holdings, handle the bulk of Italian investment in developing areas. Only joint stock companies are allowed to make public issues of bonds on the Italian capital market. Any issue in excess of 500 million lire by residents or non-residents must be authorized by the Ministry of the Treasury after consultation with the Inter-Ministerial Committee of Credit and Savings. Since World War II, there have been on the Italian market only three foreign bond issues:

(a) A 15 billion lire issue in 1961 by the World Bank;

⁸³ International Bank for Reconstruction and Development, *External Public Assistance for Development available from National and Regional Sources*, February 9, 1962, p. 40.

(b) A 15 billion lire issue in 1962 by the European Investment Bank;

(c) A 15 billion lire issue in 1962 by the Inter-American Development Bank.

184. Both the net flows of private and official capital show considerable increase in Italy. The total net flows rose from \$253 million in 1961 to \$397 million in 1962. Private capital flows registered an increase from \$168 million to \$286 million in the above two years. The volume of guaranteed export credits rose to the level of \$100 million in 1962 and in that year \$18 million accounted for portfolio financing.

JAPAN

185. In Japan, two institutions, the Export-Import Bank of Japan and the Overseas Economic Co-operation Fund, are concerned with provision of credit and investment funds to the developing countries. The Government also provides aid through the general budget and the special account for settlement of reparation and extraordinary debts. Private capital has been made available to the developing countries through direct investment, portfolio investment and export credits.

The Export-Import Bank of Japan

186. The Export-Import Bank of Japan is an independent Government agency established in 1950 as a long-term export financing institution; it was reorganized in 1952 and its scope of activities was enlarged. The capital of the Bank was increased successively and as of 31 July 1963 it amounted to 118,300 million yen. The Bank is authorized to borrow from specific sources and its borrowing from the Government stood at 164,275 million yen as of the end of July 1963.

187. According to article 1 of the Charter of the Export-Import Bank of Japan, the Bank is called upon to "supplement or encourage the financing by ordinary financial institutions of exports and imports and overseas investments, for the purpose of facilitating through financial aid Japan's economic interchange, mainly in the field of trade, with foreign countries". Financial assistance of the Bank to Japanese firms include provision of credits for their exports and imports and also lending to Japanese firms engaged in foreign ventures independently or in participation with foreign concerns in joint ventures. The Bank also may guarantee the liabilities of the Japanese firms and in some cases of their foreign partners arising out of borrowing for these purposes from other sources.

188. The Bank's financial operations also cover granting of loans to foreign governments and foreign corporations for the import of capital goods and technical services from Japan. India and Pakistan have been the beneficiary of the bulk of loans granted in this connexion. The Bank also extends loans to foreign public agencies for financing their capital contributions to or stock acquisitions in joint ventures with Japanese firms, as in the case of a loan granted to a government

institution in Brazil for the purpose of acquiring stocks in a Brazilian-Japanese steel mill enterprise. Under a financial operation called "development loans" the Bank may acquire bonds issued by foreign governments for the financing of imports from Japan of the capital goods requirement for development projects.

189. As of 31 March 1963, export credits constituted close to 84.7 per cent of the Bank's financial operation (267,000 million yen) and one half of these credits were granted for sales of vessels. Import credits amounted to 1.5 per cent and investment and development loans to 13.8 per cent.

The Overseas Economic Co-operation Fund (OECF)

190. The Overseas Economic Co-operation Fund (OECF) is an independent Government agency which was established by a law promulgated on 27 December 1960 and began operations in March 1961. According to the articles of the law establishing the OECF, its purpose "shall be to contribute to the economic development of South-East Asia and other developing regions ... and thereby to promote international economic co-operation by engaging in the necessary operations for facilitating the supply of such developmental funds as are difficult to obtain from the Export-Import Bank of Japan and for ordinary financial institutions as well as in other related operations".

191. The capital of the OECF amounted to 16,900 million yen as of the end of March 1963. The Government may, within the amount appropriated in the general budget, make additional subscriptions to the capital of the OECF. The functions of OECF include administration of a 5,000 million yen fund (the South-East Asia Development Co-operation Fund — SADCF) which was originally established within the Export-Import Bank of Japan.

192. The operations of OECF include granting loans required for projects which are considered useful to the economic development of South East-Asia and other regions, and specifically to strengthening Japan's economic interchange with these regions. It also finances studies and pilot projects. These loans and investments are made where funds cannot be borrowed from the Export-Import Bank of Japan or from other financial institutions on reasonable terms.

193. Loans given by the Fund usually do not exceed 20 years including a five-year grace period. The rate of annual interest is normally 3.5 per cent or over. Where a project is considered important and attempts to obtain necessary equity financing from other sources fail, the OECF may make equity investments in Japanese and foreign companies instead of loans. It is required, however, that the shares acquired be sold, when appropriate, to release the funds for other operations of the Fund.

194. The flow of private capital from Japan to all countries increased from \$43 million in 1959 to \$160 million in 1961 and fell to \$118 million in 1962. Direct investment and lending account for the bulk of private capital flows and guaranteed private export credits amounted to \$35 million in 1962, a decline of close to

50 per cent from the previous year. Total net flow of official and private capital from Japan has fluctuated between \$195 million (1959), \$381 million (1961) and \$286 million in 1962.

OTHER COUNTRIES

Austria

195. Austria has no specialized institutions for the channelling of financial aid to economically less developed countries. Austria's official and private financial flows to the developing countries have been primarily in the nature of export credits and credit guarantees operated through the Austrian National Bank and the Oesterreichische Kontrollbank A.G.. The Austrian capital market is accessible to borrowing activities of the International Bank for Reconstruction and Development and other multilateral agencies. In November 1962, IBRD floated a \$10 million bond issue in Austria, half of which (at 4.5 per cent interest and 15 years maturity) was publicly subscribed in the capital market, while the other half (at 4 per cent interest rate at 5 years maturity) was acquired by the pension fund of the National Bank. The Oesterreichische Kontrollbank A.G. headed the syndicate of twelve banks through which this first non-shilling issue was offered publicly in the Austrian capital market. In recent years, increasing efforts are being made to render the market more active in these issues. Guaranteed export credits amounted to over \$15 million and close to \$10 million in 1961 and 1962 respectively. Net official disbursements in 1962 increased to about \$14 million consisting of grants for bilateral technical co-operation and loans for procurement in Austria.

Belgium

196. The Development Co-operation Office (Office de Coopération de Développement), under the direct authority of the Ministry of External Trade and Technical Assistance, is in charge of execution of the Belgian aid programme. Official financial assistance, which is primarily in the form of grants, amounted to slightly less than \$100 million in 1962. Guaranteed private export credits amounted to \$35 million in that year and the major part of these credits had maturities of over five years.

197. The Association pour la Coordination du Financement à Moyen Terme des Exportations Belges (Credit-Export). This institution was established on 6 August 1959 as a non-profit organization by six Government institutions and 25 commercial banks interested in foreign trade.⁸⁴ Its purpose is to examine applications for

⁸⁴ The six Government institutions are: The Banque Nationale de Belgique, the Caisse Générale d'Épargne et de Retraite, the Société Nationale de Crédit à l'Industrie, the Institut de Récompte et de Garantie, the Caisse Nationale de Crédit Professionnel and the Office National du Ducroire.

The 25 commercial banks are the following: Banque Borsu, Banque Commerciale de Liège, Banque d'Anvers, Banque de Bruxelles, Banque de Commerce, Banque de la Société Financière

medium-term export financing on behalf of its member institutions.

198. *The medium-term export financing pool.* Export transactions approved by Credit-Export are refinanced from a rediscount pool of 6,000 million Belgian francs (4,750 million from August 1959 to May 1962) committed by the members. The most important contributors are the Société Nationale de Crédit à l'Industrie (about 31 per cent), the Caisse Générale d'Épargne et de Retraite (about 21 per cent), the Banque de la Société Générale de Belgique (about 14 per cent), the Banque de Bruxelles (about 10 per cent), the Kredietbank (about 5 per cent), the Institut de Récompte et de Garantie (about 3 per cent), and the Caisse Nationale de Crédit Professionnel (about 2 per cent). Each participant in the pool opens a rediscount line and commits itself to provide refinancing facilities for transactions approved by Credit-Export.

199. *The long-term export financing pool.* In February 1962, a pool of 2,000 million Belgian francs was arranged by some members of Credit-Export for the refinancing of export transactions with maturities extending beyond five years. Half of the fund for the second pool is committed by government institutions and half by the private banking sector.⁸⁵

200. The Belgian capital market has contributed to the financial resources of multilateral agencies. In 1959, it purchased IBRD bonds amounting to 500 million Belgian francs at 5 per cent for ten years. Private Belgian banks have also participated in an International Finance Corporation loan to Chile. Under the present trend towards the opening up of European capital markets to foreign investors and borrowers, Belgian private banks, insurance companies and other capital market institutions are expected to invest further in foreign securities. Floatation of securities issued by non-residents are subject to laws dating partly to the pre-war years. The Minister of Finance must approve not only the floating of foreign issues of stocks or bonds on the Belgian market, but also, the admission to trading of foreign securities already issued. Normally, domestic and foreign securities are treated alike by both the listing committee of the Belgian stock exchange and the Banking Commission.

201. A major channel for the flow of private Belgian capital to developing countries is provided by the large Belgian companies such as the Société Générale de Belgique and the Union Minière which are active in various African countries, especially the Congo (Léopoldville),

Bruxelloise, Banque de la Société Générale de Belgique, Banque de Paris et des Pays-Bas, Banque des classes moyennes, Banque Industrielle Belge, Banque Jules Joire et Cie, Banque G. et C. Kreglinger, Banque Lambert, Comptoir du Centre, Comptoir National d'Escompte de Paris, Crédit Commercial de Mons, Crédit du Nord Belge, Crédit Général de Belgique, Crédit Lyonnais, O. de Schaetzen et Cie, Banque régionale, Kredietbank, Nagelmackers fils et Cie., Jules Philippson et Jean Degross et Cie., Société Belge de Banque.

⁸⁵ The main contributors include: Société Nationale de Crédit à l'Industrie, Caisse Générale d'Épargne et de Retraite, Banque de la Société Générale de Belgique, Banque de Bruxelles, Kredietbank, Banque d'Anvers, Banque Lambert and Société Belge de Banque.

chiefly in extractive industries. These companies float sizable bond issues in the Belgian capital market and make the proceeds available to their foreign branches and subsidiaries.

Canada

202. There is no special financial institution for the channelling of Canadian aid to underdeveloped countries. The External Aid Office (E.A.O.) and the Export Credit Insurance Corporation (E.C.I.C.) have specific responsibilities related to external aid and the granting of export credits respectively. The External Aid Board advises the Secretary of State for External Affairs on external aid policy and the Inter-departmental Finance Committee oversees the activities of E.C.I.C.. Net disbursements of official Canadian assistance in 1963 are estimated to have increased twofold (to 125 million Canadian dollars) over 1962. In the past the Commonwealth countries of the Colombo Plan area have been the major beneficiaries of the Canadian aid, but under a new long-term loan programme introduced in 1961, Latin American countries have received over one-half of such loans.⁸⁶

203. The flow of private capital from Canada to the developing countries is estimated to have amounted to \$C30 million in 1962 which is below the level of some previous years. Portfolio investment in multilateral agencies has been relatively high accounting for \$C27 million in 1960 and 1961.

204. Guaranteed long-term export credits provided through the following institutions amounted to \$C5 million in 1962.

205. *The Chartered banks.* Practically all commercial banking business in Canada is carried out by eight chartered banks which have over 5,000 branch offices.⁸⁷ These banks are organized under federal charter in accordance with the provisions of the Bank Act. In medium-term export financing, the chartered banks act mainly as intermediaries by financing transactions which are subsequently refinanced by the Export Finance Corporation of Canada Ltd. The chartered banks may also serve as intermediaries for long-term credits granted by the Finance Division of E.C.I.C. (see below).

206. *The Export Finance Corporation of Canada Ltd. (EFC).* This institution was created in 1959 with a capital of 10 million Canadian dollars entirely subscribed by the eight chartered banks with the purpose

⁸⁶ This new programme, which was characterized as flexible, will provide for: "(a) Aid to Colombo Plan Countries of Asia at a higher level than was provided prior to the reduction in 1962; (b) more comprehensive and sizable Canadian programmes for the Commonwealth countries of the Caribbean; (c) larger and more effective programmes for Africa, including the French-speaking states; and (d) a further contribution to Latin American development, in close co-operation with the Inter-American Bank, through the availability of new and additional lending resources." Extract from Statement made by Mr. Paul Martin, Secretary of State for External Affairs, in the House of Commons, Ottawa, Canada, 14 November 1963.

⁸⁷ These banks are: the Royal Bank of Canada, the Banque Canadienne Nationale, the Provincial Bank of Canada, the Mercantile Bank of Canada, the Bank of Montreal, the Canadian Imperial Bank of Commerce, the Bank of Nova Scotia and the Toronto Dominion Bank.

of providing medium-term financing of one to five years. The Corporation is authorized to seek additional resources by increasing its capital to 50 million Canadian dollars and borrowing up to ten times the amount of its total capital, resulting in potential maximum resources of 550 million Canadian dollars.

207. *The Export Finance Division of the Export Credit Insurance Corporation.* Under section 21a of the Export Credits Insurance Act, ECIC is authorized to grant direct long-term export financing up to a global ceiling of \$200 million to foreign purchasers or to accord financial guarantees to export financing institutions in connexion with projects which are considered beneficial to the Canadian economy. The ECIC will purchase, to the extent of 100 per cent, promissory notes or other negotiable instruments signed by the foreign purchaser to the order of the Canadian supplier. Within the framework of the ECIC's long-term financing facilities, Canada agreed at the 1961 meeting of the India Consortium to make available to India a credit of 20 million Canadian dollars to be used for the purchase of machinery and equipment in Canada within two years commencing in June 1961. At the meeting of Pakistan Consortium in 1961 a credit of 6.5 million Canadian dollars was granted to Pakistan for the same purpose.⁸⁸

Denmark

208. The Board of Technical Co-operation with Developing Countries (Sekretariatet for Teknisk Samarbejde med Udviklingslandene) is the principal administrative agency carrying out the Danish aid programme. The aid extended by this agency amounted to \$7 and \$8 million in 1961 and 1962. The flow of private capital to developing countries in 1961 amounted to nearly \$15 million as the result of high volume of guaranteed export credits with over 5 years of maturity. The flow decreased in 1962 to \$5 million.

209. In Denmark, export credits are provided exclusively by commercial banks which may obtain refinancing facilities from the National Bank of Denmark for credits of more than 1 million Danish krone with maturities of at least two years. The export contract must be insured by the Export Credit Council (Eksportkreditraedet), and to qualify for refinancing the credit must exceed 1 million Danish krone and be extended over a minimum period of two years. The refinancing process consists of issuing freely negotiable two to five-year bearer certificates eligible for refinancing up to 85 per cent of their nominal values. Export credit insurance which was previously under the direction of the Ministry of Trade is now granted by the Export Credit Council which includes representatives of industry, the National Bank, private banks and the ministries concerned. In addition to export contracts, the Council is also empowered to issue guarantees for stocks held abroad, and undertake sales promotion and bank loans in relation to export transactions.

⁸⁸ International Bank for Reconstruction and Development, *External Public Assistance for Development available from National and Regional Sources*, 9 February 1962.

Netherlands

210. The Ministry of Foreign Affairs formulates and executes all the bilateral aid programmes. Loans provided through consortia device are administered by the Netherlands Reconstruction Bank (Herstelbank). The Committee for International Technical Assistance deals with technical assistance services to the developing countries. Net disbursements of official assistance totalled \$86 million in 1962, half of which consisted of contributions to multilateral agencies. The overseas territories of the Kingdom were the recipients of the bulk of the bilateral grants. The net flow of private capital to the developing countries has been significant and reached \$200 million in some years (1959 and 1960). Although a greater part of such flows have been in the form of direct investment, financing through the provision of export credits has increased and in 1961 amounted to \$35 million. The Netherlands capital market has also been an important source of funds in Europe for bonds and notes issued by the multilateral financial institution. In 1959, subscriptions to these issues amounted to \$48 million but they have declined in recent years and in 1961 and 1962 they amounted to \$16 and \$11 million respectively.

211. *The Netherlands Reconstruction Bank (Herstelbank)*. This institution was created in 1945 and is jointly owned by the State and a number of large banks and a few private investors,⁸⁹ for the purpose of development financing in the Netherlands. In 1948, the Herstelbank organized an institution, the Nederlandse Participatie Maatschappij, for the financing of medium-size enterprises and in 1951 it sponsored the establishment of Export-Financiering Maatschappij (EFM) as a specialized agency dealing with provision of export credit. Herstelbank plays an important but indirect role in export-financing. Besides being the principal subscriber to the capital of the EFM, it also provides the latter with additional resources in the form of a renewable loan of 25 million florins. The basic functions of the Reconstruction Bank are in the investment field and in provision of long-term loans. Loans extended by this institution to developing countries are usually combined with funds from the Netherlands and other sources through organization of consortia. This bank now extends 20 to 25 year-loans (with 5 to 7 year grace periods) to developing countries at interest rates ranging between 4.5 to 5.5 per cent.

212. *The Export-Financiering Maatschappij (EFM)*. This institution was created in 1951 as a private company on the initiative of the Herstelbank which owns 60 per cent of its capital, the remaining part of the capital being subscribed by seven large private banks. Its initial subscribed capital of 15 million florins was recently raised to 30 million florins of which only 6 million florins is paid up. Additional resources may be obtained through bond issues on the capital market, from a rediscounting ceiling of 50 million florins granted by

⁸⁹ These included the following institutions: The Nederlandsche Bank, The Central Bank for Agriculture Credit, the largest private banks and insurance companies.

the Nederlandsche Bank N.V. and from a renewable loan of 25 million florins from the Herstelbank. Although it is empowered to engage in financing of the export of all types of goods, in practice it finances the export of capital goods. Loans on export transaction in the period 1955-1961 have averaged over 500 million florins annually.

Norway

213. The Norwegian official assistance is under the responsibility of the Ministry of Foreign Affairs which administers the government bilateral programmes through the Norwegian Agency for International Development (Norsk Utviklingshjelp). This agency is financed by means of a 0.25 per cent tax on personal income (Saerskatt til Utviklingshjelp) earmarked for this purpose. This is a unique method of development aid financing. Net disbursements of official assistance amounted to \$9 and \$7 million in 1961 and 1962 respectively. Over one half of the total flow of private capital (\$4 million) in 1962 consisted of guaranteed export credits. Guarantees are issued by the State Export Credit Commission and special efforts are being made on the part of the Government and the private financial institutions to reduce the cost and the maturity requirements of credits extended to the developing countries.

Sweden

214. The Ministry of Finance is responsible for financial assistance and also for contribution to the multilateral agencies which is administered by the Riksbank (The Central Bank). The Agency for International Assistance (Nämnden för internationellt bistånd — N.I.B.) in the Ministry of Foreign Affairs administers Sweden's technical and relief assistance. The Agency's Board and Advisory Council are composed of representatives of public and private institutions. Export credits guarantees are issued by the Export Credit Agency (Exportkreditnämnden) a semi-official agency attached to the Ministry of Commerce.

215. The commercial banks provide a very limited line of medium-term export credits especially in relation to export of ships and heavy machinery.⁹⁰ The Export Credit Institute (Aktiebolaget Svensk Exportkredit) formed in 1962 is a semi-public institution which provides long-term export credits. Its authorized capital of 100 million Swedish krona is to be contributed in equal amounts by the Government (Ministry of Finance) and a consortium of commercial banks. The borrowing capacity of the institution is set at six times the paid-up capital (50 million Swedish krona in 1962-63) and nine-tenths of the book value of the qualified assets. Under a new scheme authorization is given to grant export credits on "soft" terms to the developing countries within a total credit of \$38.7 million.

216. Net official disbursements increased from over \$8 million in 1961 to close to \$19 million in 1962 and the

⁹⁰ The most important commercial banks are the Skandinaviska Banken, the Svenska Handelsbanken, the Stockholms Enskilda Bank, the Goeteborgs Banken and the Sveriges Kredit Bank.

rise was primarily due to supplementary contributions made to multilateral agencies. Guaranteed export credits reached \$10 million in 1960 but fell to \$6 and \$3 million in 1961 and 1962. Total flow of private capital also declined in 1962 to \$18 million as compared with \$43 million in 1961.

Switzerland

217. The bulk of the flow of capital from Switzerland consists of private investment which has risen in recent years, amounting to \$145 million in 1960 and \$157 million in 1961. In the latter year financing through grant of export credits accounted for \$39 million of the total and portfolio investment in multilateral agencies for \$37 million which reduced to \$28 million in 1962. Swiss official financial contributions to under-developed countries take the form of loans to governments, technical assistance grants and contributions to multilateral agencies. In Switzerland financial assistance is under the responsibility of the Department of Finance while technical assistance is administered by a committee responsible to the Federal Department of Foreign Affairs. Net official disbursements which amounted to over \$23 million in 1961 were reduced to less than \$5 million in 1962 excluding contribution to multilateral agencies.

218. Three major banks: the Swiss Credit Bank, Zurich; the Swiss Bank Corporation, Basle; and the Union Bank of Switzerland, Zurich, engage in granting credit facilities to firms located abroad. Each of the three banks are normally involved in some way in many types of foreign lending. Their lending activities may take the form of jointly underwriting a foreign bond issue in the Swiss market, in which case they may choose to act as intermediaries for the listing of a new stock on the exchange, or by sharing with each other a large commercial credit to a foreigner. During the period 1947-1962 foreign bonds issued publicly in Switzerland by multilateral agencies and on behalf of the developing countries totalled \$234.5 million, constituting over 20 per cent of the total foreign bonds issued publicly in Switzerland in this period. These issues included a \$7.4 million loan for Argentina, a \$6 million loan for Peru and a \$55.3 million loan for the Congo (Leopoldville). The IBRD issues amounted to \$165.8 million.

Chapter V. Specialized financial institutions in the developing countries concerned with financing of development

219. Financial institutions specialized in the technique of development financing have greatly facilitated the mobilization of savings and their channelling into investment projects, requiring medium and long-term capital on equity and debt basis.

220. In the initial stage of development the private sector has relied on household financing traditions, the public sector on budgetary appropriations and tax earmarkings and the need for short-term credit has been met through commercial banking services prima-

rily in relation to export and import transactions. Industrialization in a market economy will result in the creation and expansion of the corporate sector which together with the government sector rely on household savings as an additional source of funds for their investment or capital formation.⁹¹

221. In a developed capital market the financial intermediaries such as securities exchanges, investment trusts, insurance and pension funds, development finance institutions and other investment institutions serve to facilitate this intersectoral transfer of resources particularly between the household and the corporate sectors. Effective channelling of savings into productive economic uses through such mechanism will also cause an increase in the supply of investment funds by drawing a growing proportion of disposable income into savings in the form of financial assets. In the majority of the developing countries commercial banks have performed highly useful services by mobilizing private funds through demand and time deposits and by providing short-term credit and also in some instances capital for extended periods through the practice of credit renewals and over-drafts. But commercial banks because of their liquidity structure cannot normally undertake long-term financing and owing to their concentration in short-term credit and discounting services they lack the specialization and training required for dealing with development financing functions based on entirely different concepts, techniques and investor-borrower relationship. As will be indicated in the following pages, the development banks and finance companies established in a number of developing countries are designed to fill this role which is specially significant where there are well-developed capital markets and will at the same time facilitate the formation of such markets.

A. PURPOSES AND FUNCTIONS OF DEVELOPMENT FINANCE INSTITUTIONS

222. The main function of development banks is to stimulate investments through the mobilization and transfer of capital and savings to entrepreneurs willing to assume the necessary risk for industrial projects. By providing a point of contact with the capital markets of industrialized countries development banks help to promote a flow of external capital directly to local industries and attract foreign investment through the sale of their own securities. They act as clearing houses

⁹¹ The above changes can be readily observed in the surveys recently made on the pattern of savings and investment in the household, government and corporate sectors in India, Malaysia and Japan. The data show that the corporate sector in Japan has contributed about one half of the total capital formation while the relative contribution of this sector was much smaller in the other two countries (12 per cent in India and 23 per cent in Malaysia). The share of the government sector was about 30 per cent in Japan, 31 per cent in India and 26 per cent in Malaysia. In all three countries the household provides the bulk of gross savings (81 per cent in India, 69 per cent in Malaysia and 50 per cent in Japan) but such savings are transferred to the other two sectors for capital formation. In Japan the corporate sector absorbed close to two thirds of such transfers while in the other two countries this occurred primarily through the government sector.

for capital from foreign governments and international lending agencies and establish relations with banks and industrial concerns in other nations. Some of these banks, similar to commercial banks, extend short-term credits or finance working capital needs of industrial and commercial concerns. Others act as *entrepreneurs* in countries that lack a significant class of *entrepreneurs* by making investments in their own name. They attract industrial knowledge from abroad, provide technical assistance to industries, undertake promotional campaigns to accelerate the growth of domestic industries and extend medium and long-term loans on reasonable terms to enterprises that could not readily secure them from other sources.

223. A large number of development banks⁹² have been created in recent years to cope with the financial needs of a variety of enterprises from the establishment of new plants in the textile industry to the building of highways and communications networks. The overwhelming majority of them are public institutions established by the Governments in order to set up and operate government-owned enterprises or to finance large development projects. As shown in the appendix to chapter V, fifty-four of the eighty-four banks listed are wholly government-owned, fourteen have mixed ownership with the majority of voting shares held by the Governments, six are mixed with the majority of the capital in private hands and ten are completely privately owned. Private development banks have increased in number in the last few years. Such institutions have been established in Bolivia, Malaysia, Morocco, Nigeria, the Philippines and Venezuela. Africa offers an example of the growing importance of the development banks. In 1956 there were only eleven banks in seven African countries; by the end of 1958 the list totalled fifteen, ten of which were in sub-Sahara Africa (not including the Union of South Africa), seven were located in one country, Nigeria. In fourteen additional countries development banks existed or were being established.

B. SOURCES OF FUNDS

224. Funds made available to development banks are often supplied by a variety of sources, underlining the important role that development institutions can play in marshalling capital from within and outside the country for industrial development.

225. If the bank is established as a public institution, usually the Government is the main supplier of its capital which it provides either through budgetary appropriation by earmarking a portion of the tax revenue, or by subscribing the controlling majority of the initial stock issue and also of future capital increase. Thus, Nacional Financiera, the largest single source of capital for industrial development in Mexico, recently raised its authorized capital from the initial \$US 16 million to \$US 104 million, of which 51 per cent was to be

owned by the Government. The Corporación Venezolana de Fomento since its foundation in 1946 has been expanding its resources by means of government appropriations and the flotation of bonds guaranteed by the State. Placement of development banks' securities with the public is also frequent, especially when the institution is successful. The Nacional Financiera relies heavily on the issue of certificates (*certificados de participación* and *titulos financieros*) as sources of funds. Their outstanding amount by the end of 1961 was pesos 2,500 million. The participation certificates entitle the investor to a co-ownership right in the securities portfolio of the institution. These certificates yield a fixed, tax free return of 5 to 6 per cent, they are redeemable at any time and thus represent a kind of investment, without much risk and yet remunerative, attractive to investors in Mexico. Since 1959 Nacional Financiera has raised 700 million pesos from private individuals through a new type of issues with maturity of 5 years secured by first class industrial obligations and common stocks, yielding an annual guaranteed tax free interest of 8 per cent combined with a variable dividend.

226. Foreign participation in a development bank is offered in Morocco by the Banque Nationale pour le Développement Economique. The majority of shares of this institution is held by the Government, but a substantial part of its capital, is owned by financial institutions domiciled in France, Italy, the Federal Republic of Germany and Belgium. In other instances the majority of the bank's equity is subscribed by private individuals or institutions, as in the case of the Industrial Development Bank of Turkey, whose capital was taken up by commercial banks, industrial firms and trade associations and private persons, in the proportion of 88 per cent, with the remainder of the capital owned by the Government. A pool of international interests, including Iranian, Belgian, Dutch, French, German, Italian, United Kingdom and United States investors, without any African holding a controlling majority, has subscribed to the capitalization of the Industrial and Mining Development Bank of Iran. In January 1964, the privately controlled Nigerian Industrial Development Bank, the newest in the field, has been established with a \$12 million initial capital subscribed by the Nigerian Central Bank, private United States, European and Japanese investors, and IFC funds.

227. Foreign loan capital is mainly provided to industrial development banks by international financial institutions and foreign banks. The International Bank for Reconstruction and Development, its affiliate the International Finance Corporation and the United States Development Loan Fund (DLF now integrated in AID) have been the main sources of foreign loan financing to development banks in Ethiopia, India, Turkey, Israel, the Philippines and Spain. Around eighty per cent of the 73 million dollars granted in foreign loan capital to the Pakistan Industrial Credit and Investment Corporation until 1961 was provided by IBRD and the United States Development Loan Fund. Credits to Nacional Financiera from international and private foreign institutions amounted to \$380 million by the

⁹² A selected list of development banks is supplied in the appendix to chapter V.

end of 1960. These institutions also provide funds on a regular basis to other private development banks.⁹³

228. Loan financing raises the problem of the ideal capital structure of a development bank since excessive borrowing might jeopardize the bank's ability for proper and timely refunding, and consequently adversely affect its chances of raising further funds through borrowing. Development institutions are inclined to rely on long-term borrowing as source of debt capital because it constitutes a less costly source of funds for investment in medium and long-term development projects. International financial institutions, however, aware of the risk involved in long-term financing, are rather strict on the terms and conditions they impose to supply this kind of finance to the development banks and require the banks to keep a sufficiently large equity cushion. These considerations are reflected in a variety of debt-to-equity ratios which usually range from the 3:1 ratio (for the banks in Iran, India and Pakistan) to a 4:1 ratio (for the Industrial Development Bank of Turkey).

229. In some cases, national Governments have assisted development banks by granting advances in the form of non-interest bearing bonds which are usually repayable after a 10 to 20 year grace period, and these are considered to be a particularly important source of finance to development banks. These advances constitute a source of funds without risk for the bank, as their repayment is subordinated to that of other debts and capital stock of the banks. Such funds are thus, from a financial standpoint, considered as quasi-equity and their inclusion in the Banks' capitalization does not alter the debt equity structure, leaving intact their borrowing capacity.

C. CRITERIA FOR FINANCIAL ASSISTANCE

230. As banks, and therefore business establishments, development banks are concerned with the profitability of their investments and the consequences that their financial operations will have on their financial statements. The objectives and the policies they adopt to achieve them do, on the other hand, differ from those of other financial institutions, as their primary role is often to finance projects whose impact on the national economy is more important than the banks' profitability. This is especially the case for government development banks. Even in the case of private development banks, special attention is paid to the value and needs of new enterprises which find it harder to raise capital. Seventy of the one hundred and thirty-three companies which received assistance from the Industrial Credit and Investment Corporation of India between 1955 and 1961 were new.

231. Many development institutions tend to base their investment decisions on the development priority assigned to an enterprise in the national economic plans. This is so for public institutions, like the Banco Nacional do Desenvolvimento Economico do Brazil which gives

the highest priority to railway transport, ports and shipping, electric power and then to basic industries; it is also the case for the private Pakistan Industrial Development Corporation whose operations are limited to fourteen specific industries (including iron, steel, heavy chemicals, electrical industry and ship building) and exclude such fields as cotton textiles in which interest is shown by private investors. Most private banks, however, are likely to finance any productive enterprises, led by sound management and expected to be profitable. The new Banco de Desarrollo Económico Español, S.A. (Bandesco),⁹⁴ provides medium and long-term capital to all enterprises considered to make a contribution to the industrial development of Spain.

232. Development banks like other investment institutions consider the profitability of applicant enterprises as a measure of economic efficiency, but in contrast to the latter, they rely more heavily on an applicant's long-term earning potential. Some development banks, such as the Finance Corporation of India, apply the profit tests inversely. This bank rejects, in fact, very profitable applications if they are likely to make no useful contribution to the industrial development of the country. The Corporación de Fomento de la Producción de Chile is empowered to finance social projects which are not necessarily self-liquidating. The by-laws of the Banco Nacional do Desenvolvimento Economico do Brazil take into account such matters as the extent to which the project can satisfy existing or future demands; the effect on the balance of payments prospects for attracting foreign private capital; the size of the project in terms of its optimum economic efficiency. This bank prefers to finance large concerns because of the importance of lowering operating costs through economies of a scale applicable to the present stage of development of the Brazilian economy. On the matter of the size of the projects to finance, some development banks have set a minimum acceptable limit below which the banks' operating expenses could not be covered and a ceiling to ensure diversification of investments. The following table shows the upper and lower limits applied by a number of development banks.

233. Some banks, however, give particular importance to the needs of small business concerns. The Industrial Development Bank of Israel is an example of an institution which particularly welcomes small industries for the purpose of developing as broad a class of *entrepreneurs* as possible. In Mexico, the government has set up a fund under the administration of Nacional Financiera for the promotion of medium and small industries. Until December 1960 the Fund had extended 512 million pesos of medium-term credits to 1,830 companies with capital of less than 3.5 million pesos, for the purchase of equipment and the financing of inventories.

234. The choice in the form of financial assistance by the development banks should be determined by the consideration of the capital structure appropriate for

⁹³ For a list of recent loans extended by IBRD, IFC, IDA and development banks see chapter III, table 4.

⁹⁴ Bandesco was established in January 1963 by the Banco Español de Crédito, IFC, Banca Commerciale Italiana, Barclays Bank D.C.O., Deutsche Bank A.G. and other European and American interests.

an enterprise. In some cases, initial financing through convertible debentures has proved to be a convenient solution to the choice between loan and equity financing. Share options, preference shares, income notes and other financial papers largely utilized in the capital market of industrial countries might also be introduced or encouraged by the development banks in the developing countries.

235. Interest rates charged by development banks are usually set at 2 or 3 percentage points above the cost of money to the bank in order to cover administrative expenses and generate a margin for reserves and profit to the stock capital. Interest charged by the Industrial Credit and Investment Corporation of India ranges between 6 and 6 1/2 per cent on rupee loans to 8 per cent on foreign currency loans extended for a period of 10 years, as against 4 to 5 per cent paid on its borrowing. The Pakistan Industrial Credit and Investment Corporation charges 2 1/2 percentage points above the bank rate (minimum of 6 1/2 per cent) on domestic currency, and a rate of 7 1/2 per cent on foreign currency loans. Since development banks provide loans on a medium or long-term basis, they may charge higher rates where they wish to protect themselves against inflationary trends, or secure their loans against non-repayment. Thus the Corporación de Fomento de la Producción of Chile adopts interest rates ranging between 12 per cent and 17 per cent against a prevailing commercial bank rate of 14 per cent for overdue loans. The Industrial Finance Corporation of Thailand has been making loans at 9 per cent per annum and at a maximum rate of 15 per cent for overdraft capital.

D. CONTRIBUTION TO DEVELOPMENT OF CAPITAL MARKETS

236. Development banks can also be active promoters of a capital market mechanism, providing the incentive

and means to encourage savers to invest directly in industrial shares. This will result in channelling a higher volume of internal financing to productive projects and ultimately contributing to self-sustaining economic growth. The bank usually keeps in its portfolio shares of new enterprises in whose capital it has subscribed. When the enterprise begins to show higher earning capacity the bank offers the shares to the public. Development banks, by increasing the supply of marketable securities and broadening the existing and potential participation of investors in industry, perform some of the functions of a stock exchange in countries where the development of such an institution is premature in view of the low level of savings and industrialization and the absence of a widespread investment mentality.

237. The contribution of development banks to foster a capital market varies from country to country. The Industrial Development Corporation of South Africa operates in a country where the banking system is fully developed and savers are accustomed to hold part of their savings in the form of negotiable securities. The bank has thus found it easy to underwrite shares of enterprises in need of finance and to place them afterwards with the private investors. On the contrary, the Industrial Development Bank of Turkey had to limit its operation to offering its own shares to the public. Interest in investment is promoted by offers of bonds of relatively short maturities, particularly in countries where there has been an inflationary experience and investment habits in long-term financing are not fully developed. Accordingly, Nacional Financiera of Mexico has been able to sell 5 to 10 year bonds but not 20 to 25 year bonds. As mentioned before, another common practice of this bank is to offer participation certificates to the public issued against a fund of shares and bonds held by the Financiera. Development banks have also attracted participation by foreign private investors in attractive projects by undertaking systematic promotion programmes and selling equities in the capital markets of Europe and America.

238. As indicated in chapter IV, a growing number of financial corporations and investment associations have been established and are being created by private concerns from developed countries for the purpose of providing investment banking facilities and acting as a catalyst for project development and financing in the developing countries. In many aspects the functions performed by these institutions are similar to those performed by many development finance corporations referred to above. Among these new institutions, one may cite the South East Asia Development Corporation Limited (SEADC), which was incorporated in Kuala Lumpur, Malaysia, in 1963 to operate as investment bankers in South East Asia. The company was sponsored by the Development Finance Corporation, an Australian investment banking group. Its authorized capital is 5,000,000 Malayan dollars of which 3,500,000 Malayan dollars is paid up. The Corporation is to provide investment banking services to stimulate the development of industries which will make useful contributions to the economies of the area. The Financial Corporation for Overseas Countries (Société Financière pour les

Pays d'Outre-Mer) is another example of such an investment corporation. It was established in 1961 in Switzerland (with a capital of 20.6 million Swiss francs) by a group of investment houses in the capital supplying countries in association with financial institutions in the developing countries⁹⁵. The contributions of these types of institutions to the capital market activities in the developing countries supplement those made by the new investment arrangements and consortia established in the industrial countries to which reference was made in chapter IV.

239. The earning records of the development banks have not been outstanding, especially if compared with those of commercial banks in some developing countries. But one should keep in mind that their primary role is often to finance projects whose impact on the national economy is of primary importance. For this reason, in many instances development institutions are created and brought into operation in adverse economic environments which would not normally attract other financial institutions. The development banks have incurred high operating costs, as high-priced skills are needed to run the banks, and staff must be trained at a high cost where no trained personnel is available. Furthermore, since another main function of the banks is to encourage *entrepreneurs*, loans are extended on terms that do not return high profits. Some of the larger banks which have been able to start with a heavy cushion of equity capital, or with quasi-equity loans from their own governments, have been able to return good profits to their shareholders.

240. Although the activities of development institutions, by and large have resulted in net economic gains for the private sector in which they operate, considerable room for improvement remains for raising the banks to a higher stage of efficiency, both in terms of banking operations and in terms of training and business education of personnel and *entrepreneurs* associated with these operations. The function of appraising applications for loans is a difficult task in developing countries due to the lack of official statistics of general business information. This service could be facilitated by trying to obtain directly, through enquiries made through the banks, information on such subjects as raw material and production costs, type of equipment being purchased and marketing plans of the assisted enterprises. Often loan decisions are formulated by the banks solely on

⁹⁵ The principal stockholders are Bank of America (International), Banca d'America d'Italia, Banque Lambert, Banque Nationale pour le Commerce et l'Industrie and the associated institutions are: United Overseas Bank (Banque Unie pour les Pays d'Outre-Mer), Banque Africaine Internationale, Société Congolaise de Banque, Banque du Ruanda-Urundi, Banque Internationale pour le Commerce et l'Industrie du Sénégal, Banque Internationale pour le Commerce et l'Industrie de la Côte d'Ivoire, Banque Internationale pour le Commerce et l'Industrie du Cameroun, Commercial Bank of Africa Limited.

the basis of information provided in standard questionnaires without verification. The types of data required in these questionnaires are in many cases too refined and elaborate for the normal business concerns seeking funds; these either refrain from providing the data and may thus fail in obtaining financial assistance or they may supply questionable data.

241. A better planning of the period of loan extension could also be achieved through a more attentive financial analysis. Many development banks grant their loans in accordance with the repayment periods of the credit they receive from external sources, which usually calls for bi-annual installments, while more frequent repayments by local loan recipients may diminish the risk of the bank, increase its turnover of funds permitting the financing of a greater number of concerns and at the same time insure a better financial planning and management on the part of the enterprise. A system of follow-up of the loans scarcely exists in many development banks. Regular visits by bank staff could be scheduled in order to appraise the position of project funds and advise a revision in the financial plan when needed.

242. The above discussions may serve to underline the importance of training of skilled personnel as economists, financial analysts, engineers and accountants in order to perform the needed technical services for the banks and also for their clients. Many governments and institutions in the developing countries provide technical training for these purposes. In Latin America, the Banco Nacional do Desenvolvimento Economico do Brazil and the Nacional Financiera of Mexico, as well as the regional Centre de Estudios Monetarios Latino Americanos (CEMLA) offer special courses for selected personnel. Other development banks avail themselves of the services offered by various state and private institutions and universities. These are supplemented by the training programmes offered under bilateral and multilateral programmes. The United Nations provides such training through its expanded and regular programmes of Technical Assistance, within the framework of the United Nations Development Decade⁹⁶ and especially in its regional institutes for economic development and by a special course on development financing at United Nations Headquarters presently limited to participants from Africa and the Middle East. The Economic Development Institute of the World Bank is also active in providing special training in project evaluation and appraisal. In-service training is offered in the developing countries where United Nations Technical Assistance personnel provide advisory services in the field of development financing and services related to development bank operations.

Chapter VI. Financing of capital imports through export credits systems

A. NATURE AND FINANCIAL SIGNIFICANCE OF EXPORT CREDITS

243. Substantial foreign direct investments, grants and loans from Governments and international worldwide and regional financial institutions have enabled developing countries to acquire capital goods. But the inadequacy of these sources and the decline in their foreign exchange earning capacity have led them to look increasingly to suppliers in industrialized countries for sales on deferred payment terms. As a result, the scope of existing methods of export financing has been widened and additional methods have been developed in order to meet particular demands that have arisen in the medium and long-term field.

244. Export credits have represented an important source of international financing and have come to be used increasingly for the purchase of industrial machinery and equipment. This evolution would, of course, have been impossible without a corresponding change in the length of the credits. Before World War II, export credits were usually limited to a six-month period and such

short-term credits are still a common method of financing international trade in consumer goods. After the war, however, export credits were increasingly granted for periods of up to five years (medium-term credits), thus permitting their utilization for the acquisition of capital goods. This post-war trend towards the extension of maturities has continued and in the last few years credits have been granted for periods greatly exceeding five years (long-term credits). This reflected the growing difficulties experienced in procuring export orders without the provision of credit to the buyer, particularly in connexion with the execution of large-scale projects in developing countries. Export credits have thus acquired characteristics of both commercial credits and development credits.

245. Export credits generally take the form of bank credits through discounting bills of exchange drawn on foreign buyers or promissory notes signed by the buyers. The bills of exchange or promissory notes, usually discounted by commercial banks, are in many cases then rediscounted by specialized institutions, often government-owned or government-sponsored, and may also be rediscounted in the last resort by the central banks. Mobilization of export credits is facilitated by guarantees given by special insurance companies usually with access to state financial resources.

Magnitude of export credits

246. The available data show a rapid growth of export credits in the last decade. In recent years the amount of net government-guaranteed private export credits has averaged \$450 million, compared to an annual net average of \$400 million during the 1950-1959 period and an annual net average of \$200 million in 1950-1955. As seen in table 14, net guaranteed medium-term export credits have followed a downward trend in the last three years, declining from \$369.4 million in 1960, to \$217.2 million in 1961 and \$147.8 million in 1962. Net guaranteed long-term export credits have, on the contrary, increased from \$93.0 million in 1960 to \$225.5 million in 1961 and to \$300.5 million in 1962. These data give a reasonably valid approximation of the flow of medium and long-term export credit from most industrialized countries since the majority of these export credits are normally guaranteed. This does not hold, however, where guarantees are not available for all countries of destination (e.g. in French trade with the rest of the franc area), where the guarantee system is not widely used (e.g. in the United States), or where it does not exist at all (e.g. in countries with centrally planned economies). The geographical distribution of net guaranteed export credits is shown in table 15.

247. In chapter II, references were made to the increasing significance of export credits in financing of capital investment in the developing countries. The following cases may further illustrate this trend. In Turkey, in recent years, suppliers' credits have represented approximately one third of international public development

financing, which in turn has constituted about 20 per cent of total investments. For example, the Demirkopru and Kemer dams were constructed with equipment supplied on credit terms by French firms. The construction of the Mirzanli hydroelectric plant was carried out on the basis of a medium-term credit supply by a British firm. In Dahomey, Government plans for the country's economic development included the construction during 1963 of a palm-oil mill with a capacity of 41,000 metric tons a year, which was to be financed on the basis of a \$3 million credit to be supplied by a German company. Export credits are making an important contribution to the financing of the Third Plan in India and the Second Economic Development Plan in Pakistan.

B. GOVERNMENT-BACKED EXPORT CREDIT INSURANCE

248. Credit risks involved in foreign trade transactions tend to be greater than in domestic trade. Information concerning potential foreign buyers may be scanty, unavailable or unreliable and in case of default it may prove complicated and costly for the supplier to press his claims in a foreign court. Moreover, in addition to the traditional "default" or insolvency risk faced by the exports,⁹⁷ external trade involves other risks which fall outside the scope of the supplier purchaser relationship. The seller may be prevented from

⁹⁷ This is the so-called *del credere* risk, which consists in the insolvency of the buyer or his failure to pay within a specified period for goods accepted.

collecting his full claims by new regulations imposing, e.g. exchange control or by currency devaluation, expropriation, revolution or war. These risks are often difficult to assess according to actuarial principles and private insurance corporations have been reluctant to provide protection against them. In order to enable their exporters to accept credit orders many Governments have found it necessary to engage in export credit insurance. This type of insurance which was developed during the late twenties and was originally applied mainly to short-term transactions has been in the post World War II period very widely utilized for medium-term export transactions, i.e., credits with maturities of generally between six months or one year and five years. Recently it has been extended to long-term transactions, i.e., credits with maturities exceeding five years. Export credit schemes were broadened as a means of promoting certain industries (particularly engineering) or for boosting exports in general. The expansion of the schemes also responded to the willingness of the developed countries to participate in the industrialization of the developing countries.

249. Besides providing a guarantee, an export credit insurance policy can also be of great assistance in the financing of export credit transactions. In many cases, such a policy is a prerequisite for the granting of export credits. It enables the supplier, whose sale is affected by his ability to finance the transactions, to find refinancing facilities and even to obtain better discounting conditions. Export bills covered by an insurance policy are generally regarded as first class paper and may be considered as a liquid reserve. Financing institutions are in such cases inclined to place less emphasis on the exporter's credit worthiness and may even discount export bills without recourse to the exporter, thus relieving the latter of a financial burden which would otherwise have encumbered his assets. The fact that the risks involved in export transactions are covered by a Government-sponsored institution has increased the willingness of private lenders to participate in the export financing process, leading to mobilization of funds which would not otherwise have been available. It is even acknowledged that the Government endorsement constitutes a more solid guarantee than that provided by acceptance

houses and private insurance companies for short-term transactions or as regards ordinary commercial risks.

250. The growing importance of export credit insurance as a basis for export financing is illustrated in the following table which indicates the changes during 1962 in the limits of official guarantees in some major capital exporting countries.

Institutional features

251. The export credit insurance scheme is administered by a public agency in Canada, Denmark, Finland, Japan, Norway and Sweden (and also in Brazil, India and Israel) where the Government assumes responsibility for both commercial and non-commercial risks. In the other credit-supplying countries the scheme operates within the framework of co-operation between private institutions and the State, with responsibility for non-commercial risks being directly or indirectly assumed by the Government. In France, commercial risks are covered by a mixed company which also insures non-commercial risks for the Government's account while in the Netherlands the institution performing this task is private. In Italy and Switzerland, non-commercial risks (except natural catastrophe risks in Switzerland) are insured by a Government agency and credit risks (plus natural catastrophe risks in Switzerland) are handled by private insurance companies. In Germany (Federal Republic), all risks are insured by a private company acting on behalf of the Government, while in Austria this service is provided by a mixed institution acting on behalf of the State. In Belgium, export credit insurance for both commercial and non-commercial risks is provided by two institutions, one of these is a private company dealing only with exports to Western European countries and the other is a Government institution which is responsible for insurance of exports to other countries (mainly developing countries) and in addition reinsures the transactions carried out by the private company. In the United Kingdom two institutions provide export credit insurance: one is a Government Department covering both commercial and non-commercial risks; the other is a private firm covering commercial risks only. In the United States, export credit insurance, which until 1962 was provided by a Government institution, now falls within the competence of a private consortium which insures non-commercial risks on behalf of the Government.

252. The apparent differences as to the administration of the export credit insurance schemes, i.e., whether the insurance-providing agency is a government department, a mixed corporation or private company are not of great significance. In fact, the degree of Government liability is approximately the same in most countries and there is considerable control at the policy-making level. However, and in spite of international co-operation aimed at the harmonization of the various national schemes and the effects of competition which tends to increase the similarity among these schemes, there are still certain differences as regards the types of risks covered, the risk coverage, the types of policies issued and the cost of the insurance.

Table 16. Changes during 1962 in the limits of official guarantees
(In millions of United States dollars and percentages)

Country	Maximum liability		New limit as percentage of previous limit	New limit as percentage of total exports in 1961
	Now	Previously		
United Kingdom ...	5,040	3,920	129	49
Denmark	290	217	134	19

Types of risks covered

253. All national schemes provide guarantees against the usual political risks, i.e., war revolution, civil disturbances, expropriation of exported items and imposition of legal restraints affecting repayment. In addition, all national schemes except those of Italy and Switzerland cover insolvency risks. Protection against default or delayed payment (generally a delay of six months with the exception of one year in Canada) is provided by all schemes except those of Italy and Belgium. However, the latter does cover default in the case of sales to public entities. Natural catastrophe risks are covered in Austria (where cases are evaluated on an individual basis), Canada, France, Italy and the Netherlands. Certain countries extend coverage to certain fringe risks. Thus, coverage against exchange-rate fluctuations is available in France, the Netherlands and to some extent in Denmark, Germany (Federal Republic) and Sweden. "Pre-financing" coverage to protect against losses from cancellation of contract prior to shipment, is also available in most countries, and two of them (France and Italy) offer protection against price increases during the production period of the items to be exported. A few countries provide guarantees against special risks, such as deterioration of the buyer's currency — exchange risks — (France, Switzerland and in certain cases in the Netherlands and Sweden) or increased production cost (Italy).

254. These variations are largely attributed either to institutional arrangements such as the availability of cover under private schemes or to the unwillingness of the State to provide protection against risks not considered as being beyond the normal supplier-purchaser relationship. Sometimes also they are explained by special factors; thus in France the protection against cost and exchange-rate fluctuations was motivated by the inflationary conditions of the immediate post World War II period.

Risk coverage

255. The coverage of non-commercial or political risks of insured transactions tends to be substantially higher than commercial risk coverage owing to the relatively greater difficulty in assessing political risks. When the foreign buyer is a Government or public body, coverage for both commercial and political risks is generally higher. The following table indicates that while commercial risk coverage ranges from 70 to 85 per cent of the insured claim, non-commercial coverage ranges from 80 to 95 per cent. In some countries coverage is identical for both commercial and non-commercial risks and may attain 90 per cent of the invoice value. The similarity of the plans is a reflection of the degree of competition among exporting countries. It should be noted, however, that in all countries the exporter is still expected to carry a share of the risk on his own so as to induce him or his bank to make his appraisals of his customer's credit worthiness as realistic as possible.

Table 17. Political and commercial risk coverage

(Per cent of export credit insured)

Country	Non-commercial risks	Commercial risks
Austria	80	80
Belgium	85	75
Canada	85	85
Denmark	90	85
France	80 to 90	70 to 80
Germany, Federal Republic of	80	70
Italy	85	^a
Japan	90	90
Sweden	80 to 85	70 to 75
Switzerland	85	^a
United Kingdom	90 to 95	85
United States	95	85

^a Not insured by Government.*Types of policies*

256. Basically, the policies issued fall into two broad categories — comprehensive or global and specific. Under the specific policies, the exporter insures individual export transactions, while under the comprehensive or global policies, the exporter insures the whole of his export trade for a determined forward period. Global policies are usually offered as a means of averaging relatively riskless and riskier transactions thereby improving the actuarial experience of the schemes. In Austria, only specific policies covering individual transactions are issued. Belgium issues specific policies covering political risks for transactions with private buyers; political risks for transactions with public entities; and commercial and political risks for transactions with private purchasers involving maturities exceeding six months, on condition that the exporter agrees to cover all his short-term operations or an approved portion thereof by a "global policy". Belgium also issues global policies, covering commercial and political risks on short-term transactions in contracts with private buyers as well as with public authorities. France issues global short-term policies covering both commercial and non-commercial risks and specific policies covering non-commercial risks only for all medium-term and some short-term transactions. In Germany (Federal Republic), there are four main types of policies covering all risks for (a) a single transaction; (b) all transactions with a single foreign customer; (c) transactions with several purchasers in one or several countries; (d) the whole turnover of an exporter. In the United Kingdom, the most frequently issued type of policy is the global policy, under which the exporter insured all his export sales for a period of one or three years. Specific policies are also issued, covering exports of capital goods and the execution of constructional projects which are unsuitable for comprehensive cover. In the United States "whole turnover" policies may be issued for both short-term and medium-term transactions while "specific" policies are only issued for medium-term transactions.

Cost of export credit insurances and the magnitude of losses incurred

257. Export credit insurance is granted in accordance with "commercial principles," i.e., by charging premiums which due to the number of operations involved would, over a set period, compensate possible losses and cover administrative expenses. Under these circumstances, the role of any insurance fund is to provide adequate working capital and to constitute a line of reserves which creates the flexibility and confidence necessary for the operation of the scheme. Premium rates vary considerably and are usually determined according to the market concerned, the over-all period of risk, the financial standing of the buyer and the nature of the risks involved. In certain countries such as Italy and Switzerland, premium rates range from 0.2 per cent to 1.0 per cent on political risks and from 0.3 per cent to 1.25 per cent on payment and transfer risks. In Canada, premiums average less than 1 per cent of the amount insured. In France, premiums charged for non-commercial risks depend on the purchasing country and fluctuate between 0.4 per cent and 1.5 per cent for private purchases and between 0.8 per cent and 3.0 per cent for governmental purchases. In the United States, premiums vary according to the country of destination and the credit terms, ranging from 0.5 per cent to 2.5 per cent of the outstanding balance guaranteed.

258. Considering the magnitude of the insurance coverage, the amount of loss suffered has been relatively low. From its introduction in 1934 to December 1961, the Swiss Export Credit Insurance scheme issued guarantees for the amount of 7,900 million Swiss francs, but has paid claims amounting to only 3.3 million Swiss francs. In the United Kingdom, export business valued at almost £3,400 million was insured during the five years 1957-1962 inclusive and less than £29 million was paid by the Export Credits Guarantee Department (ECGD) in claims.⁹⁸ Losses have generally been short-lived (e.g. in 1953-1954 in the United Kingdom as a result of the Brazilian crisis) and subsequently recouped. Insolvency has caused an outstandingly low level of losses; most losses have arisen from political and conversion risks. Although even export credit insurance schemes cannot be based entirely on actuarial principles, experience has shown that by following certain time-tested criteria of risk selection, e.g. by imposing "whole turnover policies" instead of insuring separate transactions or by setting up a system of incentives or disincentives, according to the type of risk, it is possible to keep a scheme under control.

The Union des assureurs pour le contrôle des crédits internationaux (Berne Union)

259. Following the example of the private insurance companies, which had formed the "International Credit Insurance Association" (ICIA) to promote international

⁹⁸ Communication from the Permanent Mission of the United Kingdom to the United Nations to the Economic and Social Council secretariat, 5 June 1963.

co-operation as regards ordinary commercial risks, most State export insurance institutions, together with certain private insurers engaged in export-credit insurance, created in 1933 the Union des assureurs pour le contrôle des crédits internationaux known as the Berne Union.⁹⁹ The Berne Union holds annual meetings in which experience is exchanged on a confidential basis and mutual agreement is sought on the formulation of policies. According to a "gentleman's agreement" arrived at by the members, credit insurance should not be extended beyond six months for raw materials and consumer goods, beyond three years for light capital goods and beyond five years for heavy capital goods following delivery of the last part of the export order. The Berne Union has also recommended that exporters of capital goods be requested to assume a risk to 20 per cent of the value of the exports.

C. NEW TRENDS IN EXPORT CREDIT INSURANCE AND EXPORT FINANCING

260. While it may be possible to amortize credits for machinery and equipment over a period of two or five years in the case of small-scale industries, amortization of credits for equipping medium and large-scale industries would normally require more than five years and even up to twenty-five years. For quite a number of projects a five-year credit limit may be neither technologically nor economically appropriate and may represent an impediment to a harmonious development programme. In certain countries, the granting of import licences for machinery and equipment is conditional upon the supplier agreeing to accept deferred payment terms which would ensure that the reimbursement credits would not impose an undue strain on the foreign exchange reserves. In practice, this means that suppliers who are able to secure adequate credit facilities, and can therefore sell on the requested deferred payment terms, are in a position to obtain a greater volume of orders.

261. While the vast bulk of all credit insured business is still conducted on terms within five years, ability to provide credits in the longer term needed by developing countries has, since the late fifties, become an important factor in competition for export markets. Exporting countries have been gradually forced into a competitive race for the provision of long-term insurance coverage and credits, exceeding the five-year limit. In the Federal Republic of Germany, for example, as well as in the United Kingdom and more recently in other countries, export guarantees with maturities of over five years have been authorized where this has been deemed to be in the "national interest". According to these arrangements, credits are granted directly to the foreign purchaser (financial credits) rather than to the exporter (suppliers' credits). These arrangements have made it

⁹⁹ The Berne Union member countries are: Australia, Austria, Belgium, Canada, Denmark, France, Germany (Federal Republic), India, Israel, Italy, the Netherlands, Norway, Spain, Republic of South Africa, Sweden, Switzerland, the United Kingdom and the United States. The Headquarters of the Berne Union is in Paris while that of the ICIA is in Zurich.

possible to insure, and thus more readily mobilize, credits with maturities beyond the five-year limit recommended by the Berne Union. Confronted with such tendencies, the Berne Union itself has conceded a case for extending official guarantees up to seven years in certain circumstances (for example for sales of jet aircraft and ships) and even up to fifteen years for exports under bilateral, and inter-governmental agreements.

262. It is thus becoming generally acknowledged that, in the case of industrial machinery and equipment for certain large capital projects, it is both admissible and appropriate for credits to extend beyond the five year limit. Although the Berne Union continues to serve the vital purpose of consultation and co-operation among members over the granting of cover for various lengths of credit, the granting of long-term export credits or the so-called "financial credits" has nevertheless caused concern over the possibility of excessive competition among the capital exporting countries, and attempts to preserve orderly arrangements for the international provision of export credits have been undertaken. On 27 September 1960, the Council of the European Economic Community created a special body called "Groupe de Coordination des politiques d'assurance-crédit, des garanties et des crédits financiers" to study the question of further international co-operation in the export financing field and make appropriate recommendations.

263. At its sixty-seventh meeting in May 1962, the Council of the European Economic Community approved proposals submitted by the Group for a procedure for prior consultations among its members for credits exceeding the Berne Union five-year limit or in those cases where a member intends to depart from the terms and conditions agreed upon by the Council. The EEC members agreed upon a set of terms and conditions which should be observed by the respective Governments and be incorporated into the national export credit insurance schemes. With respect to guarantees, it was agreed not to exceed 90 per cent of an original credit. A minimum delay of six months was also set before payment of further types of indemnity wherever the debtor was a public organization. Institutions guaranteeing credits were also to enter into reciprocal arrangements to cover sub-contractors from other Governments up to 30 per cent of the value of the contract. Political risks were also defined and a uniform system of premiums was drawn up. These decisions have also responded to the wishes expressed by the Berne Union itself at its annual meeting in May 1962, when it recalled that the Union had repeatedly stressed the hope that progress would be made in establishing a system of international co-ordination on a government level.

264. Moreover, the Franco-German Treaty of Collaboration signed on 22 January 1963 by France and the Federal Republic of Germany stipulates that the two Governments shall study together the means for strengthening their co-operation in export credit policy.

265. It is true that the threat of a disruptive export credit race among industrial countries may affect not

only capital exporters, which may overbid one another without any significant or lasting increase in the total flow of such capital and with danger to their own individual credit structure, but capital importers also. But basically, the problem is to see to what extent export credits might play a part in filling the gap between purely commercial (essentially short-term) credit and purely development (essentially long-term) credit. The tendency to lengthen the amortization period of export credits and to grant them directly to the foreign purchaser rather than to the exporter has resulted in an increasing similarity between export credits and development credits. However, there are important differences especially in terms of banking techniques between these two types of credits.

266. The first basic differences derives from the origin of the resources utilized. While development credits are financed by official institutions out of public funds raised on the capital markets, export credits are for the most part financed by recourse to the money market, through rediscounting facilities offered by the central banks or consortia of private banks.

267. All kinds of export credits (short, medium and long-term) are financed exclusively from the money-market in Austria, Belgium, Denmark, the Netherlands, Norway and Switzerland. Medium-term export credits are generally financed from the money-market in all countries where such credits are granted except in Italy, Japan and the United States, where Government resources are used for this purpose, sometimes in conjunction with funds from commercial banks.

268. Long-term export credits are financed out of Government funds in Canada, Italy and Japan; out of Government funds and funds raised on the capital market in the Federal Republic of Germany; out of funds provided by insurance companies and in exceptional cases out of Government funds in the United Kingdom; and out of Government funds combined with funds derived from insurance companies in France.

269. The second difference is that development credits are generally granted on relatively soft terms while export credits are granted on commercial terms. Even those export credits accorded on a long-term basis do not extend beyond ten or fifteen years, while in the case of development credits a maturity of fifteen years may be considered as relatively short. Maturities of development credits granted by the Export-Import Bank of Washington may attain twenty years and sometimes even more, depending on the type of project involved. The maturity periods of IBRD loans usually vary between seven and twenty-five years. They may attain fifty years in the case of development credits granted by the Agency for International Development (AID) and the International Development Association (IDA).

270. Interest rates for development credits are in general lower than those for export credits. The Agency for International Development may charge interest rates as low as 0.75 per cent. Credits accorded by China (Mainland), Czechoslovakia, Poland and the Union of Soviet Socialist Republics may be as low as 2.0 to 2.5

per cent. These rates are lower than those of export credits which are granted on commercial terms as seen in the following table:

Table 18. Cost of export finance (per cent)

Country	Medium-term (2 to 5 years)	Long-term (over 5 years)
France	5 to 5 5/8 ^a	6 1/2 ^a
Germany, Federal Republic of	6 to 8 1/2	8
Italy	5 1/2-6 ^a	5 1/2 ^a
Japan	5 1/2 ^a	
United States	5 3/4	5 3/4 ^b
United Kingdom	5 1/2	6 1/2

SOURCE: *The Economist*, 24 February 1962.

^a There exist special official facilities.

^b There exist special rates for foreign aid projects.

271. A third difference lies in the fact that development credits are granted through official channels, at the request of the receiving countries, to Governments, public entities or enterprises with official backing. Export credits, on the other hand, are in most cases granted at the request of the exporter; only recently have they been granted at the request of the purchaser and even then are known as "financial credits" rather than "export credits". Export credits are normally granted through ordinary commercial channels to private as well as public borrowers.

272. Long-term export credit facilities may now be obtained in Austria, Belgium, Canada, Finland, France, Germany (Federal Republic), Italy, Japan, Norway, Sweden, Switzerland and the United Kingdom. Long-term credit facilities, granted exclusively at the request of the buyer, have been made available since 1934 in the United States by the Export-Import Bank of Washington, long before the extension of export credit insurance to medium and long-term export transactions. These United States long-term credits, though granted on commercial terms as far as interest and credit-worthiness are concerned, have in most cases been accorded on a very long-term basis.

273. These credits need not be insured and should be regarded as development credits rather than export credits in the strict sense of the term. Tied loans granted under section 3 of the Export Credit Guarantee Act in the United Kingdom, Agency for International Development credits in the United States, loans granted by the Kreditanstalt für Wiederaufbau in Germany (Federal Republic) "to finance projects deserving of assistance in foreign countries" are operations specifically intended to assist development. Similarly, export credits available in countries with centrally planned economies (e.g. China (Mainland), Czechoslovakia, Poland and the Union of Soviet Socialist Republics), granted at low interest rates and in many cases reimbursable in commodities, should be considered rather as development credits.

D. PROMOTION OF EXPORT CREDIT FINANCING AND INSURANCE IN DEVELOPING COUNTRIES ¹⁰⁰

274. In developing countries banking systems are inadequate and in most cases their limited financial facilities are granted only to the largest exporters; medium and small exporters are obliged to sell on a cash basis or on the basis of confirmed irrevocable letters of credit. In implementing their economic development programmes the developing countries have, in effect, begun diversifying their production and consequently their exports, which have been traditionally limited to primary products such as minerals and agricultural commodities. The promotion of exports of manufactures is in fact one of the important items before the United Nations Conference on Trade and Development.

275. Export of manufactured and semi-manufactured goods from developing countries has been expanding at a rapid rate particularly since 1959. Exports of manufactured goods from these countries increased by as much as 43 per cent between 1958 and 1961. This increase was mainly the result of several manufacturing industries having passed the stage of "infant industry" and developed to the stage of "infant trade". In order to operate successfully the new manufacturing industries must export their production in excess of domestic demand and these exports must compete with similar products on the world markets.

276. In order to assist their exporters in facing this international competition, in which the ability to offer attractive terms is an important factor, certain developing countries have been contemplating the introduction of export credit insurance schemes and such schemes were established in India and Israel in 1957.¹⁰¹ These insurance schemes are similar to those adopted by the developed countries. Although the Indian and Brazilian schemes provide for the issuance of policies covering medium-term credits, the tendency is to cover short-term credits since developing countries are essentially exporters of consumer goods which are normally sold on terms not exceeding six months.

277. These insurance schemes are administered by a public body and cover both the commercial and political risks. Thus the Foreign Trade Risks Insurance Corporation Ltd. of Israel provides protection against the following risks:

The insolvency of the buyer;

The failure of the buyer, even though not actually insolvent, to pay within a period of one year any debt owing in respect of goods of which he has duly accepted delivery;

Delay or prevention of transfer from the buyer's country of payment in the currency tracted owing to the operation of any law or regulation of the

¹⁰⁰ See also *World Economic Survey—1963*, United Nations publication, Sales No.: 64.II.C.1, chapter 8.

¹⁰¹ The Israel scheme was established with the assistance of a United Nations expert, see *Export Credit Insurance in Israel*, 12 September 1956, document TAA/ISR/28.

country or generally to economic difficulties, shortage of exchange etc.;

War between Israel and the buyer's country;

War, civil war, rebellion or any general political disturbance in the buyer's country;

Cancellation of any import licence or introduction of new import restrictions.

278. In India, the Government not only provides export credit insurance but has also arranged for the granting of special financial facilities. Following the recommendations in April 1961 of a Study Group on Credit Facilities for Exporters, the State Bank of India Act was amended authorizing the Bank to extend term credits to exporters or persons engaged in such business or trade, as might be specified by its Central Board, and to hold any negotiable instrument relating to or arising out of exports from India with a remaining maturity of more than six months, as collateral for its loans. In pursuance of another recommendation of the Study Group, the Refinance Corporation for Industry launched, effective 1 January 1963, a scheme for refinancing medium-term credits, i.e., credits for periods exceeding six months but not above five years, granted to exporters in the private sector by approved credit institutions which are also authorized dealers in foreign exchange.

279. On 30 September 1963, the Board of Governors of the Inter-American Development Bank approved the basic regulations governing the organization and operation of a programme to provide export credits (but not insurance) for intra-regional exports of capital goods. This programme was scheduled to begin operation by 1 January 1964. This programme, considered as "one of the most effective measures adopted by the Bank to promote the economic integration of Latin America" is designed:

(a) To promote the development of Latin American basic industry through an increase in intra-regional trade;

(b) To contribute to the maximum mobilization of domestic and foreign financial resources;

(c) To provide maximum flexibility within the framework of a simple, adaptable operating mechanism.

Under the programme, the Bank will make available credits of between 180 days and, in general, five years to finance the export of capital goods as enumerated on a provisional list. The goods should originate in the Latin American member countries of the Bank and the value on non-Latin American materials should not exceed 50 per cent of their FOB price. The list approved in conjunction with the regulations is an open list subject to periodic amendments and includes such goods as power generating electrical, agricultural, office, metal-working, mining, industrial and railway equipment and machinery and automotive vehicles for industrial and commercial use, aircraft, ships and prefabricated buildings.

280. The Bank may finance up to 70 per cent of the invoice value; the importer will make a down payment

of at least 20 per cent and the remaining 10 per cent may be financed from other sources. The cost of the transaction may in no case be less than that charged for other transactions financed through ordinary capital resources.

281. The programme will operate through agencies designated by the Latin American exporting countries and responsible for the task of centralizing programme operations and compliance with enforcement of the provisions of the regulations at the national level. The Bank may employ three main methods:

(a) Grant a global loan, i.e. a credit to the national agency of the exporting country with authorization for relending for discount of promissory notes issued by the importer;

(b) Purchase promissory notes issued by the national agency of the exporting country and secured by the importer's promissory notes previously discounted by the agency;

(c) Rediscount the promissory notes issued by the importers and guaranteed by the national agency of the exporting country.

The Bank also announced that in order to mobilize additional external funds for the programme it will seek to sell participations, without its guarantee, in the global loans to commercial banks outside Latin America and will also seek to place in the world's capital markets credit documents to be purchased or rediscounted from the national agencies.

E. EXPORT CREDITS AND EXTERNAL INDEBTEDNESS OF THE DEVELOPING COUNTRIES

282. The main question arising in this connexion is to what extent export credits can be utilized to finance economic development projects. It is a fact that export credits enable developing countries to import needed machinery and equipment without immediately paying the full price in cash. However, there is a danger that borrowing countries, when unable to secure long-term development credits or direct investments, may be tempted to fall back on export credits, which may be easier to obtain, rather than postpone the implementation of their development projects. This temptation may be accommodated by export credit suppliers who, in order to gain temporary access to a market, may grant credits without sufficiently considering such factors as debtor countries' ability to repay such credits given their overall debt position. Those credits which are not often related to the expected life of the imported equipment are likely to become due for repayment in a relatively short period, before the foreign exchange directly or indirectly expected from the new investments can be earned. If the countries concerned are already carrying a substantial amount of foreign indebtedness that commits them to a sizable flow of debt service payments, the added financial commitments associated with medium-term export credits will tend to raise the riskiness of all outstanding debts and worsen whatever balance of payments difficulties may be associated with their chronically unstable foreign exchange earnings.

283. As long ago as 1954, the President of the World Bank warned against an irrational use of export credits: "The manner in which suppliers' credits are offered, moreover, sometimes results in projects being undertaken which are far from the highest priority in developmental needs. The exporting country wishes to boost its exports and therefore offers credits for financing a project using its equipment. The manufacturing supplier of equipment naturally welcomes any opportunity to increase his sales and he can certainly not be blamed if he takes advantage of whatever credit facilities may be made available. And the importing country may feel that the credit, being available, should be accepted even if not for the most useful of purposes nor on the best of terms and even if, as often happens, under these arrangements a higher price for the goods must be paid. This is contrary to the interests of the importing country and may result in slower rather than faster development."¹⁰²

284. Those warnings were reiterated in subsequent years, particularly as two studies made by IBRD of the balance of payments of developing countries indicated that a significant and growing share of their foreign exchange earnings was being committed to service payments on foreign indebtedness.¹⁰³ That these risks remain was stressed very recently by the Bank of England and the Chairman of the Development Assistance Committee of OECD.

285. In its report for the year ended 28 February 1963, the Bank of England made the following comments: "Developing countries obtain not only Government aid and private foreign investments but also a substantial volume of commercial credit from foreign exporters under suppliers' credits. These now account for a significant proportion of the external debt service of many borrowing countries. If allowed to grow, this may seriously aggravate their problems unless the projects themselves bring a commensurate relief."

286. In his September 1963 report, the Chairman of the Development Assistance Committee expressed the following view: "The problem of keeping the debt-servicing obligations within manageable limits is further complicated by the fact that public debt obligations of these countries arise not only from the official loans made by the donor countries, but also may be ultimate consequence of suppliers' credits extended in connexion with private transactions (though in many cases guaranteed by some public body in the country of origin). Guaranteed export credits are an established factor in the conduct of trade and offer a politically easy way of providing assistance. However, it is necessary that the less developed country should avoid undertaking an excessive volume of borrowing in forms such as suppliers' credits on 'hard' commercial terms; at the

same time, the credit guaranteeing bodies in the donors have a responsibility to maintain close checks on such borrowing. As in the case of long-term credit, the danger is less that of any one country's excessive extension of credit to a borrowing country than of the undue expansion of the aggregate from all sources."¹⁰⁴

287. The capacity to service new export credits must be evaluated from both the micro and the macro-economic point of view. On the micro-economic level, this capacity depends on the economic efficiency of the individual projects. Projects may be given priority because they are likely to generate foreign exchange, either directly by turning out goods for export, or indirectly by producing for the local market goods normally purchased abroad. According to OECD, "Projects to be supported by public or publicly-guaranteed export credits may create special problems. The range of projects and countries concerned in the provision of these credits will probably tend to be more a matter of the competitive potential and salesmanship of the donor country's exporting industries than of a deliberate attempt by anyone to determine priorities."¹⁰⁵

288. On the macro-economic level the servicing capacity depends, regardless of the soundness of individual projects, on the degree of the over-all indebtedness which the importing country is capable of sustaining in the light of its balance of payments conditions and prospects. The preparation of foreign exchange budgets offers a useful practice for the determination of upper limits for foreign indebtedness within which the country's needs for external financing in the public and private sectors are assessed and allocated according to their development priorities. When priorities are defined and observed the export credit mechanism buttressed by export credit insurance can serve to mobilize important external resources for the financing of industrial development in the developing countries. The current trend towards lengthening of the export credit maturities and the grant of such credits under more liberal terms is likely to increase the usefulness of this source of external financing in the future.

Chapter VII. Measures for the promotion of foreign private investments

289. Governments of developing and developed countries, which are interested in stimulating an increased flow of private capital to developing countries have at their disposal, and have increasingly used, various measures to meet the desiderata and apprehensions of private investors within the framework of their national needs and policies.

290. In addition to the different forms of financial assistance reviewed in the preceding chapters, these measures relate chiefly to the initial stimulation of investment projects, the use of tax concessions to enhance

¹⁰² International Bank for Reconstruction and Development, Summary Proceedings, Ninth Annual Meeting of the Board of Governors, Washington D.C., 1954, p. 10.

¹⁰⁵ *Ibid.*, para. 98.

their attractiveness and the reassurance of potential investors regarding non-business risks. The most important of these measures will be examined in the following pages.

A. Promotion of investment projects

291. A broad range of measures and facilities exists in capital-supplying and capital-receiving countries to speed the investment process. At their simplest, they provide background information on general economic conditions in a country and its legislative and institutional framework (relating, for example, to tax law, commercial law or banking structure). As a further step there may be facilities for a prospective investor to secure more specific information on conditions in a given field of industry or with regard to a particular venture (location, labour force, market etc.). Such facilities may be offered by private institutions such as banks, chambers of commerce, industrial consultants or, as a public service, by Ministries of commerce, economy or finance or special agencies such as investment centres or development banks.

292. The value of these facilities from the point of view of actually attracting new, and especially foreign, investment, however, is bound to be limited unless they are coupled with an active programme for the identification and promotion of specific investment projects. Large international companies are likely to have the financial ability and technical know-how to secure the needed information themselves, and in many cases prefer to do so. Smaller foreign investors would be in a position to turn to these facilities only after they had already made the decision to investigate investment opportunities in the country concerned and had in fact located a possible venture; yet *entrepreneurs* in highly industrialized countries are not normally on the search for investment opportunities in developing countries, and if they are, are not easily in a position to find out what opportunities exist or to originate ventures on their own. In fact the relative dearth or ready and worthwhile investment projects constitutes in itself one of the major limiting factors on private foreign investment.

293. A number of developing countries have therefore established investment promotion centres at home and abroad which have the task of developing appropriate investment projects and searching out likely foreign and domestic *entrepreneurs*. These centres, or related agencies, can also assist the *entrepreneur* in the implementation of the project by providing detailed information on investment and market conditions, by steering him through administrative formalities and negotiations, by finding supplementary finance, etc.

294. The effectiveness of the promotion agency is thus in large measure conditioned upon its initiative in finding projects and investors (rather than waiting for applications) and upon its ability to recognize and meet the needs of the investor. Its value to the economy on the other hand depends in part upon the extent to which it is co-ordinated with a development plan, so that it can follow the order of priorities established

therein. In certain cases this function is therefore assigned to the planning organization or the development bank.

295. The active promotion of investment projects is thus among the most important, but also the most difficult, functions because it requires a rare combination of technical and commercial expertise and negotiating ability. Where, however, an investment agency originates and develops a project and secures the active participation in its implementation of a foreign firm which had not previously been looking for investment opportunities in that particular country, the resulting foreign capital inflow can be directly traced and credited to this specific investment promotion technique — which can only rarely be done with most of the other known techniques.

296. Because of their familiarity with the requirements and habits of investors, governments of capital-supplying countries can be particularly effective in the investment promotion service. Governments of several capital-supplying countries which have a policy of favouring investments in developing countries by their nationals, have established facilities to inform potential — especially smaller — investors on general business conditions as well as on specific investment opportunities in developing countries. As an example, the United States Government organizes group missions by interested businessmen to developing countries for the study of investment conditions and opportunities; in addition, the Agency for International Development has recently established a punch-card catalogue of investment opportunities, which currently provides detailed information on some one thousand specific projects in more than eighty developing countries; interested investors can secure AID financing for up to 50 per cent of the costs of studies of the feasibility for these or other promising ventures.

297. The technical assistance activities of international agencies also serve to develop investment opportunities which are either not known or not readily accessible. Foremost among these activities, are the pre-investment projects of the United Nations Special Fund, e.g. mineral surveys which may indicate the existence, quality and location of mineral resources capable of commercial exploitation, and technological institutes which may develop industrial uses for domestic raw materials or by-products that are either not exploited at all, or exported short of the processing stage, which can be economically carried out in the country.

298. Frequently, the feasibility of an industrial venture may be conditioned upon the provision of those physical facilities whose absence is a natural concomitant of under-development. While large enterprises, especially in the natural resources field, have frequently provided their own facilities, the manufacturing investor is not ordinarily in a position to do so. Moreover, many Governments do not welcome the entry of foreign investors into what are typically governmental spheres of activity. Governments in developing countries are therefore turning increasingly to the use of so-called industrial estates (often located in priority areas, away

from already established industrial centres) which provide plant space, utility lines, transport facilities, workers housing, etc., generally at advantageous prices and credit terms.¹⁰⁶

Tax measures

299. Tax concessions which serve as indirect financial stimuli to favoured ventures are perhaps the oldest and certainly the most widespread form of investment promotion. They are in use both in capital-supplying and capital-receiving countries.

1. Tax incentives in developing countries

300. Today practically all developing countries offer financial incentives in the form of tax concessions.¹⁰⁷ These chiefly consist in the reduction or exemption from tariffs on the import requirements of the enterprise as well as from income taxes (on the profits of the enterprise and on the dividends received by the investors), and in provisions for reinvestment credits or accelerated depreciation allowances. These concessions are granted for a limited period — typically for the first five years of operation.

301. For the foreign investor, broad tax exemptions, usually proffered in special Investment Promotion Laws which manifest the government's favourable attitude towards private (and private foreign) enterprises, may dramatize, and thus arouse interest in, investment opportunities which might not otherwise attract attention. Where the exemptions result in a substantial increase in net profits (e.g. through an extended "tax holiday") they may reduce the pay-back period and thus the initial risk inherent in a long-range investment; alternatively, they permit the expansion of an enterprise through self-financing without the need for fresh capital. Customs concessions, in turn, allow a venture to be started with a smaller initial investment by reducing the cost of imported plant and equipment needed to establish the enterprise, and at the same time increase the profits by reducing the depreciation charges.

302. Yet, in gauging the potential value and thus the possible effectiveness of such concession offers, it must be realized that profit projections for a future venture in an unfamiliar country cannot be very accurate, so that the difference in the expected rate or return resulting from concessions, especially on low-rate taxes, are likely to be of an order of magnitude well within the margin of error.

303. Moreover, since most broad concessions are granted for a limited period only, the investor must also consider the normal tax burdens under which he will have to operate after the expiration of the concessions. For this reason, he may be more attracted by a well-balanced tax system geared to a reasonable rate level

than by the combination of an unsatisfactory tax structure with special tax exemptions and reductions.

304. From the Government's point of view, extensive exemptions, especially from income tax, impair the revenue structure by decreasing tax revenue needed for financing development programmes, and by undermining the equity of the tax structure and thereby its acceptability to the taxpayer at large. Where such tax concessions are granted for very long periods (e.g. up to twenty-five or thirty years, as under some laws), they are tantamount to quasi-permanent subsidies; yet, the large well-financed enterprises for which these top concessions are usually reserved are precisely those which could be expected to make a major contribution to government revenue. There is moreover a serious risk involved in attempting to freeze the tax treatment of especially a foreign-owned enterprise for an entire generation: experience would indicate that governments are rarely successful in tying the hands of their successors for so long a period, and conflicts between contractual rights and changing conditions and necessities may well arise before the concession period reaches its end.

305. Even limited tax concession schemes would appear to be appropriate chiefly for an early stage of industrialization, where the industrial sector is not yet a major factor in the economy, while the tax system is likely to be particularly burdensome on industry: major indirect taxes, such as import duties, internal excises and export duties may place heavy burdens on the operation and products of the very industries to be promoted; direct taxes are likely to discriminate against profits by *entrepreneurs* which are more easily assessed than other incomes, while, for instance, capital gains from speculation are often exempt by law. To a potential investor, such a defective tax system may be less of a deterrent if he will not become subject to it until after he has had a chance substantially to recover his initial investment under the protection of tax exemptions — the more so if there is reasonable expectation of tangible improvement of the tax system during that period.

306. As the industrialization process advances, limited concessions intended to favour specific investment practices, such as the above-mentioned re-investment and accelerated depreciation allowances, may retain their place in a more development-oriented tax system, where the corresponding advances in tax administration will allow these more refined tax-burden differentials to become fully effective.

307. Whatever the tax incentive scheme, its appropriate coverage presents a major problem, since the concessions cannot be granted to all enterprises. All the laws are, therefore, selective and aim at limiting the concessions to those enterprises which have a high development priority. Since many governments are not administratively equipped to pass on each investment proposal individually, some schemes use a two-category system: under one category, limited tax concessions are granted automatically to well-defined groups or lists of industries, sometimes limiting the concessions

¹⁰⁶ See: *Establishment of Industrial Estates in Under-Developed Countries*, United Nations publication, Sales No.: 60.II.B.4.

¹⁰⁷ See: annex I: "Selected List of Laws and Other Official Texts Concerning Foreign Private Investment in Developing Countries".

to those ventures which also satisfy certain requirements relating to the number of jobs or the percentage of domestic input they will provide. In the other category, a broader range of tax concessions is available for top priority investments which would qualify on the basis of an individual evaluation of their potential value to the development programme in terms not only of the product, but also of the technical and managerial quality, the proposed pricing structure, etc.

308. The selection of favoured enterprises will be the more purposeful where the government has a development programme which permits the establishment of broad priority classifications at least, which can be incorporated in the tax concession law, and where the administration of the scheme is co-ordinated with the implementation of the plan. Even then, such a law will be more likely to produce results if it is part of an overall investment promotion effort, and if the administering agency does not rely solely on interested investors coming forward on their own initiative and applying for the tax concessions, after having already made their investment decision.

309. Even the broadest tax concessions are outweighed in value to the investor by the grant of a protective tariff for his product. While this is not the place for examining the dangers of loosely granting such protection to infant industries, the fact must be noted that it remains among the most eagerly sought after and the most frequently granted of all investment incentives in the developing countries.

2. *Tax incentives in capital-supplying countries*

310. The popularity of the tax concession technique has also spread to the developed countries, a number of which have sought to encourage foreign investment by their nationals, either in general or in developing countries only, by giving more favourable tax treatment to the profits derived from these investment than to equivalent amounts of profits from investment at home (or in other developed countries).

311. Thus the United States grants since 1942 an outright reduction in the tax rate (currently from 50 per cent to 36 per cent) to companies which derive their income from active business operations in the Western Hemisphere. A recent proposal by the President to the Congress would allow a credit against current taxes equal to 30 per cent of all new investments in a trading or manufacturing venture in a developing country; under the current 50 per cent corporate tax rate, this tax credit would result in increasing the rate of return on such investments almost by one-half. The development orientation of this measure is emphasized by the proviso that the tax benefit will be cancelled retroactively, if the investment is repatriated within the first five years.

312. Under a more limited variant of this technique, enterprises of the Federal Republic of Germany which make new investments judged, in each individual case, to be making a "contribution to the economic deve-

lopment" of a developing country, may deduct up to one-third of the cost of such investments from current taxable profits (not from the tax itself), but must, after a two-year grace period, repay this tax credit in five annual installments; a corresponding concession is also granted against the net worth tax.

313. One may also consider as tax incentives the exemption of investments in developing countries from certain rules, enacted by the United States in 1962 to limit tax avoidance on foreign incomes, as well as from the proposed interest equalization tax on foreign loans.

314. In addition to these unilateral measures, special tax concessions have been incorporated by a number of countries in bilateral tax agreements concluded with developing countries. The most recent of these is the so-called tax-sparing privilege, which enables a foreign investor to credit against (i.e., deduct from) his home government's tax on his foreign income, not only the foreign tax actually paid thereon, but also the foreign tax which was spared him under a special tax incentive scheme in force in that country. This is intended to offset the normal operation of the foreign tax credit under which a reduction or elimination of foreign tax simply leads to a corresponding increase in the tax remaining due to the investor's home country, thus wiping out the benefit of the tax concession. Up to the present, tax sparing clauses have been included in United Kingdom tax agreements with Israel, Malta and Pakistan, in Japanese tax agreements with India, Pakistan, Thailand and Malaysia, and in the tax agreement between Sweden and Israel. None of the United States tax agreements providing for tax sparing have been ratified.

315. Broader concessions are granted in the agreements concluded by France with a number of African countries of French expression, under which France gives exemption (except from the personal income tax) for dividends paid out of profits earned in the latter countries. The Swedish tax agreements with Argentina and India also go beyond the concessions usually extended to foreign income in Swedish agreements, by exempting practically all items of foreign income derived by Swedish corporations from these countries.¹⁰⁸

316. Over the years, there has been considerable support for more comprehensive relief from taxation by the capital-supplying countries, on the part of interested business circles as well as of the governments of some developing countries anxious to increase the flow of foreign investment. It may however be doubted whether even outright tax exemption would provide a significant additional stimulus for foreign investment in developing countries, since most of the profits from these investments (especially if they are retained abroad) are already largely relieved from tax liability in the developed countries; this is the result partly of these countries' far-reaching measures for the elimination of double taxation through tax credit or outright tax exemption, and partly of their rules of tax jurisdiction,

¹⁰⁸ For a list of income tax agreements covering developing countries and territories, see annex III.

which in most countries exclude profits earned by foreign subsidiaries or permanent establishments.¹⁰⁹

C. NON-BUSINESS RISKS TO FOREIGN INVESTMENTS

317. Complementing the economic and financial measures designed to attract and facilitate foreign investments, a series of techniques have been introduced, or proposed, for the purpose of overcoming investors' apprehensions of non-business risks. These apprehensions relate chiefly to possible government interference with, or expropriation of, the investor's business, or to such contingencies as non-convertibility, war and civil disorders. Governments of both capital-receiving and capital-supplying countries, as well as interested international agencies, are endeavouring through individual and joint measures, to provide assurances to investors which are directed either towards avoiding the occurrence of these risks or towards redress of the resulting loss or grievance.

1. *Measures against the occurrence of non-business risks*

318. Assurances by many Governments of capital-receiving countries regarding their future policies and conduct, especially in the matter of nationalization, have been incorporated in formal policy statements, individual concession agreements, investment laws and even constitutional texts. Yet, since the value of such unilateral undertakings must depend in part on the long-run stability of the particular Government or governmental system, they are likely to be less effective in the cases where such assurances would be especially needed.

319. Efforts have been made to resolve this dilemma by giving these assurances the force of international obligations through their incorporation in bilateral agreements between governments of capital-supplying and capital-receiving countries. Such provisions have been included in treaties of friendship and commerce, and in agreements for the promotion and mutual protection of capital investments concluded with developing countries by the United Kingdom, the United States, the Federal Republic of Germany and more recently Japan and Switzerland.¹¹⁰

320. The desire to extend the geographical scope of these unilateral or bilateral assurances has led to many proposals for multilateral conventions and investment

¹⁰⁹ See: "Taxation in capital-exporting and capital-importing countries of foreign private investment" (E/2865, para. 29), see also "The promotion of the international flow of private capital — progress report of the Secretary-General (E/3325 and Corr.1-3, para. 145) where it was noted that the United States Treasury had estimated its annual tax revenue from United States direct investments abroad at only \$240 million in 1959; at that time this corresponded to less than 1 per cent of the total value of such investments (\$29.7 billion) and less than 8 per cent of the annual income therefrom (\$3.3 billion) — while the corporate tax rate was in fact 52 per cent (see "Survey of Current Business" United States Department of Commerce, Office of Business Economics, September 1960, pp. 18, 20).

¹¹⁰ For a list of these agreements, see annex II.

charters over the years;¹¹¹ Currently, the most active of these is the Draft Convention on the Protection of Foreign Property pending before the Council of the Organization for Economic Co-operation and Development.

321. The difficulties which seem so far to have prevented the actual adoption of such a charter must be traced chiefly to disagreements between various countries on the applicable substantive rules of international law. There is, in fact, concern that the formalization of this disagreement, which an attempt to negotiate such a charter could bring about, might tend to increase investors' apprehensions rather than to allay them. Even among the Governments which in their actual conduct give full protection to foreign investors, there are those which would hesitate to bind themselves and their successors to the observance of specific rules by a formal international undertaking. The extension of the provisions of such a charter to pre-existing investments, might be expected to increase the reservations especially of new countries whose governments have inherited long-term concession agreements which they had no part in negotiating.

2. *Measures for relief from non-business losses*

322. In view of these manifold obstacles in the way of securing widespread agreement on international rules defining the substantive rights — and obligations — of foreign investors, increasing interest is being directed by both governments and investors to the possibility of encouraging foreign investments by offering protection to the latter, if not against the occurrence of political risks, at least against their consequences. Here, investment insurance provided by the investor's home government can constitute an effective guarantee against non-business losses (though the question whether a given loss was indeed due to the insured risk, and the precise valuation of the amount of the loss may often present difficult issues of fact). Such insurance schemes are now in effect in the United States, the Federal Republic of Germany and Japan covering expropriation, inconvertibility and losses from war and insurrection.¹¹²

¹¹¹ Especially by the Organization for Economic Co-operation and Development (OECD), the Council of Europe and the International Chamber of Commerce. For earlier proposals, see documents E/3325 and Corr.1-3, paras. 191 to 199, E/3492, paras. 259 to 267 and E/3665/Rev.1, para. 41. The efforts for conclusion of such charters can be traced back to the Havana Conference on International Trade and Employment. The Havana Charter, signed in 1948, echoing in turn recommendations in the League of Nations report on "Conditions of Private Foreign Investment", called for the preparation of "a general agreement or statement of principles regarding the conduct, practices and treatment of foreign investment" (article 11.2.C). These efforts, however, were not implemented, since the Charter did not come into effect.

¹¹² Since 1961, United States guarantee insurance is also available in more limited amounts for so-called "extended risks" including ordinary business losses up to a certain percentage of the investment, for selected projects (including especially pilot and demonstration projects in housing construction) approved individually by the President as "furthering social progress and the development of small independent business enterprises" (*Foreign Assistance Act of 1961* as amended, section 221 (b) 2).

323. While the magnitude, of the United States plan especially is evidenced by the fact that guarantee insurance outstanding as of 1 January 1964 amounted to \$1,125 million under the over-all authorized ceiling of \$2.5 billion, the contributions of these national plans to the solution of the over-all problem is limited by the fact, that they are available to investors from only these three countries. A number of multilateral investment insurance schemes have therefore been put forward; these, as well as the problem as a whole are currently under consideration by the Development Assistance Group of the Organisation for Economic Co-operation and Development on the basis of a study on the subject prepared at its request, by the World Bank.¹¹³

3. Measures for the adjustment of investment disputes

324. Insurance recovery for the loss of his investment resulting from an act of the host Government, however, offers the investor only a last resort, since the primary interest of the investor, as of the Government, will normally be to permit the continued operation of the enterprise. Increasing interest is, therefore, being directed by both Governments and investors to the possibility of providing foreign investors a recourse to international arbitration and conciliation facilities for the settlement of grievances arising out of actions by the Government of the country of investment. Commitments by Governments to let such investment disputes be decided by international arbitration procedures may be found in individual concession agreements, in national investment laws and in bilateral treaties.

325. In his first report on the promotion of the international flow of private capital issued in 1960 pursuant to General Assembly resolution 1318 (XIII), the Secretary-General reviewed the existing situation and referred to the contribution which could be made by the creation of a special international arbitration and conciliation facility with members drawn from both capital-supplying and capital-receiving countries, for the settlement of investment disputes.¹¹⁴ The results of an inquiry undertaken by the Secretary-General among member Governments in 1961 in response to Economic and Social Council resolution 762 (XXIX) showed widespread interest in this possibility.¹¹⁵ The existence of such a facility may well constitute a most effective reassurance to a prospective investor especially in a country whose government had undertaken, either in a special agreement with him, or under a general investment law or treaty, to submit future investment disputes to this forum for arbitration or conciliation.

326. On this basis the President of the World Bank

¹¹³ International Bank for Reconstruction and Development, *Multilateral Investment Insurance*, March 1962.

¹¹⁴ "The promotion of the international flow of private capital — progress report by the Secretary-General", document E/3325, and Corr.1-3, para. 207.

¹¹⁵ *Ibid.*, document E/3492, paras. 286 ff.

stated at the 1961 meeting of its Board of Governors that he believed "that a very useful contribution could be made by some sort of special forum for the conciliation or arbitration of these disputes. The results of an inquiry made by the Secretary-General of the United Nations show that this belief is widely shared".¹¹⁶

327. At its most recent annual meeting in September 1963, Mr. Woods informed the Bank's Board of Governors that the plan "... to establish facilities, under the umbrella of the Bank, for the conciliation and arbitration of international investment disputes," which had been studied by the Executive Directors together with the staff, "has now been given the form of a draft convention. Over the next six months or so", he continued, "this draft will be discussed at a series of conferences of legal experts of our member countries, to be held, through the courtesy of the four regional Economic Commissions of the United Nations".¹¹⁷ These four regional meetings had been successfully completed by May 1964, and it is expected that later this year, "the Executive Directors will be able to present to this Board concrete conclusions and recommendations on this matter".¹¹⁸

328. While arbitration is the most prominent technique for the international settlement of investment disputes, the availability of conciliation procedures in which the parties seek to settle their disputes amicably with the help of independent conciliators, is generally considered as an important complement to arbitration.¹¹⁹ Arbitrators are concerned with determining the rights of the parties on the basis of their existing legal relationships. Yet these relationships may become outdated by the dynamic changes of a developing economy and may call for renegotiation rather than strict enforcement. It is in this context that the Secretary-General suggested in an earlier report: the purpose of preserving the investor's rights, instead of merely assuring redress in cases of violation, is served most effectively when such a forum provides not only arbitration but also conciliation facilities, through which the mutual adjustment of the rights and requirements of both parties can most readily be secured, without actually compelling the investor to become a formal adversary of the government of the host country in which he expects to operate for many years to come.¹²⁰

329. Conciliation could thus include not only the voluntary settlement of disputes concerning the interpretation of existing rights and obligations, but their actual renegotiation, in the light of changing economic

¹¹⁶ International Bank for Reconstruction and Development, *Summary Proceedings, 1961 Annual Meetings of the Board of Governors*, Vienna, 1961, p. 9.

¹¹⁷ *Ibid.*, *Summary Proceedings, 1963 Annual Meetings of the Board of Governors*, Washington D.C., 1963, p. 14.

¹¹⁸ *Ibid.*

¹¹⁹ The above-mentioned plan of the World Bank contemplates facilities for both conciliation and arbitration.

¹²⁰ *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes*, agenda item 6, document E/3665/Rev. 1, chapter III.

and social conditions and policies. It has often been noted that the ultimate assurance for a company's political — and, in fact, business — survival rests in its continued ability and willingness to adjust to these changes and to contribute to economic growth in harmony with the development programme. On the other hand, in certain cases, an enterprise may not be able to continue its operations under a long-term agreement if a government insists on strict compliance, e.g. with production commitments which no longer suit the market situation, or price levels which leave no operating margin for profit and expansion. In both types of situations, the alternative to negotiation has sometimes been the outright breach of legal undertakings — by one party or the other.

330. Experience shows that renegotiation of investment conditions is a widening practice. Even in the field of the extraction of natural resources (petroleum, metals), where huge amounts of capital must be invested over a long period of time, it would be hard to find many important concession agreements which, though originally concluded for twenty, thirty, fifty years or more, have remained substantially unchanged for anything like such periods. Long-term concession agreements covering commercial plantations and public utility operations have also been modified by voluntary renegotiation in many cases. It is noteworthy that the above-mentioned OECD Draft Convention on the Protection of Foreign Property contemplates the possibility of renegotiation of the terms of an investment agreement, where this contingency is expressly provided for in the original agreement.

331. Study may well be given to the question, whether here — as in arbitration — the acceptability and the process of renegotiation may be facilitated by its institutionalization. Such a forum could serve not only those parties which had included a renegotiation clause in their original agreement but also those who, in the absence of such a commitment, may be encouraged by the existence of the facility to seek the assistance of international conciliators in achieving a negotiated resolution of their conflicting interests.

332. There is considerable precedent in the domestic field, for example, in labour relations law, for the effective operation of institutions designed to facilitate such negotiations and for their beneficial results. Indeed, short of a major political reorientation, the primary interest of both, the government and the foreign company, will be not the disposition of the latter's physical assets, but rather the continuing effective operation and growth of the enterprise and its resulting contribution to the economic development of the country.

333. While the effectiveness of most government measures discussed in this chapter can be evaluated only in the most indirect way, experience shows that where they have been implemented smoothly and as integral parts of an active development programme, they can contribute significantly to the creation and maintenance of a favourable investment climate.

ANNEX I

Selected list of laws and other official texts concerning foreign private investments in developing countries *

Afghanistan

Law of 13 May 1959 for the encouragement of investment of private capital in Afghanistan.

Algeria

Law No. 63-277 of 26 July 1963 establishing a foreign investment code (*Journal officiel de la République algérienne*, No. 53, 2 August 1963, p. 774).

Argentina

Decree-Law No. 14630/44 of 5 June 1944 on development and defence of national industry (*Boletín Oficial*, 10 June 1944).

Law No. 14222 of 26 August 1953 on the entry of foreign capital for investment in industry and mining (*Boletín Oficial*, 28 August 1953).

Resolution No. 1018/59, Ministry of Finance, on deductions provided in the general income tax (arts, 82 to 84, T.O. 1956).

Law No. 14789 of 10 June 1959 increasing income tax deductions for reinvestment.

Law No. 14780 of 22 December 1958 on the regulations for the investment of foreign capital (*Boletín Oficial*, 30 December 1958).

Law No. 14781 of December 1958 on industrial development.

Decree No. 1421 of 12 February 1959 on "Regulations Concerning Domestic Production of Tractors".

Decree No. 3693 of 25 March 1959 on "Regulations Concerning Domestic Production of Motorcars".

Decree No. 5038/61 of 22 June 1961 granting tax exemptions to new steel production plants (*Boletín Oficial*, of 22 June 1961).

Decree No. 5039/61 of 22 June 1961 granting tax exemptions to new petro-chemical plants (*Boletín Oficial*, of 28 June 1961).

Decree No. 6130/61 of 21 July 1961 granting tax exemptions to new industrial installations in Patagonia (*Boletín Oficial*, 12 August 1961).

Petroleum Law No. 14773 of 10 November 1958.

Decree No. 744/63 of November 1963 annulling oil production contracts.

Bolivia

Law of 17 October 1945 on the "Régime of Foreign Investment" amended on 19 August 1954 by *Decreto Supremo* No. 3812 and on 15 December 1956 by *Decreto Supremo* No. 4538.

Law of 16 December 1960, Investment Law, and Instructions for Investors thereunder.

Petroleum Code of 26 October 1955.

Regulations to the Petroleum Code, *Decreto Supremo* No. 4298 of 24 January 1956.

Instruction No. 231 of 24 October 1962 of the Superintendency of Currency and Credit.

Brazil

Law No. 1807 of 7 January 1953, on exchange control.

Law No. 1942 of 12 August 1953, authorizing the Executive to grant concessions for the establishment of cement factories in the country.

Law No. 4.131 of 3 September 1962 relating to foreign capital and remittance of funds abroad. *Diário Oficial*, September 1962, p. 10073.

Law No. 2132 of 11 December 1953 granting tax exemptions for aluminium companies.

* This list contains the information available to the Secretariat at the present time. It is based on the list contained in the third Report on The promotion of the international flow of private capital (E/3665/Rev.1) which has been revised and expanded chiefly with the help of information supplied by Governments to the Secretary-General.

Instruction No. 113 of the exchange authorities of 15 January 1955, relating to imports of capital goods financed by foreign capital.

Law No. 2993 of 6 December 1956 granting tax benefits to automobile companies.

Decree No. 42820 of 16 December 1947 containing regulations to the laws on exchange operations (*Diario Oficial*, 16 December 1957).

Mining Code, Decree-Law No. 1985 of 27 January 1940, as amended up to 1946.

Petroleum Law No. 2004 of October 1953.

Law No. 2597 of 12 September 1955 relating to ownership of natural resources.

British Honduras

The Development Incentives Ordinance of 29 July 1960.

Brunei

The Mining Enactment of 1920, as amended.

Oil Mining Enactment, 1955 (*Government Gazette*, 31 December 1955).

Burma

Transfer of Immovable Property (Restriction) Act of 1947.

Income Tax (Second Amendment) Act of 1954.

Investment policy statement of 8 June 1955 (*Burma Weekly Bulletin*, 23 June 1955).

Investment Act (No. 41) of 1959.

The Investment Rules, 1960.

The Industries Nationalization Law (No. 33) of 19 October 1963.

The Burma Oilfields Manual, 1938 (corrected to 1 July 1946).

Metalliferous Mines Manual (corrected to 1 May 1941).

Mineral Concession Directions, 1947.

Union Mineral Resources (Grants of Rights of Exploitation) Enabling Act, 1949.

Mineral Resources Development Corporation Act, 1952.

Mineral Concessions Rules (Notification of the Ministry of Finance of 18 November 1957).

Petroleum Law No. 11780 of 12 March 1952 (*El Peruano*, 14 March 1952).
Petroleum Regulations of 16 June 1952.
Law No. 12376 of 8 July 1955 establishing conditions for granting concessions in the zone of the Oriente.

Philippines

Basic Industrial Law: Republic Act No. 3127 of 27 June 1961.
Republic Act No. 35 of 30 September 1946 authorizing exemption of new and necessary industries from the payment of internal revenues taxes, as amended by Republic Act No. 901 of June 1953 (*Official Gazette*, vol. 49, No. 7) and Department of Finance Order No. 185 of October 1953, further amended by Republic Act No. 2351 of 20 June 1961.
Coal Lands Act No. 2719 of 14 May 1917, amended by Republic Act No. 240 of 18 June 1952.
Mining Act No. 137 of 7 November 1936 (as amended).
Petroleum Act of 1949 (Republic Act No. 387).

Puerto Rico

Industrial Incentive Act of 1954 (Act No. 105) as amended 28 June 1956, and 12 June 1961.

Saudi Arabia

Law of April 1957 regulating the investment of foreign capital.

Senegal

Law No. 61-33 of 22 March 1962 instituting an investment code. (*Journal officiel de la République du Sénégal*, No. 3520, 31 March 1962, p. 587).

Somalia

Foreign Investment Law No. 10 of 13 February 1960 (*Official Bulletin* of 19 February 1960).

Southern Rhodesia

(Formerly Rhodesia and Nyasaland (Federation of)).

Spain

Decree-Law 16/1959 of 27 July 1959 on foreign capital invested in Spanish enterprises (*Boletín Oficial*, 28 July 1959).
Decree of 30 September 1959 implementing decree-law on investment of foreign capital in Spanish enterprises.
Decree of 24 December 1959, complementary to the decree-law on the investment of foreign capital in Spanish enterprises.
Order of 24 December 1959 on acquisition of Spanish securities by foreigners.
Order of 10 February 1960 relating to special registration by foreigners of securities and shares in industries.
Order of 12 March 1960 extending the time for declaration by foreigners of shares and securities in Spanish enterprises established in art. 2 of the order of 10 February 1960.

Sudan

Act No. 8 of 1956 on concessions for approved enterprises (Legislative Supplement to *Sudan Government Gazette* No. 892 of 15 March 1956).

Surinam

The Investment Ordinance adopted by the Surinam Legislative Council on 3 February 1960.

Syria

Legislative decree No. 47 of 7 August 1952 regulating Syrian industry.
Legislative decree No. 103 of 27 September 1952 on the encouragement of industry.
Mining Law, Decree No. 151 of 2 March 1952.
Mining Law No. 7 of 21 December 1953.

Tanganyika

Act No. 40 of 20 September 1963 for the protection of certain approved foreign investments.

Thailand

Exchange Control Act of 1942.
 Industrial Promotion Act of 10 February 1962 supplanting the
 Promotion of Industrial Investment Act of 17 October 1960.
 Ministerial Regulation No. 1, B.E. 2503 (1960) issued in accordance with the provisions of the Promotion of Industrial Investment Act B.E. 2503 (1960).
 Communiqué of the Bank of Thailand dated 17 July B.E. 2502 (1959) concerning facilities for investors in Thailand.
 Notice of the competent offices of the Exchange Control No. 2/2503.
 Exchange Control Act B.E. 2485 (1942) and Ministerial Regulations No. 13 B.E. 2497 (1954) issued thereunder.
 Communiqué of the Bank of Thailand dated 4 October 1960 (B.E. 2503) concerning relaxation of Exchange Control.
 Mining Law of 1918 (B.E. 2461), as amended 1950.

Togo (Republic of)

Law No. 57-36 of 11 September 1957 on the fiscal régime of the contractual enterprises (*Journal officiel du Togo*, 11 September 1957, p. 3).
 Law No. 60-32 of 2 November 1960 completing the list of materials and supplies annexed to law No. 57-36 of 11 September 1957 (*Journal officiel du Togo*, 16 November 1960, p. 769).

Trinidad

"Regulations and Policy concerning Investment of Foreign Capital in Trinidad."
 Aid to Pioneer Industries Ordinance of 16 March 1950, and Amending Ordinances No. 16 and No. 32 of 1956.
 Income Tax (in Aid of Industry) Ordinance, Ch. 33, No. 2, and Amending Ordinance No. 48 of 1955.
 Hotels Development Act of 1963.
 Income Tax (Amendment) Ordinance No. 30 of 1954, relating to investment in hotel construction and equipment.
 Cement Industry (Development) Ordinance, 1 December 1951.
 Oil Mining Regulations of 1939 and 1945.

Tunisia

Decree of 4 June 1957 on the Guarantee Fund for the repatriation of capital and profits derived from foreign investments (*Journal officiel*, 4 June 1957).
 Laws for the Encouragement of Investments: 19 September 1946, 18 September 1947, 30 March 1953, 27 June 1954 (Certificate of Establishment); 17 December 1942, 1 October 1945 (Certificate of Agreement); 1 January 1948, 22 March 1956, 30 March 1957 (Guarantees of equipment loans); 29 December 1955 (special tax reliefs) and 10 February 1958.
 Basic decree of 13 December 1948 on petroleum exploration and exploitation in Tunisia: amended by decree of 1 January 1953, further modified by Law No. 58-36 of 15 March 1958 (*Journal officiel tunisien*, 21 March 1948, and *Journal officiel de la République tunisienne* No. 22 of 18 March 1958).

Turkey

Law No. 6224 of 18 January 1954 on the encouragement of foreign investment (*Official Gazette* No. 8615 of 23 January 1954).
 Law No. 6791 of 9 July 1956 on expropriation or confiscation guarantees.
 Ordinance No. 53 of 6 September 1956 enumerating activities forbidden to foreign nationals, enterprises and institutions.
 Law No. 6309 of 3 March 1954 on mining (*Official Gazette* No. 8655, 11 March 1954).
 Law No. 6326 of 7 March 1954 on petroleum (*Official Gazette* No. 8658, 16 March 1954), as amended by Law No. 6558 of 13 May 1955 (*Official Gazette* No. 9011, 21 May 1955) and by Law No. 6987 enacted on 29 May 1957 (*Official Gazette* No. 9626, of 6 June 1957).

Regulations for Administration of the Petroleum Law of 7 March 1954 approved by Decree No. 4-5633 of 28 July 1955.

United Arab Republic

Law No. 169 of 1952 regarding the exemption of foreign aviation companies from some taxes, as amended by Law No. 588 of 1953.
 Law No. 156 of 1 April 1953 on the investment of foreign capital in economic development projects, amended by Law No. 475 of 2 September 1954.
 Law No. 430 of 3 September 1953 establishing tax exemptions for the strengthening and development of the national economy (*Journal officiel* No. 712, 3 September 1953).
 Ministerial decree No. 6 of 25 January 1954 concerning the execution of Law No. 430 of 3 September 1954.
 Law No. 20 of 13 January 1957, as amended by Law No. 138 of 29 June 1957 relating to the appointment of a representative to the boards of companies of national interest.
 Law No. 66 of 19 February 1953 on Mines and Quarries, as amended by Law No. 86 of 14 March 1956, and Law No. 98 of 3 May 1959.
 Decree No. 69 of 28 February 1959 concerning the application of the Law No. 86 of 14 March 1956.

Upper Volta

Law No. 25-61 AN of 5 July 1961 creating a fund to aid new industries (*Journal officiel de la Haute-Volta*, 15 July 1961, p. 657).
 Law No. 14/62/AN of 22 June 1962 establishing a stabilized preferential tax treatment applicable to approved enterprises.

Uruguay

Law No. 10079 of November 1941 on new industries.

Venezuela

Resolution No. 95 of 6 June 1939 relating to import duties on equipment and raw materials.
 Decree No. 173 of 21 April 1958 simplifying the procedure contained in Decree No. 315 of 24 September 1951 granting total or partial exemptions for materials imported for use in industries (*Gaceta Oficial*, 22 April 1958).
 Decree No. 255 of 18 March 1960 concerning exemptions from tariffs of machinery, equipment and raw materials imported for use in industry or agriculture (*Gaceta Oficial*, 8 April 1960).
 Mining Law of 29 December 1944, as amended.
 Law on Hydrocarbons of 1955 (*Gaceta Oficial*, 13 October 1955).

Viet-Nam (Republic of)

Decree Law No. 2-63 of 14 February 1963, regulating investments (*Journal officiel de la République du Viet-Nam*, 23 February 1963).
 Presidential declaration of 5 March 1957 on the policy of investment in Viet-Nam.
 Circular on the application of the Presidential declaration of 5 March 1957 relative to new investments.
 Decree No. 478-KT of 16 November 1957 creating an Industrial Development Centre.

Multilateral Conventions for the unification of tax incentive laws

Central American Convention on Tax Incentives for Industrial Development signed on 31 July 1962 by Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua (not yet in force).
 Convention on the Treatment of Investments in the Equatorial Union, signed on 12 November 1960 by Chad, Central African Republic, Congo (Brazzaville) and Gabon (not yet in force).

ANNEX II

List of Agreements providing for the promotion and protection of private foreign investments in developing countries *

1. *Japan*

Agreements of friendship and commerce concluded with:
Philippines: 9 December 1960
Pakistan: 18 December 1960

2. *United Kingdom*

Agreements of friendship and commerce concluded with:
Iran: 11 March 1959
Cameroon: 29 July 1963

3. *United States*

Agreements of friendship and commerce concluded with:
China: 4 November 1946
Israel: 23 August 1951
Ethiopia: 7 September 1951
Iran: 15 August 1955
Nicaragua: 21 January 1956
Korea, Republic of: 28 November 1956
Muscat and Oman: 20 December 1958
Pakistan: 12 November 1959
Viet-Nam, Republic of: 3 April 1961

4. *Germany, Federal Republic of*

Agreement of friendship and commerce concluded with:
Dominican Republic: 23 December 1957

Agreements for the Promotion and Mutual Protection of Capital Investments concluded with:
Pakistan: 25 November 1959 (in force)
Malaysia: 22 December 1960 (in force)
Greece: 23 March 1961 (in force)
Togo: 16 May 1961
Morocco: 31 August 1961
Liberia: 12 December 1961
Thailand: 13 December 1961
Guinea: 13 April 1962
Cameroon: (in force)

Agreements with the following countries were initialled:
Ceylon, Chile, Ethiopia, Iran, Korea (Republic of), Madagascar, Philippines, Senegal, Sudan, Tunisia, Turkey

5. *Switzerland*

Agreements concerning trade, protection of investments and technical co-operation with:
Niger: 28 March 1962
Guinea: 26 April 1962
Ivory Coast: 26 June 1962
Senegal: 16 August 1962

ANNEX III

General Agreements for the avoidance of double taxation with respect to taxes on income covering developing countries and territories

I. COUNTRIES MEMBERS OF THE UNITED NATIONS

See table on page 70.

* This list is based chiefly on information supplied by Governments to the Secretary-General.

II. OVERSEAS TERRITORIES

(i) Income tax agreements concluded between the United Kingdom and:

Aden	Guernsey
Antigua	Isle of Man
Barbados	Jersey
Basutoland Protectorate	Malta
Bechaumaland Protectorate	Mauritius
British Guiana	Montserrat
British Honduras	Northern Rhodesia
British Solomon Islands Protectorate	Nyasaland
Brunei	St. Christopher and Nevis
Dominica	St. Lucia
Falkland Islands	St. Vincent
Fiji	Seychelles
Gambia	Southern Rhodesia
Gilbert and Ellice Islands	Swaziland
Grenada	Virgin Islands (British)

(ii) Income tax agreements concluded between Northern Rhodesia, Southern Rhodesia, and Nyasaland and:

Kenya	Uganda
South Africa	Zanzibar
Tanganyika	

(iii) Income tax agreement concluded between:

Jersey and Guernsey

(iv) Income tax agreement concluded between:

Mauritius and Seychelles

(v) Income tax agreement concluded by Gambia with Ghana and Nigeria.

(vi) Agreement relating to taxes on income from movable capital concluded by France with French Oceania and Comoro Islands.

(vii) Income tax agreement between South Africa and South West Africa.

(viii) Income tax agreement between the United States and the United Kingdom of 16 April 1945 extended to:

Aden	Northern Rhodesia
Antigua	Nyasaland
Barbados	St. Christopher, Nevis and Anguilla
British Honduras	St. Lucia
Dominica	St. Vincent
Falkland Islands	Seychelles
Gambia	Southern Rhodesia
Grenada	Virgin Islands
Montserrat	

(ix) Income tax agreement between Canada and the United Kingdom of 5 June 1946 extended to:

Aden	Mauritius
Antigua	Montserrat
Barbados	Northern Rhodesia
British Guiana	Nyasaland
British Honduras	St. Christopher and Nevis
Dominica	St. Lucia
Falkland Islands	St. Vincent
Fiji	Seychelles
Gambia	Southern Rhodesia
Grenada	Virgin Islands

E = Agreements in effect.

S = Agreements signed but not yet in effect.

^a This Agreement was jointly concluded by the Central African Republic, Chad, Congo (Brazzaville) and Gabon.

^b Agreement relating to taxes on income from movable capital only.

^c This Agreement jointly concluded between Dahomey, Ivory Coast, Niger and Upper Volta, relates to taxes on income from movable capital only.

^d Now part of the United Republic of Tanganyika and Zanzibar.

(x) Income tax agreement between South Africa and the United Kingdom of 14 September 1946 extended to Gambia, Grenada, Mauritius, Seychelles and the income tax agreement of 28 May 1962 to South West Africa.

(xi) Income tax agreement between New Zealand and the United Kingdom of 27 May 1947 extended to:

Aden	Montserrat
Antigua	Nyasaland
Falkland Islands	St. Christopher and Nevis
Gambia	St. Vincent
Grenada	Seychelles
Mauritius	Virgin Islands

(xii) Income tax agreement between the Netherlands and the United Kingdom of 15 October 1948 extended to the Netherlands Antilles and to Northern Rhodesia, Southern Rhodesia and Nyasaland.

(xiii) Income tax agreement between Sweden and the United Kingdom of 30 March 1949 extended to:

Aden	Mauritius
Antigua	Montserrat
Barbados	Northern Rhodesia
British Honduras	Nyasaland
British Solomon Islands	St. Christopher and Nevis
Dominica	St. Lucia
Falkland Islands	St. Vincent
Fiji	Seychelles
Gambia	Southern Rhodesia
Gilbert and Ellice Islands	Virgin Islands

and income tax agreement between Sweden and the United Kingdom of 28 July 1960 extended to Bechuanaland Protectorate and Swaziland.

(xiv) Income tax agreement between Denmark and the United Kingdom of 27 March 1950 extended to:

Aden	British Honduras
Antigua	British Solomon Islands
Barbados	Dominica

Falkland Islands	St. Christopher and Nevis
Fiji	St. Lucia
Gambia	St. Vincent
Gilbert and Ellice Islands	Seychelles
Mauritius	Southern Rhodesia
Montserrat	Virgin Islands
Northern Rhodesia	Faroe Islands
Nyasaland	

(xv) Income tax agreement between France and the United Kingdom of 14 December 1950 extended to Northern Rhodesia, Southern Rhodesia and Nyasaland.

(xvi) Income tax agreement between Norway and the United Kingdom of 2 May 1951 extended to:

Aden	Mauritius
Antigua	Montserrat
Barbados	Northern Rhodesia
British Honduras	Nyasaland
British Solomon Islands	St. Christopher and Nevis
Dominica	St. Lucia
Falkland Islands	St. Vincent
Fiji	Seychelles
Gambia	Southern Rhodesia
Gilbert and Ellice Islands	Virgin Islands
Grenada	

(xvii) Income tax agreement between Switzerland and the United Kingdom of 30 September 1954 extended to Northern Rhodesia, Southern Rhodesia and Nyasaland.

(xviii) Income tax agreement between South Africa and the United Kingdom of 18 June 1959 concerning Basutoland, Bechuanaland Protectorate and Swaziland.

(xix) Income tax agreement between the Netherlands and the United States of 29 April 1948, extended to the Netherlands Antilles.

(xx) Income tax agreement between Denmark and the Netherlands of 20 February 1957 extended to the Netherlands Antilles.

(xxi) Income tax agreement between Denmark and Switzerland of 14 January 1957 extended to the Faroe Islands.

DOCUMENT E/3947

Transformation of the Special Fund into a United Nations Capital Development Fund: study of the practical steps involved prepared by the Secretary-General

[Original text: English]
[15 July 1964]

A. BACKGROUND

1. By resolution 1521 (XV), the General Assembly decided "in principle that a United Nations capital development fund shall be established". In the intervening years, the General Assembly's Committee on a United Nations Capital Development Fund, established by that resolution, has undertaken extensive work in order to prepare for the implementation of this decision. At its most recent third session, the Committee examined the manner in which action to this end could most readily be effected, and decided to look, in the first place, toward the potentialities that might be opened through a transformation of the Special Fund into a capital development fund. It, therefore, recommended, and in resolution 1936 (XVIII) the General Assembly

decided, to request the Secretary-General "To prepare, in consultation with the appropriate organs of the United Nations and such other institutions as may be necessary, a study of the practical steps to transform the Special Fund into a capital development fund in such a way as to include both pre-investment and investment activities;".¹²¹

¹²¹ Pursuant to General Assembly resolution 1936 (XVIII) this study was first submitted to the United Nations Conference on Trade and Development (as document E/CONF.46/66 and Corr.1). At a later stage it will be considered by the General Assembly's Committee on a United Nations Capital Development Fund in the light of any views expressed by the Conference and by the Council. The views of the Conference are communicated to the Council in document E/3934. The Committee on a Capital Development Fund is to report to the General Assembly at its nineteenth session.

2. Resolution 1240 B (XIII) adopted by the General Assembly on 14 October 1958 envisaged the Special Fund as “a constructive advance in United Nations assistance to the less developed countries which should be of immediate significance in accelerating their economic development by, *inter alia*, facilitating new capital investments of all types by creating conditions which would make such investments either feasible or more effective”. That resolution also recognized that “In view of the resources prospectively available at the time of the initial period of the Special Fund’s operations, projects to be assisted by the Fund might be in one or a combination of the following forms: surveys; research and training; demonstration, including pilot projects”. In effect, the level of resources available has limited the Fund to these broad areas of activity. Resolution 1240 (XIII) authorizes the Governing Council “to consider allocating part of the resources of the Special Fund for assistance on a refundable basis at the request of Governments for projects within the terms of reference of the Fund,” but the Managing Director recently stated that “more experience and study are required to establish criteria and practical arrangements for such a departure from present practices”.¹²²

3. A “review [of] the scope and future activities of the Special Fund” was contemplated by General Assembly resolution 1219 (XII) “as and when the resources prospectively available are considered by the General Assembly to be sufficient to enter into the field of capital development, principally the development of the economic and social infrastructure of the less developed countries”.

4. The General Assembly’s decision to examine the possible transformation of the Special Fund at the present time must be seen against the background of the trend, on the part of the industrialized countries, “towards channelling more development assistance through the United Nations system,”¹²³ corresponding to the increasing needs of the developing countries for such assistance. “The United Nations system is thus confronted with the task of gearing itself to administer an increased proportion of an increased volume of needed assistance”.¹²⁴ The Secretary-General’s proposal of “bringing EPTA and the Special Fund together in a new United Nations Development Programme” is designed to serve this end by equipping “the United Nations system to meet more effectively its current and prospective responsibilities for the promotion of economic and social progress in the developing countries”. Since 1959, the first year of Special Fund operations, resources available for the combined Special Fund and EPTA programmes have increased from \$55 million to \$137 million (1964) — which still falls short of the present target of \$150 million. As demonstrated by the

requests being received from Governments, the needs for the pre-investment activities these two programmes are now performing continue to expand, and the General Assembly agreed in resolution 1833 (XVII) “to consider new targets for the Expanded Programme of Technical Assistance and the Special Fund at its nineteenth session”.

B. FINANCIAL REQUIREMENTS

5. In order to carry out the transformation contemplated in resolution 1219 (XII) the General Assembly would have to find that “the resources prospectively available are ... sufficient to enter into the field of capital development”. In the discussions by successive United Nations bodies of plans for a Capital Development Fund, “the views with regard to the initial sum needed (have) centre(d) around the range of \$200 million to \$250 million ... renewable annually or at other intervals”.¹²⁵ This estimate was first put forward more than ten years ago, and the intervening years have seen considerable shifts in the magnitude of the scope and costs of development programmes on the one hand, and the level of available development financing on the other, including financing provided through new institutions, such as the International Development Association. In order to obtain maximum benefits from any new resources becoming available to a United Nations capital development fund, they should be directed to areas where additional capital investment is most needed and where their financing by this Fund could be expected to be particularly appropriate and effective. Among such areas are, first, those related to major United Nations programmes and activities (see para. 18 below) and, second, the sponsoring of, and participation in, consortia for the financing of development projects to which other public and private bodies would presumably contribute substantially larger resources than the Fund itself.

6. If less than an additional \$200 to \$250 million were to be forthcoming, it might nevertheless be possible — and under the terms of resolution 1936 (XVIII) appropriate — to consider the possibility of a gradual transformation of the Special Fund into a capital development fund which would mature at such a speed and in such a direction as the successive allocation of additional funds and functions would allow. Before examining the manner in which such a gradual transformation might be effected (see section D below), it would be desirable to discuss the institutional incidences of the contemplated transformation, whether immediate and total, or gradual.

¹²² Statement of the Managing Director to the eleventh session of the Governing Council of the Special Fund (SF/L.98, mimeographed).

¹²³ Report of the Secretary-General on “Co-ordination of Technical Co-operation Programmes” (E/3850, para. 6.)

¹²⁴ *Ibid.*, para. 7.

¹²⁵ Final Report of the *Ad Hoc* Committee on the Question of the Establishment of a Special United Nations Fund for Economic Development, *Official Records of the General Assembly, Twelfth Session, Annexes*, agenda item 28, A/3579 and Add.1, part III, para. 4. See also: Report on a Special United Nations Fund for Economic Development, United Nations publication, Sales No.: 53.II.B.1, para. 55; Special United Nations Fund for Economic Development, final report by Mr. Raymond Scheyven, prepared in pursuance of General Assembly resolution 724 B (VIII), *Official Records of the General Assembly, Ninth Session, Supplement No. 19*, A/2728, chapter IV, section 1.

C. INSTITUTIONAL CHANGES INVOLVED

7. In either case, the extension of the Special Fund's functions here under review would require that the substantive authority in part B, sections I and II of resolution 1240 (XIII) be modified so as to indicate clearly the added authority for engaging in "investment activities", the fields in which financing may be provided, who may benefit from such financing, and the forms (grants, types of loans, etc.) which such financing may take.

8. What is suggested in resolution 1936 (XVIII), however, is not only the possibility of adding investment activities to the present range of activities of the Special Fund but precisely that of the transformation of the Special Fund into a capital development fund, combining both pre-investment and investment functions. This would have important organizational, procedural and financial implications and would require that the relevant provisions contained respectively in parts IV, V and VI of resolution 1240 (XIII) be adjusted accordingly, taking into account the draft statutes prepared by the Committee on a United Nations Capital Development Fund.¹²⁶

9. Some of the provisions governing the Special Fund, and contemplated for the capital development fund, can uniformly apply to both pre-investment and investment activities, once these are combined under one agency: the appointment and functions of the Managing Director and Staff would presumably fall into this category. On the other hand, the difference in the nature of the two types of activities would require different operational approaches to each, no matter what the organizational structure of the over-all agency were to be. Thus, the implementation of all pre-investment projects (i.e., primarily surveys, research and training facilities) has to date been entrusted by the Special Fund to the United Nations and its related agencies. For the purposes of providing capital investment assistance, the Fund might have to consider setting up machinery for the evaluation of the projects and the control of their execution, as well as for the determination and follow-up of the long-term financial arrangements. The Fund would, of course, closely consult with the United Nations family of agencies and make full use of their specialized technical support. The Fund would also seek to establish appropriate lines of consultation and co-ordination with other international and regional development finance institutions, especially the International Bank for Reconstruction and Development and its affiliates, the Inter-American Development Bank, the African Development Bank (see Draft Statutes for the Fund, especially article III.4).

10. Financially, a separation of accounts for the resources available to the Fund for these two purposes — investment and pre-investment — would be indicated, in order to assure the proper programming of each branch of activities and their effective co-ordination. Such separation would also serve to meet the concern expressed by certain

Governments that the addition of capital investment functions should not be allowed to impair the pre-investment functions now carried out by the Special Fund. At the same time, it would respond to the views of those who did not feel that additional resources for development financing through new institutional channels could be readily mobilized at this time.

11. Technically, the allocation of the Fund's resources between the two activities could be made:

(i) By periodic, or by *ad hoc*, decisions of an authorized organ. These could serve, in particular, to assure to pre-investment the level of resources which Governments may want to reserve before allocating the remainder to investment financing;

(ii) By individual Government decisions at pledging conferences. This method would enable Governments if they so desired to make separate pledges to the two types of activities and thus to adjust their contributions to their policy priorities.

12. Organizationally, however, the operational and financial differentiation, referred to in paragraphs 10 and 11 above, could be readily accommodated within a single structure. This would be so, whether this structure would result from the transformation of the Special Fund into a Capital Development Fund, or from the addition of capital investment functions to those of the new United Nations Development Programme proposed by the Secretary-General under Economic and Social Council resolution 900 A (XXXIV).

D. POSSIBLE GUIDELINES FOR A GRADUAL TRANSFORMATION

13. In calling for "a study of the practical steps to transform the Special Fund into a capital development fund", resolution 1936 (XVIII) (see para. 6 above) presumably covers both the case of an immediate and total transformation and that of a gradual transformation through a series of successive steps — pending the mobilization of adequate resources (see para. 5 above). Such a gradual transformation may emerge readily from developments already under way.

14. As indicated above (para. 2), the Special Fund's existing authority already extends into the border area between pre-investment and capital investment, and its eventual extension, in certain circumstances, into the capital development field was contemplated from the very beginning (General Assembly resolution 1219 (XII)). On this basis, the Managing Director of the Special Fund recently expressed the Fund's intention of "enlarging its activities in the financing field ... to help requesting governments find the finance to implement the recommendations of the Special Fund supported projects".¹²⁷ As a first step, the services of financial advisers, charged with this task, have been included in a number of Special Fund projects, in accordance with the authorization given at the eighth session of the

¹²⁶ See *Official Records of the Economic and Social Council, Thirty-fourth Session, Annexes*, agenda item 6, document E/3654.

¹²⁷ See *Official Records of the General Assembly, Eighteenth Session, Second Committee*, 882nd meeting.

Governing Council. In addition, "certain of the investments of the cash balances of the Fund might be made in the form of short-term loans whose purpose is directly related to the acceleration of economic development of the modernizing nations." The Special Fund has also for some time assisted pilot projects and is broadening its criteria to the extent that funds become available for assistance in the financing of demonstration projects.

15. Once the Fund was ready itself to participate in the financing of investment projects growing out of its own pre-investment activities, it could supplement its own limited resources by mobilizing — e.g. through the sponsorship of financial consortia — the participation of other financial institutions active in the development field, both national and international, and of private enterprises interested in undertaking, or participating in, specific investment projects on a basis acceptable to the Government of the country concerned.

16. The existence of such continuing consultative and co-ordinating arrangements between the Fund and other financial institutions as were referred to in paragraph 9 above, could greatly facilitate these efforts. So could the establishment within the United Nations of "a service to provide developing countries, upon request, with information and guidance" in the matter of access to sources of development capital and assistance as contemplated by General Assembly resolution 1715 (XVI) on the United Nations Development Decade.

17. On the basis of the experience and relationships thus developed, the Fund might subsequently sponsor development projects — not connected with its pre-investment activities, but presented to it by Governments or groups of Governments or by international or regional financial institutions. In this way, the Fund could extend its usefulness in cases where its special background in pre-investment assistance would enable it to play a particularly effective role as a bridge between pre-investment and capital investment.

18. Until that stage is reached, however, and as long as the transformation proceeds with modest increases in resources, it would be necessary to agree on particularly strict criteria so as to channel the Fund's capital investment resources to areas of top priority, not adequately covered by other capital supplying facilities. Without attempting to anticipate what these priorities would be, it may be assumed that special reliance may be placed on serving developing countries in fields related to major United Nations programmes and institutions.

Among these possible priorities for investment aid by the Fund mention may be made of the following:

(a) Participation in the financing of the World Food Programme and other special development activities of the United Nations family;

(b) Development financing aid in geographic areas in which the United Nations has undertaken special responsibilities;

(c) Financial participation in appropriate projects with other United Nations-sponsored financial institutions, such as the African Development Bank;

(d) Management of special capital resources which might be established within the United Nations for such fields as industry, housing, science and technology and literacy.

19. In order to be meaningful, such a gradual expansion of the Fund's activities would have to aim from the beginning at its ultimate full-fledged entry into the field of capital investment. Clearly, the more effective its performance in the intermediate stages, the more readily may participating Governments be expected to add to the Fund's scope and resources. The creation of a United Nations Development Programme as recommended by the Secretary-General for the merger of the Special Fund and the Expanded Programme of Technical Assistance would, as indicated in his report to the Economic and Social Council, "provide a more solid basis" for this growth process (E/3850, para. 8). The necessary diversity in operational methods outlined in paragraph 9 above could readily be provided within the over-all organizational structure of such a new Programme. At the same time, the ability of the United Nations family to assure the effective orientation and implementation of its technical assistance and pre-investment activities would be enhanced by the addition of capital investment functions.

20. Beyond this, the availability of such a broadly conceived development programme would in itself provide an impetus to the very process of expansion which resolution 1936 (XVIII) contemplates. An effectively operating United Nations development programme would provide the United Nations family of agencies with a highly adaptable instrument which could assume — and to which the General Assembly and the Economic and Social Council could assign — additional functions in the broad area of development and through which, consequently, increased financial contributions could be channelled, as major new resources were made available for international development aid purposes.

DOCUMENT E/3985

Report of the Economic Committee

[Original text: English]
[13 August 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President of the Council, Mr. Akira Matsui (Japan), considered at its 351st, 352nd, 353rd and 358th meetings on 7, 10 and 13 August 1964 item 10 of the Council's agenda which had been referred to it by the Council at its 1314th plenary meeting on 13 July 1964.

2. The Committee had before it the following documents: E/3905 and Add.1, E/3908, E/3917, E/3930, E/3934, E/3947 and E/CONF.46/66.

3. The Committee also received a draft resolution submitted by the delegations of Argentina, Colombia, Ecuador, France, and Japan (E/AC.6/L.310).

4. Since this draft resolution was subsequently withdrawn by the sponsors, the Committee has no recommendation to make to the Council in connexion with this item.

**International and regional symposia on industrial development:
report of the Secretary-General**

[Original text: English]
[18 June 1964]

INTRODUCTION

1. The present report is being submitted pursuant to General Assembly resolution 1940 (XVIII) which in operative paragraph 5 requested the Secretary-General to initiate consultation and studies with States Members of the United Nations and members of the specialized agencies, with the specialized agencies, the International Atomic Energy Agency, the regional economic commissions and the Committee for Industrial Development, on the advisability of holding, not later than 1966, an international symposium, preceded, as appropriate, by regional and sub-regional symposia, relating to the problems of industrialization of developing countries, and to report to the Economic and Social Council at its thirty-seventh session and to the General Assembly at its nineteenth session.

2. The Committee for Industrial Development, at its fourth session, adopted resolution 1 (IV) on international and regional symposia on industrial development (see annex B below), which in paragraph 3 further requested the Secretary-General to "submit to the Economic and Social Council, so that it may consider them and make recommendations to the General Assembly, in the light of the discussions in the Committee and the replies to the consultations referred to above, proposals concerning the organization of the symposia and the subjects to be discussed at these meetings as well as budgetary estimates for their adequate financing".

3. Part I of this report is concerned with the views and proposals that have been put forward by Governments and some of the results of the consultations undertaken with the regional economic commissions,

particularly as related to the arrangements for holding regional symposia and a tentative appraisal of the required preparatory work for the International Symposium. It consists of the following sections: (1) views expressed by Governments in respect to the scope and objectives of the symposia; (2) regional symposia, containing a description of the proposed arrangements and organization of the regional symposia on the ECA, ECAFE and ECLA regions; (3) International Symposium, containing a tentative outline of the preparatory work involved in the organization of the International Symposium on Industrial Development; and (4) preliminary budget estimates for each one of the regional symposia as well as for the International Symposium.

4. Part II of this report contains the replies received from Governments.¹ Replies received subsequently will also be circulated as addenda to the present document.

5. A list of subject suggested by Governments for discussion at the symposia and the texts of the resolutions adopted by the Committee for Industrial Development and the regional economic commissions appear as annexes A and B below.

PART I. SUMMARY OF VIEWS AND PROPOSALS RELATED TO THE SYMPOSIA

6. As requested in General Assembly resolution 1940 (XVIII), States Members of the United Nations and members of the specialized agencies, the heads of the specialized agencies and the IAEA, the regional economic commissions and the Committee for Industrial Development were invited to indicate their views on the advisability of holding, not later than 1966, an international symposium, preceded, as appropriate, by regional and sub-regional symposia, relating to the problems of industrialization of developing countries.

7. The replies received from Governments reflect a general consensus in favour of the proposal. About two thirds of the seventy-two replies from Governments received by mid-June 1964 support fully the proposal of holding an international symposium preceded by regional and sub-regional meetings. Twelve other replies which reflect a similar position include certain qualifications, in some cases related to the nature of the meetings. About ten replies express agreement in principle with the proposal but consider that the final decision on holding an international symposium should be subject to the results of the regional symposia. Two replies favoured the holding of regional and sub-regional symposia but did not consider appropriate an international symposium. One Government supported an international symposium but expressed doubts about the value of regional or sub-regional symposia. One Government expressed its inability to attend the proposed meetings.

8. The general consensus reflected in the replies from Governments was further apparent in the response of the regional economic commissions. The decisions

adopted in the respective meetings of the latter were wholly favourable to the proposal of holding an international symposium preceded by meetings at a regional level as appropriate (see annex B.) The regional economic commissions also expressed their interest in co-operating in the preparatory work for the International Symposium and put forward a number of suggestions in this respect. Considerable stress was laid on the preparation of country reports primarily by the developing countries themselves and the need to make assistance available to them for this purpose. Furthermore, in the case of ECA, ECAFE and ECLA arrangements were proposed for holding regional symposia, which are described in more detail in section 2 below. The ECE welcomed the suggestion of holding symposia on industrial development except in the ECE region and requested the Executive Secretary to co-operate in the preparation of the International Symposium and the regional symposia which may be held in other regions (see annex B).

9. In their replies, the specialized agencies and the IAEA stressed their willingness to co-operate with the Secretary-General in the proposed symposia.² In its twenty-ninth report to the Council the Administrative Committee on Co-ordination noted that "the response of the agencies to this proposal has been generally favourable and welcomed the steps being taken to invite the collaboration of the United Nations family of organizations".³

1. Views of Governments

10. While there appears to be considerable agreement on the essential aspects of the proposal for holding international symposia on industrial development, there have been a number of diverse suggestions on various matters relating to one or another aspect of the proposed symposia. An attempt has been made to summarize below the views on the nature of the symposia that have been put forward by Governments, either in reply to the consultations undertaken by the Secretary-General or in the discussions of the General Assembly, the Committee for Industrial Development and some of the regional economic commissions. A large number of these proposals were formulated in the context of other considerations or as isolated suggestions of a general nature subject implicitly to further elaboration as a more detailed framework for the symposia is being worked out. Thus, it was found necessary to consolidate some of the suggestions so as to avoid duplication and to group them broadly with a view to conveying the essential points.

11. The views expressed on the scope of the symposia stressed broadly the over-all importance of industrialization, the need to focus attention on the problems of industrial development and the mobilization of efforts under tangible programmes of action aimed at speeding up the industrialization of the less developed countries.

² The replies of the specialized agencies and the IAEA were issued in documents E/C.5/L.31 and Add.1.

³ *Official Records of the Economic and Social Council, Thirty-seventh Session, Annexes, agenda item 6, document E/3886, para. 91.*

¹ Part II of this report is contained in document E/3921/Add.1, circulated only in mimeographed form.

The detailed examination of specific subjects and proposals and the need to concentrate on the technical problems of industrialization were also emphasized.

12. Frequent mention was made of the need to exchange experience and information and the symposia were viewed as a vast process of consultation on the most appropriate methods of accelerating the process of industrialization in the developing countries. They have also been considered as an opportunity for the exploration and discussion of the various aspects of industrialization from the point of view of different countries at different levels and with different socio-economic systems. Their usefulness as a means of review and co-ordination of industrial development at an inter-regional level was also emphasized.

13. It was suggested that the regional symposia should be devoted to the substantive problems raised by industrialization in order to assist the Centre for Industrial Development in evaluating the nature and magnitude of the needs of the developing countries. It was also held that they should focus on the development of manufacturing industry in terms of human, institutional, material and financial resources of the developing countries.

14. In respect to the objectives to be achieved, the identification of the needs for international efforts and external assistance were frequently emphasized. Stress was also laid on the formulation of precise policies and the drawing up of a programme of action based on the examination of industrialization problems and a comparison of the experiences and results obtained in different countries. It was suggested that the results of the symposium should enable the United Nations to get a clear picture of the most urgent needs of the developing countries and give the latter more information about the outside assistance available.

15. There were also suggestions that the International Symposium should provide a follow-up to the United Nations Conference on Trade and Development and attempt to establish priorities in the process of industrialization. The development of a strategy of growth through industrialization and utilization of material resources has been frequently mentioned.

16. Some views tended to stress that at the symposia economists and technicians should study in detail well-defined aspects of industrial development while others tended to emphasize the need for a full-fledged international conference to establish basic policies for international action in this field. Related to the latter view was a suggestion that to undertake the necessary preliminary work a preparatory committee should be set up by the United Nations.

17. It was also suggested that the regional symposia should ensure adequate preparation for the International Symposium and that documentation should be prepared on the current and future situation in the developing countries and a complete analysis should be made of needs and resources by country and by branch of industry. The advanced countries should be invited to submit papers on the prospects of various branches of industrial

activity, in the light of the latest technical advances, with recommendations concerning the optimum level for new productive installations.

18. In respect to the preparatory work for the regional symposia, it was suggested that it should include country studies by the less developed countries providing comparable information of a narrative as well as statistical nature which could be circulated to all Member States and other concerned organizations in advance of the symposia. The developing nations themselves should prepare detailed country studies on problems of industrialization and on their development programmes.

19. A number of Governments have made specific suggestions on topics that might be taken up at the symposia. A summary list of the various subjects suggested is given in annex A.

2. Regional symposia

20. In compliance with the request contained in paragraph 5 of General Assembly resolution 1940 (XVIII), the question of holding international symposia on industrialization was taken up for consideration at the appropriate meetings of each one of the regional commissions. Their decisions and the proposals developed for action at the regional level are reported below for ECA, ECAFE and ECLA (see also annex B). The Economic Commission for Europe in its resolution 14 (XIX) requested its Executive Secretary to co-operate, in agreement with the Executive Secretaries of the other regional economic commissions concerned, in the preparation for, and follow-up of, the regional and sub-regional symposia which may be held in the other regions prior to the International Symposium; and to contribute in other forms, as requested by Secretary-General, to the preparation for and organization of the International Symposium itself.

Economic Commission for Africa

21. In its report on its second session (3-13 December 1963) the Standing Committee on Industry, Natural Resources and Transport of the Economic Commission for Africa:

“... endorsed the proposition of holding a world symposium and decided to call an industrial African conference to be held in 1965 and to be preceded by intensive preparations at sub-regional and sectorial levels as may be arranged jointly by the Executive Secretary and the Commissioner for Industrial Development within the available budgetary resources. The Committee noted that its own intensifying programmes of activities would be a substantial contribution to the success of both the African regional conference and the world conference.

“The Committee, in supporting these propositions, considered that a world symposium was essential for, and a visible evidence of, the intensification of United Nations activities in the field of industrialization and would be an opportunity for establishing closer contact among African countries and the

agencies in a position to provide finance and practical assistance and for promoting the transfer of industrial technology. The world conference would indeed provide, for those countries who were making at present strenuous efforts to achieve a larger degree of industrialization, the widest possible international forum to discuss the many problems arising; it would also serve to focus the world's attention on the needs and problems of industrialization and as a call to mobilize its resources for an over-all effort such as envisaged through the proclamation of the Development Decade."⁴

22. The report on the second session of the Standing Committee on Industry, Natural Resources and Transport was approved by the Economic Commission for Africa at its sixth session.⁵

23. The secretariat of ECA in consultation with the Centre for Industrial Development developed a number of tentative proposals for holding the African regional symposium as envisaged by the Commission. It is anticipated at this stage that the meeting would be held in the last quarter of 1965 and that its duration would be limited to about two weeks or twelve working days. All African countries would be invited to attend and it is expected that on the average each delegation would consist of about two or three representatives.

24. It is expected that a detailed agenda will be developed following further consultations with the member countries of ECA and in the light of results of a number of consultative meetings of a sub-regional character on problems related to specific sectors of industry which have already been programmed for the second half of 1964 and the early part of 1965.

25. In general terms it is envisaged at this stage that the regional symposium will be concerned primarily with an examination of the problems and prospects of industrial development at the country level and at the regional level and that the agenda is likely to be built around the following proposed documentation:

(a) *Country reports*, including a brief review of the status and importance of manufacturing in the economy; structure of manufacturing industry; institutional, service and promotion facilities for industry, Government policies, industrialization programmes and major projects.

(b) *Regional and sub-regional studies* related to the prospects of joint action for the establishment of specific industries on a wider market basis. These studies would also include a survey of common problems facing industrialization efforts throughout the continent.

(c) *Sectoral studies* covering some of the major industrial sectors such as iron and steel, chemicals and fertilizers, textiles, engineering, food industries, building materials, etc. These studies would examine the market prospects, existing production, technological and cost aspects, infrastructure and capital requirements, etc.

⁴ E/CN.14/245, paras. 8 and 9.

⁵ See *Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 10*, para. 145.

(d) *Functional studies* would refer to industrial research, standardization, technological information, training, financing, Government measures and investment laws, international trade aspects of industrialization, small-scale industry services, etc.

(e) *External aid* — documentation under this subject would cover information on bilateral and multilateral aid activities. It would also include a consolidated statement of technical assistance requirements as reflected in the other documentation submitted to the symposium.

Economic Commission for Asia and the Far East

26. In its report on its sixteenth session (27 January-3 February 1964) the Committee on Industry and Natural Resources of the Economic Commission for Asia and the Far East:

"... regarded as highly opportune the proposal set forth in General Assembly resolution 1940 (XVIII), for convening, not later than 1966, an international symposium, preceded, as appropriate by regional and sub-regional symposia, relating to the problems of industrialization of developing countries; it expressed its unanimous approval of this measure and requested the Executive Secretary to take all necessary steps to ensure adequate and appropriate Asian participation in the symposium, including, if the need were to make itself felt after detailed examination, the convening of an Asian regional symposium on industrialization, to precede the international symposium, in 1965.

"The Committee felt that these symposia should take up specific projects rather than generalities. In particular, the regional symposium could recommend the technical subjects of interest to the region for discussion at the world symposium in 1966. The regional meeting should consider industries in which many countries of the region have indicated interest, such as iron and steel, aluminium, fertilizer, small scale industry and utilization of natural gas as an energy resource and for industrial use through joint efforts of the countries of the region. The regional meeting could take stock of the degree to which industrialization has been achieved in the developing countries of the region and of the difficulties encountered by those countries in their efforts to industrialization. It might also discuss the role of the more advanced countries in promoting industrialization in the developing countries of the region. It could consider priorities in regional co-operation and the possibilities for trade liberalization which was considered to be closely linked with the establishment of joint ventures on a regional and sub-regional basis.

"The regional meeting might also examine the requirements of technical and managerial personnel for industrial development in countries of the region, the facilities available for training them and the extent of outside assistance required.

"The Committee considered that the work programme of the secretariat and the creation of the proposed regional industrial planning and promotion centre were in line with the preparatory effort required for the symposium. It felt that the national plans

of the countries of the region should be examined and information collected on industrialization procedures and experiences.

"In preparing for the symposium, information should be sought from the advanced countries on their experience in giving and ensuring utilization of aid. The Committee asked the secretariat to request the Governments of the countries of the region for their views on topics suitable for discussion at the symposium.

"In order to focus attention on this important matter, the Committee suggested that the main objectives of the symposium should be:

"(a) To examine the procedures and the steps for industrialization so far practised in the developing countries, to assess their success and to identify measures for improvement and for better utilization of resources;

"(b) To consider the needs of developing countries in further accelerating their industrial development programmes and to recommend specific measures to establish and/or expand appropriate industries;

"(c) To consider the applicability of modern technological methods and techniques to developing countries in the establishment of the above industries;

"(d) To promote the organization of industrial feasibility surveys in those countries where coherent industrial development plans had not yet been formulated;

"(e) To examine technical and managerial personnel required for industrial development and training facilities required;

"(f) To examine the role and effectiveness of outside assistance from international financial institutions, Governments and private sources in promoting industrial development in the developing countries;

"(g) To consider possible co-ordinated establishment of industrial projects as joint ventures on a regional and sub-regional basis.

"The Committee requested member countries of the region to prepare country studies, with the assistance of the secretariat as required, which could serve as background papers for the symposium; it suggested these studies should include all relevant information regarding resources, markets and also the experience so far gained in investment promotion."⁶

27. At its twentieth session, the Economic Commission for Asia and the Far East approved the report of the Committee on Industry and Natural Resources and also adopted resolution 52 (XX) in which it welcomed the suggestion to convene a world symposium on industrialization in 1966 and invited the member countries of the region to give their full support to and participate in the proposed symposium.

28. The Commission considered that the convening of an Asian regional symposium on industrialization

in 1965 to precede the proposed world symposium in 1966 might be advisable. However, as two sessions of the Committee on Industry and Natural Resources would take place before the world symposium was convened, it might be possible to use the meetings of the Committee as preparatory meetings for that symposium. The Commission felt that the next meeting of the Committee on Industry and Natural Resources should devote itself primarily to the subjects to be considered at the world symposium. The question as to whether a separate regional symposium should be held was then discussed. It was felt that the regional meeting, if held, should devote particular attention to specific projects. In that connexion, a suggestion was made that priority be given to the consideration of: (a) measures for the establishment and/or expansion of specific industries; (b) the possible establishment of industrial projects as joint ventures on a regional and sub-regional basis, as directed by the Ministerial Conference on Asian Economic Co-operation.

29. In the light of the discussions of the Commission and the Committee on Industry and Natural Resources, the Executive Secretary of ECAFE, after further consultations, proposed arrangements for holding a symposium on industrial development for the ECAFE region. The next session of the Committee on Industry and Natural Resources would be utilized as a preparatory meeting for the regional symposium. ECAFE suggested tentatively the following items for the agenda of the regional symposium;

(a) Over-all evaluation of progress and problems of industrialization in the ECAFE region;

(b) Factors affecting rate of growth of industries in the developing countries of the ECAFE region;

(c) Present status and future prospects in the development of key industries in countries of the ECAFE region including projections of industrial development possibilities;

(d) Institutional requirements for development of industries;

(e) Possible regional arrangements in the development of industries through joint efforts of countries of the ECAFE region;

(f) Industrialization and foreign trade;

(g) External assistance for industrialization;

(h) Recommendations on items to be discussed at the world symposium on industrialization in 1966;

(i) Resolutions;

30. In connexion with the above items the documentation to be prepared would include:

(i) A paper outlining the main characteristics of industrialization in the region with special attention to objectives and achievements in sectors like employment, import substitution, export diversification etc; a series of country reports to be prepared by countries themselves on their national programmes of industrial development, the present structure of their industry and the future growth prospects and requirements.

⁶ E/CN.11/652, paras. 117-123.

(ii) Studies dealing with economic, technical, institutional and infrastructure factors affecting the rate of growth of industrialization in the countries of the ECAFE region.

(iii) Studies by major sectors of industry such as aluminium, industries based on natural gas, iron and steel, and engineering industries, chemicals, petrochemicals, fertilizers, paper and pulp, textiles, food processing, silicate industries and small-scale industries.

(iv) Functional studies including industrial financing and credit institutions, training, industrial research, standardization and marketing, and industrial co-operatives.

(v) A study on the possibilities of joint or regional action on the basis of documentation prepared by ECAFE, the sectorial studies and consultations in the countries.

(vi) Studies on promotion of export countries.

Economic Commission for Latin America

31. The Committee of the Whole of the Economic Commission for Latin America, at its tenth session (12-14 February 1964) adopted, resolution 242 (AC.57) on activities in the field of industrial development (see annex B).

32. In line with the above-mentioned resolution, plans for the eleventh session of ECLA include a comprehensive review of the industrialization process in Latin America aiming at: (a) an over-all evaluation of Latin America's industrialization process; (b) a systematic review of the current characteristics of Latin American industry; and (c) an analysis of industrialization policies as well as Government measures and institutional facilities in this field. Furthermore, the Commission will also be convened with the requirements and prospects for programming and regional integration of a number of specific industrial sectors such as the metal transforming industries, chemical industries, iron and steel, textiles and pulp and paper.

33. In the light of the high priority assigned by the Commission to industrial development, it is expected that a regional meeting on industrialization will be convened within an adequate lapse of time from the Commission's eleventh session, possibly in conjunction with the first meeting of the standing committee on industry which ECLA may establish at its eleventh session. This meeting, that would in fact represent the regional symposium for Latin America, would be held late in 1965 or early in 1966. Its main purpose would be to provide follow-up action in respect to the regional industrial integration issues discussed at the Commission's eleventh session. It would also provide an appropriate framework for reviewing the country surveys which will be prepared by the Governments of the area. Furthermore, it would involve a number of studies on specific sectors of industry such as iron and steel, mechanical and machine building industries, petrochemicals, automotive and transport equipment industries as well as small-scale industries. Special studies on export industries and institutional aspects of industrialization would also be prepared.

3. International Symposium

34. The Committee for Industrial Development, at its fourth session, in its resolution 1 (IV) welcomed the suggestion of holding symposia on industrial development and went on to state that it regarded the "regional and sub-regional symposia as preliminary steps for holding of the international symposium" (see annex B). Thus, the Committee viewed the regional symposia and the International Symposium as successive steps in the implementation of the programme initially proposed in the General Assembly. The views expressed by Governments and the actions proposed by the regional economic commissions, especially in the case of ECE, also reflect a considerable consensus on this type of functional relationship whereby the regional symposia, while of considerable value in themselves, would be organized primarily as preparatory stages for the international meeting.

35. The existence of a general consensus is also apparent in respect to the need to clarify and bring into sharper focus the problems connected with the achievement of accelerated industrialization and the efforts required to speed up the industrial development of the developing countries. While it would seem premature at this stage to attempt to formulate an agenda for the International Symposium, it is possible to outline in broad terms, and in the light of the views and proposals reviewed above, the basic elements that would be involved in the preparatory work for the International Symposium.

36. A major contribution to the preparatory work for the International Symposium will be represented by regional symposia which ECA, ECAFE and ECLA propose to hold along the lines reflected in section 2 above. The results of the regional symposia would reflect as fully as possible the problems and requirements as well as the future prospects of industrialization in the developing countries. They would also lead to a clearer picture of the existing opportunities for action at the regional level. Thus, a series of guidelines may emerge for the harmonization of the industrial development programmes of the developing countries and for a rational approach to the problems of industrial integration at the regional or sub-regional level.

37. Parallel with the preparation and organization of the regional symposia additional preparatory work will be required so as to establish an appropriate framework for viewing the national and regional activities not only in their own context but also in relation to each other and the world economy as a whole. Thus, the International Symposium will serve to link the results of a thorough review of the specific problems of industrialization of the developing areas to the developments in the advanced countries which are to a large extent shaping the world economic situation and the external aid that may be available for accelerating industrialization of the developing countries. The preparatory work for the International Symposium would therefore have to be complementary to that undertaken for the regional symposia so as to provide a basis for a comprehensive assessment of the problems involved,

with full awareness of the interests of both the developing and the advanced countries and an adequate knowledge of the possibilities and requirements of accelerated industrialization.

38. The documentation to be prepared for the International Symposium as well as for the regional symposia will naturally follow in detail the established agenda in each case. In general terms, however, it is possible to envisage at this stage that simultaneously with the documentation and studies to be prepared for the regional symposia it will be necessary to undertake from the outset the preparation of documentation for the International Symposium along the following broad lines:

(i) Studies on subjects of major importance relating to problems common to most industrializing countries. These studies would cover topics such as industrial programming and policies, development of institutional and other factors required for accelerated industrialization, conditions for the development of export industries and promotion of exports of manufactures and semi-manufactures from developing countries, technical and industrial training of manpower, and orientation and direct application of new developments in science and technology to the problems of under-developed areas.

(ii) Documentation contributed largely by the advanced countries covering such subjects as (a) a description of their institutional services and facilities for promoting industry which may be of interest to developing countries, (b) a discussion of their industrial policy and the range of significant problems encountered as well as the measures and instrumentalities used to solve them, (c) a review of their policies with respect to scientific and technological research relevant to industrial development and the institutions doing work in this field within the country, (d) a list of the institutions undertaking broad structural and market studies related to specific sectors of industry, (e) a description of training programmes and facilities connected with industrial development, (f) a survey of the international assistance provided to developing areas particularly in respect of industry, (g) other aspects of the country's industrial development which may be considered particularly relevant for discussion at the International Symposium.

(iii) Consolidated review of the external assistance available for industrialization through bilateral and multilateral channels and from both private and public sources; survey of the availability of finance and technical know-how for the establishment of new industries.

(iv) Studies by branches of industry designed to reflect the over-all picture of the situation and prospects of the major industrial sectors on a world-wide basis as regards technology, output, markets, supply of raw materials, etc. Their purpose would be to provide the necessary background information for evaluating opportunities and requirements of the developing countries in terms of specific industrial branches.

(v) Consolidated reports on the major subjects considered at the regional symposia, including analytical reviews of common elements at a regional level as well

as relevant particularities of major significance for the countries involved and the region as a whole.

(vi) Consolidated review of the requirements, possibilities and prospects of the developing countries as reflected in the country studies submitted at the regional symposia, intended to provide guidelines for their comprehensive examination at the International Symposium.

39. Of the studies enumerated above only those related to items (v) and (vi) would be undertaken in the light of the results of the regional symposia. Preparation of the other studies would have to begin at the earliest possible stage and proceed parallel with the preparatory work for the regional symposia. In particular, action in respect to items (i), (ii) and (iv) would have to be initiated as soon as possible to ensure that the necessary time is available for adequate coverage and careful preparation of the documentation involved.

4. *Estimated budgetary requirements*

40. The preparatory work for the regional symposia will be carried out largely by ECA, ECAFE and ECLA in co-operation with the Centre for Industrial Development and the ECE. It is expected that the existing work programmes in the field of industrial development of the regional economic commissions will be oriented as far as possible towards the needs of the regional symposia. The additional requirements are reflected in the tentative budget estimates submitted respectively by ECA, ECAFE and ECLA which are shown below.

41. In respect to the International Symposium only a rough indication can be given at this stage of the budgetary requirements. Thus, the tentative budget estimates given below should be taken as a broad indication of the over-all magnitude of the total financial requirements involved.

42. It should be emphasized that in each case the budgetary estimates have been prepared with due regard to the fact that existing resources and facilities would be utilized to the maximum possible extent. In the case of the Centre for Industrial Development as much of the regular staff as would be possible within the limits of the authorized priority work programme would be devoted to preparatory work for the symposia. Maximum use would also be made of the staff and other technical resources of ECE. The industry staff of the other regional commissions would naturally be directly involved in the preparation and organization of the regional symposia. Further, reduction in over-all costs would be achieved in respect to ECA where the Standing Committee on Industry, Natural Resources and Transport would meet simultaneously with the African regional symposium; and in respect to ECAFE whose Committee on Industry and Natural Resources would at its coming meeting act also as a preparatory committee for the regional symposium in the area. The considerably lower estimates submitted for the Latin American regional symposium are to a large extent a

reflection of the fact that the eleventh session of ECLA will take up as a major subject the regional aspects of industrialization for which the preparatory work will be largely completed in 1964.

Tentative budget estimates for an African conference on industrial development

	1965 United States dollars	1966 United States dollars
1. Assistance to Governments in the preparation of country surveys (travel and <i>per diem</i> of staff and/or provision of short-term consultants, editing and reproduction, etc.)	45,000	—
2. Sectoral studies of the following industrial branches: iron and steel, chemicals and fertilizers, textiles, engineering and other metals, building materials, food industries (cost of consultant services, travel and <i>per diem</i>)	60,000	—
3. Special studies on institutional and regional aspects of industrialization (staff consultants, travel and <i>per diem</i> , secretarial assistance, etc.)	80,000	—
Tentative subjects:		
(a) Industrial and technological research,		
(b) Development of export industries,		
(c) Regional aspects of industrial development in Africa,		
(d) Financing and promotion of industry,		
(e) Governmental policies and measures in the field of industry,		
(f) Industrial training,		
(g) Small-scale industry,		
(h) External aid		
4. Conference costs (language and meeting staff and services)	25,000	—
5. Travel and <i>per diem</i> of secretariat staff in connexion with preparation and organization of conference	16,000	—
6. Printing and publication of proceedings	—	4,000
TOTALS	226,000	4,000

TOTALS	237,000	530,000

ANNEX A

Summary list of subjects suggested by Governments for consideration at the symposia

A number of Governments have suggested various subjects for discussion at the symposia. The list given below is intended as an indication of the various topics of a substantive nature suggested by Governments. No attempt has been made to classify these suggestions within a rigid framework. It was, however, frequently necessary to consolidate several of them dealing with the same subject in order to avoid duplication.

Progress made in the elaboration and execution of national industrialization plans in the developing countries.

Common problems of development at regional and/or inter-regional levels.

Industrial development in small economies; possibilities of regional industrial integration to compensate the smallness of national markets and the inadequacy of national resources.

The improvement of training and administration in the matter of industrial technology, production, programming and planning.

Priorities for industrialization in different countries.

Analysis of the process of industrialization and comparison of the experience of countries with different economic systems.

Problems related to the development of new techniques appropriate for the conditions of the under-developed countries; technical production methods in countries with surplus manpower.

Establishment of technological institutes capable of training highly qualified technical and research staff.

Intensification of scientific research into the problems of industrial production, programming and planning.

Effective use of industrial technology by developing countries, including the publication of existing information, research on the creation or adaptation of industrial technology geared to the needs of developing countries, and dissemination of industrial patents.

Collection, analysis, interpretation and publication of data on industrial production, programming and planning.

Collection and use of industrial statistics.

International measures for the promotion and expansion of exports of manufactured and semi-manufactured products from the developing to the advanced countries.

Influence of industrialization on the balance of trade and payments.

Effects of the establishment of new industries on the international division of labour and mutual economic co-operation with particular regard to securing the means for the financing of industrial development.

Credit policies designed to promote the industrial expansion of the developing countries and to stimulate their exports of manufactures and semi-manufactures.

Fiscal and tax policies for industrial development.

Industrial financing, planning and promotion of investment in industry; the role of industrial development banks.

Concentration of material and financial resources on the most important sectors of the economy; the role of the public sector and public financing to accelerate industrial development.

Financial and material requirements of plans concerned with the utilization of natural and energy resources; problems of development of power and fuel resources.

Exploitation of natural resources for the purpose of industrialization; development of agriculture as a raw-material basis for industry.

Complementarity of industrial and agricultural growth.

The efficient use of existing resources and the creation of new industrial products aimed at increased industrial productivity and the diversification of the economies of the developing countries.

Design and marketing of industrial products.

Prerequisites for the establishment of industries related to the natural and economic conditions of the country, which would determine the structure of their economy and establish the conditions for the development of other industrial branches.

Ways and means of meeting the needs of machines and equipment for the establishment of new industries.

Conditions for obtaining building materials needed for the expected industrial construction.

Manpower assessment and planning in the industrialization of developing countries; labour mobility, regional planning and training for industry.

Adoption of programmes, on a national, regional and international level, for the intensification of industrial training of personnel from developing countries.

Technical and institutional aspects of industrialization.

Ways and means of assisting the developing countries to set up an organization and a system for management and planning the industrial development within the framework of the aggregate economic development.

Technical assistance for the industrial development of developing countries.

Evaluation of the effectiveness of existing international machinery in the field of industrial development, and the establishment of additional machinery including, in particular, a specialized agency for industrial development.

National, regional and international action directed to speed up the industrial development of developing countries.

ANNEX B

Resolutions adopted by the Committee for Industrial Development and the regional economic commissions relating to the holding of international and regional symposia on industrial development^a

RESOLUTION 1 (IV) ADOPTED BY THE COMMITTEE FOR INDUSTRIAL DEVELOPMENT ON 17 MARCH 1964

International and regional symposia on industrial development

The Committee for Industrial Development,

Recalling General Assembly resolution 1940 (XVIII), dated 11 December 1963, which, in paragraph 5 requested the Secretary-General "to initiate consultation and studies with States Members of the United Nations and members of the specialized agencies, with the specialized agencies, the International Atomic Energy Agency, the regional economic commissions and the Committee for Industrial Development, on the advisability of holding, not later than 1966, an international symposium, preceded, as appropriate, by regional and sub-regional symposia, relating to the problems of industrialization of developing countries",

Bearing in mind the key role of industrial development in achieving higher standards of living, full employment and economic and social progress,

Considering further the variety and complexity of the problems involved in the process of industrialization,

Convinced that to accelerate the process of industrial development of the less developed countries additional efforts will be required from the developing as well as from the developed countries,

Noting the response of the regional economic commissions, the specialized agencies and the IAEA to the consultations undertaken by the Secretary-General in compliance with the General Assembly's request,

1. Welcomes the suggestion of holding symposia on industrial development and regards regional and sub-regional symposia as preliminary steps for holding of the international symposium referred to in resolution 1940 (XVIII), utilizing for this purpose, as far as possible the facilities of the regional economic commissions and those of the Committee for Industrial Development;

2. Requests the Secretary-General to continue his consultations with Member Governments and report on their results to the Economic and Social Council so that the Council may consider them at its thirty-seventh session and make recommendations to the nineteenth session of the General Assembly;

3. Requests further the Secretary-General to submit to the Economic and Social Council, so that it may consider them and make recommendations to the General Assembly, in the light of the discussions in the Committee and the replies to the consultations referred to above, proposals concerning the organization of the symposia and the subjects to be discussed at these meetings as well as budgetary estimates for their adequate financing;

4. Invites the Governments of States Members of the United Nations and members of the specialized agencies, the regional economic commissions, the specialized agencies and the IAEA to co-operate with the Industrial Development Centre in the preparatory work for the symposia;

5. Further invites the Governments of the developing countries to prepare surveys and studies of their industrialization process for submission at the regional symposia and the international symposium;

6. Directs the Industrial Development Centre to assist Governments in the preparation of the country studies mentioned in paragraph 5 above.

RESOLUTION 52 (XX) ADOPTED BY THE ECONOMIC COMMISSION FOR ASIA AND THE FAR EAST ON 11 MARCH 1964

Activities in the field of industrial development

The Economic Commission for Asia and the Far East,

Taking note of the General Assembly resolution 1940 (XVIII) on "Activities in the field of industrial development" requesting the Secretary-General of the United Nations to consult with, among others, the regional economic commissions, on the advisability of holding, not later than 1966, an international symposium, preceded as appropriate, by regional and sub-regional symposia, relating to the problems of industrialization of developing countries,

Mindful of the importance of industrial development to the economies of the developing countries,

1. Welcomes the suggestion to convene a world symposium on industrialization in 1966;

2. Invites the member countries of the region to give their full support to and participate in the proposed symposium;

3. Suggests that the main objectives of the symposium be:

(a) To examine the measures adopted for accelerating industrial development in the developing countries, to assess their success and to identify measures for improvement and for better utilization of resources;

(b) To consider the needs of developing countries in further accelerating their industrial development programmes and to recommend measures for the establishment and expansion of industries,

(c) To consider the applicability of modern technological methods and techniques to developing countries in the establishment of the above industries,

(d) To promote the organization of industrial feasibility surveys, particularly in those countries where coherent industrial development plans have not yet been formulated,

(e) To examine questions of technical and managerial personnel required for industrial development and training facilities required,

(f) To examine the part external assistance can play in promoting industrial development in the developing countries, and

(g) To consider possible co-ordinated establishment of industrial projects as joint ventures on a regional and sub-regional basis;

4. Invites member countries of the region to prepare country studies, with assistance of the secretariat as required, which could serve as background papers for the symposium;

5. Suggests that these studies include all relevant information regarding resources, markets and also experience so far gained in the developing countries.

^a In respect to the Economic Commission for Africa, the decision taken at the second session of the Standing Committee on Industry, Natural Resources and Transport of the ECA is contained in paragraph 21 above.

RESOLUTION 14 (XIX) ADOPTED BY THE ECONOMIC COMMISSION
FOR EUROPE ON 30 APRIL 1964

*Activities in the field of industrial development with reference
to General Assembly resolution 1940 (XVIII)*

The Economic Commission for Europe,

Recalling paragraph 5 of General Assembly resolution 1940 (XVIII),

Bearing in mind the request of the Secretary-General to the Executive Secretary that he ascertain the view of the Commission on the advisability of holding, not later than 1966, an international symposium on problems of industrialization of developing countries and of holding, prior to the above symposium, a regional symposium or sub-regional symposia in the ECE region on the same subject,

Noting that the Secretary-General, in his message to the nineteenth session of the Commission, expressed his appreciation for the assistance the Commission was furnishing to United Nations activities designed to speed industrialization and promote rational utilization of the resources of developing countries, while urging that the Commission not turn away from or neglect its basic tasks in its own region,

Determined to co-operate in every practical and effective way possible with the programme of the United Nations for furthering the industrial development of the developing nations,

1. Requests the Executive Secretary to take action as follows:

- (a) To prepare various studies on problems of industrialization,
- (b) To co-operate in agreement with the executive secretaries of the other regional economic commissions concerned, in the preparation for, and follow-up of, the regional and sub-regional symposia which may be held in the other regions prior to the international symposium, and
- (c) To contribute in other forms, as requested by the Secretary-General, to the preparation for and organization of the international symposium itself;

2. Welcomes the suggestion of holding symposia on industrial development except in the ECE region and regards regional and sub-regional symposia as preliminary stages for the holding of the international symposium, referred to in General Assembly resolution 1940 (XVIII), utilizing for this purpose as far as possible the facilities of the regional economic commissions and of the Committee for Industrial Development; and bearing in mind the need to take into account the results of the Secretary-General's consultations with Governments referred to in the resolution mentioned above;

3. Requests the Executive Secretary to reply to the questions of the Secretary-General in the sense of this resolution;

4. Invites the Executive Secretary to report on the execution of this resolution to the twentieth session of the Commission.

RESOLUTION 242 (AC.57) ADOPTED BY THE COMMITTEE OF THE
WHOLE OF THE ECONOMIC COMMISSION FOR LATIN AMERICA ON
13 FEBRUARY 1964

Activities in the field of industrial development

The Committee of the Whole of the Economic Commission for Latin America,

Considering that industrialization is one of the most important elements in the economic development of Latin America,

Bearing in mind the studies by the secretariat on the general problems of Latin American industry and on its growth, promotion and financing, together with the analyses made of the basic and dynamic industrial sectors,

Taking into account resolution 1940 (XVIII) of the United Nations General Assembly which, among other things, requests the Secretary-General to initiate consultation with States Members of the Organization, with various international agencies and with the regional economic commissions on the advisability of holding, not later than 1966, an international symposium, preceded by regional and sub-regional symposia, relating to the problems of industrialization of developing countries,

Decides:

1. To take note with satisfaction of the work being done by the secretariat in the industrial field;
2. To welcome the General Assembly's recommendation in resolution 1940 (XVIII) regarding the holding of an international symposium on the problems of industrialization of developing countries;
3. To ask that the secretariat, at the eleventh session of the Commission, to be held in 1965, give special importance to studies of Latin America's problems of industrial development and integration, and that these studies, and the Commission's discussions on that occasion, should serve the purposes of the regional symposium whose convening is recommended in the said General Assembly resolution;
4. Further to ask the secretariat to increase, as far as possible, the number of industrial sectors under study, and to take due account, in the studies in question, of the essential elements of the regional integration of Latin American industry.

PART II

[Part II of this report is contained in document E/3921/Add.1, circulated only in mimeographed form.]

DOCUMENT E/3974

Report of the Economic Committee

[Original text: English]
[12 August 1964]

1. The Economic Committee, under the chairmanship of the first Vice-President of the Council, Mr. Akira Matsui (Japan), at its 349th to 353rd meetings on 5, 7 and 10 August 1964 considered item 11 of the Council's agenda (Activities in the field of industrial development),

which had been referred to it by the Council at its 1342nd meeting on 4 August 1964.

2. The Committee had before it the following documents: report of the Committee for Industrial Develop-

ment on its fourth session (E/3869); international and regional symposia on industrial development: report of the Secretary-General (E/3921) and replies from Governments (E/3921/Add.1).

3. The Committee also had before it the following draft resolutions in connexion with its consideration of this item:

(i) Draft resolution I submitted by the Committee for Industrial Development (E/3869, chap. VII);

(ii) Draft resolution II submitted by the Committee for Industrial Development (*ibid.*); and amendments to this draft resolution by Algeria, Argentina, Cameroon, Chile, Colombia, Ecuador, Ghana, India, Indonesia, Iran, Iraq, Mexico, Senegal, United Arab Republic and Yugoslavia (E/AC.6/L.303), and by the United States of America (E/AC.6/L.304);

(iii) A draft resolution submitted by Chile, Colombia, Czechoslovakia, India, Indonesia, Iran, Iraq, Senegal, Union of Soviet Socialist Republics, United Arab Republic, United Republic of Tanganyika and Zanzi-

bar, United States of America and Yugoslavia (E/AC.6/L.305 and Corr.1).

4. The Committee approved draft resolution I by 22 votes to none, with no abstentions.

5. The representative of the United States having withdrawn his amendment (E/AC.6/L.304) to draft resolution II of the Committee for Industrial Development, the Committee approved the fifteen-Power amendments (E/AC.6/L.303) by 15 votes to none, with 8 abstentions. It then approved draft resolution II, as amended, by 16 votes to 8, with no abstentions.

6. The delegation of Ecuador having joined the sponsors of the thirteen-Power resolution (E/AC.6/L.305 and Corr.1), the Committee approved this text by 22 votes to none, with no abstentions.

7. The Committee therefore recommends the adoption by the Council of the following draft resolutions:

[*Texts adopted by the Council without change. See below, "Resolutions adopted by the Economic and Social Council".*]

RESOLUTIONS ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1030 (XXXVII). Activities in the field of industrial development

A

UNITED NATIONS MACHINERY IN THE FIELD OF INDUSTRIAL DEVELOPMENT

The Economic and Social Council,

Recalling General Assembly resolutions 1525 (XV) of 15 December 1960, 1712 (XVI) of 19 December 1961, and 1821 (XVII) of 18 December 1962 and Council resolutions 873 (XXXIII) of 10 April 1962 and 969 (XXXVI) of 25 July 1963,

Bearing in mind the recommendations of the Committee for Industrial Development at its fourth session⁷ concerning organizational changes in the field of industrial development, in response to General Assembly resolution 1940 (XVIII) of 11 December 1963,

Bearing further in mind the recommendations of the Committee for Industrial Development at its earlier sessions concerning general guidelines for the work of the Industrial Development Centre, and in particular the provisional definition of industrialization set forth in the report of the third session,⁸

Expressing its appreciation for the contribution made by the Industrial Development Centre, under the leadership of the Commissioner for Industrial Development,

to the intensification and improvement of United Nations activities in the field of industrial development,

1. *Requests* the Secretary-General to make any necessary changes in organization and procedures required in order that the Industrial Development Centre may carry out, without prejudice to the continuation of activities now being performed by the Centre and other parts of the United Nations system, in accordance with relevant resolutions and taking into account the views expressed in the Committee for Industrial Development at its fourth session, a dynamic programme of activities involving *inter alia* the following principles and functions:

(a) The essential *modus operandi* of the Centre would be that of an activating and catalytic agent, centrally concerned with industrial development policy and overall progress in the field of industrialization and capable of promoting appropriate arrangements by the developing and advanced countries with a view to meeting the opportunities and needs of industrialization through the availability of adequate facilities and services;

(b) Promotion of industrial development projects through the provision of assistance, in consultation with the resident representatives, in the formulation of requests by Governments for technical assistance under the programmes of the Special Fund, the Expanded Programme of Technical Assistance, and the United Nations programmes of technical assistance;

(c) Study of the economic and technical problems of industrialization with the assistance, where appropriate, of panels of scientists and technical specialists of recognized standing in various sectors of industry, whose

⁷ *Official Records of the Economic and Social Council Thirty-seventh Session, Supplement No. 6., chap. VI.*

⁸ *Ibid.*, *Thirty-sixth Session, Supplement No. 14*, para. 89.

views on the problems of the developing countries would be sought by correspondence;

(d) Establishment of *ad hoc* working groups of high-level experts to deal with technical subjects which are intended for submission to the Committee for Industrial Development, with the purpose of providing the Committee with an evaluation of the work of the Centre in the respective field of the *ad hoc* working group as well as an assessment of the general orientation and progress within that field;

(e) Assistance to the developing countries in the establishment and strengthening of national institutions, such as industrial development boards, programming offices, industrial promotion centres, engineering and technological institutes, that could provide special stimulus to the growth of industry;

(f) Establishment of close contacts with those persons and institutions in the developing countries directly concerned with industrialization and those in the advanced countries who can help them, with a view, *inter alia*, to promoting arrangements for carrying out joint or participation projects;

(g) Establishment of a more adequate documentation service to maintain contacts with the sources and users of technical data, and provision of assistance in the establishment or strengthening of adequate technical information services in the developing countries, including the organization of training programmes for technical information officers;

(h) Development of a periodic world industrial development survey to provide a review and assessment of developments which may be significant for the industrialization programmes of the developing countries and to review the over-all progress achieved in the field;

(i) Effective co-ordination by the United Nations system of its activities in the field of industrial development in order to avoid unnecessary duplication of the work which is carried out by the United Nations family; to that effect, the Centre should follow closely the activities of the various organizations, undertake joint projects and make arrangements for adequate reporting to the Committee for Industrial Development and the Economic and Social Council;

(j) Undertaking of research which would be of practical use to the developing countries through the preparation or contracting of specific studies and by providing a channel through which studies from the research facilities of States Members of the United Nations or members of the specialized agencies may be made available to the developing countries;

2. *Decides* that the Committee for Industrial Development shall, in co-operation with the Economic and Social Council, be responsible for providing general policy guidance to the Commissioner for Industrial Development;

3. *Recommends* that adequate budgetary provisions be made for the Industrial Development Centre so as to provide it with the necessary operational strength to fulfil the requirements of a dynamic programme as

outlined above, including provision for the travel of members of the staff of the Centre in order to assist Governments whenever necessary, in the formulation and implementation of programmes and projects in the field of industrial development and to maintain close co-operation with the regional economic commissions;

4. *Recommends further* that the Secretary-General maintain flexibility with respect to the programming and administration of activities in the field of industrial development, in keeping with their complex nature and changing requirements;

5. *Requests* the Secretary-General, in connexion with his annual budget estimates and in consultation with the Advisory Committee on Administration and Budgetary Questions as required, to identify in a separate annex the resources provided in those estimates for industrial development activities;

6. *Further requests* the Secretary-General to draw the attention of Governments of States Members of the United Nations or members of the specialized agencies to his authority to receive voluntary contributions for special purposes in accordance with sections 7-2 and 7-3 of the United Nations Financial Regulations, and to inform them that such voluntary contributions may be made for activities in the field of industrial development, including joint or participation projects;

7. *Welcomes* the decision taken by the Technical Assistance Committee at its session held on 12-13 December 1963 designed to make available for industrial development additional funds from part V of the regular budget;⁹

8. *Invites the attention* of Governments of developing countries to the opportunities for obtaining increased assistance for their industrial development, within their over-all development programmes, from various elements of the United Nations system through the formulation of new project requests;

9. *Invites the attention* of Governments of developing countries to the possibility of applying to the Special Fund to provide preparatory allocations to assist in the formulation of projects in the field of industrial development;

10. *Decides* that the foregoing arrangements are subject to review in the light of any other organizational changes in the field of industrial development that may be deemed necessary.

*1348th plenary meeting,
13 August 1964.*

B

UNITED NATIONS MACHINERY IN THE FIELD OF INDUSTRIAL DEVELOPMENT

The Economic and Social Council,

Bearing in mind the view of the General Assembly, expressed in its resolution 1940 (XVIII) of 11 December 1963, that there is a need to carry out changes in the

⁹ *Ibid.*, *Thirty-seventh Session, Annexes*, agenda item 19, document E/3849, annex IV.

existing United Nations machinery so as to provide an organization capable of dealing with the problems of developing countries, in order to intensify, concentrate and expedite United Nations efforts for industrial development,

1. *Takes note with appreciation* of the working paper by the Secretariat on United Nations machinery in the field of industrial development;¹⁰

2. *Declares* that there is an urgent need to establish a specialized agency for industrial development within the framework of the United Nations family, in order to assist developing countries in the promotion and acceleration of industrialization;

3. *Requests* the Secretary-General to prepare a study on the scope, structure and functions of this agency, including draft statutes and information on steps required to bring such an organization into operation, taking into account the views expressed by the Committee for Industrial Development at its fourth session,¹¹ by the United Nations Conference on Trade and Development, as recommended in Annex A.III.1 of its Final Act¹² and by the Economic and Social Council at its thirty-seventh session, and to submit this study to the nineteenth session of the General Assembly;

4. *Recommends* the General Assembly, at its nineteenth session, to consider the deliberations of the Committee for Industrial Development at its fourth session, of the United Nations Conference on Trade and Development, which resulted in the recommendation included in Annex A.III.1 of its Final Act, and of the Economic and Social Council at its thirty-seventh session, and the study requested in paragraph 3 above, with a view to expediting action towards the establishment of such an organization;

5. *Calls upon* States Members of the United Nations or members of the specialized agencies to give increased financial support to existing United Nations programmes in the field of industrial development, without prejudice to the immediate action on the establishment of a specialized agency.

*1348th plenary meeting,
13 August 1964.*

C

INTERNATIONAL AND REGIONAL SYMPOSIA OF INDUSTRIAL DEVELOPMENT

The Economic and Social Council,

Recalling General Assembly resolution 1940 (XVIII) of 11 December 1963 which in operative paragraph 5 requested the Secretary-General "to initiate consulta-

tion and studies with States Members of the United Nations or members of the specialized agencies, with the specialized agencies, the International Atomic Energy Agency, the regional economic commissions and the Committee for Industrial Development, on the advisability of holding, not later than 1966, an international symposium, preceded, as appropriate, by regional and sub-regional symposia, relating to the problem of industrialization of developing countries",

Taking into account the views of States Members of the United Nations, members of the specialized agencies or the International Atomic Energy Agency in reference to the Secretary-General's request made pursuant to General Assembly resolution 1940 (XVIII),

Noting the resolutions of the regional economic commissions on activities in the field of industrial development with reference to the above-mentioned General Assembly resolution,

1. *Takes note* of the Secretary-General's report on international and regional symposia on industrial development (E/3921);

2. *Endorses* resolution 1 (IV) of the Committee for Industrial Development, dealing with international and regional symposia on industrial development;¹³

3. *Endorses also* the decisions of the Economic Commission for Africa, the Economic Commission for Asia and the Far East and the Economic Commission for Latin America to hold regional and sub-regional symposia in Africa, Asia and Latin America, taking into account their endorsement of the holding of the International Symposium utilizing for this purpose as far as possible the facilities of the regional economic commissions and those of the Centre for Industrial Development;

4. *Welcomes also* co-operation by the Secretariat of the Economic Commission for Europe with the secretariats of the other regional economic commissions in the preparation for the regional and sub-regional symposia which may be held in the other regions as preliminary steps to the holding of the International Symposium and the contribution in other forms, as requested by the Secretary-General, to the preparation for and organization of the International Symposium itself;

5. *Requests* the Secretary-General to prepare a report for one of the next sessions of the Committee for Industrial Development on the results of regional and sub-regional symposia, together with any recommendation on the agenda for an international symposium which he finds to be appropriate;

6. *Requests* the Committee for Industrial Development to report to the Economic and Social Council its recommendations with regard to an international symposium following review of the Secretary-General's report;

7. *Transmits* to the General Assembly the Secretary-

¹³ *Official Records of the Economic and Social Council, Thirty-seventh Session, Supplement No. 6, para. 118.*

General's report on international and regional symposia on industrial development;

8. *Invites* the Governments of Member States of the United Nations or members of the specialized agencies, the regional economic commissions, the specialized

agencies and the International Atomic Energy Agency to co-operate with the Centre for Industrial Development in the preparatory work for the symposia.

*1348th plenary meeting,
13 August 1964.*

CHECK LIST OF DOCUMENTS

The role of the United Nations in training national technical personnel for the accelerated industrialization of the developing countries

I. INTRODUCTION

1. The General Assembly at its seventeenth session adopted resolution 1824 (XVII) on the role of the United Nations in training national technical personnel for the accelerated industrialization of the developing countries. In the operative part of the resolution, the Secretary-General is requested, in co-operation with the Member Governments and in consultation with the Technical Assistance Board, the Special Fund, UNESCO, ILO and other agencies, to prepare a report which would include:

“(a) An estimate of the requirements of the developing countries, whenever possible according to their development plans, for technical personnel of the intermediate and higher levels and an estimate of the available possibilities for training such personnel in those countries, using *inter alia*, the methodology and techniques for assessing those requirements the formulation of which is envisaged in the programme of work in the field of industrialization of the Committee for Industrial Development;

“(b) Information concerning methods of training national technical personnel in various countries, taking into account the experience of States with different social and economic systems;

“(c) Information concerning the progress being made in the training of technical personnel for the developing countries in the industrially advanced countries, and the methods employed;

“(d) Proposals for measures within the United Nations system and recommendations to the Governments concerned with regard to intensifying the

training, and improving the facilities for the training, of national intermediate and higher technical personnel in the developing countries and, where appropriate, on an intra-regional basis.”

2. The Sub-Committee on Education and Training of the Administrative Committee on Co-ordination met at Geneva on 10 April 1963 and 10 April 1964 to consider the implementation of the resolution. Representatives of the following organizations attended the first meeting: United Nations, ILO, UNESCO, FAO and WHO. The second meeting was attended by representatives of the United Nations, ILO, FAO, UNESCO, WHO, UPU, ITU, WMO, UNICEF and IAEA.

3. While final responsibility for the report would rest with the Secretary-General of the United Nations, it was agreed that it should, at all stages, be a product of all the interested organizations in the United Nations family. Since there was already close collaboration in matters of education and training, it was considered that no new machinery would be needed to achieve this end.

4. Full use was made of the ACC Sub-Committee on Education and Training itself, and of two inter-secretariat working parties, one on technical education and vocational training and the other on manpower Assessment and educational planning. The membership of the working parties was, for the purpose of preparation of the report, extended to cover all interested organizations, namely: the United Nations, ILO, FAO, UNESCO, WHO, ITU and WMO.

5. The working parties met separately in May 1963 and in joint session in August 1963 and January 1964. At these meetings the subject matter to be discussed in the report was agreed upon including the outline of the report.

6. With regard to the scope of the report, the Sub-Committee agreed that “technical personnel of the intermediate and higher levels” should cover skilled workers, foremen and engineers including top management. It was also considered that for this purpose the term “industrialization” should be defined broadly to include manufacturing, transport, energy and other fields, including supporting services (for example, occupational health). Although the vital function of commerce and the service industries in industrial development is fully recognized, the report deals only to a limited extent with training for these sectors. For the purpose of this report the word “training” covers all forms of preparation for employment within the framework of industrialization and includes, among other things, technical education, vocational training and management training. Although it was realized that the training of all categories of health personnel has a direct bearing on the total programme of training for industrial development and its neglect would hamper the desired progress, no attempt was made to discuss the training of all health services because this will have to depend on the stage of industrial development and the development target established by each country. It was felt, however, that this aspect of the problem should be the subject of a further study based on the present report.

7. The Sub-Committee also agreed that too literal an interpretation of some parts of the resolution, particularly relating to estimates of requirements, would call for a report of unmanageable length and go beyond the resources and time available for the task. In view of the magnitude of this task and the limited time available, it was felt that full use should be made of the material and experience normally available to the United Nations system. These would be supplemented by case studies relevant to the issues involved. A few such case studies are appended to the report.¹

8. It must be emphasized that the present report cannot give a full answer to all the main issues referred to in General Assembly resolution 1824 (XVII) which, in a way, covers the entire field of education and training. One of the principal features of the report is to indicate the extent of the effort required in the fields of research, thought and action. It also indicates gaps in various fields of training and suggests main lines of action for the international organizations in order to intensify their work.

9. From a substantive point of view, the available material indicates the immensity of the tasks involved in the training of technical personnel for industrialization. It is clear that much thought needs to be given to the basic problems; namely, planning for and adaptation of educational and training institutions and methods to meet the needs of the developing countries in their efforts to accelerate the process of industrialization. There is an urgent need to provide vastly increased facilities for training, both in the developing countries and in the developed countries. The report attempts to present the problem in the over-all perspective of national needs and to point out various measures necessary to carry out the tasks.

II. SUMMARY OF ISSUES AND MAIN FINDINGS ²

The determination of the numbers to be trained for industrialization

10. The assessment of world requirements of higher and intermediate personnel for industrialization involves a number of difficulties. The sound procedure for approaching the problem of estimating requirements is therefore the regular review by each country of the supply and demand position for higher and intermediate level personnel in the light of information on trends and conditions. This review should aim at permitting a high degree of long-term planning, but should not overlook the crucial question of allocation of students and trainees in the short-run between different types of education and training. The allocation of resources for the education and training of manpower for industry should be treated within the framework of over-all resource allocation procedures and must be an integral part of the general development plan.

11. Industrialization requires a different level and type of skills from those traditionally available in developing countries. In particular, it requires a larger proportion of scientific and technical personnel. The supply of such personnel in the developing countries varies considerably and this, to some extent, reflects the disparity in industrial progress prevailing in the countries. Information on the adequacy of the numbers in the industrial sectors can only be ascertained by periodic review in the light of the best available facts in each country and by use of appropriate methods. Such methods include:

(a) Establishment inquiries concerning specific industries, with a view to establishing the current and short-term requirements for intermediate and higher-level personnel in various industrial branches;

(b) Manpower forecasting which relates social and economic targets established under a given plan to occupations, and occupations to educational and training backgrounds, so as to determine the educational and training requirements, for the planned period;

(c) The education-output ratio approach which omits the intermediate "occupational" step of the manpower forecasting method and attempts to derive educational and training requirements directly from social and economic targets; and

(d) The "indicators" method which utilizes a number of indicators of educational and training development in relation to indicators of economic growth.

12. The results obtained by these methods should be cross-checked wherever possible against each other, with a view to arriving at more refined estimates. Inter-country comparisons of patterns of industrialization, in relation to requirements of occupational, educational and training patterns should be made as a means of further refining and developing these methods.

13. An attempt is made in chapter 1 to estimate requirements of technical personnel necessary for accelerating the process of industrialization in the developing countries. The above-mentioned methods are employed and available data has been collected to arrive at an estimate of requirements by 1975. These estimates by no means should be considered as definitive. They are presented only to indicate rough orders of magnitude involved in the efforts of the developing countries to accelerate the process of the industrialization.

14. Estimates are given of industrial employment by main regions in 1960 and for 1975, in the light of the targets mentioned in the development plans of the countries in the region and on the assumption that planned growth rates can be maintained until 1975. Indications regarding the present proportion of engineers and scientists in the industrial labour force are available for only a few countries in each region. In the light of the available data it was considered desirable to present both conservative and more optimistic estimates of the proportion of such personnel for each region as a whole. Estimates are accordingly given of the number and proportions of engineers and scientists to industrial employment by main regions in 1960 and of the additional

¹ See E/3901/Add.2, chapter 1, annexes C and D.

² Subjects dealt with in this section are based on the material contained in E/3901/Rev.1/Add.1, chapters 1 to 5. The titles of subsections correspond to the titles of the chapters.

number of engineers and scientists that need to be trained by 1975 in these regions.

15. The number of technicians required can be determined by applying the ratio representing the proportion of technicians to be employed for every engineer or scientist in industry. Although there is considerable variation in this ratio in different countries it has been assumed that, for the purpose of the report, it should be an average between the highest and lowest of the ratios in certain industrialized countries. On this basis an estimate is presented of total training requirements for technicians (excluding normal replacement needs).

16. The calculations seem to indicate that approximately 400,000 engineers and scientists and 1,000,000 technicians need to be trained by 1975 in order to meet the requirements of industrialization (and "Africanization" in Africa). It should be stressed again that this data is meant only to indicate the tremendous task involved in training the new engineers, scientists and technicians required.

17. The annexes to chapter 1 (E/3901/Rev.1/Add.2) provide available material and discuss the various aspects concerned with estimates of data on ratios of higher and intermediate level personnel to total employment. Use of percentage ratios of engineers and scientists to total employment in forecasting requirements of engineers and scientists in industry and assessment of training requirements in selected industries and countries are dealt with in the annexes.

Existing facilities in developing countries for the Education and training of technical personnel

18. It has not been possible to answer the question implicit in the resolution as to the adequacy of existing training facilities with respect to requirements for technical personnel in the developing countries. This is due to the incompleteness of the information available, both nationally and internationally, particularly in regard to the quality of training given and to in-plant training. Moreover, internationally recognized classification of types of schools and training institutions does not exist. Owing to these difficulties, it has not been possible to arrive at inter-country comparisons. In addition, the data available on the various categories and levels of skills required are often not sufficiently comprehensive. Examples of detailed case studies in selected industries show how much detailed investigation is necessary to make a reliable estimate.³

19. On the basis of the available data, it has been possible to arrive at some broad conclusions. It is clear that in many developing countries the existing facilities are patently insufficient to meet the needs of large-scale industrial development programmes. In others, much remains to be done if the target of accelerated industrialization is to be met.

20. No general trend is evident in the development of secondary technical education. The areas of technical competence and responsibility between different

ministries and other authorities are not always clearly defined and often there is no co-ordination of action as a whole. Close links which are necessary between the authorities responsible for technical education and vocational training and those responsible for economic planning and manpower policy do not always exist. In addition, there is frequently inadequate provision for the necessary collaboration with and by industry itself. Internal administration is often rendered cumbersome by complex procedures, which is particularly true in matters of financial administration.

21. The authorities responsible for technical education and vocational training do not as yet have the means to set standards of performance and to control their application. In a large number of countries this problem is particularly acute for training institutions outside of the educational system. Systems of inspection for all forms of training are frequently inadequate.

22. There is an acute shortage of well-trained, competent teaching staff. All countries do not provide training to the teaching staff. The training given to this category is not always sufficiently comprehensive. The situation, however, has improved in recent years in countries which have established special training institutions for teaching personnel, some of which are supported by the United Nations Special Fund. Difficulties are encountered in attracting suitable candidates and the drop-out rate during training is substantial. This situation is largely due to the inadequacy of the salaries and conditions of service offered.

23. The developing countries have considerably extended facilities for training supervisors in recent years. There are still many countries, however, in which training for supervisors is far from adequate. The position is the same for management training which had made substantial progress with the establishment of courses in universities and specialized institutions.

24. While schemes for systematic training by enterprises have been established by a number of developing countries in recent years, the pattern of systematic inplant training is far from general. It is obvious that insufficient use is being made of the potential reserve of technical manpower represented by those already in employment. Where the training does exist it has very often not yet reached the desired standard. The new vocational training services established in recent years, particularly in Latin America, have, however, made a considerable contribution to this goal. This has been due largely to the setting and application of standards of training and to the organization of facilities for training of teaching staff both for training institutions and for the enterprises.

25. The level of general education is rising steadily in a large number of developing countries. The coverage, however, has been inadequate and thus does not provide the sufficient basis required for technical education and vocational training. In spite of the determined efforts made by the developing countries, considerable numbers of adult workers are semi- or completely illiterate. Consequently, they lack the necessary basis for learning a technical occupation.

³ See (E/3901/Rev.1/Add.2), chapter 1, and annexes C and D, chapter 2, annex A.

26. In many developing countries there is a general tendency to seek employment in administrative or clerical work, rather than in industry. Technical studies often do not attract gifted persons, largely due to the prestige attached to liberal and non-manual occupations and to the absence of information about industrial occupations. In many developing countries there is a serious lack of facilities for giving young persons the occupational information and vocational guidance.

*Systems and methods of technical education and vocational training for technical personnel*⁴

Objectives of training

27. There is a need to have a clear grasp of the objectives of training, particularly in regard to vocational training, if the necessary arrangements are to be made for efficient and properly co-ordinated action concerning systems and methods of technical education and vocational training. These objectives of training emerge from the analysis of needs for trained manpower, as indicated in chapter 1. For the purpose of determining the objectives of training, however, it is necessary to break down the data on manpower needs still further to ascertain the exact levels of qualification and the content at which training should aim for these levels.

28. Personnel to be trained should be classified as follows: semi-skilled workers; skilled workers; foremen and supervisors; assistant technicians; technicians; and engineers.

29. As regards the content of training, the fundamental objectives may be defined as:

(a) The acquisition of the mathematical, scientific and technological knowledge required for understanding and in some cases innovating the principles underlying the construction and functioning of machines and instruments;

(b) The acquisition and development of manipulative and practical skills appropriate to the level of training required;

(c) The adaptation of trainees to the conditions of work in enterprises;

(d) Adaptation to standards of industrial output, particularly as regards speed and quality of production.

It is evident that the specific nature of these objectives will depend in each case on the occupation involved and on the circumstances in which it is practised.

30. The national training policy aim at providing all members of the population with the means of acquiring knowledge and skills for practising an occupation. Accordingly, the training systems should cover the initial training of young persons and adults, further training of adults, training for promotion, upgrading, and retraining or conversion training. In many develop-

⁴ The special aspects of training in management functions for higher administrative and managerial personnel are discussed in the later paragraphs. The preceding sections cover training for this category of personnel only in so far as training in technical, as distinct from functional, qualifications is concerned.

ing countries it is not possible for all of these objectives to be achieved. It is necessary, therefore, to take into account not only the needs but also the position in economic and educational sectors concerned in establishing priorities for achieving these objectives.

Training systems

31. There are three main types of training systems:

(a) Systems of an institutional character, i.e., when training is given in appropriate institutions organized for the purpose, either within or outside the framework of the general system of education;

(b) Systems of in-plant but not necessarily on-the-job training;

(c) Combined systems which combine training in an institution and training in an enterprise.

32. The discussion on this subject in chapter 3 is concerned with the ways in which these forms of training may be organized. The institutional training system covers the following: technical and vocational schools, higher technical education, accelerated training and centres for basic and further training organized by groups of employers or workers. The discussion on systems of in-plant training includes, among others, apprenticeship systems. An indication is given regarding various safeguards which should be considered in framing apprenticeship legislation. Reference is also made to training partly or wholly in workshops separate from production and the development of permanent services for the further training of personnel employed.

33. The combined systems of training take various forms, and are referred to in the UNESCO Recommendation concerning Technical and Vocational Education and the ILO Recommendation concerning Vocational Training. Often initial training is given in a school and subsequent training in a plant. Training institutions have also been set up within an enterprise or industry, and sometimes the vocational schools are linked directly with an enterprise or group of enterprises in which their pupils gain practical experience. In Latin America a special form of combined training has been established which seems of particular interest for developing countries.

Training standards and methods

34. Before considering training standards and methods for the three main categories of technical personnel, attention is invited to the need to take account of occupational health questions which apply to all categories. For this reason, the need for training all levels of personnel in occupational safety and health should not be overlooked. Arrangements should also be made for training doctors and allied personnel specialized in this field and, wherever possible, for establishing occupational health services.

35. A number of problems exist with regard to the training of workers. There is often a lack of balance between the level and content of training and requirements in employment. Action to overcome this impor-

tant problem includes determining occupations for which national standards of qualifications need to be established, analysing these occupations and establishing the corresponding standards and training programmes.

36. There is also the problem of the numbers to be admitted for training, of vocational guidance and of selection. Steps should be taken to ensure that the appropriate balance is achieved between the numbers required by industry, the number of pupils admitted and retained and the number for whom adequate training facilities are available. Steps should also be taken to ensure that the candidates admitted have the necessary qualifications and ability. Vocational guidance and selection, provision of financial and other help, and the provision for training in plants, as well as in training institutions, are some of the measures which help to achieve these aims.

37. Standards need to be established to ensure the adequacy of training. They should cover, among other things, the qualifications to be attained, the training to be given and the evaluation of training. Unless proper means of evaluation are used, such as examinations based on training standards, it is extremely difficult to ensure that training is adapted to the requirements of employment. In the absence of evaluation, it is also difficult to avoid the exploitation of young people trained in enterprises, since there will otherwise be no assurance that they are receiving of training of the desired content and quality.

38. Adequate training programmes and methods help considerably to ensure the best return from training systems, and considerable progress has been made in this field. Sometimes insufficient attention is paid to the need to improve other elements of the national training system.

39. Developing countries face serious problems in connexion with the recruitment and training of teaching staff, particularly workshop instructors. The difficulties are due both to the conditions of employment offered and to the inadequate qualifications of candidates for teaching posts. While some training institutions exist for the training of teaching staff, they are too few in number. The training given in these institutions is not always sufficiently comprehensive to bring trainees up to the standard required.

40. Some of the observations concerning standards in respect of workers apply also to technicians. The training in this category varies according to the category of technicians and the duties they perform. In some developing countries the curricula for training engineers appear to correspond more to curricula used in industrialized countries for technician training. Curricula for engineers should include more thorough and abstract treatment of the subjects at the classroom level, a higher element of individual construction and research work.

In-plant training of graduate engineers

41. There is growing recognition in many countries that theoretical training should be combined with the practical during the undergraduate years and, in leading

schools of engineering, industrial practice has been made part of the curriculum along with the theoretical instruction. The main objectives of these periods of practical work is to acquaint the student with the working conditions and atmosphere of an industrial establishment and to give him the opportunity of observing the application in practice of engineering theory. The value of these periods is generally recognized, but a criticism frequently levelled by industry, universities and the students themselves, is that they confine the student to observation and do not let him play an active role, however modest it might be.

42. This has over the years given rise to a serious problem. It is being increasingly realized that a gap exists between fundamental knowledge gained at the university and the actual requirements of knowledge and skills required by the industry. In-plant training is one way of helping young engineers to bridge this gap. It is being recognized in many industrial enterprises in the developing countries that the solution of the problem should not be left to chance; in other words that it would not suffice to attach the graduate as an apprentice to technical personnel and hope that he will obtain the required experience in a reasonable period of time. There is a need to provide systematic and closely supervised guidance to the graduates in applying the basic scientific principles learned at the university to the many practical problems arising daily in the factory. Proposals for such training are included in chapter 3, annex D of part three of this report (E/3901/Rev.1/Add.2).

Training of higher administrative personnel in the government organizations

43. The training of the higher administrative and managerial personnel to deal with problems of industrialization needs to be approached at two levels: at the level of formulation of policies and preparation of plans for industrial development and at the level of management of individual enterprises. The latter category is easily identifiable and recently its role in the efficient administration of the industrial enterprises has received considerable attention. The role of the State, on the other hand, is very important in the developing countries. It provides a horizon in terms of development goals and creates an atmosphere in which industries can be established and operated. The role of the government and of economic administrators therefore, becomes more meaningful in aiding the process of industrial development. The economic administrators in the developing countries are already playing a vital role, not only in initiating various industrial development projects, but also in influencing the pace of development through systems of allocation of foreign exchange, raw materials, licensing and so on.

44. The training of economic administrators, who deal with problems of formulation and implementation of industrial development programmes in the developing countries has been so far intimately connected with the training in economic planning. It is being increasingly realized, however, that the knowledge and skills required in this area require training which, in

a way, attempts to provide technical background to economists and economic background to engineers and technical personnel working in government and semi-government institutions. Training in formulation, evaluation and implementation of industrial development projects should be provided in the existing economic development training institutions sponsored by the governments and the international organizations. This should be followed by evolving training programmes in industrial development for the economic administrators. Such training programmes could be introduced in the Planning and Development Institutes sponsored by the regional economic commissions of the United Nations and assisted by the Special Fund.

Education and training of higher administrative and managerial personnel for public and private industry

45. Experience in all countries in recent years has demonstrated the importance of qualified management personnel as a factor in industrial development. Developing countries are in considerable need of managers who can effectively organize and direct the production of goods and services. This need has often not been taken into account in planning for growth.

46. Management is based on knowledge and skills which can be learned with appropriate training, guided experience and other development facilities. Most industrialized countries, having recently recognized the importance of management for accelerated growth, have acquired extensive facilities for management training. These facilities include new university programmes. Where universities have not been sufficiently flexible and where the training needs have been urgent, as in the case of many European countries, special schools or institutes are sponsored by governments, industrial firms, chambers of commerce, consulting firms and professional associations. Most public and private enterprises also have strong internal management development programmes.

47. Understandably, the developing countries, particularly those which have only recently begun to establish or manage their own public and private enterprises, lack educational institutions and sound industrial enterprises in which managers can learn from good on-the-job experience. In some countries many of the former managers have been expatriated and have to be replaced with new managers who require much training and experience. Their backgrounds are diverse and commonly do not include much industrial experience. As in the industrialized countries, the main source of professional managerial personnel is the young man with general education as well as technological training. Most of the countries have recently acquired some beginnings of university management education, both graduate and undergraduate. The latter have been acquired almost entirely with outside assistance. These facilities are mostly recent, they have relatively few students and their quality requires much development, mainly in terms of adequate teaching staff. It will be some time before their graduates will make a

significant impact on the economics of their respective countries. Their significance is for the longer-range future.

48. Many of the developing countries, recognizing that they need facilities which produce more immediate and practical effects, have recently established a variety of training institutions designed for this purpose. These are government-sponsored management development and productivity centres, usually established with outside technical assistance, whose functions include training for top and middle management, productivity technicians, supervisors and union representatives, as well as providing advisory and consulting services on raising productivity. There is evidence that these programmes can accelerate the growth of management personnel and of industry.

49. One of the major problems of management development centres as well as of colleges and universities is the shortage of management teachers. The centres have begun to meet this need with direct technical assistance programmes and fellowship study abroad, both largely financed by the Special Fund. However, in order to staff management schools with competent teachers, these countries will also have to send individuals abroad for post-graduate studies. They have little or no financial means for this purpose.

50. There is little doubt that special facilities, such as the management development centres, are the best means of providing managers on an increasing scale in the developing countries. The centres can provide training designed to meet the practical needs of particular industries and enterprises, including small-scale industries, co-operatives and industrial estates. Their programmes need to become more comprehensive and integrated. They need more qualified national staff and their services should be expanded geographically to serve managers of small-scale industries and others in outlying towns of the country.

Intra-regional and regional arrangements for education and training of national technical personnel

51. It is generally agreed that training should be provided in the trainees' home countries as far as possible. However, the choice concerning training within the country concerned, within the region and training abroad will be influenced by the local or regional facilities available and the degree of specialization required for the trainee. Available information indicates that trainees sent abroad are generally higher level personnel seeking either specialization in particular fields or comparative experience in various institutions dealing with certain basic problems.

52. The case for training in the countries themselves or within the region is based on low cost of training and the desirability of providing training under familiar environmental conditions. The levels of industrial development often differ among the countries of the same region and the degree of training facilities varies accordingly. Thus there is considerable scope for regional bilateral co-operation and training. Moreover, various

bilateral and multilateral programmes of technical assistance have encouraged the establishment of institutions to serve countries within regions. The programmes of technical co-operation of the United Nations and of its regional economic commissions, for example, have been instrumental in assisting such countries by both financing selected trainees and assisting the countries in establishing the training institution itself. Such institutions are mainly concerned with specialized training. However, the main feature of training in regional institutions is the adaptability of their training programmes to fill local needs, a feature which is difficult to obtain in industrially advanced countries. This has been particularly evident in the case of training of government officials in planning techniques in economic and industrial development.

53. The United Nations regional economic commissions, for example, have been instrumental, with the assistance of the Special Fund, in setting up institutes (one each in the ECAFE, ECLA and the African regions). The objective of these institutes is to raise the technical level of government officials and specialists in the field of economic development and planning. They also assist the Governments in establishing the institutional and technical organizations to evolve policies and formulate development programmes. A technological research institute (ICAITI) has been established in Latin America. The Institute collaborates with Central American Governments and other organizations in the region in promoting scientific and industrial research including the training of researchers and technicians. In the African region, plans are being made to establish industrial research and development institutions on a sub-regional basis. A regional centre for French-speaking African countries is being sponsored by the ILO for training in labour administration. In the earlier stages of operation, it will concentrate on the training of middle- and lower-grade personnel of the Departments of Labour in the region. The Asian Productivity Organization, established in May 1961, has developed other forms of intra-regional training co-operation with a view to upgrading management and technical skills in its member countries, such as study missions and training courses for which developing countries of the Asian region have acted as hosts.

54. The attention of developing countries is drawn below to various points which emerge from the experience acquired thus far in this field and are relevant in undertaking intra-regional training arrangements:

(a) Training outside the home country is not normally envisaged as a means of providing basic skills but rather for raising the level of qualifications;

(b) The establishment of regional training centres for which the technical, administrative and financial responsibility must be shared by several Governments is a costly undertaking. Financial assurance over a period of years is therefore necessary;

(c) All countries of the region need to be fully informed of the national training facilities available for regional use and of the procedures to be followed in order to enable their nations to take advantage of them;

(d) The trainees from various countries participating

in a course should have similar basic qualifications and similar practical experience;

(e) Since trainees attending courses at the regional institutes will normally be persons occupying positions of responsibility which preclude long absence from their home countries, training courses in the institutes should not be unduly long;

(f) Training should be consistent with the need of the country and capable of immediate application in the trainees' home countries on completion of the training course.

55. Another significant method of intra-regional co-operation is the convening of seminars and workshops in which representatives of government, industry and other organizations participate. The training element consists, primarily, of exchanging views and national experiences on specific problems of industrial development. This often leads to the implementation in the respective countries of the decisions reached at the meetings.

International action and its future development

56. The current and future programme of international action in the field of industrial training, as in other fields, is primarily governed by the requests of Governments to the United Nations or to the appropriate international organizations. The work of the United Nations family in this area is threefold: studies and research, establishment of standards and models, and operations. All these are interdependent.

57. Under studies and research, a first group of projects deals with studies on systems and means of technical education and vocational training and the planning and organization of such systems in relation to manpower requirements. A second group of projects consists of studies of specific problems of education and training in relation to industrialization. Lists of research projects are given in chapter 3, annex E (E/3901/Rev.1/Add.2). The work will be carried out both at the international and at the regional levels. Collaboration will be enlisted from the various specialized institutes or research centres which the international organizations have established in recent years.

58. Standards established in recent years include the UNESCO Recommendation concerning Technical and Vocational Education and the ILO Recommendation concerning Vocational Training. It is now proposed to prepare, in the course of the next few years, technical standards in the form of guides or manuals which will make it easier to execute both national training programmes and international technical assistance projects. In addition to these projects a special programme is foreseen for the preparation of standards applicable to training in given industrial sectors. It is more difficult to establish standards in the field of technological research but it will be possible to elaborate recommendations on particular problems.

59. A significant proportion of the operational programme undertaken by the United Nations and specialized agencies is in the field of industrial training. The

resources devoted to this sector have been augmented after the establishment of the United Nations Special Fund.

60. Additional programmes for training national officials and for the future training of technical personnel will become possible in the next few years as a result of the regional economic development institutes of the United Nations, the UNESCO Institute for Educational Planning and the ILO International Centre for Advanced Technical and Vocational Training.

61. The Conferences and other meetings organized by the international organizations help to develop governments' desire for technical co-operation. They make it possible, in connexion with a particular problem to bring out the various factors and to determine the means of achieving the objectives through international co-operation. The various publications of the international organizations, including those prepared for such meetings, constitute an important source of information for the organizations themselves and the technical assistance experts.

62. The increase in operational activities financed by the Special Fund has given rise to a considerable increase in work of the organizations dealing with studies, analyses and normative activities. Such work covers various problems of industrialization which can be tackled within the limits of presently available resources. In order to avoid duplication of substantive effort and to promote co-ordinated action, appropriate inter-secretariat machinery has been established in fields such as manpower assessment and educational planning, technical education and vocational training, and agricultural education.

Training policy and industrialization

63. Training policy cannot be isolated from the other elements of national policy. Implementing the national educational and training policy is dependent on the qualifications of the population, degree of industrial development and the availability of resources. The resources allocated to education and training, as the experience shows, are more often inadequate. The situation is not uniform in all developing countries, and the policy to be followed in regard to training therefore depends on a large number of variable factors. The problem of deciding on training policy is therefore more complex.

64. It is, however, possible to suggest for industrializing countries a general strategy in regard to training systems and methods. First, where detailed analyses can be undertaken, such analyses should consist of evaluation of the needs for technical personnel, the assessment of existing training facilities and the return they give. It should be possible in the light of such evaluation to evolve immediate steps, taking into account industrialization programmes and the available resources.

65. These steps include using facilities outside the national training system, with a view to meeting short-term needs and those which arise in connexion with capital-intensive industries. Also, steps should be taken immediately to improve existing training systems.

66. In countries which are in the early stages of industrialization, particular attention should be given to determining the priority to be given to: training programmes which have a multiplier effect; the development of systems of training persons already in employment and the establishment or development of programmes of further training.

67. Countries having adequate industrial and educational infrastructure might aim at achieving all the objectives and methods of training described earlier and thus making full and rational use of the available human resources. They might, for instance, consider progressively extending training facilities to the population as a whole, the establishment and development of high-level training for new techniques, the improvement of the links between schools and industry and the development of research on technological progress.

The financial implications of technical education and vocational training

68. The estimation of the financial aspects of the education and training programmes in the developing countries in connexion with industrialization involves a number of difficulties:

(a) The over-all cost of such programmes depends on preparing fairly accurate prior determination of requirements of the numbers of technical personnel. Difficulties involved in this task are discussed in chapter 1 (E/3901/Rev.1/Add.1);

(b) Cost estimates per pupil are not readily available and the existing data need to be up-dated. This is particularly true for training programmes undertaken in addition to those undertaken by the technical schools, institutions and universities;

(c) The available estimates of requirements and costs vary considerably from region to region and from country to country. Therefore, estimates should be considered as illustrative only, and subject to revision;

(d) There is lack of data on "drop-out" rates at various levels, the present flows of students into various types of employments, and the appropriate lags in the expansion of these flows (5, 10, 15 or even 20 years, as the case may be). Data on such aspects are particularly necessary in the costing of the capital requirements of education and training programmes;

(e) Data on the sources of funds for education and training are limited to the government educational system in most countries. The data, however, do not make it clear concerning the proportion of fees, loans and taxes as sources of financing.

69. An attempt has been made to estimate costs involved in undertaking training programmes for industrial high-level technical personnel estimated as an illustration in chapter 1.⁵ It must be emphasized here that these estimates, subject to the difficulties mentioned above, are presented for illustrative purpose only. They are primarily meant as rough orders of magnitude and are not meant to be translated for immediate operational

⁵ See para. 16.

purposes. On the basis of the regional cost estimates, per-pupil recurring costs and per-pupil/place capital costs, and on the basis of the numbers of high-level technical personnel derived as an example in chapter 1, an estimate of the higher-level educational costs has been made for each region. The costs of training thus arrived at are approximately \$2,600 million over fifteen years for all the developing countries. This means an expenditure of approximately \$177 million per year. It is difficult to interpret this as too high or too low. It is based on a number of simplifying and hypothetical assumptions contained in chapters 1 and 4 (E/3901/Rev.1/Add.1). It must be emphasized that this estimate is merely one estimate amongst a wide range of possibilities and is meant for illustrative purposes only.

70. The Addis Ababa Plan envisages that about 30 per cent of the cost of the programme for Africa would have to be financed externally. The aid implications for the other regional plans cannot be precisely established. They may be assumed to be less in view of the special factors operating in Africa which make education more costly. The aid implications might therefore be reduced to, say, 20 per cent for all the regions taken as a whole.

71. It is very difficult to estimate the present level of international aid for the development of technical education and training in the developing countries. It is possible, however, to estimate the level of aid for this purpose provided by the United Nations family. Such aid amounted to roughly \$40 million in 1961. It was not possible to estimate the extent of bilateral aid in this field.

72. There are difficulties in identifying accurately each source in relation to the type of training. For example, Governments and enterprises very often subsidize private educational institutions. Government subsidies and tax concessions are given by the governments to enterprises fulfilling certain training requirements. Sometimes, apprentice taxes are levied to finance training centres. Some fragmentary evidence of a qualitative nature with regard to fees charged, and assistance from government and industry is given in chapter 4. The data should be interpreted with due regard to the supplementary evidence appended as notes to such data.

73. The Governments of the developing countries have attached great importance to the development of the educational system. It is likely that, as economic development proceeds, the development of the educational system becomes increasingly the responsibility of governments and less the responsibility of pupil's parents. If this is so, the means by which governments financed technical education will become increasingly important in the developing countries, although ways of encouraging enterprises to finance more training and ways of increasing expenditure by individuals on technical education and vocational training in an equitable manner will play a vital part. There are three ways in which Governments finance programmes of technical education and vocational training: taxation, loans and by making use of personnel in other government activities without detracting too heavily from the performance of their primary functions. In order to finance the train-

ing expenditures, all means should be explored. These include greater participation of industry, levying apprentice taxes, subsidies or limited forms of bond systems, etc.

74. The central argument against financing education or training through fees is that it is inequitable as between pupils from poorer and richer families. However, it is a fact that, in many instances, it is only the relatively well-to-do families which can afford the income loss involved in a full-time formal education for their children, once these come of earning age. This age occurs around the time when children usually start secondary-level training. Thus, to encourage poorer families to give their children full-time education, substantial scholarships and allowances would be necessary at a level commensurate with the earning capacity of these children in employment. It would not be sufficient merely to eliminate fees altogether, and the financial responsibility of the government would have to be markedly increased if formal education at secondary and higher levels were to be truly on a basis of equal opportunity.

75. The developing countries should keep under review the financial implications of their programmes of technical education and vocational training. To this end, standard costing systems would be instituted for each educational and training programme, so that data may be collected and analyses made of:

(a) The costs of systems of providing the higher and intermediate technical personnel required for industrialization; and

(b) The ways in which enterprises, and government and private schools may finance increased technical education and vocational training, with a view to reducing the costs of technical education and vocational training wherever possible and finding methods of finance appropriate to conditions in the developing countries.

The international agencies concerned should provide assistance to the developing countries in carrying out detailed inquiries into these financial questions, through their research and information programmes and under their programmes of technical co-operation. In conclusion it may be said that large sums will be required to finance the technical educational and vocational training plans for developing countries with a view to their industrialization. The sums involved will exceed the resources available domestically in the developing countries, so that there will be a need for external assistance, including assistance under the control of the international organizations, in the form of loans and grants, particularly for the building and equipping of schools and training centres, in providing teachers and instructors, and in providing facilities for foreign students in the industrially advanced countries themselves.

Training of technical personnel from the developing countries in the industrially advanced countries

76. The developed countries have provided training facilities on an increasing scale to personnel from the developing countries and large numbers go to the developed countries for this purpose every year. Arrangements

for training are also made by equipment producers, companies with branches in the developing countries and trade organizations. Data on such arrangements are, however, difficult to obtain, as are data on the whole subject of training in the industrially advanced countries of personnel from developing countries.

77. A questionnaire was sent to twenty governments to obtain information, sixteen of which replied. These answers contained valuable information, but they were not always comprehensive. The total information available on this subject is far from complete.

78. The number of personnel from the developing countries receiving training in 1962 in the developed countries is given in chapter 5. Although the data are not firm, they provide rough orders of magnitude. Generally, students are supposed to be preparing for a diploma in the established educational institutions and the trainees are undergoing *ad hoc* training programmes both inside and outside of the educational system. It seems that most, but not all, of the training abroad is at the level of engineers, technicians and scientific personnel. Training of skilled workers and foremen is provided in the developing countries themselves, the donor governments assisting by the provision of experts.

79. In order to handle a large number of trainees, host governments of the developed countries have set up special machinery to evaluate requests for training and administer training programmes. Where aid given is comparatively small, the services of diplomatic offices in the developing countries are utilized as contact points. International comparisons in regard to the number of trainees are not possible. The number in a particular developed country is determined by the size of its aid programme, historical ties with other countries and the facilities available for training.

80. The United Nations has provided training in industrial development under its various technical assistance programmes. In 1963, 6,031 fellowships were awarded by the United Nations family, of which 645 were in the field of industrial development. This number is considered to be rather low, although developing countries attach considerable importance to industrialization programmes. In a way, this experience is borne out by the data on training given under bilateral programmes of assistance.

81. The formulation of a training programme is undertaken by the developing country in the light of facilities for training in the donor countries and the candidates are chosen by the host governments in accordance with their ability to benefit from training. While fairly well-established procedures exist, there is much delay between the date of application and the date on which the training programme commences in the host country.

82. Trainees prefer, as far as possible, to work for a degree or diploma. The programmes arranged by donor countries, on the other hand, emphasize training in skills which can be obtained quickly. Senior personnel in government and industry prefer general observation tours.

83. Placement of the trainees in industrial establishments for lengthy periods has been found to be very

difficult to obtain. In the experience of the United Nations, only a very small number placed would be in the plants. Since plant experience is valuable, alternative means of obtaining such experience will have to be found. Proposals for in-plant training of graduate engineers have been suggested to augment training facilities in the countries themselves and on a regional level.⁶

84. Group training has recently received attention and is being encouraged both by participants and host governments. It involves groups of personnel of all levels in a given industry or groups of personnel of similar levels or functions in a number of industries. Group training was generally found to be useful, but was not always suitable for senior officers or specialized personnel. It is clear, however, that more thought and study are necessary on the question of appropriate methods of training.

85. A number of institutions have been established by the international organizations which are located in developed countries to provide training. The United Nations Secretariat organized a programme of development financing to provide group training, as a continuation of an earlier United Nations programme devoted to the training of African economists. The IBRD established, since 1955, the Economic Development Institute which provides training on the problems of economic development including industrial development for senior officers of developing countries. The Turin Centre, established by ILO with the assistance of the Italian Government, provides training, beginning in 1965, to highly skilled workers, technicians, foremen, instructors and senior management personnel from the developing countries.

86. The United Nations has taken steps in convening seminars in industrially developed countries which have been attended by technical personnel from developing and developed countries. Such meetings have provided scope, not only for an exchange of views but also for training in recent advances in technology including economic aspects of specific industries. For example, one was convened in Prague and in Geneva, in November 1963 for iron and steel, another in Denmark in May 1964 for cement.

87. Various arrangements have been made, especially by the major donor countries, for the follow-up of fellows. A survey recently undertaken by the United Nations among former United Nations fellowship holders indicated that, after two years subsequent to their training 91 per cent of the fellows were engaged in their home countries in work related to their studies. A recent survey by the Agency for International Development of the United States of America showed that a large majority of the trainees were utilizing their training effectively and contributing directly to the economic development of their countries.

Programmes of international organization

88. Interest for, and action in the field of education and training of technical personnel have always been a

⁶ See E/3901/Rev.1/Add.2, chapter 3, annex D.

significant aspect of the programmes of work of the United Nations and the specialized agencies. The emphasis on the need for planning for economic and social development has given a new impetus to their activities in this field. As a part of the work involved in the United Nations Development Decade, substantial efforts are being made to integrate programmes of education and training with the over-all planning of economic and social progress.

89. Work has been intensified by the United Nations family in the field of standard setting. Since 1960, resolutions on vocational training have been adopted by regional conferences of the ILO in Africa, America and Asia. In 1961, a conference on education and economic and social development in Latin America was held in Santiago, Chile, under the auspices of UNESCO, ECLA, FAO, ILO and the Organization of American States. Regional Conferences of Ministers of Education have been convened by UNESCO in Addis Ababa (1961), Tokyo (1962), Tananarive (1963) and Abidjan (1964) to deal with similar problems. Action concerning the planning, organization and methods of training forms an integral part of the Programme of Human Resources adopted by the ILO in 1963. It is expected that instruments on objectives and general principles of employment policy will be adopted by the ILO in summer 1964.

90. The United Nations has provided assistance to developing countries in the field of training through the Regular, EPTA and Special Fund programmes. Assistance under these programmes takes several forms: inquiries on the needs of the country, organization of training systems, establishment of training facilities, fellowships for training abroad.

91. The assistance to industrial training under the United Nations technical co-operation programmes has expanded considerably in recent years, particularly since the establishment of the United Nations Special Fund. In 1959, 32.5 per cent of the total appropriations for Special Fund projects were in the fields of vocational training and university level technical training; in October 1963, 41 per cent of the total earmarked by the Special Fund were for projects concerning engineering training at universities and polytechnics, management development, industrial worker training and training for civil aviation and telecommunications. Of the total resources devoted to industrial development in 1961-1962 under the EPTA programmes, about 23 per cent of the resources was concerned with vocational training and technical education and training. In addition, the International Bank and the International Development Association are now prepared to grant more substantial long-term loans for the development of education and training in relation to economic, including industrial development. In 1961, UNICEF decided to extend its aid to the field of education, vocational training and guidance of children and youths; by December 1962, already 8.1 per cent of the approved allocations were for educational and vocational training services. Since 1958 a series of inter-regional and regional training courses and seminars have been organized by WHO, in collaboration with ILO and national authorities or

institutions for occupational health physicians and nurses, engineers, chemists and industrial hygienists from developing countries. These meetings served to widen the knowledge and experience of senior workers and to give more basic theoretical and practical training in occupational health to those who are already engaged in occupational health services. Similar types of activity have been developed by WHO in the training of personnel in environmental health including sanitary engineers, sanitarians, auxiliary staff, waterworks operators, etc. In the field of research and information, considerable work is planned by the members of the United Nations system. The projected studies will be carried out both on an international and on a regional level.⁷

III. PREREQUISITES FOR ACTION

92. The inquiry into various aspects of industrial training pursuant to General Assembly resolution 1824 (XVII) has disclosed certain gaps in this regard. On the basis of evaluation of data and of problems, suggestions are made in this report regarding the priorities involved and the lines of future work that need to be undertaken both by the Governments and by the United Nations family. Implementation of the recommendations present both an opportunity and a challenge. For the United Nations and the specialized agencies, they provide a substantial basis on which the work could be undertaken within the limits of the financial resources available to them.

93. A number of general observations should be made before setting out the basic recommendations on the various questions discussed in this report. It has dealt from an exclusively technical angle, with the problems involved in training technical personnel for industrialization in developing countries. Implementation of the main recommendations does not depend essentially on technical factors, but on more general factors which should be considered as prerequisites for such action.

94. In the first place, it cannot be over-emphasized that all efforts in the field of training need to be undertaken within the framework of the plans or programmes of countries for economic, social and educational development. It is particularly important, when industrialization plans or programmes are being established, to prepare, at the same time, plans for training. Indications on the steps to be taken in the field of training should be spelled out. In addition, arrangements should be made to ensure that appropriate employment is available so that the maximum use is made of the knowledge and skills acquired in the course of training.

95. Secondly, the success of training policies and programmes is essentially dependent on the readiness of the public authorities (at the highest level of direction as well as at the level of responsibility for economic and educational planning) to carry out the decisions taken in connexion with these policies and programmes. It is also dependent on the existence of adequate administrative machinery for this purpose.

⁷ See paras. 56-62.

96. Thirdly, on the assumption that the above-mentioned prerequisites are fulfilled, the most difficult task facing the public authorities is to decide the order of priorities. In this, due account should be taken of the inevitable sacrifices involved as a result of limited funds and of the need to carry out planned training programmes.

97. Fourthly, it is essential for developing countries to establish institutions which are capable of identifying training problems, utilizing international and foreign resources and experience and working out the countries' own solutions to these problems. It is necessary that such institutions should carry out their functions in close collaboration with industry.

98. Fifthly, the successful implementation of the policies and programmes of training requires active participation of persons of all levels. Incentives are necessary to encourage those concerned to collaborate in this work. Such incentives include, among other things, improved conditions of work, improved status for manual occupations, more favourable revenue and wage policies, possibilities of promotion, the suppression of illiteracy, the overcoming of cultural, sociological and psychological obstacles and the provision of a supply of consumer goods for demonstration effect.

99. Finally, general education is in principle an essential basis for all training for industrialization, wherever given. This is because if there is not the foundation of basic knowledge no amount of training in techniques can progress beyond a certain stage, while the possibility of re-adaptation, should the need arise, is greatly reduced. In the short run, it may be necessary to undertake specific training action, such as training of workers in the newly established industry without providing them with an initial basis of general education. In such cases, arrangements, however, need to be made over a period of time to provide general education in order to fill the basic gap.

IV. BASIC RECOMMENDATIONS ⁸

100. It is in the light of the above remarks that the recommendations which emerge from the various parts of the report are given below. These are presented against the background of the United Nations Development Decade which attaches the highest priority to training for industrial skills and of the steps recently taken in the United Nations for intensified inter-governmental co-operation for the international transfer of scientific and technological knowledge. It need not be emphasized that "... the main scientific and technological resources of a country lie in its trained people. Specialized workers, technicians, engineers, scientists and researchers constitute the most important elements. Their number and the distribution at different levels define the capability of a country ..."⁹

⁸ Detailed recommendations are included in the various chapters of the report. They cover the different aspects of training of technical personnel for the acceleration of industrialization.

⁹ *Draft Report of the First Session of the Advisory Committee on the Application of Science and Technology to Development to the Economic and Social Council*, E/AC.52/L.16, para. 50.

Recommendations for action by developing countries

101. Certain recommendations suggesting action by developing countries appear to be of particular importance. In carrying out these recommendations it will clearly be necessary for all those concerned with industrialization, whether public or private authorities, labour or management, to work together in close collaboration and consultation. The recommendations are as follows:

(a) Setting up systems for keeping under regular review the requirements of personnel for industrialization and integrating the results of these reviews into the overall planning of education and the development of human resources;

(b) Setting up, in planning organizations, units specializing in the analysis and forecasting of the training and education requirements for industrialization and arranging for the training of the personnel of such units;

(c) Arranging for the collection of more adequate educational, occupational and industrial data and for economic analyses to be made by industry for the purpose of determining personnel requirements and improving the statistical basis for making forecasts, projections and targets;

(d) Establishing some means of collecting and analysing comprehensive information about existing training facilities, including technical education, vocational and management training, and assessing at regular intervals the adequacy of these facilities in the light of manpower requirements for accelerated industrialization;

(e) In the light of these assessments and manpower requirements, establishing and implementing, in order of priority, a plan for action in the field of training, including technical education, vocational and management training, which takes account of the resources available, both nationally and under bilateral or international aid programmes;

(f) Keeping under review the financial implications of their programmes of training, including technical education, vocational, and management training, particularly with a view to obtaining maximum returns from their scarce resources thus invested.

Recommendations for action by international organizations

102. The recommendations to international organizations, which are formulated below, should be considered against the background of the extensive action already undertaken by them in the field of education and training and industrial development. Considerable attention has been paid to education and training over the past fifteen years in the international organizations and this has led to a great variety of measures. This action has, however, inevitably been restricted as a result of the limited resources available to the organizations. Should additional resources become available, it would be important for the organizations to pursue

the forms of concerted and co-ordinated action which they have together built up over a period of many years. The following items already in progress or on their work programmes appear of particular interest in this connexion:

(a) Research and studies on employment objectives in economic development and employment policy and the economic problems of training, including technical education, vocational and management training;

(b) The study of methodologies appropriate to the forecasting of requirements of personnel for industrialization in countries at different levels of industrialization and the improvement and development of tools and techniques needed for work in this field;

(c) Assistance to countries in the training of people to undertake the necessary national surveys, in the analysis of the results, in the study of trends in the demand for technical personnel and educational and training qualifications, and in the establishment of administrative machinery for carrying out these various functions;

(d) The collection, analysis and dissemination of information about training, including technical education, vocational and management training;

(e) The evaluation of training systems, (including technical education, vocational training, management training), and the study of methodologies for making such evaluations;

(f) Assistance in the planning and implementation of schemes of training, in particular by setting up or strengthening the necessary administrative machinery;

(g) Assistance in carrying out detailed inquiries into the financial implications of programmes of training in developing countries and in instituting standard costing systems for each education and training programme.

103. Furthermore, it is necessary to give attention to basic problems of planning for, and implementation of, industrialization programmes and to train personnel to undertake these tasks. The training of key personnel in the developing countries in the following areas is required:

(a) Assessment of existing industrial activities and potentialities for further development; in particular training in undertaking detailed studies of individual industries, taking into account economic and technical aspects and evolving methods to combine both macro and micro aspects in planning for industrial development;

(b) Establishing an appropriate institutional framework designed to promote industrial development such as, for instance, industrial research and development institutes and industrial estates;

(c) Disseminating information relating to technology, process development and other relevant information concerning establishment, management and operation of industrial establishments;

(d) Ensuring fuller utilization of all domestic and international resources in the field of industrial develop-

ment in general and industrial training in particular through appropriate administration and co-ordination procedures and arrangements.

104. The Economic and Social Council may wish to recommend that the General Assembly should request the Secretary-General: (1) to transmit the present report to Governments, to the specialized agencies, to the regional economic commissions and to the Committee for Industrial Development for their comments and recommendations; (2) to report to the Economic and Social Council on the subject as and when appropriate.

ANNEX

1824 (XVII). The role of the United Nations in training national technical personnel for the accelerated industrialization of the developing countries

The General Assembly

Considering that the task of accelerating industrialization, which is an indispensable condition for the development of national economies, requires adequate facilities for general education and a large number of well trained national technical personnel,

Recalling its resolution 1515 (XV) of 15 December 1960, Economic and Social Council resolution 898 (XXXIV) of 2 August 1962 and the latest report of the Committee for Industrial Development,^a in which the training of technical personnel is regarded as an important factor in the economic development of under-developed countries,

Recognizing that the training of national technical personnel should be an integral part of national economic and social development plans and should be carried out having regard to current and long-term needs for specialists in connexion with those plans,

Recognizing also that the training of national technical personnel should be carried out mainly in the developing countries themselves whenever possible,

Noting with satisfaction that the United Nations and the agencies concerned, in implementing their programmes of technical assistance, are paying increasing attention to the problem of training national technical personnel in the developing countries,

1. *Considers it desirable* to intensify the work of the Committee for Industrial Development with regard to assistance to the developing countries in training national technical personnel, so that further concrete measures within the framework of the United Nations system and recommendations for the Governments concerned may be elaborated in this field;

2. *Requests* the Secretary-General, in co-operation with the Governments of Member States and in consultation with the Technical Assistance Board, the Special Fund, the United Nations Educational, Scientific and Cultural Organization, the International Labour Organisation and the other specialized agencies, to prepare a report, which would include:

(a) An estimate of the requirements of the developing countries, whenever possible according to their development plans, for technical personnel of the intermediate and higher levels and an estimate of the available possibilities for training such personnel in those countries, using, *inter alia*, the methodology and techniques for assessing those requirements the formulation of which is envisaged in the programme of work in the field of industrialization of the Committee for Industrial Development;

^a Official Records of the Economic and Social Council, Thirty-third Session, Supplement No. 2 (E/3600/Rev.1), paras. 54-65.

(b) Information concerning methods of training national technical personnel in various countries, taking into account the experience of States with different social and economic systems;

(c) Information concerning the progress being made in the training of technical personnel for the developing countries in the industrially advanced countries, and the methods employed;

(d) Proposals for measures within the United Nations system and recommendations to the Governments concerned with regard to intensifying the training, and improving the facilities for the training, of national intermediate and higher technical personnel in the developing countries and, where appropriate, on an intra-regional basis;

3. *Invites* the Committee for Industrial Development to give special consideration at its forthcoming sessions to the need for intensifying the training of technical personnel in the process of industrialization, and to assist the Secretary-General in preparing the above-mentioned report;

4. *Invites* the Economic and Social Council to consider the Secretary-General's report and the results of the discussion thereof in the Committee for Industrial Development, and to submit to the General Assembly, at its nineteenth session, for consideration within the framework of the problems of industrialization, a progress report on the implementation of the proposals and recommendations approved by the Council;

5. *Urges* the United Nations organs which carry out the programmes of technical assistance, the regional economic commissions and the specialized agencies concerned to increase their efforts in developing both national and regional projects aimed at promoting the training of national technical personnel for industry;

6. *Urges* Member States to develop their educational systems to meet the needs of industrialization, particularly as regards the supply of personnel at the secondary, technical and higher levels.

1197th plenary meeting,
18 December 1962.

5.5 Placement according to type of fellowship programme ..	73

Chapter 1. The determination of the numbers to be trained for industrialization

(a) *Basic principles*

I. BASIC PRINCIPLES AND GENERAL CONSIDERATIONS

1. During the last few years, an increasing number of developing countries have attempted to evaluate their present and future manpower situation. In the majority of cases, these studies have formed part of the preparation of a broader plan for economic and social development or have been based on such a plan seeking to determine its manpower implications. In a few countries where no plan had yet been drawn up, efforts were made, nevertheless, to assess manpower needs in relation to trends in the changing structure of the economy and of society.

2. Generally speaking, however, the art of preparing estimates of future manpower requirements is still relatively new in most countries and undoubtedly the most widely accepted conclusion based on experience to date relates to its complexity. Indeed, the problems and difficulties which have been met are by no means peculiar to the developing countries, although some are felt more acutely, in particular those resulting from the inadequacy of basic data. However, improved statistical and other information on manpower is not the only condition for increasing the reliability of the estimates. Progress in this area depends also in large measure upon progress in forecasting the future course of other factors which influence manpower supply and demand, e.g., demographic, economic, social and technological factors.

3. For these reasons, it is highly unlikely that any estimate of future manpower requirements prepared in the present state of knowledge and with the help of currently available methods would prove fully accurate — except by accident. This does not mean that such estimates should not be attempted. In the first place, it is in the process of preparing them that specific types of information to be developed become apparent and that methods are gradually refined. Moreover, a close scrutiny, as the future unfolds, of the results of the forecasts in the light of actual events may help to create a better understanding of the causes for change and to eliminate errors in basic assumptions. Clearly, this cannot be done until a first estimate, however rough, has been prepared. Thirdly, even though, in the present state of affairs, little reliance can be placed in detailed quantitative figures, the estimates can at least provide an indication of priorities in, and orders of magnitude of, the needs to be met. Indeed, since most developing countries have requirements that exceed their capacity to meet them rapidly, such information may be sufficient in the initial stages as a basis for allocating investments in education and training.

4. In view of all this, it may be useful to summarize some basic principles to be observed and general considerations to be kept in mind when preparing estimates of future manpower requirements. These remarks are based on the experience acquired in this field by both industrialized and developing countries, and on the results of research.

5. Several of the principles to be observed in making manpower estimates stem from the purposes for which such estimates are made. Since the present report is concerned with manpower estimates as a basis for planning educational and training programmes, particular attention will be given to the principles that have special relevance to this end. It must be pointed out, however, that assessments of the manpower situation and trends often have other objectives in addition to that of throwing light on educational and training requirements. Reference can be made in particular to the use of manpower information in determining requirements for employment creation, in guiding measures to encourage or slow down the geographic mobility of workers, in establishing policies that affect the labour force participation of groups, such as women, young or older people, or again in detecting imbalances in the labour supply that may be due to such factors as the structure of wages and other incentives. While these aspects will not be dealt with here, it should be remembered that they are highly relevant to the formulation of a comprehensive human resources policy, and that an assessment of the manpower situation and trends should be concerned with these questions as much as with the evaluation of educational and training requirements.

6. When considered from the angle of those responsible for planning the development of education and training, there are clearly certain conditions that manpower requirements estimates should fulfil.

7. In the first place, they should, so far as possible, express requirements in terms of educational and training needs, and not merely as the number of workers required for different occupations. This raises certain difficulties which will be dealt with at greater length subsequently in this chapter.

8. In the second place, the estimates should be concerned with new requirements for trained people resulting from growth or change in demand or from replacement needs. This involves estimating the total future requirements of the economy — suitably broken down by categories — and balancing these against the present supply, from which the number of people expected to leave the labour force as a result of death, retirement or for other reasons, should be deducted. A related aspect — on which very little information is available now — is the extent to which new requirements will be met without organized training programmes, by promotion from within or by horizontal transfers, since this natural flexibility in the labour supply has repercussions on the amount of education and training to be provided. Although the present chapter is mainly concerned with the methods of estimating gross future requirements for personnel of the higher and intermediate levels, it is important not to lose sight of the other steps involved in presenting net requirements for education and training.

9. Thirdly, unless the estimates cover the requirements of the whole economy — not merely those of

certain sectors, e.g., industry or even modern industry — they are of limited value to the educational and training authorities, who will not know the total requirements they should seek to meet. Although, as required by General Assembly resolution 1824 (XVII), the report concentrates on the assessment of requirements resulting from industrialization, it must be remembered that these represent only a portion of the whole.

10. Fourthly, the estimates should make it possible to plan any required expansion or reorientation of educational and training programmes sufficiently in advance to produce results when desired. At the present time, most estimates of future manpower requirements do not give sufficient recognition to the time-lag involved in educating and training qualified manpower at the higher and intermediate level, which ranges between three to five years for elementary skills and fifteen to twenty years for high-level skills. There are several reasons which necessitate looking ahead as far as possible. The expansion of the numbers to be trained at higher levels usually involves, particularly in developing countries, in addition to measures designed to increase the capacity and efficiency of educational and training facilities at those levels, the previous expansion of the numbers trained at lower levels: thus, in order to increase the number of university graduates, it is often necessary as a first step to expand secondary education, from which students of higher educational institutions are recruited. Also at all levels of skill, the initiation or expansion of a training programme requires that the necessary teachers, training facilities and organizational arrangements shall be available beforehand, all of which requires time and, therefore, advance planning. Other restraints may be of a material and financial nature, or may result from the slowness of administrative decisions, and there may be social, psychological or cultural obstacles as well which can only be overcome gradually. An additional factor is the time required to change substantially the existing stock of personnel in the categories concerned.¹

11. Another condition which estimates of requirements should meet relates to the amount of detail provided. There are two conflicting considerations here: on the one hand, educational and training authorities must have an idea of the types and number of facilities and programmes they will need to provide; but on the other hand, because a margin of error is unavoidable, it is desirable to deal as far as possible with broad categories and to avoid spurious precision in detail. Accordingly, it is the minimum requirements of educational and training authorities that should dictate the amount of detail provided.

¹ One may, for example, take the case of a country where a yearly out-turn of thirty-six engineering graduates is sufficient to maintain the present stock of engineers at 1,000 (assuming a replacement rate of 3.6 per cent and assuming that all engineering graduates enter the occupation); even if the intake of engineering faculties were suddenly increased by as much as 50 per cent, it is only when the new engineering students would graduate, say after four years, that the out-turn would be modified. This means that it would take fourteen years to increase the stock by 180 engineers, or by only 18 per cent.

12. Obviously, short-term estimates need to be more detailed than long-term estimates, since decisions must be taken now as to the number of people to be admitted to various forms and types of training. For the medium (up to 10 years) and long-term (up to 15 or 20 years), much less detail is required, except in respect of occupations which require highly specialized training of a long duration and also in respect of what may be called "derived demand", i.e., the demand for teachers and instructors who must be available in time to train future trainees or students. Indeed, for all the occupations requiring a relatively short period of training and for which training facilities can be expanded with relative ease, there is little need for detailed long-term requirements estimates.

13. Some detail is also required as regards the geographical distribution of future requirements, since this is the basis for decisions regarding the places or regions where training facilities of specific types should be planned. In addition, in the case of long-term forecasts, some indication should be given regarding the volume and structure of demand at different times during the period considered, since, so far as possible, plans should be made to ensure that the supply is at all times in line with the demand.

14. Finally, estimates should be prepared in such a form as to enable users to find out how the results presented were arrived at. Estimates presented in this way have a greater force of persuasion and are therefore more likely to be accepted by all concerned as the basis for measures to meet future requirements. A clear indication of basic assumptions and the methods followed also makes it easier to detect and correct any errors, and by a comparison of working hypotheses with actual developments, to reach a better understanding of the factors causing changes in the structure of the demand for, and supply of, trained personnel.

15. In addition to these conditions relating to types of information to be presented in estimates of future requirements of trained personnel, the actual work involved in preparing the estimates should also be guided by certain principles.

16. Comprehensive planning poses important problems of co-ordination between the various authorities concerned. In principle, it matters little what agency or authority draws up the economic and social development plan, provided it is in a position to cover all aspects of planning including manpower, education and training. However, even comprehensive planning may remain ineffective unless there is consultation and co-operation between the planners and the authorities or bodies which can provide the information and advice on which sound decisions can be planned, and which in the last resort will be responsible for the day-to-day execution of the plan within their individual areas of responsibility. Only on that condition can the necessary adjustments be made between the targets set in different fields so as to produce a consistent and, if possible, optimal plan.

17. Another principle to be kept in mind is that the task of preparing the estimates is a continuing one.

Estimates need to be kept under review and to be revised or refined as required. In addition, it is necessary to prepare "rolling" estimates, i.e., the period covered by the estimates should be extended year by year so that education and training authorities may at all times have the advance information they need for planning their activities and programmes.

(b) *Some general considerations*

18. Before examining certain approaches and methods which have been used in the preparation of estimates of future requirements of technical personnel, it may be useful to review briefly certain general considerations that should be kept in mind.

19. One of the most important considerations relates to the flexibility of manpower demand under different conditions of supply. Thus, when manpower is relatively cheap and abundant in comparison with other factors of production, there exists a tendency to use more manpower than under conditions where it is relatively expensive and scarce. This factor appears to account to a large extent for differences in patterns of manpower utilization in different countries, as illustrated by Annexes A and B (E/3901/Rev.1/Add.2), which show widely varying percentages of higher and intermediate personnel in the industrial sector of different countries, as well as considerable variations in the relative shares of engineers and technicians. The fact that employment ratios of higher personnel are particularly low in the developing countries appears to be due both to the shortages that exist in these categories and to a tendency to use low-skill manpower on a relatively larger scale than in the industrialized countries, where such manpower is less plentiful and more costly.

20. This factor should be taken into account when estimating future requirements for technical personnel in the developing countries. It seems very probable that as long as different conditions prevail in the developing and in the industrialized countries respectively, as regards the availability of the factors of production, including manpower, different patterns of manpower utilization will continue to be observed. It may be added that this is in accordance with the need for emphasizing labour-intensive production techniques in the developing countries in order to reduce unemployment.

21. It is clear, however, that the objective of maximizing employment must be reconciled with that of maintaining productivity at an adequate level, and this means, *inter alia*, raising the skill level and improving the skill structure of the labour force. However, estimates of trained manpower requirements should take account of the existing level of skill in the labour force and of the need for fixing realistic targets for education and training, having regard to the resources available for expanding existing facilities and programmes to the possibility of doing so rapidly.

22. Estimates of trained manpower requirements should also indicate priorities and this may raise problems of choice namely a satisfactory balance between the short-term and long-term needs. For example, if the objective

of economic development is to increase substantially both production and productivity, it may appear more urgent to raise the skill level of the employed labour force by rapid training methods than to provide relatively more expansive facilities where a smaller number of persons not in the labour force would receive thorough training of longer duration. Yet a balance must be struck between the two, and it is the task of the manpower forecaster to foresee the implications now and later of different possible courses of action.

23. All this points to the fact that estimating future manpower requirements is not a theoretical exercise. Adequate consideration needs to be given to the existing supply situation and to the financial and other restraints that prevent its being modified rapidly. In other words, there is a close interdependence between estimating future manpower requirements and planning to meet these requirements.

24. Similarly, planning to meet manpower requirements is closely interrelated with economic planning.² The manpower implications of an economic development plan may be such that they cannot be met, because the resources available for education and training under the plan are insufficient. In that case, the production targets of the plan may have to be adjusted or the resources allocated to education and training increased, or both.

II. APPROACHES AND METHODS

25. Estimating the future requirements of technical personnel of the higher and intermediate levels would be a relatively easy task if it were possible to consider these independently of variations in other factors. For example, one could envisage extrapolating past trends of employment of the above-mentioned categories, the ratio of such personnel to total employment and their corresponding growth rates. Data on these aspects are, of course, an important ingredient in the forecasting process. However, it is generally admitted that simple extrapolations from these data, taking no account of new or changed circumstances that may modify existing trends in the future, do not provide a reliable picture of future requirements of technical personnel, especially in the developing countries. One reason is that a major objective in these countries is to step up development, and this involves breaking away with past trends; moreover, data about the past from which underlying trends could be derived are frequently unavailable.

26. An alternative "simple" approach could consist of assuming that a given rate of increase of the stock of technical personnel with a view, e.g., to doubling its size over a certain period would be consistent with broad social objectives. This method has the advantage of not depending on the availability of information about past trends, but the decisions made may very well be arbitrary. It takes no account of the factors

² *The Interdependence of High-Level Manpower Planning and Economic Planning*, by the International Labour Office (E/CONF.39/B/17, 9 October 1962). United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas.

known to influence the demand for technical personnel and, consequently, the assumed targets may be too low — in which case economic development could be slowed down; or they may be too high. In the latter alternative, there is little doubt that the additional trained personnel could be absorbed in the economy, having regard to the elasticity of demand under different conditions of supply.³ However, the effort involved in training the higher number of technical personnel which would have to be supported from available resources, might well conflict with other demands and with the need for optimizing the use of resources.

27. Consequently, close attention has been given in recent years to defining the relationships connecting the demand for technical personnel with economic growth and, more particularly, with industrial development. Various approaches have been explored to this end. In this connexion, an attempt has been made to determine the factors which influence the demand for technical personnel and to measure their impact. Special attention has not only been paid to changes in the volume of industrial employment, in its distribution by sectors, and in productivity, but also to the development of a forecasting methodology based on the use of this information. Theoretically, the analytical or disaggregated approach, the practical application of which is considered in section (a) below, can be carried into considerable detail, especially as regards the extent to which industrial employment is broken down into sectors and sub-sectors. In practice, however, it meets with two main difficulties: the unavailability or inadequacy, particularly in developing countries, of data on which the estimates would need to be based; and the fact that in the present state of knowledge, the impact of the factors analysed can in any event not be measured with precision so that the margin of cumulative error may become very great.

28. The use of more aggregative techniques has therefore been considered with a view to avoiding some of these difficulties. Broadly, two main approaches can be mentioned. The "manpower" approach relates changes in the demand for technical personnel to changes in employment and productivity. The "indicators" approach utilizes a number of indicators of educational and training development (including the density of technical personnel) in comparison with indicators of economic growth. These approaches are described in section (b) below.

29. The approaches discussed in sections (a) and (b) are of assistance in defining the underlying trends in the development of the demand for technical personnel and are therefore particularly suitable for the preparation of long-term forecasts. Various factors, however, may cause fluctuations around the basic trends (e.g., business cycle). Moreover, more detailed information

is required on short-term than on long-term needs. Section (c) examines certain methods for obtaining this detailed information and for measuring the impact of certain factors which may operate in the short run.

(a) *Disaggregated manpower requirements approach*

30. It is generally recognized that a chain of relationships connects production with educational and training requirements. More specifically, the industrial composition of output or "output mix" influences the industrial structure of employment, which in turn, affects the occupational composition of employment (since different industries have different occupational patterns). Finally, there is a relationship between occupations and the qualifications, in particular the education and training, of the workers in them. It should be noted that, since output in turn depends on the availability of workers with the required educational and training qualifications, the chain of relationships is circular and all variables are interdependent.

31. The disaggregated manpower requirements approach, as the name implies, takes into account sectoral variations in the proportions of technical personnel employed. This method can only be applied, if information is available on the sectoral distribution of output (or employment) and on the ratios of technical personnel to employment in each sector.

32. If the relationships between output mix, employment, occupations and educational and training requirements were clear, stable and well-defined, it would be possible to relate output directly to occupations or to educational and training qualifications. On this basis, an input-output table could be built, cross-classifying occupations by industry, and the matrix of input coefficients would show inputs of labour of different categories per unit of production. Basically, such a table would consist of the usual table of inter-industrial relations, but the row showing labour inputs would be split up on the basis of the occupational or educational characteristics of those inputs. Such an approach has all the weakness of a usual input-output model: it assumes constant input-output relations and does not allow for choice between alternative skill mixes in individual lines of production. Although these weaknesses can be remedied to some extent,⁴ it remains that the approach, although interesting in theory, can hardly be applied today. The inadequacy of available data is a basic obstacle, especially in the developing countries. But the main difficulty stems from the loose nature of the relationships between output mix and employment, between employment and occupations, and between

³ While a saturation point could conceivably be reached, it seems very unlikely that in the developing countries, which suffer from a severe shortage of technical personnel, this could happen within the 15-20 year period which would normally be taken into account for educational planning. Any surpluses would be more likely to result from the inadequacies of market mechanisms, including the wage structure.

⁴ The input-output model can be expanded to a linear programming model and its extension pursued in two ways. First, different skill mixes for similar production activities can be introduced as possible alternatives, allowing for choice on the basis of optimality of skill composition (having regard to the current skill structure of the labour force). Secondly, skill-producing activities can be introduced in the model on the same basis as the activities concerned with physical production. This introduces the possibility of choice between skill-producing and goods-producing activities and forms a typical example of an approach that tries to integrate the problem of physical and human resource allocation in one process.

occupations and education and training characteristics. These relationships vary both from country to country and over periods of time. This makes it necessary to look at each link in the chain of relationships in the light of the best available knowledge in each country concerned and of international comparisons to supplement national data.

33. The first link is the forecasting of the industrial distribution of employment. This has sometimes been estimated directly, without reference to production, on the basis of an extrapolation of past trends.⁵ Another method starts from the supply side, i.e., population forecasts. These can be used as a basis for deriving successively the labour force, the civilian labour force and the civilian employment (some assumption being made about the future volume of unemployment, both open and disguised). Civilian employment can be further broken down on the basis of past trends in the distribution of employment.⁶ Both these methods, because of their reliance on data about the past, may be difficult to apply in the developing countries. Moreover, in the case of the latter method some doubts may be raised as to the logical sequence of a procedure which derives sectoral demand from aggregative manpower supply data through assuming an unemployment rate. Although measuring the manpower supply forms an essential part of any manpower forecast, it seems more appropriate to calculate demand and supply separately and to check supply against demand at the end of the forecasting process. Therefore, whenever possible, it would seem best to derive manpower demand directly from production.

34. This has in fact been done in most recent manpower forecasting studies, which have based their estimates of future employment by sectors directly on production targets. Basically, three kinds of data are required: planned output by sectors, the present relationship between production and employment in the various sectors, and the prospects in each sector for raising productivity through investment in new plant or equipment or by other methods.⁷

35. In studying the relationships between production and employment in each branch of activity, an important distinction should be made between the traditional and the modern sectors, since patterns of manpower

utilization in the two sectors are often quite different. Incidentally, this affects not only the numbers employed per unit of production, but the occupational distribution of employment and educational and training requirements.

36. A convenient method for drawing the line between the "traditional" and the "modern" sectors in industry is to include in the latter only plants employing more than a certain number of workers (say twenty or fifty) or using more than a certain amount of horsepower, with the "traditional" sector comprising all smaller undertakings as well as self-employed persons engaged in various handicrafts.

37. At this point, there is sometimes a tendency to leave aside the traditional sector and to concentrate attention solely on the manpower requirements of the modern sector. Often, however, there is scope for increasing production and productivity in small-scale industries, which under the above definitions are included in the traditional sector, through, *inter alia*, better training of the management, technical personnel and workers in those industries. This points to the need for including attention to small-scale industry when estimating future manpower demand.

38. Once the industrial structure of employment has been determined, the next step consists of deriving estimates of requirements for technical personnel. Here again, various approaches have been used. The simplest is to take the current ratio of technical personnel to employment in individual sectors, to assume that it will remain constant, and to derive future requirements by applying this ratio to future sectoral employment. However, the assumption that the ratio will remain constant is open to doubt. Another method is based on the analysis of the occupational structure of employment in a sample of leading firms, and on the assumption that the structure for each sector as a whole will tend to approximate in the future to that found today in these representative firms. This approach appears rather promising. However, it relies on assumptions being made about the probable speed of change and adaptation of existing firms. Moreover, particularly in the developing countries where the promotion of small-scale industries is emphasized, a distinction should be made on the basis of the scale of enterprises, since the structure of employment in large-scale and small-scale firms often differs substantially.

39. Changes in the ratio of technical personnel (or of one category, e.g. engineers) to sectoral employment can also be forecast by relating the ratio to certain variables, such as productivity and the scale of enterprises. One of the difficulties about using such ratios and making assumptions about the changes that may take place in them over a period of time is the inadequacy of data. There is uncertainty regarding the extent to which the ratios are to be raised during the period considered. Consequently attention has been given recently to the possibility of using ratios from other countries (or the growth rates of such ratios) as a point of comparison in setting growth targets for national ratios. This should, however, be done with caution. Although available data

⁶ See United States, Department of State, Agency for International Development, *The Forecasting of Manpower Requirements*, Washington, 1963 (chapter III); UNESCO, Regional Advisory Team for Educational Planning in Asia, *Long-Term Projections for Education in India*, New Delhi, 1963, mimeographed, pp. 25 and ff.; and IBRD, *The Economic Development of Venezuela*, John Hopkins Press, Baltimore, 1961.

⁷ See studies initiated by the OECD in the Mediterranean countries of Europe. As an example of recent manpower forecasting studies undertaken by a developing country, reference is made to a research project of the Institute of National Planning in the United Arab Republic on manpower forecasting and educational planning. Under this programme, a number of surveys were undertaken and final results have been presented in *Manpower Requirements for the United Arab Republic for the period 1960-1985*, memorandum No. 431 (26 May 1964), edited by Dr. Mostafa Hamdy.

show some striking correlations in the ranking of the ratios according to sectors in industrialized and developing countries, they also reveal important variations in the size of the ratios for given industrial sectors in different countries.⁸ These divergencies are due to some extent to differences in the scale of enterprises, in technology and in the availability of personnel of the categories considered. But an equally important cause of variation appears to stem from differences in the industrial composition of the sectors considered and in the extent to which research and development activities are included. This points to two conclusions: in the first place, close attention should be paid to the activities actually covered by ratios relating to broad industrial sectors; secondly, however, the reliability of the "ratio" approach appears to increase when the ratios are more closely related to well-defined types of production.⁹ This seems to indicate that further research in this area, as well as analysis of the causes of variation between national ratios, could provide useful information with a view to helping the developing countries to estimate their future technical personnel requirements.

40. Estimates of requirements for individual technical occupations still need to be translated into estimates of education and training requirements, expressed in terms of the duration and types of education and training required.¹⁰ This task should, of course, be carried out in close consultation and co-operation with the educational and training authorities and with due regard to the structure of the educational and training system and to the types of facilities available in the country concerned.

41. Here certain difficulties arise because most occupations are not homogeneous as regards the educational and training qualifications of people in them. Some are significantly less homogeneous (e.g. management) than others (e.g. engineers or doctors). Differences in training background relate not only to the type of training but also to its level. The occupations of engineers and scientists usually include a proportion of people whose level of education and training is somewhat below the "norm" for the occupations concerned but whose experience or other qualifications are considered to make up for the difference.¹¹

42. In translating occupational requirements into educational and training requirements, account should be taken of these "equivalents" and of their training backgrounds. Another aspect relates to their suitability and to the desirability or otherwise reducing their proportion.

43. Clearly, the greater the diversity of training backgrounds of people in a given occupation, the more difficult it is to draw from the existing patterns any firm conclusions regarding the specific training requirements for that occupation. The present composition of occupations according to the educational and training qualifications of persons in them is an illustration of the flexibility of manpower demand and is strongly influenced by the composition of the supply. In other words, it does not shed much light on what would be a desirable composition of future supply. Perhaps because of these difficulties, some studies have concentrated attention on the proportion in total employment of certain educational and training groups, especially high-level groups, without reference to the occupations in which the people concerned were employed. This approach is based on the assumption that the present level of employment of persons of different educational and training groups corresponds broadly to the absorption capacity of the economy, if not to the ideal requirements of specific occupations. Thus, the operations involved in analysing successively the occupational structure of employment and the educational and training backgrounds of people in different occupations, only to reaggregate these data as a basis for estimating future educational and training requirements, are considered largely superfluous.

44. While this is a plausible approach, it overlooks completely the problem of the relationship between education and training and occupations. It would, for example, be useful to know something about the range of occupations in which people with a specific educational or training background are engaged, and about the proportion of "equivalents" in specific occupations. Although such information can be obtained independently, there seems to be an advantage in seeking it within the framework of the forecasting exercise.

(b) *Aggregative approaches*

45. The main attraction of the disaggregated manpower requirements approach, described above, is that it attempts to measure variations in the demand for technical personnel that are due to changes in the industrial composition of output and consequently of employment. However, the longer the period, the broader and more aggregative must be the terms in which targets of economic and social development are expressed — for the very long term these perhaps can only be specified in terms of "production" or "consumption". Use of a sectoral approach becomes impossible under these circumstances and the specification of educational and training requirements will become broader and more aggregative. One may distinguish two main types of the aggregative approach, the "aggregative manpower requirements approach" and the "indicators approach".

(i) *Aggregative manpower requirements approach*

46. This is not basically different from the disaggregated manpower requirements approach, except that ratios of technical personnel are not computed for

⁸ See E/3901/Rev.1/Add.2, chapter 1, annex A, table No. 1.A.2.

⁹ See E/3901/Rev.1/Add.2, chapter 1, annex C for an elaboration of this topic, with reference to the cement, fertilizer and iron and steel industries. See also FAO care studies (annex D) and chapter 2, annex A.

¹⁰ An additional aspect relates to the methods of acquiring qualifications, e.g. in institutions, organized apprenticeship and on-the-job training. This, however, raises questions of policy which can best be dealt with by the educational and training authorities.

¹¹ See E/3901/Rev.1/Add.2, chapter 1, annex B.

each industrial sector, but for industry or even for the economy as a whole. The omission of this "sectoral" step makes the calculations much simpler, because it greatly reduces the number of variables to be considered, but it also means that the effects on the ratios of possible future changes in the industrial structure of employment are not taken into account directly. This can however be remedied; for example, allowance can be made for a shift in the distribution of employment between less skill-intensive and more skill-intensive activities. Thus, according to a United States study, 40 per cent of the changes in the ratio of engineers and scientists to the industrial labour force in that country can be attributed to shifts in the employment structure.¹² Changes in the ratios of technical personnel can also be related to expected changes in productivity. Thus, a Swedish study analysed the relationship between the ratio of engineers to employment and labour productivity, found this relationship to be close and used it to forecast the long-term demand for engineers.¹³

47. If a forecasting model is used, the introduction of such additional explanatory variables does not raise special difficulties since the total number of variables is *per se* much smaller than in a disaggregated model and remains, therefore, very manageable. The limited number of variables allows for refinement in other respects, e.g. by introducing time lags and splitting up the forecast period in successive phases.

(ii) "Indicators" approaches

48. These approaches differ from those previously described in that they omit the intermediate steps of forecasting employment and occupations, and attempt to derive educational and training targets directly from economic and social targets. They are highly aggregative and provide only a rough guide to the planning of education and training. Their advantage is that they are based on relationships derived from data that are usually available in developing countries.

49. One such approach is termed the *education-output* approach, because it relates broad educational categories to levels of national output.¹⁴ While it provides broad indications, more specific planning with this method would require research into methods of disaggregating and analysing educational and output data and into the underlying relationships between educational requirements and output targets.

50. It is also possible to use indicators of educational and training development in comparison with other indicators of economic growth, e.g. national income, its growth rate, income *per capita* or per unit of the labour force, public expenditure as a percentage of national income, the growth of investment — which has

the advantage of taking into account the rate of both technical change and expansion of the sectors concerned. These and other indicators can be related to the stocks and outputs of educated personnel in broad categories. Again, such a method provides only a rough planning guide and research would be required to determine the extent to which disaggregation into requirements for individual industries would be possible, and into the underlying relationships between the indicators.

51. All the methods described above have advantages and drawbacks. Whenever possible the results obtained by these methods should be cross-checked against each other, to provide guide-lines within which close estimates may be sought.

(c) Estimates of current and short-term requirements

52. The methods and approaches discussed above are most suitable for determining long-term trends in the manpower demand for technical personnel. In addition, special efforts should be made to assess current and short-term requirements. First, as already pointed out, such information needs to be more detailed than data on long-term demand. Second, current bottle-necks in supply, which need to be overcome rapidly, may imply different orders of priorities in training programmes for the short term and for the long term. Finally, factors such as fluctuations in the business cycle may cause variations in demand which, though they do not modify the long-term trend, should if possible be determined in advance.

53. Current shortages may be visible, for example, unfilled vacancies registered at employment offices, or posts filled by expatriates because of the lack of nationals with suitable qualifications. These can be identified easily. Or they may be concealed, that is, employers may be conscious of them, yet not take steps to advertise their needs since they feel this would not bring any results; or, even though the demand has adjusted to the supply apparently without causing friction, the level at which such a balance is achieved may result in low productivity and poor quality of goods produced.

54. One way of ascertaining current shortages is to determine, by means of establishment inquiries, the number of unfilled vacancies or inadequately filled jobs. An alternative method is to estimate concealed demand by applying staffing patterns prevailing in other countries or in representative firms within the same country.

55. These methods have their limitations for which allowance must be made, even though no substitute methods can be suggested. Employers, when interviewed, often tend to overstate the required standards of qualification for a given occupation, and do not always seem aware of the increased remuneration which should go with higher qualifications. The difficulties in the use of ratios from other countries have already been discussed. And staffing patterns from so-called representative firms do not as a rule closely reflect the current needs of the industry as a whole.

56. Short- and medium-run fluctuations of manpower demand around the long-term trend find their origin

¹² D. M. Blank and J. G. Stigler, *The Demand and Supply of Scientific Personnel*, National Bureau of Economic Research, New York, 1957.

¹³ *Universitet och Högskolor I. 1960—Talets Samhälle*, Statens Offentliga Utredningar 1959:45, Stockholm, 1959, p. 50 *et seq.*

¹⁴ See J. Tinbergen, "Quantitative Adaptation of Education to Accelerated Growth", *Planning Education for Economic and Social Development*, OECD, 1963.

chiefly in general movements of employment and population. As far as employment is concerned, such fluctuations appear to be due mainly to cyclical or accidental causes. Cyclical fluctuations are largely absent on the population side¹⁵—which influences not only the labour supply, but the total level of demand for goods and services and, consequently, the labour demand—but accidental events may be of great importance, a relevant example being the post-war baby boom in Europe.

57. How can the impact of such developments on the demand and supply of particular categories of manpower be measured so as to adjust the trend data? It seems that the influence of accidental events can only be dealt with separately, through *ad hoc* measurements. There is still little experience in accounting for cyclical movements in employment, but reference can be made to the Netherlands, where this is done by using appropriate mathematical models.¹⁶ Alternatively, one may simply adjust the trend having regard to the expected movement of the business cycle during a period of one to three years ahead. This movement can be determined on the basis of business interviews and/or analysis of business cycle indicators.

III. FUTURE REQUIREMENTS OF SCIENTIFIC AND TECHNICAL PERSONNEL IN THE DEVELOPING COUNTRIES

58. For the purposes of the present report, an attempt will be made to assess the training requirements for technical and scientific personnel of the higher and intermediate levels for the period 1960-1975 in the developing countries of Africa, Asia and Latin America. The estimates are based on the aggregative manpower requirements approach. As indicated above, such a method can provide, at best, only a rough planning guide. Moreover, the estimates have been determined under certain broad and hypothetical assumptions which are subject to review. Thus, it should be noted that the estimates of requirements are provided for illustrative purposes only.

59. The following table gives an estimate, based on

TABLE 1.1. ESTIMATED INDUSTRIAL EMPLOYMENT BY MAIN REGIONS, 1960

Regions	Total industrial employment (millions)	Ratio of industrial employment to labour force (percentage)
Africa	4.5	5.1
Asia	33	5.0
Latin America	10	14.7
TOTAL	47.5	

¹⁵ Some cyclical fluctuations in labour supply, such as changes in female labour force participation rates, appear to be largely in response to changes in labour demand.

¹⁶ P. de Wolff, "Employment Forecasting Techniques in the Netherlands", *Employment Forecasting*, op. cit., pp. 90-91.

available data,¹⁷ of industrial employment in 1960 in Africa,¹⁸ Asia¹⁹ and Latin America,²⁰ and of its share in total employment.

60. A number of developing countries have drawn up plans showing at what rates they expect employment in the industrial sector to expand during the plan period. These rates vary significantly for a number of reasons, of which an important one relates to the present size of the industrial sector in the economy. It is easier to double this size over a given period if the industrial sector is very small than if it employs already a significant proportion of the labour force. However, in looking at the targets set in development plans, and assuming that planned growth rates can be maintained until 1975, it seems possible to define, for each region, reasonable maximum and minimum cumulative rates of growth of industrial employment.

61. Thus it seems likely that in Africa the rate would be neither higher than 3.9 per cent per annum²¹ nor lower than 2.3 per cent.²² In Asia it would range between a maximum of 6.8 per cent²³ and a minimum of 4.6 per cent²⁴ and in Latin America between 5.0 per cent²⁵ and 4.4 per cent.²⁶ For the purposes of the present report, average rates of 5.7 per cent for Asia, 3.1 per cent for Africa and 4.7 per cent for Latin America have been retained; and table 1.2 presents estimates of industrial employment by main regions for 1975, based on these average rates.

¹⁷ The estimates in the present section are based on *The United Nations Statistical Yearbook*, and the *ILO Yearbook of Labour Statistics*, as well as national census data and data or estimates found in the development plans of some countries. They include only salaried employees and wage earners and exclude employers, workers on their own account and family workers, who usually include a large proportion employed in handicrafts rather than in modern industry.

¹⁸ For the purposes of this section, Africa includes all African countries, except the Union of South Africa, where the structure of the labour force differs substantially from that of other African countries.

¹⁹ Includes all Asian countries, including those of the Near and Middle East, but excludes the Asian Republics of the USSR, Israel and Japan, where the structure of the labour force differs from that of other Asian countries.

²⁰ Includes all independent countries of South and Central America and the Caribbean Islands.

²¹ Weighted average of rates found in development plans of Morocco, Tunisia and the United Arab Republic (5.6 per cent) and assumed rate of growth of 3 per cent for the rest of Africa.

²² Weighted average based on growth rate of 4.5 per cent for North Africa and the United Arab Republic (eliminating higher growth rates forecast in Morocco and Tunisia) and assumed growth rate of 1 per cent for the rest of Africa. The latter low average growth rate takes account of difficulties encountered recently by several African countries in maintaining past levels of industrial employment.

²³ Weighted average of programmed growth rates in ten Asian countries.

²⁴ Weighted average of planned growth rates in eight Asian countries (leaving aside some countries where targets appear to have been set very high).

²⁵ Weighted average of programmed growth rates in seven Latin American countries.

²⁶ Weighted average of programmed growth rates, leaving aside some countries where targets appear to have been set very high.

TABLE 1.2. ESTIMATED INDUSTRIAL EMPLOYMENT
BY MAIN REGIONS, 1975

Regions	Assumed growth rate	Total industrial employment (millions)	Ratio, industrial employment to labour force (percentage)
Africa	3.1	7.1	6.3
Asia	5.7	75.8	8.5
Latin America	4.7	19.9	19.0
TOTAL		102.8	

62. Indications regarding the present proportion of engineers and scientists²⁷ in the industrial labour force are available for a few countries at the most in each region.²⁸ This makes it difficult to determine what this proportion may be for each region as a whole. However, on the basis of available data it seems possible to present both a conservative and a more optimistic estimate of that proportion. Estimates range between .20 and .40 per cent in Africa, .18 and .36 per cent in Asia and .30 and .60 per cent in Latin America. For the purposes of this report ratios representing an average between the higher and the lower estimate for each region have been assumed. These are presented in table 1.3 which also gives the absolute number of engineers and scientists in each region as of 1960, as determined by applying these average ratios to the figures in table 1.1 concerning total industrial employment.

TABLE 1.3. ESTIMATED NUMBER AND PROPORTION OF ENGINEERS AND SCIENTISTS TO INDUSTRIAL EMPLOYMENT BY MAIN REGIONS, 1960

Regions	Ratio, engineers and scientists to total industrial employment (percentage)	Absolute numbers (thousands)
Africa30	13
Asia27	89
Latin America45	45
TOTAL		147

63. New requirements for engineers and scientists over the period 1960 to 1975 may be expected to result from four main causes: first, the expansion of industrial employment; secondly, the need to raise the proportion

²⁷ Includes architects, engineers and surveyors (minor group 0-0 of *International Standard Classification of Occupations*; chemists, physicists, geologists and other physical scientists (minor group 0-1); biologists, veterinarians, agronomists and related scientists (minor group 0-2). In a few instances, available data refer only to engineers. There are, however, indications that in developing countries engineers represent the bulk of the engineer and scientist group. Variations that may result from different definitions should therefore remain well within the range of variations indicated in this paragraph.

²⁸ The countries for which data or indications are available include Congo (Leopoldville), the Federation of Rhodesia and Nyasaland, Tunisia, United Arab Republic, Uganda, China (Taiwan), India, North Korea, Argentina, Brazil, Chile, Venezuela.

of engineers and scientists in total industrial employment above its present levels; thirdly, in Africa in particular, the need to replace expatriates, who at present form a substantial proportion of the total number of engineers employed, by Africans; fourthly, normal replacement needs. The expansion of industrial employment has already been discussed. Available data suggest that Africanization is likely to affect some 75 per cent of the engineers and scientists at present employed in Africa.²⁹ As regards the growth of the ratio of engineers and scientists to the industrial labour force, it appears that the most appropriate method would be to determine reasonable maximum and minimum growth rates. The ratio cannot be expected to grow at a higher rate than 5 per cent per annum. This is close to the highest growth rates observed in the United States and Sweden, in both cases over five-year periods.³⁰ Such a cumulative growth rate over a 15-year period would involve more than a doubling of the ratio of engineers and scientists to the industrial labour force which, coupled with an expected substantial increase in the industrial labour force (see table 1.2), would involve about a fourfold increase of the existing stock of engineers and scientists. On the other hand, some increase in the ratio of engineers and scientists to industrial employment is probably to be expected, to take account of technological change in existing industries and of the growth of new industries employing a larger proportion of technical personnel than the existing ones. Thus it has appeared reasonable to set the "low" growth rate, at 1 per cent per annum. In table 1.4 an average cumulative growth rate of 3 per cent has been assumed.

64. Normal replacement rates resulting from retirement, death, permanent illness or transfer to other occupations are difficult to estimate in the absence of information on the present age structure of the engineer and scientist group or on the extent to which they remain employed as engineers or scientists throughout their working lives. There are reasons to believe that most of the existing stock of engineers and scientists are relatively young, so that replacement needs resulting from retirement, death or permanent illness could be expected to be very low, at least during the 1960-1975 period. The replacement rate has been set at 2 per cent of the existing stock per annum. This is assumed to make sufficient allowance also for the (presumably very low) replacement requirements affecting the future stock to be trained during the 1960-1975 period.³¹

²⁹ The proportion of African engineers and scientists out of the total number of engineers and scientists employed appears to be negligible in Africa south of the Sahara. For the countries of North Africa and the United Arab Republic the relationship of African to foreign personnel was determined for individual countries on the basis of available statistics; the number of African engineers and scientists in these countries represents 25 per cent of the total number of engineers and scientists in Africa.

³⁰ See E/3901/Rev.1/Add.2, chapter I, annex B, table 1.B.3.

³¹ This replacement rate, which is applied also in the case of technicians in table 1.5, corresponds to "normal" replacement needs, i.e. it does not take into account the problem, known to be acute in many developing countries, resulting from the fact that a substantial proportion of people who have completed technical studies do not go into, or stay in, the technical occupations for which they have been trained.

TABLE 1.4. ADDITIONAL NUMBER OF ENGINEERS AND SCIENTISTS TO BE TRAINED BY 1975 BY MAIN REGIONS

(In thousands)

Regions	Ratio of engineers and scientists to industrial employment (Percentage)		Total engineers and scientists required by 1975	Net increment	Africanization	Replacement of existing stock	Total engineers and scientists to be trained
	1960	Target 1975					
Africa	0.30	0.47	33	20	10	1	31
Asia	0.27	0.42	318	229	—	27	256
Latin America	0.45	0.70	139	94	—	13	107
TOTAL			490	343	10	41	394

65. The number of technicians³² required can be determined by applying a ratio representing the proportion of technicians to be employed for every engineer or scientist in industry. In industrialized countries there is considerable variation in this ratio, which at recent dates was, for example, .7 in Belgium and the United States, 2.5 in the USSR, 3.3 in the Federal Republic of Germany, 3.8 in the Netherlands and 4.3 in Sweden.³³ It would seem that a high ratio of technicians to engineers and scientists approximating that found in Sweden, would have much to commend itself in developing countries in view of the relatively lesser cost and shorter time required to train technicians than engineers or scientists and of the ability which is known to exist for substitution between technicians and engineers in particular.³⁴ However, current ratios of technicians to engineers and scientists are rather low at the present time in most developing countries and as a result the attainment of a ratio as high as that prevailing in Sweden may be an unrealistic training target to be achieved during what is, after all, a relatively short period. The determination of the most suitable ratio is certainly a matter that would require closer examination with a view to setting the scope of technician training programmes, but for the purpose of this paper it will be assumed that this ratio should be an average between the highest and the lowest of the above-mentioned ratios. On this basis, table 1.5 presents an estimate of total training requirements for technicians (including normal replacement needs).

66. The above calculations seem to indicate that total training requirements by 1975 may be in the order of 394,000 for engineers and scientists and 992,000 for technicians, in order to meet the needs created by industrialization (and Africanization in Africa). The limitations of these estimates must, however, be stressed. There is, of course, the fact that little is known of the

³² Includes draughtsmen and science and engineering technicians as defined in minor group O-X of *International Standard Classification of Occupations*.

³³ The exact definitions of the groups covered in the ratios vary somewhat from country to country and will be found in E/3901/Rev.1/Add.2, chapter 1, Annex B, table 1.B.4.

³⁴ See E/3901/Rev.1/Add.2, chapter 1, annex B, paras. 7 to 12.

TABLE 1.5. ADDITIONAL NUMBER OF TECHNICIANS TO BE TRAINED BY 1975 BY MAIN REGIONS

(In thousands)

Regions	Estimated requirements 1975	Estimated technicians (excluding expatriates) 1960	Replacement of existing technicians	Total technicians to be trained by 1975
Africa	83	14	4	73
Asia	795	233	70	632
Latin America	347	86	26	287
TOTAL	1,225	333	100	992

future course of certain factors likely to influence future requirements for engineers and scientists and for technicians, e.g. the greater or lesser emphasis placed in future development plans on industries employing larger proportions of technical personnel than those suggested in the tables, the extent to which the proportion of engineers, and scientists to industrial employment, or of technicians to engineers, may be affected by technological change or by other causes. But the main limitation of the estimates results from the inadequacy of the data on which they are based. Rough assumptions, based partly on the scant data available and partly on judgement, have been made regarding the range within which existing ratios or the growth rate of such ratios, were likely to be confined. For the lack of better information, a decision was made to select, for each calculation a ratio or growth rate — representing an average between the “higher” and “lower” hypotheses put forward. However, these average ratios and growth rates are necessarily rather arbitrary and this affects the value of the end results regarding total training requirements for engineers and scientists and for technicians. It could be argued that in view of all these uncertainties, it would have been better not to present estimates representing an average between various hypotheses, but to show the full range within which the estimates might vary, depending on whether “high” or “low” assumptions were retained. Thus, it

appears that if the "high" assumptions had been used systematically in the successive calculations in tables 1.1 to 1.5,³⁵ total training requirements would have been assessed at 843,000 for engineers and scientists and 4 million for technicians, i.e., respectively 2.1 and 4.0 times higher than those presented in tables 1.4 and 1.5. On the other hand, the use of "low" assumptions would have yielded 169,000 engineers and scientists and 309,000 technicians, i.e., respectively 2.3 and 3.2 times lower than those in the tables. In other words, depending on which of the admittedly rough — but reasonable — assumptions presented are used, estimates of the training requirements for engineers and scientists appear to vary by a factor of about 5 and those for technicians by a factor of approximately 13.

67. For the purposes of the present report it was thought preferable to present average estimates rather than the widely divergent estimates produced by the use of high and low ratios. It must be remembered, however, that in the present state of knowledge a plausible case could probably be made for any estimate within the wide range just indicated. This shows the difficulty of arriving at any realistic estimate of training requirements for industrialization in the developing countries, and the need for improving data on the current situation, future prospects and desirable targets to be attained both as regards the proportion of engineers and scientists in the industrial labour force and the technician/engineer-scientist ratio.

68. In spite of all these reservations, the figures presented here are significant in that they show the tremendous task involved in training the new engineers, scientists and technicians required. Clearly, this will require, in addition to the mobilization of all resources that can reasonably be made available in the developing countries for this purpose, a major effort on the part of the international community in order to help these countries in overcoming the technical and financial difficulties that such a large-scale training programme would raise.

IV. REQUIREMENTS AND RECOMMENDATIONS

(a) *Information requirements*

69. Much progress has been made recently in defining various approaches to the determination of the requirements of technical personnel resulting from industrialization. However, much still remains to be done to improve the basic information that is needed in order to make these estimates, and to obtain a closer insight

³⁵ The higher estimates are based throughout on the higher ratios and growth rates presented in the text. The lower estimates are based on the lower ratios and growth rates, except in the case of technicians; the ratio of 0.7 technician per engineer and scientist (as in Belgium and the United States) is lower than the average ratio currently prevailing in developing countries and its use would have yielded a figure representing a decrease in the stock of technicians in 1975 as compared with 1960. This was considered unrealistic and a ratio of 2.5 corresponding both to the average ratio used in the calculations and to the ratio found in the USSR was used.

into the specific impact of various factors on technical personnel requirements and into the broad interrelations between educational and training development and economic and social development.

70. In the developing countries, the chief need is for more adequate data on the labour force, its distribution by branches of economic activity and specific industrial sectors, the proportions in key occupational categories such as engineers, scientists, management and technicians, as well as other categories needed for the planning and implementation of industrialization programmes. Information on the age and sex distribution of the labour force, on its geographical distribution and on mobility trends is equally essential. The structure of wages and salaries and other incentives should be examined when considering the causes of current imbalances in the supply and demand of trained and educated personnel. Finally, data should be obtained on the educational and training characteristics of workers, particularly in key occupations, and the output of the educational and training system should be measured from the standpoint of its adequacy to meet the quantitative and qualitative needs of industrialization.

71. Censuses and labour force sample surveys provide much of the information required on the labour force. However, economic analyses will also need to be conducted, industry by industry, with a view to obtaining the detailed information required in order to relate requirements for technical personnel of the higher and intermediate levels to specific types of production, technologies used, scale of undertakings, etc. For this purpose, establishment inquiries are an indispensable tool. Their use is of a three-fold nature. In the first place, they are an indispensable complement of the census through providing information for the inter-census period on the structure of the labour force, its size and distribution over the different activities, the occupational and educational characteristics, etc. and the changes therein over a period of time. Such information is essential to long-term forecasting, since it represents the basic data to be used as a starting point. Moreover, establishment inquiries are a convenient tool for gathering information because of the ease with which questions about particular problems can be incorporated in them, and because their limited scale means that their results can be processed rapidly. In addition, through such surveys information can be obtained about the views and expectations of management with regard to future manpower demand. Although such information is not usually reliable for the medium and long term, it can provide useful indications about short-term prospects.

(b) *Recommendations for developing countries*

72. Governments should set up systems for the periodic review, preferably annually, of the requirements of personnel for industrialization. The results of this review should be integrated into the overall long-term planning for human resource development. In particular, since educational plans involve long periods of time for their execution a system of rolling adjustment should be

envisaged in order that education and training plans are not over-rigid but adjusted to changing circumstances.

73. Within the limits of available resources countries should endeavour to train economists and statisticians with a good knowledge of manpower and educational questions, and set up, in their planning organization, units specializing in the analysis and forecasting of the patterns of training and education required for the process of industrialization.

74. Steps should be taken to collect more adequate educational, occupational and industrial data and to conduct economic analyses, industry by industry, for the purpose of determining higher and intermediate-level personnel requirements and for improving the statistical basis for the formation of forecasts, projections and targets.

(c) Recommendations for international organizations

75. The international agencies concerned should pursue:

(i) The study of methodologies appropriate to the forecasting of the requirements of personnel for industrialization in countries at different levels of development. Inter-country comparisons of patterns of growth should be established, as far as possible based on past experience and what is known as regards future trends of the use of different types of skill and knowledge for industrial purposes.

(ii) The improvement, and development at the international level, of tools and techniques needed for work in this field, including research for the development of an international educational and training classification system; for the improvement of quantitative indicators of, and techniques of analysis for, human resource development; for the determination of relationships between educational and occupational categories and between occupational structure and employment in given industrial sectors; and for the identification, definition and standardization of data necessary to be collected from countries, and internationally, for this purpose.

(iii) Measures to aid countries by technical assistance and other means in the training of people to undertake the necessary national surveys, in the analysis of the results, and in the study of trends relating to the demand for higher and intermediate-level personnel and educational and training qualifications. Arrangements should be made for the international dissemination of the necessary knowledge and techniques through seminars and clearing arrangements for information and publications.

Chapter 2. Available facilities in developing countries for the education and training of technical personnel

I. INTRODUCTION

76. This chapter is concerned with existing facilities in developing countries for technical education and vocational training in the light of the requirements for

technical personnel for industrial development. It must be emphasized, however, that considerable difficulty has been encountered in endeavouring to establish a comprehensive picture of existing training facilities, even for a limited number of developing countries, owing to a number of factors.³⁶

77. An overall but unavoidably incomplete picture, as far as facilities within the educational system are concerned, is given in the various volumes of the UNESCO publication *World Survey of Education*. It is not possible, however, in such a publication to cover qualitative, as well as quantitative, aspects. It is also not possible, for reasons of space, to include all quantitative details — such as number of schools, their location, workshops and laboratory facilities, machines and other equipment. Global enrolment figures, even if available, do not permit an answer to the question of adequacy.

78. Moreover, the *World Survey* does not cover the training facilities which exist outside the educational system and sufficient information is not available on these facilities to complete the picture even on the quantitative side. One of the reasons for this lack of information on facilities for training outside the educational system is the fact that there is frequently no arrangement within the countries for collecting and analysing information from enterprises and other bodies which give or organize training outside the educational system. The task, in any case, is not an easy one since training in plants is very often organized on an *ad hoc* basis and is not always continuous.

79. An additional problem encountered is the fact that no internationally-recognized classification of types of school and training institution exists which would have permitted the collation and comparison of information on an international basis. Some work has already been done towards the establishment of such a system, the classification being based on the length of the course offered by the school or training institution. Account is also taken of the length of prior education or training required. The work has not yet progressed far enough, however, to allow adequate international comparisons to be made, even if the necessary information were available.³⁷ Moreover, even when detailed quantitative data are available it is very difficult to evaluate the quality of the education and training provided and yet this is the core of the problem.

80. Although information is available as far as technical education and vocational training is concerned on the number of hours of instruction and length of courses, this information alone does not give an account of the benefit derived from instruction. The number of hours

³⁶ In preparing this chapter, consideration was given to obtaining information through the questionnaire to the Governments. Owing to lack of time, this method was not pursued. Moreover, the information could not have been obtained on training outside the established educational system.

³⁷ The UNESCO recommendation concerning technical and vocational education refers to the desirability of promoting the systematic application of international norms relating to one or other field of technical education, such as systems of units and scientific symbols.

alone is no criterion of either the quantity or quality of the work done in the course, but it can be taken as an indication of the time that the student is in contact with his teacher, and as such can possibly be regarded as a measure of the facilities available for dissemination and absorbing of knowledge by direct contact. It is quite clear that in those countries where early specialization takes place, the number of hours devoted to formal teaching are generally much greater than in some other countries where there is less specialization. Also it is evident from the details of the various curricula supplied that the proportion of the total time devoted to laboratory and/or drawing-office work varies considerably between the countries, and in some cases between the different branches of engineering.

81. On paper at least, some countries would seem to possess adequate facilities to meet the requirements of their expanding industries, but these very countries make great efforts to improve the quality of technical education and vocational training. In other countries enormous efforts have been made during the past years to increase the number of technical schools but without a concomitant effort to maintain or improve the quality of education they provide. Other countries have established or developed facilities for training in enterprises, in an effort to provide the trained manpower they require, but the necessary close co-ordination with existing facilities has not always been arranged.

82. In addition, the data available on the various categories and levels of skills required are often not sufficiently comprehensive. Overall estimates need to be given by branch of industry, geographical location and, if possible, by occupation if plans for the creation of schools and training facilities are to be realistic. As the case study on Forest Industries in Chile (E/3901/Rev.1/Add.2 chapter 2, annex A) shows, it is necessary to make a more detailed investigation to reach a reliable estimate.³⁸

83. In spite of the fact that it has proved to be impracticable, within the limits of this study, to present a comprehensive picture of the adequacy of existing facilities as a whole, the survey of available data has confirmed that, in many developing countries, the existing facilities are patently insufficient to meet the needs of large-scale industrial development. While the situation is better in some countries, it is not yet satisfactory and much remains to be done in order to assist the process of industrialization. In the following paragraphs, an attempt has been made to identify certain patterns and to arrive at conclusions applicable to developing countries in general.

II. INFORMATION ON EXISTING FACILITIES

84. The developing countries have in recent years made enormous efforts to establish, reorganize or expand their systems of technical education and vocational

training. Some of them have already made fairly exhaustive reviews of these systems and in some cases are well on the way to implementing the action which the reviews have shown to be necessary. Frequently this work has been carried out with the aid of international agencies or of other countries.

85. The criteria by which systems of technical education and vocational training should be assessed are set out in two international instruments adopted in 1962 by UNESCO and ILO. These instruments are the recommendation concerning technical and vocational education and the recommendation concerning vocational training which were adopted respectively by the General Conference of UNESCO at its twelfth session and the General Conference of the International Labour Organization at its forty-sixth session.³⁹

86. Attention has been drawn in earlier paragraphs to the inadequacy of quantitative information on existing technical education and vocational training facilities. If developing countries are to have a comprehensive picture of the existing facilities of all kinds and plan for future development of these facilities, they need some means of collecting and analysing the appropriate information on training, wherever given. In addition, as a by-product of such collection of data and provided a recognized classification of facilities is followed, it will also be possible to make international comparisons which will help countries to evaluate their efforts by reference to general practice.

87. The available information includes data relating to several developing countries on: the number of vocational training institutions by type — second level — (table 2.B.1); enrolment in vocational secondary education and ratios to total secondary enrolment (table 2.B.2); similar ratios as above by students' age groups (table 2.B.3); secondary vocational enrolment per 1,000 total population (table 2.B.4); students/teachers ratios at the vocational second level (table 2.B.5); facilities for skilled workers, mainly outside the educational system (table 2.B.6); enrolment in third level education and ratios to the total population of the country (table 2.B.7); number of engineering degrees or diplomas granted in universities or technological institutes (table 2.B.8).⁴⁰ As mentioned before, these are not sufficient for an answer to the question of adequacy. Moreover, the survey showed that data concerning size of school buildings, workshop and laboratory space are not in general available.

88. Data contained in the tables mentioned above are not intended to convey norms. They show that in most of the developing countries secondary technical education has been in the past, and still is in many cases, insignificant by comparison with general secondary education. In countries where the increase of vocational education is substantial this is largely due to an extensive

³⁸ See also document No. 76, FAO Advisory Committee on Pulp and Paper (5th Session) "Requirements of Technical Education and Training for the Chilean Forest Industries and E/3901/Rev.1/Add.2, chapter 1, annex C.

³⁹ ILO, Recommendation concerning Vocational Training and Technical Education, Official Bulletin, volume XLV, No. 3 July 1962, and UNESCO International Recommendation on Technical Education, UNESCO/ED/183, Paris, 31 October 1961, and UNESCO/ED/183/Add.1, 1962.

⁴⁰ See E/3901/Rev.1/Add.2, chapter 2, annex B.

development of commercial education with which this report is not concerned.

89. A study of the rate of increase of technical secondary schools by comparison with that of the general secondary schools showed that no general trend was discernible. In some countries technical and vocational education in full-time schools has grown much faster than general secondary education, in others the reverse trend could be observed. In the Philippines for example, the increase in enrolment in technical schools for the period 1957-1960 was 79.5 per cent, whereas enrolment in general secondary education increased by only 6.1 per cent. In Pakistan the increase in both branches of education was approximately 12 per cent for the same period, and in Brazil the situation is characterized by the following table.

TABLE 2.1. BRAZIL: FULL-TIME SECONDARY EDUCATION

Year	General secondary		Technical	
	No. of schools	Enrolment	No. of schools	Enrolment
1949	1,766	360,271	...	15,086
1951	2,190	405,049	421	17,013
1956	2,746	619,019	402	17,504
1958	3,308	761,740	426	19,835
1961	4,015	960,489	419	30,759

SOURCE: UNESCO *World Survey*, vol. IV and UNESCO *Statistical Yearbook*, 1963.

90. Thus the total number of technical schools has not grown since 1949 and the ratio of students in technical schools to those in general secondary schools has decreased from approximately 1:24 to 1:31. But these figures do not take into account the significant development of SENAI which consists of a mixed system of training at schools and at enterprises organized by the national federation of industry under the general supervision of councils including also representations of the ministries concerned with education, labour and industry.⁴¹

III. ORGANIZATION AND ADMINISTRATION

91. It is frequently appropriate that responsibility for technical education and training is vested in different ministries, where each is responsible for training in clearly defined major sectors of the economy. It is necessary that their areas of technical competence and responsibility be clearly defined, whether they be separate ministries, departments within a ministry, or provincial authorities, to avoid duplication of effort and waste of scant resources.

92. In-service training often takes place without proper control of standards and performance; individual responsible ministries should take steps to rectify this. Other forms of training are carried on by a variety of authorities without co-ordination of action as a whole.

Nor is there always the necessary close link between the authorities responsible for technical education and vocational training and those responsible for, among other things, economic planning, manpower policy and the employment situation. In addition, there is frequently no provision for the necessary collaboration with and by industry itself. Internal administration is often rendered cumbersome by complex procedures. Where simple rule of administration and, in particular, sufficient delegation of responsibilities are observed there are few problems.

93. In some case, school budgets are not fixed before the financial year begins, so that for the first few months no expenditure is possible. Although this former case may be rare, it does frequently happen that even when budgets are fixed and approved, the director or administrator of the school cannot incur expenditures for individual items without reference to other authorities. Schools, therefore, often resort to production work to make a little extra money for their budgets. Though the practical experience gained by the pupils may be useful — if the work done is of a level of complexity appropriate to the stage of their progress — the amount of time that must be spent for such productive work to be financially rewarding is out of proportion to the pedagogical benefits obtained by such methods.

94. In addition the cumbersome nature of financial administration often leads to undesirable delays in paying teachers' salaries. The consequence is that teachers will try to find other jobs alongside their teaching — a very familiar phenomenon in many of the developing countries. While there can be no objection in principle to part-time teaching, it must not be on a scale that is detrimental to effective instruction and education.

95. In many cases, the authorities responsible for technical education and vocational training do not yet have the means to set standards of performance and achievement and to control their application. As far as the schools are concerned, this problem may be partially solved by the establishment or approval at a national level of curricula, and in some cases even of syllabi, when national examinations are set. But this is not always done and for vocational training outside school the problem of setting appropriate standards and controlling adherence to them is, in many countries, acute. Systems of inspection both for the schools and all the various forms of vocational training are frequently inadequate or, in the case of training outside the educational system, may not exist. Where inspection services do function their activities frequently do not include the complementary and very important function of providing the necessary guidance and advice to those organizing or giving training. Even if the function is envisaged the necessary trained staff, reference material and documentation are not always available.

IV. TEACHERS AND INSTRUCTORS

96. There is an acute shortage of well-trained, competent teachers and this shortage is probably the greatest obstacle the developing countries have to overcome.

⁴¹ See E/3901/Rev.1/Add.2, chapter 3, annex B.

Their number needs to be increased substantially. There is, in many countries, too much part-time teaching in schools and training institutions and many teachers and instructors are not sufficiently well-qualified for their work.

97. Not all countries provide training for teaching staff and the courses which do exist for them are not always fully comprehensive.⁴² Sometimes, for instance, they cover only teaching techniques, sufficient account not being taken of the almost certain need for further theoretical and technical training. Frequently persons who give training in enterprises are not given any training for this special kind of work. These are examples of common shortcomings observed with regard to teaching staff of all kinds.

98. A number of developing countries in recent years have, however, established special training establishments for teaching staff, frequently with the assistance of the United Nations Special Fund. Projects of the Expanded Programme of Technical Assistance have also been devoted to the training of instructors in particular in the agricultural industries. In these countries, the situation has improved considerably as a result, but is not yet fully satisfactory. There remain, even in these countries, let alone the others, large numbers of inadequately trained teaching personnel. The problem is evidently more serious still in countries without such facilities at their disposal, either locally or abroad.

99. There is, in addition, clear evidence that some of the resources now being used for training technical teachers and instructors for schools and training institutions are not being used to the best effect. In many cases the best elements are not attracted and candidates without the desirable entrance qualifications often have to be accepted for training. In addition, there is considerable drop-out during the courses given for teaching staff and many of the persons who do complete their courses do not continue as teachers for any period of time. This situation is largely due to the inadequacy of the salaries and conditions of service offered to teaching staff in training institutions, by comparison with those which persons with equivalent qualifications are able to obtain in industry.

V. SYSTEMATIC TRAINING BY ENTERPRISES

100. A number of developing countries have, in recent years, established schemes for systematic training by enterprises and the quality of the active labour force has thereby been improved. In addition, such schemes have enabled young persons who could not afford to stay on at school or attend a training institution full-time to gain technical qualifications, for instance, through systematic apprenticeship. This training is mainly for workers but has also been used for training technicians in certain fields; as a general rule the in-plant training is supplemented by theoretical instruction given in a technical school.

⁴² Some indications regarding available facilities for instructor training mainly outside the educational system can be found in E/3901/Rev.1/Add.2, annex B, table 2.B.6.

101. The pattern of systematic training by enterprises is far from general, however, and it is obvious that insufficient use is being made of the potential reserve of technical manpower represented by those already in employment. Where the training does exist, moreover, it has very often not yet reached the desired standard. The new vocational training services established in recent years, particularly in Latin America, have however made a very considerable contribution to this end. This has been due largely to the setting and application of standards of training under their auspices, and to the organization of facilities for training teaching staff both for training institutions and for the enterprises.

VI. PRIMARY EDUCATION

102. The level of general education required before technical education can be effective is rising steadily. The study has shown that, in a large number of developing countries, it has not yet been possible to provide all the population with the general education they require as a basis for technical education and vocational training. Whereas in the industrialized countries general education is compulsory until the age of 14 to 16, that is for a period of eight to ten years if not more, most of the developing countries as yet are able to afford only six years. Moreover, the losses in primary schools are enormous and, in some countries, quite large numbers of children still do not go to school at all.

103. By comparison with the industrialized countries, pupils in similar educational institutes of the developing countries tend to begin pure vocational training, or specialization for particular skills, at a much earlier age. The results are unsatisfactory, partly because the technical and vocational schools often have to make good the deficiencies of primary school instruction and partly because the pupils are not old or mature enough.

104. In addition, in spite of the strenuous and determined literacy campaigns organized in developing countries, quite considerable numbers of adult workers are semi- or completely illiterate. They require at least the elements of literacy, however, if they are to be enabled to learn a technical occupation and make better use of their inherent ability. An indication of the magnitude of the problem involved is given in the table which follows and which shows the percentage of illiterate

TABLE 2.2. PERCENTAGE OF ILLITERATE ADULTS IN SELECTED COUNTRIES

Country	Percentage
Bolivia (1960)	60
Malaya (1957)	49
India (1961)	73.3
Iran (1961)	80
Pakistan (1961)	84.7
Philippines (1957)	25
Sudan (1960)	90

adults in a number of developing countries at the dates indicated.⁴³

VII. GUIDANCE

105. In many of the developing countries there is a decided tendency of students to seek employment in administrative or clerical work, although they may have been trained in a technical field. As a result the technical education and vocational training they have received are not used to the best advantage. Moreover, the prestige attached to the traditional liberal studies such as law, literature and philosophy makes it very difficult for technical studies to attract the more gifted students. Ignorance of the possibilities and satisfaction to be derived from skill and competence as a craftsman or technician often prevent youths from engaging in a technical course. Moreover, their whole background is often alien to the attitudes valued in a technological society. Children in industrialized countries nowadays grow up with a considerable background of technical information; in the developing countries lack of such a background presents a serious handicap if children are to be interested in a technical career for which they may be well suited. The survey has shown that there is a serious lack, in many developing countries, of the necessary facilities for giving young persons information about the types of career which may be open to them and for providing them with the vocational guidance they should have before commencing training for their future occupation.

VIII. RECOMMENDATIONS

106. The following recommendations are suggested for future action in the light of the results of the study.

A. To Governments of developing countries:

(a) To establish some means of collecting and analysing comprehensive information about existing technical education and vocational training facilities, as a basis for determining what further action may be necessary to develop these facilities in the light of manpower requirements;

(b) To arrange for the data available on the various categories of skills required for the purposes of accelerated industrialization to be broken down into the necessary detail, in particular by branch of industry, location and occupation;

(c) To assess at regular intervals the adequacy of their existing facilities for technical education and vocational training in the light of the criteria set out in chapter 3, with particular regard to the common shortcomings to which attention has been drawn in chapter 2.

B. To the international organizations:

(a) To assist, as required, in the implementation of the above recommendations and particularly to aid

⁴³ UNESCO, *World Campaign for Universal Literacy*; document submitted to the Economic and Social Council, E/3771.

Governments in assessing the adequacy of their technical education and vocational training systems;

(b) To collect, analyse and communicate to countries, information on the general and technical organization of technical education and vocational training, in both developing and already industrialized countries;

(c) To promote the exchange of information on technical education and vocational training as well as the comparative study of such information and, for this purpose, to pursue their efforts towards the establishment of a recognized classification of types of school and training institution.

Chapter 3. Systems and methods of technical education and vocational training for technical personnel

107. This chapter is primarily concerned with training⁴⁴ for industry, both large- and small-scale. Since training for small-scale industry has certain characteristics, further discussion of that subject is included in annex A to this chapter (see E/3901/Rev.1/Add.2). The preceding sections cover training for this category of personnel only insofar as training in technical, as distinct from functional, qualifications is concerned. The remarks on methods and systems contained in this chapter refer to training for commerce and service industries which contribute to the growth of industry. The discussion on training for one sector, however, needs to be considered in the overall context of requirements of the economy and the training network of the country as a whole.

I. OBJECTIVES OF TRAINING

108. One important consideration with regard to technical education and vocational training is the need to maintain a balance of conflicting factors, such as vocational specialization on the one hand and the cultivation of broader interests on the other. The latter should be taken into account in considering the more specifically vocational aspects with which this chapter is concerned.

109. Educators and economists need to have a clear grasp of the objectives of training, particularly in regard to vocational training, if the necessary arrangements are to be made for efficient and properly co-ordinated action concerning systems and methods of technical education and vocational training. These objectives of training emerge from the analysis of the needs for trained manpower, as indicated in chapter 1. For the purpose of determining the objectives of training, however, it is necessary to break down the data on manpower needs still further to ascertain the exact levels of qualification and the content at which training should aim for these levels.

⁴⁴ In this chapter, "training" covers all forms of preparation for employment within the framework of industrialization and includes, among other things, technical education, vocational training and management training.

110. As regards the levels of qualification, the distinction is usually made between three main categories of technical personnel: skilled workers, technicians and engineers. In practice, this is not sufficient from the viewpoint of organizing training and this leads to the following classification of personnel to be trained: (i) semi-skilled workers, whose short-term training involves the acquisition of specialized manual skills and limited background knowledge; (ii) skilled workers, who receive a broader range of practical training and the scientific and technological knowledge required for the occupation involved; (iii) foremen and supervisors, who have been trained and employed as skilled workers, who require further training of a functional nature covering such aspects as organization of work and human relations and who may also require further technical training and/or general education; (iv) assistant technicians who, after being trained as skilled workers or the equivalent, have received additional technical training lasting two or three years; such training covers mathematics, scientific and technological knowledge, experience in research and technical operations and in the preparation and supervision of work and production, including the use of appropriate apparatus and instruments; (v) technicians, who have received full secondary education and specialized technical education lasting one to two years and emphasizing construction and drawing skills; (vi) engineers, who have received full secondary education emphasizing mathematics and the sciences and who have received three to six years of higher technical education in a technical institute or at the university level.

111. As regards content, the fundamental objectives of training may be defined as: (i) the acquisition of the mathematical, scientific and technological knowledge required for understanding and, in some cases, innovating the principles underlying the construction and functioning of machines and instruments; (ii) the acquisition and development of manipulative and practical skills appropriate to the level of training required; (iii) the adaptation of trainees to the conditions of work in enterprises; (iv) adaptation to standards of industrial output, particularly as regards speed and quality of production. It is evident that the specific nature of these objectives will depend in each case on the occupation involved and on the circumstances in which it is practised.

112. The training objectives naturally need to be considered within the framework of the basic overall objectives of a national training policy. Such a policy must provide for young persons, and adults who so desire, to have the means of acquiring the knowledge and skills which are indispensable for practising an occupation. This means that it is essential to establish diversified training facilities which, in addition to providing training of the content and for the levels required in employment, will be accessible and available to all throughout working life. It is usually necessary, therefore, for these facilities to cover the initial training of young persons; the training of unskilled adults to qualify them for employment; the further training of persons already in employment, either to improve their qualifications

for the work on which they are engaged or with a view to promotion; and the retraining or conversion training of adult workers for a new occupation, when the change is necessary or desirable for economic, technical or personal reasons.

113. It is clear that the general objectives of training mentioned above have not been achieved in many developing countries. It is also not possible for them to achieve all the objectives since they represent the ultimate goal of a training policy and can only be realized progressively. It is equally evident that progress in realizing these objectives is dependent on factors such as development of educational sectors (other than technical education), the present structure of industry, the rate of growth of the economy and industrialization and the evolution of production techniques. Thus, it is necessary to take into account not only the needs but also the position in the other economic and educational sectors concerned in establishing priorities for achieving these objectives.

114. It would appear that the essential problem is not simply to develop training facilities to the maximum, but to ensure that they are adapted on a continuing basis to the evolving needs both of the economy and of the labour force.

115. In connexion with training for small-scale industry, it will, for instance, be necessary to take account of the need for this training to be linked with an overall programme for the development of the small-scale industry sector. Small firms are in particular need of regular guidance and counselling in the technological, economic and social spheres. The training schemes should therefore be supported by a scheme of industrial extension service adapted to the needs of the industry concerned, with a view to ensuring, among other things, an appropriate place for small-scale industries alongside medium- and large-scale enterprises.

II. TRAINING SYSTEMS

116. The considerable diversity of training systems is due to the large number of factors which influence them. It is possible, however, to distinguish three main types of training systems for the purpose of analysing the characteristics of such systems and their effectiveness for a programme of industrialization:

(i) Systems of an institutional character, i.e. when training is given in institutions organized for the purpose. These institutions may exist both within the framework of the general system of education, in which case they give technical and vocational educational which usually comes under Ministries of Education. The institutions may also exist outside this framework, in which case they are centres for basic or further training which may be established by the State, by employers' or workers' groups, or by other organizations;

(ii) Systems of in-plant training, in which training is given mainly in enterprises, possibly in premises apart from the shop floor; it includes apprenticeship and the further training of workers and cadres;

(iii) Combined systems which combine training in an institution and training in an enterprise, and which take various forms.

(a) *Institutional systems*

117. In most of the developing countries, schools for technical education and vocational training are an integral part of the general system of education and these are invariably patterned on the experience of the industrialized countries.

118. The variety of different schools is commensurate with that of the systems of education and it would seem that no amount of systematic presentation or the use of classification symbols at their present stage of development can sort the vast complexity of 200 school systems into neat comparable groups. Detailed discussion of existing types and comparisons is not possible in the space available. Comparisons of these types cannot be made in depth and the general conclusions drawn should be interpreted with caution.

119. The titles used for the schools are varied and often cover different things in different countries. The term, "technical school" in some countries, for instance, embraces establishments providing commercial education, whilst in others it refers only to schools in which the mechanical and industrial arts or applied sciences are taught. However, in spite of this variety of names and the differences in length of courses, some basic pattern of school training can be discerned in most of the countries. First, these schools require the completion of primary education for entry — some even require an examination, but in general, selection does not seem to be rigid. Since the duration of primary education ranges from four years to eight years according to the country, the requirement that primary education be completed does not provide much information on the level of knowledge and skill attained. While the curricula of primary schools often do not contain vocational subjects, some primary schools, whose curricula extend over a period of eight years, do include handicrafts among the subjects taught in the last years. Sometimes the general education given in the primary schools is inadequate and has to be supplemented by the vocational and technical schools.

120. Most developing countries have vocational or trade schools which aim at training craftsmen and skilled workers. They may be called arts and crafts schools, artisan schools or vocational training centres. They are, in general, meant to give a terminal education and, when primary education is of limited duration, the vocational schools also provide a good measure of general education. In Iran, for example, all pupils in the recently established Amouzeshgah schools which are meant to train skilled tradesmen, starting with boys who have completed six years of primary school, devote considerable time to general education. The completion certificate of the schools does not entitle the holder to continue his studies at a secondary school or a vocational secondary school. Since the course is normally

three years' duration, boys complete their training in the school at about sixteen years of age, on the average.⁴⁵

121. Technical secondary schools constitute another general category. They usually offer a basic cycle of advanced general education together with vocational training in a given craft. This first cycle may be terminal; the main difference between the training given and that given in a trade school may therefore be the greater amount of time allotted to general subjects. Examples of this type are the Technical Preparatory Schools in the United Arab Republic which require completion of six years of primary education and offer a three-year course.

122. In many cases, however, the first cycle of the technical schools is not terminal but comprises a course of general secondary education with some vocational or technical bias and specialization comes in the second cycle. The first cycle may also be taken at a general secondary school — sometimes called a preparatory or middle school. In countries in which technical education is patterned on the North American system the first cycle would roughly correspond to junior high school and the second cycle to senior high school. In Mexico, the second cycle is often given at a university.

123. In countries which have adopted the French system of technical education, one finds the *lycée* or *collège technique*, both of them leading to the *baccalauréat technique*. This type of course provides, in addition to practical work, a technical education which calls for higher intellectual ability and prepares for employment as a technician.

124. The education provided in what may be broadly called the category of technical secondary schools has a strong component of general education, since it is meant to produce technicians, foremen and supervisors. On the other hand, there is a trend towards including technical and vocational subjects in the general secondary stream. This trend towards a broadening of the curriculum in both the technical and the general secondary schools is encouraged by the educators, though it may not be in keeping with the more narrowly vocational objectives based on purely economic grounds. It constitutes one of the main issues which should be taken into account in determining the educational and training policy to be followed.

125. Full-time technical and vocational schools exist in most of the developing countries and, in some cases, may even be the only training system in existence. While the schools described are essentially intended to train young people for their future occupations, they often also provide the basis for programmes of further training of persons already in employment. This type of long-term education and training has a number of advantages. It can, for instance, provide pupils with a reasonably comprehensive background of general knowledge, particularly in the sciences, as well as providing the basis

⁴⁵ Children enter primary school between 6 1/2 and 7 1/2 and in the early stages of the Amouzeshgah scheme have not necessarily entered an Amouzeshgah direct from primary school. The possibility of organizing the final stage of the course in an enterprise is under consideration.

for more specialized technical training. In addition, the institutional character makes it easier to ensure a regular and systematic progression in the instruction. Experience has shown that it is particularly suitable for basic training covering a broad range of skills and lasting a considerable time.

126. Technical and vocational education in developing countries frequently suffers, however, from a number of shortcomings. The main ones are:

(i) The serious lack of balance between the numbers trained for a particular occupation and the number entering that occupation, since the majority of those trained often seek and obtain employment in other sectors, such as the army or the administration;

(ii) The considerable wastage during training, which greatly increases the cost per pupil trained;

(iii) The insufficient adaptation of the training to conditions of work in enterprises, as well as to the speed and quality required on the job;

(iv) The shortage of personnel and incompleteness of equipment, since the funds available are not always adequate for the needs of technical institutions; and

(v) The inadequate qualifications of teaching staff, particularly workshop instructors.

127. The system of technical and vocational education is essential in the framework of the general system of education. There is clear evidence, however, that in many developing countries it will require a large number of urgent reforms and closer co-ordination with other systems of training if it is to be used effectively for a specific accelerated programme of industrialization.

(b) *Higher technical education*

128. In higher technical education there is also a great variety of institutions with the result that it is difficult to compare the actual levels of the graduates without more extensive reference to the entrance requirements, to curricula and examination or graduation standards. Even then the similarities often exist only on paper, because of differences in methods of teaching and in laboratory and workshop equipment.

129. It is important to note, however, that in matters of internal administration, the universities and colleges are usually autonomous and this autonomy often also covers all educational aspects, such as programmes of study, selection of subject matter, teaching methods and organization of classes and laboratory work. The autonomous universities also have the right to confer degrees, though often when these degrees are recognized by law, the relevant government authority has some influence on the course of study — if only by having to approve the curricula.

130. As a result governmental action to develop or improve the system of higher technical education is less direct than in the case of schools at secondary level. Governments can and do, of course, create their own technological research institutes but the facilities for the training of engineers in such institutes are usually limited to a few cases of post-graduate study and research.

131. Governmental action to develop the system of higher technical education thus usually takes the form of creating and endowing new facilities. International assistance through the despatch of teachers and instructors, by the provision of equipment and the allocation of fellowships is most important in this field.

132. As is the case for the technical secondary schools there is strong criticism of the products of present higher technical education in many of the developing countries. It is that the young engineers have too much theoretical knowledge and too little practical experience for them to be able to apply this knowledge in industrial enterprises. Proposals have therefore been made in Annex D to this chapter (see E/3901/Rev.1/Add.2) to organize in-plant training courses for young engineers or engineering students. These courses would be different from the periods of practical work in industry that form a manual prerequisite for most of the engineering degrees offered at technical universities or graduate schools. The courses are discussed briefly later in this chapter.

133. It is not yet possible to evaluate the effect of such programmes but it seems that an attempt should in any case be made to cure a recognized defect where it arises, i.e., in the institutions of higher technical education themselves.

134. Another form of institutional training is accelerated training in centres for adults. A typical system of this kind appears to be of particular interest for industrializing countries. The essential aim of the centres under the system is to meet urgent needs for skilled manpower and to accelerate industrialization, to adapt manpower to technical progress, and to facilitate the transfer or promotion of workers in employment or the vocational rehabilitation of the unemployed.

135. The system has been mainly used hitherto for training skilled workers⁴⁶ in such basic occupations as metal and woodworking trades, building and office work. The aim is to bring adults to this level of qualification by means of training which varies in duration from 1,000 to 2,000 hours. The effectiveness of the training is ensured by very strict selection of candidates, teaching methods appropriate to the age of the trainees and the objectives of the training, and by appropriate pedagogical training for teaching staff.

136. It would seem desirable, however, for developing countries, to bear in mind the following characteristics of this system of training:

(i) The cost of training tends to be high as a result of the quality requirements specific to accelerated training programmes. It is essential for teaching staff to have had industrial experience and for their salaries to reflect this experience. It is necessary for trainees

⁴⁶ The term "skilled worker" should be understood to mean that the persons trained in these centres are qualified to perform one job at the skilled level whereas persons who have received long-term training, for instance by apprenticeship or in a vocational school, have a broader range of skills and knowledge and may be considered qualified to perform several jobs at the skilled level. (Based on terminology used in *Accelerated Vocational Training for Unskilled and Semi-Skilled Manpower*, European Productivity Agency, Organisation for European Economic Co-operation Paris 1960).

to receive allowances or remuneration at a sufficiently high level for them to be able to meet their needs as adults, who may be responsible for families. The initial expenses involved in setting up the centres, and particularly those covering premises and equipment, may not be justified if the training programmes have to be adapted rapidly to sudden fluctuations in the employment market;

(ii) The value of accelerated training centres has been shown mainly in countries in which the level of industrial employment is steadily rising. Their value is, however, doubtful when the rate of unemployment and under-employment is high and plans for industrialization are limited in scope and slow in implementation. In other words, accelerated training requires short-term outlets for employment on the basis of plans which are reasonably certain of fulfilment;

(iii) In countries in which the levels, both of employment and of labour force qualification, are low and stagnant, efficient accelerated training for adults tends to lead to the unemployment of the less qualified workers who are displaced by the better qualified workers trained. While the introduction of accelerated training may be useful economically in such cases, therefore, it does not necessarily help to reduce the social problem of unemployment.

137. Accelerated training has also been used for training semi-skilled workers. Colombia and Chile, for instance, have developed accelerated training programmes at this level for textile and clothing workers. These experiments have tended to show the usefulness of accelerated training methods and to gain the confidence of the industrialists. In principle, however, it does not seem reasonable to make the national budget finance programmes at this level of training, in view of their relative benefit to the employers concerned. It is possible, however, for accelerated training at semi-skilled level to represent a stage towards the training of skilled workers and to form part of the system of training for that purpose. In such a case the observation just made would not apply.

138. It would seem of particular interest, for developing countries, to mention the organization of accelerated training centres⁴⁷ for technician training. This is a relatively new development which has occurred mainly in France and Italy. Centres of this kind make it possible to secure for key posts in industry young people from general secondary education who cannot find employment unless they have some technical qualifications and who would otherwise not be able to secure the necessary training. The centres also make it possible to apply at this level of qualification the accelerated training methods which have proved their value in the training of skilled workers. By this means industry can be provided more rapidly with the intermediate level cadres of which it is in such need.

139. Centres for basic and further training organized by groups of employers or workers are very varied in

type and meet particular needs. The most interesting initiatives, as far as industrializing countries are concerned, appear to be those which have been taken either by industrial sectors or by groups of enterprises in order to supplement the state's general training effort, with a view to reducing the bottlenecks due to shortages of trained manpower.

140. The training of workers in such group centres may be of particular interest for small-scale industries since the enterprises concerned are unlikely to have the resources or personnel required for organizing full training in their plants. If they combine forces, however, the cost to each firm is reduced and the training can be organized on a satisfactory basis. This method has been used with conspicuous success in Japan where a substantial proportion of enterprises consist of small-scale industries.

141. The Italian Institute for Industrial Reconstruction (IRI) which operates a large number of enterprises and has established its own system for training senior technicians, has recently taken an interesting initiative with a view to overcoming shortages. Realizing that it would require 1,200 engineers for the period 1964-1967 and that the national system of technical education would only be able to provide 400 to 500 of these engineers, IRI decided to give young technicians who had just gained their diplomas further technical training and to change the internal structure of its labour force in such a way that these new entrants would make up for the shortage of engineers.

142. Similar problems exist in other countries and, in France, the Inter-Enterprise Centre in Paris gives further training to technicians from more than 100 enterprises in the region. Initiatives of this kind would appear to be of particular interest for countries which are short of technicians or engineers and cannot meet their needs rapidly enough with the existing training facilities.

*In-plant training*⁴⁸

143. The oldest and most classical system of in-plant training is apprenticeship; that is systematic long-term training for a recognized occupation taking place substantially within an enterprise. This system has the advantage of increasing rapidly the possibilities for training, particularly of skilled workers, without requiring large-scale expenditure on premises or material or the recruitment and training of teachers. Because of this, some industrializing countries are tempted to establish apprenticeship legislation which obliges enterprises to train a fixed minimum number of apprentices. Experience has, however, shown that if apprenticeship legislation does not contain very specific safeguards and if conditions are not favourable for this form of training, the legislation is likely to lead directly to the exploitation of young people who are virtually obliged to become apprentices without having the assurance that they will receive the requisite training in acceptable conditions;

⁴⁷ The courses often provide for the training in the centres to be supplemented by a period of in-plant training and experience.

⁴⁸ In-plant training of graduate engineers is dealt with in section IV of this chapter.

the exploitation in such cases varies in gravity according to the country's degree of economic and administrative development.

144. A number of requirements need to be met if conditions within enterprises are to be favourable for the development of efficient apprenticeship. The first requirement is for the general working and safety conditions to be satisfactory. Secondly, enterprises must be so organized that it is possible to teach there the basic elements of the occupation. Finally, the supervisors or skilled workers responsible for training apprentices require to have the necessary technical and pedagogical competence. In developing countries enterprises in the traditional industries often do not provide the necessary favourable conditions for apprenticeship in accordance with these criteria and it would seem desirable for apprenticeship legislation to provide for the necessary safeguards on this point.

145. Other safeguard provisions in apprenticeship legislation should cover such aspects as:

(i) The determination of apprenticeable occupations and the duration of apprenticeship for them. These occupations need to be recognized occupations, not just parts of occupations, and of a level corresponding to that of skilled worker or, if appropriate, of a higher level, for instance in the training of technicians by apprenticeship.

In the United States of America only occupations which involve at least 4,000 hours (2 years) of practical work, as well as theoretical instruction, are considered apprenticeable:

(ii) The obligation to provide related theoretical instruction, without which there is no real training. This obligation naturally involves the existence or establishment of appropriate facilities for theoretical instruction, either in the enterprise or in an establishment for vocational or technical education. Where the apprentice attends such theoretical courses outside his enterprise the legislation should provide for him to do so during working hours without loss of pay;

(iii) adequate safeguards for apprentices both from the technical and social points of view. These safeguards should include, for instance, the existence of a central apprenticeship service to be responsible, among other things, for acting as apprentices' public guardian. In this capacity it would give support to apprentices' parents and, if necessary, take over full responsibility for apprentices from parents who were not looking after them satisfactorily. The service should also be responsible for receiving, listing and keeping apprenticeship contracts up-to-date and for settling any conflicts between the parties to apprenticeship. Other safeguards should include participation in apprenticeship by bodies representative of the various occupations. This participation might be arranged through tripartite committees set up for each sector and consisting of representatives of government, employers and workers. The safeguards should also include adequate provision for vocational training technicians to supervise technically the preparation and implementation of apprenticeship

programmes, and the organization of annual or half-yearly examinations covering both the practical and the theoretical training.

146. The best method of organizing apprenticeship in developing countries is certainly to arrange for legislation to be sufficiently flexible for it to be applied progressively as industry develops and the technical and social conditions indicated above are improved. If this is not done, abrupt and generalized application of apprenticeship legislation is likely to lead to a situation in which it is impossible for the facts to conform with the law.

147. In-plant training for skilled workers including apprenticeship can be organized partly or wholly in workshops separate from production. In the latter case this really amounts to having works training centres. This system of training is applied mainly in large establishments such as railways, petrol producing companies, textile factories, motor manufacturing firms, metal and chemical factories. In some respects centres under the system resemble the centres in institutional systems of training. They vary from them, however, as a result of the naturally closer adaptation to employment conditions and the skill needs of the enterprises concerned. A recent development has involved the extension of existing in-plant training schemes, which were essentially for the initial training of workers to cover all personnel employed and with emphasis on further training. Under this system specialized training services are established which are responsible for analysing needs for further training, for preparing the training programmes and for carrying them out in co-operation with the other departments of the enterprises concerned.

148. As is the case with apprenticeship, the development of permanent in-plant services for further training requires the prior existence of certain conditions. The first of these conditions is certainly the unreserved support of management, without which training action cannot be envisaged. It may appear paradoxical, but this is a difficult condition to realize, because the management of enterprises, particularly in developing countries, does not always give to training problems the attention and attribute to them the importance which they deserve. It is of course also necessary that the enterprise should provide acceptable production and working conditions and should have supervisory and management staff who can benefit from further training. If these two conditions are not fulfilled the problems which need to be solved, if productivity and efficiency are to be improved, can only be influenced by training activities to a slight degree and improvements of another character should be made before embarking on training action.

149. In-plant training programmes are being rapidly developed at the present time in highly industrialized countries. A recent report by the OECD on techniques of evaluating the training of cadres⁴⁹ drew attention to:

(i) The considerable increase in numbers trained;

⁴⁹ *Evaluation of supervisory and management training methods*, Organisation for Economic Co-operation and Development, Paris 1963.

(ii) The integration of training services in the enterprise, which means that training is considered as a permanent and generalized function of the enterprise;

(iii) The very definite increase in the funds expended on training by enterprises; and

(iv) The large number of private training bodies which offer their services to enterprises.

150. The situation is less favourable in developing countries where enterprises have shown much less interest in training. In recent years, however, a number of these countries have taken action to develop in-plant training schemes, frequently with international or bilateral aid. This has been the case, for instance in Brazil, Chile, India, Iran, Mexico, Pakistan, Peru, Senegal, Tunisia, and Turkey.

Combined systems of training

151. The main difficulty with institutional systems of training is that, while they are in a better position than enterprises to give instruction, they are not in a position to provide adaptation to a working environment or the speed of industrial work. The contrary applies to systems of in-plant training. There is thus the fundamental problem of how the two systems can be combined, in order to ensure the maximum efficiency of training.

152. Various ways of combining the two systems have been developed over many years. The UNESCO Recommendation concerning Technical and Vocational Education suggests that, when establishing institutions for such education, the competent authorities should consider the following main systems:

(i) Full-time technical and vocational education, including practical training, provided in the school itself;

(ii) Theoretical education provided by the school while part of the practical training is obtained by periods of work in the chosen occupation;

(iii) The day-release system providing for workers to attend school for one day a week;

(iv) The "sandwich" or "co-operative" system under which periods of school alternate with periods in a factory, farm or other undertaking;

(v) The block release system whereby employees are released by their employer to attend technical and vocational education courses for one or two short periods a year;

(vi) Evening courses for persons in full-time employment;

(vii) Correspondence courses;

(viii) Refresher courses for persons who have already received vocational and technical education, or for those having practical experience in the occupation.

153. The ILO Vocational Training Recommendation, 1962, recommends that enterprises not in a position to furnish their trainees with all the theoretical and practical knowledge required for a particular occupation should as necessary:

(a) Arrange for the deficiency to be made up in training institutions on the basis of one or more of the following: (1) day release; (ii) release for periods of several weeks at a time every year; (iii) alternating substantial periods of training within the undertaking with substantial periods of study in the training institution; (iv) other suitable training arrangements in accordance with national regulations;

(b) Establish and operate joint training schemes involving the use of their several facilities or the establishment of a common training centre.

154. Some countries have attempted to solve the problem by organizing training in two successive stages, the first in a school or centre, the second in an enterprise. When this is done the trainee frequently attends the school or centre for theoretical instruction at intervals during the period of in-plant training.

155. In other countries the existence of new economic structures has made it possible to envisage more radical solutions. In countries with a market economy, large nationalized sectors of production such as mines, power and transport have been able, for instance, to organize training facilities which combine the advantages of both systems. They have done so by establishing training schools or centres within an enterprise or an industry, these training establishments functioning for the enterprise or enterprises concerned.

156. In centrally planned economies, such as the USSR, the vocational schools are closely linked with industry. Each school has a so-called "patron" enterprise, or group of enterprises, in which its pupils obtain practical experience. The strengthening of the links between education and life, of which this association between school and enterprise is an example, has become one of the most fundamental principles in educational policy of the Soviet Government. The Act on strengthening the links between school and life to provide for further development of the system of national education was adopted by the Supreme Soviet in December 1958.

157. A combined system of training, which seems of particular interest for industrializing countries, has been established in Latin America as a result of the pressure arising from industry's growing needs for skilled workers. The common features of this system in the countries concerned may be summarized by saying that the authorities of these countries wished to meet the needs for skilled workers by:

(i) Organizing training facilities for young persons who could not attend vocational schools and who were to start or had already started work;

(ii) Introducing programmes of combined training involving successive periods of training in a school and in an enterprise;

(iii) Obliging employers to accept the pupils as apprentices throughout their training and to pay them as such during this period;

(iv) Financing and managing the system independently under the general control of the State. The system is financed by means of a contribution from the employers

which varies between 1 per cent and 2 per cent of their payrolls.

158. The necessary action has been taken within the framework of national training services established for the purpose. The first initiative was taken by Brazil when it established the National Industrial Apprenticeship Service (SENAI).⁵⁰ The apprenticeship service in Argentina,⁵¹ the National Apprenticeship Service in Colombia (SENA), the National Institute for Co-operation in Education in Venezuela (INCE) and the National Service for Training Industrial Workers in Peru (SENATI) were subsequently established. Chile established a vocational training service, under a slightly different form, which is attached to the Institutes for Economic Development (CORFO).

159. These bodies have been mainly concerned hitherto with the initial training of skilled workers. Several of them, however, particularly SENAI in Brazil and SENA in Colombia are beginning to orient their programmes towards the further training of intermediate cadres in industry (technicians, foremen and supervisors) and of highly skilled workers such as those in maintenance and repair services. This extension of the objectives of these institutions, in conjunction with their flexible nature and financial autonomy, would seem to make them particularly suitable for meeting the needs of industrialization. Developing countries may therefore find it desirable to consider in greater detail the principles governing these new training services, the way in which they operate and the results obtained by the combined forms of training which they have organized.⁵²

III. TRAINING STANDARDS AND METHODS

160. The training standards and methods are reviewed in this section within the framework, among other things, of the three overall categories of technical personnel. Occupational safety and health are of importance for all categories of personnel. Neglect of these will have serious repercussions on personnel and also, in the long run, on the industry itself.

(a) Occupational safety and health

161. It is evident that personnel at all levels need to be aware of the hazards which may exist in connexion with their work and to be familiar with the necessary safety and health precautions. In consequence, training in occupational health and safety needs to be included in all technical education and vocational training programmes for both initial and further training. In order for this instruction to be effective it should be linked with both theory and practical work. It is particularly important that the instruction should be given to manage-

⁵⁰ There is also a National Commercial Apprenticeship Service (SENAC).

⁵¹ This service has since been incorporated in the National Committee for Technical Education (CONET).

⁵² A more detailed description of the systems introduced in Latin America is given in E/3901/Rev.1/Add.2, chapter 3, annex B, entitled, "A new system of apprenticeship in Latin America".

ment and supervisors and in general to all those who assume responsibility for other people in industry. These responsible cadres and other personnel should subsequently be enabled to arrange, within the enterprises, for the necessary training and information to be given to the workers themselves on a continuing basis and to ensure that the safety and health standards laid down are observed.

162. This direct training of industrial personnel in safety and health should be supplemented by the special training of doctors and allied personnel in this field and the establishment wherever possible of occupational health services. By this means an important contribution can be made towards adapting the work and the conditions in which it is carried out to local manpower in the light of their physiological and psychological needs.

163. A further contribution can be made by government officials and particularly by members of the labour inspectorate. In addition to their work of checking whether regulations are observed, labour inspectors have an important advisory role in the field of occupational safety and health. It is therefore important that they should be well informed and competent in this field and receive the necessary training for this purpose. Some countries, however, have difficulty in recruiting technical cadres rapidly for labour inspection. In such cases a doctor qualified in industrial health and occupational medicine is often in a position to act as expert, technician and adviser to the inspectorate or within its framework. This will help to ensure that human problems are not misunderstood or neglected during training for industrialization when the tendency may be to concentrate on problems of short-term productivity.

(b) Training of workers

164. One of the main problems to be solved is that of achieving a balance between the level and content of training and the requirements of employment. It is clearly undesirable, from both the social and economic points of view, to place on the employment market workers whose qualifications do not correspond to industry's needs. Unfortunately this is what happens in some industrializing countries.

165. It would be therefore desirable for the competent authorities in collaboration with all other interested bodies, to take a number of steps in order to get over this difficulty. These steps include:

(i) Determining the occupations for which national standards of qualification are considered necessary or desirable;

(ii) Analysing these occupations with a view to the preparation of training programmes;

(iii) Establishing such standards and programmes, on the basis of these analyses.

166. In developing countries there is frequently a tendency to adopt training standards and programmes which are inspired by those in use in industrialized countries. It is evident, however, that the structure of

the labour force, occupational practice and the level of general education vary widely from one country to another and that standards and programmes will not be sound unless they are based on the analysis of occupations as practised in the country in which the standards and programmes will be used. The importance of this question is being increasingly recognized in developing countries, and action is being taken by some of them to establish standards and programmes consistent with their own circumstances and requirements.

167. A second major problem to be solved relates to the access of candidates to training and to their vocational guidance or selection. These questions are inter-related and are of particular importance in countries where training facilities and funds are limited.

168. The problem is then to obtain the maximum return from the existing training facilities' needs. This would mean:

(i) Limiting access to the number for whom these facilities can provide adequate training, i.e., to the number for whom sufficient premises, equipment and teaching personnel are available;

(ii) Within the limits of acceptable numbers, eliminating candidates who do not possess adequate ability and qualifications for the training concerned;

(iii) Eliminating, during the course, the trainees who are clearly not capable of continuing the training to the end.

169. This is, of course, an exclusively economic and technical view of training. It cannot always be reconciled, at least on a short-term basis, with the principle that each member of the community should be entitled to vocational training in order that he may fulfil his full role in society; it will for the countries themselves to decide on the action to be taken when the two aspects cannot be reconciled and a choice is necessary.

170. The situation is also complicated by the fact that, in many developing countries, very few complete the full course in comparison with the numbers at the beginning of training. This means that there is an excess, which is sometimes very considerable, at the stage of "access to training facilities" and a shortage during the final stages of training. In consequence the problem does not consist only of making a choice between free access to training or systematic limitation of the number of candidates but also of ensuring a reasonable balance between the numbers required by industry, the number of pupils and the number for whom adequate training facilities are available.

171. It is clear that a number of pupils in excess of the available facilities should not be admitted and that the essence of the choice is to decide between giving adequate training to an appropriate number of trainees and inadequate training for a greater number. While it is possible to accept temporarily slightly more candidates than existing facilities warrant this should be done only in special circumstances since otherwise the risk will be too great that all the pupils, not only those additional to the normal complement, will be inadequate-

ly trained. If the number of suitable candidates desiring training, coupled with the employment which will be available, exceeds existing training places, then the only solution would appear to be to extend the training system accordingly.

172. Training for occupations which do not offer much prospect of employment in the near future should also be discouraged, as it will inevitably lead to considerable difficulties. Some countries consider training as a means of reducing the number of unemployed when there is general unemployment and under-employment and, from the social point of view, training can be very useful in such cases. The effort may however be largely wasted if an energetic employment policy is not introduced at the same time.⁵³

173. The problem is more complex as regards free access to training on the basis of candidates' suitability. In some forms of training, for instance accelerated training for adults, there can be no question of admitting unsuitable candidates and strict selection is therefore essential. If it is not practised the training will not be successful.

174. The position is however less rigid with regard to the long-term training of younger people. In developing countries there is often very considerable diversity of general education and basic knowledge among candidates for such training. While it is certainly reasonable to reject those who are not physically or intellectually suitable for the training programmes envisaged, it is less certain that those whose only shortcoming is inadequate general education should be rejected. In such cases it would seem desirable either to make special arrangements within the framework of technical and vocational education for the deficiency to be made up — for instance by means of special courses — or, alternatively, to make more general arrangements to prevent such deficiencies arising, for instance by establishing better co-ordination between general and technical education.

175. Consideration should be given only as a last resort to the radical elimination, during a training course, of pupils who are not up to standard and then only after everything possible has been done to obviate the necessity for such a step which, in itself, is an admission that the training facility in question is not being used to the best advantage. Action for this purpose would include adequate vocational guidance and selection before training commences with a view to ensuring that those admitted have the necessary ability and thus reducing wastage, on technical grounds, to the greatest extent possible.

176. Certain trainees may be obliged to drop out for financial reasons or family troubles, unless provision is made for financial or other help to be available in case of need. Even so, there are likely to be pupils who cannot continue in a school or training centre. If steps can be taken to provide better links between the various training systems so that such pupils are enabled to continue their training while earning, then their parti-

⁵³ See paragraph 136 in this connexion.

icipation in the course will not have been a waste, either for themselves or as regards the benefit which the community should receive from the training facility constituted by the course. Similarly, if there is close liaison between school and industry, pupils obliged to leave school should be able to find employment without difficulty. In such situations the training will not have been a waste.

177. Another question which should be covered by standards is the duration of training, a question which might usefully be studied by countries in the process of industrialization. In doing so, they may wish to bear a number of points in mind. To begin with, institutional systems of training have been in existence for a long time and have frequently been little, if at all, changed during that period. It is quite possible that the various durations observed for different courses within these systems date back many years and are no longer valid today, in view of the changes which may have occurred in the content of the occupation and the improved teaching techniques and facilities which can be used. In the second place the duration, set in terms of the training programme involved, will naturally vary according to trainees' level of general education, the type of training involved and the teaching facilities available — such as appropriate staff, equipment and premises. Thirdly, it is sometimes the practice in countries at all stages of industrialization to maintain durations which are unnecessarily long. This occurs both in apprenticeship and in institutional training.

178. Standards need to be established to evaluate training and to organize examinations. It is generally agreed that examinations are an excellent means of checking training, whether given in a school or in an enterprise. The examinations need, however, to be based on nationally set training standards covering both the theory and the practical work of the occupations involved, if they are to serve their purpose of checking that training is satisfactory in terms of the objectives laid down. It may also be desirable to supplement traditional examinations with other evaluation methods such as school marks, tests, observations and questionnaires so as to obtain comprehensive results. If adequate means of evaluating training are not used, it is extremely difficult to ensure that training is adapted to the requirements of employment and to prevent young people who are being trained in enterprises from being exploited.

(c) *Teaching programmes and methods*

179. The use of programmes and methods of high pedagogical value will help considerably to secure the necessary return from training systems. Considerable progress has been made in this field in recent years in developing countries. International assistance has been given to achieve a progressively higher quality of training.

180. The improvements in teaching methods have come about by the increasing acceptance of various means: the experimental method, the active method,

the use of audio-visual aids integrated into instruction and the global method which is used particularly for accelerated training and which concentrates all theoretical instruction around practical exercises and programmed instruction which makes use of appropriate machines.

181. Similarly, very considerable progress has been made in the preparation and application of teaching programmes as a result of the improvement in teaching methods, of developments in the analysis of occupations and the levels of qualification of the establishment of training standards and of the increased account which has been taken of the level of general education of both pupils and teaching staff.

182. The particular difficulties which developing countries sometimes encounter in using teaching programmes and series of practical exercises are due to a number of causes. The use of unsuitable training programmes is often evidence that a training system is old and traditional. While these programmes can be improved the desired improvement in the quality of training will not be achieved if action is not taken simultaneously on such matters such as relevant renewal of equipment to meet current training needs, the training of teachers, and the acquisition of audio-visual material. This is evidence once again of the interdependence of the various elements of training systems. Language problems also have to be faced, since access to documentation is frequently made difficult by lack of knowledge of the languages used.

183. Expert assistance has been extensively utilized in dealing with problems, and in particular in improving training methods and programmes of education and training. This assistance, however, involves a risk. It tends to lead to the introduction of programmes which are employed in developed countries but which are not suitable to the needs of industrializing countries. For this reason, it is essential for teams of international experts to include specialists in methodology who are capable of making the necessary adaptations of programmes to local requirements, in addition to specialists in the techniques of particular occupations.

(d) *Recruitment and training of teaching staff*⁵⁴

184. The seriousness of the problems with which developing countries are faced in connexion with the recruitment and training of teaching staff is generally recognized. These problems are particularly acute for workshop instructors and are due in the first place to the conditions of employment especially the salaries paid, which make it difficult to recruit personnel of the required quality. It is clear that these problems will become even more serious as industrialization develops more rapidly as the best instructors are likely to be attracted by the greatly increased opportunities in industrial employment. Problems also arise in regard to technical and pedagogical training for instructors and

⁵⁴ The term is used here to cover both those who give training in training institutions and those who give it elsewhere, for instance, in the course of work.

are due, in many countries, to the low level of general education, technical knowledge and industrial experience of candidates for posts as instructors. They are also due to the shortage of the necessary training facilities for them.

185. The qualifications required of teaching staff vary according to the level and type of training they are required to give. Teaching staff fall broadly into the following categories: teachers of practical work; teachers of theoretical technical courses; teachers of general subjects. Teachers of general subjects should be trained at the normal pedagogical institutes or teacher training colleges.⁵⁵

186. For teachers of theoretical technical subjects only a few specialized institutes exist. It is essential that in any programme of developing schools for technical education, in particular at the secondary level, provision will have to be made for specialized institutes. Entry requirements would correspond to the completion of secondary education, preferably in a technical school, but access from general secondary education should also be allowed. In that case additional periods of practical technical instruction would be necessary to bring the candidates up to the level of technical knowledge required. The practice of appointing as teachers of theoretical technical subjects students who have just completed their own courses in technical education, while understandable on the grounds of extreme scarcity of teachers, should not be allowed to continue. Such future teachers should, at the very least, be given a period of special instruction in pedagogical methods, the use of teaching aids, etc., at a specialized training institute for technical teachers.

187. Teachers of practical work are essentially workshop instructors. They carry out their duties both in training institutions and in enterprises. In addition to an adequate level of education and training for the occupation they teach they should have some years of practical experience in it so as to be familiar with the conditions in which it is practised in industry.

188. At the present time, however, trainee workshop instructors in developing countries do not always have the requisite mastery of their occupation, or practical experience in it, and it is necessary to provide further technical training for them. It is probable that they will also need further general and technical education to ensure that their educational and technical background is adequate in the light of the level of training they will be required to give. Before commencing their instructional work they will need instruction in pedagogical techniques, a necessity which is frequently overlooked, particularly when the training is given within the enterprise.

189. A constant effort is, however, being made to organize a network of technical teacher- and instructor-training institutes in developing countries. In Asia, for instance, India is in the process of establishing with the help of the United Nations Special Fund six instructor training institutes. Pakistan is setting up two institutes and Cambodia one. Burma, Indonesia and Iran also

have institutes of this type. In Latin America, and again with the help of the United Nations Special Fund, institutes or systems of instructor-training are being established in Chile, Colombia, Mexico, Peru, Uruguay and Venezuela. In Africa similar projects are foreseen or are in operation in such countries as Algeria, Congo (Leopoldville), United Arab Republic, Libya, Morocco, Nigeria, Senegal and Tunisia. Similar projects are also in progress in Europe and the Middle East.⁵⁶

190. The International Centre for Advanced Technical and Vocational Training which is being established at Turin by the ILO will be able to make a substantial contribution to the training of teaching staff. This Centre will commence operation in 1965 and it will be possible to organize on a large scale programmes of further training for instructors which will involve both pedagogical training and periods of practical application in industry, or in European training bodies. It will thus supplement the possibilities for further training for teaching personnel which are available on a regional or international basis with international or bilateral assistance.⁵⁷

(e) *Education and training of supervisors and technicians*

191. Most of what has been said in the previous section concerning access to facilities for technical education and vocational training applies also to personnel in the categories of supervisor and technician. However, at this level it is more difficult to define or delimit occupations as precisely as can be done in the case of skilled workers. Nor is it in many cases possible to lay down national norms and standards for technicians' occupations because the rapid development of technology brings with it considerable changes in functions and duties. It is therefore necessary to look a little more closely at the actual content of the courses.

192. In addition to the category of foremen and supervisors, two groups of technicians were referred to earlier, namely assistant technicians and technicians. The functions of the assistant technician frequently overlap with those of foremen and supervisors and will therefore not be separately discussed here. The combined group of foremen and supervisors/assistant technicians is, broadly speaking, constituted by those who, after completing a full training as a skilled worker and acquiring considerable practical experience in their craft, have followed a full or part-time course of supplementary education providing them with the necessary background of underlying theory and principles, as well as instruction in related subjects. Their duties usually involve supervising the work of skilled craftsmen. Amongst other functions, this comprises the planning, control and inspection of production in a given workshop or unit, working out the details of a task in the light of well-established practice, distributing work and personnel, ensuring the application of safety and labour legislation and dealing

⁵⁶ Brief descriptions of several schemes are given in E/3901/Rev.1/Add.2, chapter 3, annex C "Examples of national training schemes for instructors".

⁵⁷ See section VI below.

⁵⁵ See chapter 2, para. 97.

with personnel problems. Such duties require considerable experience and knowledge of skills, operations, administrative practice and human relations. In practice, this ideal will often not be immediately attainable in the developing countries; many will accede to such positions without having undergone formal supplementary courses. It would be advisable for this group to provide part-time courses by which they could supplement both their general education and the background knowledge necessary for the efficient execution of their functions. Adequate opportunity should be provided to skilled workers having the necessary initiative to make use of such supplementary part-time courses. The immense desire to learn and to advance often found among young workers should be exploited by encouraging private study.

193. The content of such supplementary courses would include improvement in the use of the mother tongue or the working language, workshop arithmetic and some elementary science. Technical subjects should convey practical knowledge of specific tasks and a general understanding of machines, tools and instruments. The courses should further provide instruction in works' organization and administration and last, but not least, in problems of human relations. The latter subject is of particular importance to all those acceding to the position of supervisor. In practice, the effectiveness of such supervision is often hampered by lack of personal authority. Such lack of authority is, however, not only due to insufficient knowledge. It can also be due to the fact that, in certain countries, the industrial supervisor who does not belong to a family which traditionally holds responsibility and authority in the social hierarchy may not be recognized by the workers under him as having the right to exercise authority in the industry hierarchy. In these and other countries, however, superior education and training are being increasingly recognized in their claim for leadership.

194. The group of technicians consists of persons who, having completed the first cycle of secondary education, and sometimes both, continue their studies at a full-time technical institute for training in techniques requiring more theoretical knowledge and understanding of scientific principles. They may also, after their secondary education, engage themselves as engineering apprentices or the equivalent in other branches and attain the same level by alternating periods of practical work and attendance at the technical institute or college. The duties of such technicians in the engineering field include the following: working on design and development of engineering plans and structures; erecting and commissioning of engineering equipment and structures; engineering drawing and detail constructions; estimating, inspecting and testing engineering construction equipment; use of surveying instruments; operating, maintaining and repairing engineering machinery, plant and engineering services and locating defects therein; laboratory work, testing of materials and components, sales engineering and advising customers.

195. The study course for this group would, in general, have to include some general subjects, in particular a

foreign language in common technical use if their own does not enable them to become and remain conversant with the development of techniques in their speciality. The course also includes basic sciences and general technical subjects such as applied mechanics, strength of materials, thermodynamics and the specialized technical subjects and practical exercises, in particular engineering drawing and construction, covering the chosen vocation.⁵⁸ The entry requirements for such a course, of two or three years' duration, need to be quite rigorous.

196. Many of the industries in developing countries process agricultural products. The operation of such processing plants requires special skills. The duties of a milk plant operator or foreman, for example, include the following: operation of reception and processing equipment; maintenance of equipment in good working condition and supervision of its cleaning after the daily run; supervision of the quality of incoming milk to be processed, and the milk or milk products to be distributed, through routine laboratory examinations; heat treatment of liquid milk to be packaged in bottles or cartons; manufacture of butter, various kinds of cheese, fermented milk products and so on.

197. The course of study for such a group of technicians would need to include biological and bacteriological subjects and an understanding of marketing principles, as well as many of the subjects outlined in paragraph 195.

(f) *The education and training of engineers*

198. The training for the engineering technician mentioned above will apply in many respects, at least when curricula are compared, to the training actually provided, with the aim of producing graduate engineers, in many existing post-secondary technical institutes in the developing countries. It must be emphasized however that, in general, the education and training of graduate engineers in the highly industrialized countries requires a much longer and more exacting period of study, namely four to six years.

199. Entry to such a course normally requires a level corresponding to a full secondary education with a predominance of mathematics and natural sciences. The ratio of theoretical to practical instruction will be much higher than for the engineering technicians. Moreover, although in the beginning of the course the subjects are similar to those of the engineering technicians' course mentioned in the preceding paragraphs, their treatment needs to be much more thorough with an emphasis on general principles and application of these principles to the most varied problems.

200. Furthermore, it is necessary for the curriculum of the graduate engineer to contain a great deal of individual and independent construction (engineering drawing) and research work. He is expected to be competent by virtue of his fundamental education and training to apply the scientific method and outlook to the analysis

⁵⁸ The question of practical work in enterprises for student engineering technicians is discussed below, in paragraph 202.

and solution of engineering problems and to be capable of closely following progress in his branch of engineering science by consulting newly published work, assimilating such information and applying it independently. This knowledge and competence can only be acquired by individual and direct experience. This means that the future graduate engineer must, as part of his education, have conceived, planned and drafted some piece of machinery or structure having predetermined characteristics. Alternatively, he must have investigated some engineering process in detail and suggested improvements in machinery or operation, as a part of the independent diploma or thesis work required at the end of a graduate engineering course.

201. Advanced technological research very often is not possible to undertake within the present financial or human resources of universities and technological institutes in the developing countries, particularly in subjects such as semi-conductors, atomic reactors or electronics. This is also true in the case of fundamental research concerned with "unnatural" states of distance, speed, size, time, temperature and pressure, because it involves heavy expenditure on equipment and increasingly refined techniques are required to measure them. On the other hand, there are many subjects or problems which can only be investigated locally, in a given geographical region, where applied research and engineering science contribute to development. Surveys of natural resources, extraction, processing and utilization of local materials, exploitation of unconventional energy sources, irrigation and hydraulics are obvious examples. Research, or at least an individual creative effort in engineering science, should therefore be an essential part of the training of top-level engineers in the developing countries.

(g) *Practical work*

202. Practical work, either before the study course or between terms or for one or two full terms during the course, is an essential complement of any graduate engineer's or engineering technician's education. There are several ways of arranging practical work periods. It will not be difficult to make them compulsory for both categories of students, because it should be easy to enlist the support of industry. The purpose of such practical work periods is not to supplement the instruction given at the university or technological institute, but to acquaint the future engineer or technician with practical work conditions and requirements. He evidently cannot be expected to rival an experienced worker in his particular skill but he should have first-hand acquaintance of manipulating tools and machinery and should have spent some time in the maintenance workshops and production sections of a factory.

IV. IN-PLANT TRAINING OF GRADUATE ENGINEERS IN THE DEVELOPING COUNTRIES

203. The above-mentioned considerations refer to the training of engineers in the established educational systems of the developing countries. While such efforts

will assist in improving the quality of education, attention needs to be given to a serious problem that exists in the developing countries, namely a gap between the actual requirements of knowledge and skills by the industry and the supply of such skills as acquired by the engineers through the existing educational system. It is basically the problem of how to bridge the gap between the fundamental knowledge gained at the university and its application in industrial practice. In-plant training is one way of helping young engineers to bridge this gap. It is being increasingly recognized in many industrial enterprises in the developing countries that the solution of the problem should not be left to chance; in other words, that it would not suffice to attach the graduate as an apprentice to technical personnel and hope that he will obtain the required experience in a reasonable period of time. There is a need to provide systematic and closely supervised guidance to the graduates in applying the basic scientific principles learned at the university to the many practical problems arising daily in the factory.

204. A factor bearing on the type of in-plant training required is the extent to which practical technological education has been provided to the young engineer during his stay at the university. There is growing recognition in many countries that theoretical training should be combined with the practical during the undergraduate years, and, in leading schools of engineering, industrial practice has been made part of the curriculum along with the theoretical instruction. The main objective of these periods of practical work is to acquaint the student with the working conditions and atmosphere of industrial establishments and to give him the opportunity of observing the application in practice of engineering theory. The value of these periods is generally recognized, but a criticism frequently levelled by industry, universities and the students themselves, is that they confine the student to observation and do not let him play an active role, however modest it might be. As a contract, in-plant training programmes emphasize the development of abilities, that is the acquisition of skills and the exercise of judgement in concrete cases rather than the addition to technical knowledge. Another purpose is to make apparent the suitability of graduate engineers for particular occupations.⁵⁹

205. Since the in-plant training programme is designed to fill a gap in the first instance, each programme of training will have to be tailor-made for the situation. Whether it should form a permanent feature of the

⁵⁹ "The American industrial attitude regarding the education of engineers is very widely that of expecting the undergraduate engineering curriculum to provide a good basic scientific and technical foundation upon which the industry can provide the necessary development and understanding of problems peculiar to it after the student has entered the company employ. The expectation that an engineering graduate will be immediately productive is less prevalent today than it was two decades ago; in fact, it has largely disappeared." *A Report on the Education and Training of Professional Engineers in the United States* (Conference of Engineering Societies of Western Europe and the United States), Engineers' Council for Professional Development 1962, p. 80. Also, see Yap Kie Han, "In-plant Training of Graduate Engineers". *Industrialization and Productivity Bulletin No. 4*, United Nations, New York, pp. 50-57.

country's network is a question that needs to be explored further. This is a much more complex problem, in view of the fact that it involves basic policy questions on national education.⁶⁰

V. EDUCATION AND TRAINING OF HIGHER ADMINISTRATIVE AND MANAGERIAL PERSONNEL FOR PUBLIC AND PRIVATE INDUSTRY

A. TRAINING OF HIGHER ADMINISTRATIVE PERSONNEL IN THE GOVERNMENT ORGANIZATIONS

206. The training of the higher administrative and managerial personnel to deal with problems of industrialization needs to be approached at two levels: at the level of formulation of policies and preparation of plans for industrial development and at the level of management of individual enterprises. The latter category is easily identifiable and recently its role in the efficient administration of the industrial enterprises has received considerable attention. As the discussion of the subject will indicate later, the subject of management of industrial enterprises was originated in the United States of America and later followed extensively in the West European countries. The subject in those countries has been approached primarily at the plant level. The role of the State, on the other hand, is very important in the developing countries. It provides a horizon in terms of development goals and creates an atmosphere in which industries can be established and operated. The role of the government, therefore, becomes more meaningful in aiding the process of industrial development. The economic administrators in the developing countries are already playing a vital role, not only in initiating various industrial development projects, but also in controlling the pace of development through systems of allocation of foreign exchange, raw materials and licensing. The economic functions of the administrators in the governments have been increasing and any improvement in the services they provide to aid the industrialization process would be desirable.

207. The training of economic administrators, who deal with problems of formulation and implementation of industrial development programmes in the developing countries has been so far intimately connected with the training in economic planning. It is being increasingly realized, however, that the knowledge and skills required in this area require training which, in a way, attempts to provide technical background to economists and economic background to engineers and technical personnel working in government and semi-government institutions. In a recent survey carried out by the United Nations, certain gaps in training provided by the economic development institutes were ascertained. The consensus of opinion of those involved in the training of economic administrators was that courses in formulation, evaluation and implementation of industrial development projects should be provided in the existing economic development training institutions

⁶⁰ For details of the in-plant training programme for engineers, see E/3901/Rev.1/Add.2, chapter 3, annex D.

sponsored by the governments and the international organizations. This should be followed by evolving training programmes in industrial development for the economic administrators. Such training programmes could be introduced in the Planning and Development Institutes sponsored by the regional economic commissions of the United Nations and assisted by the Special Fund. The experience gained there could be made available further for use in similar training programmes.

208. Training programmes in the above-mentioned areas are, to some extent, handicapped by the lack of data on feasibility reports and other data on implementation of projects which are often considered as confidential data by leading agencies, consulting firms and, in some cases, the governments themselves. To permit the adequate preparation of teaching materials in training programmes on project analysis, etc., the release of some of the data contained in the feasibility reports would be considered essential. Further work, both on the substance of the training programme and the ways and means of preparing teaching materials, needs to be undertaken as soon as possible.⁶¹

B. EDUCATION AND TRAINING OF HIGHER ADMINISTRATIVE AND MANAGERIAL PERSONNEL FOR PUBLIC AND PRIVATE INDUSTRY

1. Introduction

209. The term, "higher administrative and managerial personnel for industry" here refers to the members of an enterprise who have responsibility for policy-making, planning, organizing, and directing important affairs of the enterprise. For example, in organizations employing a staff of several hundred, in which work is commonly performed by personnel at four levels, namely, workers, foremen or supervisors, department managers and senior or top management, the term includes primarily the last two levels. The term, "department manager" here includes managers whose administrative responsibilities consist of matters concerned with production, accounting, finance, marketing or personnel management. In small enterprises, particularly those which employ less than forty people, only the top managers would be likely to have the kind of responsibilities mentioned here.

(a) *The need for management*

210. The arbitrary definition of management is not intended to portray a systematic managerial structure. Its object is merely to identify the positions which carry a high degree of administrative responsibility, because the proper staffing of these positions is most important to the successful operation of an enterprise. Indeed their staffing, together with an understanding of the managerial functions which they involve, is now regarded as being of vital importance to the industrial development of

⁶¹ See *Preparation of teaching materials in economic and industrial development* (E/C.5/54); document submitted to the Fourth Session of the Committee for Industrial Development of the Economic and Social Council.

any country. This fact has been recognized by industrially developed countries, mainly within the past two decades. It now emerges clearly in developing countries, especially with the growth of larger scale industry and expatriation of some managers. Nevertheless, the functions of management and the training of managers are themselves subjects which are not yet sufficiently developed throughout the world. However, the progress recently made in this field by many industrialized countries has major significance for industrial development anywhere. It is for this reason that a broad description of management training and development in industrialized countries is provided here. While the developing countries have to adapt facilities to their needs, experience shows that the basic process described may be considered as being generally applicable.

211. While the importance of general education and training is usually recognized, analysis of the need for particular types of education and training has often omitted important sectors. Even when shortages of trained manpower have been found to exist at all levels in developing countries, shortages of engineers and technicians have until recently received most attention, while shortage of management personnel seem to have received the least. But it is management personnel, i.e., those responsible for planning, innovating, organizing, co-ordinating and directing who make resources such as skilled labour, technology and capital productive. This has been adequately expressed as follows:

“Effective management can often make a weak project prosper, but the strongest project has little chance if it does not have adequate management. This is true in the most industrialized countries; it is equally true in the under-developed nations, where impediments to industrialization can be surmounted only by superior management. Yet, due to the very nature of the non-industrialized countries, the thing they lack even more than capital is experienced management.”⁶²

212. Failure to recognize the importance of management in developing countries can perhaps be attributed to past experience in industrialized countries where developments were more gradual and the supply of managerial talent tended to follow economic growth more naturally. However, even these countries, as this report will show, have recently had to make strenuous efforts to acquire the management personnel essential for extensive and complex economic growth.

(b) *The professional manager*

213. The need for management depends a great deal on the rate and scope of enterprise development for which it is required. The small family-owned firm, which may make only one product over a long period of time for a limited and known market, needs less highly trained management. In past years even industrialized countries could afford to let young men grow with an

enterprise and slowly take places in managerial ranks. However, when the rate of industrial growth increases or when there is scope for increasing it, as in the developing countries, the rate of training must be accelerated. Larger enterprises, together with new and continual technological developments, require a higher level of qualifications in management.

214. Although small-scale family-owned and operated firms are still predominant in many developing countries, they do not usually meet the whole range of industrial needs. When a family firm grows to meet new circumstances, it cannot usually provide enough family staff to keep pace with this growth. This difficulty, as well as the emergence of large public enterprises — increasingly common in developing countries — and larger multiple-owned private corporations, has brought into being the professional manager. This new type of manager, who is the administrative mainstay of public and private enterprise in industrialized countries, is himself an employee. He is professional in the sense that he has intellectual qualities and fairly universal skills which he uses to serve the enterprise — public or private. In countries with large sectors of public enterprise, the top managers are senior civil servants. The manager of an enterprise in a developing country generally has a more difficult task than his counterpart in a developed country. As a rule, the operation of industry in the more advanced countries takes for granted the existence of the so-called external economies, that is, of a complex of economic overhead, including transportation, power and water supply, repair facilities and availability of spare parts, and of a variety of skills ranging from highly complex managerial skills to a labour force brought up in an industrial tradition and possessing at least a minimum of general and professional education. The entire institutional framework, which has gradually evolved throughout the course of economic development, provides a favourable climate for the operation and growth of the industrial sector, or at least does not interfere with this. In the developing countries, economic and social changes brought about by industrialization are relatively recent phenomena and are accompanied by a number of frictions and maladjustments; many and varied obstacles have still to be overcome.⁶³ The manager cannot always recruit workers with the necessary understanding of the functions of the enterprise and of such matters as administrative discipline. Moreover, there is no large body of managerial colleagues who can help him solve his problems and correct his mistakes when necessary. He has to be highly self-reliant and must constantly help other members of the staff to do their work properly.

(c) *Qualifications for management*

215. While the abilities of managers in contemporary industrial society must be of a high order, it should not be assumed that managers must have special biological or mental characteristics. Occasionally, one finds cults

⁶² Murray Bryce, *Industrial Development, a Guide for Accelerated Economic Growth*, New York, McGraw-Hill Co. Inc., 1960, p. 158.

⁶³ *Management of Industrial Enterprises in Under-Developed Countries* (E/3143) United Nations publication, Sales No.: 58.II.B.5, p. 2.

of leadership and personality in management, but none of these have withstood the test of scientific inquiry. Research on the qualifications needed for success as managers shows primarily that most persons of sound mind and body who have more than average intelligence, the courage to make decisions, a strong sense of responsibility, and the necessary interest and motivation, can become good managers — if they have the opportunity to learn. The occupation of manager is of a general character and there is no need for innate qualities. Nevertheless, in particular circumstances a manager may be required to possess a particular combination of skills, since managerial qualifications, (e.g. technical knowledge, innovation, energy, tact) vary according to the particular needs of the position.

2. *Education and training of management in industrialized countries*

216. The systems and methods of education and training of managerial personnel for public and private enterprises in industrialized countries are outlined below. Education and training is interpreted here as the more or less formal and systematic teaching of management in universities, schools, institutes and special training centres and under programmes sponsored by particular enterprises.

217. In the earlier stages of industrialization, where there were more family-owned and managed firms, the families concerned generally provided their own managerial personnel. However, managers were also recruited from the ranks of craftsmen, tradesmen or clerical personnel, some of whom slowly rose to senior positions.⁶⁴ Later, professionally trained engineers and accountants became available for management positions. In public enterprise, lawyers and persons of university education were appointed. There were no management training programmes either inside or outside enterprises. However, there was more time for individuals to learn through actual experience of managerial functions.

(a) *Development of management education in universities and colleges*

218. In the early part of the twentieth century, universities and colleges in many countries introduced commercial courses, usually as adjuncts to economics courses. Commerce courses provided some training in accounting, finance and economics of trade. These courses have continued until the present day. They were not intended to provide, and do not provide, management training, although graduates from the courses seem to have made the transition to management occupations more easily than persons with no economic or commercial training. However, these graduates usually remain in professional work of a technical character, such as accounting and finance, and do not take up senior management posts. Formal management and business education was pioneered some time about 1910 in the

⁶⁴ Learning a trade or craft by apprenticeship is still common in some Western European countries, even for sons of industrialists who are destined to become managers.

United States of America. The new concept was that management is a process of planning, organizing and directing, of appropriate functions which commonly include production, accounting, finance, marketing and personnel management in the industrial enterprise. University and college programmes, both graduate and undergraduate, based on this general concept became widely established in that country during the next fifty years.

(b) *Management education in Europe — special institutions*

219. During the past fifteen years many industrialized countries in Europe have made considerable efforts to develop management education facilities. With few exceptions, they have encountered resistance, or at least lack of interest, on the part of the universities. Consequently, they have had to develop facilities outside the university framework, in the form of special institutes or schools sponsored and operated by industrial firms, chambers of commerce, consulting firms and professional associations. France, the Federal Republic of Germany, Italy, the Netherlands, Sweden and the United Kingdom each have a number of such training institutes, which have the advantages of autonomy and of adaptability to meet rapidly changing needs. However, universities are needed for research and for long-range development of scientific knowledge in this field. Several countries have been able to stimulate interest on the part of their universities. In France, management departments (Instituts de préparation à l'administration des entreprises) have been established in all universities during the past six years. In the United Kingdom more than 200 technical and commercial colleges are now offering some courses in management at the undergraduate level as part of their regular curricula. Many of these colleges offer a wide range of special short courses for managers, as well as courses for a nationally recognized management diploma.

(c) *Management training within the enterprise*

220. A further significant development in almost all industrialized countries during the past ten years is that most large enterprises, both public and private, have also established their own programmes for training managers. These programmes vary widely, ranging from full-time courses of several weeks' duration to part-time lecture courses, seminars and conferences. The instructors are senior managers, full-time professional teachers and guest lecturers from consulting firms and universities. They generally teach the whole range of management subjects, with emphasis on the particular needs of the enterprise concerned.

(d) *General trend of management education and training in industrialized countries*

221. The general trend of management education and training for larger enterprises in industrialized countries is approximately as follows:

A strong system of primary and secondary education of about twelve years' duration;

Four years of university or college studies, which include one or more of the following: physical sciences, social sciences, humanities, engineering, commerce and management;

One or two years of professional management education at the post-graduate level;

Some years of part-time employer-sponsored management training after several years' employment as a specialist (e.g. an engineer or accountant);

Occasional specialist courses or seminars in various aspects of management, provided by universities and management institutes.

3. *Education and training of management in developing countries*

222. The problems of management training in developing countries are, in the main, threefold. First, these countries generally have a shortage of people with the required basis of a sound, general education. Secondly, they lack management education facilities. Thirdly, they seldom have enterprises in which managers can learn from good on-the-job experience.

(a) *College education — the commerce courses*

223. Some of the colleges in the developing countries provide courses in commercial subjects such as accounting, finance and economics, in addition to the general curriculum of subjects such as languages, history and philosophy. They are patterned on the commerce course of some industrialized countries. These courses provide general college education and limited preparation for accounting and financial occupations. There are indications that some of these colleges have modified their commerce courses to include management training (e.g. training in marketing, work study, personnel administration, labour relations and administrative theory and practice) patterned on the business administration courses of the United States.

(b) *Universities and special institutions*

224. During the past ten years some of the developing countries have acquired new educational institutions designed specifically to provide management training. The University of the Philippines now has a post-graduate course in business administration which was developed with assistance from the United States. The Philippines Industrial Development Centre also offers management training. The Ford Foundation has assisted the United Arab Republic to establish a Higher Institute for Management. Pakistan now has an Institute for Public and Business Administration at the University of Karachi. Brazil, Colombia, Ghana, Iraq and Uruguay each have at least one management department in a university. Mexico has at least four such departments. Nigeria has established in 1946 an Institute of Administration for the training of public servants. Management institutes for the training of graduates have recently been established in Ahmedabad and Calcutta, India, with the aid of the Ford Foundation. India also has an

Administrative Staff College, established in 1957, and the Indian Institute of Science has a Department of Management.

225. The foregoing account, although incomplete, gives an indication of how management education has been initiated in some of the developing countries. Most of the facilities mentioned have only recently been established, and it will be some time before their graduates make an impact on the economy of their respective countries. These university, college and institute programmes will, in due course, assume particular importance in countries now receiving outside technical assistance in the field of management education. When this assistance ends, the universities, colleges and institutes concerned must be ready to take over responsibility for management education and research.

(c) *Need for undergraduate programmes*

226. Since these countries need to train managers as quickly as possible they will have to emphasize the undergraduate level of university education for some time. This does not imply that they should not at the same time initiate graduate training programmes, particularly programmes for training management teachers. However, emphasis on undergraduate programmes with properly balanced curricula can produce potential managers and management specialists more quickly. The curriculum of an undergraduate programme should include:

Social sciences such as economics, political science, sociology and psychology to provide the student with a good understanding of the culture of his society and the environmental determinants of industry;

Quantitative methods of analysis, with emphasis on statistical methods;

Principles and methods of the general process of management;

The four main "specialities" of management, namely, economics of the firm, finance and management accounting; work study or industrial engineering; marketing; personnel management.

This type of programme enables young graduates to become of service to industry fairly quickly in one or more of the specialized fields mentioned.

(d) *Need for management teachers*

227. The chief difficulty encountered when initiating university and other management training programmes is the shortage of management teachers at all levels. Teachers for management development centres (described in the following section) are trained in these centres and under various current fellowship programmes. However, university and college management teachers require intensive post-graduate education for which most developing countries have very limited facilities. For some time to come, their best means of obtaining higher-level management teachers will be to send selected nationals to industrialized countries for graduate studies.

(e) *Management development and productivity centres*

228. Many of the developing countries, recognizing that they need facilities which produce more immediate effects, have established a variety of training institutions designed to provide such facilities. Many of the institutions recently established are called management development and productivity centres. These centres are established under the auspices of the governments of the countries concerned and are usually attached to a government department or ministry. They have an advisory council including representatives of other interested ministries, universities, employers' and workers' organizations. The function of the centres is to stimulate the interest of the whole community of enterprise — public and private, management and labour — in productivity. Their activities usually include:

Publicity and promotional activities in favour of productivity improvement;

Programmes of education and development for top and middle management, productivity technicians, supervisors and workers' representatives;

Technical information and inquiry services and a reference or lending library;

The preparation (including translation and adaptation) of textbooks, training manuals, films, film strips, etc.;

Advisory and consultant services and research into problems of raising productivity.

Their concept is similar to that of the productivity agencies organized by many European countries during the past ten years.

229. The work of these centres commenced with providing practical demonstrations of work study at the factory level. As it usually became obvious that improvements in productivity were also heavily influenced by middle and senior management decisions, the programmes in these centres have been extended to include senior management training. They are now planned to cover the whole field of management. It has become increasingly recognized that restricting training to specialists and to some levels, particularly the lower levels, does not improve productivity very much and that comprehensive and systematic programmes are required.⁶⁵

230. A scheme for a fully integrated management development and supervisory training programme is presented in chart I. This does not imply that there should be only one programme or that one centre should necessarily supply the whole range of training. The purpose of data in chart I is to identify all sectors of the industrial enterprise for which training facilities are normally required. This is necessary in order to avoid the above-mentioned lack of balance and loss of effectiveness which occur when training is given only at

certain levels and in certain specialities. It is also necessary because junior members of the industrial community require training facilities which will enable them to work their way up to senior positions. For example, a young man working in the production field will need courses in such subjects as production planning and work study, to enable him to become a specialist before becoming a manager. If he is competent and can receive administrative training and experience, he will be able to assume managerial responsibilities sooner, perhaps first in production management and later in general management. Industrial personnel in a developing country require facilities for rapid mobility and progress which training can help to provide. The kinds of training proposed in the scheme do not exclude the possibility of further technical training and/or education if this should be necessary, particularly in the case of line supervisors and foremen. (Nos. 44 to 49 of chart I.)

(f) *Long-term need for management development and productivity centres*

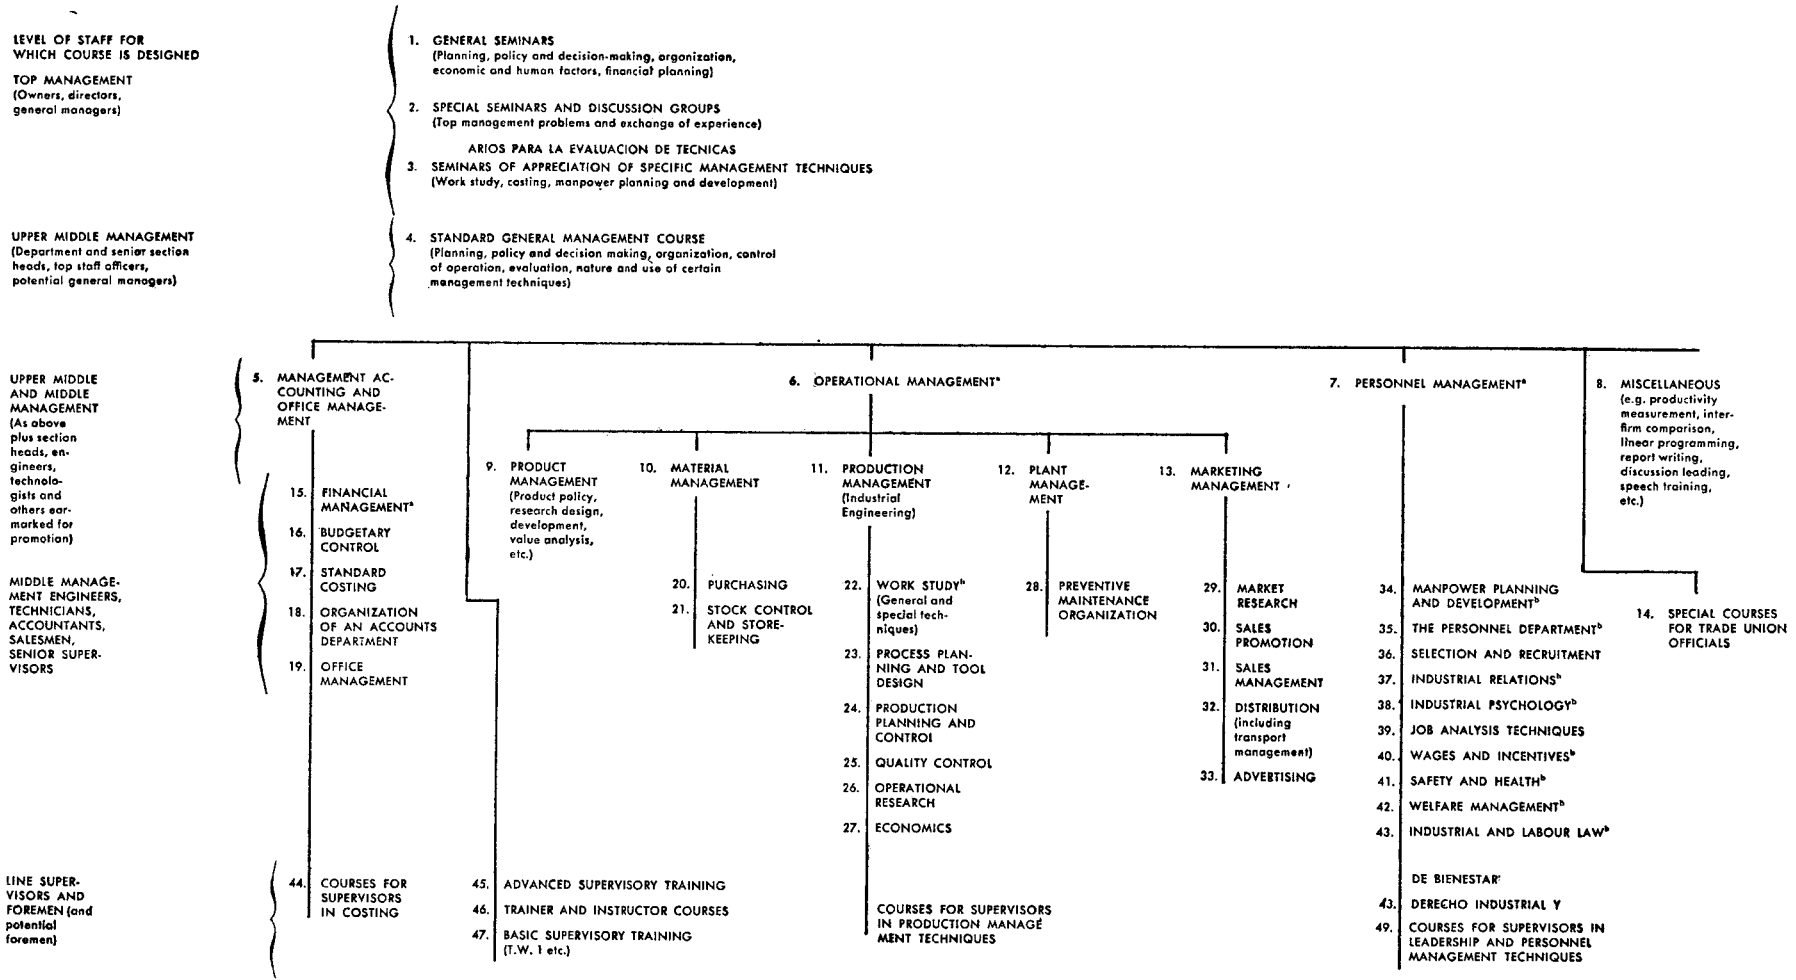

231. The smaller developing country generally has a greater need for a centre with a wide range of training facilities. However, wherever practicable, other training resources should be developed and used as quickly as possible. Technical colleges and vocational schools can provide full and part-time training for managers, management specialists, foremen, supervisors or workers' representatives. Professional bodies representing fields such as accountancy, personnel management, work study, general management and trade unionism, can also play their part in training. But in most cases, the centres will, for many years to come, have to meet the continuing and changing training and productivity needs of their countries, either with or without outside technical assistance. The need for them will diminish as long-term or permanent facilities become available in universities, colleges and technical and vocational schools. However, the flexible services of the centres will still be needed to fill many gaps. This conclusion has been reached by many industrially advanced countries with regard to their own needs, in the light of their experience during the past ten years.

(g) *The fellowship programme*

232. The fellowship programme connected with the management development and productivity centres is a further means of management training. Fellowships give staff members of the centres an opportunity for appropriate studies in industrialized countries. These studies, which may last from several months to one year, usually include a combination of specialized courses and attachment to selected industrial enterprises where the fellows can become acquainted with advanced methods. Fellowships enable individuals to obtain first-hand acquaintance with the personnel, theories, practices and system of industrialization in other countries. They establish sources of future contact and information and provide much encouragement. The number of fellowships was very limited when the major source of technical assistance funds was the Expanded Pro-

⁶⁵ See Richard S. Roberts, Jr., *Economic Development, Human Skills and Technical Assistance, A Study of ILO Technical Assistance in the Field of Productivity and Management Development*, Librairie E. Droz, Geneva, 1962. This publication provides a description of ILO assistance in this work, including a case study, entitled, "ILO productivity work in India".

Chart I. Scheme for a fully integrated management development, productivity and supervisory training programme

^a Any of the courses in these groups can, of course, be taken separately or in various combinations and at different times.

^b Courses suited for participation by workers' representatives and trade union officials.

gramme of Technical Assistance. However, the Special Fund has made it possible to grant many more fellowships.⁶⁶ Governments and enterprises in many countries have generally received a growing number of fellows and have played an important part in their training.

(h) *The Turin centre and management training*

233. If the necessary funds become available, the Turin Centre for Advanced Technical and Vocational Training will provide managerial training for 400 persons from developing countries each year. The participants will be carefully selected on the basis of their education, experience and general suitability for training for senior management posts. In the early stages, however, emphasis will probably be placed on the training of management teachers. Candidates for such training would be members of the staffs of productivity centres and management development institutions and senior managers from the more important enterprises who may participate in the activities of these institutions as part-time instructors.⁶⁷

(i) *Management development for public and private enterprises*

234. The preceding section dealt with the more or less formal functions of management training. The present section is concerned with the more informal process of managerial growth termed "development". This process, although more informal, is nevertheless planned and directed by organizational means as well as by individuals themselves. This is not to deny the importance of cultural influence, i.e., the influence of life-long exposure to the values, customs and disciplines of a particular industrial society, on the development of the manager. Indeed, it is now commonly recognized that one of the major obstacles to industrialization in developing countries is that people are generally unacquainted with the pattern of industrial living and working conditions. Transition from rural conditions and from more individualistic or small group traditional occupations (such as farming and home crafts) to urban life and to more formally organized work in a modern enterprise is a difficult process, mainly because there are no established patterns to follow. This difficulty pertains to the whole range of industrial personnel including potential managers who must be recruited among individuals without industrial experience. However, one of the important requirements of a modern industry at any stage of its development is that all its personnel, managers and workers alike, must continue to learn throughout their whole working life, because knowledge and skill become quickly obsolete. Training and development processes have acquired greater importance because there is now less time for people to learn their occupation and because the requirements of that occupation are continually changing. The manager in particular needs development throughout his career. Development is here understood to mean the process

whereby an individual learns through inner and outer direction, on-the-job experience and guidance from others.

(j) *Management development in industrialized countries*

235. A discernible process of management development has emerged in many of the industrialized countries during the past twenty-five years or more, in medium and large-scale enterprises.⁶⁸ It applies to public as well as private enterprises, although the latter have often led the way, presumably because they have had to be more adaptable. The process is described here because it has been found to have considerable relevance to developing countries, particularly as they acquire larger public and private organizations. Considerable effort is devoted to the selection of managers. Employers make some attempt to identify potential managers when they engage individuals who have just left school. However, the main work of identification takes place later, when the qualities of the person have been demonstrated in employment, even if only at worker level. Selection is, of course, a recurring process because after appointment as a manager, a person frequently moves to a position at a higher level and takes on other functions, and reappraisal of his qualifications is therefore necessary. The following is a common pattern of progress for an individual who becomes a manager. He begins his industrial career, after a university education, as a specialist (e.g. in engineering, accounting, personnel or marketing). After four or five years, he becomes a supervisor in his specialized field and after a further five to ten years, he becomes manager of his department. If he is destined for promotion to higher levels he must then broaden his experience and knowledge so that his qualifications become general, rather than specialized. The identification of the training and development needs of each individual is related to the selection of management personnel. At best, this is a co-operative venture on the part of the individual and his organization. It involves deciding on realistic development objectives and the means of achieving them. It requires analysis of present and future needs for managerial personnel within the enterprise.

(k) *Management development in developing countries*

236. In developing countries, the manager is faced with an uphill struggle for development. There is a lack of experienced senior managers to guide him, he has fewer professional colleagues, he has little published material and he has fewer norms or examples as a reference. At the same time, his status and authority are very high, and his enterprise, including his subordinates, fully expect him to manage competently. He is so preoccupied with managing others, developing policies and methods and basic organizations, that his own development is neglected. These circumstances

⁶⁶ See chapter 5, paragraph 324.

⁶⁷ *Ibid.*, paragraph 336.

⁶⁸ A report of management development activities in eight countries exemplifying degrees of industrialization (Chile, France, the Federal Republic of Germany, Great Britain, India, Italy, Japan and the United States) entitled *Developing Better Managers* was compiled and published by the National Industrial Conference Board, New York City, in 1961.

naturally condition him but often in the wrong direction, making him cynical. One additional problem is that managers in developing countries are less inclined to be selected objectively. Patronage of one kind or another often plays too great a part in their appointment. A related problem is the myth that managers do not really need any particular competence, but only authority and power. While technical functions like those of an engineer are considered difficult, managing is thought to be a simple task.

237. Fortunately, there are usually potentially competent managers available. They are owners of small, medium and large enterprises or members of owners' families; they are, to an increasing extent, young men with general education and technical training in technology, accounting, and so on, who become available for managerial positions in the same way as in the industrialized countries. The question which arises is how to assist them to become trained. The management development and productivity centres are, at least in principle, the best source of assistance. These centres can also influence the development of professional management associations. Some developing countries already have specialized societies such as personnel associations. However, they also need management institutions such as a "Society for Advancement of Management" with chapters in various sectors which provide "do it yourself" opportunities toward establishing management as a competent profession. The centres can provide published material and information on other sources of knowledge. They can also provide consulting services to enterprises and help them set up their own management selection, training and development programmes. Most of the centres are new and require much development themselves. They need additional backing from governments. They also generally need much more outside technical assistance of the type which many of them are now receiving.

(1) *Concluding observations on the training of managers in public and private industrial establishments*

238. Experience in all countries in recent years has demonstrated the importance of qualified management personnel as a factor in industrial development. Developing countries are in considerable need of managers who can effectively direct the production of goods and services. It is now known that, contrary to earlier assumptions, management is based on knowledge and skills which can be learned. Moreover, with appropriate training and other development facilities the learning process can be vastly accelerated.

239. Since the major developments in management education have taken place in the industrialized countries only within the past twenty years, it is understandable that the developing countries, particularly those which have only recently begun to establish their own public and private enterprises, have a dearth of management training facilities.

240. Most of the developing countries have begun to acquire management training facilities of the following

types: higher general education, commerce and management training at university and college levels, management development and productivity centres. These facilities are generally new and need to be considerably developed. The main problem is lack of teachers. University programmes of training and research are essential for the long-term supply of management knowledge and personnel. Formal educational institutions (e.g. universities, colleges and vocational schools) are also needed to provide ancillary services, in the form of adult education programmes for industrial personnel.

241. In the meantime, many developing countries have demonstrated that management development and productivity centres, with technical assistance from outside, can accelerate the development of managerial personnel. There is evidence that this leads to an improvement in productivity. The current formula for technical assistance of this nature, namely, expert assistance in development centres, together with a fellowship programme, appears to be appropriate. The centres need to improve the quality and geographical range of their work. Many of them require much more outside assistance. Finally, it should be emphasized that for at least the next ten years developing countries will need the help of internationally assisted management development centres which can provide practical training for persons already employed as managers and for new managers. At the end of this period, more formal educational and training facilities, such as those which now exist in many Western countries, may also be able to assist in providing sufficient qualified managers to accelerate economic progress in the developing countries.

VI. INTRA-REGIONAL AND REGIONAL ARRANGEMENTS FOR EDUCATION AND TRAINING OF NATIONAL TECHNICAL PERSONNEL

242. It has been generally agreed that training should be provided in the trainees' home country as far as possible. Almost all international organizations working in this field have recommended the establishment and expansion of local facilities for education and training.⁶⁹ However, only a few countries can claim to have an adequate network of educational and training institutions capable of meeting the needs of the country at all levels.⁷⁰ Therefore, the developing countries will have to take advantage of facilities available elsewhere both in the region and in the industrially advanced countries.⁷¹

243. The choice concerning training within the region and training abroad will be influenced primarily by the facilities available in the region itself and the degree

⁶⁹ I.L.O., First African Regional Conference, Lagos, 1960, Reports of First and Second sessions of the Committee for Industrial Development, *Official Records of the Economic and Social Council, Thirty-first Session, Supplement No. 2* and *ibid.*, *Thirty-third Session, Supplement No. 2*. Colombo Plan Bureau: *Report on Training Facilities at the Technician Level in South and South-East Asia*, Colombo, 1961.

⁷⁰ See chapter 2 of this report.

⁷¹ Training abroad has been dealt with in detail in chapter 5.

of specialization required for the trainee. In general, the available experience indicates that trainees sent abroad are generally a higher level personnel seeking either specialization in particular fields or comparative experience in various institutions dealing with certain basic problems.⁷² Trainees have been sent to the developed countries generally when there is no alternative, namely, training in the country itself or in the region. The report on the Development Decade, pointed out that "Individual fellowships for study abroad should be limited to high-level specialists or to students who will acquire new technical knowledge in fields where training in the developing countries would be difficult or uneconomic".⁷³

244. The case for training in the countries themselves or in the region is based on low cost of training. In particular, it is based on the desirability of providing training in an environment similar to that prevailing in the trainee's country. These considerations are satisfied in the case of training in another country of the same region, and hence the importance attached to intra-regional arrangements for training.

245. The levels of industrial development differ in the countries of the same region and the degree of facilities for training vary accordingly. There is thus considerable scope for co-operation and help. Sometimes, the capacity of the institutions is not utilized to the fullest extent and this should facilitate acceptance of trainees from other countries in the region.⁷⁴ This situation often exists in the case of institutions which have been newly established.

246. Apart from placement of trainees in other countries of the region which have adequate facilities for training, serious consideration has been recently given to establishing institutions to serve groups of countries in the region or all countries in the region. Such institutions very often cater to the needs in specialized training. The training offered is generally of a high level, if not superior as compared to that in the developed countries. The main feature of training in regional institutions is the adaptation of a training programme to suit local needs, a feature which is too expensive and difficult to obtain in the case of individual training in the industrially advanced countries. As pointed out earlier, training programmes to be effective need to be adapted to suit the needs of the trainees in the developing countries. While this can be achieved in the case of regional training institutes, they can also prepare training programmes to deal with peculiarly local problems of development. This has been particularly evident in the case of training of government officials in planning techniques in economic and industrial development.

A. INTRA-REGIONAL CO-OPERATION IN TRAINING

247. Various bilateral and multilateral programmes of technical assistance have encouraged placement of trainees in the countries of the regions. Similarly in countries in Latin America and in the Middle East, there is a continuous flow of students and trainees within the region.⁷⁵ Some of it is planned under the regional plans of co-operation and some is spontaneous and privately financed. The programmes of technical co-operation of the United Nations assist such countries in this field by both financing selected trainees and assisting the countries in establishing the training institution itself.⁷⁶ In the Latin American region, the co-operation by organizations in Colombia (SENA), Brazil (SENAI), Peru (SENATI) is instructive. The ILO has played a significant role in assisting the activities in those countries. The Marine Diesel Training Centre in Rangoon originally established at the request of the Government of Burma trained students from other parts of the region.

248. The regional economic commissions of the United Nations are actively engaged in sponsoring regional co-operation on all matters of economic and social development. In the field of training for industrialization, they have been instrumental in setting up Institutes for Economic Development and Planning with the assistance from the Special Fund. The objective of these institutes (one each in the ECAFE and ECLA region and two in the African region) is to raise the technical level of government officials and specialists, both through an expanded training programme and by in-service training. They also assist the Governments in establishing the institutional and technical organizations to evolve policies and formulate development programmes. The United Nations has also been active in establishing, with the assistance of the Special Fund, a Technological Research Institute in Latin America (ICAITI). It is concerned, among other things, with collaborating with Central American Governments and other organizations in the region in promoting scientific and industrial research including training researchers, technicians, etc. Technological research institutes are being established in a number of countries mainly to serve the needs of individual countries. In the African region, plans are being made to establish industrial research and development institutions on a sub-regional basis.

249. The Asian Productivity Organisation, established in May 1961, has developed other forms of intra-regional co-operation with a view to up-grading management and technical skills in its member countries, such as study missions and training courses for which developing countries of the Asian region have sometimes acted

⁷⁵ The main factor facilitating intra-regional co-operation is the existence of a common language. See Annual Report of the Technical Assistance Board for 1960, *Official Records of the Economic and Social Council, Thirty-second Session, Supplement No. 5*, document E/3471.

⁷⁶ See chapter 5.

as hosts.⁷⁷ India, Pakistan and the Philippines were some of the host countries for a study mission carried out in August and September 1962 which enabled participants from national productivity centres in member countries of the Asian Productivity Organisation to study the work of similar centres in other member countries and thus improve their own efficiency in the field of programme planning. Thailand was one of the host countries for a training course held in October and November 1962 to enable participants from Asian Productivity Organisation member countries to improve their knowledge of marketing and distribution techniques.

250. The Inter-American Vocational Training, Research and Documentation Centre (CINTERFOR) now being established in Montevideo by the ILO, in co-operation with the countries of the American continent, represents an attempt to extend intra-regional co-operation into fields other than the actual provision of training.⁷⁸ The Centre is being set up in response to a resolution adopted by the Seventh Conference of American States Members of the ILO. The main functions of the Centre will be to carry out research and organize seminars on all practical and technical questions related to the development of human resources, to establish a documentation service for these purposes and to provide assistance to interested bodies in respect of all problems connected with the general and technical organization of vocational training programmes. The Centre is financed by the ILO and the countries of the American Continent and part of its programme will be supported by international technical assistance funds.

251. A regional centre for French-speaking African countries is being sponsored by ILO for training in labour administration. It is envisaged that in the earlier stages of operation (beginning late in 1966) it will concentrate on the training of middle and lower grade personnel of the Departments of Labour in the region.

B. REGIONAL SEMINARS

252. Another significant method of intra-regional co-operation is the convening of seminars and workshops in which representatives of government, industry and other organizations participate. The regional economic commissions, in the case of the United Nations, sponsor seminars and meetings on subjects of interest to governments in the region. The specialized agencies, in response to suggestions made in the general conference of the organizations, appointed special committees to deal with questions in the region and to sponsor and organize meetings on technical subjects. The train-

⁷⁷ The following countries are members of the Asian Productivity Organisation: Republic of China, India, Japan, Republic of Korea, Nepal, Pakistan, Philippines, Thailand. Other Asian countries are also eligible for membership.

⁷⁸ An International Vocational Training Information and Research Centre (CIRF) has already been established jointly by the ILO and the Council of Europe in Geneva, Switzerland, to serve the countries of the European region. The Organisation for Economic Co-operation and Development, the European Economic Community and the European Coal and Steel Community are also participating in the work of CIRF. There will be practical co-operation between CIRF and CINTERFOR.

ing element involved in such meetings is of a special character. It consists, primarily, of exchanging views and national experiences on specific problems of industrial development. It results in arousing the interests of senior technical persons attending such meetings to pursue further study of a particular subject. It also results more often in implementing in the respective countries the decisions reached at the meetings. Such regional meetings have immediate operational character of significant interest. The following table provides a sample of such meetings held during 1961, 1962 and 1963.

253. The urgent need for qualified technical personnel in the developing regions, the growing awareness of the scope for greater intra-regional co-operation and the rapid evolution of training methods and techniques and of the actual content of training programmes to keep pace with technological progress are all factors which will certainly lead to the development of new forms of co-operation in the future. It is therefore not without interest at this time to draw the attention of the governments to the following points. These emerge from the experience acquired thus far and are relevant in undertaking intra-regional co-operation.

(i) Training outside the home country is not normally envisaged as a means of providing basic skills but rather for raising the level of qualifications with a view to highly specialized work, for the training of instructors and, in some cases, for giving training or further training to high level personnel.

(ii) The establishment of regional training centres for which the technical, administrative and financial responsibility must be shared by several governments is a costly undertaking. Financial assurance over a period of years is necessary and should not be affected by the fact that budgets are voted annually.

(iii) All countries of the region need to be fully informed of the national training facilities available for regional use and of the procedures to be followed in order to enable their nations to take advantage of them.

(iv) The trainees from various countries participating in a course should have similar basic qualifications and similar practical experience.

(v) Since trainees attending courses at the regional institutes will normally be persons occupying positions of responsibility which preclude long absence from their home countries, training courses in the institutes should not be unduly long. They should be designed to provide appropriate advanced technical training.

(vi) Training should be consistent with the need of the country and capable of immediate application in the trainees' home country on completion of the training course: (e.g., instructors should be trained abroad only if the facilities for giving instruction already exist — or are being simultaneously established — in their home country).

VII. WORK OF THE UNITED NATIONS FAMILY

254. The present section is concerned with the current and planned activities of the United Nations family

TABLE 3.1. INTRA-REGIONAL PROJECTS UNDER THE UNITED NATIONS TECHNICAL CO-OPERATION PROGRAMMES (1961-1963)

<i>Name of project</i>	<i>Location</i>	<i>No. of countries participating</i>	<i>No. of personnel participating</i>
Seminar on organization and operation of industrial estates	Madras, (India)	22	22
Working party on chemical industries	Bangkok, (Thailand)	14	14
Handicrafts (CREFAL)	Patzcuaro, (Mexico)	5	NA
Training course on Logging Techniques	Rangoon, (Burma)	6	NA
Productivity Seminar	Tokyo, (Japan)	13	25
Rural development and handicrafts	Lavyou, (United Arab Republic)	NA	NA
Apprenticeship Seminar	Cairo, (United Arab Republic)	9	18
Fisheries processing and technology training centre	Quezon City, (Philippines)	10	24
Fisheries training centre (South Pacific Commission)	Tulagi, (Solomon Islands)	4	25
Training courses in laboratory techniques	Talkerim, (Jordan)	11	NA
South Pacific regional training in boat building	Auki, (British Solomon Islands) and Nouville (New Caledonia)	NA	31
Development prospects of basic chemical and allied industries in Asia and the Far East	Tehran, (Iran)	—	—
Inter-regional seminar on modern methods of iron and steel making	Prague and Geneva	50	126
Seminar on training supervisors held by ILO	Singapore	13	45
Seminars on accelerated training held by ILO	Karadj, (Iran)	8	14
Regional seminar for high-level labour administrators, held with assistance of ILO	Brazzaville, (Congo)	15	16
Regional seminar for high-level labour administrators, held with assistance of ILO	Freetown, (Sierra Leone)	12	19
Travelling seminar for senior management from private undertakings, held by ILO in co-operation with ECLA	Central America	6	16
Technical meetings on productivity and public works held under auspices of ILO	Lagos, (Nigeria)	18	21

in regard to the development of systems and methods of education and training. The international action in this context is to a large extent determined by the requests addressed by Governments to the United Nations or to the appropriate international organizations. The work of the United Nations and the specialized agencies in the field consists of studies and research, establishment of standards and models, and operations. It should be borne in mind, however, that all these are interdependent, both at the planning stage and when the programme is being implemented.

255. Details regarding research projects undertaken by the United Nations family are given in E/3901/Rev.1/Add.2, chapter 3, annex E. As regards standards, the international organizations have prepared a number of them relating to the organization of vocational and technical education and vocational training. These standards are general, regional, or by sector. The most important of them are contained in the UNESCO Recommendation concerning Technical and Vocational Education (Paris, 1962) and the ILO Recommendation concerning Vocational Training (Geneva, 1962). The two organizations have reproduced these recommendations in a joint publication which is being sent to the Governments of their member States.

256. Plans are under way to prepare technical standards in the form of guides or manuals. These documents will take account of the results of technological research and experience gained in operational activities and will facilitate the execution of both national training programmes and international technical assistance projects. It is envisaged that these new standards will cover, among other things:

- (i) Employment objectives and manpower organization;
- (ii) The establishment of vocational guidance tests in a number of developing countries;
- (iii) The preparation and use of audio-visual aids;
- (iv) The construction and fitting out of premises;
- (v) Equipment for training workshops;
- (vi) Codes of practice for various industrial sectors — building, electrical, mechanical and chemical industries;
- (vii) Basic equipment lists for teaching and practice laboratories;
- (viii) Guide to management education at various levels.

257. A substantial programme is foreseen for the preparation of standards applicable to training in given industrial sectors. It is intended that these standards should be based on:

- (i) The identification and selection of functions and key occupations in the industry concerned;
- (ii) The determination of the qualifications they require;
- (iii) The determination of the content, duration and conditions of training for these functions and occupations;
- (iv) A study of the organization of training in the industry;
- (v) A study of participation by employers' and workers' organizations in the preparation and implementation of training programmes.

It is envisaged that, during the next five years, this programme will cover the chemical, textile and metal working industries, printing, transport, mining and petroleum. In the field of technological research, it is more difficult to establish standards but it will be possible to elaborate recommendations on particular problems such as:

- (i) The planning and design of prototype testing and research centres, and
- (ii) The typology of research laboratories and institutions.

258. A substantial portion of the operational programmes undertaken by the United Nations system is devoted to the training of technical personnel for industrialization.⁷⁹ This programme, which goes back many years, has grown rapidly as a result of the increasing demand from the industrializing countries and the development of the various aid programmes. The volume of the action involved is illustrated by the fact that, as of 31 October 1963, sixty-six projects approved by the Special Fund since its establishment were in the specific fields of technical education and training and management development for industry.⁸⁰ The Special Fund allocations for these projects exceeded \$60 million.⁸¹

259. Technical co-operation projects involve work in the following areas:

- (i) The analysis of manpower problems and the preparation of training schemes;
- (ii) Educational planning;
- (iii) The establishment or development of national training systems;
- (iv) The improvement of standards and methods;

⁷⁹ See chapter 4, paragraph 300.

⁸⁰ Excluding, for instance, technological, research institutes, agricultural or public administration training institutes, small industry service institutes, telecommunications and civil aviation training establishments, general education, manpower planning, etc.

⁸¹ *The Implementation of the Programmes Approved by the Governing Council at its Second Through Tenth Sessions*, (SF/L.92), 3 December 1963.

- (v) The training of teaching staff;
- (vi) The establishment of engineering schools and specialized technological departments in universities;
- (vii) The establishment of management education and training facilities;
- (viii) The establishment of institutes of metrology and standards, mechanical engineering, and other research institutes;
- (ix) Establishment of extension and training services in agricultural and small-scale industries; and
- (x) The development of post-graduate training for scientists' and engineers' highly specialized fields.

These missions and projects are usually national in character. They may, however, be confined to a specific area in a country or involve a number of countries in one region or continent which are faced with the same problem.

260. Technical co-operation within the international programme for the developing countries takes different forms but generally combines the services of international specialists, the award of fellowships to national specialists, and the provisions of equipment for demonstration purposes.⁸² A particularly important contribution to programmes for training national officials and for the further training of technical personnel will become possible in the next few years following the establishment of such bodies as the regional economic planning institutes, the UNESCO Institute for Educational Planning in Paris and the ILO Centre for Advanced Technical and Vocational Training in Turin.

261. The conference and other meetings organized by the international organizations help to develop the desire of governments for technical co-operation. They make it possible, in connexion with a particular problem, to bring out the various factors and to determine the means of achieving the objectives through international co-operation. The various publications of the international organizations, including those prepared for such meetings, constitute an important source of information for the organizations themselves and the technical assistance experts.

262. The increase in operational activities financed by the Special Fund has given rise to a considerable increase in the work of the organizations dealing with studies, analyses and normative activities. Such work covers various problems of industrialization which can be tackled within the limits of the resources available at present. In order to avoid duplication of substantive effort and to promote co-ordinated action, appropriate inter-secretariat machinery has been established in fields such as manpower assessment and educational planning, technical education and vocational training, and agricultural education.

⁸² For details see Reports of the Technical Assistance Board to the Technical Assistance Committee for the years 1960, 1961, 1962, *Official Records of the Economic and Social Council, Thirty-second Session, Supplement, No. 5*; *ibid.*, *Thirty-fourth Session, Supplement No. 5*; and *ibid.*, *Thirty-sixth Session, Supplement No. 5* and chapter 5 of this report.

VIII. TRAINING POLICY AND INDUSTRIALIZATION

263. Training policy can no longer be isolated from the other elements of national policy, particularly when this policy is conceived and operated within a framework of economic planning. The policy itself will be influenced by the rate of growth, the proportion of investment devoted to industrial development and the prevailing position of the educational system.

264. The situation in developing countries is characterized by low levels of skills, inadequacy of funds for education and training. The situation, however, varies widely from countries with primitive economies to those in which industry has developed substantially. Between these two positions there are numerous countries in which a backward sector exists alongside an extremely modern sector.

265. The policy to be followed in regard to training is thus, therefore, dependent on a large number of factors. These, in turn, depend on the conditions of the country concerned, the degree and dynamism of its economic and social development, its administrative structure and on the overall objectives of its national policy. In addition, the problem of determining the appropriate training policy is made complex by the inadequacy of available data, which are necessary if a national training policy is to be satisfactorily planned at the national level. It is, nevertheless, possible to suggest for industrializing countries, a general strategy for training systems and methods.

266. It is possible, in the first instance, to undertake analyses for determining a short- and long-term training policy. Such analyses include estimating needs for technical personnel and a review of training facilities. The latter includes a review of the structure and organization of existing training facilities for the three main levels of qualification; the use made of and the pedagogical and economic return from these facilities; the extent to which methods and programmes were adapted to the training objectives and the respective costs of the training systems. Once the results of such analyses are available it is possible to determine what immediate steps should be taken in the light of the programme of industrialization and the resources available.

267. A first category of such measures might aim at using facilities outside the national training systems, such as immigration, training abroad, training by foreign companies, international or bilateral technical assistance. Other measures will include those such as systematic organization of work, raising productivity, redistributing functions, increasing working hours temporarily. These measures constitute a basis for effective action for overcoming the shortage of technical manpower and particularly for meeting short-term needs.

268. A second category of short-term measures would be designed to improve the effectiveness of existing training systems. Some of these measures would be concerned with administrative organization and co-ordination at the national, regional and local levels, particularly as regards the links between the different training systems, the authorities responsible for training and

those responsible for education and the economy. Such action is suggested because, even in countries where training systems are not as yet developed, these systems often come under the administrative jurisdiction of different authorities and require co-ordination. Lack of proper co-ordination will, however, inevitably lead to inefficient use of national training facilities as a whole. The lack of co-ordination may be due to the inadequate government administrative machinery. In such cases, a general effort in improving public administration would be desirable.

269. Other measures in this second category would be aimed at making improvements in the training systems and methods used. Consideration would be given in this connexion to such aspects as:

- (i) The structure of the training systems, their geographical distribution in the country and their capacity in relation to short- and long-term needs;
- (ii) The volume and distribution of training expenses, particularly in institutional systems of training;
- (iii) Wastage and drop-out during training;
- (iv) The standards and method used;
- (v) The relationship between training and employment possibilities and the links between training systems and industry.

270. A third category of possible immediate measures seems particularly appropriate for countries which are in the earlier stages of industrialization. It is possible that the competent authorities in such countries will have to choose, within the framework of industrialization schemes and the limits of available resources, between training for the various levels of qualification (skilled workers, technicians, engineers) and between institutional and in-plant training. It may be desirable for these countries to devote particular attention to determining the priority to training programmes with a multiple effect, namely:

- (i) To the training of trainers, particularly teaching personnel in institutional training systems, and supervisors and foremen in industry;
- (ii) To the training of persons in key functions such as management, personnel of maintenance and repair services and lower and intermediate level supervisors;
- (iii) To the development of systems of training young persons and adults who are already in employment;⁸³
- (iv) To the establishment and development of programmes of further training (technical and pedagogical training and general education) since such programmes

⁸³ "The quickest way to increase productivity in the less developed countries is to train the adults who are already on the job. Education for children is fine, but its potential contribution to output over ten years is small compared with the potential contribution of efforts devoted to improving adult skills. This field is almost wholly neglected... Yet there is ample testimony to what adult education can achieve, whether in the form of training-within-industry, evening classes, or sandwich courses in urban centres..." Lewis, A. W. "Education and Social Development" UNESCO *International Social Science Journal*, vol. XIV, No. 4, 1962.

are usually of considerable importance as a means of improving the qualifications of the labour force as a whole.

271. For countries with a network of educational infrastructure and of some industrial development, consideration may be given to the following main measures:

(i) The extension of training facilities to the population as a whole, both for the initial training of young persons and adults at all levels and for the adaptation, specialization, retraining and further training which become necessary as a result of economic and technical progress. These facilities should be sufficiently flexible and varied to meet all the requirements of the persons concerned and to provide for training to continue, as necessary, throughout working life;

(ii) The improvement of the links between schools and industry, since at this stage of industrialization the general and scientific culture of technical personnel is increasingly important as a basis for training and technical specialization;

(iii) The development of research on technological progress and the study of its repercussions on training, with a view to adapting training methods and programmes constantly to the prospects of industrial evolution.

IX. RECOMMENDATIONS

A. FOR DEVELOPING COUNTRIES

272. In the light of experience in recent years, the following measures are suggested to train the required technical personnel within the framework of programmes for accelerated industrialization:

(1) Evaluating existing training facilities in the light of current and estimated requirements for technical personnel at all levels, from workers to engineers and management;

(2) In making the above evaluation review particularly the structure and organization of facilities for the three main levels of qualification, the use made of and the return from these facilities, the extent to which methods and programmes are adapted to training objectives and the respective costs of the various training systems employed;

(3) On the basis of the results of the above assessments, establish priorities in the light of a programme of industrial development, resources available and the needs for the whole range of industrial personnel, based on the following possible measures:

(a) The improvement of existing training systems;

(b) The use of facilities outside the national training system such as immigration, training abroad, training by foreign companies, international or bilateral technical assistance and the more systematic organization of work and enterprises.

(4) The improvement of existing training systems with regard to:

(a) Administrative organization and co-ordination at the national, regional and local levels, particularly as regards the links between the different training systems and the links between the authorities responsible for training and those responsible for education and economic development;

(b) The structure of training systems and forms of training, their geographical distribution and their capacity in relation to needs for technical personnel, both short- and long-term;

(c) The volume and distribution of training costs;

(d) Wastage and drop-out during training;

(e) The standards and methods used;

(f) The relationship between training and employment possibilities and the links between training systems and industry.

(5) For countries in the early stages of industrialization, paying particular attention to determining the priority to be given:

(a) To training programmes with a multiplier effect, that is for the training of trainers, particularly of teaching staff in institutional training systems and of supervisors and foremen in industry;

(b) To the training of persons in key functions or at key levels, for instance the training of management, the training of personnel in maintenance and repair services, and the training of lower and intermediate level supervisors and of technicians;

(c) To the development of systems of training young persons and adults who are already in employment, for instance by organizing systems of in-plant training;

(d) To establish and develop programmes of further training as a means of improving the qualifications of the labour force as a whole.

(6) For countries which have passed through the first stages of industrialization and have already developed their industrial and educational infrastructure, the following measures are suggested with a view to achieving the full and rational use of all human resources:

(a) The extension of initial and further training facilities to the population as a whole, in accordance with their needs and those occasioned by economic and technical progress;

(b) The establishment and development of high level training for new techniques, both for research and production;

(c) The improvement of the links between schools and industry, in view of the increasing importance at this stage of industrialization of general and scientific culture as a basis for training and technical specialization;

(d) The development of research on technological progress and the study of its repercussions on training,

with a view to adapting training methods and programmes constantly to the prospects of industrial evolution.

(7) The following measures are suggested in connexion with the training of management personnel:

(a) The development of university and college management education, both post-graduate and undergraduate, including management courses in technological education, for the longer-range supply of managerial practitioners and teachers;

(b) The establishment and further development of management training facilities, such as management development centres, for the more immediate supply of managerial practitioners and teachers: such centres to offer comprehensive management training for all levels of management and to cover a wide range of industries, including small-scale enterprises and co-operatives.

B. FOR INTERNATIONAL ORGANIZATIONS

273. It is evident that the existing programme of the United Nations and the specialized agencies in the field of Industrial Development, particularly in regard to technical education and vocational training, will need to be intensified and increased. The following items already in progress or planned (see paras. 259 to 260) would seem to be of particular importance within such an intensified and increased programme:

(1) Studies and research on:

(a) Employment objectives in economic development and employment policy, and particularly:

(i) Employment creation in relation with industrial development;

(ii) Factors to be considered in determining what choice might be necessary between employment growth, changes in the conditions of employment, and patterns and rates of economic growth;

(iii) Formulation and implementation of policies for increasing employment.

(b) Problems of development of small-scale and handicraft industries;

(c) Methods of forecasting requirements for technical personnel for economic and particularly industrial development;

(d) Changes in the occupational structure of the labour force and the composition of occupations;

(e) The economic problems of technical education and vocational training in developing countries with a view to establishing a basis for long-term planning and with particular respect to such aspects as:

(i) The determination of priorities in technical education and vocational training;

(ii) The determination of the costs of the various systems of technical education and vocational training;

(iii) The extent to which the various systems of technical education and vocational training are used and the return they give;

(iv) Methods for organizing and planning education and training in relation to general development policy.

(f) The national planning of technical education and vocational training, including their organization and structure;

(g) Education and training methods and programmes and problems of status and training for teaching staff;

(h) Specific problems of training higher technical education and management development;

(i) The establishment of inventories of training institutions in selected fields of industrial development;

(j) The assessment of needs for technical education and vocational training in selected industries;

(k) Problems connected with the development of local resources and local engineering planning;

(l) Occupational health;

(m) Specific problems concerning the social and economic conditions of engineers and higher technicians;

(n) The professional training of highly specialized personnel of all grades in the developing countries in such branches as meteorology, telecommunications and civil aviation;

(2) The establishment of standards and models, with a view to facilitating the implementation both of national schemes and of international technical assistance projects, on such subjects as:

(a) Employment objectives and manpower organization;

(b) The establishment of vocational guidance tests in a number of developing countries;

(c) The preparation and use of audio-visual aids;

(d) The construction and fitting out of training premises;

(e) Equipment for training workshops;

(f) Basic equipment lists for teaching and practice laboratories;

(g) Codes of practice for various industrial sectors;

(h) Training in given industrial sectors;

(i) Guide to management education at various levels.

(3) The establishment of recommendations covering such problems as the planning and design of prototype testing and research centres and the typology of research laboratories and institutions.

(4) Operational activities, in accordance with requests from Governments, and consisting of:

(a) Survey missions involving studies on economic, technological, manpower and educational problems in relation to the creation or development of industries, either as a whole or in a specific sector, and studies on the structure and organization of technical education, vocational training and management development and programmes for all or specific levels of qualification, occupational specialization or functions;

(b) Operational projects involving advice and/or cooperation in the planning, establishment or develop-

ment of systems, programmes and facilities for technical education, vocational training and management development for industry and the provision of experts, fellowships and equipment as necessary.

Chapter 4. The financial implications of technical education and vocational training

I. COST ESTIMATES OF EDUCATION AND TRAINING

274. The estimation of the financial aspects of the education and training programmes in the developing countries in connexion with industrialization involves a number of difficulties:

(a) The overall cost of such programmes depends on preparing fairly accurate estimates of the numbers of technical personnel. Difficulties involved in this task are discussed in chapter 1.

(b) Cost estimates per pupil are not readily available and the existing data need to be up-dated. This is particularly true for training programmes undertaken in addition to those undertaken by the technical schools, institutions and universities.

(c) The available estimates of education and training vary considerably from region to region and from country to country. Therefore, estimates should be considered as illustrative only, and subject to revision.

(d) There is lack of data on "drop-out" rates at various levels, the present flows of students into various types of employment, and the appropriate lags in the expansion of these flows (5, 10, 15 or even 20 years, as the case may be). Data on such aspects are particularly necessary in the costing of the capital requirements of education and training programmes.

275. An attempt will be made in this chapter to assemble available data and to estimate costs involved in undertaking training programmes for intermediate and higher level technical personnel concerned with industrial development. These estimates are subject to the difficulties and qualifications mentioned in the preceding paragraph. It must be emphasized here that estimates are presented for illustrative purposes only. They are basically rough orders of magnitude and it is hoped that, as more data become available, firm estimates may be prepared.

276. Some estimates of recurring costs and of capital costs per pupil/place are presented in table 4.1 for various levels of education. Some are actual costs, while other refer to planned future costs.

277. The relatively higher proportion of costs per pupil at the higher educated level, compared with the primary level in Africa, are due to the need for greater reliance on expatriate teaching personnel, for providing residential facilities for the students and teachers (also at secondary levels) and to the low pupil/teacher ratios in many African higher educational institutions. Plans to raise the proportion of indigenous teaching personnel, and the ratios of pupils to teachers, will reduce these

costs in the future, as the development of the lower levels of the educational system enables more young people to take advantage of a university education and to become teachers themselves.

278. On the basis of the regional cost estimates of table 4.1, and on the basis of the numbers of scientists, engineers and technicians for industry estimated for illustrative purposes in chapter 1, an estimate of the higher-level educational cost has been made for each of the regions. It must be emphasized that this estimate:

(a) Takes no account of the education of higher and intermediate-level manpower required for fields other than industrialization or any other educational needs;

(b) Takes no account of the present or past output of higher-level technical personnel (see paras. 279 (d) and 281 below.)

279. The educational assumptions on which this estimate is drawn up are the following:

(a) The duration of higher education is five years for engineers and scientists, and three years for technicians;

(b) The capital costs for Asia are 20.7 per cent of the total recurring costs.⁸⁴ All other recurring and capital costs for the three regions are taken from the regional per-pupil estimates of table 4.1.

(c) The time-table over which graduates will be forthcoming to meet the fifteen-year needs indicated in chapter 1 is also fifteen years. In so far as countries between 1960 and 1965 have not produced a pro-rata share of the output required up to 1975, the annual requirements and annual recurring costs would have to be substantially increased for the period 1965-1975. In that, however, countries were already producing in 1960 some proportion of the numbers required, the total capital expenditure necessary over the period is overstated.

(d) In so far as countries have not succeeded in achieving (between 1960 and 1965) a pro-rata share of the industrial output and employment targets, on which the fifteen-year educational requirements are based, the industrial output and employment targets for the remaining ten-year period might have to be scaled down, and the requirements of higher-level technical personnel for industry reduced in consequence. This would, of course, reduce the total educational costs to be incurred.

(e) The flow of graduates is evenly distributed over the fifteen-year period. This assumption is introduced for simplicity. It implies that the necessary number of pupil places are constructed just as the period begins and are fully occupied throughout the period. In reality, the flow of graduates is certain to be less in the initial years, and more in the later years. The total capital cost over the fifteen-year period would be greater than has been estimated, therefore, as the larger flow of the later years requires a larger number of places to be constructed and equipped. The capital costs in the

TABLE 4.2. COST OF HIGHER-LEVEL EDUCATION FOR SCIENTISTS AND ENGINEERS

	Asia	Latin America	Africa	Total
<i>I. Number of scientists, engineers and technicians assumed to be required^a</i>				
Scientists and engineers	260,000	110,000	30,000	400,000
Technicians	630,000	290,000	70,000	990,000
<i>II. Cost of higher-level education for scientists, engineers and technicians for industry (\$ million)</i>				
15-year recurring cost	957	852	366	2,175
15-year capital cost	198	114	170	482
15-year total cost	1,155	966	536	2,657

^a Data given in chapter 1 rounded to the nearest 10,000.

initial years, however, would be smaller than the fifteen-year capital cost indicated in table 4.2.

(f) It is assumed that pupils drop out at the higher level, and they do not repeat any year. This assumption is necessary in the absence of data on the average number of years it takes a pupil in the three regions to complete science, engineering and technical courses. Both the fifteen-year recurring costs and the fifteen-year capital costs will be too low because of this assumption.

(g) It is also assumed, for the purposes of the estimate, that the total number of technical personnel will complete their training in the new institutes established at the beginning of the period covered by the plan.

280. The rough cost estimate based on these assumptions is presented in table 4.2.

281. The estimated cost of \$2.6 billion for the fifteen-year period appears to be considerable. However, this would amount to an annual expenditure of approximately \$177 million for all the developing countries which, in itself, may not be substantial. In any case, this figure is meant for illustrative purposes only and any attempt to translate it at this stage into operational matters would be truly misleading.

II. THE COST ANALYSIS OF TRAINING

282. There are two basic factors which influence the cost of training, namely, training systems and methods and thoroughness in training.

A. TRAINING SYSTEMS AND METHODS

283. It is possible to ascertain a training "terminal" point. It is assumed that, at this point, the successful trainee possesses such skills which equip him to undertake specified jobs at a given level of efficiency whatever the training "route" by which he reached the terminal. In practice, the quality of training given under alternative training routes to the same terminal point may

differ widely. If the higher quality training costs more, then consideration will have to be given as to whether the extra quality is worth the extra cost. It is assumed in the chapter that all training courses can be adjusted to the quality required. In other words, jobs can be analysed and broken down into component skill elements necessary for the job and that training courses can be designed to inculcate this precise set of skill elements. In this regard, the Turkish Five-Year Development Plan states:

"... the functions of skilled workers, foremen and technicians should be defined precisely, and appropriate training methods should be worked out. Co-ordination between the Ministries of Industry and Labour and the trade unions should be established in this respect ..."⁸⁵

The skill elements required will depend on the productivity and technology which are required in the job. Thus, a tool-maker using "old-fashioned" techniques will require "up-dating" or retraining if he is to continue as a tool-maker as technology advances and the skill elements required of a tool-maker change.

284. Given these assumptions, it is clear that systems of training should use those methods which minimize their costs and that those systems which cost less should be gradually expanded and those systems which cost more should be gradually contracted so as to minimize the cost of training per successful trainee for the numbers it is planned to graduate from each training terminal.

285. This problem is relatively simple analytically, although there may be some procedural complications in identifying the various cost elements. Each training system should be costed and compared on the basis of the cost per successful trainee. These systems should be compared, not only with other systems where these provide alternative routes to the same training terminal, but also with the same system in other countries and in different establishments in the same country. Costs may be affected by such factors as trainee/instructor ratios, size of training establishments, teaching techniques, length of training period, where training is given (in a centre or in an enterprise, for example), whether training is part-time or full-time and how such training is distributed over each day, week and year, and the selection procedures and past experience and qualifications of trainees.

286. Such comparative analysis should seek to establish, for example, whether an apprenticeship system with fifteen apprentices to each instructor, using programmed learning techniques over a period of two years, would not result in lower costs per successful trainee than other apprentice systems leading to a given training terminal. It should seek to establish whether the scale of training would not have to be larger than a given size for most economical results, thus leading to the recommendation that smaller firms should co-operate

⁸⁵ Turkish Republic, Prime Ministry State Planning Organization, *First Five-year Development Plan, 1953, 1967, Ankara, 1963-1967, Ankara, 1963.*

in training or that special centres should be set up which are large enough to provide training on such a scale.

287. The costs can be traced by cost accounting methods to the various elements in each training system which contribute to the costs per successful trainee, for example instructors' wages or salaries, other variable and fixed costs, the success rate of trainees, the length of training and so on. A standard method for costing the training of apprentices was recently developed by the Personnel Management Advisory Service of the Ministry of Labour, in co-operation with the British Association for Commercial and Industrial Education (table 4.3).⁸⁶

288. This costing formula effectively encompasses all the cost elements the point of view of an individual enterprise. For the purpose of planning training, however, some adjustments are required. First, to allow for wastage, the unit costs should be multiplied by the numbers in training in each year of each course. These aggregate yearly costs should be added and the total divided by the number graduating from the course concerned.⁸⁷

289. Secondly, when determining the cost of training for the economy as a whole, item 1 (a) in table 4.3 should be calculated as the wages which the trainees would have earned had they been working instead of learning. This is the real cost of engaging in training and is relevant for planning of national training systems. In the developing countries, where youth unemployment is very high, this real cost may be very low. Reference may also be made here to the cost formulae for education contained in the Addis Ababa and Tananarive Plans and to the work of the OECD on this problem.⁸⁸

290. In order to improve the efficiency of the training systems, it is considered important that the developing countries undertake to collect cost data relating to training. In the absence of data, it will be difficult to ascertain whether the resources devoted to training are being used in the most effective ways. For example, methods of accelerated training may, in given circumstances, be quite the cheapest and most effective means of training over a wide range of occupations. Programmed learning methods, which may allow more rapid and more effective training, while economizing on the need for instructors, may prove a most effective technique in developing countries. Again, a system of shifts of trainees and instructors in the same buildings and using the same equipment might yield a considerable saving in overhead costs, and in particular in library costs and trainees' facilities. But until the relative costs are known, these methods will scarcely be tried as an alternative to established methods.

291. The question of cost plays an important role in the decision of the industrial enterprises in adopting a

given type of training programme. The capital which enterprises invest in training necessarily become embodied in employees who are usually free to move where their skills can earn the greatest rewards. One consequence of this is that the prospect of losing workers and the capital invested in their skills impels enterprises towards providing training programmes which bring a rapid return, that is, which are specifically applicable and necessary to the functions of the employees concerned. Another consequence is that certain types of longer-range training, which might be more economically and efficiently provided on an in-plant than on an institutional basis, may have to be provided in institutions or not at all, unless means can be found for reducing labour turnover or for providing training on a co-operative basis, and compensating enterprises for the loss of employees trained by them.

292. Labour turnover to some extent can be reduced and secure a rapid return on training expenditure by the industrial enterprises. A commitment to work in a certain kind of job for a specified period, as is the practice of some Governments in dealing with trainees going abroad, is one way out of this situation. In Japan, large enterprises, in order to retain workers trained by them, use "the wage system, fringe benefits, such as retirement allowances, paid vacations, health insurance and recreational resorts, in such a way as to elicit a life-long commitment of employees to a particular enterprise".⁸⁹ This system not only discourages labour mobility, but tends to place much more importance on younger workers as trainees.

293. Practices that severely discourage and penalize labour mobility have, however, some disadvantages, and Governments might wish to explore the possibilities and the difficulties of devoting public funds to the subsidizing of in-plant training in cases where this is considered a more economical system, from a national point of view, of achieving given results.

294. It is in the enterprises' own interests that training is carried out efficiently so as to yield the maximum returns. The widespread use of what has been termed learning by absorption on the job might seem to indicate that many employers have found this the most economic method of training, despite the apparent waste of output while the employee is absorbing, by hit-or-miss methods on the job, the specific skills required. These *ad hoc* methods may be attributable to scale factors, however, in the sense that small enterprises cannot afford at their scale of output to employ full or part-time training staff, and an employee trained less well by *ad hoc* means is a better economic proposition.

295. Large enterprises, on the other hand, which require large numbers of workers to be trained, may take advantage of techniques of training which are more efficient on a large scale than the absorption methods of small enterprises. These techniques, calling for specialized training staff and equipment, involve heavy

⁸⁶ *British Association for Commercial and Industrial Education Journal*, London, vol. 17, No. 3, September 1963, pages 102 to 104.

⁸⁷ A slightly more elaborate method will have to be used if the apprentice intake is rapidly growing.

	Craft £	Tech- nician £	Techno- logist £	Gra- duate £	Com- mercial £	
I. Wages and salaries (taxable)						
(a) Apprentices — for time spent in works and offices and at college or courses						
(b) Instructors ^a — full-time or part-time (foreman or craftsman undertaking other duties)						
(c) Clerical and administrative — to include allocation of training and/or personnel department effort						
(d) Statutory and social — payment for statutory and annual holidays, national insurance, and company contribution to pension scheme						
TOTAL COST FOR WAGES AND SALARIES						
II. Maintenance of training centre or defined training area ...						
(a) Rents						
(b) Rates and taxes						
(c) Depreciation of fixed assets (plant, buildings, etc.)						
(d) Light, fuel and power						
(e) Indirect labour costs (e.g. shop labourer)						
(f) Maintenance of machine tools						
(g) Maintenance of other equipment of a capital nature .. (Shops tools, fixtures, furniture, equipment and materials, etc.)						
(h) Consumable equipment						
(Training material, stationery, etc.)						
TOTAL COST OF TRAINING CENTRE OR AREA						
III. Recruitment and selection						
Advertising of vacancies, apprenticeship brochure, school visits, selection processes (including cost of interviewing, testing, entertainment, etc.), travelling expenses (of candidates and staff)						
IV. Fees						
(a) Fees paid to technical colleges, etc						
(b) Cost of external courses and educational visits						
TOTAL COST OF FEES						
V. Awards						
Books, tools or prizes, cost of prize-giving ceremony — parents' day, etc.						
VI. Fringe benefits						
Cheap canteen meals, subsidized travel, apprentice, association sports and recreational activities, etc.						
VII. Accommodation						
Cost of lodging allowances, provision of hostels, etc.						
VIII. Donations and subscriptions to external bodies for training purposes						
IX. Any other items please detail						
GROSS COSTS						
CREDITS ITEMS						
(i.e., value of apprentices' production if done by skilled men) ..						
NET COSTS						
(i.e., gross costs less credit items)						
UNIT COSTS

^a This should include any relevant payments for overtime or bonus.

fixed costs which can be spread over a sufficiently large number of trainees to provide cheaper and more effective training than absorption training. The arguments levelled against the inadequate training carried out over a large part of industry are, therefore, arguments in favour of co-operation by small enterprises in carrying out their training activities together, and for public financial and organizational support of such joint training so that economical use can be made of better techniques of training. The possibility of such co-operation would depend on the spatial distribution of small enterprises in industrial branches, the degree of similarity of production techniques, and on guarantees against abuses to gain an economic advantage to any particular enterprise, for example, by non-payment of training dues. Government action to promote and protect such co-operation might be necessary and desirable in the interests of the industry as a whole.

B. HOW THOROUGHLY SHOULD PEOPLE BE TRAINED ?

296. Training costs influence the degree of specialization in training and the distribution of training time over the working life of trainees. The problem in this case is to find the appropriate time pattern and the degree of specialization of training which is most suitable to the peculiar conditions prevailing in each country. For example, over-training, while possibly advantageous for the individual, since it may allow a wider range of occupational choice, may not be directly useful for the country since there will be no immediate opportunity for full utilization of the skills acquired. Under-training, on the other hand, may be frustrating for the individual. It creates a rigidity in the skill structure of the working population and does not allow sufficient mobility to accommodate the rapid changes in the "product mix" required for industrialization. There is a problem, therefore, of balance between specificity and flexibility. Both over-training and under-training have undesirable aspects. The more skills acquired and the more generalized the training, the more flexible will each trained person be in the event of changes in the occupational structure of the work force. Conversely, the fewer skills acquired and the more specialized the training, the less flexible will each trained person be. In order to determine the appropriate method in training which will provide a worker with the necessary specialization within the time pattern no clear-out solutions can be given. The initial training can be devised in such a way as to equip the worker to work in the full range of occupations. Alternatively, the training may be phased: initial training of a limited type to be followed by further training. There are, however, certain factors which need to be considered. First, there is a risk in undertaking a full initial training, since the entire range of skills may not be required for some time. Secondly, a trainee might wish to seek employment as soon as he has a certain skill basis rather than wait until the entire training is finished. The social, as well as the personal, cost of waiting is particularly high in the developing countries, where living standards are so low. Training projects with low initial capital

outlays and short waiting periods such as a training plus retaining system, appear to be suitable to the conditions in the developing countries. On the other hand, subsequent retraining may result in loss of income to the worker, at a time when he needs it most, in view of his dependants, etc. In such cases, subsidies are sometimes given. This experience is prevalent in some eastern European countries, France and Sweden. In Sweden, for instance, workers undergoing retraining for the adaptation of their skills to structural changes in production are paid transportation costs, housing expenses and an amount equal to the beginning wage of the occupation for which they are being trained.⁹⁰

297. In some developed countries, emphasis seems to have been on full initial training rather than on limited initial training plus further training. Their social framework is such that most people are unable to afford the loss of income attached to training in later years, and cannot obtain finance over the period to cover this loss of income.⁹¹ In eastern European countries, however, more stress seems to have been laid on training plus further training systems. Special holidays with pay are granted for workers to attend advanced courses. Many workers attend general and technical education classes part time. In one factory at least in the Ukrainian Soviet Socialist Republic every second worker was receiving some kind of additional training.⁹² In the Byelorussian Soviet Socialist Republic, 10 to 15 per cent of all workers are retrained each year.⁹³ In the USSR, in 1960, 6.8 million workers and employees, including 6.4 million wage workers, were enrolled in programmes of training for increasing skills within individual plants. About 40 per cent of trainees were in professional technical courses, about 14 per cent in work method courses designed to raise the level of productivity of low-output workers. There were about 14 per cent receiving training in a second field of work to increase their job mobility, and the remaining were retrained owing to changes in technology on product mix.⁹⁴

III. FINANCING OF EDUCATION AND TRAINING

A. EXTERNAL AID

298. The Addis Ababa Plan envisages that about 30 per cent of the cost of the programme for Africa would have to be financed externally. The aid implica-

⁹⁰ Statement by Bernard E. Teets, "European Manpower Report to the Annual Meeting of the Interstate Conference of Employment Security Agencies", Omaha, United States of America, October 1963 mimeographed, p. 8.

⁹¹ In France, Sweden and the Netherlands, however, considerable steps have been taken towards removing this burden from persons seeking retraining, through the provision of wages for trainees and housing and other benefits.

⁹² Statement by Eugene I. Efremenko (Workers' delegate, Ukrainian SSR) at the *Preparatory Technical Conference on Employment*, International Labour Organisation, Geneva, October 1963.

⁹³ Statement by Victor F. Pashentsev (Employers' delegate, Byelorussian SSR) at the *Preparatory Technical Conference on Employment*, Geneva, October 1963.

⁹⁴ Murray S. Weitsman, Murray Feshbach, Lydia Kulchycka, "Employment in the USSR", *Dimensions of Soviet Economic Power*, 1962, p. 637.

tions for the other regional plans are not precisely set out, but they may be assumed to be less, say, 20 per cent, because of the special factors operating in Africa which make education more costly. The external finance needed for the higher-level education of the required technical manpower derived in chapter 1 might therefore amount to about \$500 million over the fifteen years 1960-1975.⁹⁵

299. It is exceedingly difficult to estimate the present level of international aid for the development of technical education and training in the developing countries. However, the level of aid or technical assistance directly for this purpose administered by the United Nations⁹⁶ organizations may have been roughly about \$40 million in 1961.

300. This amount was made up of the following:

TABLE 4.4. UNITED NATIONS ASSISTANCE TO EDUCATION AND TRAINING IN THE DEVELOPING COUNTRIES

^a Calculated on the basis of the average expenditure (\$2,038 per annum) per fellowship.

^b Calculated on the basis of the same proportion of aid (15 per cent) being devoted to technical education and training, vocational training, science teaching and assistance to advanced education as in the EPTA programme.

301. It should be noted that the expenditure on technical assistance projects in teacher training (approximately \$1 million) has been excluded. Data given in table 4.4 cover fields wider in scope than technical education and training proper. This factor is, to some extent, counter-balanced by the technical training directly or indirectly entailed in the advisory services, and the training of local "counterparts", accompanying technical assistance projects outside the field of training proper. It was not possible to make an estimate for the bilateral aid and technical assistance in this field.

302. It should be noted here that expenditures financed under technical assistance programmes cannot be

⁹⁵ See paragraphs 280-281 of this chapter.

⁹⁶ Latest data for which the breakdown of aid was available.

compared with the estimates of foreign assistance. The training programmes mentioned in paragraph 300 above contain salaries plus allowances and travel of expatriate staff, while the latter relate to needs in terms of local educational costs. Thus, the estimates of foreign contributions to training programmes need to be revised upwards to include costs of sending expatriates to the developing countries.

B. INTERNAL FINANCE

303. The internal finance required for the higher-level education and training was roughly estimated in the earlier paragraphs to be \$2,000 million over the period 1960-1975.

304. There are difficulties in identifying accurately each source in relation to the type of training. For example, Governments and enterprises very often subsidize private educational institutions. Government subsidies and tax concessions are given by the Governments to enterprises fulfilling certain training requirements. Sometimes apprentice taxes are levied to finance training centres. Some fragmentary evidence of a qualitative nature with regard to fees charged, and assistance from Government and industry is given in table 4.5. The table should be interpreted with due regard to the supplementary evidence appended as notes to the table.

305. The Governments of the developing countries have allocated great importance to the development of the educational system. There are three ways in which Governments finance programmes of technical education and vocational training: taxation, loans and by making use of personnel in other government activities without detracting too heavily from the performance of their primary functions.

306. All taxes for technical education and vocational training will be redistributive in the sense that those concerned directly in the process of technical education and vocational training (teachers and pupils, builders, printers and so on) will be better off, whilst those who pay taxes will be worse off. If sufficient resources are raised through taxation, it would mean a transfer of income from the traditional sector, which is very large in all developing countries, to the modern sector, which includes technical education and training activities. Such a transfer sometimes tends to create difficulties of a political nature.

307. Practices of levying tax on education and training matters vary in different countries. In Yugoslavia, enterprises which do not train apprentices pay a special tax corresponding to the costs which would have been incurred had they undertaken the training customarily required. These funds are used to finance special training centres. In the United Kingdom, steps are being taken to introduce a similar scheme, supplemented by subsidies to enterprises undertaking approved training. In Colombia and Brazil, the National Apprenticeship Services (SENA and SENAI respectively) are financed by an allocation from funds collected by means of a pay-roll tax under the family allowances scheme. In Colombia, 2 per cent of the pay-roll of enterprises employing

more than ten persons is devoted to SENA for training purposes in special centres. While such a scheme is not specifically tied to an enterprise's performance in providing training, it has, on the other hand, advantages of simplicity. It facilitates distribution of financial responsibility for training in an equitable manner upon those

who will benefit from it, ensuring that enterprises which do not provide training facilities themselves must still pay for the training of the skilled personnel which they obtain.

308. Loans are generally raised in financing expenditure on buildings and equipment for technical education

and vocational training institutions. They may be used in lieu of taxes (and fees) to finance these expenditures. While they raise fewer political difficulties than taxes, there are usually economic difficulties in mobilizing the savings required. On the other hand, in view of the small sum, the effects on interest rates and the inflationary potential may not be of considerable significance.

309. In-plant training has certain merits. It ensures that the skills taught are those appropriate to existing, and not out-dated, technology, and is by definition responsive to changes in demand for various categories of skills. Moreover, such systems allow earning to accompany training. This system of training thus lends itself to serious consideration. The available experience shows that the results are very favourable. It presents, on the other hand, difficulties largely of implementation. It is difficult to promote this kind of training on a purely voluntary basis since the returns may not fully accrue to the enterprise which has incurred the costs of training, as those who have been trained may go to other enterprises. Nowadays, it is generally the enterprises paying the highest wages or offering the best conditions which do most of the in-plant training and these usually tend to be the largest enterprises. Their turnover of trained personnel also tends to be low. In order to expand in-plant training, the enterprises generally should be encouraged to expand their training, and means must be found therefore, to insure them against losses of investments made in training their personnel.

310. A limited form of a bond system might be applied on the basis of a bond commitment by trainees to an industry or group of firms which would collectively finance the training. This system would permit freedom of choice of occupation and place of work within the industry for the trainee and should also protect his right to work outside the industry in circumstances of individual need. On the other hand, subsidies might be given to enterprises which undertake training, such as is done in the Netherlands, Switzerland, Pakistan and Canada, for example. Finally, the system of apprenticeship taxes already mentioned provides an insurance against losses of investments made in training personnel, since all enterprises collectively finance the training required.

IV. FEES AND PART-TIME TRAINING

311. The central argument against financing education or training through fees is that it is inequitable as between pupils from poorer and richer families. However, it is a fact that in many instances, it is only the relatively well-to-do families which can afford the income loss involved in a full-time formal education for their children, once these come of earning age. This age occurs around the time when children usually start secondary-level training. Thus, to encourage poorer families to give their children full-time education, substantial scholarships and allowances would be necessary at a level commensurate with the earning capacity of these children in employment. It would not be sufficient merely to eliminate fees altogether, and the financial responsibility

of the Government would have to be markedly increased if formal education at secondary and higher levels were to be truly on a basis of equal opportunity.

312. It is evident, therefore, that to expand training at the rate required for rapid industrial development implies that, at secondary and higher levels of training, adequate part-time systems of education must be set up to allow the abilities of the children of poorer families to be fully realized. Such part-time systems are not normally part of the formal school system, except at higher levels, in some fields, in which courses are so arranged as to enable students to complete their qualifications on a piecemeal basis. However, there exist numbers of private part-time and correspondence training institutions organized as profit-making concerns, which are not subsidized by the State, and thus charge high fees, which are their sole source of revenue. Such concerns frequently offer the most economic training alternative to full-time education to children from poorer families despite the high level of fees, since they enable training to be combined with gainful employment. An expansion of similar State-organized institutions, which might charge fees at a level commensurate with, or even lower than, the level of fees in the formal school system, might well prove both more equitable and more effective than an expansion of full-time formal schooling financed largely by State funds.

313. In the Soviet Union, for instance, great emphasis has been placed on developing part-time and vocational training as an alternative to full-time general and technical education. Two-thirds of those undertaking training in secondary technicums, for example, do so by part-time means.

V. CONCLUSIONS AND RECOMMENDATIONS

314. A. The developing countries should keep under review the financial implications of their programmes of technical education and vocational training. To this end, standard costing systems should be instituted for each educational and training programme, so that data may be collected, and analyses made of:

(a) The costs of systems of providing the higher and intermediate technical personnel required for industrialization;

(b) The ways in which enterprises, and government and private schools, may finance increased technical education and vocational training, with a view to:

(i) Reducing the costs of technical education and vocational training wherever possible;

(ii) Finding methods of finance appropriate to conditions in the developing countries.

B. The international agencies concerned should assist the developing countries in carrying out detailed inquiries into these financial questions, through their research and information programmes and under their programmes of technical co-operation.

C. The investment made in training by enterprises must be emphasized as an important factor in the industrialization of developing countries. Educational and

training plans in the developing countries should take due account of this importance.

D. The development of systems of part-time education and training which reach a wide population of people who can not afford the income lost during full-time education and training, is an essential ingredient of an equitable and effective technical educational and vocational training system.

Chapter 5. Training of technical personnel from the developing countries in the industrially advanced countries

I. INTRODUCTION

315. General Assembly resolution 1824 (XVII) in its operative paragraph 2(c), requested "Information concerning the progress being made in the training of technical personnel for the developing countries in the industrially advanced countries, and the methods employed". In this chapter, available information on the subject is reviewed, and in particular information on the experience acquired by the developed countries in transferring the technical know-how to the developing countries through training programmes. Reference will be made to the extent of the use of training facilities available in the developed countries rather than to providing the data on facilities themselves.⁹⁷

316. A preliminary inquiry into the available sources of information on the above indicated that there are serious gaps in the data. While there is considerable material on the subject of training generally, it was difficult to ascertain the industrial component of the training programmes. The reports dealing with bilateral aid programmes generally dealt with assistance in the field of training as a whole which, in itself, was a part of the over-all discussion of the programmes of assistance. Training provided under the bilateral and international organizations is only a part of the picture. The bulk of training in industry is provided by the equipment producers, parent companies with industrial establishments in the developing countries, trade organizations and so on. In addition, various private foundations sponsor and finance training of technical personnel in the developed countries. Data on such training are not available. It is also difficult to collect data from thousands of private industrial establishments within the time and resources available in preparing the present report.

317. Under the circumstances, it was decided to circulate a questionnaire to donor Governments seeking data on certain important aspects of training.⁹⁸ In order

⁹⁷ Considerable data on the training facilities both in the established educational institutions and in the *ad hoc* training institutions exist in publications such as ILO, *Trainees Abroad*; OECD, *Third Country Training Newsletter*; International Association of Universities, *International Handbook of Universities, Paris: 1959*; American Council on Education, *American Universities and Colleges*, Eighth Edition, Washington, D.C., 1960.

⁹⁸ Many developing countries offer training facilities to other countries under certain regional arrangements. These were excluded from the inquiry.

to extend the coverage as far as possible, the Governments were also requested to provide data on training provided by private companies. The questionnaire, which was sent to twenty Governments, was prepared by the Centre for Industrial Development and approved by the Inter-Secretariat Working Parties in May 1963.⁹⁹ A copy of the questionnaire and the list of the countries to which it was sent are contained in E/3901/Rev.1/Add.2, chapter 5, annexes A and B.

318. In order to make the questionnaire more specific, the following definitions were provided: The term "technical personnel of the intermediate and higher levels" has been defined to cover skilled workers, foremen and engineers including top management. For this purpose, the term "industrialization" has been defined broadly to include manufacturing, transport, energy and other supporting services.

(a) Skilled workers: Persons who have received a broad education and training in the exercise of a trade or craft in a particular field. These persons have normally undergone a certain number of hours as apprentices in a factory and can set machines and take work from daily-paid or unskilled workers. (Example — tool and die maker, repair and maintenance mechanics.)

(b) Foremen or technician: The term applies to persons in occupations requiring a knowledge of technology and related sciences between that of a skilled worker and that of an engineer; duties at this level would require inspection and maintenance, detailed development plans, supervision of production work, etc.

(c) Engineers or technologists: The term applies to persons working in occupations for which the need of education in the appropriate sciences in universities or equivalent institutions of higher education is officially or traditionally recognized; this level of occupation would cover such activities as research, development, organization, production.

(d) Management: Personnel for making decisions and supervising their implementation.

319. Of the twenty countries to which the questionnaire was sent, sixteen replied. Valuable information was provided by the Governments in their replies. The information, however, lacked uniformity and, in many cases, it was limited. Although it would be difficult to draw any substantial conclusions, the data provide a concrete base to illustrate the problems involved in training.

320. It must be stated here that the discussion of the problems in the present chapter is based primarily on the data contained in the replies. While an effort is made to supplement this information from other sources, one cannot but feel the inadequacy of information in general, which is bound to reflect on the treatment of the problems in this chapter.

II. NUMBER OF TRAINEES IN THE DEVELOPED COUNTRIES

321. Each year a large number of technical personnel from the developing countries travel to the developed

countries to undergo training in various aspects of industrial development in the universities, government-sponsored institutions and in industrial establishments. The number of trainees undergoing such training has grown considerably since 1950. The intensification of efforts by the developing nations to promote and accelerate the process of industrialization has provided considerable stimulus to the increased flow of trainees to the developed countries. There is also a growing desire, which is a part of the over-all process of learning and doing, to seek better understanding of the process of development in general and to acquire technical knowledge in particular.

322. The number of trainees in a developed country is determined by the size of its aid programme, historical ties with developing countries and the extent of training facilities available for education and training. Table 5.1 gives an estimated student and trainee population in various countries receiving training in all fields. The data are not firm, largely owing to the fact that estimates lack uniformity. On the other hand, they provide rough orders of magnitude. Generally, students are supposed to be preparing for a diploma in the established educational institutions and the trainees are undergoing *ad hoc* training programmes both inside and outside of the educational system.

323. The replies to the questionnaire contained specific data on trainees in the field of industrial development. The detailed tables are contained in E/3901/Rev.1/Add.1, chapter 5, annex C. From the available information, it is apparent that most of the training in the field of industrial development is provided at the professional level; namely engineers, technicians, and scientific

personnel. The emphasis on providing training facilities at the intermediate and higher levels is based on both financial considerations and the nature of facilities available for training. In Canada, a similar approach was evident but exceptions were made in the case of supervisors and instructors in machine-shop practice, mill and foundry practice, power house operation and maintenance, etc. In the case of the United States, the training programmes undertaken under the auspices of the Agency for International Development related to foremen or technicians, engineers or technologists, and management categories. Similarly, in the USSR, nearly all the nationals of the developing countries were studying in higher technical establishments, which train intermediate and higher level specialists in various fields. Of 2,307 trainees in 1963, only 310 were in the secondary technical schools.

324. It will be interesting to refer to United Nations experience in providing training in industrial development under its various programmes of technical experience.¹⁰⁰ Of 6,031 fellowships awarded by the United Nations in 1963 under its Expanded and Regular Programmes of Technical Assistance (See table 5.2) 645 fellowships were awarded in the field of industrial development. Almost all the fellows received their training in the developed countries. The number of fellowships awarded for industry is rather small which, to some extent, is due to the narrow definition employed in the tabulation. Nevertheless, it is surprising that, despite high priority accorded to industrialization programmes in

¹⁰⁰ A detailed study on the subject is to be found in the article, "United Nations Fellowships for Industrial Development": *Industrialization and Productivity, Bulletin No. 6, pp. 47 to 56.*

^a United Nations, Specialized Agencies and the International Atomic Energy Agency.

^b Including chemical industries, engineering (machinery and tools) industrial management, primary metal industries, printing, pulp and paper, small-scale industries, textile industries, and others.

^c Vocational training and, since 1960, manpower organization, which has been combined with this heading, have not been excluded from the ILO data in this table, since the article is not concerned with fellowships of this type. In the ILO programme, these amounted to:

1957, 286; 1958, 185; 1959, 276; 1960, 330; 1961, 226; 1962, 397. The ILO figures include social security, co-operation handicrafts and small-scale industries, labour conditions and administration, workers' education, productivity and management development. It is assumed that most of the fellowships in these fields relate to industrial development.

^d Fisheries and forestry. The FAO also grants fellowships for land and water development, plant and animal production and protection, rural institutions, nutrition, etc.

^e Natural sciences—UNESCO also grants fellowships in education, social sciences, cultural activities and mass-communication.

^f In addition, during 1959-1963, 310 persons, working on 56 projects supported by the United Nations Special Fund, were sent abroad for advanced training.

the developing countries, the number trained in industrial development and technology is very small. The Economic and Social Council noted this trend with concern in its resolution 898 (XXXIV) of 2 August 1962 and invited the Technical Assistance Board, the Special Fund and the organizations participating in the United Nations Technical Co-operation Programmes "... to give favourable consideration to requests aimed at the education and training..." for industrial development of developing countries.

325. Data on the training in industrial development as a percentage of total training under the bilateral programmes are not readily available. However, some data for the United States of America and the Colombo

Plan countries indicate the similar experience as encountered by the United Nations. The following tables 5.3 and 5.4 show the number trained in industrial development. The number of trainees in industry is considerably low as compared to training in other fields.

III. ORGANIZATION MACHINERY IN THE DONOR COUNTRIES

326. In order to handle a large number of trainees, the host Governments have set up, in some cases, special machinery to deal with evaluation of requests for training and administration of training programmes. Very often, such organizational machinery forms a part of

aid operations. In the case of countries where the volume of aid is comparatively small, the services of the diplomatic offices in the developing countries are utilized for receiving and transmitting applications to the appropriate ministries in the host Governments. In the case of the United States, the International Training Division in the Agency for International Development handles the requests submitted by the AID offices located in the developing countries. The AID training officers arrange and supervise programmes of training with the assistance of various federal agencies and scientific and technological institutes in the country. The Department of Technical Co-operation in the United Kingdom is responsible for programmes of training in the United Kingdom which are financed under British technical assistance. Applications for facilities for training are made through British diplomatic missions in developing countries within the limits of aid available. The arrangements for placing of the trainees in the United Kingdom are handled by the British Council and the Ministry of Labour, in consultation with manufacturers' associations, scientific organizations and so on. In the Soviet Union, the training programmes, as in the case of their bilateral aid programmes, are handled by the State Committee for Cultural Relations with Foreign Countries, in close co-operation with the Academy of Sciences of the USSR, the Ministry of Higher and Specialized Education, and other bodies.

327. In France, the Association for the Organization of Training Courses (ASTEF) was established in 1958 to deal with the training of personnel from the developing countries. This organization is sponsored by the Government and several industrial enterprises, both public and private. In Czechoslovakia, the state organization Polytechna is in charge of technical co-operation with developing countries. Its function consists of planning, provisional finance, organization of individual schooling and provision of social facilities for trainees, evaluation of the results of training, and co-ordination of the work of individual institutions participating in training. Preparation of schooling of trainees is made by the department for foreign relations of every ministry and specialized agency. In Japan, the quasi-governmen-

tal Overseas Technical Co-operation Agency performs the planning, programming and executing of training of foreign personnel, under the supervision of the Ministry of Foreign Affairs. In the Netherlands, the Office for International Technical Assistance is set up to handle, among other activities, the training of personnel from developing countries.

328. While the above-mentioned donor countries administer individually their bilateral aid in training of technical personnel from the developing countries, Norway and Denmark launched a special system by channeling their aid through the United Nations, which is expected to result in a wider choice of placement, better selection of training institutes and larger economy on over-all expenses.¹⁰¹

IV. METHODS OF TRAINING

329. The formulation of a training programme is undertaken by the developing country in the light of its needs and of facilities for training in the donor countries. In the selection of trainees, considerations applicable to programming of technical assistance at the country level applied to questions of training as well. The candidates were chosen by the host Governments in the light of their ability to benefit from training. Considerable work was involved in the processing of applications and in arranging a training programme. In this, much experience has been obtained and fairly well-established procedures have been set up with a resulting economy of time and resources, although much needs to be done in terms of reducing the waiting period between the date of application and the commencement of the training programme in the host country.

330. While efforts are made on the part of the aid-giving Governments to provide opportunities to obtain training in a number of institutions, the general preference of the trainees from the developing countries, on

¹⁰¹ Organizational procedures adopted by the United Nations and the specialized agencies are treated in detail in *Annual Report of the Technical Assistance Board for 1962*, (E/3759/Rev.1), Review of Fellowships, pp. 89-99.

the whole, is in favour of acquiring a university degree as a part of their training programme. It is realized that obtaining a degree involves a longer period of stay and higher outlay for the training programme. In view of the considerable importance attached to foreign degrees and diplomas, a trainee prefers, as far as possible, to plan his programme leading to a degree or a diploma. The training programmes arranged by the aid-giving countries on the other hand, emphasized training in skills which could be obtained quickly.

331. The senior personnel in government and industry dealing with policy and management problems, as the data indicated, prefer general observation tours. The time period for such type of training is generally short and, in some cases, tends to be too short. This is largely because senior technical personnel, who are very scarce in the developing countries, can not afford to be away from their jobs for a longer period of time. However, it is not possible to generalize on the basis of time allotted to training alone, in view of the fact that each training programme is tailor-made and needs to be evaluated separately.

Placement in the factories

332. While every effort is being made by the aid-giving countries to provide facilities for training, placement for the trainees in the industrial establishments for a longer time has been found to be a very difficult problem. There has been a desire on the part of the trainees to obtain practical experience by being able to work in the factories as a part of their training. Although formal training with occasional visits to the factory is helpful, it is considered as no substitute for actual work in the plant itself. Problems of placement within industry have been experienced in the case of United Nations fellows in the field of industrial development. As the data in the following table 5.5 indicate, it was possible to obtain placement in industry for the United Nations fellows for only 3 per cent of the total fellowships offered.

333. There are, however, inherent problems in this task, since the industrial establishments will find it difficult to interrupt work schedules by accepting additional persons, which tends to hamper, to some extent, the routine of operations. Moreover, some of the industrial establishments are jealous of guarding certain advances in technology, on which they have spent large sums of money. In some countries, labour unions object to training of this type in the case of foreign participants. Since plant experience is valuable, alternative means of

obtaining such experience will have to be found. Consideration, therefore, may be needed in formulating appropriate training programmes and providing facilities for them.¹⁰²

Group training

334. Recently, group training has received some attention and it is being encouraged both by the participants and the host Governments. From the point of view of the host Governments, group training provides advantages of economy, homogeneity of groups and language requirements. Some countries such as the United States encourage, where possible, group training programmes, particularly if the duration of the training period is eight weeks. Two types of group training have been encouraged, namely personnel at all levels in a given industry, and personnel of similar levels of functions in a number of industries. In the experience of the United States, group training for longer periods may not be fruitful; the reason being that longer training will obviously require training in depth and this can be given only on an individual basis. From the data available, it was not possible to indicate the superiority of one type of training over the other. Much depends on the special situation involved in the question.

335. According to the United Nations experience, there are cases in which a fairly large number of fellows from one country or from a group of countries with similar conditions can be given group training abroad. The International Labour Office reports success with group methods in such fields as vocational training and labour administration, but it is not always suitable for senior officers or advanced specialized personnel who must continue to be dealt with individually.¹⁰³ Other organizations in the United Nations system had favourable experience with training by holding seminars for groups of senior officials. The United Nations Secretariat at New York has organized a training programme for development financing for the purpose of providing officials from developing countries with additional knowledge and information on the way development projects can be financed and the existing sources where such financing can be obtained. This training programme is a continuation of an earlier United Nations programme devoted to the training of African economists, which was first initiated in 1957.¹⁰⁴ The International Bank for Reconstruction and Development has established since 1955 the Economic Development Institute which provides training in problems of economic development, including industrial development for senior officials of developing countries. This Institute, which is located at Washington, has so far trained 225 officials from over sixty countries.¹⁰⁵

¹⁰⁵ International Bank for Reconstruction and Development, *The Economic Development Institute, 1963-64*, Washington, D.C., September 1963.

336. The International Labour Office has established an International Centre for Advanced Technical and Vocational Training at Turin with the assistance of the Italian Government. The Government of Italy has provided buildings and some financial assistance, which is supplemented from financial contributions from other Governments, private foundations, etc. Training facilities will be available for 600 trainees in the first two years, leading to 2,000 trainees in 1970. Training will be given to highly skilled workers, technicians, foremen, instructors and senior management personnel from the developing countries. The training programme at the Turin Centre is designed to provide advanced technical training, for which facilities do not exist in the developing countries. The Centre is to commence its activities in 1965.

337. The Centre for Industrial Development has initiated recently, in co-operation with the Bureau of Technical Assistance Operations, the convening of seminars in the industrially advanced countries in which technicians and engineers from both advanced and developing countries participate. These seminars and workshops deal with recent advances in technology, including economic aspects of specific industries which are of importance to developing countries. In Prague and Geneva, an inter-regional symposium on recent advances in iron and steel-making was convened in October 1963, in which representatives of fifty countries participated. Of these, twenty-nine were representatives of the developing countries.¹⁰⁶ A seminar on the cement industry was convened in Denmark in May 1964. Another seminar on industrial complexes is planned in September 1964 in the Soviet Union.

Other training

338. In addition to the training given to the personnel of the developing countries in the developed countries, experts, technicians and teachers are sent out to train local personnel in the various countries themselves. They are engaged in teaching at the vocational and higher technical educational institutes, and in instructing workers on the job within the local industries. Equipment is provided for training and educational institutes in the developing countries. Some countries provided, in addition to the current aid programmes, special aid assistance (e.g. Peace Corps, United States; Overseas Training and Aid Development Service, Federal Republic of Germany).

339. In the experience of the organizations participating in the United Nations technical assistance programmes, fellowships are usually most effective when given in conjunction with expert advice. The counterpart of the expert, after an initial period of work, goes abroad as a fellow to obtain the required training and subsequently replaces the expert. In this, way training is made more specific and directed to fill the gap. While such training will enhance the efficiency of a given technical assistance programme (bilateral and multilateral) in

the developing country, it is only a step, perhaps an essential one, in the over-all training programme of a country. Also, this method may be relevant in the case of a country with a certain basis of technical skills. In the case of newly independent countries, where training requirements tend to be more basic, other methods will have to be considered.

Follow-up of training

340. The problem of follow-up has been considered as one of the important, though difficult, aspects in the completion of the training programme cycle. It is generally understood that the trainee, upon return to his country, will work in the area in which he has received training. However, there is not much data about the manner in which training abroad has been utilized in the home country. Recently, certain procedures have been developed, largely with a view to keeping contacts between the trainees and the training establishments in the host countries. These are achieved through publications by the alumnae associations, organizing technical conferences among participants after returning from training and so on. This has been possible in the cases of trainees going to the United States, United Kingdom, etc., but in the case of countries where the volume of resources devoted to training is comparatively small, no formal follow-up efforts are made on the progress of the trainees after their return.

341. The United Nations recently undertook a survey to determine whether trainees under its programme have been working in their home countries in the fields in which they were trained. Questionnaires were sent to 1,850 trainees, of which 1,271 from eighty-two countries replied. The results showed that after a period of two years subsequent to their training, 91 per cent of the fellows were still engaged in their home countries on work related to their fields of study. Of the remaining 9 per cent, it is also certain that some were contributing to the advancement of their countries on the basis of knowledge gained during their fellowships.¹⁰⁷

342. The Agency for International Development of the United States Government has recently undertaken a study of evaluation of training programmes and the progress made by the trainees in their countries. The objective of the survey is:

- (a) To ascertain if trainees have returned to designated jobs, are utilizing their training effectively and transmitting their knowledge and skills to others;
- (b) To identify significant factors contributing to or hindering training utilization and communication of knowledge and skill;
- (c) To determine if the training is at the appropriate level of good quality and relevant to the trainee's need in the context of the home country situation;
- (d) To ascertain if AID administrative practices and procedures are adequate to identify training weaknesses;

¹⁰⁶ Report of the Fourth Session of the Committee for Industrial Development (E/3869), p. 12.

¹⁰⁷ Annual Report of the Technical Assistance Board for 1962, E/3739/Rev.1, para. 615.

(e) To provide more reliable information concerning the most effective types of study and training for particular cultures, to evaluate age and work experience relevant to successful training accomplishments and subsequent utilization.

Detailed results of the entire survey are not yet known, but available data indicate that a large majority of the trainees are utilizing their training effectively and contributing directly to the economic development of their countries.

ANNEX A

Ratios of higher and intermediate level personnel to total employment

1. This annex presents ratios reflecting the proportion of higher and intermediate level personnel to employment in the industrial sector as a whole or in certain branches of industry. These ratios have been derived from various censuses and manpower surveys. The occupational categories included in the groups have been defined by reference to the International Standard Classification of Occupations.¹ Broadly, the group herein referred to as "higher and intermediate level personnel" includes all workers in major groups 0 (professional, technical and related workers) and 1 (managers, administrators and proprietors) of the above classification.

2. In using data drawn from different countries, problems of comparability arise because the coverage of different censuses or surveys or the definitions vary from country to country. This is particularly true in respect of the management group (major group 1) in which some studies include all managers, proprietors and administrative staff down to a level comparable to that of supervisor in industry, while others use a more restricted definition and others still do not specify the job levels included. Such problems will be dealt with when presenting the statistical material of various countries.

3. No attempt has been made to present separate ratios for "higher personnel" (in occupations for which a university degree or diploma or equivalent experience is normally required) and for "intermediate personnel" (in occupations for which a certificate at less than university level, or equivalent experience is normally required). While a distinction between the two levels can be made relatively easily for occupations in major group 0, this cannot be said of those in major group 1, which in many cases are not directly related to a particular educational level or course of study. In any event, it is probably more relevant for purposes of educational planning to know the number in each group who are, with or without formal training in various fields and at various levels as well as trends in the evolution of their respective shares.²

I. HIGHER AND INTERMEDIATE-LEVEL PERSONNEL

4. Table 1.A.1 presents ratios of higher and intermediate level personnel to total employment in fifteen countries.³ Although these give a broad indication of the relative importance of this group in the countries listed, their comparability has limitations which must be stated. While in most cases the figures relate to the manufacturing sector only, there are a few countries where the coverage extends to industry in general or to the manufacturing and extractive industries. Sectoral differences in the density of higher- and intermediate-level personnel may affect the ratios quoted to some extent, and possibly the ranking of some countries.

5. A few of the studies from which the above ratios were derived include the self-employed, others do not. Some, *inter alia* the South American countries, include all employers, others exclude employers of less than a specified minimum number of employees. Such differences can affect the ratios substantially. The French census data shows, for example, that the proportion of higher and intermediate level personnel to total manufacturing employment is 8.8 per cent when all employers are excluded, 10.2 per cent when employers of more than five employees are included, 13.4 per cent

¹ *International Standard Classification of Occupations*, International Labour Office, Geneva, 1958.

² Some information on this subject is presented in annex B.

³ Similar information is available for other countries; it was not included in the table because of lack of comparability (c.f. I. H. Abdel-Rahman "Manpower Planning in the United Arab Republic", *Etude mensuelle sur l'économie et les finances de la Syrie et des Pays Arabes*, Damascus, June 1963, pp. 34 et seq.)

when all employers are included, and the proportion rises to 20.1 per cent when the coverage extends to the self-employed. The second of these ratios was retained for inclusion in the table, since it appeared most comparable with those of the United States and the Soviet Union, two countries where the proportion of very small firms is relatively small.

6. Finally, the demarcation line between management (included in the higher and intermediate categories) and clerical and sales personnel (excluded) appears to be rather fluid and this may be a source of non-comparability. Thus, the percentage of higher and intermediate personnel in Belgium appears surprisingly low in comparison with other countries at a similar level of development. Further investigation reveals, however, a very high percentage in that country of workers defined as clerical and sales personnel, and a total proportion in the two categories which roughly approximate that of France. This suggests that the ratios in the Belgian survey may reflect different definitions rather than a different occupational structure.

7. The above observations point to the need for a closer analysis of the situation as regards the occupations considered.

II. COMPARISON OF RATIOS AND RELATIVE SHARES OF PROFESSIONAL AND TECHNICAL PERSONNEL AND OF MANAGEMENT PERSONNEL

8. Table 1.A.2 shows the ratios and the relative shares of professional and technical workers and of management personnel respectively, in fifteen countries. It reveals that the ratio of professional and technical personnel has a greater range of variation than that of management personnel. While it is higher than the latter in highly industrialized countries such as the United States and the Soviet Union it drops to between one-third and one-fifth (Brazil: 21 per cent) of the total — higher and intermediate personnel — in several developing countries. There is also a correlation between higher ratios of professional and technical personnel and the tendency for the number of such personnel to exceed those of management personnel.

9. Table 1.A.3. shows the proportion respectively of professional and technical personnel and of management in selected industries in one developing country, India, and one highly industrialized country, the United States. It is apparent that when the technical and management personnel ratios for various sectors are ranked according to size, the ranking shows similarities for both series of

coefficients (except, in the United States, for the transportation industry, where technical personnel ranks relatively high in comparison with management, and the food industry, where the reverse holds true). Co-variation of the respective coefficients indicates that high technical personnel ratios involve also higher management ratios.

10. The above statement should be qualified by the remark that while management ratios rise with technical personnel ratios, they do not increase as rapidly. As a result, the latter show a wider range of variation than the former. It would be appropriate to note that a similar finding has emerged from the country by country analysis in table 1.A.2.

III. SOME FACTORS AFFECTING RATIOS OF HIGHER AND INTERMEDIATE LEVEL PERSONNEL

11. The ratios, both for professional and technical personnel and for management personnel, are influenced by a number of factors, such as the extent of technological development, the types of production, the size of firms and the relative availability and cost of higher and intermediate level personnel and of semi-skilled and unskilled manpower respectively.

12. It is very difficult, however, to assess the impact of each factor individually. For example, it is generally agreed that the degree of technological development strongly influences the ratio of professional and technical personnel⁴ to total employment. Actually, however, high skill is not necessarily associated with advanced technology. An obvious example is art products, such as pottery or enamelware. Even in industry, some choice can be exercised as regards both methods and types of production so as to avoid making excessive calls on scarce capital while using human resources that are more plentiful. Thus, Japan, which until recently was relatively rich in both skilled and unskilled manpower but lacked capital, tended to concentrate on skill-using productions while saving on capital equipment, *inter alia*, by decentralizing production as far as possible to small-scale working units.

13. In contrast, however, certain industries require both a high degree of technology and a high density of technical personnel (e.g. machine-tool industry, aeronautical industry). Since many developing countries lack both the necessary capital and trained personnel, these industries are likely to develop at a later stage than others and this will be reflected in the over-all professional and technical personnel requirements of the countries concerned.

⁴ Management personnel will not be considered in this section. It has been shown above that its proportions appears to rise with the proportion of technical personnel, though less rapidly.

14. Since different sectors have reached different levels of technological development, it is important to study the ratios of professional and technical personnel for individual sectors. Ratios are presented in Table 1.A.4 for selected activities in the United States, France and India.

15. With some important exceptions (chemical industry in France, basic metal products in India) the ranking of the various activities in the three countries presents a striking similarity and largely confirms the importance of the technological factor. Moreover, for basic metal products and food products, the ratios of the three countries are of comparable magnitude. For the other sectors, however, the Indian ratios are substantially lower than those of France and the United States. This is probably due to two main reasons: types of production requiring technologically advanced processes are still scarcely represented; and in all sectors, as a result of the overall manpower situation in India, the input of higher and intermediate level skills is kept to a minimum, while the unskilled or semi-skilled labour input is high.

IV. GROWTH RATES OF THE RATIOS FOR HIGHER AND INTERMEDIATE LEVEL PERSONNEL

16. The factors affecting the relative magnitude of the ratios of higher and intermediate personnel to total employment also determine the rate of change of such ratios. In particular, since technical personnel appear to expand more rapidly than management personnel, the growth rate of the ratio for both groups taken jointly will be largely determined by the growth rate of the technical personnel ratio. Table 1.A.5 shows growth rates of the technical and management personnel ratio for the Soviet Union (at different periods) and for the United States, Italy, France and Belgium during a recent period.⁵

17. In the Soviet Union, the annual growth rate was very high in the early period until 1936, but subsequently it tended to taper off. For the 1950-1959 decade the rate stood at about 0.5 per cent with the absolute ratio rising only from 8.5 to 8.9 per cent. The annual growth rate rose again to 0.8 per cent for the period 1956-1961.

18. In the United States, the ratio grew fairly rapidly during the 1950-1959 period (by about 2.5 per cent annually), considering that the absolute ratio of higher and intermediate level personnel was already high at the beginning of the period. This increase was

⁵ These growth rates are given as examples and the usual reservations regarding comparability of data between countries must be made. Except in the case of the United States, the sectors and categories covered in the data available differ somewhat from those covered in table 1.A.1.

TABLE 1.A.4. RATIOS OF PROFESSIONAL AND TECHNICAL PERSONNEL IN SELECTED INDUSTRIAL SECTORS. UNITED STATES, FRANCE AND INDIA

Sectors	Countries					
	United States (1950)		France (1954)		India (1956)	
	Ratio	Ranking	Ratio	Ranking	Ratio	Ranking

TABLE I.A.5. GROWTH RATES OF RATIOS OF HIGHER AND INTERMEDIATE LEVEL PERSONNEL TO EMPLOYMENT IN BELGIUM, FRANCE, ITALY, THE UNITED STATES AND THE SOVIET UNION

Country	Period	Ratios at beginning and end of the period	Average annual growth rate of the ratios
Belgium	1952-1957	2.65-2.84	1.4
France	1956-1962	3.5-4.1	2.6
Italy	1951-1959	2.9-4.2	4.7
United States	1950-1960	9.7-12.7	2.5
Soviet Union	1913-1928	1.6-3.2	4.2
	1928-1936	3.2-6.8	9.9
	1936-1950	6.8-8.5	1.4
	1950-1959	8.5-8.9	0.5
	1956-1961	8.8-9.2	0.8

Sources and notes at the end of annex A.

chiefly due to a rise in the proportion of technical personnel which jumped from 4.9 to 7.6 per cent, while the management personnel ratio increased only from 4.8 to 5.1 per cent. This may provide an explanation for the high growth rate of the over-all ratio of higher and intermediate level personnel during the 'fifties. In 1950 the proportion of technical personnel was relatively low compared with the Soviet Union, but during the decade it rose rapidly and by 1960 the technical personnel ratios of both countries were of comparable magnitude.

19. The growth rate of the Italian ratio has also been very high. On the other hand, the rate of increase has been moderate in France and modest in Belgium, especially if one considers that the absolute size of the ratios at the beginning and end of the period is still very low. This is probably due to the fact that intermediate level personnel are excluded. Indeed, as will be indicated in Annex B, intermediate level personnel, at least in the technical field, expands more rapidly than high level personnel.

V. CONCLUSIONS

20. Even when allowance is made for differences in definition, over-all ratios of higher and intermediate level personnel vary considerably from country to country. The same appears to be true of ratios for individual sectors in different countries. This indicates that over-all and sectoral ratios are largely a response to the specific situation in each country, having regard, in particular, to the general level of the industrial and technological development and to the relative availability and cost respectively of higher and intermediate personnel and of semi-skilled and unskilled manpower. Considerable caution should thus be exercised in applying ratios from one country to employment in another in order to determine the latter country's future requirements for personnel in the categories concerned.

21. The distribution of output and the corresponding employment structure influence heavily the magnitude of ratios of higher and intermediate level personnel. This is however more so in the case of technical than of management personnel, since the ratios of management personnel show a lesser range of variation between different industries and between countries at different levels of development than technical personnel ratios.

22. Although both technical and management personnel ratios appear to rise with the level of industrial and technological development, the former ratio seems to rise more rapidly than the latter.

23. The growth rates of the ratios for higher and intermediate level personnel show considerable elasticity. This elasticity appears to be greater in the case of relatively low than of relatively high ratios.

Sources and notes to tables

TABLE I.A.1

- United States of America
United States Census of Population 1960, Final Reports. PC (1)—1D, tables 209 and PC (2)—FC, table 1.
- USSR
The ratio of engineers and technicians to total employment in industry was 9.0 in 1960 and 9.2 in 1961. The figure of 13.0 given in the table includes, in addition to engineers and technicians, salary earners of whom large numbers fall within major groups 0 and 1 of ISCO (minor groups 0-Y1, 0-Y3, 0-Y4, 0-Y9, etc.).

TABLE 1.A.2

The ratios are based on the same sources as those in table 1.A.1. However, the breakdown between technical and management personnel was not made explicitly in the available statistics of the USSR and the Congo (Leopoldville) and had to be calculated separately, along the lines indicated below:

USSR

For manufacturing, mining and public utilities, the following were retained as management personnel: directors of industrial enterprises, chief engineers and leading specialists and their deputies; heads and their deputies of administrative units, bureaux and other structural subdivisions of plant, main administrations, shops and laboratories; heads of shops and their deputies; shift supervisors, production unit supervisors, section unit supervisors and heads of divisions within shops; foremen, chief accountants and bookkeepers.

For the construction sector and for research and development establishments, job definitions were available in similar terms and the sub-division between technical and management personnel followed identical lines.

No breakdown could be found for the transportation and communications sector. For the sake of simplicity it was assumed that its personnel was stratified in the same way as that of manufacturing, mining and public utilities sectors.

The second set of ratios in the table relates only to manufacturing, mining, public utilities and construction and excludes foremen.

Nicholas De Witt. *Education and Professional Employment in the USSR*, National Science Foundation, 1961, chapter VI.

Congo (Leopoldville)

No data were available on the occupational structure of the group. The breakdown was therefore made on the basis of educational qualifications. Engineers and scientists with university degrees and graduates of higher and secondary technical schools were considered as technical personnel, all the other being grouped under management.

TABLE 1.A.3

Occupational Structure in Manufacturing, India, 1956, op. cit., p. 12.

TABLE 1.A.5

Belgium

As already indicated, the definition of higher and intermediate personnel in the study concerned was rather restricted so that probably the major part of intermediate personnel was not taken into consideration. Sectors included are manufacturing, extractive industry and construction. *Les dirigeants*, op. cit., pp. 53-55.

France

The data refer to the metal industry only. The high level occupational group involved comprises professionals and "cadres supérieurs". *Les ingénieurs et cadres supérieurs des industries des métaux. Situation en 1962, prévisions de besoins*, Union des Industries Métallurgiques et Minières, Paris, p. 15.

Italy

Higher and intermediate level personnel includes "managers" and "technicians" as defined in the SVIMEZ report. Such occupations include top managers, high level professionals and technical personnel above the level of superintendents.

Trained Manpower Requirements... of Italy, op. cit., pp. 85-86.

United States of America

The occupational group of management, professional, technical and related personnel as delimited in the United States sources corresponds closely to ISCO. *United States Census of Population 1950 [Bulletin PC 1]*, United States Department of Commerce, 1953, Table 134] and 1960 [Final Report PC(1)-1D, op. cit., Table 209].

USSR

The higher and intermediate level personnel includes "inzhenerno — tekhnicheskie rabotniki" i.e. all personnel performing functions of technical guidance and supervision of the production process. They include: directors of plants and industrial enterprises; deputy directors engaged in functions of a more technical nature; chiefs, heads and officers of divisions and shops immediately connected with production, superintendents, and their deputies, of such divisions and shops; engineers and technicians; foremen and their deputies. As can be seen this employment category differs somewhat from that employment category defined as high and intermediate level in sources and notes to table 1.A.1. Employment includes production and non-production workers. For 1913 and 1936 the figures refer to large-scale enterprises only. Different sources had to be used to compute the ratios for different periods as follows: 1913, total employment figure: *Narodnoe khoziaistvo TsUNKHU Gosplana*, Moscow, 1932.

1913, higher and intermediate personnel figure: *Sotsialisticheskoe stroitel'stvo SSSR, Statisticheskii ezhegodnik, TsUNKHU Gosplana*, Moscow, 1935.

1928, total employment: *Narodnoe khoziaistvo SSSR, Statisticheskii sbornik, TsSU SM SSSR*, Moscow, 1956.

1928, higher and intermediate level personnel: *Dostizheniia sovetskoi vlasti za sorok let v tsifrakh; Statisticheskii sbornik, TsSU SM SSSR*, Moscow, 1957.

1936 employment and higher and intermediate level personnel: *Trud v SSST, TsUNKHU Gosplana*, Moscow, 1936.

1950, total employment and higher and intermediate level personnel: *Narodnoe... Moscow, 1956*, op. cit.

1959, total employment and higher and intermediate level personnel: *Narodnoe khoziaistvo SSSR v 1958 godu*, op. cit.

1961, total employment and higher and intermediate level personnel: *Narodnoe khoziaistvo SSSR v 1961 godu*, pp. 181, 578-579.

Education and Professional Employment in the USSR, op. cit., p. 500

ANNEX B

Use of percentage ratios of engineers and scientists to total employment in forecasting requirements of engineers and scientists in industry

1. Percentage ratios of engineers and scientists to total employment are often thought of as a valuable instrument in forecasting requirements of engineers and scientists in industry. This annex presents such ratios for a few countries and, on the basis of a comparative analysis, attempts to indicate the major factors influencing their magnitude and development.

2. First, however, it is necessary to define the group studied. In the first place, it includes high-level personnel in industry who have had a minimum of four years of training at a university, technical college, or technological institute, irrespective of the occupation followed. Such a definition, however, does not fully reflect the situation in most countries where a proportion of engineering and scientific positions are occupied by persons whose educational qualifications are less than those stated above. Therefore, table 1.B.1 presents two sets of ratios, one in which the

TABLE I.B.1. PERCENTAGE RATIOS OF ENGINEERS AND SCIENTISTS TO TOTAL EMPLOYMENT
IN THE INDUSTRIAL SECTOR OF TEN COUNTRIES

(1) Country	(2) Reference year	(3) Sectors involved	(4) Professions involved	(5) Educational level	(6) Ratio (includes equiv- alents)	(7) Educational level	(8) Ratio (strictly applied)
Belgium	1957	Industry and related; firms with more than 50 employed	Engineers and scientists	Graduates of universities and higher technical schools	1.3	University graduates	0.8
Chile	1960	Manufacturing	Engineers and scientists	University and college graduates and equiva- lents	0.3		
Congo (Leopoldville) ..	1959	Industry and related large-scale enterprises only	Engineers and scientists	Graduates of universities and higher technical schools	0.7	University graduates only	0.3
France	1954	Manufacturing	Engineers		1.2		
India	1956	Manufacturing	Engineers and scientists		0.9		
Japan	1959	Manufacturing	Engineers and scientists	University and technical college graduates	2.0	University graduates	0.9

U.S.A.	1960	Manufacturing	Engineers and scientists	One year university or college and above	2.4	Four years university or college and above	1.8
U.S.S.R.	1961		Engineers and scientists			Universities and techno- logical institutes	2.2

Sources and notes at the end of annex B.

definition is strictly applied, (column 8), and the other covering also "equivalents" or engineers and scientists whose formal training is somewhat below the norms set out (column 6).

I. FACTORS AFFECTING THE RATIOS OF ENGINEERS AND SCIENTISTS TO TOTAL EMPLOYMENT

3. The figures in columns 6 and 8 show how much the ratio depends on the definitions used. Table I.B.1 also shows substantial national differences in the structure of ratios according to the educational level of the engineer and scientist group. Rather than go into a comparison of national ratios, however, an attempt will be made to look into the major factors determining their magnitude.

(a) Industrial composition

4. One important determining factor is the industrial output mix or the range of industrial sectors covered. Table I.B.2 shows ratios for four industries in seven countries. In selecting these industries the industrial activities comprised in them were taken into regard so as to ensure that they were roughly comparable. The ratios vary widely for every country according to the particular industry. Variation is highest in the United States, where they range from 0.3 in the textile industry to 9.0 in the chemical industry. There are also substantial variations in that country at the sub-sector level; for example, the ratio for "metal processing, machinery, electrical and transportation equipment", ranges from 7.6 for "electrical equipment", to 2.6 for "primary metal products". The corresponding ratios in France are respectively 3.8 and 1.6.

6

5. As a result of these sectoral variations, national ratios for the industrial sector as a whole depend heavily on the relative importance of the different industry branches; similarly sectoral ratios are affected by national differences in the industrial composition of each sector. In this respect, it should be observed that there is no "natural output mix" towards which an economy tends to move as it gets more developed, since output mix always depends on comparative costs in individual countries. In order to avoid errors in technical manpower forecasting due to differences in industrial structure, great caution should be exercised in using ratios of scientists and engineers from one country in order to determine requirements in another, even when such ratios are available for individual industrial sectors.

(b) Scale of enterprise

6. Another factor which may be of some influence is scale, but unfortunately statistical data that might throw light on this aspect are very scarce. In this respect, it should be noted that enterprises in higher-size classes often make other products than smaller ones, and these types of production frequently require more technical skills from their manpower. This means that along with the scale factor other factors are at play from which the scale effect alone cannot be separated.

(c) Interchangeability

7. The ratio of engineers and scientists also appears to be affected considerably by the structure of the supply of technical and scientific personnel. Different categories of technical and scientific

TABLE 1.B.2. RATIO OF ENGINEERS AND SCIENTISTS TO EMPLOYMENT IN SELECTED INDUSTRIES AND COUNTRIES

Countries	Reference year	Sectors				Remarks
		Metal processing, machinery, electrical and transportation equipment	Chemicals	Textile mill products and apparel	Food and kindred products	
United States of America	1959	5.4	9.0	0.3	0.7	Including "equivalents"
U.S.S.R.	1959	3.1	3.9	0.6	1.3	"Intra-plant" activities. Textile includes garments and leather
Japan	1959	4.6 3.4		0.6		Including college graduates. The ratio 4.6 refers to the sector "equipment", while the ratio 3.4 covers the sector "machinery"
United Kingdom	1959	1.3	3.9	0.4	0.4	Including graduates of universities and of a limited number of engineering and science colleges and institutes. Only firms with more than 100 employed are included
France	1954	1.9	2.3	0.6	0.6	Including "equivalents"
India	1956	1.7	2.5	0.6	0.6	Including "equivalents"
Belgium	1957	1.4	2.7	0.2	0.8	Civil engineers only
Chile	1960	0.4	1.2	0.2	0.4	Including "equivalents"
Argentina	1961-62	1.0	1.1	0.3	0.2	Engineers only; only firms with more than 100 employed are included

Sources and notes at the end of annex B.

personnel are to a certain extent both complementary and interchangeable. Engineers and scientists have to be supported by complementary skills, particularly by technicians. When these complementary skills are not available in sufficient quantity, the marginal productivity of engineers and scientists is lower and, in order to achieve a given output goal, may have to be employed in larger number than if technicians had been available. It follows that the ratios of technicians and of engineers and scientists should be determined with regard to the interdependence of the marginal productivities of both categories. A higher ratio of engineers and scientists may reflect a less productive distribution of the labour force than a lower ratio supported by a higher ratio of technicians.

8. On the other hand, in a large number of jobs, professionals in other fields, or semi-professionals, can be substituted for engineers and scientists. Clearly the broader and better the educational and training background of other qualified manpower, the higher the interchangeability will be. For example, the better the quality of technicians, the more easily they can be substituted for engineers and scientists. This seems to be the case for the Swedish *Läroverks* and *Institutsingenjörer* in relation to civil engineers, and of Japanese college engineers in relation to university engineers.

9. Substitution rates of professionals in other fields and of technicians for engineers and scientists are also heavily influenced by the relative scarcity and prices of different types of personnel of the higher and intermediate levels. Thus, in Belgium, where engineers and scientists are fairly expensive in relation to technicians, it appears that some firms call on technicians to the largest possible extent.⁶

⁶ Centre d'Etude des problèmes sociaux et professionnels de la technique. Université libre de Bruxelles, Institut de sociologie, *Etude de la qualification de l'emploi dans le secteur des fabrications métalliques*. Brussels, 1960, p. 67.

(d) Development of research and planning activities

10. In some areas, fully qualified engineers and scientists cannot be replaced easily. This is particularly true of research and planning. The fact that research is highly developed in a country will therefore be reflected in a higher ratio of engineers and scientists. In this respect it should be noted that some countries, such as the United States and the USSR, obviously do perform, and will continue to perform, more research than others. In the United States, as of 1952, engineering and science research in manufacturing absorbed 0.3 of employment.⁷ This means that, in relation to the work force, the United States had in 1952 as high a proportion of engineering and scientific workers engaged in research as Chile had in total.⁸

11. For the Soviet Union no figures are available on the number of engineers engaged in research. However, the number of professionals with higher education engaged in research, design and planning institutes and services directly supporting industry was 291,000, i.e. 30.5 per cent of the total.⁹

12. Another point should be noted in this connexion: in some countries such as Belgium, private industry delegates research work to research units in the service sector (universities and semi-public organisms) while in other countries, such as the United States, the Government delegates it to private industry. This again may tend to inflate or lower engineering and scientific ratios in industry.

⁷ D. M. Blank and G. J. Stigler, *The Demand and Supply of Scientific Personnel*. National Bureau of Economic Research, New York, 1957, p. 40.

⁸ More than half of these research workers were in the aircraft electrical machinery and chemical industries. (*Scientific Research and Development in American Industry, a Study of Manpower and Costs*, United States Department of Labor, Bulletin No. 1148, Washington, 1953, p. 3). This fact may partly explain the high United States ratios for "metal processing, machinery, electrical and transportation equipment" and for "chemicals" in table 1.B.2.

⁹ *Educational and Professional Employment in the U.S.S.R.*, op. cit., p. 488.

II. GROWTH RATES OF RATIOS OF ENGINEERS AND SCIENTISTS TO TOTAL EMPLOYMENT

13. The preceding section has pointed to the problems arising when ratios of engineers and scientists to total employment from one country are used as an instrument in estimating future requirements for such personnel in another. It has sometimes been suggested that rather than the absolute ratios, the rates of growth of these ratios could be used either to determine the probable rate of growth of the demand for engineers and scientists, or to check whether estimates of that demand which has been arrived at by other methods involved rates of growth that appeared feasible in the light of the experience of other countries. Table 1.B.3 shows the evolution of such growth rates for selected periods in the United States, Sweden and Japan.

TABLE 1.B.3. AVERAGE ANNUAL GROWTH RATES OF THE RATIO OF ENGINEERS AND SCIENTISTS TO INDUSTRIAL EMPLOYMENT, UNITED STATES, SWEDEN AND JAPAN

Country	Period	Ratios at the beginning and end of period		Rate of increase (in percentage)
United States ..	1930-1940	1.5	2.0	3.3
	1940-1950	2.0	3.1	4.2
	1954-1959	2.7	3.5	5.4
Sweden	1935-1940	1.4	1.6	2.7
	1940-1950	1.6	2.5	4.5
	1950-1955	2.5	3.2	5.1
Japan	1954-1959	1.7	2.0	3.5

Sources and notes at the end of annex B.

14. Although the figures are too divergent and too few to draw any far-reaching conclusions, it should be noted that the respective growth rates follow a similar pattern in the United States and Sweden, i.e., the ratio grows at an accelerating pace.

15. Both the United States and the Swedish studies from which these data are drawn tried to explain the development pattern of the ratio involved. The United States study found that changes in employment structure were a major factor determining the increase of the ratio for the economy as a whole. A rough estimate showed that 42 per cent of the increase in the ratio was due to this factor.¹⁰ The Swedish study took labour productivity as an explanatory variable and also found close correlation.¹¹ The results of both studies are not contradictory since increased productivity is partly due to changing distribution of output.

III. RATIO OF TECHNICIANS TO ENGINEERS AND SCIENTISTS

16. It is often assumed that a fairly stable relationship exists between the employment of engineers and scientists and that of engineering and science technicians. Obviously such a ratio only has meaning in the context of clear definitions. If engineers and scientists are defined as having had at least four years of university training, technicians can be defined as graduates of higher technical schools and colleges, with less than four years' higher education (higher technicians), and graduates from secondary technical schools (lower technicians). Or higher technicians as defined above can be grouped with engineers and scientists, in which case "technicians" will include only graduates of secondary technical schools. Or again, if the terms "engineers and scientists" are taken to refer to the occupations of engineers and scientists without reference to

educational attainments, the term "technicians" will refer to technical occupations at the sub-professional level, i.e. at a level between engineers and scientists on the one hand and foremen on the other. In using ratios of engineers and scientists to technicians as a forecasting instrument, it does not really matter how the definitions are established, as long as the framework of definitional tools is consistent. But differences of definitions affect the comparability of data from different countries. Table 1.B.4 gives a number of such ratios for various countries.

17. As could be expected, there is not much similarity in the magnitude of the ratios for different countries, since so much depends on the delimitation of what is an "engineer" and a "technician". The coefficient is 0.7 in the United States and Belgium. In the Netherlands it is 3.8 when higher technicians are compared with academically trained graduates, but it becomes 13 when lower technicians are compared with graduates of universities, technological institutes and higher technical schools. It is 4.3 in Sweden, but *Läroverks* - and *Institutsingenjörer* are of higher secondary, not of post-secondary level. In the Soviet Union the ratio is 2.5, but technicians are partly of secondary, partly of post-secondary level. The ratio is 2.5 in France, but when draughtsmen are excluded it stands at about 1.7.

18. Thus, in using ratios of technicians to engineers and scientists as a forecasting instrument, careful attention should be paid to the definitions used, so as to ensure that one compares like with like.

IV. GROWTH RATES OF RATIOS OF TECHNICIANS TO ENGINEERS AND SCIENTISTS

19. It is a well-known fact that the number of technicians expands more rapidly than that of engineers and scientists; consequently, the ratio between them should gradually increase. Table 1.B.5 presents the growth rates of the ratio in a few selected countries during selected periods.

20. Available statistics are not sufficient to allow any definite conclusions. In the Netherlands the ratio grew very rapidly between 1915 and 1955, but the available data do not show its evolution during successive periods between 1915 and 1955. It seems likely that a saturation point was reached during the latter part of the period and the ratio may even have declined slightly. A further decline took place during the period 1955-1960. The probable reason indicated for the falling back was a tendency towards a concentration of undertakings which led to an increased intake of engineers.¹²

21. The Swedish figures also seem to indicate that, from a certain point on, the rate of increase of the ratio tapers off. In Belgium, where the initial ratio in 1953 was still very low, the intake of higher technicians during the period 1953-1958 was in full expansion, which explains the high annual growth rate.

V. CONCLUSIONS

22. Considerable caution needs to be exercised in using ratios relating the employment of engineers and scientists to total employment as a tool in forecasting requirements for such personnel. Overall ratios seem to be of doubtful value, since their magnitude depends largely on the industrial sectors covered and on the distribution of the industrial labour force between them. Even sectoral ratios may be misleading since they may conceal variations in the ratios of individual sub-sectors. As a general rule, it can be said that the higher the specificity of the ratios, the greater will be their reliability for forecasting purposes. It is difficult to say whether, having regard to the need for using comparable definitions, highly specific ratios could be developed in the present state of knowledge and availability of statistics.

TABLE I.B.4. RATIOS OF ENGINEERING AND SCIENCE TECHNICIANS TO ENGINEERS AND SCIENTISTS

Country	Year	Sectors covered	Definition of engineers and scientists	Definition of technicians	Ratio
Belgium	1957	Manufacturing	Graduates from universities	Graduates from higher technical schools	0.7
Congo (Leopoldville)	1960	Industry and related	University graduates	Graduates from higher technical schools	1.2
France	1957	Manufacturing	Engineers, scientists and "equivalents"	Technical personnel between engineers and scientists and workers	2.5
Federal Republic of Germany	1956	Industry	Graduates from Institutes of technology (technische Hochschulen)	Engineering schools. (Prerequisites: 10 years' general education in primary and secondary schools and two years' apprenticeship)	3.3
India	1956	Manufacturing	Engineers and scientists	Engineering and science technicians	0.6
Japan	1959	Manufacturing	Graduates from university and colleges	Graduates from technical high schools	2.2
Netherlands	1955	All economic sectors	Graduates from universities	Graduates from higher technical schools	3.8
	1955		Graduates from universities and higher technical schools	Graduates from craft schools (secondary level)	13
Sweden	1955	Manufacturing	Civil engineers	Läroverksingenjörer and Institutsingenjörer	4.3
U.S.S.R.	1959	Industry	Engineers and scientists with higher education	Graduates from technicians (teknikumy)	2.5
United States of America	1959	Manufacturing	Engineers and scientists with four-year college education or equivalent experience	All persons engaged in work requiring a knowledge of physical, life, engineering and mathematical sciences comparable with knowledge acquired through a technical institute; junior college or other formal, post-high school training, or through equivalent on-the-job training and experience	0.7

Sources and notes at the end of annex B.

TABLE I.B.5. AVERAGE ANNUAL GROWTH RATE OF THE RATIO OF ENGINEERING AND SCIENCE TECHNICIANS TO ENGINEERS AND SCIENTISTS FOR SOME SELECTED COUNTRIES

Country	Period	Sectors covered	Ratios at the beginning and the end of the period		Average annual growth rate of the ratios	Remarks
Belgium	1953-1958	Metal industry	0.9	1.2	5.9	Higher technicians against university graduates
Netherlands	1915-1955	Economy as a whole	0.7	3.8	4.2	Higher technicians against university graduates
	1955-1960		3.8	3.6	-1.1	
Sweden	1940-1950	Industry	2.7	3.8	3.5	Technicians include Läroverks- and Institutsingenjörer
	1950-1955		3.8	4.3	2.3	

Sources and notes at the end of annex B.

23. Even if highly specific ratios could be developed, using comparable definitions, it is likely that they would vary from country to country, reflecting, for instance, different traditional patterns of skill utilization, a structure of the training system leading to greater or lesser interchangeability between different

skill categories, or different national situations as regards the availability and cost of engineering and scientific personnel. Due account would have to be taken of these factors. At a later stage it might also be useful to study the relationship of the resulting skill structures to productivity.

24. It would seem useful to have ratios of technicians to engineers and scientists in order to determine the proportions of people to be trained in the two categories. A preliminary survey of such ratios in a few countries shows wide variations. It appears, however, that to a large extent such variations may reflect differences in the definition of the categories concerned. In using such ratios close attention needs therefore to be paid to the definitions used.

25. Growth rates of the ratio of engineers and scientists to total employment may help in determining the probable rate of growth of the demand for such personnel or in checking estimates of future demand made by other methods. On the other hand, growth rates of the ratio of technicians to engineers and scientists provide information on the trends in the relative shares of the two groups. Only scant statistical data were found on these two aspects, which appear to deserve further investigation.

26. While much stress has been placed on the need for comparability of data, it should be stated that full international comparability is probably impossible. National differences in the contents of educational and training programmes and in the levels at which technicians and engineers and scientists are trained will always affect both the ratios and what they represent. This is not to say that ratios can never be of any use, but rather to emphasize again the need for caution in applying them to different countries.

Argentina

"The Engineering Profession and Economic Development in Argentina" by E. Oteiza. Paper submitted to the *Conference on Problems of Employment in Economic Development*, Geneva, 12-18 December 1963; International Institute for Labour Studies, Geneva, 1963, p. 33.

Belgium

Les Dirigeants d'entreprise de l'économie belge. . . op. cit. Figures based on a sample of firms with more than fifty workers in manufacturing, extractive industry and construction. Higher technical schools provide a three-year course, but their graduates do not have comparable pay and responsibilities with civil engineers and scientists. Their graduates include a small number of architects.

Chile

El empleo de ingenieros en la industria manufacturera, op. cit. The study does not indicate whether "equivalents" are included. However, since it compares Chilean with United States figures and bases estimates of future requirements on the latter, it seems probable that the definition of engineers is the same as in the United States, i.e. covering the persons employed as engineers (including "equivalents").

Congo (Leopoldville)

La qualification du personnel européen . . . op. cit.

France

Recensement général de la population de mai 1954, op. cit., 1^{er} partie, *Ingénieurs* appear to include a proportion of "equivalents". The term covers scientists in chemistry and other natural sciences and may also cover such categories as *ingénieur commercial*. On the other hand, certain scientists such as mathematicians are probably excluded.

India

Occupational Pattern in Manufacturing Industries, op. cit. The figures refer to persons employed as scientists or engineers. It was not possible to determine the proportion of "equivalents".

Japan

Manpower Requirements in Industrial Planning, op. cit., p. 12; *Demand and Supply for University Graduates*, op. cit., p. 31. College training lasts from two to four years. College graduates (at least those of the pre-1950 school system) appear largely interchangeable with university graduates. The ratio of college and university graduates together was derived from 1959 figures. Another study referring to the year 1954 divided this overall group into college and university graduates respectively. The 1954 percentages were applied to the 1959 figures.

Poland

Rocznik Statystyczny 1962, G.U.S., Warsaw, 1962, pp. 51-53.

Sweden

Universitet och Högskolor I 1960—Talets Samhälle, Statens Offentliga Utredningar 1959:45, Stockholm 1959. The Swedish "Läroverksingenjörer" and "Institutsingenjörer" are graduates from secondary level technical schools. It seems that such engineers can to some extent be substituted for academically trained engineers.

United Kingdom

Committee on Scientific Manpower. *The Long-Term Demand for Scientific Manpower*, H.M. Stationery Office, London, 1961. The training facilities taken into account are universities and colleges of advanced technology. The level of education in the colleges has been described as comparable in scope and standard with that of the universities.

USSR

TsSU SM SSR, *Narodnoe khoziaistvo SSR v 1961 godu*; statisticheskii ezhegodnik, Moscow 1962, pp. 181, 578, op. cit., *Education and Professional Employment in the USSR*, table VI-60. The data exclude employment in research and development services immediately supporting production ("inter-plant activities"), and covers only persons engaged in production. Engineers and scientists include graduates from universities proper and from higher technological institutes ("institutys") providing four years' training equivalent to university training.

United States

The number of professional engineers and scientists (chemists and other natural scientists) and the total number of employed were derived from the 1960 Population Census [Final Report PC(1)-1D, table 209]. However, this source provides the number of persons in the occupations of engineers and scientists, and includes "equivalents". On the other hand, high level personnel with science and engineering training but working in other occupations, such as managers, are excluded. In order to estimate the proportion of "equivalents", professional engineers and scientists were split up according to length of training, on the basis of the Census Report, PC(2)7B. This made it possible to compute the percentage share of professionals respectively with a minimum of one and four years of university or college training. Those percentages, referring to the economy as a whole, were assumed to hold equally for the manufacturing sector and were applied to the number of personnel occupying positions as engineers and scientists in the manufacturing sector. For this purpose, some types of engineers and scientists, e.g. agricultural engineers, have been eliminated beforehand. This procedure yielded the ratios appearing in columns 6 and 8 of table B-1: the former includes engineers and scientists with one year university or college training and above, the latter engineers and scientists with four years at university or college training and above.

TABLE I.B.2

See table I.B.1, except for the United States and the United Kingdom. For the United States figures have been drawn from the *Long-Range Demand*, op. cit.; the British data comes from *Scientific and Technological Manpower in Great Britain, 1962*, Committee on Scientific Manpower, London, H.M.S.O. 1963.

TABLE I.B.5

Belgium

Université libre de Bruxelles, Institut de Sociologie, Centre d'Etudes des Problèmes Sociaux et Professionnels de la Technique. *Etude de la qualification de l'emploi dans le secteur des fabrications métalliques*, Bruxelles, 1960. "Higher technicians" are graduates of higher technical schools (three years' education at post-secondary level).

Netherlands

"Employment Forecasting Techniques in the Netherlands", op. cit., p. 36. "Higher technicians" refer to graduates of higher technical schools. The above source gives a ratio of 3.1 per cent for 1960, but indicates that this is a normalized benchmark 15 per cent below the actual figure, which was accordingly assumed to be 3.6.

Sweden

Universitet och Högskolor . . ., op. cit., p. 63. The proportion is of "Läroverks" and "Institutsingenjörer" to academically trained scientists and engineers.

ANNEX C

Estimation of technical and supervisory personnel requirements in specific industrial branches

A. MANPOWER ESTIMATES AT THE PLANT LEVEL: AN APPROACH

I. Introduction

1. The necessity for manpower and educational planning as an integral part of comprehensive economic planning is now widely recognized and need not be elaborated. Manpower and educational programming in newly developing countries is, however, hampered by lack of data. It will be necessary, therefore, to utilize various approaches which aim at using the industrial experience of more developed nations profitably. The use of industrial personnel ratios, or staffing patterns from more developed countries, is a basic approach in deriving estimates of requirements for technical personnel.

2. Chapter 1 and particularly annex B, of the same chapter, have utilized available data in revealing significant variations in the size of personnel ratios, for given broad industrial sectors in different countries. Reasons have been put forward in order to explain these variations, namely differences in the industrial composition of the sectors (i.e., output-mix), differences in the scale of enterprises and of technology. Moreover, caution in the use of such ratios has been recommended. It is recognized, nevertheless, that the reliability of the "ratio" approach appears to increase when the ratios are more closely related to well-defined types of production. The object of this annex is to expand, and at times elaborate, this idea in order to evolve methodology and to indicate further lines of work in this field.

3. Relating manpower and consequently training requirements to specific industrial branches involves, essentially, carrying the analysis down to the plant level. Problems encountered by the influences of different technology and size of plant on technical staffing patterns have still to be contended with. To isolate these effects, it is suggested that what is required is to conduct surveys of plants, in developed and developing countries, of similar technology and size.

4. An attempt to analyse the problem of training requirements at the micro-economic (plant) level is important in manpower and educational planning for the following three reasons:

(a) It is possible to make more precise estimates of requirements of technical personnel at the plant level since there is no need to rely on aggregate ratios such as sector average labour productivities and sectorial estimates.

(b) The total data on manpower and training requirements arrived at on the basis of plant data could be used as a check on sectorial or national estimates.

(c) The information would be of significant value to planners faced with the problems of choosing between individual investment projects. Economic planning at the project level necessitates information on availabilities and requirements of technical and managerial personnel for particular industrial branches.

5. The above-mentioned approach, while admittedly an important task, presents difficulties in view of the lack of readily available data on the subject. Useful data, which are collected in connexion with project feasibility studies, technical assistance reports of plant and industry organizations, etc., exist with leading consulting firms, private firms (in developed countries) with foreign operations, well established domestic firms and government departments. This data, however, is considered as confidential by the organizations concerned and a special effort is necessary to obtain it.

6. In this Annex, available data has been utilized to arrive at patterns, or ratios of supervisors, engineers and technicians to total employment with regard to three specific industrial branches. Reference will also be made to industrial personnel training methods. The object of such an exercise, as already mentioned, is primarily to evolve methodology and to indicate further lines of work in this field. This approach will include determining the content and type of data and collection of such data by survey.

II. Case studies

(a) Cement

7. There are two types of data on cement plants which are relevant: (a) general staffing data which can be obtained from

plant feasibility studies, engineers' handbooks and manuals of plant specifications; and (b) actual staffing data which can be ascertained from reports of technical assistance experts, concerned mainly with management and plant organization.

8. Both general and actual plant data are presented in tables 1.C.1 and 1.C.2. In order to identify various classes of manpower that may be consistent with training programmes, data on personnel presented in the form of tables 1.C.1 and 1.C.2 need to be grouped, or aggregated, into major occupational categories as shown in table 1.C.3. This aggregation can be accomplished by taking into account the operations performed by personnel, or

the educational levels attained, preferably both. For the former, job description information is essential, and for the latter, of course, information as to the educational requirements for different types of jobs is needed. In the absence of such information data in tables 1.C.3 and 1.C.4 are estimated rather arbitrarily.

9. Available data for the cement plants point to the following preliminary observations: (a) Comparison of data for plants (4) with data for plant (6), given in table 1.C.3, shows a large discrepancy in personnel requirements of similar size plants located in developed countries on the one hand, and developing countries on the other. Moreover, this discrepancy appears evident not only among unskilled workers, but throughout the vertical skill structures; (b) comparison of general plant data, obtained from feasibility reports and engineering data, with actual plant data in table 1.C.3 shows that projected personnel plant requirements may be unrealistic with respect to actual plant staffing patterns in developing countries; (c) comparison of data in table 1.C.4 with data shown in table 1.C.6, for the iron and steel plants, indicates that total labour requirements for the cement plants appear to be small in relation to manpower needs of the iron and steel plants. Furthermore, the number of technical and skilled personnel out of total labour requirements appears to be much greater for the iron and steel plants. The above observations point to the fact that whereas for the iron and steel industry, in developing countries, an elaborate training programme — as will be indicated later on — is required, this may not be quite as essential for the operation of new cement plants.

(b) Fertilizer

10. Available data for the fertilizer industry at present permit indicating the experience with respect to technical manpower requirements for only a particular country, namely India. Furthermore, the data do not provide a range of plant sizes and technologies, from which to gauge their effect on technical personnel patterns. Therefore, a special effort needs to be made to collect detailed plant data for this industry.

11. The number of engineers, chemists and workers as a whole used in the Indian fertilizer plants is generally considered excessive by modern standards, and there is currently an attempt on the part of the Government and management to get away from out-moded staffing patterns. Figure I shows the organization plan for an Indian fertilizer plant suggested by the United Nations Fertilizer Mission to India in 1961. The plan is for the fertilizer plant only, and does not include the administrative and policy-making

functions of the company.¹³ The following suggestions are made by the United Nations Mission for arriving at the staffing standards set by the organization plan of figure 1:

- (i) Limit the number of men reporting to any one man at the supervisory level;
- (ii) Keep the number of levels of line supervision to a minimum;
- (iii) Preferably have only one grade of "operator" but definitely do not use more than two grades;
- (iv) Define the individual job requirements, then delegate the authority and responsibility necessary to carry out these jobs;
- (v) Dignify the place and importance of each job so that workers will take pride in their work and have a feeling of responsibility.

12. Table 1.C.5 shows estimates of requirements of technical and other personnel in three fertilizer plants due for completion during India's Third Plan; table 1.C.5 also shows the corresponding figures derived from the plant organization plan shown in figure 1. "Engineers" category covers all college-trained engineers, chemists, etc. "operators" category covers all those with matriculation level of education. The data for the different fertilizer plants are not strictly comparable; plant A on the west coast has slightly a larger output than plant B and C mentioned in the table. This, of course, is reflected on the different personnel requirements among the plants. Plant C, however, has several features common to several programmed fertilizer plants in India, in terms of size, raw materials used, etc. It would be appropriate to note that personnel estimates for plant C are still in excess of those recommended by the United Nations Mission, and that plants of similar

¹³ Plant capacity of 80,000 tons (N), using naphtha as feedstock.

size are run in the developed countries with a considerably lower number of personnel. The estimates for the three plants shown in table 1.C.5 were derived from fertilizer feasibility studies made by the Kane Committee in 1958; it would be interesting to ascertain how far actual plant requirements have conformed to these estimates.

(c) Iron and steel

13. An attempt is made here to bring together, from various unpublished feasibility reports and papers, information as to personnel requirements and personnel patterns for various size steel plants with different plant facilities located in different countries.

14. Table 1.C.6 shows size and structure of manpower requirements for a few steel plants located in various countries, of different capacity size, degree of integration, product-mix and plant facilities. Data has been collected from unpublished economic and technical feasibility reports, carried out by leading engineering consulting firms from the developed countries, with the exception of the manpower requirements for the Brazilian plant, which are based on actual plant data for the year 1956. It is clear from table 1.C.6 that additional data on actual staffing patterns in the plants are necessary before any generalizations as to standard staffing patterns in the iron and steel industry can be made. However, it is possible to make a few preliminary observations on the basis of existing data.

15. In the initial phases of a steel plant, it is perhaps too much to expect that the top level of the plant personnel, management, engineering and even technical, will be locally available. This is particularly true when the plant happens to be the first of its kind to be

Notes:

- Plant A is located on the west coast of India.
- Plant B is located in a north-east State of India.
- Plant C is located on the southern coast of India.

Figure I. Over-all company management (including managing director, board of directors, executive committee, etc.)

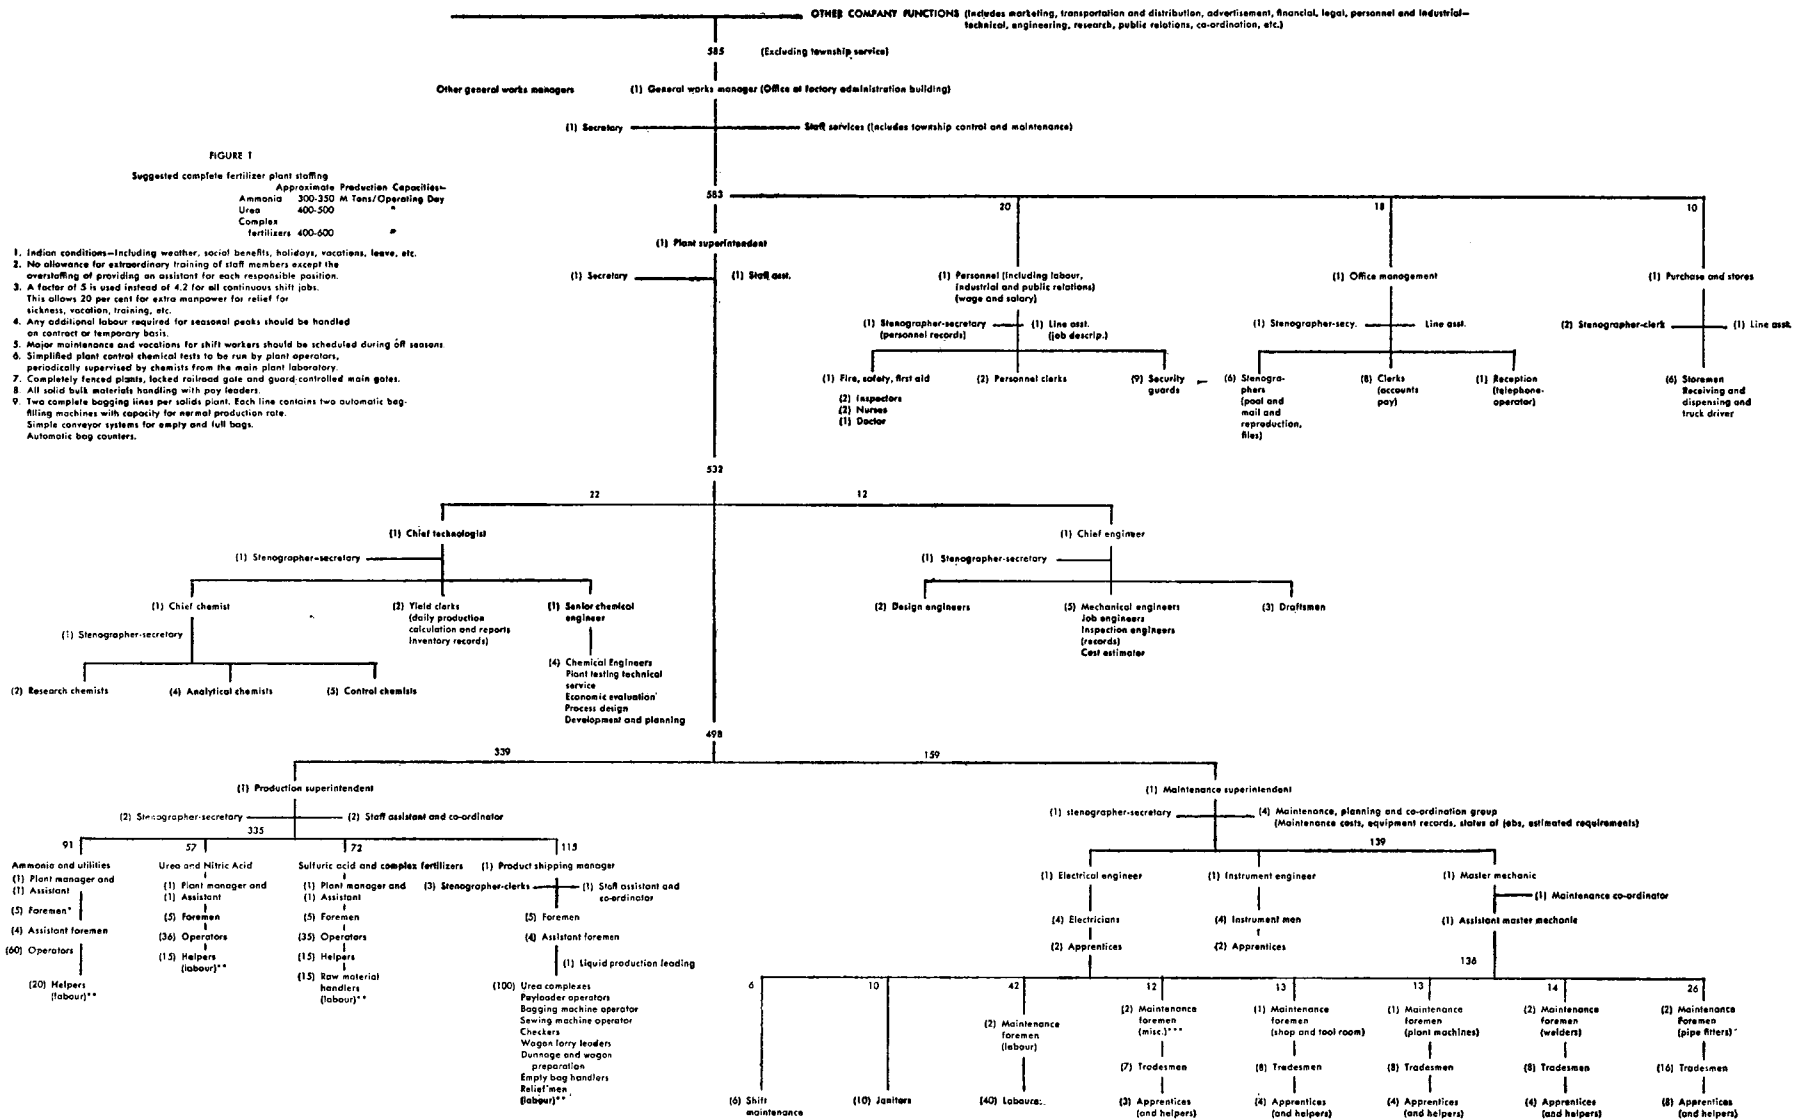

FIGURE I
Suggested complete fertilizer plant staffing

	Approximate Production Capacities-
Ammonia	300-350 M Tons/Operating Day
Urea	400-500 "
Complex fertilizers	400-500 "

- Indian conditions—Including weather, social benefits, holidays, vacations, leave, etc.
- No allowance for extraordinary training of staff members except the overhauling of providing an assistant for each responsible position.
- A factor of 5 is used instead of 4.2 for all continuous shift jobs. This allows 20 per cent for extra manpower for relief for sickness, vacation, training, etc.
- Any additional labour required for seasonal peaks should be handled on contract or temporary basis.
- Major maintenance and vacations for shift workers should be scheduled during off seasons.
- Simplified plant control chemical tests to be run by plant operators, periodically supervised by chemists from the main plant laboratory.
- Completely fenced plants, locked railroad gate and guard-controlled main gates.
- All solid bulk materials handling with pay leaders.
- Two complete bagging lines per solids plant. Each line contains two automatic bag-filling machines with capacity for normal production rate. Simple conveyor systems for empty and full bags. Automatic bag counters.

* Ammonia and utility plant foremen have over-all responsible plant charge during night shifts, holidays and week-ends.
 ** Any additional labour requirements requested daily from maintenance labour pool.
 *** Includes painting, carpentry, bricklayers, insulators, cement men, etc.
 Labourers: Use lead men for groups.

installed in the country. The greater part of the personnel required at this level may, therefore, have to, or should, be imported (see table 1.C.7). Steel plants will, due to lack of skilled personnel, of necessity be required to start operation with a low ratio of skilled domestic employees to total number of workers. But this problem, together with the previous one of shortages of top level personnel appears amenable to solution over a relatively short period of time, through training and in-plant upgrading. In the Brazilian steel plant, for example, in 1951, the ratio of skilled to total workers was 11.27 per cent. By 1955, the ratio had increased to 37.94 per cent (see table 1.C.8). The Chilean steel plant in 1951 had 134 foreign personnel with an ingot annual capacity of 172,000 tons. By the end of 1953, the number of foreign employees had decreased to 52, with an annual ingot capacity of 313,000 tons, and by the end of 1956, the number of foreign personnel had further decreased to 25 while annual ingot capacity had increased to 375,000 tons (see table 1.C.7).¹⁴

III. *Some preliminary general observations*

16. The data are not entirely adequate to draw specific conclusions. Nevertheless, they point to certain trends which are often referred to in qualitative terms only in the literature. While it is true that staffing patterns for any two plants will not be the same in view of dissimilarity of depth of skills of the available personnel, and national and management policies, it is conceivable that the number required in each of the component units of the plant vary in given range in a country. What is significant, however, is the fact that there is a substantial difference in terms of labour inputs in plants of similar size and technology located in the developed countries on the one hand, and developing countries on the other. In some cases, the difference in terms of personnel employed is alarming. Various arguments have been advanced to explain the

¹⁴ Data shown in tables 1.C.7 and 1.C.8 were obtained from unpublished papers presented at the Latin American Meeting of Experts on the Steel Making and Transforming Industries, São Paulo, Brazil, 15 to 28 October 1956.

discrepancy but these very often are concerned with approving or disapproving the state of affairs. The large numbers employed in plants are explained in terms of need to provide employment. On the other hand, the use of large numbers of personnel are criticized in terms of inefficient performance of the plant and the high unit cost of the product. These arguments are the natural extension of different viewpoints regarding strategy of industrial development.

17. The relevant factor that needs to be considered is the use of qualified and trained personnel in the plants. The manner of their utilization or non-utilization (namely, more technical personnel to do a job than is normally required) is very important since the number available is generally in short supply in the developing countries. These countries cannot afford to waste scarce resources, namely both capital and human skills. In order to weigh the problem of appropriate utilization of scarce technical personnel carefully, further research is needed to ascertain the degree of utilization of technical personnel in specific component units of the plant in the developing countries, as compared to similar experience elsewhere.

B. TRAINING METHODS IN IRON AND STEEL

18. Reference will be made here to possible personnel training approaches in the iron and steel industry, in the developing countries, by describing the experience of two actual plants under differing conditions: (a) a plant under construction and about to begin operation and (b) a well-established plant in the process of expansion.

I. *Colombia (Acerias Paz del Rio, S.A.)*

19. In the early 1950's, the directors of Acerias Paz del Rio, S.A., were engaged in the building, assembly and entry into operation, by stages, of the technical installations; they recognized that skilled workers and technicians, who would subsequently occupy

TABLE 1.C.8. BRAZILIAN STEEL PLANT
Ratio of skilled employees to total number of workers: 1951-1955

Classification	(1951)	(1952)	(1953)	(1954)	(1955)

^a There are 1,189 positions requiring workers who have had basic industrial training courses.

key posts in the new plant, could not receive adequate training and instruction on the spot. The obvious solution was to send them abroad and place them in a similar industry.

20. The problem of choosing which key posts ought to be filled by workers who had benefitted from a course abroad was solved by distributing nominations among the principal departments. A satisfactory balance was found by assigning four scholarships to the blast furnace department, two to the steelmaking department, one to the foundry (second melting), seven to the rolling mills, three to the maintenance services and one to the chemical laboratory. Several exploratory missions were undertaken in the different countries capable of receiving the trainees, in order to choose the most suitable countries and industrial establishments. In some cases, the choice was narrowed by certain

technical considerations. The Thomas Converter operator and the maker of linings for the Bessemer Converter, for example, could best be placed in plants in France or Luxembourg. Spanish-speaking countries were given preference in order to avoid language problems; in fact it subsequently turned out that Colombian technicians who went to Europe were severely handicapped by not knowing the language. Table 1.C.9 shows the different enterprises which received the trainees and the functions for which the courses were organized.

21. Selection of the trainees was made by an industrial psychologist specialist attached to the International Labour Organisation. In the main, they were selected on the basis of the following two qualities:

(a) Workers and technicians who already had some knowledge;

TABLE 1.C.9. PLACEMENT OF COLOMBIAN STEEL TRAINEES

Country and host enterprise	Commencement, termination, duration	Function for which the Course was organized			Remarks
		Department	Grade	Job Description	
1. Chile: Compania de Acero del Pacifico Huachipato	6.12.53-5.6.54, six months	Rolling mill	Technician	Head of rolling department (rails and shapes)	
2. Ditto	"	Rolling mill	Technician	In charge of multiple stand rolling mill	
3. Ditto	"	Blast furnace	Skilled worker	Blast furnace operator	
4. Ditto	"	Blast furnace	Skilled worker	Foreman blast furnace operator	
5. Ditto	"	Blast furnace	Skilled worker	Head of charge preparation	
6. Ditto	"	Rolling mill	Skilled worker	Rolling mill operator (small shapes and wire)	
7. Ditto	"	Maintenance	Skilled worker	Roll shop turner	
8. Ditto	"	Foundry	Skilled worker	Sand preparation operator	
9. Ditto	"	Rolling mill	Skilled worker	Slabbing mill operator	
10. Ditto	"	Rolling mill	Skilled worker	Rolling mill operator	
11. France: Sidelor, Usine Micheville Villerupt .	27.1.54-26.7.54, six months	Rolling mill	Draughtsman	Specialist in roll plans (for rolling shapes)	
12. Union des Mines et de la Métallurgie, Longwy	22.3.54-21.9.54, six months	Steel mill	Skilled worker	Thomas blast furnace operator	
13. Union des Mines et de la Métallurgie, Longwy	29.3.54-28.9.54, six months	Rolling mill	Technician	Rail rolling technician Dolomite operator	Stay extended for 6 months after 28.9.54 by firm of origin
14. Luxembourg: Arbed, Division, Belval	15.2.54-14.8.54, six months	Steel mill	Skilled worker	Making of linings for Bessemer Converter	
15. Brazil: Companhia Siderurgica Nacional, Volta Redonda	1.10.54-31.3.55, six months	Maintenance	Technician	Electrical mechanic specialized in maintenance of control and measuring apparatus	
16. Ditto	"	Chemical laboratory	Chemist	Laboratory analyst (coal and and by-products)	
17. Ditto	1.4.55-31.8.55, six months	Maintenance	Technician	Electrical technician	
18. Ditto	1.4.55-24.5.55, two months	Blast furnace	Technician	Gas recuperation technician	Stay cut short by illness

(b) Employees who were capable, once their course would be over, of teaching their knowledge to others.

The above would indicate that one of the primary requisites for the success of training programmes of this type (i.e., the careful

selection of candidates) was taken into account in the case of the Colombian steel trainees. Table I.C.10 shows the training subjects given by the Huachipato Plant in Chile, where ten of the Colombian trainees were sent; the table also roughly shows the training methods employed and place of training. The data indicate that

TABLE I.C.10. CHILE: HUACHIPATO PLANT
Training programmes carried out from January 1955 to August 1956

<i>Subject</i>	<i>No. of persons taking part</i>	<i>Method employed and place of training</i>
1. Personnel relations	300 supervisors	Pamphlet in the industry
2. Organization	300 supervisors	Pamphlet in the industry
3. Electric welding	300 welders	Pamphlet in the industry
4. Oxy-acetylene welding	300 welders	Pamphlet in the industry
5. Safety	600 supervisors	Pamphlet in the industry
6. Safety	600 supervisors	Cards with safety recommendations in the industry
7. Safety	250 supervisors	Lectures in the industry
8. Fire prevention	250 supervisors	Lectures with demonstrations in the industry
9. Fire prevention	65 guards	Lectures with demonstrations in the industry
10. First aid	26 supervisors	Lecturers with demonstrations in the industry
11. First aid	65 guards	Lectures with demonstrations in the industry
12. Traffic control	65 guards	Lectures with demonstrations in the industry
13. Job instruction	420 supervisors	Lectures with discussion in the industry
14. Improvement methods	420 supervisors	Lectures with discussion in the industry
15. Personnel relations	420 supervisors	Lectures with discussion in the industry
16. Oxy-acetylene welding	20 welders	Practical jobs in industry
17. Electric welding	70 welders	Practical jobs in industry
18. Electricity	20 electricians	Lectures, information in industry
19. Diesel motors	12 mechanics	Lectures, information in industry
20. Foundry	15 melters	Lectures, information in industry
21. Locomotive drivers	50 drivers	Practical jobs and lectures in the industry
22. Plate layout	35 workers	Practical jobs and lectures in the industry
23. Machine tool operator	5 mechanics	Practical jobs and lectures in the industry
24. Machine tools shop organization ...	1 supervisor	Practical jobs and visits to industries in the United States
25. Carbide tipped tools	1 specialist	Practical jobs and visits to industries in Germany
26. Heat treatment	1 mechanic	Practical jobs in other industries
27. Sanitary engineering	1 specialist	Practical jobs and lectures in universities
28. Steckel mill	3 engineers	Makers, other industries in the United States
29. Furnace masonry	1 specialist	In work and visit to other industries in the United States
30. Steel plant procedures	1 specialist	In work and visit to other industries in the United States
31. Industrial relations	1 specialist	Universities and visits to United States industries
32. Electronic rolling mill equipment ...	1 specialist	In work in British industries

the training given was well balanced between the lecture type of instruction and practical experience in the works of the plant. Valuation of the training was ascertained through reports from the host enterprises and from the trainees themselves. This should perhaps, in similar cases, be supplemented by follow-up of the trainees to ascertain how far they have made use of the training in their plant work.

22. The foreign training programme for Colombian workers and technicians is a good example of a particular effort towards improving the knowledge of personnel in a new iron and steel industry. It is questionable, however, whether efforts of this type can produce adequate results by themselves. In the iron and steel industry, in which technical and skilled requirements extend almost all the way down the manning schedule, this type of training will need to be supplemented by a much broader dissemination of advanced, middle and elementary technical training among workers as a whole.¹⁵

II. India: (Tata Iron and Steel Company)

23. The Tata Iron and Steel Company established, in 1921, the Jamshedpur Technical Institute to train personnel for plant operation and maintenance. Although the emphasis has been on the training of new entrants to the industry, the development and training of existing personnel has not been neglected. The Tata Iron and Steel Company has also been instrumental in the training of supervisory and skilled personnel for other steel plants in India and for at least one other developing country.

Graduate training scheme

24. This course is specially designed for training supervisory personnel for the Tata Steel Plant. Trainees with engineering qualifications are given a regular course in metallurgy and those with metallurgical qualifications a regular course in mechanical and electrical engineering. Minimum admission requirements are:

(a) A degree in mechanical or electrical or metallurgical engineering from a recognized engineering college or a technical institution or the Certificate of Proficiency in Electrical Technology or Diploma in Metallurgy awarded by the Indian Institute of Science, Bangalore;

(b) Age not to exceed twenty-five years on 31 July of the year of recruitment;

(c) Medical fitness and a fairly strong physique so that trainees can perform hard manual labour when necessary.

25. The duration of the course is two years consisting of combined theoretical training at the Jamshedpur Institute and practical training in the Steel Company's works. During the first year, the trainees attend the works and the institute in alternate weeks. Separate staff look after their theoretical training at the Technical Institute and the practical training in the works. During the second year, the trainees attend the works whole time during the day and attend the Institute for evening lectures four times a week. These lectures are delivered by the senior officers of the steel company and are meant to give a final finish to the earlier work done in the first year by the regular Institute staff. For works' training, trainees are assigned for definite periods to the different departments according to a programme. By the middle of the second year, the trainees are allotted particular departments for specialized training for a period of six months, where they are expected to be finally absorbed in suitable vacancies.

¹⁵ For a description of an advanced training scheme for foreign steel trainees at the United States University of Pittsburgh, see: J. Alfred Berger, "Training of engineers and operators for new iron and steel operations in developing countries". Paper presented at the United Nations inter-regional symposium on the application of modern technical practices in the iron and steel industry to the developing countries, (Geneva, 11 to 26 November 1963), STEEL:SYMP.1963/TECHNICAL PAPER/B.24.

Technical probationer scheme

26. The technical probationer course has as its objective the training of technicians for such designations as: assistant second hands, second hands, first hands and convertermen in the steel melting shops; assistant blowers and blowers in the blast furnaces; assistant foremen and foremen in the coke ovens; assistant rollers and heaters or equivalent designations in the mills or for auxiliaries in the operation departments. Minimum admission requirements are:

(a) A degree in Science with physics, chemistry and mathematics or a degree in Science with any two subjects from the group — physics, chemistry and mathematics. A minimum aggregate of 50 per cent marks is necessary.

(b) Age not below 19 and not above 23 years on 31 July of the year of recruitment.

(c) Possession of robust physique and medical fitness so that trainees can perform the hard manual labour which is required of all operation jobs.

27. The course has a duration of three years in which selected candidates are given a combined theoretical and practical training at the Technical Institute and in the works of the company. For the first six months, trainees are given general training which consists of a brief orientation to the company's works, a course in shop practice, general works' training in all the production departments and a course of lectures in mechanical drawing, blueprint reading and iron and steel technology. At the end of this six months' period, trainees are allotted specific departments for specialization. Specialized training for the remaining period of two and one-half years consists initially of general training in all the sections of the particular department allotted. The above training within particular departments is followed by a closely supervised on-the-job specific position training. Operative courses, which are in the nature of part-time evening classes, are started early during the specialization phase of the programme. Separate operative courses for different steel plant processes such as manufacture of pig iron, steel making, rolling and forging, are designated and it is compulsory for each technical trainee to attend the course applicable to his nature of work.

Artisan training scheme

28. The course is designed to train skilled artisans in certain specified trades which are applicable in the steel industry. The training scheme produces skilled craftsmen of second grade proficiency in their respective trade, and further development to first grade proficiency is expected and achieved by them while working on the shop floor in the course of going through their salary grade. Training is carried out in the following trades: mechanical fitter; electrical fitter; turner; machinist; blacksmith; welder — gas and electric; pattern maker; moulder; refractory mason. Minimum admission requirements are: (a) passed secondary school-leaving certificate from a state board or equivalent; (b) age between 16 years and 18 years on 30 April of the year of recruitment; (c) good physique and health so that trainee can perform hard manual labour.

29. The duration of the course is two years, consisting of theoretical training at the Technical Institute and practical training inside the works of the Company. All trainees attend the Technical Institute one day a week. The subjects taught are English, elementary science (physics and chemistry), workshop calculations, mechanical or brick drawings. Five days a week are allotted to practical training. During the first four months, basic training is imparted in the bench fitter's trade with a view to introducing the trainees to workshop atmosphere, of which most of them are completely ignorant. At the end of this period, each trainee is allotted a specific trade for specialization. For the remaining period of twenty months,

intensive training is given to the trainees in their respective trades. For the moulders and masons, the scheme is a little different, the duration still being two years. Moulder and mason trainees do not have basic fitting training but are assigned their specialized trade from the start. Every day, physical training for one hour is compulsory for every trainee in this category. This one hour physical training is considered important and carefully planned, to build and develop these trainees at this formative age, both physically and morally.

Employees' training scheme and evening classes

30. The training of new entrants to the Tata Steel Company has been described under the graduate training scheme, the technical probationer training scheme and the artisan training scheme. Development of existing steel plant personnel, however, is considered an equally important duty and responsibility of management. This development training prepares employees for upgrading or promotion and assists the industry in providing well-trained personnel to meet changed operating conditions introduced by technological developments in the manufacture of iron and steel. The Employees' Training Centre has been established outside the works' premises as part of the Technical Institute to provide maximum training facilities under the employees training scheme. The training is voluntary, and the duration of the training courses varies, depending upon the type of trade being learnt. For the development of operation personnel, it is obvious that the skills required cannot be studied in a training shop or centre. These skills must be acquired on the job under instruction from plant supervisors. The Institute, however, provides assistance by conducting specialized refresher courses for employees. A listing of available programmes at the Technical Institute which have been conducted in the past or are being conducted at present, is given below:

- Special course for fitters (in sketching and use of precision instrument);
- Special course for mistries (in sketching, drawing, blueprint reading and use of precision instruments);
- Special course for chargehands (mechanical shops);
- Special course for chargehands (electrical);
- Special course for assistant foreman trainer (maintenance);
- Refresher course on lubrication;
- Refresher course for heaters and assistant heaters;
- Course for mill hands;
- Course on the metric system;
- Course for boiler attendants;
- Course for rate setters and computers;
- Coke ovens operative course;
- Blast furnace operative course;
- Steel melting operative course;
- Mills operative course;
- Reheating furnace operative course.

31. Part-time evening courses are for the benefit of those who, while working in industry, have an intense desire to study in their spare time with a view to acquiring higher technical qualifications. The courses, as at present run, have been so designed that they have a direct bearing on the minimum academic technical qualifications laid down for junior and senior supervisory positions in the works of the Tata Iron and Steel Company. Admission to these courses is based on an entrance test. No restriction regarding age or prior qualifications is imposed, in order to provide these oppor-

tunities to as large a section of employees as possible. A listing of available courses and duration is given below:

Course	Duration
Basic course I and II years	Two years
Basic drawing course ...	One year's duration for those who have passed I.Sc., with physics, chemistry and mathematics
Trade course in engineering drawing, parts I and II	Two years
Mechanical engineering course	Four years—parts A, B, C and D each of one year's duration and one year of practical training
Electrical engineering course	Four years—parts A, B, C and D each of one year's duration and one year of practical training
Metallurgy course	Four years—parts A, B, C and D each of one year's duration.

32. The description of the training programme at the Tata Iron and Steel Company has been given in some detail because it represents a significant effort in the field of industrial technical training, which should be of special interest to readers of this report. The technical training experience at Tata is a technological pool that may be useful for future steel enterprises, in the developing countries, in the preparation and implementation of technical training programmes. The lack of technical preparation of Indian workers in iron and steel technology forced Tata Iron and Steel to create its own training service. It would be appropriate to note, however, that the training programme at Tata has been developed over a period of more than thirty years, and requires an existing well-established operation, in which practical training can be provided.¹⁶ Thus, the Tata case represents somewhat of an ideal particular case of the systematic training of personnel in the iron and steel industry. Many developing countries may only gradually be able to develop such elaborate training schemes. However, the training process appears amenable to being speeded up by public and international initiative in the establishment of regional or sub-regional specialized technical training institutes.

ANNEX D

Summaries of small-scale industry studies in selected countries

I. THE RICE INDUSTRY IN CEYLON

(a) Requirements for technical personnel

1. Ceylon is now producing 960,000 tons of paddy; it is estimated that paddy production in 1970 will be 1.15 million tons.
2. There are now 1,000 processing plants in operation which are small and primitive. It is estimated that by 1970, 200 of these small plants will have ceased operating and that sixty medium size plants will have been installed.

¹⁶ Even in developing countries where steel and iron plants are already in existence, facilities may not be sufficient for the training of a significant number of the personnel required for an expanding national steel industry. It is reported, for example, that a large number of the Hindustan Steel Company workers and technicians — running into the hundreds — were sent from India to the USSR for training.

3. Only for these sixty new plants trained personnel will be required as follows:

<i>Skilled workers</i>	540
<i>Intermediate level</i>	
Rice processing/parboiling technicians ..	60
Rice quality inspectors	30
Foremen	180
<i>Higher technical personnel</i>	
Rice milling/parboiling engineers	8
Rice and paddy storage officers	8
<i>Highest level</i>	
Rice mill managers	60
Administrators	60

(b) *Available training facilities*

4. Ceylon has good schools and universities, but a great shortage of technically trained personnel at all levels.

5. In 1954, a Technical Training Institute was established by the Gal Oya Development Board which is providing excellent training for technical personnel and for craftsmen, but has no facilities for specialized training in the rice industry.

(c) *Systems and methods of education and training*

General organizational problems

6. Practical training of rice processing techniques should be given in the proposed United Nations Special Fund Rice Centre which will be sufficient for the purpose, provided the trainees have sufficient technical background.

Skilled and highly-skilled workers

7. They are now trained on-the-spot in the existing small mills, but it should be possible to conduct short training courses in connexion with the proposed Special Fund Rice Centre.

Education and training of intermediate-level personnel

8. In addition to the intermediate level technical education facilities available in the country, students should follow up with a one-year course in rice processing to be provided by the Special Fund Rice Centre. Rice quality inspectors should also be trained there.

Education and training of higher technical and scientific personnel

This can be done at the existing universities.

(d) *Financial implications of creating and maintaining systems of technical education and training*

9. Ceylon will require foreign aid for the improvement of training.

(e) *Methods of training abroad of technical personnel*

10. Once the United Nations Special Fund Rice Centre has been established, suitable candidates will be sent abroad under the fellowships part of the project.

II. THE OLIVE OIL INDUSTRY IN SYRIA

(a) *Requirements for technical personnel*

11. The present production in Syria is 60,000 tons of olives, 12,500 tons of olive oil and 21,000 tons of presscake, while the estimate for 1970 amounts to 90,000 tons of olives, 19,000 tons of olive oil and 32,000 tons of presscake.

12. There are now 475 hand or animal-operated mills, 268 old, not fully motorized mills and 37 fully motorized modern mills plus six solvent extraction plants for extraction from presscakes. For 1970, it is estimated that only 37 old mills will survive, so that there will be 50 modernized mills and 100 new efficient and modern mills.

13. In 1970, the total requirements of personnel for oil mills, solvent extraction plants, refineries and bottling plants will be 455 skilled workers, 205 technicians, 9 analysts, 187 administrative officials and, at the higher level, 8 administrators and 8 managers.

(b) *Available training facilities*

14. Syria has two universities without facilities for the olive oil industry. There are four schools at the intermediate level, also without specialization for olive oil technicians.

(c) *Systems and methods of education and training*

General organizational problems

15. The Syrian Government will introduce an olive oil bureau that will make arrangements for training.

Skilled and highly-skilled workers:

A permanent training centre at the Gendires oil mill;
Special technical courses at government oil mills in Tartous and Salkine.

Education and training of intermediate-level personnel.

Technicians: one permanent training centre at a high school in an olive growing area (e.g. Lattakia); analysts: one permanent training centre at the quality control laboratory of the research station organized by the United Nations Special Fund Food Processing Project.

Education and training of higher technical and scientific personnel:

Managers and administrators: two permanent courses at the agricultural faculties of Aleppo and Damascus Universities. Special auxiliary courses in marketing and other subjects.

(d) *Financial implications of creating and maintaining systems of technical education and training*

16. With the technical aid given by the Special Fund Food Processing Project, no high financial implications are expected for the Government.

(e) *Methods of Training abroad of technical personnel*

17. Within the Framework of the Special Fund Project, some fellows will be trained abroad.

III. THE FOOD INDUSTRY IN CHILE

(a) *Requirements for technical personnel*

18. Requirements are likely to be affected by developments resulting from the activation of the Latin American Common Market (ALALC), the Land Reform Act of 1962, and the National Development Corporation (CORFO).

19. As a rule, only industrial firms whose staff is over 100 employ professionals and technicians. There are 370 of these (1963), of which twenty are food industries. Survey figures indicate that 658 professionals and technicians currently work in the food industry (of which 142 are without technical or professional training), plus 3,574 other employees ("skilled workers") and 15,308 labourers.

20. The rapid increase in output (5.2 per cent per annum) in the food industry, linked to a projection of the manpower state for professional and technical staff in 1963, indicates a demand for 692 such people by 1970, an increase of 176 over 1963. A rough estimate of the need for professionals and technicians in the near future indicates a figure of 287 people, of whom 81 require supplementary technical training. A figure of approximately 200 may be a useful guide. No estimates — other than standard proportionate figures — are available for employees and labourers.

(b) *Available training facilities*

21. In 1963, the only institution for specific training for the food industries was the bakery school. It has trained ten medium-level technicians and twenty specialized workers per year, but it is closed at the present time.

22. Seven institutions in four universities provide some facilities for post-graduate teaching, research and quality control. Only 5 per cent, or approximately sixty-five graduates from appropriate university faculties enter the food industry each year. There are at present no facilities for teaching skilled workers for the industry.

23. Four new institutes are planned to be soon in action and by 1966 they will be able to provide training for thirty professionals, twenty technicians and about 150 skilled labourers annually.

(c) *Systems and methods of education and training — general organizational problems*

24. A high proportion (one-third to one-half respectively) of present higher and intermediate-level management personnel have not had professional or technical training.

Skilled and highly-skilled workers

25. Four organizations in the planning stage, see (b) last paragraph. Courses provided by the Cannery Association of Chile are also envisaged for 1964.

Education and training of intermediate-level personnel

26. No institution separate from those mentioned in paragraph 27 below. No information on in-service training.

Education and training of higher technical and scientific personnel

27. By university studies, mostly in technical faculties, followed where appropriate by post-graduate studies, mostly in the United States of America:

Education and training of higher administrative and managerial personnel for industry as mentioned above for technical and scientific personnel;

Management development for public or private enterprise as mentioned above for technical and scientific personnel;

Inter-regional arrangements for education and training as mentioned above for technical and scientific personnel. There are no regional training facilities for the food industries.

(d) *Financial implications of creating and maintaining systems of technical education and training*

28. Annual budgetary allowances for colleges and universities are the major controlling factor in expanding activities.

(e) *Methods of training abroad of technical personnel*

29. According to the Chilean Society of Food Technology, forty-three Chileans have followed post-graduate courses on food technology in the United States of America. Seven have gone for such studies to Germany and France.

30. It is estimated that twelve persons will pursue graduate studies abroad annually when the four new institutions for education referred to in paragraph 23 above will be in operation.

Annexes to chapter 2

ANNEX A

Requirements of technical education and training for the Chilean forest industries¹⁷

1. SUMMARY

The forest industries in Chile were initially based on rich natural forests. During the last decade the emphasis has been gradually shifting towards industries procuring their raw materials for pulp, boards and sawn wood from plantations of short-rotation timber crops. Availability of cheap raw materials seems to justify the expected rapid growth of pulp, paper and board industries and of exports of newsprint and chemical pulp.

On the basis of the expected development of the forest industries and respective forestry activities, the requirements for technical personnel are estimated to grow as summarized below (excluding killed labour)

TABLE 2.A.1. ESTIMATED REQUIREMENTS OF TECHNICAL PERSONNEL

	1963	1970
Administrative personnel	34	90
Graduate engineers	39	140
Technicians	88	425
Foresters and forest engineers . . .	21	60
Rangers	35	195
TOTAL	217	910

Most of the university-level training is recommended to be carried out in the country. Some six to ten fellowships should be made available annually for post-graduate specialization abroad in research, technology and economics in mechanical forest industries and pulp and paper industries and in some special fields of forestry.

¹⁷ This annex is based on a paper on the subject prepared by FAO/ECLA/BTAO Pulp and Paper Advisory Group in Latin America.

Practically all technical education at the intermediate level is recommended to be carried out in the country as far as special education in forest industries is concerned. Foreign instructors may be made available for technical schools and on-the-spot training.

The above-mentioned education and training should be supplemented by short-term training centres, seminars and study tours, partly organized abroad in collaboration with FAO and similar organizations making use of available multilateral aid programmes.

Education and training of skilled labour should be given the highest priority.

Estimated increases in the requirements for technical personnel in the intermediate level and for skilled labour are so great that at least in the next few years great difficulties are foreseen in meeting these needs.

2. A REVIEW OF THE FOREST INDUSTRIES

The Chilean forest industries which were established on a modest scale on the basis of natural forests, during the last decade have obtained their raw materials more and more from the plantations of a quick-growing pine (*pinus radiata*). In particular, this is typical of the modern plup, paper and board industries of which the newsprint and chemical pulp industries have become notable export industries.

The sawmill industry is partly using broad-leaved species, mainly from natural forests of southern Chile and partly conifers: *araucaria* and, to an increasing extent, pine from plantations. In the early sixties the annual output was about 650,000 cu.m. of broad-leaved sawn wood and 500,000 cu.m. of coniferous sawn wood.

Out of the 1,371 sawmills during the 1962-1963 season, many small units operated only on a part-time basis and 256 were closed down. Only sixty-nine mills had an output over 2,400 cu.m. per annum. Mills using broad-leaved species have faced increasing difficulties in procuring adequate supplies of raw materials.

It is foreseen that during the period to 1980 the output of broad-leaved sawn wood and also the total number of sawmills will decrease, due to closing down of inefficient small units and local shortages of sawlogs. Consequently, the average output per mill and labour productivity will increase. Sawn wood made from plantation pine, which by 1962-1963 already amounted to some 90 per cent of coniferous sawn wood, will gain a larger share of the total output of sawn wood. The prospective development of the sawmill industry is presented in table 2.A.2.

TABLE 2.A.2. ESTIMATED DEVELOPMENT OF THE SAWMILL INDUSTRY, 1963-1970

	1963	1965	1970
Number of mills in operation ...	1,115	900	700
Output of broad-leaved sawn wood, 1,000 cu.m. per annum	640	640	500
Output of coniferous sawn wood, 1,000 cu.m. per annum	506	600	800
Share of plantation pine of the total output of coniferous sawn wood, per cent	90	90	95
Employment, persons	12,500	9,000	6,500

The veneer industry consists of three small plants with a total capacity of 1,500 cu.m. per annum. The prospective development of the industry (table 2.A.3) does not indicate any capacity expansion.

TABLE 2.A.3. ESTIMATED DEVELOPMENT OF THE VENEER INDUSTRY, 1963-1970

	1963	1965	1970
Number of mills	3	3	3
Capacity, cu.m. per annum	1,500	1,500	1,500
Output, cu.m. per annum	800	900	1,000
Employment, persons	100	100	50

The plywood industry, comprising two mills is being expanded by one mill with a capacity of 8,000 cu.m. per annum. Besides the original raw material, *araucaria*, some other species are being used. Difficulties in utilizing pine are expected to be overcome but prime logs of peeler quality are available only to a limited extent. The prospective development of the industry (table 2.A.4) seems to indicate problems in a full utilization of the capacity.

TABLE 2.A.4. ESTIMATED DEVELOPMENT OF THE PLYWOOD INDUSTRY, 1963-1970

	1963	1965	1970
Number of mills	2	3	3
Capacity, cu.m. per annum ...	13,000	21,000	21,000
Output, cu.m. per annum	8,000	12,000	18,000

The particle board industry consists of two plants of modest size, while a third factory with a capacity of 15,000 cu.m. is under construction. Raw material is pine from plantations and minor quantities of *araucaria* residues from a veneer mill. The presently low operating ratio of the industry is due to difficulties in processing and marketing which are hoped to be overcome in due course (table 2.A.5).

TABLE 2.A.5. ESTIMATED DEVELOPMENT OF THE PARTICLE BOARD INDUSTRY, 1963-1970

	1963	1965	1970
Number of mills	2	3	3
Capacity, cu.m. per annum ...	16,000	31,000	38,000
Output, cu.m. per annum	8,500	24,000	32,000

The fibreboard industry has one plant in operation; an expansion of the capacity is expected to be carried out by 1965. Raw material is derived from pine plantations. The problem of full use of the installed capacity is less serious than in the particle board industry (table 2.A.6).

TABLE 2.A.6. ESTIMATED DEVELOPMENT OF THE FIBREBOARD INDUSTRY, 1963-1970

	1963	1965	1970
Number of mills	1	1	1
Capacity, metric tons per annum	12,000	18,000	18,000
Output, metric tons per annum	10,000	15,000	17,000

The pulp and paper industry has undergone drastic changes during the last decade; it has been able to meet the domestic demand for pulp, paper and paperboard and also to gain export outlets, mainly to other Latin American countries. Pine from plantations is used as raw material for both groundwood and chemical pulp. The pulp and paper industry is at present dominated by one company with integrated production, while three other companies operating in the field are of modest size. Another larger company will start newsprint production by 1965. Owing to the cheap pulpwood available from pine plantations and also to the possibilities of improving economies through integration of the pulp and paper production with the sawmill industry and pine plantations; the pulp and paper industry is expected to expand rapidly during the sixties (table 2.A.7) and to develop into a major export industry during the seventies. The best export possibilities are foreseen for newsprint and chemical pulp.

TABLE 2.A.7. ESTIMATED DEVELOPMENT OF THE PULP AND PAPER INDUSTRY, 1963-1970

	1963	1965	1970
<i>Groundwood</i>			
Number of mills	3	4	4
Capacity, 1,000 metric tons per annum	62	120	200
Output, 1,000 metric tons per annum ..	60	115	190
<i>Chemical pulp</i>			
Number of mills	1	2	2
Capacity, 1,000 metric tons per annum	88	160	300
Output, 1,000 metric tons per annum ..	84	155	280
<i>Newsprint</i>			
Number of mills	1	2	2
Capacity, 1,000 metric tons per annum	66	140	230
Output, 1,000 metric tons per annum ..	65	135	225
<i>Other paper and paperboard</i>			
Number of mills	8	8	8
Capacity, 1,000 metric tons per annum	90	125	200
Output, 1,000 metric tons per annum ..	85	120	185

Estimated wood requirements and equivalent forest areas are presented in additional data (table 2.A.9) at the end of this annex, calculated on the basis of the estimated development of the forest industries (tables 2.A.2 to 2.A.7). It is anticipated that removals will increase from 1.8 million cu.m. in 1963 to 4.5 million cu.m. in 1970 and consequently the equivalent plantation area will grow from 130,000 ha to 290,000 ha while annual clear-routing of natural forests may decline from 9,500 ha to 8,000 ha.

3. REQUIREMENTS FOR TECHNICAL PERSONNEL

Requirements for technical personnel are estimated separately for (1) the sawmill industry, (2) wood-based panel industries (veneer, plywood, particle board and fibreboard industries), (3) pulp and paper industry, (4) tree plantations and (5) natural forests (table 2.A.8.). The estimates are based on the production prospects for the forest industries and trends in employment per unit of production, adjusted in accordance with local expert opinion. It should be emphasized that the estimates include only personnel directly employed by the industrial enterprises and in forest production and administration. Personnel for central government agencies, research, education, insurance, banking and shipping services, etc. are not included.

TABLE 2.A.8. ESTIMATED REQUIREMENTS OF TECHNICAL PERSONNEL, 1963-1970

	1963 (actual employment)	1965	1970
<i>Sawmill industry</i>	10	75	260
Administrative personnel	10	15	30
Graduate engineers	—	10	30
Technicians	—	50	200
<i>Wood-based panel industries</i>	27	39	39
Administrative personnel	4	6	6
Graduate engineers	4	8	8
Technicians	19	25	25
<i>Pulp and paper industry</i>	124	215	255
Administrative personnel	20	35	55

Mechanical forest industries	19	75	225
Pulp and paper industry	69	120	200
Foresters and forest engineers	21	35	60
Rangers	35	100	196

Note: Requirements for skilled labour (vocational training) are not included. Personnel research, education, etc. is not included. The figures are not rounded so as to reflect the accuracy of the estimates.

According to the education principle, the requirements for technical personnel are divided into the following categories: (1) industrial administrative personnel; (2) graduate engineers; (3) technicians; (4) foresters and forest engineers and (5) rangers (including those with education in engineering). The first three categories refer to personnel employed by the mills directly.

Personnel for industrial administration and management with university education needs, in the forest industries, a similar educational background as that for the manufacturing industries in general. The requirements of such personnel, some six to nine per annum in the forest industries during the period to 1970, are not excessive. Discussion on specific educational requirements and facilities is beyond the scope of this report.

Requirements for graduate engineers number around fifteen per annum from 1963 to 1970. As far as processing proper is concerned, in the mechanical forest industries, i.e. in the sawmilling and wood-based panel industries, the required educational qualifications are closely related to those for mechanical engineers, while in the pulp and paper industry they are very similar to those for chemical engineers. Instead of mechanical engineers, the mechanical forest industries can use civil engineers also in many instances because of similarities in education and of the use of products in construction and housing. How the specialized education in the

different forest industries should be provided is, by and large, a question of the scale of these industries and consequently of the number of engineers needed.

The annual requirements for graduate engineers in the mechanical forest industries are only some five or six in 1963-1970, and even this estimate is likely to exceed the actual recruitment. Much of the sawmilling industry is in units too small to justify the employment of graduate engineers. Nearly one half of the requirements for graduate engineers is for electrical engineers. Thus, the need for specialists in mechanical woodworking is limited to about three engineers per annum. Even considering that a few specialists in this field be needed for public services, the requirements for specialization can be met by making available annually two to four fellowships for overseas studies.

The annual requirements for graduated engineers in the pulp and paper industries are around ten to twelve in 1963-1970. Considering that the bulk of the industry will produce a few standard products, the requirements for specialized knowledge in pulp and papermaking are relatively low, but those for specialization in power and steam generation and distribution, process instrumentation, disproportionately heavy.¹⁸ Approximately one third of the total needs for graduate engineers will consist of specialists on pulp and papermaking. On the other hand, it is to be noted that the need for research-orientated engineers and scientists as compared with operational engineers is relatively more important in pulp and paper than in mechanical wood-working. It is concluded that a specialized course in the pulp and paper technology is justified within the department of engineering of a recognized university. For highly specialized training in pulp and paper, which is desirable to fill a few posts in the industry, teaching and research, it is preferable to rely on fellowships to engineering graduates, obtaining their post-graduate specialization overseas or at a Latin American school for pulp and paper.

The requirements for technicians ("engineers" with intermediate technical education employed by the mills) in 1963-1970 are nearly thirty in the mechanical forest industries and about twenty in the pulp and paper industries. As compared with the requirements for graduate engineers, the mechanical forest industries have very heavy needs for technicians, owing to the type of operations and to the numerous establishments.

The need for technicians in the mechanical forest industries could be even higher than thirty per annum if the technicians were available and if the sawmill industry was able to absorb a desirable number of technicians. It is foreseen that without special promotion for employment of technicians by the industries, the actual recruitment will not match the estimated needs. Requirements for technicians justify special educational programmes with subjects of mechanical and electrical engineering, wood technology and equipment for woodworking and mechanical handling and transport. Technicians in mechanical and electrical fields can substitute for woodworking technicians. For the time being lack of specialized education in this field is a major obstacle hindering the improvement and development of the mechanical forest industries.

About one half of the total requirements for technicians in the pulp and paper industry should have specialized knowledge of pulp and paper making, consequently around ten additional pulp and paper technicians should be educated annually, which number justifies a department of the engineering school at the intermediate level.

Requirements for foresters and forest engineers are increasing with the expansion of industries and a larger share of plantation-grown timber. Moreover, both the government authorities and forest industries are becoming aware that tending of forest resources will ultimately be profitable. In the case of plantations in particular, there is little difference of opinion as to the total number

of foresters and forest engineers, as well as rangers, necessary for planting, logging and other operations. Until now, agronomy engineers have been employed to be in charge of the plantations, together with skilled and less skilled labour who have advanced to positions of responsibility. In line with the growing importance of forest industries and their forestry operations and three plantations, there is no doubt that personnel with more specialized education will be necessary. Some five to six professional foresters and forest engineers are needed per annum. As stated above, this estimate refers only to "industrial" forestry operations. Even so, the figure is believed to be rather conservative.

Requirements for forest rangers for direct and indirect "industrial" operations to grow, cut and transport timber, seem to be about fifteen to twenty per annum.

In the time available for preparing this report, it has not been possible to estimate thoroughly the needs for vocational training. In the case of the sawmill industry, for instance, up to now vocational training has not been organized. It is not foreseen that the requirements for technically trained labour should be in the order of 50 by 1965 and 300 by 1970. Vocational training is needed immediately also in the pulp and paper industry. Such training should include the training of labour at present employed. In the pulp and paper industry, perhaps the highest priority should be given to vocational training because better possibilities exist to recruit technicians and engineers from general engineering fields.

4. REQUIREMENTS FOR EDUCATION AND TRAINING VERSUS AVAILABLE FACILITIES

While the previous chapter discusses the requirements for all technical personnel for the forest industries, the discussion on the available and proposed facilities is limited to specialized education and training in forestry and forest industries in 1963-1970.

University level

(a) It is recommended to make available for post-graduate training of mechanical engineers two to four fellowships per annum for specialization research, technology and economics in mechanical forest industries abroad.

(b) It is recommended to make available for post-graduate training of chemical engineers three to six fellowships per annum for specialization in pulp and paper research, technology and economics abroad.

(c) It is recommended to establish in the 1960's a course in pulp and paper technology on a university level, optional to chemical and mechanical engineering undergraduates, with an estimated capacity of three to five engineers per annum. University teaching should be combined either with pulp and paper research or with training of pulp and paper technicians.

(d) It is considered that the Universidad de Chile, Santiago and the Universidad Austral de Chile, Valdivia, with facilities for training forest engineers, should cope with the growing need for foresters and forest engineers for the requirements of the forest industries, estimated to be about five to six professionals per annum. For specialization in such fields as forest economics and timber marketing, it is recommended that one fellowship is made available annually to a graduate forester or forest engineer for post-graduate studies abroad.

Intermediate level

(e) It is recommended that the school for wood technicians, within the technical school of the Universidad Técnica del Estado, Concepción, established in 1963, be strengthened to cope with the estimated requirements of some thirty wood technicians per annum

¹⁸ Owing to the past educational patterns, the pulp and paper industry employs relatively many civil engineers.

and that promotion be carried out to make the industry aware and willing to absorb the obviously needed technical personnel at the intermediate level.

(f) It is recommended that a pulp and paper department be established at an intermediate technical school for chemical engineering, with a capacity of about ten technicians per annum. Admission of third year students in mechanical engineering to the pulp and paper department courses should be assured.

(g) It is recommended that short-term courses be organized, possibly in collaboration with FAO and ILO, to train intermediate technical personnel and skilled labour in sawmilling, lumber grading and seasoning and pulp and paper technology. Various international technical assistance programmes, both multilateral and bilateral should be helpful for short-term training on specific skills. Part of short-term training under the aegis of a government education agency, could be given by visiting teams in each of the major mills.

(h) To complement the recently established forestry schools on the university and vocational level, a ranger school is considered urgently necessary, to train fifteen to twenty-five forest rangers per annum, exclusive of those entering non-industry services.

Skilled and highly-skilled labour

(i) It is recommended that vocational training be made available to those entering the sawmills and pulp and paper industries. Consideration should be given to the establishment of such schools jointly by the government and industrial associations or enterprises.

(j) See point 4(e).

5. THE ROLE OF FAO IN EDUCATION AND TRAINING

In certain fields of specialized education and training for the Chilean forest industries, it seems that FAO could give advice and assistance in developing and carrying out necessary programmes. The following functions are considered desirable:

(a) To co-operate with government agencies with assessment of training requirements, establishment of priorities and establishing and designing of facilities and courses;

(b) To advise industries and other respective organizations of the needs for specialized education and training in forestry and forest industries;

(c) To provide personnel for education and training under the Expanded Programme for Technical Assistance and the Special Fund programme in Chile;

(d) To make facilities available for students and trainees from Chile when regional education and training programmes are carried out for Latin American countries in collaboration with FAO, whether in the form of regional institutes or training centres, seminars or study tours;

(e) To provide fellowships for studies abroad.

Additional data

TABLE 2.A.9. WOOD REQUIREMENTS AND EQUIVALENT FOREST AREAS

	1963	1965	1970
<i>Wood requirements delivered at the mill, 1000 cu.m.</i>			
Coniferous sawnwood	1,010	1,190	1,590
Broadleaved sawnwood	1,060	1,060	930
Veneer and plywood	21	30	45
Particle board and fibreboard	38	80	90
Groundwood	150	290	480
Chemical pulp	462	845	1,560

	1963	1965	1970
<i>Requirements for standing timber,^a 1000 cu.m.</i>			
Sawnwood plantation timber	1,140	1,340	1,870
Coniferous sawnwood, natural forests	130	150	100
Broadleaved sawnwood, natural forests	1,940	1,940	1,550
Veneer and plywood, natural forests	26	40	55
Particle board and fibreboard, plantation timber	42	90	110
Groundwood, plantation timber ..	167	325	540
Chemical pulp, plantation timber .	513	940	1,730
<i>Equivalent Forest Area,^a 1000 ha</i>			
Coniferous natural forest ^b	0.7	1.0	0.9
Broadleaved natural forest ^b	8.8	8.8	7.0
Plantations for sawnwood ^c	87	100	145
Plantations for "pulpwood" ^c ...	44	85	145

^a Assuming no utilization of sawmilling residues for pulping.

^b Clearcut area per annum, as presently practised.

^c In practice there is no distinct separation between sawlog and pulpwood plantations.

TABLE 2.B.6. FACILITIES FOR VOCATIONAL TRAINING FOR SKILLED WORKERS
MAINLY OUTSIDE THE EDUCATIONAL SYSTEM IN A NUMBER OF DEVELOPING COUNTRIES

Explanatory notes:

- (1) Most if not all of these countries have vocational and technical schools within their educational systems; these have not been included in the tables which follow.
- (2) The tables have been prepared on the basis of information available to the international organizations; it is realized that they may not be complete.
- (3) The indication that a country has a particular facility does not necessarily mean that the training is of the level desired and that it extends to all branches of industry.
- (4) The following symbols have been used in the sense indicated:

Initial training for youth

A—training entirely in industry;

B—combined forms of training, including such forms as apprenticeship involving initial training in a school or centre, as well as in-plant training, sandwich courses, or day or block release for

the purpose of related instruction, as well as training mainly in institutions but including periods of practical experience in enterprises;

C—initial training or retraining in specialized centres;

D—training on the job;

E—upgrading of skilled workers;

F—instructor training;

G—foreman and supervisor training.

ANNEX A

Training of personnel for small-scale industries *

I. INTRODUCTION

1. Because of the dynamic impact which rapid industrial growth has upon other sectors of the economy, including agriculture, and because of its direct impact upon social and institutional structures, governments of developing countries generally strive for accelerated industrial growth.

2. In many parts of the world — in developed as well as developing countries — small-scale industries play an important role in the continuing process of economic growth. In developing countries their role assumes greater importance.

3. One of the main problems facing the development of small-scale industries is the lack of technical knowledge among personnel. The purpose of this document is to discuss some important aspects of training for small-scale industries which will influence the course, growth, and survival of this important sector of the economy.

II. SOME CHARACTERISTICS AND PROBLEMS OF SMALL-SCALE INDUSTRIES

4. It is important to cite the principles which underline a general concept of small-scale industries.

(a) Small-scale industries are not limited to a particular type of activity. They cover a wide variety of products, such as food, chemical, pharmaceutical, electrical, metal, textile, carpentry, pottery, paper industries, etc. The products may be used for utilitarian or artistic purposes.

* Figures in parentheses relate to references appended to this annex.

(b) Production is not restricted to one particular method. Manual, as well as mechanical, means can be employed.

(c) Production is not confined to certain types of premises, but may take place in the home or in a central place, such as a factory; through individual or group effort.

(d) The establishments are small — the size being determined by the number of workers, fixed capital and value added. For the purpose of this document, the number of workers per establishment will not ordinarily exceed 100.

5. Small-scale industries, as they exist today, are handicapped by certain characteristics which tend to retard their promotion and development, and must be taken into consideration during the planning of a training programme. The following examples illustrate some of these problems.

6. *Lower wages.* In a small-scale industrial establishment, a worker's income is low when compared to that of workers in larger establishments. In Afghanistan, the monthly income of a worker in the small tanning units varies from 200 to 600 Afghanis, while his counterpart in the larger units earns 600 to 1,000 Afghanis per month (4).

In 1958, the majority of handloom weavers in India earned between Rs 30 and Rs 60 per month, while weavers working in larger industry earned between Rs 130 and Rs 160 (7). In Japan wage disparity by scale of establishments in manufacturing industries is striking. In 1959, for instance, while the wage index for enterprises with over 500 workers was 100, the index was 56.1 for enterprises with 30 to 100 workers, and 44.3 for those with 5 to 29 workers (1).

Because of higher productivity, large establishments are able to raise wages periodically without disrupting the establishments' economic position. Small-scale industrial establishments, with prevailing conditions, find it difficult to raise wages regularly, which means that workers in these establishments find themselves in an underprivileged position by comparison with those in large units.

7. *Longer hours of work.* The small-scale industries worker not only earns less money than his counterpart in larger industry, but

also works longer hours. In Japan, for instance, taking the working hours in establishments employing over 500 persons as the base, the index of working hours in 1958 for workshops using 30 to 100 hands was 109.5 (1). In Somalia, the hand weaver who weaves the "futa" works 10 to 11 hours per day (8).

Longer working hours and lower wages are the product of low productivity which is caused, in part, by the lack of efficient managerial skill, proper equipment and finance. Another factor which contributes to these conditions may be the organizational weakness of labour unions in the small-scale industries sector.

8. *Low level of management.* In most small establishments the owner usually undertakes the job of management, and may have little formal training for the varied and difficult work to be done. In many instances, persons who have experience in buying and selling may start small firms thus becoming owner-managers, but have little knowledge concerning the complex nature of industrial management. The lack of managerial skill contributes heavily towards low productivity in small-scale industries establishments.

9. *Lack of financial resources.* A persistent lack of finance for the purchase of effective equipment, better plant facilities, effective marketing and for operating expenses is one of the most common problems and typical characteristics of small-scale industries in many developing countries. Credit institutions are usually reluctant to assist small establishments because of the lack of adequate security; and, in most cases, when establishments secure money, it is on expensive terms.

This chronic shortage of money affects productivity and had an adverse influence upon the owner-manager's attitude towards training his personnel which may require an outlay of money.

10. *Lack of information.* While large establishments have easy access to, and benefit from, the vast amount of information available in many fields of technology and business management, getting this information into the hands of those who need it most, the small-scale industries sector, remains a constant perplexity. One reason for this is that managers of small establishments are often unaware of their need for information. Where they do realize this need, often they do not know where to secure the required information. Accordingly, small establishments are generally slow in catching up with technological advances.

11. *Low productivity.* There are many closely related factors which influence the general level of industrial productivity of small-scale industry in the developing countries. These factors may be divided into five main groups:

(a) Environment — such as existing social tradition, educational level, attitudes, natural resources, climatic conditions, living conditions and level of nutrition;

(b) Technology — such as the factory, equipment, technique of production and design; power and raw materials used;

(c) Management — such as production; cost control and accounting, personnel practices, marketing, purchasing and industrial relations;

(d) Labour — such as adaptability, attitude towards the job, co-workers and managements; ambition and willingness to improve, wages; effectiveness of labour organizations;

(e) Capital — availability of local and foreign currency.

Small-scale industry, in comparison to larger-scale industry, is generally hampered by low productivity per worker. In part this is due to the fact that often the best workers are not attracted to small firms because of wages and working conditions which are not comparable to those obtainable in larger establishments. Also in many developing countries, the people who finish school feel entitled to better positions than those offered in small firms, and invariably seek employment with the government.

III. THE NEED FOR TRAINING FOR SMALL-SCALE INDUSTRIES

12. As countries intensify their social and economic development, the trend to engage rapidly in programmes of industrial development becomes apparent. Because of the accelerated industrial development programmes in many countries, a growing force of local technical skills is required. In the Ten Year Plan (1958-1968) of Ceylon 130,000 persons are expected to find new employment in small-scale industries (10). In India, the new employment expected in small-scale industries by 1966 (5 years) is 900,000 (3). Two hundred thousand new skilled workers are needed in Pakistan for the implementation of the small-scale industries sector of the Five Year Plan, 1960-1965.

13. The foregoing examples are but a few which indicate the growing need for training which will provide the new and improved skills required for expanding industrial growth in the small-scale industries sector. If developing countries are to attain the goals to which they are committed, and which, if realized, will have a profound effect upon their socio-economic development, the urgency for training in small-scale industries becomes very great.

14. Sufficient training opportunities are needed for all levels of employment — from workers to managers.

15. In order to achieve a high standard of productivity it is important to augment the worker's skills so that he may successfully meet the challenge of modern methods and techniques of production. The worker may have to learn how to operate machines effectively, safely and economically. Alternatively he may have to learn how to handle materials, sort and process properly, inspect, pack and handle goods in storage and transportation. He must adapt himself to working in a factory; establish congenial relations with fellow workers; accept discipline and co-operate with management. If he has emigrated from a rural area, he must adapt himself to urban living.

16. The worker who is entering the industrial field for the first time is compelled to make adjustments on both a technical and social level, in a comparatively short time. All of this he must do if he accepts employment in an industrial establishment. To perform efficiently, however, he must have a minimum of effective training.

17. Management, with its responsibility to worker and consumer alike, as well as being a determining factor in the success or failure of an industry, requires intensive training in order to create the managerial skills which will profitably guide an industrial establishment.

18. The managerial skills required in small-scale industries are not less demanding than those required in their larger counterparts. A successful manager must know how to initiate, analyse business, and solve organizational problems, albeit of smaller magnitude. He must be able to develop good production standards in order to control production, estimate costs and determine wage incentives. In order to compete on the market, assure consumer acceptance and profit-making, he must know how to price his products effectively. A knowledge of the market for the purpose of determining type, quantity and quality of products to be manufactured is essential. In order to improve plans and programmes of activities he must know how to appraise his establishment's competitive position, be aware of fiscal problems, and understand how to use available loan facilities effectively. He must learn to delegate authority and maintain discipline. He must study the methods of selection, placing and training of personnel, and understand the field of human relations in order to minimize grievances and win the co-operation of his employees. Mistakes made by management are costly, and have a long range effect on business.

19. Experience, though valuable, has not proven to be sufficient in itself in creating the managerial skills required. Through the training of potential and present managers or owner-managers an appreciable increase in productivity can be expected as new

methods and techniques are learned and applied on the managerial level.

20. The supervisor who directs the work of others may be a master-craftsman or foreman. His duties, being varied, require numerous skills. He must know how to maintain quality and quantity of production, keep cost down, control waste, improve production methods, establish good working relationships with workers, managers or owner-managers, maintain discipline, provide leadership among the workers and promote high morale. The development of a good supervisor requires adequate training because he must not only be highly skilled technically, but must possess the managerial skills which are essential to the job.

IV. OBJECTIVES OF TRAINING FOR SMALL-SCALE INDUSTRIES

21. The goals of training for small-scale industries are varied. It seeks higher productivity per worker, an accelerated production of goods and services for local communities, an alleviation of the unemployment problem, a rise in the status of personnel; it also seeks to grant assurance to the industry of a safe and secure place alongside its larger counterparts.

22. Small-scale industries are primarily planned to aid in the socio-economic development of many countries, and are not intended to be a burden on the economy. To a certain extent, the protective measures which may be taken by governments can assist in developing national small-scale industries, but the incentive to grow rests with the industry itself. Small-scale industries can achieve success only when production stability is attained, products are of good quality, reasonable cost, and meet the need and acceptance of consumers. One important objective of training is to contribute towards attaining higher industrial productivity which will strengthen and broaden the scope of small-scale industries.

23. Training is not a goal in itself, but rather a tool to be used to assist in the production of goods and services of social utility at a competitive price.

24. As the standard of living improves in developing countries, the domestic requirements for industrial products increase. These countries import many industrial products which could successfully be produced by local small-scale industrial establishments. For instance, by following the importation figures in Libya over the period 1958-1961, a constant increase can be noted in the amount and value of imported industrial products. The figures in 1961 showed the following percentage increases: rugs and carpets 83, shoes 100, tiles and bricks 74, wood manufactures and furniture 148, and clothing 60.

25. The prevailing conditions in small-scale industries which have led to low wages and poor working conditions can be eradicated, in part, through training. Thus, one primary goal of training is the improvement of working conditions and wages.

26. Through training, better technology and managerial practices can be applied in small-scale industrial establishments, thereby making it possible for these industries to develop hand-in-hand with medium and larger industries. Through training, this important goal can be achieved whereby small-scale industries will share in industrial development and co-exist harmoniously with their larger counterparts.

27. As developing countries continue to press forward, the demand for new jobs increases accordingly. Training is one of many tools through which unemployed persons — and those who drift to the towns from rural areas — are able to acquire skills which will assist them in finding gainful employment.

V. SYSTEMS AND METHODS OF TRAINING FOR SMALL-SCALE INDUSTRIES

28. Planners in many developing countries have committed themselves to the goal of accelerated small-scale industrial develop-

ment. It is evident that formal technical education will not fulfil the immediate critical skill shortage existing in many countries. These countries will have to rely largely on training skilled workers for specific jobs or occupations through employment establishments or through a limited number of small-scale industrial training centres. It is not feasible, for instance, through formal education to expect to train about 200,000 new skilled workers who are needed for the implementation of the small-scale industry Five Year Plan of Pakistan.

29. The need to upgrade the skills of workers who are already employed is as pressing as the need for new skills. The worker lacks the financial resources to enable him to quit his job and seek formal education and training elsewhere. At the same time, industry's demand for better skills is urgent. Thus in-service training would seem to be the logical method of enabling existing workers in small-scale industries to become skilled.

30. As has been mentioned before, the supervisor's role is an important and varied one. If, in addition to appropriate vocational or technical school education, graduates are given the necessary in-service training, industry should then have well qualified supervisors. In-service training given to skilled workers who are selected and promoted to become supervisors can help to supply the additional technical skill and managerial knowledge required to carry out supervisory responsibilities.

31. In training the small *entrepreneur* and managers of small-scale establishments, a programme comprised of short courses, discussion groups, lectures, and the general exchange of experience can form the basis.

32. The various educational institutions such as technical or trade schools, colleges or universities can play an important role in training programmes. The physical facilities of these institutions can be put to use in off hours for the training of personnel. Staff members of these institutions can be called upon to assist in the preparation of training materials, to deliver lectures, or to present short courses which have been especially adapted to serve the trainees' needs.

33. Training for small-scale industries is often given by means also employed in training for large-scale industries — such as apprenticeship, institutional training, both in schools and centres, and on-the-job training. These training systems are not discussed in this document since they are dealt with in the report to which it is annexed. Reference will be made only to those systems which are particularly relevant to the small-scale industry sector.

34. Training-cum-production centres have been established in India, Libya, Pakistan and Thailand. An important feature of these centres is that training is combined with production work. In the early stages, the trainee is provided with theoretical and practical training in his craft. Later, when he has acquired some proficiency he is put on production work and also given some training in business organization and management. The advantage of this method is that production work gives the trainees confidence in their ability to produce goods of good quality while proceeds from the sale of goods help to minimize the cost of training. Maintaining a proper balance between training and production must be constantly sought. The training-cum-production centres are intended in some cases ultimately to become independent production units, owned and operated by the trainees.

35. *Group vocational training.* In Japan, for instance, group vocational training is a method designed to train technicians in the smaller industries, and is conducted by an organization which has been formed by small establishments which are individually unable to provide a training programme. The trainees who are employed in various establishments attend classes in a common place. The Vocational Training Law of Japan regulates this type of training. Those who complete the training course are favourably treated in their examinations to qualify for an engineer's licence. In 1959, 467 organizations comprising 18,123 companies with 38,894 trainees engaged in this type of group training scheme (1).

36. *Small-scale industry service institutes.* Many governments in developing countries such as Ceylon, India, Morocco, Pakistan, and the United Arab Republic have established small-scale industry service institutes which will serve as multi-purpose institutes. One of the main functions of these institutes is to train managers, foremen, instructors and skilled workers in techniques and management. The training is done through the institutes' workshops or demonstration vans which travel to rural areas. Aside from training, the institutes actively engage in research and industrial extension.

37. There are various opinions as to where responsibility for training for small-scale industries should lie and the question is a controversial one. Many governments are now, however, actively engaged in training programmes for small-scale industries. An example of this is Libya where the Ministry of Industry has a special department of training which formulates policies and conducts and finances training programmes for managers, foremen and workers employed in various plants. The first Five Year Plan of Libya includes about \$800,000 for the purpose of in-employment training for small-scale industries.

38. The Productivity Bureau in Belgium has developed a special programme for small enterprises which combines management training with direct assistance in the form of advice on management matters. This system of "self-organisation" groups eight to twelve enterprises which are represented by the person in charge of each establishment. In addition the Ministry of the Middle Classes supervises apprenticeship for small-scale industry. The State finances the programme through grants which are given to various organizations having its approval (11).

39. In Japan, the Ministry of Labour formulates basic programmes of vocational training. The government and the prefectural governments partly subsidize, for instance, the group vocational training for smaller industries.

40. In Italy, a separate administration which was set up in 1955 administers the Fund for vocational training of workers. The Fund provides financial support for those bodies which organize apprenticeship training for small-scale industries (12).

41. Some trade unions provide short courses and conferences for their members. For example, the International Union of Food, Drink and Tobacco Workers, in conjunction with the Organization for European Economic Co-operation, has organized training courses for bakery workers in Greece, and for beverage workers in Turkey (9).

VI. CONCLUSIONS

42. Populations in many developing countries are increasing at a fast rate, and the problems of unemployment as well as under-employment cause social and economic stress in various communities. Yet, a shortage in skills exists in various sectors of the economy. The skill shortage which exists in the small-scale industrial sector occurs among managerial personnel, technical personnel, supervisors, instructors and skilled workers. On the other hand, there is evidence of a labour surplus especially among the highly educated personnel in developing countries. In some instances, chemists or technologists may not be employed because of their feeling that present employment opportunities are beneath their status; or they may refuse to work in rural areas because they are apprehensive about living accommodation.

43. Various governments have committed themselves to rapid small-scale industrial development as a part of general economic and social development. These industries lean towards the labour intensive pattern so as to provide more jobs for the unemployed and tackle the problem of insufficient local capital. But being labour intensive does not necessarily mean that mechanical equipment is not used. On the contrary, the developing countries are striving to acquire a proper balance between increased employment and mechanization in small-scale industries in order to achieve

a higher rate of productivity. Once this is achieved, employers will benefit through higher profits; workers through employment and higher wages; and consumers through the availability of better quality local products sold at a competitive price.

44. The accelerated small-scale industrial growth which is taking place in various parts of the world requires many measures of support of which training is one of the most important expedients. Training does not function in a vacuum, but should be linked to production and to employment potentialities. Training for small-scale industries should also be a part of a general manpower strategy. This being the case, proper co-ordination machinery is necessary for the implementation of a well-rounded training programme. The government's role may be one of leadership in planning, but employers' and workers' organizations should not be precluded from participation in this task.

45. Although the government carries the burden of financing training schemes for small-scale industries, measures should be taken to encourage employer and worker participation which will thereby facilitate the execution of the training programme.

46. In-service training is an important method through which the pressing need for technical skills can be fulfilled. Although developing countries will create their own system of training which will satisfy local conditions, the experience of various countries in this field can prove to be a valuable aid.

47. Training for small-scale industries should not be conceived to enhance technical skills only, but should also endeavour to improve working and day-to-day relationships on the factory and community levels.

48. In support of training, a system of industrial extension which is adapted to the needs of each country should be developed. Regardless of whatever knowledge has been acquired by personnel in small-scale industries, the need for continuous assistance remains. Extension services can effectively provide the regular guidance and counselling needed by small firms, and will enable them to keep abreast of technological advances.

ANNEX B

A new system of apprenticeship in Latin America ¹⁹

1. The urgent need to accelerate the training of workers of all grades to provide the manpower required for economic development has led to the emergence of a new systems of apprenticeship and the establishment in a number of countries of special services for its application, SENAI and SENAC in Brazil, CONET in Argentina, SENA in Colombia, INCE (The National Institute of Educational Co-operation) in Venezuela and SENATI which was established in Peru in 1961. The essential features common to all the legislation adopted for the purpose may be summed up in the statement that in the five countries the authorities planned to meet the unsatisfied needs disclosed by examination of the social and economic situation through:

(a) The establishment of systematic training facilities for young persons who in fact could not go to vocational schools with an ordinary time-table, these facilities being so organized as to combine in the training process the particular advantages of a school with those of a work atmosphere and surroundings, by sending the trainees to school and to their place of work alternately (sandwich system, or co-operative courses);

(b) An obligation on employers to employ as apprentices a certain number of young persons who would be paid throughout their apprenticeship, both when at work and when receiving instruction, provided their attendance was satisfactory.

2. Originally the need was felt most acutely in the industrial sector, and the first services were established for industrial training — SENAI in Brazil and the CONET in Argentina. Later on the same system was applied to commerce in Brazil, with the establishment of SENAC after it had been shown that the training of workers for first-level occupations could be carried out along the same lines in both sectors and that the existing commercial training facilities had the general defects described above. These defects can be reduced to the fact that there was only inadequate make-shift training on the job for the great majority of young persons who entered employment on reaching the statutory minimum age, and that the systematic training organized in schools was available only to a very small minority of pupils training for occupations at the intermediate level or even higher.

3. When SENA was established in Colombia, the public authorities considered that the new system of apprenticeship was applicable to all economic sectors. Moreover, the ultimate objectives of the new training service, that is, the improvement of the workers' educational and technical qualifications and the raising of national productivity as a means of raising their standard of living without upsetting the country's economic balance, could be attained only by extending the service to the three major sectors of the economy — industry, commerce and agriculture. The same considerations underlay the establishment of INCE in Venezuela. Its objectives show an understanding of the educational and economic factors that enter into the vast problem of vocational training, and the wise intention of dealing with all of them in order to make progress. The objectives of INCE are: to promote the vocational training of workers in all the economic sectors of the country; to encourage and develop the apprenticeship of young persons by the establishment of special schools and the organization of apprenticeship

within undertakings in co-operation with employers and to co-operate in the campaign against illiteracy and contribute to the improvement of general primary education within the country as a means of promoting vocational training. The purpose of SENATI in Peru is to give basic and further training to young persons and adult workers, including supervisors and instructors in industry.

4. As regards the main methods used, the new national apprenticeship services have been obliged to resort to new methods of financing and administration. In view of the chronic shortage of budgetary funds, it is not surprising that a new source of revenue to cover the cost of vocational training activities on such a large scale was sought. Moreover, it would not have been sufficient to obtain one large allocation or funds, or even annual allocations: it was wisely realized that vocational training work would increase with economic development over the years and that it was for economic development itself, partly dependent as it was on the efficiency of vocational training, to contribute progressively to its support. It was therefore decided, in the five countries mentioned above, to introduce a special tax of 1 per cent — 2 per cent in Colombia — of the total payroll of undertakings covered by the relevant legislation, the receipts from this tax being used exclusively for the national apprenticeship services. This tax may be reduced to one fifth when a particular undertaking maintains an apprenticeship course approved by the national service, as occurs in Brazil and Argentina. To this source of revenue may be added another, namely an additional tax which is payable by undertakings that employ more than 500 workers, and is equivalent to one fifth of the basic tax; SENAI derives part of its income from such resources. There are two other new sources of revenue in Venezuela: the receipts from the basic tax are increased by an amount equivalent to 0.5 per cent of the sums paid to wage earners and salaried employees from annual profits, and by a contribution from the State equivalent to at least 20 per cent of the annual sum of the two totals previously mentioned.

5. Another common feature of these services is the firm desire, evident in the legislation under which they were established, for co-operation between the State, employers and workers. In the first place, it should be made clear that in the five countries there was no thought at any time of doing away completely with existing in-plant training schemes. On the contrary, their existence was recognized and they were incorporated in the new system, with provision for the rate of tax to be reduced when the courses were approved ²⁰ and they were made liable to inspection by the national apprenticeship service. This service also provides undertakings with technical aid in the form of job analyses, technical documentation and teaching material and services, including the loan of teachers and instructors; it also accepts instructors from undertakings in the upgrading courses it organizes for teaching staff. As a general rule, the national apprenticeship services have gone further still and encourage undertakings to establish their own apprenticeship sections. The services have taken this action in accordance with the principle ²¹ that they had been established, not to monopolize the provision of vocational training, but rather to fix standards for the activities of management in this field and to organize all the vocational training facilities required to supple-

²⁰ For Brazil, see, for example, section 5 of Legislative Decree No. 4048 of 22 January 1942, and Order No. 36A issued by the Ministry of Education under that Decree on 15 January 1943. The Order lays down the standards to which these courses must conform and provides for an agreement to be signed between the undertaking and SENAI.

²¹ In Argentina, the decree on apprenticeship already mentioned, after stating in section 1 that "The State shall be responsible for the supervision, inspection and control of the employment and apprenticeship of young persons from 14 to 18 years of age" proposes in section 8 that industrial establishments should separately or jointly organize courses for apprentices from 14 to 16 years of age, who are to work four hours a day. Section 9 requires such courses to be approved by the CONET. Section 10 provides for the CONET to establish half-time vocational schools to supplement the facilities established under section 8. In addition, sections 11 and 17 provide, respectively, for the CONET to organize continuation courses for young persons from 16 to 18 years of age, who are to work eight hours a day, and for the establishment of land colleges and factory-schools providing a combination of vocational instruction and productive work.

¹⁹ This annex is based on ILO, Seventh Conference of American States Members of the International Labour Organisation, Buenos Aires, April 1961 (Vocational Training), report III, pages 33 to 37. The text has been modified to take recent developments into account.

ment and extend the activities of undertakings or of employers' and workers' associations.

Secondly, the principle of co-operation between the State, employers and workers with regard to training was followed in the legislation establishing the new training services in the four countries mentioned, through the establishment of management, advisory and internal bodies which included representatives of the economic interests concerned. This principle is already applied in very many countries and recommended in many texts on the subject adopted by the International Labour Conference and the Regional Conferences of American States Members of the International Labour Organisation. In Brazil, the State entrusted the organization and management of SENAI and SENAC to the national confederations of industrial and commercial employers respectively. In Argentina, Decree 14538/44 gave responsibility for implementing the provisions governing apprenticeship and the employment of young persons to a Commission known as the National Apprenticeship and Vocational Guidance Commission, which is made up of representatives of the State and of employers' and workers' organizations.²² The Decree also provided, e.g. in sections 6 and 7, for consultation with joint committees of employers and workers prior to the setting of certain standards. In Colombia, Decree No. 164 of 6 August 1957 made a National Council and a National Directorate responsible for the management of SENA. The Council consists of representatives of the Government, the Roman Catholic Church, the organizations of employers in the three sectors of the economy and the trade union confederation with the largest number of affiliated unions. In Venezuela the management and administration of INCE, under the Act of 22 August 1959, will be the responsibility of a National Administrative Council and an Executive Committee. The former will consist of the chairman, vice-chairman and secretary-general, appointed by the President of the Republic, and of representatives of the Ministries of Education, Labour and Development, of organizations of farmers and of industrial and other workers, of the Chambers of Agriculture, Industry and Commerce, and of the Venezuelan Teachers' Federation. These organizations will appoint their representatives in accordance with their own rules. The Executive Committee will consist of a chairman, a vice-chairman, a secretary-general and two ordinary members. The first three will be the persons occupying the corresponding positions in the National Administrative Council. The two ordinary members will be appointed by the National Administrative Council from among its own members, and an attempt is to be made to ensure that private enterprise and workers' organizations have equal representation on the Executive Committee.

7. An examination of the main trends in vocational training for first-level occupations in Latin America shows that the urgent need for trained workers gave rise to the idea of a new system and, above all, to the introduction of a new means of applying this system.

ANNEX C

Examples of national training schemes for instructors

1. INDIA

*Central instructor training institutes at Bombay, Calcutta, Hyderabad, Kanpur, Madras and Ludhiana*²³

These institutes train instructors for industrial training institutes and in-plant training schemes.

²² Act 15240/59 merged under one body, the National Council of Technical Education, the CONET courses and schools and the network of vocational schools maintained by the Ministry of Education. The National Council of Technical Education consists of a chairman and seven members appointed by the Government; three of them are technical teachers, three representatives of employers' organizations appointed on the latter's recommendation, and one a representative of the recognized trade union confederation who is appointed on its recommendation.

²³ Scheduled to start operation in 1964.

Entrance qualifications required

Candidates should be matriculates between 20 and 40 years of age. In addition they should have eighteen months' experience of the trade they wish to teach, preference being given to diploma or certificate holders and/or to those employed as supervisors or instructors. These requirements may, however, be relaxed in favour of otherwise suitable candidates sponsored by government and private institutions or industrial establishments.

Courses given

- (a) Initial nine-months' courses.
- (b) Refresher training courses.

Content of training

The curriculum of the nine-months' courses covers:

- Practical work in the trade concerned;
- Related theory;
- Means and objectives of vocational training;
- Pedagogy, methodology and teaching practice.

The refresher courses are both technical and pedagogical, with a view to keeping instructors familiar with the latest methods of training and industrial production.

2. ISRAEL

Institute for training of instructors, supervisors and technicians

Sources of recruitment for future instructors

1. Among experienced workers (25 to 35 years of age) with five years' trade experience and a background of basic technical and general education of the level of a skilled trade.
2. Among young persons or adults at present undergoing training as workers:
 - (i) In full-time schools or industrial vocational training centres;
 - (ii) Under a system of apprenticeship (partly with the undertaking and partly in complementary courses).
3. Among young persons or adults at present undergoing training as technicians in schools or other training establishments of the necessary level under different systems, such as evening courses.

Courses provided

- (a) *Evening courses*, lasting two years (two or three times a week according to the trade).
- (b) *Day courses*, lasting one year or six months according to the category involved.

The six-months' courses are for the purpose of providing supplementary pedagogical training for unqualified instructors who are employed to instruct in vocational schools, apprenticeship workshops and vocational training centres. They take the form of evening classes over six months, supplemented by six half-days during vacations.

Content of other courses

Introduction to vocational education, educational psychology and general pedagogy. Applied mathematics and physics, practical teaching exercises in classrooms and shops under the guidance of experienced vocational training instructors, organization and work of machine and tool maintenance.

3. MOROCCO

*Training institute for vocational instructors in training centres outside the educational system**Entrance qualifications required*

Candidates should be at least 20 years of age, hold the certificate of vocational aptitude in their trade and have worked for at least two years in an enterprise. In practice it has not always been possible to meet these criteria and it has been necessary to accept youths of 18 to 20, who have just gained the certificate of vocational aptitude and have not had practical experience in an enterprise.

Course of training

The formal instructor training course lasts ten months, each week including twenty-four hours of practical training and sixteen hours of general and technical education. The last eight weeks, however, are devoted to applied pedagogy. After the formal course the newly trained instructors are posted to centres where their work is supervised by means of regular visits by members of the staff of the instructor training institute.

4. NIGERIA

*National training scheme for vocational instructors²⁴**Capacity of scheme*

It is anticipated that during the first four years of operation 113 expatriates and up to 300 other trainees will be trained as technical instructors.

Entrance qualifications required

Nigerians enrolled for courses as potential instructors are required to have the intermediate certificate of the City and Guilds of London Institute in the appropriate subject.

Courses given

(a) A short-term intensive course up to six weeks duration in the art of teaching for expatriates and local instructors in service in the region.

(b) A six months course of training for qualified Nigerian instructors in two three-monthly periods full time. The sandwich type of training is envisaged with three months in training, three months back on the job, followed by a further three months training. During the three months of full-time study instruction is given in the principles and practice of teaching as applied to vocational training, practical teaching in the classroom and workshop, the keeping of records and the setting up and marking of tests.

(c) For potential Nigerian instructors a two-year full-time course, during which practical training is given in the trainees' own trades, to bring them up to the final City and Guilds standard, as well as instruction in teaching techniques and practice. The course will include instruction in the efficient utilization and maintenance of tools and equipment, relating theory to practical work, lecturing and workshop demonstrations. The subject matter covered gives trainees an opportunity to qualify to take the examination for the City and Guilds Technical Teachers' Certificate.

5. URUGUAY

*Instructor training centre of University of Labour**Entrance qualifications required*

The candidates selected are required to have a good general education and some technical training as well as at least four years of practical experience in the trade.

Training given

Instructors are given training for instructional work at intervals throughout their career or after having worked in industry. The courses given include:

- (a) Further training for existing instructors and teachers of the University of Labour;
- (b) Further training for instructors working in enterprises;
- (c) Basic training given to future instructors without previous experience.

The training includes practical work in the trade, related theory, means and objectives of vocational training, training in schools or centres and in-plant training, pedagogy, methodology, and teaching practice.

Duration: a minimum of 1,000 hours is required for basic training; for courses of supplementary training, the length may vary.

ANNEX D

In-plant training of graduate engineers in developing countries

I. INTRODUCTION

1. Each year many young engineers graduate from universities and colleges in the developing countries. At the moment of embarking upon their careers, they and the industries which they will serve are confronted with an increasingly serious problem. It is the problem of how to bridge the gap between the fundamental knowledge gained at the university and its application in industrial practice. In-plant training is one way of helping young engineers to bridge this gap. It is being increasingly recognized in many industrial enterprises in the developing countries that the solution of the problem should not be left to chance; in other words, that it would not suffice to attach the graduate as an apprentice to technical personnel and hope that he will obtain the required experience in a reasonable period of time. There is a need to provide systematic and closely supervised guidance to the graduates in applying the basic scientific principles learned at the university to the many practical problems arising daily in the factory.

2. In-plant training should be of particular interest to newly industrializing countries where scientifically trained personnel are scarce and where, because of this, responsible functions of a managerial nature often have to be performed by recently graduated, newly recruited engineers. Very often this results in the creation of a cadre of "office engineers". There is also a tendency on the part of such a group, partly because of social factors and partly because of circumstances, "not to dirty their hands with grease" in the plant. Actual experience, although for short periods, in the various departments of the plant under close supervision will provide the trainee with the necessary background and framework for undertaking suitable responsibility quickly and efficiently.

3. The wide gap between the skills obtained at the universities and the skills needed in industry is being increasingly appreciated in the developing countries; consequently, some attention is being given to this problem and various in-plant training programmes

²⁴ The scheme also caters for supervisors.

are being considered. In India, training programmes for the iron and steel industry, forge and foundry, technology, fertilizers, etc., have been evolved and satisfactory results have been obtained. Other countries are sending engineers in large numbers to the developed countries. However, they are experiencing difficulties, not only in the form of allocation of scarce foreign exchange resources for such training, but also in terms of placement facilities in factories for on-the-job training.²⁵ This calls for evolving training facilities within the countries as far as possible and also co-operation of the industrial establishments in facilitating placement of participants of the in-plant training programme.²⁶

II. CONTENT OF THE IN-PLANT TRAINING PROGRAMME

4. Since the in-plant training programme is designed to fill a gap in the first instance, each programme of training will have to be tailor-made for the situation. Whether it should form a permanent feature of the country's network is a question that needs to be explored further. This is a much more complex problem, in view of the fact that it involves basic policy questions on national education.²⁷ An effort is made here to present a skeleton of a programme which is essentially based on the experience of industrial countries in Europe.

5. Published information on the subject is scanty. Most of the training programmes in the United States and European countries have been undertaken by the private industrial establishments, and information on such programmes is not readily available. The following training programme, for example, was recommended by the Council of the Institute of Mechanical Engineers of the United Kingdom. The programme would consist of two successive stages. The first, lasting from six to nine months, would provide basic practical training and would take place at the university. The second would last fifteen or eighteen months; training would take place at the factory and would cover research, operation and maintenance of equipment, sales, design, product and process development, and production. In another case, a two-year programme was carried out in a large metal-working plant and was divided into two equal periods. During the first year, theoretical courses were provided for one week at the beginning of the training, for another week at the end of three months, and for a further two weeks at the end of six months. About three months were devoted to training in the workshops, three months to assembly of mechanical equipment, and six months to work in the tool-room, fabrication, machining and mechanical testing departments. Towards the end of the first year, interviews with the students were arranged in order to plan the second year programme. During the second year, specialized training was provided, according to the interests of the students, in design, development, research and other occupations. Some theoretical courses in these fields were provided for two weeks at the end of the programme.

6. Some specialists think that the two-year duration of these programmes is unnecessarily long for university graduates.²⁸ In their view, careful analysis and planning of the programme might cut the length of training to between ten and fifteen months, while maintaining comparable education standards. The United Nations Centre for Industrial Development recently undertook a survey of experience in this area in the leading industrial establishments in Europe. Some material on the available experience from the

developing countries was also collected with a view to evolving an in-plant training programme. Certain elements of training emerge from this experience and they can be phased as follows: (a) general introductory training; (b) practical experience and follow-up on the training and assessment of career progress; (c) short-term courses with specific objectives.

7. The general introductory training aims at providing an overall orientation of the problem of the specific industry or plant in which the trainees are expected to work. The trainee, at this stage, would be given a review of the work of the industrial establishment including its development opportunities in the light of the country's industrial development plans. The general introductory training should include a thorough review of the functions within an industrial enterprise with a view to developing an understanding of the contributions and limitations inherent to each function and the interdependence between the various functions, especially between the technical and non-technical ones.

8. The nature of training under the category of practical experience varies with the career pattern a trainee would like to follow. For young scientists and engineers who are expected to start in an industrial research function at the company's laboratories, the practical period may be restricted to a brief orientation in the departments directly associated with the laboratory's work, such as process and product design, testing and quality control, technical trouble-shooting, etc. An orientation on the work of external research institutions may further be desirable. In the research function itself, the trainee may also be instructed in the use of research procedures, experimental design, data-processing and documentation analysis techniques. The total period may be relatively short as the scientists and engineers are primarily engaged in specialized professional work close to their university education and mostly to be executed personally.

9. The training of young engineers for production-management functions will generally require a relatively longer period. The trainee is in the first place expected to acquire a thorough knowledge of products, materials and manufacturing processes of the industrial establishment. In the mechanical industries such a training would generally require four to six months or even longer. In addition, orientation may be desirable in complementary processes. For mechanical industries these may, for example, be the industries supplying the raw materials (metals, basic and foundries) and the industries utilizing the company's products (e.g. food industries in case of a manufacturing company of food equipment). Furthermore, a period of orientation or experience will be advantageous in various technical and non-technical staff departments (design, sales-engineering, purchasing, etc.). In developing countries, where industrial enterprises may not have developed such staff departments to the same extent, this part of the training could be considered at various industrial institutions, e.g. applied research or industrial extension institutions. It may also be highly desirable to include a thorough appreciation of vocational training work and even to gain ability in vocational instruction technique.

10. The short courses for the support of career development cover a variety of specific objectives, such as:

- (a) Information on new technological developments;
- (b) Evaluation of general progress in the branch of industry — continuation at a more advanced level of the similar training during the general introduction period;
- (c) Training in specific professional techniques, e.g. costing, investment-analysis, statistical quality control, market analysis;
- (d) Management training at various levels — supervisory, middle and senior management, and also research administration;
- (e) Information and consultation of participants on certain company plans and policies.

The programming of these courses will generally be done on short term, say for periods of six to twelve months.

²⁵ See chapter 5. According to a survey of experience in training of fellows in industrial development, 3 per cent of the total surveyed were placed in the industrial establishments in the developed countries. See *Industrialization and Productivity Bulletin* No. 6, United Nations publication, Sales No.: 63.II.B.1, page 49.

²⁶ See chapter 3.

²⁸ Institute of Mechanical Engineers, *Report on Practical Training*, London, 1958, appendix A, "Comments on Existing Schemes".

Skeleton of in-plant training programme

UNIVERSITY	FACTORY				FIELD OF WORK			
Basic training (to be carried out preferably at special training workshop of engineering college) Lectures and exercises in: Bench-work and fitting Machine shop operations Metrology Foundry-work Metal joining, forging, hardening Assembly				Office work	Production and staff management			
			Experimental work	Office work	Design, and product and process development			
			Experimental work	Office work	Sales			
			Plant, shop and office work		Operation and maintenance of equipment			
	Work on factory floor	Office work	Experimental work	Research work	Research			
	6	9	12	15	18	21	24	Months

11. The combinations of various training activities should, as mentioned previously, constitute entities aimed at the development of particular branches of industry. Periodic assessment of career progress is needed. Within a particular establishment this can be related to the individual person. For a whole branch this assessment would generally follow a pattern of periodic reviews of planning and programming, as indicated above.

III. ROLE OF THE UNITED NATIONS

12. The role of the United Nations in this area is twofold: first, to obtain information and to clarify the nature and purpose of training programmes; secondly, to provide technical assistance to the Governments in formulating and implementing training projects. The task of collecting information of existing in-plant training programmes in both developed and developing countries has been initiated by the United Nations Centre for Industrial Development.

13. The United Nations can assist in the formulation and implementation of in-plant training programmes in the developing countries through its several programmes of technical assistance and co-operation. Since these programmes will have direct impact in enhancing the supply of engineering skills, they provide a suitable area for Special Fund financing within the general framework of Special Fund assistance in the field of technical training.

14. Through the United Nations fellowship programme, the developing countries are arranging individual training programmes in the developed countries. The experience obtained in the operation of the United Nations fellowship programme in industrial development is instructive for the formulation of the in-plant training programme. Difficulties have been encountered in obtaining placement facilities in factories. On the other hand, study-tours for fellows have been easier to arrange. While study-tours are useful, they are not a substitute for practical experience in the plant. In order to enhance the value of the fellowship programme, group training possibilities are being explored in some developed countries, with a view to obtaining placement facilities in plants.²⁹ Preliminary discussions are under way in a few eastern European countries to obtain such facilities. This would also assist in the utilization of the local currencies made available by the respective Governments to the United Nations Expanded Programme of Technical Assistance.

15. While establishment of in-plant training facilities in the developed countries should be welcomed wherever possible, the emphasis will have to be on establishing training facilities in the developing countries themselves. Very few developing countries, however, have a network of advanced industrial establishments and suitable technical institutions. Therefore, efforts must be made to establish certain regional in-plant training facilities in selected developing countries where basic facilities and the co-operation of the Government and the industries are available. The fact that training could take place in an institutional setting presenting many of the basic economic and social characteristics of the developing countries would contribute to its effectiveness. Such regional training programmes might also present advantages from the standpoint of cost.

ANNEX E

Research projects undertaken by the United Nations family in education and training

I. GENERAL SUBJECTS

- (1) Employment objectives in economic development and employment policy.

This project covers three major areas of research:

Employment creation in relation to industrial development;

Factors to be considered in determining what choice might be necessary between employment growth, changes in the conditions of employment, and patterns and rates of economic growth;

Formulation and implementation of policies for increasing employment.

- (2) Problems of development of small-scale and handicraft industries
- (3) Methods of forecasting requirements for technical personnel for economic development in general and particularly for industrial development.
- (4) Changes in the occupational structure of the labour forces and the composition of occupations. This project will consist of four studies covering:

Analysis and evolution of the structure of the labour force by economic sectors, industrial branches and typical enterprises, according to the various degrees of development;

Comparative study of occupational structure in given industries, in countries at different stages of development;

Revision of the International Standard Classification of Occupations; and

Establishment of an occupational classification by levels of education.

- (5) The economic problems of technical education and vocational training in developing countries, with a view to establishing a basis for long-term planning.

This project will cover such aspects as:

Determination of priorities in technical education and vocational training, by examining such questions as:

Whether it is possible to define for certain levels of development an appropriate structure and minimum facilities for training. This will require efforts to develop a system of measuring the development of human resources with the idea that a set of indicators must be assigned to the measurable components of human resources, such as education and occupation, and that the concept itself will be defined in terms of these components, first, within a national or regional setting which will lead, secondly, to an international comparison;

What economic results might be obtained from developing certain education and training facilities above the minimum, e.g. the possibility of organizing shift-work, longer life for equipment, increase in output and employment and what data would be required for these results to be measured in concrete terms;

Determination of the costs in developing countries of the various systems of technical education and vocational training—e.g. in-plant training compared with training in institutions—in terms of foreign and national currency, of real and monetary costs;

The extent to which use is made of the various systems of technical education and vocational training and the return they give;

Methods for organizing and planning education and training in relation to general development policies (economic, manpower and educational plans): administrative structures and national institutions.

- (6) Studies and advice on the national planning of technical education and vocational training, including their organization and structure.

²⁹ See chapter 5.

- (7) A study on education and training methods and programmes and on problems of status and training for teaching staff.

It is hoped to devote particular attention to:

- The methods used for preparing training programmes, the role, organization and operation of offices or services responsible for training methods, and the possibility of preparing basic programmes for given occupations.
- (8) The place of management education and training in the national training network.
- (9) The establishment of inventories of training institutions in selected fields of industrial development.
- (10) The assessment of needs for technical education and vocational training in selected industries.
- (11) The role of scientific and professional societies in developing countries.

II. RESEARCH IN SPECIFIC PROBLEMS OF EDUCATION AND TRAINING IN INDUSTRY

The subjects include the following:

- A. Training of economic administrators in industrial development;
In-plant training of graduate engineers;
Training of workers in maintenance and repair services;
Training requirements for welders;
Trade tests and examinations;
Training of technicians;
The organization and development of in-plant training.
- B. The general scientific background and technical specialization of technicians;
Changes in course content of general technical subjects as a result of advances in science;
Problems of engineering education in the developing countries.
- C. Studies of management development problems such as:
The adaptation of management techniques to the requirement of small-scale industry;
The application of work study to public works, especially earth-moving;
The use of labour intensive methods in employment.
- D. Studies in the field of occupational health, such as:
Occupational fatigue;
Textile dust;
The impact of industrialization on the health of workers.
- E. Study of specific problems concerning the social and economic conditions of engineers and higher technicians in both developing and industrialized countries.
- F. Studies of the professional training of highly specialized personnel of all grades in the developing countries, for instance in meteorology, telecommunications and civil aviation.
- G. Studies on problems connected with the development of local resources and local engineering planning such as:
Low-cost housing in the tropics.

III. SPECIALIZED INSTITUTES

A large amount of the above work can be carried out by the specially established institutions, such as:

- (a) The International Institute for Educational Planning of UNESCO;

(b) The International Vocational Training Information and Research Centre at the ILO;

(c) The Institutes for economic development and planning set up in Africa, Latin America and Asia by the United Nations;

(d) The Inter-American Vocational Training Research and Documentation Centre established by the ILO in Latin America;

(e) The International Computation Centre established by UNESCO in Rome;

(f) The International Occupational Safety and Health Information Centre established by the ILO in Geneva;

(g) The UNESCO School Construction Bureau for Africa in Khartoum;

(h) The Asia Institute of School Building Research established by UNESCO in Bandung, Indonesia.

Annexes to chapter 5

ANNEX A

Questionnaire to the developed countries on industrial training of technical personnel from the developing countries

I. INTRODUCTION

1. The General Assembly at its seventeenth session adopted resolution 1824 (XVII) on the role of the United Nations in training national technical personnel for the accelerated industrialization of the developing countries. In the operative part of the resolution, the Secretary-General is requested in co-operation with the Member Governments and in consultation with the Technical Assistance Board, the Special Fund, UNESCO, ILO and other agencies to prepare a report which would include:

“(a) An estimate of the requirements of the developing countries, whenever possible according to their developing plans, for technical personnel of the intermediate and higher levels and an estimate of the available possibilities for training such personnel in those countries, using, *inter alia*, the methodology and techniques for assessing those requirements the formulation of which is envisaged in the programme of work in the field of industrialization of the Committee for Industrial Development;

“(b) Information concerning methods of training national technical personnel in various countries, taking into account the experience of States with different social and economic systems;

“(c) Information concerning the progress being made in the training of technical personnel for the developing countries in the industrially advanced countries, and the methods employed;

“(d) Proposals for measures within the United Nations system and the recommendations to the Governments concerned with regard to intensifying the training, and improving the facilities for the training, of national intermediate and higher technical personnel in the developing countries and, where appropriate, on an intra-regional basis.”

2. The present questionnaire is specifically concerned with the implementation of item (c) of the above-mentioned resolution.

II. GENERAL CONSIDERATIONS

3. The term “technical personnel of the intermediate and higher levels” has been defined to cover skilled workers, foremen and engineers including top management. For this purpose, the term “industrialization” has been defined broadly to include manufacturing, transport, energy and other supporting services.

4. It is realized that the area to be covered in the questionnaire is not only vast but there are difficulties of defining the various categories of personnel for whom the information is requested. The following broad definitions may be considered in preparing the reply to the questionnaire.

(a) *Skilled workers.* Persons who have received a broad education and training in the exercise of a trade or craft in a particular field. These persons have normally undergone a certain number of hours as apprentices in a factory and can set machines and take work from daily paid or unskilled workers. (Example — tool and die maker, repair and maintenance mechanics.)

(b) *Foremen or technicians.* The term applies to persons in occupations requiring a knowledge of technology and related sciences between that of a skilled worker and that of an engineer; duties at this level would require inspection and maintenance, detail development plans, supervision of production work, etc.

(c) *Engineers or technologists.* The term applies to persons working in occupations for which the need of education in appropriate sciences in universities or equivalent institutions of higher education is officially or traditionally recognized; this level of occupation would cover such activities as research, development, organization and production.

(d) *Management.* Personnel for making decisions and supervising their implementation.

5. It is possible that a particular country may wish to present its material based on a separate set of definitions. In this case, it would be appreciated if such definitions could be spelled out in the reply to this questionnaire.

III. REPLIES TO THE QUESTIONNAIRE

6. Difficulties may be encountered in answering all the questions owing to lack of the data and time required to provide information. However, it would be appreciated if efforts are made to provide the maximum data on the various subjects mentioned in the questionnaire.

7. In addition to the Governments filling out the questionnaire, it would be most useful if this questionnaire could be sent by them to a few large industrial establishments which have foreign operations in order to obtain valuable information on the manner in which they tackle the subject of training under joint-venture schemes and mutual agreements between parent and local-subsidary concerns.

Questionnaire

I. GENERAL INFORMATION

1. Give a brief account of the programmes and projects undertaken by the Government for training of technical personnel (in industry) coming to the country from the developing countries.
2. Give details or organizational machinery, if any, to deal with the training of technical personnel in industry from abroad. Please send reports, if any, issued by the Government.
3. Indicate, briefly, the role of such organization in handling United Nations Fellows undergoing training in the country.
4. Enumerate, with the help of statistics if possible, the efforts of the Government in assisting the developing countries in the countries themselves.

II. TRAINING OF TECHNICAL PERSONNEL FOR INDUSTRIALIZATION

5. How many were trained in the country during the last few years in the following broad fields:

Categories	Professional and scientific personnel	Engineers	Tech- nicians	Foremen	Skilled workers
a. Chemical					
b. Mechanical					
c. Electrical					
d. Civil					
e. Management techniques					
f. Production engineering					
g. Business administration					
h. Other					

6. What is the average duration of training for the above-mentioned?
7. Briefly indicate the nature of financing their training and, if possible, average cost of training for the following categories:
 - (a) Top and middle management;
 - (b) Engineers and technicians;
 - (c) Foremen and skilled workers.

III. METHODS OF TRAINING

8. How is the training programme formulated? (i) by the trainees prior to their arrival? (ii) by consulting the Agency which handles their training after their arrival? (iii) by the institution which finally accepts them for training?
9. What is the general preference of the trainees (also in terms of the time spent)? (i) university degree; (ii) placement in the industrial establishments; (iii) general observation tours of industrial and related establishments.
 - (a) Top and middle management
 - (b) Engineers and technologists
 - (c) Foremen and skilled workers
10. What criteria do you use in selecting personnel from the developing countries for training abroad?
11. Give data, in order of largest number of trainees, on the trainees under the following:
 - (a) on the job (production and workshop);
 - (b) In the office (administration, sales, etc.);
 - (c) Special institutional courses (seminars, conferences, summer schools, etc.);
 - (d) Observational tours.

12. What is the size of requests for the developing countries for:
 - (a) Group training;
 - (b) Individual training.
13. Does the Government specifically encourage group training, and if so, why? What measures have been undertaken to encourage group training in the developing countries before the trainees leave their countries?
14. What is the period for general orientation training, if given, for the categories of personnel listed under 5 above?

IV. OTHER MATTERS

15. Is there any follow-up of the trainees after they return to their countries?
16. Has the Government attempted evaluation of its training programmes? If so, please provide a copy of such evaluation.

ANNEX B

List of countries to which questionnaire was sent

Australia	France	Netherlands	Switzerland
Austria	Germany, Federal Republic of	Romania	Union of Soviet Socialist Republics
Belgium	Hungary	New Zealand	United Kingdom
Canada	Italy	Norway	United States of America

DOCUMENT E/3967

Report of the Economic Committee

[Original text: English]
[6 August 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President, Mr. Akira Matsui (Japan), considered at its 349th, 350th and 352nd meetings on 5 and 7 August 1964 (E/AC.6/SR.349-350 and 352 item 12 of the Council's agenda which had been referred to it by the Council at its 1342nd meeting on 4 August 1964.

2. The Committee had before it a report by the Secretary-General entitled "Training of National Technical Personnel for Accelerated Industrialization of Developing Countries" (E/3901 and Corr.1 and Add.1-2).

3. The Committee received a draft resolution on this item which was submitted by Argentina, Ghana and the United States of America (E/AC.6/L.302). Subsequently the delegations of Chile, Ecuador, France, Iran, Iraq and Yugoslavia joined the co-sponsors of this draft resolution.

4. The sponsors agreed to accept the following changes in the text of the foregoing draft resolution:

(i) In the final preambular paragraph, the words "in attaining the objectives of the United Nations Development Decade" were replaced by the words "in the achievement of the rapid and self-sustained economic growth of developing countries";

(ii) In operative paragraph 1, the words "the heads of" were deleted;

(iii) In operative paragraph 2, the word "Endorses" was replaced by the word "Notes";

(iv) In operative paragraph 3, the words "and the International Atomic Energy Agency" were inserted after the words "to the specialized agencies";

(v) The following words were added at the end of

operative paragraph 5: "to review the comments and recommendations requested above, and to report thereon to the Economic and Social Council;";

(vi) Operative paragraph 6 was revised to read as follows: "6. *Undertakes* to report further to the General Assembly when the Secretary-General's report requested above has been received and considered by the Economic and Social Council;";

(vii) In operative paragraph 7, the words "the United Nations" were moved to precede the words "the Expanded Programme of Technical Assistance", and the words "the International Atomic Energy Agency", were inserted after the words "the specialized agencies";

(viii) In operative paragraph 8, the word "Invites" was replaced by the words "Recommends to", and the words "to give consideration to" were replaced by the words "and the International Atomic Energy Agency to give all the consideration they merit to";

(ix) The final part of operative paragraph 9 was redrafted to read as follows: "... the projection of technical personnel needs with national development plans and with the physical resources potential of the countries if these plans are to be implemented and resources effectively utilized for economic and social development."

5. The Committee then approved unanimously the nine-power draft resolution E/AC.6/L.302 as revised orally by its sponsors, and therefore recommends to the Council the adoption of the following text:

Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL

1029 (XXXVII). Training of national technical personnel for the accelerated industrialization of developing countries

The Economic and Social Council,

Recalling General Assembly resolution 1824 (XVII) of 18 December 1962 on the role of the United Nations in training national technical personnel for the accelerated industrialization of the developing countries,

Having considered, but without benefit of the views of the Committee for Industrial Development, the report prepared pursuant thereto by the Secretary-General,³⁰

Noting the conclusion of the Advisory Committee on the Application of Science and Technology to Development that "the main scientific and technological resources of a country lie in its trained people",³¹

Considering that the provision of trained personnel in adequate numbers and covering appropriate skills is an essential element in the achievement of the rapid and self-sustained economic growth of developing countries,

1. *Expresses its appreciation* to the Secretary-General and to the specialized agencies concerned for their valuable report, which can serve as a useful basis for future action;

³⁰ E/3901/Rev.1 and Add.1, and 2.

³¹ E/3866, para. 52.

2. *Notes* the recommendations for action by developing countries and by international organizations;³²

3. *Transmits* the report of the Secretary-General to the specialized agencies and the International Atomic Energy Agency, to the regional economic commissions and to the Committee for Industrial Development for their comments and recommendations;

4. *Transmits* the report of the Secretary-General to the General Assembly;

5. *Requests* the Secretary-General to transmit the report to Governments for their comments and recommendations, to review the comments and recommendations requested above and to report thereon to the Economic and Social Council;

6. *Undertakes* to report further to the General Assembly when the Secretary-General's report requested above has been received and considered by the Economic and Social Council;

7. *Draws the attention* of Governments of developing countries to the desirability of taking into account

the crucial importance of such training in preparing requests for assistance from the United Nations, the Expanded Programme of Technical Assistance, the Special Fund, the specialized agencies, the International Atomic Energy Agency and from other Governments;

8. *Recommends* to the Governments of States Members of the United Nations or members of the specialized agencies or the International Atomic Energy Agency to give all the consideration they merit to requests from developing countries for assistance in intensifying the training of intermediate and high-level technical personnel;

9. *Suggests* to the Governments of States Members of the United Nations and the various organs of the United Nations system the importance of co-ordinating the projection of technical personnel needs with national development plans and with the physical resources potential of the countries if these plans are to be implemented and resources effectively utilized for economic and social development.

*1348th plenary meeting,
13 August 1964.*

DOCUMENT E/3936

Report of the Economic Committee

[Original text: English]
[22 July 1964]

1. The Economic Committee, under the chairmanship of the First Vice-President of the Council, Mr. Akira Matsui (Japan),¹ at its 341st to 344th meetings on 14, 15 and 20 July 1964, considered item 13 of the Council's agenda (The role of patents in the transfer of technology to under-developed countries) which has been referred to the Committee by the Council at its 1314th meeting held on 13 July 1964.

2. The Committee had before it the following documents: report of the Secretary-General on the role of patents in the transfer of technology to under-developed countries (E/3861) and a note by the Secretary-General on the same subject (E/3861/Add.1).

3. The Committee also received the following draft resolutions in connexion with its consideration of this item: a draft resolution submitted by France and the United Kingdom of Great Britain and Northern Ireland (E/AC.6/L.295/Rev.1 and Add.1); and a draft resolution submitted by Algeria, Chile, Czechoslovakia,

Ecuador, India, Indonesia, Iraq, Mexico, United Arab Republic and Yugoslavia (subsequently joined by the United Republic of Tanganyika and Zanzibar) (E/AC.6/L.296).

4. At the 344th meeting the representative of the United Kingdom, on behalf of his own delegation and that of France, withdrew the first of these draft resolutions.

5. The sponsors of the second draft resolution agreed, at the same meeting, to incorporate the following changes in their text: the order of the fourth and fifth preambular paragraphs was reversed; and the following phrase was added at the end of operative paragraph 2: "and to report thereon to the appropriate United Nations bodies, including the Council;".

6. The Committee then unanimously approved the draft resolution (E/AC.6/L.296), as amended, and therefore recommends to the Council the adoption of the following draft resolution:

[Text adopted by the Council without change. See below, "Resolution adopted by the Economic and Social Council".]

¹ At the 344th meeting Mr. Hugo Cubillos (Chile) took the Chair.

RESOLUTION ADOPTED BY THE ECONOMIC AND SOCIAL COUNCIL**1013 (XXXVII). The role of patents in the transfer of technology to under-developed countries**

The Economic and Social Council,

Recalling General Assembly resolution 1713 (XVI) of 29 December 1961,

Reaffirming that access to knowledge and experience in the field of applied science and technology is essential to accelerate the economic development of under-developed countries and to enlarge the overall productivity of their economies,

Reaffirming also that the most wide-spread exchange of knowledge and experience in the field of applied science and technology would facilitate the continued development of industrialization and international economic relations,

Noting the report of the Secretary-General on the role of patents in the transfer of technology to under-developed countries (E/3861),

Noting the recommendation contained in annex A.IV.26 to the Final Act of the United Nations Conference on Trade and Development on the transfer of technology,²

1. *Requests* the Secretary-General to explore possibilities for adaptation of legislation concerning the transfer of industrial technology to developing countries, generally and in co-operation with the competent international bodies, including United Nations bodies and the Bureau of the International Union for the Protection of Industrial Property, and to provide additional facilities for information on and for the transfer of technical documentation and know-how to the developing countries;

2. *Requests* the Secretary-General to take whatever steps he may consider appropriate, such as arrangements for the reciprocal exchange of information and documentation, and provision for reciprocal representation at meetings, between the competent international bodies referred to in operative paragraph 1 and to report thereon to the appropriate United Nations bodies, including the Council;

3. *Transmits* the report of the Secretary-General to the General Assembly at its nineteenth session for appropriate action in the light of the recommendation on this subject contained in annex A.IV.26 of the Final Act of the United Nations Conference on Trade and Development.

*1334th plenary meeting,
27 July 1964.*

² See *Proceedings of the United Nations Conference on Trade and Development*, vol. I, *Final Act and Report* (United Nations publication, Sales No.: 64.II.B.11).

Foreword

1. The Economic and Social Council in its resolution 876 (XXXIII) of 16 April 1962 requested that "proposals for a priority programme of co-ordinated action in the water resources field within the framework of the United Nations Development Decade be drawn up by the [United Nations Water Resources Development] Centre as soon as possible with the co-operation of the various organs concerned". Implementation of the Council's request was considered at the Ninth Inter-Agency Meeting on International Co-operation with respect to the Development and Utilization of Water Resources, held in July 1962, and at a further meeting held in Paris in September 1962. By resolution 978 (XXXVI) of 1 August 1963, the Economic and Social Council noted "with appreciation" the report¹ prepared following this meeting, and requested the Secretary-General "to study these proposals further, in collaboration with the specialized agencies concerned and the International Atomic Energy Agency through the Administrative Committee on Co-ordination and to submit his recommendations to the 1964 session of the Council".

2. Accordingly, and following the work which took place during the Tenth Inter-Agency Meeting, held in Vienna in August 1963, and during an Extraordinary Meeting, held in Rome in January 1964, the present revised report is hereby submitted, taking into account General Assembly resolution 1710 (XVI) of 19 December 1961 designating the current decade as the "United Nations Development Decade" as well as Council resolution 916 (XXXIV) of 3 August 1962 requesting, *inter alia*, "detailed phased proposals for action", and Council resolution 978 (XXXVI) of 1 August 1963.

3. The Council will notice that in the present report special chapters have been dedicated to Organizational Aspects, Training and Follow-up Action. In addition, a series of annexes give the relevant information on the activities of the various United Nations organizations concerned with water resources development.

4. Proposals are now before the Administrative Committee on Co-ordination (ACC), which will no doubt be reporting thereon to the Council, to the effect that the present functions and structure of the Water Resources Development Centre should be re-examined in the light of recent developments in the water resources field. References to the Centre in the present document (see especially paragraphs 33, 37, 75 and 76 below) may need to be adjusted if modifications in the existing arrangements are decided upon.

Summary and conclusions

5. A great challenge is posed by water development requirements to meet the needs for domestic uses, irrigated agriculture, industrial water supply, hydropower production and other purposes. To solve these problems, the developing countries will need assistance through

international co-operation on a growing scale and in various forms. The framework for such assistance and action is available both inside and outside the family of United Nations organizations with regard to scientific aspects as well as practical application.

6. Action has recently been initiated for the launching of a long-term programme which will focus on the scientific problems of hydrology in their fundamental aspects.² Although the programme will not deal directly with questions of development and utilization of water resources, it will have several points of contact with practical operational activities, *inter alia* because it envisages the development of a co-ordinated programme of observations and research on the phenomena of the hydrological cycle on a world-wide, continental, regional and national basis. This, in turn, will require organization of services and entail improvement in education and training facilities and a wider exchange of information among countries, all of which would contribute to economic and social well-being through improved water management.

7. In connexion with more immediate development of water resources, it may be recalled that activities of the various United Nations organizations co-operating in the Water Resources Development Centre, already play a significant role in the programme of the United Nations and its regional commissions and of the agencies concerned.³ These activities are not only expected to continue during the United Nations Development Decade but should be fortified by putting greater financial and staff resources at the disposal of the organizations concerned in order to meet the growing challenge of water development in the developing countries.

8. As an initial step of a long-range programme in support of future operations and with a view to orderly evaluation of effective activities, three lines of proposals for co-ordinated priority action as part of the Development Decade are now presented.

9. It is first recommended that preliminary country surveys of water needs and resources be promoted. Such surveys, conducted with the assistance of teams of high level experts, would provide guide-lines for comprehensive government action in the field of water resources development, including indication of immediate development possibilities and recommendations of steps for long-term development. The surveys themselves would involve an expenditure within the range of \$50,000 to \$100,000.

10. Another priority proposal concerns preliminary surveys of international river basins of interest to developing countries. Taking into account existing knowledge

² This programme is to be served by UNESCO as a focal point. See UNESCO document NS/181.

³ Organizations co-operating with the Water Resources Development Centre are: the United Nations proper, the FAO, IAEA, UNESCO, WHO, WMO, IBRD, and IDA. For a detailed description of their activities in the water field, see the *First and Second Biennial Reports of the Water Resources Development Centre, Official Records of the Economic and Social Council, Twenty-ninth Session, Special Supplement* and *Ibid., Thirty-third Session, Special Supplement*, and also the over-all annual reports, work programmes and other documents of the individual organizations concerned.

¹ *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes, agenda item 6, document E/3760.*

of the basins and their needs, as well as local facilities and development programmes, the surveys would aim at outlining possible schemes of river basin development and formulating concrete proposals for further action and assistance. The foundation could thus be laid for joint optimum development of international waters. As demonstrated by experience, such surveys could be carried out in a matter of months by well-integrated teams at a cost within the range of \$100,000 to \$150,000.

11. The third priority proposal is somewhat analogous but concerns large-scale pre-development investigations of ground-water basins, where they extend under two or more countries. The suggested investigations take into account the fact that an increasing share of water supply has to come from development of ground-water resources to meet growing needs especially in newly developing countries in the arid and semi-arid zones lacking rivers. It is envisaged that committees of responsible government officials assisted by appropriate experts first delineate areas pertaining to the same favourable geologic systems, extending across international boundaries; then make a preliminary inventory of the existing knowledge of ground-water occurrence; estimate the water needs to be met; and recommend the undertaking on an international basis of the operations required for hydrologic investigations. It is expected that the estimated cost of the technical assistance to be supplied to each committee would be of an order of magnitude of \$50,000.

12. The actions proposed in themselves call for limited means such as have been provided in the past through the Expanded Programme of Technical Assistance of the United Nations. It is hoped that within the framework of the Development Decade other international, multilateral and bilateral sources of assistance will be found for this purpose.

13. The surveys contained in these proposals are not an end in themselves but are intended to be followed by more intensive "pre-investment" surveys and, eventually construction of the necessary facilities. To carry out this implementation phase the governments may have to draw upon, and to co-ordinate, the appropriate sources of external assistance and finance.

14. No large-scale water development projects will be of lasting value if not properly implemented and operated by well-qualified staff. One of the main objectives of the Development Decade should therefore be to ensure the training of such personnel in sufficient numbers in the various fields concerned.

CHAPTER I

The challenge and the framework for international action

15. There is no single factor more important than water in determining the prosperity and welfare of a country. Its presence or absence determines whether a land is barren desert, fertile farmland or a flooded swamp, and whether industries, navigation, hydro-power or other developments can take place. The regula-

tion of this vital resource, the prevention of drought and flood, can confer benefits on mankind which cannot be matched by any other measure.

16. The United Nations and its family of organizations, in assisting Member States with their water development programmes, recognize this importance. Some of their activities in this field will be described in this report and its annexes. However, the very work which has been done, the skills and knowledge which have been accumulated, the evidence of successes achieved and the lessons learnt from experience, all emphasize the immensity of the tasks remaining. In order to help developing countries to make the best use of their water resources, what is now needed is a plan to ensure co-ordination among those organizations which, inside and outside the United Nations family, are engaged in this work.

17. The pattern of the world's population has largely been determined in the past by man's ability to find and use water. Starting from civilizations along the courses of perennial rivers, increasing skills in well sinking, construction of canals and aqueducts, deep drilling and other advances in techniques, have enabled him to settle even farther from his obvious sources of supply.

18. Nevertheless, what formerly constituted an adequate supply is no longer sufficient for his needs, and sources which provided for domestic use, animal watering and primitive agriculture may be grossly insufficient for an increased standard of living which demands public hygiene, industry, irrigation, power generation and a host of other amenities.

19. Today a country which wishes to raise the standards of living of its people through planned industrialization, improved agricultural methods or development of its other natural resources must face the fact that for any of these purposes large quantities of water will be necessary. Furthermore, this water must be available at the time of year when it is needed, at the place where it will be used, and of a quality suitable for its purpose.

20. Even some of the more highly developed countries, where water has been plentifully available for all uses in the past, are now finding that their demands are outstripping their available supplies, and the ever increasing requirements of modern civilization are creating shortages of what was formerly considered to be an inexhaustible commodity. In many cases this position is aggravated by the piecemeal development which has taken place during the last century, and the difficulties of remedying the lack of early basic planning of water resources are becoming increasingly apparent.

21. If the newly developing countries wish to avoid these difficulties in the future they can most profitably learn from the mistakes which others have made in the past, and by wise planning now can ensure that the uses which they make of this invaluable natural resource are in the best present and future interests of their people as a whole.

22. To assist them in this, the United Nations family and other organizations must put at their disposal the

scientific knowledge and practical experience which have been accumulated from all over the world, and must also help by analysing and interpreting the wealth of knowledge which the countries themselves have often collected, but are unable to use fully due to the lack of a technical background.

23. This is already being done, and the following paragraphs and Annex I will show the part being played by the United Nations organizations. Paragraphs 25 to 31 give a brief description of the fields of activity of each organization, and Annex I contains a summary of the work which is at present being undertaken within these fields, as contributed by each organization.

24. The United Nations organizations at present active in the water field and co-operating in the Centre are the United Nations proper and the FAO, IAEA, UNESCO, WHO, WMO, IBRD and IDA; in addition the United Nations Special Fund and the Expanded Programme of Technical Assistance (EPTA) also play a considerable part. As might appear in the following paragraphs, there is sometimes a certain amount of overlapping in the work of some of the organizations. In many cases, it is more apparent than real, as work undertaken may be of different scope or scale; in others, such limited overlapping is the safest way to give flexibility in operations and to be sure that no gaps are left in the programmes.

25. The United Nations proper is represented in the field of water development by the Department of Economic and Social Affairs, through the Resources and Transport Division at Headquarters and in the regions through the regional economic commission secretariats.⁴ The Department deals with broad problems of water resources development including broad water resources surveys and ground-water exploration, hydro-power problems and navigation and carries out economic studies and assistance projects not falling within the competence of specialized agencies.

26. The Food and Agriculture Organization of the United Nations (FAO) concentrates on surface and ground-water resources investigations and development in relation to agriculture. This concerns irrigation and drainage, fisheries, watershed management in which re-forestation and range-management are important, and rural supplies especially on behalf of animal husbandry. FAO is executing agency for a particularly large number of Special Fund projects broadly related to the water field.

27. The hydrologic activities of the International Atomic Energy Agency (IAEA) consist of research, development and application of both stable and radioactive isotope techniques with respect to the investigation and development of water resources. The activities

⁴ The regional commission secretariats operate in their respective regions and with regard to particular technical and other problems of special interest for water development in the region. Their activities are supported as appropriate from headquarters and through co-operation with the specialized agencies, which often second personnel to these commissions.

are carried out through training of fellows, the Technical Assistance Programme, provision of analyses by the IAEA tritium laboratory, on site field investigations, letting of research contracts and participation in Special Fund projects.

28. The United Nations Educational, Scientific and Cultural Organization (UNESCO) concentrates on the scientific and educational aspects involved. In particular, its programmes on arid zones and humid tropics include much work in the water field, and its activities in theoretical and applied hydrology and hydrogeology have now been expanded into a long-term programme of international co-operation in scientific hydrology to begin in 1965, and to be known as the International Hydrology Decade. In addition to these specific activities, UNESCO is concerned with the training of scientific personnel and technicians and with the publication of specialist literature on hydrology and allied subjects.

29. The World Health Organization (WHO) provides special competence on the public health aspects of water development including engineering problems. It is particularly active in its community water supplies programme, covering urban and rural communities, the control of pollution and the prevention of water-borne and water related diseases. Its activities include the strengthening of national water authorities, the problem of financing, construction, management operation and maintenance of water supply systems, the training of staffs and the recommendation of quality standards.

30. The World Meteorological Organization (WMO) concentrates on hydrometeorology, which includes surface hydrology. It is particularly active in regard to standardization of instruments, methods of observations and data analysis techniques; establishment and improvement of national hydrological and meteorological services and networks of stations; the promotion of research and specialized training in relevant fields; and the international co-ordination of the exchange of hydrological data and of hydrological forecasting.

31. The International Bank for Reconstruction and Development (IBRD) and its affiliate, the International Development Association (IDA), which furnishes long-term "soft-loans", play a primary role in financing economic development, including water resources development.

32. The various United Nations organizations participating in the Centre carry out individually most of the work — conferences, seminars, research and studies, publications and operational activities — making up the total of United Nations family activities in the water field. This field appears to account for a rapidly growing proportion of the over-all activities in most cases. The bulk of their activities in the water field generally consists of substantive management and execution of assistance to the developing countries under the regular budgets of the respective organizations and under financing from the Expanded Programme and the Special Fund. In fact, all the organizations execute or otherwise participate in Special Fund projects, which have grown particularly fast at the request of governments.

CHAPTER II

Proposals for priority action

33. As will be seen from the previous chapter, and from Annex I, the various United Nations organizations which, together, form the Water Resources Development Centre are individually active in their particular spheres of interest, assisting member countries in the water resources field. The Centre, as a co-ordinating body, can most usefully help in connexion with schemes involving the work of several organizations operating together in the same area, in the interest of the countries concerned.

34. Three particular types of development have been suggested by the Centre as priority proposals for action within the framework of the United Nations Development Decade. Each of these will require joint action by various organizations; in each the aggregate benefits to be obtained by such joint action will be far greater than could be gained by unco-ordinated development of individual projects, each having a particular water use as its object.

35. It will be seen that what is now envisaged is a series of investigations, feasibility and economic studies and pre-investment surveys which can only become of value if the countries concerned follow up with action to translate them into specific projects. There is too much demand all over the world for the specialists who will be involved to permit them to spend their time on drawing up plans which have little chance to materialize.

36. The three fields of action now proposed are not intended as a substitute for work already going on, nor are they put forward as ends in themselves. Rather it is believed that their value will lie in awakening the interest of various countries in the potentialities for development of their water resources and in stimulating action to put these developments into practice. It is believed that the following proposals offer most scope for such objectives:

A. Preliminary⁵ country surveys of water needs and resources which will acquaint countries with their water potentialities and future requirements, and enable them to plan their developments in such a way as to make the best economic use of their water assets;

B. Preliminary⁵ surveys of international river basins of interest to developing countries, to show governments the great advantages to be obtained by carefully planned joint use of such rivers, compared to those possible through unco-ordinated action by individual countries;

C. Large-scale pre-development investigations of ground-water basins where they extend under two or more countries. Such investigations may well bring to light new development possibilities for areas at present of little economic value owing to shortage of water, and may in other areas at present dependent on ground-water permit more efficient development arising from greater knowledge of the resources available.

⁵ In this sense "preliminary" means reconnaissance surveys even though some surveys may have been carried out already in these areas.

Preparation and presentation of the report

37. On completion of any survey a report would be prepared and submitted through the Centre to the interested organizations for evaluation before final presentation to the requesting countries in order to ensure that full use has been made of the experience of all relevant organizations.

38. The following details show action which is now proposed under each head.

A. PRELIMINARY COUNTRY SURVEYS OF WATER NEEDS AND RESOURCES

39. It is unfortunately true that many water development schemes in different parts of the world have, in the past, been undertaken without due regard to future requirements, and without full knowledge of the extent of resources available.

40. Examples of the results of such shortsighted planning include dams which never fill owing to the capacity of the source being less than was anticipated; control works for a particular project being sited in such a way as to preclude full development of a river's potential for other purposes; ground-water being extracted beyond the capacity for recharge resulting in the drying up of an aquifer or the intrusion of sea water when the wells were near the coast; pumping mains and other works being designed for immediate requirements only and requiring expensive duplication later as demand increases; irrigation works which have become infested with parasites, requiring large sums to be spent on remedial work, owing to simple precautions having been omitted in the original design.

41. Apart from such obvious examples there are undoubtedly many instances of uneconomical planning and unnecessary expenditure which have been caused through too little information being available to those responsible for designing and constructing water projects. Often the urgency of a project has made the situation unavoidable, and schemes have had to be designed and constructed without time being available for adequate investigations beforehand.

Types of water use and benefits

42. Before considering the water resources available in a country it is as well to consider the varying uses to which these may be put, and the benefits which can be obtained from proper management. These include :

- (a) Provision of domestic and community supplies;
- (b) Irrigation of food and raw material crops;
- (c) Watering of animals;
- (d) Provision of water for industrial processes and for mining;
- (e) Generation of hydroelectric power;
- (f) Cooling water for thermal electric generation and other industries;
- (g) Fish culture;

(h) River navigation, and transport of floating material;

(i) Recreational purposes;

(j) Removal of domestic and industrial wastes;

(k) Forecasting and prevention of floods (including flood water storage);

(l) Reclamation of swamps, waterlogged and flooded lands;

(m) Reduction of waterborne diseases and disease vectors;

(n) Prevention and control of erosion and silting;

(o) Maintenance of dry season flows in rivers;

(p) Diversion of wet season flows underground to recharge aquifers.

43. As the first step in assessing a country's water needs all the above uses and benefits should be considered, together with any others which special circumstances may suggest, and due allowance made for any which, although not of immediate concern, might be required in the future.

Assessment of water needs

44. To meet one of the principal objectives of the country survey, and the one of perhaps the greatest importance for policy decisions in this field, a comprehensive appraisal has to be made of water needs in relation to economic and social development during the next ten to fifteen years.

45. The systematic evaluation of present and foreseeable water needs should proceed essentially along two lines. One line of investigation is on an area basis, that is according to geographic areas and sub-areas and river basins within the country concerned; the other is on a sectoral basis at the national level, that is according to selected major functional uses of water.

46. In the geographic area approach, it is necessary to divide the country into a number of easily and rationally defined areas for which water requirements can be reasonably forecast. The criteria adopted for the choice of areas will necessarily have to depend on the particular conditions of the country under investigation, including the fact that, in some countries, certain areas are abundantly supplied and others have insufficient water potential. In certain cases the drainage basins of rivers may be the best choice, particularly since this delineation later will facilitate matching with investigations on the resources side. However, there may be situations in which the demographic distribution would make it unrealistic to take watersheds as the units for investigation or in which the absence of rivers or the topography of the territory would make it inapplicable.

47. In the sectoral analysis, the emphasis is on the present and future water needs according to planned usage at the national level. In some measure this approach corresponds to sectoral programming of economic development and in particular draws out the water requirement implications of over-all development plans. By

pin-pointing water requirements of industrial, agricultural and other plans, this part of the survey is in fact likely to test critically how realistic those plans are from this — often overlooked — point of view. Among the sectors to be analysed, in terms of water quantity and quality requirements, are the following: domestic uses, industrial and mining use (including thermal generation of electricity), irrigation, water for cattle, hydroelectric production, navigation and transportation of floating material. Since water is very costly to transport over long distances and has therefore to be supplied from more or less local sources, it is essential that the indicated requirements are related to their actual or potential geographical localities; the analysis is thus tied in with the geographical approach and will pin-point location problems and facilitate the subsequent confrontation of water needs with resources. In some cases it will also be necessary to study closely whether the indicated use is consumptive, or non-consumptive, that is to say, whether the water will still be available after use (as with most water in industry), although possibly in degraded quality.

Assessment of water resources

48. The full assessment of a country's water resources involves a long and expensive procedure, particularly when underground reserves are concerned. It will have to include long-term hydrological measurements. In appraising the water resources available in geographic areas and sub-areas, both surface and ground-water supplies must be evaluated. Although the surface and ground-water divides may not coincide, the two sources must be considered jointly because of their interdependence: for example, extraction of ground-water may lower continuously the water table and reduce the dry season flow of the rivers, while manipulation of the river may affect infiltration and the availability of ground-water.

49. Particularly in developing countries where hydrological and meteorological data are notably scarce, the assessment of water supplies frequently requires the application of indirect methods to available data. Thus it is essential to assemble and analyse information, *inter alia*, on: streamflow; rainfall amount and intensity; evaporation, evapotranspiration (or related meteorological elements); and qualitative characteristics of surface and ground-water. Since each of these factors varies with time, the evaluation must provide estimates of a real distribution of mean values and variability as well. Additionally, preliminary analysis should be made of available information on the nature of water-bearing formations.

50. The first step is obviously to collect existing information and to evaluate the data within the framework considered here. It will usually be found that serious gaps do exist in the physical resource data. The determination of the gaps should in itself be regarded as an important objective of the survey. The closing of all the gaps will obviously take a long time, if indeed they can all be filled to the satisfaction of the insatiable demand of technicians. For practical purposes, as deter-

mined by economic factors and in particular by data requirements for development projects rather than by perfection of data collection for its own sake, some gaps will be more important and urgent than others. It is this determination of gaps, in the light of confrontation with water needs and development plans, which will require particular attention with appropriate suggestions as to how best such deficiencies may be eliminated, including the establishment of basic hydrological networks.⁶

51. The following data should result from the preliminary survey:

(a) A rough — probably very rough — assessment of the country's water resources;

(b) An indication of the areas where the available water is excessive, adequate or insufficient, and of its quality;

(c) Recommendations as to detailed investigations which should be carried out to obtain a more accurate assessment of the resources;

(d) Indications as to unused sources which should be developed, and possible areas where additional quantities might be found;

(e) Suggestions as to control works, for example, seasonal storage reservoirs which might increase the effective quantities available;

(f) A general indication of hydropower, flood control and similar potentialities and recommendations as to additional investigations necessary if these are to be undertaken in the future.

Economic and financial aspects

52. Country surveys of water needs and resources are necessarily more than a physical inventory. Various assumptions of an economic nature underlie the forecasting of needs, and physical resources become important in most cases only when they can be economically developed.⁷ The survey is therefore to be set in the broader framework of economic development, without trying, however, to deal with all economic aspects in the name of water resources development. In some cases it will undoubtedly be found that a relevant part of a country's development effort may hinge on the availability of water, and in many cases investment in the development of water resources and auxiliary facilities may become significant components in the over-all programme.

53. The preliminary survey should consider and give at least approximate estimates of the direct economic implications of water resources development in order

to guide decisions to be taken by governments concerning financial commitments for long-term water resources development. Among its tasks a survey team should, therefore, also analyse current water costs, prices and rates structures.

Administrative and legal aspects

54. The collection of existing data dealt with above will usually necessitate and lead to a clarification of functions and authority of national and local organizations in the water field. Authority over water resources, and over the different stages of water resources development and utilization, is frequently diffused among various government departments or private organizations with an ensuing lack of comprehensive vision and information and possible overlapping and waste of resources, when appropriate co-ordination is not ensured.

55. The preliminary country survey provides therefore a good opportunity to examine comprehensively the administrative organizations of the country with regard to water resources and to make proposals for improving the organization of existing services and co-ordinating their activities. In each particular case, legislative and administrative patterns derived from historic, environmental and socio-economic factors would have to be taken into account.

56. Equally important, and closely related to the question of administrative organization, is a simultaneous review of existing water legislation and of the possible need for a revised or a new legislation in this field. Wherever it does not yet exist, the promulgation of a coherent water legislation may be essential to ensure the rational development and utilization of water resources as determined through preliminary survey work. Such legislation must, in most cases, clarify water rights and should provide a sound basis for water organization and policy serving as a tool of economic development in harmony with broader goals and policies.

Recommendations to be included in the survey report

57. The completion of a comprehensive country survey, undertaken perhaps in a matter of months as a preliminary step, will culminate in a report to the government embodying conclusions and recommendations. In determining the problems raised by the development of existing water resources in order to meet the needs, the reports should make clear what has already been and is being done in that respect and by whom. Further, it should consider what should potentially be done to meet all the needs appraised for and expected in the next ten to fifteen years in the geographic areas and river basins within the country concerned. As appropriate, the report should suggest follow-up action and orders of priority established from the various angles — technical, financial, administrative and legal — together with the conditions which would make their implementation feasible.

⁶ It may be of interest to note that, as a direct outcome of country surveys already undertaken in some Latin American countries, gaps in hydrological and hydrometeorological data are now being filled with the assistance of Special Fund projects executed by WMO.

⁷ Even in cases where water resources may be developed on strategic or purely social grounds it is desirable to obtain a true economic picture for assessment of decisions made on extra-economic grounds.

B. PRELIMINARY SURVEYS OF INTERNATIONAL RIVER BASINS OF INTEREST TO DEVELOPING COUNTRIES

58. Development of international river basins presents one of the greatest challenges for the decade and beyond. Outside North America and Europe, most international rivers are still in a stage awaiting initiation of international action through preliminary surveys to gather basic data and bring countries together. Development, when it has already taken place, is far from commensurate with the variety of needs badly felt by riparian countries: needs arising from the increase of population in search of improved hygiene and higher levels of living, from increasing requirements for irrigated lands, industrial water supply and electric power production and other purposes, such as navigation, flood control, watershed management and conservation.

59. Major river development takes a long time and serves many purposes. The foundation must be laid early to deal effectively with the complex problems involved and to secure harmonious development, particularly in the case of international rivers. There is general agreement that optimum results can be achieved through integrated river basin development. Essentially this concept focuses on the river as the key to development and relates to it the basin conceived as the drainage area of the river system, its requirements and possibilities.

60. In principle, integrated river basin development is equally applicable to national and international basins. In the latter case, however, where the basin is crossed by political frontiers, additional problems are encountered, the solution of which requires international action. The United Nations family of organizations is in a unique position to provide instruments and facilities needed to facilitate co-operation among countries concerned. Moreover, preliminary surveys necessary to lay the foundation on which co-operation may develop, involve many disciplines such as can be contributed by several organizations of the United Nations family acting in co-operation with the regional commissions secretariats.

A matter of growing interest

61. The problems raised by the development of international river basins of interest to several developing countries, and international action to help solve them, have received increased attention during the last few years.

62. One of the decisive factors for the renewed interest in that domain was the successful initiative taken by ECAFE concerning the Lower Mekong Basin when, in 1951, the Economic Commission for Asia and the Far East decided to refer to the Bureau of Flood Control the task of studying the technical problems in controlling floods in international river basins, including the Lower Mekong. With the approval of the governments concerned, preliminary field investigations were undertaken. In 1955 and 1956, two reconnaissance surveys, one under the auspices of ECAFE and the other by the United States Bureau of Reclamation for the United

States International Co-operation Administration, were carried out by teams of international experts. The results of these surveys were encouraging and the governments, in response to a decision taken by ECAFE, set up in 1957, the Committee for Co-ordination of Investigations of the Lower Mekong Basin.⁸ The Committee is serviced by a team of international experts provided by the United Nations. At present 20 countries, 11 United Nations organizations, 3 foundations and several private companies assist the Mekong Committee in the implementation of its programme.

63. In 1957, a United Nations panel of international experts reviewed the implications of integrated river basin development and devoted a full chapter of its final report to "co-operative action in developing an international river basin", and made specific recommendations on the role that the United Nations and other international bodies could play to foster such co-operation.⁹

64. In September 1961, a seminar on the development and administration of the international river basins was held under the auspices of the Regional Training Centre for United Nations Fellows, at the University of British Columbia, Vancouver, Canada. The concluding report recommended, *inter alia*, that "the United Nations and other international agencies intensify their efforts to increase and broaden the range and scope of research, training, lending, consulting and other activities in the realm of river basin and related resources, as one of the most appropriate means for the stimulation of the development process".¹⁰

65. During the last two years, several requests have been sent to United Nations organizations to help in programming the development of international river basins in Africa and missions of experts have been provided for that purpose by the Technical Assistance or Special Fund Programmes in the basins of the Senegal, the Niger and Mono rivers, lakes Chad and Victoria.

Preliminary surveys and ground work

66. On the basis of experience already gained, it is suggested that preliminary surveys be undertaken in a growing number of international river basins of interest to developing countries during the United Nations Development Decade. The main task will be to prepare a comprehensive survey report for discussion by an appropriate inter-governmental committee in which each interested country would be represented by responsible officials. The report should contain: (a) an inventory of existing knowledge of the various technical fields connected with the development of the river basin as well as existing local facilities including government services; (b) a description of various possible lines of river basin development on the basis of the inventory and of local government programmes; (c) the formula-

¹⁰ See footnote 8 above.

tion of concrete suggestions for further governmental action and additional technical and financial assistance from external sources; and (d) proposal to the governments concerned for the eventual establishment of an inter-State body for the development of the basin.

C. LARGE-SCALE PRE-DEVELOPMENT INVESTIGATIONS OF GROUND-WATER BASINS

67. The pre-development investigations envisaged here would take place in regions presenting similar favourable geological characteristics extending under two or more national territories. They would aim at delineating areas in which a common aquifer is of paramount interest for two or more countries which need to develop ground-water to meet their present and foreseeable water deficiencies.

68. Such investigations would fill a gap between the scientific studies relating to water-bearing formations¹¹ and the intensive "pre-investment" exploration of limited areas immediately aiming at ground-water development. They would, in particular, constitute a step towards the orderly organization of such pre-investment projects and the sorting out of priorities.

69. It should be noted that ground-water investigations involve long and expensive research, sometimes running into years, and requiring the employment of many types of specialists, hydrologists and hydrogeologists, geologists, geophysicists, drillers, chemists and others, as well as the obviously needed skills of the surveyor and the engineer. Because of the complexity of the task, such large-scale pre-development investigations will not normally be undertaken unless there are grounds for believing that there is at least some chance of success.

70. In large areas of the arid and semi-arid zones of the world and even in parts of the humid zones, the only sweet water resources which can be found to meet the needs of a developing economy are those contained in the sub-surface formations.

71. Much of the ground-water development that has taken place, especially in developing countries, has been undertaken in a haphazard fashion, without consideration of the repercussions it may have for the whole region sharing a ground-water basin. Heavy pumping in one area can cause ground-water levels to decline over many hundreds of square kilometres, thereby drying up wells or increasing pumping expenditure. In some of these regions, it is obvious that ground-water is being over-developed, in the sense that more water is being withdrawn than can be replenished by natural means. Situations of this kind are bound to have detrimental effects and when a ground-water basin extends across

political borders, it may become the cause of serious international frictions.

72. The time has come for the development and the utilization of ground-water resources as an inseparable part of the national and regional economic development to be based on a proper assessment of resources available in ground-water basins considered in their entirety.

73. From the long-range view of basin-wide management, emphasis must be placed on studies that are regional in nature. It is rarely possible, by carrying out scattered localized studies, to establish the true potential yield of a large ground-water basin or the natural pattern of its replenishment and discharge. To achieve this goal, an over-all reconnaissance is necessary, and is particularly urgent in areas where surface waters are limited and where populations are expanding rapidly. It is in the early stage that a co-ordinated programme of investigation can produce the best results and that a sound basis for water management should be established.

CHAPTER III

Organizational aspects

74. The organizational methods suggested to carry out the proposed surveys will vary according to the stage concerned. In general, procedures will be similar for the three cases except differences at the implementation phase and in the duration and costs.

INITIATION OF THE SURVEYS

75. As the first requirement, it will be necessary to receive a request, or requests, from the country, or countries, concerned. This (or these) request(s) may come directly to any of the United Nations organizations dealing with water. When an undertaking of this nature is likely to involve the work of several agencies, it is suggested that co-ordinating action should be taken by the Centre as early as possible, and that the request should be referred to it for this purpose.

76. Having received the request, the Centre could arrange for an early short visit to the country, or countries, concerned either by one of its staff members, or consultants, or by an officer from one of the organizations participating in the Centre. The purpose of this initial visit would be to assess the size and nature of the undertaking, and to ascertain the various aspects involved so that the composition of the survey team may be chosen accordingly.

IMPLEMENTATION OF THE SURVEYS

77. In the case of a preliminary country survey of water needs and resources, the actual composition of the team will have to be adapted with adequate flexibility according to the needs of the country concerned. It is envisaged, however, that there will generally be a need to include specialists, for example, in regional economic development, hydrometeorology, water deve-

¹¹ UNESCO is actively promoting badly needed deepening of theoretical knowledge and scientific work in the ground-water field, especially in relation with its International Hydrology Decade. Mention should also be made in this connexion of the International Legend for Hydrogeological Maps, resulting from work done in co-operation with the International Association of Scientific Hydrology and the International Association of Hydrogeologists, and published by UNESCO, and of a co-operative scientific study of the artesian basins of Northern Africa recently undertaken by this Organization in this connexion.

lopment, water legislation and administration, irrigation, water supply and/or other specialists. To a certain extent, it may be possible to move the key members of such a team from one country to another in succession, provided that governments submit requests accordingly and that it is possible to constitute teams on a continuous basis. It is expected that the surveys would take several months and that the expenditure involved will be of the range of \$50,000 to \$100,000, according to the size of the country and nature of the problems involved.

78. A preliminary survey of an international river basin will require the formation of a team of highly competent experts capable of broad views covering sufficiently extensive technical fields. The number of experts and their fields would vary according to the requirements of the basin (as established in preliminary consultations), but in general it is considered desirable that the survey team should include specialists such as the following: a team leader and an associate economist, a hydrometeorologist, an irrigation engineer, a broad agronomist, a rural sociologist, a public health and water supply engineer, a specialist in dams and hydro-power, a flood control expert, a navigation expert and a fisheries specialist. It is expected that the duration of such a survey would be about three to four months and that its cost would be in the range of \$100,000 to \$150,000, depending on the nature of the problems encountered.

79. In the case of large-scale ground-water basins, a working group might be established whose members should be responsible officials from the various governments concerned, as well as specialists in the field of ground-water, such as geologists, hydrogeologists and drilling specialists. The task of such a working group should be: (a) to delineate the areas presenting similar geological characteristics and extending over two or more national territories which are water deficient; (b) to estimate the water needs of those areas and make a preliminary inventory of the existing knowledge (including available, relevant geological and other data and records) on ground-water occurrence in those areas and determine which parts need large-scale ground-water investigation; (c) to prepare a report on their findings; this report will include recommendations for the required operations for such investigations and concrete proposals for their implementation as well as the financial expenses involved. The report will be communicated to the governments concerned and to the Technical Assistance or financing bodies. It is expected that the technical assistance to be supplied to the Committee would be of an order of magnitude of \$50,000.

SOURCES OF FUNDS

80. Although in the past a number of projects of this nature have been financed by the Expanded Programme of Technical Assistance, it is hoped that within the framework of the United Nations Development Decade other international, multilateral and bilateral sources of assistance might be found.

CHAPTER IV

Training

81. Each one of the surveys proposed in the foregoing chapter should lead to follow-up action of detailed investigation and the construction of water works. Each case requires a large range of specialists and technicians for measurements, operation and maintenance; for this purpose training of staff must be provided both locally and internationally.

82. Owing to growing needs and the recent interest in water activities all over the world, there is a shortage almost everywhere of experienced and well-trained personnel, and this shortage is likely to become more acute. The implementation of the proposals outlined in this document will call for experienced specialists, and as a result of the progressive development of these activities more trained personnel will be in demand for the various aspects of water resources investigations and development.

83. At the same time it should be emphasized that all justifiable water resources activities must ultimately have as their object the good of the users. The most perfect plan is useless until it is translated into concrete development. Subsequently, operating and maintenance staff must be provided to ensure continuity and lasting results without which the investments made would be lost.

84. These facts are well recognized and therefore training programmes form a substantial part of the services which the international organizations concerned are rendering to Member States. An outline of some of the activities of the United Nations organizations in the field of training for water resources study and development is given in Annex II.

85. The lack of qualified and experienced personnel, both professional and technical, is likely to hamper not only the implementation of the proposals now submitted, but also the normal water development programmes everywhere. Water engineers and hydrologists, together with their supporting technical staffs, are the two classes most in demand; lack of these specialists is already retarding progress and the effect of the shortage is expected to become more pronounced in the near future.

86. In planning and implementing future activities at the national and international level to remedy the situation which has been described, certain obvious points in connexion with training programmes should be kept in mind.

87. As wise development of water resources is one of the most important factors in the economic and social well-being of a country, it follows that wise management and operation of such development works are equally important. Hence the staffs engaged on this management and operation should be chosen from among the most qualified citizens, who should not only be trained in the technical aspects of the jobs they will perform, but should also be imbued with the spirit of public services and professional pride in their calling.

There is a great need for this point of view to be brought home to those responsible for the recruitment of personnel within a country. There is also a need for ensuring that the status and conditions of service of water staffs are such as to attract and keep the right type of candidate.

88. Efficient management of water development undertakings entails experience as well as technical training. Such experience comes only with time, and cannot be implanted during a short course. Hence the selection and training of management staffs should not be left until the last construction stage of the works, but should be undertaken well in advance so that the men concerned may acquire post-training experience before they assume positions of responsibility.

89. One of the best ways of obtaining experience in the operation of an undertaking is to be actively employed on the construction of it. This can be extended to cover even earlier stages, and provided that a prospective manager has the right technical background, it would probably be advantageous if he were engaged at the investigation stage and thus obtain first-hand knowledge of the basic principles underlying the planning and design of the project.

90. The successful operation of water schemes involves the co-ordinated work of several classes of staff including: professional engineers, administrative and technical assistants, technicians and craftsmen. The length of training varies with the degree of skill required; obviously, the professional class needs the highest calibre candidates and the most intensive training. This should not mean that the training of the other classes should be neglected, for a few highly qualified engineers could never efficiently manage and operate an undertaking without an adequate supporting staff.

91. Water works construction is an excellent training ground for subprofessionals and for operatives, particularly if supplemented with some basic theoretical education. However, this should be properly planned, and the engagement of operational staff not left to the chance of recruiting some suitable men after the construction contract comes to an end.

92. One of the more successful training methods in developing countries is the fellowship abroad. This does not necessarily imply extensive travel and stay with highly advanced institutions. Indeed, apart from the cost involved, the fellow may actually derive less benefit from such a visit than from visiting a country much nearer home where conditions more nearly approximate to those under which he will later work. It is believed that there are many unexplored possibilities in this field, and that there are a number of less developed countries who would be too modest to claim to have international training facilities, but who have well run works of water use and control where fellows from neighbouring countries could profitably gain experience.

93. With the above considerations in mind, it appears that a high priority should be placed in all countries — and especially in developing countries — on education and training of specialists and technicians in water resources study and development, and on the establish-

ment or strengthening of appropriate training institutions. Countries having good facilities in this field should, as far as possible, offer assistance to developing countries. As indicated in Annex II, international organizations are assisting through expert missions, awarding of fellowships, organization of regional or sub-regional courses and seminars, preparation of educational materials, introduction of a training component in pre-investment projects and various other means. This type of assistance should be increased as much as possible. It is also expected that in conjunction with the International Hydrology Decade, a broad effort will be made in the coming years on training of hydrologists, hydrogeologists, hydrometeorologists and related technicians.

CHAPTER V

Follow-up action

94. The earlier chapters describe the three major items selected for co-ordinated action and indicate the operational aspects for the first step of a preliminary nature only. These preliminary surveys in themselves call for limited means. They are of course not an end in themselves but they are to be followed up by a number of steps including feasibility studies, "pre-investment" surveys, detailed investigations, planning and design, construction, etc. It would be difficult, however, to spell out and define the subsequent action since the different steps to be worked out progressively depend on the nature of the countries or basins concerned, their stage of knowledge and development, the priority needs and the findings of the initial action. In most of the cases, the full-scale study of water needs and resources and the complete survey of international basins are long-term undertakings.

95. Implementation of these steps are dependent on action carried out by the governments themselves. Very often detailed studies will have to be undertaken with a view to their practical applications so they might lead rapidly (even while still in progress) to effective and useful achievements.

96. Country surveys of water needs and resources for example will put such steps in perspective and provide general guide-lines for long-term programmes of water resources development within the framework of a national development plan. Not only should such surveys provide indications for government policy and comprehensive action in this field, but they would also help to revise accordingly or establish as appropriate related institutional structures and legislation. The indications may well lead to pre-investment investigations as well as further general data collection to fill gaps holding up development action. To carry out these surveys, many countries will be needing enough well-trained specialists and well-established institutional services.

97. Similarly, in the case of preliminary basin surveys of an international character, the essence is the formulation of concrete proposals for the follow-up action, including as appropriate, the creation of suitable inter-

governmental machinery to foster required co-ordinated pre-development surveys and planning, to promote implementation and to deal with technical, legal and other problems of joint concern.

98. For important studies and projects, such as international basins investigations and development, the pre-investment surveys and the detailed studies to be carried out by the governments concerned could involve co-operation on a continuous basis among several international organizations.

99. For the positive follow-up of each preliminary survey, the financial aspect obviously is very important. Governments often have access to a wide variety of sources for financing the follow-up, from the detailed surveying and project planning to construction and general implementation. Besides the national public finance and various bilateral and private foreign sources, there exist a number of organizations within the United Nations family which can be of assistance. The point which deserves increasing emphasis is that governments will find it necessary to systematically explore the total array of possible sources of finance and co-ordinate and allocate them to the various types of follow-up activities to which they are best suited. Much waste and inefficiency can thus be avoided, and the rate of progress in actual water resources development can be accelerated.

ANNEX I

Summary of the type of work being carried out by various international organizations in the field of water resources development

1. This summary does not pretend to be a complete listing of all the activities of the member organizations, since such a listing would in itself fill a larger document than the present report. Rather is it intended to give an idea of the scope of the activities of each organization in this field.

2. For the same reason it is not possible to give details of the numerous publications, reports of seminars and other meetings, description of training programmes and advisory services rendered throughout the world.

3. Such complete descriptions will be found in past and future biennial reports of the Water Resources Development Centre.

4. Elements of the summary have been communicated by the various participating organizations to the Water Resources Development Centre for inclusion in the present document.

UNITED NATIONS : DEPARTMENT OF ECONOMIC AND SOCIAL AFFAIRS RESOURCES AND TRANSPORT DIVISION

1. The scope and arrangement of activities of the Department of Economic and Social Affairs in the water resources field are broadly indicated in the report of the United Nations Water Resources Development Centre.^a As noted there, the Department is represented on the substantive side through the Resources and Transport Division, notably its Water Resources Section, at Headquarters and by the regional economic commission secretariats (dealt with separately) in the regions, and on the administrative side through the Bureau of Technical Assistance Operations (BTAO). The substantive side covers research as well as guidance and responsibility for substance of operational activities, which

are administered by BTAO and financed under (regular and expanded) technical assistance, Special Fund and other programmes. Particular attention is paid in the following to the substantive side, principally as carried out by the Resources and Transport Division.

2. The activities and responsibilities of the Division include broad problems of water resources development, such as those related to integrated river basin development and broad surface and ground-water surveys and exploration. Designed to assist infra-structure development, these activities, as in ground-water surveys for example, are not tied to a particular use of water but are focused on ultimately satisfying different, and often competing, needs in the most economic manner within the scope of economic development. They provide the framework and basis for specialized activities, such as in development to meet particular needs as in a subsequent step to a Special Fund project uncovering ground-water resources. As appropriate, the Division does and will elicit co-operation from specialized competence from sister organizations, under the auspices of the Water Resources Development Centre, and prepare the way for economic development.

3. In addition to the broad problems and projects, there are certain aspects of the water field which do not fall within the competence of specialized agencies and which are actively dealt with by the Division to meet the growing needs of the developing countries. Among these aspects, classified by "use" categories, may be noted hydropower development, navigation and water for industry as well as broad flood control and water pollution prevention. In this connexion may also be mentioned water demineralization, in which the Division has developed particular competence and activities, as well as the responsibility of the Division in the field of cartography serving water and other development.

4. Research and substantive support of operational activities related to these various domains include economic, administrative, technical, legal and regulatory aspects. They take into account over-all economic development and planning and tie in with these broader responsibilities of the United Nations proper.

5. The responsibilities indicated above are implemented through a variety of research and operational activities. The latter call for considerable "substantive servicing" handled by the Division for country and other projects. This servicing consists of aid in programming and preparation of projects, drafting of plans of operations and job descriptions, recruitment and briefing of experts, rendering of background information and advice, review of reports and progress, and synthesis of experience for wider dissemination. For this purpose and its other responsibilities the Division at Headquarters includes resource economists and high-level technical personnel, among them civil engineers, specialized in hydrology and hydraulics, hydrogeologists, geologists, geophysicists, electrical engineers, navigation specialists and cartographers.

6. Among the operational field activities for water resources development, serviced by the Division and administered by BTAO, the most important are those financed by the Regular and Expanded Programmes of Technical Assistance and by the Special Fund.

7. In the technical assistance category, there are in 1963-1964 about eighty BTAO experts serving in thirty-five countries and dealing with various aspects of water resources ranging from broad water resources inventories to highly specialized tasks in fields indicated above. Attached to appropriate ministries or bodies as advisers, these experts work individually or in teams, as in the case of a mission on demineralization in Tunisia.

8. Water resources projects are also prominent among Special Fund projects executed by the United Nations, for the servicing of which the Branch has been and is further building up its facilities in the anticipation of growing demand from the developing countries. Among the projects approved by the Governing Council of the Special Fund through its June 1963 session and for which

^a See *Official Records of the Economic and Social Council, Thirty-sixth Session, Annexes*, agenda item 6, document E/3160, para. 27.

the United Nations is executing agency, services are thus provided for thirteen Special Fund projects in surface-water resources development, four in ground-water development and seven combining ground-water and mineral development. Most of them are in the survey and exploration category. In addition, the Division is responsible under sub-contracts for parts of a few projects executed by other agencies, such as for a hydraulic laboratory in a WMO/Special Fund project in Peru. Several more projects are in different stages of preparation with assistance of the Division.

9. Other operational activities in this field serviced by the Division include some OPEX posts and funds-in-trust schemes, as well as some assistance to the World Food Programme. Training also forms part of the activities but is dealt with further below.

10. Research activities of the Division are largely geared to supporting operation and to distilling experience from them for wider dissemination, notably for the benefit of officials in the developing countries rather than only specialized technicians. Besides reports to the Economic and Social Council, they have resulted in publications, for example, on *Water for Industrial Use*,^b on *Integrated River Basin Development*^c and on *Large-scale Ground-Water Development*,^d the last two in co-operation with specialized agencies concerned.

11. Among its research activities, the Division is currently completing for publication a survey on water demineralization in developing countries, based in large part on field visits to forty-three developing countries and territories. Other research projects in various stages on the work programme deal with river basin economics, value and cost of water for different uses, prevention of water pollution in areas in early stages of industrialization, transportation of water and policy of water development as well as a more comprehensive study on the economic significance and timing of natural resources development in under-developed countries.

Economic Commission for Africa
