## NOTE BY U.K. DELEGGTE

In view of the Iimited time available to the Drafting Committee, the U. K. Delegation have prepared the attached contribution to the Committee's work and to the eventual report of the Sub-Comittee. It represents not a formal statement of the U.K. attitude to the various matters discussed, but a possible startina point in the search for acreed findines.

It has been propared under conditions of extreme pressure and will no doubt have to be revista or supplemented in the light of the reports from tho touring parties. The figures, Which aro drawn from a varicty or sources believed to be relianlo, are the best that it has been possible to obtain in the circumstances. It has not, however, been possible in all cases to verify them from U. K. sourcus, and they are therefore not to be regarded as in any sense official U.K. ficures.

We have deliveratoly concentrated on thoso aspects of the problem whero we rolt that our contribution coula De most cifectivo and helpful. The Sucretariat already has so much naterial on a country to country basis that we have thought it mnecossary to duplicate their work on this part of the report. lo have, howover, thought it dosirable to prepare two statements enclosod as appendices, one roluting to the position of the United Kingdom which we should like to sec utilised in the Country Section of tho Sub-Comission ropout, and ons rilatine to Gurnany, which has alruady buon fomburdod to the Secrotariat to assist them in any attention tho may be devoting to the place of Gommany in the furopoan economy.

In formulatincs recomendation 4, which deals with Post-ivar Beonomic Co-oporation in Furope wo have had the advantage of discussine with tho U. S. 1 . Delegation a proposal of thoir own on tho sano subject which we understand is being submittod to tho Sucretariat for considoration by the Draftine Committec.

## IWRT I ~ INTRODUCTORY

## DEV: ST'ATED EUROPE $^{2}$

For over five years of war the ereatur part of the Continent of $\ddagger u r o p e$ was an island cut orf from the outside worla to which it had boon mitted by a contury of tradins. The island Was for Pour years uncior ruthlews, all-pervading NationalSocialist control; its men anu women, towns ind villages, factories and fiolds, mines, rivers and railways, were worked to fuel the Germen war machine. Its econonly was plundered and distortad into now shapos by the Mationel-Socialist effort to make it solt-sumificiont, dopenuent on Gomany, and indepondent of the outsiue world which had sent it food and row materials and the ancill luxuries of the ordinary man and Woman. This process wés not itself devastation; but it did vital danage to a comulicated system of human and financial relationships mhich in three genurations had raised the living habits of the masis of Europeans from primitive levels.

Oven this distonted islind of Europe swept three tides of destruction. Firstly, the German acreression of 1939-40, eastwards into the iepths of poland, southwaris to the eastom Mediterranean, westwards and northwards to the Channel and the Nooth Sea. The fighting and the plunderine destroyed dwellincs and placus of work, bridees, roods, lochs and railways. is men mat momon rlud, or were killed or herded away, With their cattio anci mimals, the crops wore neglected, markets broken up, cind distribution of food and goods stopped or slowed down. Recovery from this firct wave of war was organised by the Germans, in their own interests and according to their patterms.

Then cant the second tide of dustruction, the German invasion and occupation of teatom Rusaia, which croated havoc in the Ukraine wid Witc Russia, in the cirime and the northem Sancasub. ina as the tidu receldod with the Gemman retroats and the Russican pursuit, it sorocd for two years over the industriolised and soodmroducing peoples of the east, Poland, Czechorlovakia, lrugery, Roumania, and zustria, to the confines or areicultural Prussia and Saxony and Silesia. The thime tide of destruction can from tho south and the West; Italy, France, Belgium, Hollana, Luxemboure and Western Gemmany wore foush over by tho allied and Gemon amios for twelvu hectic montha; many of the richost, busiest regions of westom Europe were devastated and depopuiated, some ur them crippled for yeins to come. ind lor three years the mastor state of Europe was itself being systematically dovastatad by Nilied bonburs and exheusted by the NationalSocialist recime's elfort to pull the last ounces of energy out of the German economy.

There is somstan; nore to be done in Burope than the repair of this aevastation, which is commonly called reconstruction of ruhobilitation. There is also a task of bredine and straichtuning out the economic petterns imposed by the Gumans, in sone countribs with tho hely of collabonators This is boinč atticked side by side with tho efoorts of almost all Iiberated countries to ostablish new condition's on life theoren purties comnitted to policies of
national plannine, which rane from full statu control of . production ans consumption: throrich somi-bocialist planning, to sonething life the free ontorprise of provive times. . Yet within this vapind and confusine picture of Europe strugelins to wecovir tron five yoars of German aconomic direction there is one comba reature: the effort to obtain as duackiy as posible the fooi, the diothing, the houses and the transport without, whict the owinaig meng woman and child cannot live.

Side by wine with tan intomational offort, made by such Dolius wi U. M. R.R.i. ant the Guponcon Conl Organisation to shape omalis the short sumples avisimpo, and to craduate and bexur uvenly he probsba of recovery by consultation and plamine ano on inaviond national ofertsto buy and

 unrelatabu, with Ince or travpont Intiting the range and volune of denive wis, conatrios are at prosent usiag the primitive and cumpors mathen of wart to those of normal
 though zo frip only an onow oriods. inpedy there exist over 80 Europem bilutu" towd agremente, spread over 22 countrios, and tiore we moro on the my. The tendency is simply cxplicanlo; it comorem the desipe of the peoples
 of mure gurvival. Tn many awes there how been no practical altemative to suah airot-teme bilateral mothods of rebuilding trade. But shotia they tum out to be more than temporary expedients and bisis on considurations not otrictly commercial, tiney will in the lone run obswed the reconstraction of trade on the vasis or cmatitive ef iticioncy.

Contineatal. surope cumot, and has knom that it cannot, pecover its former standimen of livine wad production without imports from outsidu. Thiss io true in the long as well as in the short man. Byen bhen meoge is providins something like
 Will still nede to inuort the cistra foode and household luxuries fron ontende. Th 1945 coreal production over large parts of Turope was loes then 60\% of prewtor Isvelis; at least half the dovasteted lands nal lost a ye:r ago haff the in cattle, piss and joultry. Anove all will Euroyo noed to impont for its inductrien the monterials without which cannot be provece the goode wich will oarn foreign currency. In the proaperon wor 1938 , the net unnal imports from abroad of Continmtici Eurons (excluding the U.K. and the U.S.S.E.) cost over 1,000,000 dollars. Since the war ended the Unitea States iuve montod to tho devastated nations of Continental muropu uvir 1,000 million dollars in creaits for reconstruction. into to thesu 2,400 million dolliars in relief imports allocatod we the enc of 1946 Viv U.R.R.R.A. on behalf of non-Continent countries, the cruits yucuntly asked for by Beletum, Yugoblavia, Greved, Chechoblovikia, Poliand, and Italy, anl the pirture of furpets Temoniance on imports for
 Detailud study or hux reeds for 1947 has yet to bo made, but would probibly iho" that financisl assietiance vill stili be needed.

Her inability to pay for such a volume of imports inadequate though it is for the full purposes of recovery is tne measure or Europe's weakness now and for some time to come. Her exports increased only slightly in 1945 and remained far below the 1939 level. Devastation and distortion, hunger and privation, the killing and the neglect of men have reduced by something like a third her capacity to produce - and without production she cannot trade. When we try to find out in detail why these countries cannot produce more we find the causes in facts that the war created. When this summer began, 100 million people in Europe were being fed at a level of 1500 calories or less - the level at which health suffers severely and working capacity is quickly reduced or destroyed, Another 40 million were living at the little less dangerous level between 1500 and 2000 calories. We know little of the position in Russia, but it is probably correct to say that 30 per cent of the people of Europe are reduced to a diet which has grave physical effects even over a period of a few months. Europe's food production alone cannot bring them back to normal health.

These people are also desperately short of houses, domestic equipment, tools, clothes, and footwear. Thousands of the young men and women among them have had no training in skilled work. Generations who would have taught them have in some countries been wiped out. The casualties in killed, disabled, missing and deported persons are classified as "scarcity of man-power", but the economic loss cannot be estimated in figures alone, appalling though those are. Excluding Sovict Russia, for which official figures are not known, the devastated countries of the continent have lost over sixteen million men and women, over six million of them in Poland and one and a half million in France.

If man-power is short, how much shorter is the material power which drives the factories anc tho transport. Western Continental Europe is producing coal at 30 per cent below the pre-war rate. Even Eastern Europe, al though Czechoslovakia and and the U.S.S.R. are believed to $n$ nearly back to normal, is still well below pre-war levels. production is low because output per man-shift has fallen; in many places because miners have not enough to eat, in others because there are no recruits to the mines from the surviving young men, everywhere because machinery has been destroyed or overworked. Devastated Europe is crying out for a coal surplus from prostrate Germany or from devastated Poland.

Take one or two examples of the dilcmmas in which European countries now find themselves, Czechoslovakia, which has had her economy disturbed by German occupation, could even now produce coal and sugar, glass and steel goods which Europe needs, but she has not the capital equipment or the raw materials to do so on an adequate scale. If these cannot be bought outside Europe by exports they must be bought on credit. Poland has corl to sell: but coal will not oarn the doliars needod to buy the food and raw materials which would feed the men and machines of her textile and chemical industries. Again, much of the food Poland needs was once grown in Europe, even in Poland itself: but the farms that produced it need fertilisers, and machinery, and animals, and seeds. The bulk of the fertilisers must come for the time being from outside Europe, because her synthetic ammonia industries, gasworks and coke ovens have not the fuel they need. Animals must be bought for years to come from outside. The machinery is needed more quickly than local industry can produce it.

Whether they survey their foreign trade prospects or their reconstruction taske at home, all devastated countries face serious transport problems. Europe's losses in locomotives and goods trucks were crippling: bridges, stations, permanent ways and signalling systems will need reconstruction and repair for years to come before the continental transport system returns to normal. Movement on the great rivers which run through the Continent-particularly on the flbe, the Oder and the Danube - lage far behind the level which should have been reached 12 months after the war. There are as many political as technical reasons for this. If any problem demands a European approach it is this one. the stagnation on the Danube affects eight nations. the state of the German milways interests Czechoslovakia bocause she has trade to do with the west; it also insterests France which noeds Polish coal: it also interests Denmark and Sroden, old customers of the Ruhr.

Here then, in the key matters of food and clothing, fuel, transport and raw matcrials, Europe has to struggle out of the vicious cirdle; insurficient food and clothing mean low human output: low output and scarcity of workers, fuel and raw materials mean low production in agriculture as well as in industry: low production means inability to buy - as distinct from borrowing - essentials from abroad. It is from this vicious circle that international relief, the beginnings of international planning and the policy of the creditor nations are trying to pulil tho devastated countries. The latter struggle with more modest means to restore trade among themselves by bilateral barter or compensation transactions, supplemented by small grants of credit.

Some of the little that is now being produced in devastated Europe is passing across its land frontiers in the form of reparations. For example, among ex-enemy countries, Finland is exporting anmually some $25 \%$ of her pre-war export figure in reparations, Hungary and Rumania some $50 \%$ of theirs. And Germeny, the producer ot the heart of Europe which once provided much of the cossential capital equiment of eastern Europe and much of the fuel, fertilisers, ohemicsls and repupactured goods of central Europe, is not only among the worst devastated countries of the Continent but potentially its heaviest payer of reparations.

Because of the present prostration of Germany and the level of industry fixed for her by the controlling Powers, that part of the pattern of world trade which was once shaped by exchanges between Germany and the rest of the world cannot return to the pre-war norm. Three years hence she will have to offor only a fraction of the iron and steel menufactures, chemicals na fertilisers, machinery and electrical oquipment tret she exportod ten yours aso. This fall in parcuction st the hoart of Furope rast be counted ac a majur factor in the situation, whether it is regardeá au apresent loss to reconstruction or as a future opportunity for Germany's neighbours to take her place. The attempt to make good the loss may well havo a decisive influenco on the shape of the whole Europon economy.

Not the least vicious of tho legacies left by German rule and devastation is tho currency inflation with which most of its victims are still struggling. There is available in most countrios more purchasing power and far more cagerness to increase ennsumption and restore oquipment than are needed to absorb the limitod goods and servicos available. Generally
speaking, the countries of western and northern Europe appear to have had more success in reducing or blocking this excess of purchasing power than some of those in eastern and southenstorn Burope, where horvy public expenditure, low revenues, and-in the case of ex-cnemy countrics - the support of occupying forces and the stroin of reparetion payments have all encouraged inflation. In such conditions even a rapid increase in production - hampered by the obstacles already described - will not be enouch to ensure that, currencies can be brought into stable relations, reflecting comparative price levels and costs of production. The goal for each country would have to be the free acceptence of its currency as convertible into other stable currencies, involving membership of the International Monetary Fund and the International Bank for Reconstruction and Development. So long as such stable relations are absent, so long will be delayed a return to the strictly commercial, non-discriminatory exchanges of the years before Germany's economic policy began to dominate hor neighbours. Whether there are other tendencies, inherent in the political and economic programmes of the post-war governments, which will reinforce these exclusive tendencies and lead to the formation of economic blocs within Europe restrictive of trade remains to be seen, Such tendencios could not be oasjly reconciled with the present dependence of Europe on that assistance - whether through relief or credit - from internationn bodies and from countries outside the European continent which has been shown to be essential.

The two most urgent needs for the devastated countries are; firstly, to increase production for export and the free exchange of goods within Europe; secondly, to ensure that imports of raw materials and essential foods reach Europe from outside. It is as certain as any economic forecast can be that until after the 1947 harvest there will be not only a Europenn but a world food shortage; that European production jn the countries most needing food and raw material imports will not be able to provide a surplus to pay for more then a part of the imports they require: that the devastation of industrinl cquipment all over Europe, but particularly in Germany, will make it impossible for the countries hardest hit to restart and re-equip their industries from oxclusively Europern sources for several years to come.

The situation is evidently one demanding concerted action: not only co-operation between neighbouring nations and within sroups of Gavernments, but also consultation and mutual help through effective international machinery.

## IMPODUCTOEY

Oven wide anoas of europe, when the fighting ceased, industry, joining and transport had been brought almost to a standstill; and whin a lew antis there fits an acute rood crisis, accentuated in southern mao by one of the worst droughts on record. In the sumer of i945, twelve months after the collanse or Gomany, wile the selects of devastation are no less in evidence, trasmont and employment in industry apo improving and nithorto tho throne of adespread pestilence and taino hes boon, by a narrow warping averted.

At the lowest point touchod ianediotely after liberation, industrial production as pediecu to less than
 Greece, Poland and Tuosfaria. Ia year later, there had been a marked inmrovancit in the est to a level ranging between 60 and 75 per cent. In ranter nope the improvement vas less general; in poland bis index of boduction roached 60 in December 1945, in finland 55, and in Yugoslavia and Greece about 35. Revival. of nisi irangout was a main contributing factor. tin rance, it had reecho 75 pore cent. or the 1938 level, and wa exacted to reach the an - mari level by the
 functioning at about 40 to 50 jer cont. in jaechoslovacia, 35 pei cent. in poland. and 30 dor cont. in Fujosjavia.

The varying rates of zeoviny in different countries, in comparison with sone contains outside summons an bought out in the Polloriad table: - -

## TRESPORT.

During the rerp railwars, popts and bideges rere anong the $\therefore$ in tarates of destruction. on the day of victory, the intricute not ont of cominncations, on wich the wole economr of buro e dozends, was virtueliy joralysed. It mast nevitably tako nay yian to mestore European transport to its premar level. In Frence, $4,000 \mathrm{~km}$. of track and wore thon haf the wromliag and trans-shipment yarcs :u dostrond. In ruyostavia ziad Groce, trouthirds of the ruiluay stetern were mit out of use. In Czechoslovakia, 25 per cont. of the tumels were blocked; in eqland 70, of tine bridies wero destroys and about one-third of the stations, workshops and othon installations.

In Belgiun and Frence ouly about 40 per cent. of the stean loconotivos were left in a sorviceable condition. In Greuce, stocks of locomotives barely oxceeded 10 per cent. of prew.... In the Tother.ends 50 oin cent. of loconotives disamearad, and of those rominine half wore unservicuable.

In Belciun only 50 per cont. of the prewar freight cars were lart, and of these, Din- cuantor needed vepair. In Prance the ftock of fef, fit ow left was 56 per cont. of pre-mar, and of these onc-third vore out of use.
 left ( 15,000 out of 30,000 ), and of these 12,300 were forcien argons.

Roving stoch hich hou escepd duatruction was scattored throughout hurope and ons othe fiast tasks which the Juapoan central Inlend Transport Orfjanisation sfo itsoln was to sort out mous and get thon returned to the countries to which they belonged.

 of wivibry convoys. The cosepse or transpont imnaiately afrected the production and distribution of coal.

013 nost of the inlond wtorears traffic ias at a standstil. Ais raids did sabotace had been onicr too succossiuliy diwetud a; ainst cenois, dakes and bridgos. At the wownt of liburction, ongy 50 kin out of $9,624 \mathrm{~km}$. of the french incand watipays wore opon to avigation. Thintruifive zei cart. of the Rhin fleet mas lost.

During the Alied advance into east and west Germany road blocks and dostruction of ritul bridges rendered road transport everywhore difficult, and in many places impossible. Vast amounts of road vehiclos woro requisitioned and destroyed, and throughout zurope there was anaute shortage of petrol, oil and tyres. Lone-distance trensport of civilian goods and passengurs was practically suspunded. This had grave repercussions on the transport of agricultural produce and food distribution.

In spite of the greatest difficulties, rail transport is gradually emercing from the state of chaos lert by the war. Current repairs wore greatly hampered by shortage of sparc parts and equipment. During the first few months arter liberation, the filied ammes were in a position to give considerable assistance, and since it was constituted in May, 1945, the European Contral Inland Transport Orgenisation has accomplished a most useful work of co-ordination and
co-oporation. By ripil, 1946, the number or locomotivos in scrvice had increased substantially in Irrance and the Nethorlands, and much urogross had boon mado in the ropair of wagons, permanent way and equipment. In Yugoslavia, where two-thirds of the railroads vere damaged or destroyed during the war, moro than 75 per cont. of the permanent way is now opon to single track working, though the rolling stock available is not much more than 20 per cont. of the prewar numbers. In Czechoslovakia, the numbur of Proight cars in good condition is now about 40 per cont. of prewar, and in Poland about onc-third of the locomotives and passengor ears and one-half of tho freight cars available in 1939 are in running order.

As regards road transport, some improvoment has resulted from tho acquisition of surplus Army trucks, and in some of the countrics assisted by UNRRA tho number of trucks compares favourably with the pre-war level. Emergency repairs to Duropean ports have overcome what was at one time a serious bottloncer to the import of overseas supplies.

The poaition with rugard to inland waterways is by no means uniform. Considerablo progress has been mode in restoring the national systoms of inland waterweys; but transport on the principal international rivers the Rhine, the Eice and the Oder 7 ror a variety of reasons; partly political rather thentechnical, still lags far behind the level which should have bson reachod twelve months after the conolusion of hostilities. In this respect, conditions vary from the Rhine, where transpurt has made a good recovery towards the pro-war levol, to the Danube, where international traffic is practically at a standstill.

In general, it may be said that improvement of transport has about kept wee with improvement in production, and was indeod its essential condition; but to complete the restoration of transport facilities by road, rail and inland watervay to the pre-var levol will t ake many years and will require a very large amount of invostront, which will impose a heavy burden on the countrios that have suffercd most and are least able to bow it.

## CLOTHING INND FOORTMAR.

In most countrios of hurope shortage of clothing and footwear, especially cuping the winter of $1945-16$, caused severe hardship. The war cut off the imports or wool, cotton, hides and taning matcial rihich furope normally obtained from the Western and Southern homispheres. In South Eastern Turope particularly in Grecce and in parta of Poland and Yugoslavia, lack of clothing and sholter was at one time almost as great a menace to human lire as the food shortage. -1.5-

The URREA progrenime foi completion by the enco of 1946 inchades naont $\$ 450$ minion woth of clothing footwear and textile ? moducts and raw motaing. Shiments or raw eotton will be 250,000 tons and of raw oool 113,000 tons. (Source Droc statistical Bulletin and League of Nations Monthly Bullotin).

German pie iron production bofore the wap was larger than that of France ind the Unitud Kingdom combined. In March, 1946, the production of the British and imerican zones of Germany was 148,000 tonis compared with a pre-war production for the Whol: country or 1.3 million tons. Undor the Nllied Level of Industry Plan Gemmany will probably export only a very small fraction of her 1936 exports. This will be a factor of outstanding importance for tho Juropean and stoel position.

France waz before the war an exportor of iron ore. In Fobruary 1966 oxtraction was not mone then 75 per cent. of pre-war, tho slow rate of reoovery being duc to a combination of shontrae of labour ind fucl and the losis of the Gorman market for Lorrainc iron ore. The stecl industry, which has shown a marked incruaso durine tho last twolve months, is uvorymuru handjcapied by shortagu or skilled vorkors, pig iron and fuel, as woll as by the noed por further replacement of plant and machinery damaged or acstroyed during the war.

## FITATOE ADDUREITCX

In :rosenting ane nicture of post-mai juropog sone refurede must be ade to the question of rinance and currency. In fomionly occupiod countiias ono of the iajor tasks has boon to deal ath tho ineletionary consequences on warmime robbery and duvatation. The Pinancin situation has been handed with virying degroes of fixiness zin different countriese as is shom 0 indicus on pices and fieures of notes in cipcuration. At one atatie there has been rumavay inflation in Gruce and mumane at the othom comparative stribility as in une United sin don, Demank and Nonway.

in Fu;oslavia there are no publishod figures for note cinculation, but the inders is mobabry between 150 and 200 , and wolesciu pricos butwen throe ad foum times pe-var level. th polad motes in cimatation are unofticialy estimeted et afteon to trente tims premar level; official prices in the public sertor of the economy are about ten or
 promar. In itudy the note circulation is nearly sixteon times pre-rars an inder mioh conbines official and riee maret prices stands at abont 2,300 , and froe and wlack aricet prices 4s600. In Rounanie sud Gresee notes in circulation are about 35 and 45 thas arunar respectively.

In Gredce tae mama inflation whon stanted during the war wad continuad ?o? taj tast montin after liberation was ended by the converimon 0150,000 iainilion old dicachas for ono ner drachin. sunaray inflation in zumery his been evon romse. Th tha adalo ô July lyb the note oipountion redched the fantastic loved of 75 foslored by 24 aoucincs, and a new currency, "forint", was introduced on ist August, 1916.

In many liberated countrics the inflationary situation inherited Irom the German occupation was successfilly attackea by withdraval and conversion of the currency, and by cancellinc or blockine part of the excess above a prescribed levul. This was first done in October 1944 in Lielgium, and exnly in 1945 in Denmark, Norway, the Netherlands, Czechoslovakio, Finland, roland and Yugoslavia. The first effect of these mefsures was to bring about a contraction of purchasing powne and some fall of prices in the frue or blach marlet; but later the impossibility of balancine Government expenditure by taxation, and pressure for incraased mages in face of the physical scarcity of goods, led to a reneved infletionary tendency or varying degree in difforent countrics In roland, free market prices and tho cost of living indmx foll for six months between ipril and September, 1945, and has sinco risen to about the level ruling a yoar ago. In Coechoslovakia, wholesale prices and the cost of living remained steady during most of 1945, rose sharply in Decmber and Jentary, and have remained steady since thon. In France, whore no capital levy has taken place, the volume or purchasing power, the indices of prices and the cost of living have risen by about 50 per cent during the last tivelve months.

In countries where prices have remainad relatively stable during the last twelve months, the increase in the volume of currency compared with 1930 has generally been greater than tho rise in prices. Jino converse is true in countries Where prices are rising. The difference is largely explained by the degree of public considence in the future value of the currency, and the success with which direct price control and rationing are enforeed. This, in its turn, depends in part on the degree of scarcity of consumer goods, and the willingness of domestac rood producers to market their surpluses through offfcial channels.

Instability of prices and uncertainty about their probable future level have made it impossible in many countries to establish foreig exchange rates which accurately refluct the relative puechasing power of different European currencios. In mosit cuuntries there are black market quotations whicn tend to under-value local currencies, while official rates fruduently show a tundency towards overvaluation. Amone the principal mupopean currencies, those of Denmark, Norway, the wetherlands, Sporin, iortugal and Switacriand presorve roughly their pro-mar relation to the dollar; sterline has been dopreciated 14 pen cent and the value of the Sweiisin liona has recentiy been raised by 16. 7 per cent. poderato depreciations in relation to sterling have been established for Belgium, the lotherlands and Gzechoslovak curpencios, an tho currencies of France, Italy and Finland havo fallen to luss then half their pre-war sterling valuos. In other countries of Eastern Europe (except in Czechoslovcikia) no mutuanly agreed rates of exchange havo yot buen established; official rates and the black marlect rates have littlu relevance, since barter agreements are nommilly concluded on a basis of world prices rathor than intemad wioces.

Durine 1945 there win an increase of imports into most Iiberatea countries comparu with 1944, but there was little or no improvement in axporta, which rerained far below the 1939. Ievol.

The excess of imports over exports was financed partly by reduction of foreign assets (particularly in the case of France, Bolcriuri, Norvay and the Netherlands), partly by foreign loons and credits (far the greater proyortion of them irom the $\mathrm{J} .3 . \mathrm{A}$.), and partly out of U.IT.R.R.A. funds and military relief in the case of those countries receiving free assistance, the former being subscribed primarily from the U.S.A., the United Kingdom and British Dominions.

## TRiDE

It is difficult to estimate the total volume of international trade in Continental Burope for purposes of comprison with permar, but a considered and recent atterpt has placed it (in mid-1946) as not creater than - if as ereat as - a third of whit it was in 1938. Moreover, the Continent as a whole has at present a heavy debit balance with the outside vorld. This last factor, of course, (omitting from considaration for the moment its actual size) is not as such an abomal feature of Burope's trade relations with the rest of the world, but the disturbing aspect of the present situation is that the normal method of inancing Europe's import surplus - i.e., by the invisible items in her international account, which were principally the yield or suropean investments in other continents and the income rectived for jervices performed has been very considerably dislocated by the recent war. Europe is therefore largely thrown back on to her own efforts er purposes of reconstruction, and for the revival or international trule, plus what aid she can get from the rest of the world in the way of relief, rehabilitation and crodits.

In 1933, Continental Iurope (excluding the U.S.S.R.), while representine $29 \%$ of vorld industry, accounted for as much as $38 \%$ of worid trade; of this volume of trade, rather more than half roppesented intra-European trade, the renainder representine trade with the rest of the world. It is difficult to estimate the position tomay, but it is a reasonable assumption that the proportion of intraEuropean trade has expandod considerably at the expense of trade with the rest of the worla, on fortiori grounds. A major current problem of Furopean tracié, viemed us a Whole, is therefore the rusumption and development of trade with the rest of the worla so that necessary imports may, so far us possiblu, be fintanced by exports.

Continental surope has alway been dependent on importa from the outside worla for certain essential raw materials (c.e. cotton and wool). The decine in agricultural production, and the diversion, especially in Eastian Burope, of the flow of supplies of food and feeding stules Irom the nomal channeis, have created for certain countries a demwa wich would not nomally exist for imports of food and feedine stuffs from outside Europe. At the same tine, the neog for cupital plant for immedate reconstruction and Ionger tem rohabilitation, coinciding With the virtual cussation of production in Germany and reduced levels of production ulswhere in Durope, results in an exceptionally large demand for imports of capital gcods from the outside rorld, These neeas have been covered in part by credit assistance already granted, but a large gap still remains.

The occupation of Continental Europe by the enemy involved the cessation of trade of the oceupied countries With the rest of the world and an inevititie distorion of the nomal premar pettern of trade. pollowing lioeration, these countries hed to set about rebuildine their trade with one another and vith the rest of the world virtually from scratch. Apart fpon the neutral countries less jirectly arpected by the war, all the counties had at first very limited production for export and heavy and urgent dendands for imports. Each had therefore to exercige tight control of exchange movements and or the impont and expont on goods. Since the exchange earned by exports to other European counties was genorally not convertible into other currencies and since the need for imported goous was pressing, Eich Buropeon country, as production gradually revived, naturally sousht to use its limited ability to supply essential coode in demand by other guropean countries as a lover for securing in return supplies of the goods it most newded. Though there are a few welcome signs of a movement towargs more liberal policies by the compries whose recovery has urocenssed furthest, the general position tomay is that inter-European tasde is mainly conducted under bilateral ajreoments providing for the exchange of specificd goous to speciriod values. In the negotiation of such pilateral breemonts, each side noturally tries to gist the maximim imponts of the essential goods it most needs, but irequently countries appear to have found it nocessary to aeree to some imports of loss essentisl goods as a condition of findine expont outlots for their om production of less sasential goous, The ebneral aim of these bilatoral agreemerts is that they should balance over a limited period, sut the few countries of Continental Burope in u position to do so have sought to assiat the reconstraction of their noighoourg by providing wnder such aspements credits which have tncibled the more neogy countries to obtain urgently nocded supplies of foodstuffs, row materials, capital plant and consurox goods for which they could not immediately pay in goods.

马Very country cariius on sone trade vith every other country although in some crasu this trade is obviously very small. This pattom is rollured closely in Northmestern Europe and the Unitod Kingom, for example, has some trade With every other courtrer in furope. The main exceptions to this genoad pattum ane:-
(a) Min feninsula Spia is not trading with fustria. France, the U.S. $\bar{S} . \dot{\text { rid }}$ and other countries in Eastern Furope such as pinland, jolanâ, Ifugary, Rounania, Bulgaria and Yugoslavia.
(b) Austrio. Italy and Greece. These three countries have all hid dificulty in rosstelishing thair foreign trade. Austria is nuw beginning to resume tracle with neichbouring countries such us Italy, Switzerlund, limgary and Czechoslovaikia and the oceupving powom. Itair is again tradine principaly with the United Kinedom, Sueden, Switzerlanci, Spain, Austrias France and Demark. Grevce has ocen alower in resuming her trade contacts.
(c) The U.S.S.R. and certain countries in Zastern Europe The U.S.S.R. trades mainly with tho other countries in Eastorn Europe. For fostom trade ia limited to small amounts with Gwoum, Bwitzerisand, Forvay and the United Kinedom and thero have been no exchaneses uncer the Franco-Soviet Agrement (see Table I) opart from the recent export of Goviet erain to Frrance. In agreement, however, is boing nerotiated with Sweren and another has just been siched vith Demark (see Table I), so trade with the West may increase in the future. The trade of Finland, Czechoslovakia and joland, however, is more wide-spread although zolish trede do the present has been hindered by tionsport difficultios.

The trade of Hungary, Rourania, Bulguria and Yugoslavia is up to the prescht mainiy with the U.S.S.R. and other countries in Eestern Europe. It is difficult to estimate the direction of their trede as detailed statistics have not been releasod but it is clear that trade with Fostum Burope is so far limited. There has been a little trade between all these countrios and the United Kinedom. Hungary has resumed trade with Switzerland and Sweden and there have been reports of trade between Yugoslavia and Switzorlond, the Netherlanis and jweden which have not been confimed by official sources. There has been a little trade between Bulgaria and Sweden, Switzerland and Belcium. Huncery and Roumania have both sienud agreomonts recently with France and Bwitieriand, Fungary has signed agreements with Denmark, Yugosiavia an acreement with France, and Bulgaria is negotisting an exchnee of goods with Prance so, as in the case or the U.S.S.R., are incruase in trade between this area and fobtern Furope may bo expected in the future.

The conditions of trade provailing in Dastorn Burope, rerlect to soms uxtent the chances political situation. Folan, Dofore tho wor, lid Iittle trade with the U.S.S.R., mainly for political reasons, and its connections were more anci more with lwatern furo, and overseas. It now seems thet the very considurablo oportunities for rolish-Soviet truate are to be fully expluited - it may be that the U.S.S.i. Will absorb much of the coal of Upper Silesia, littlo of wich is likely to go to its former German markets. The wane is true of Goviet trade with South-iastem Europe, Which previousiy found its chtof markets and sources of supply in Germiny, The Goviet aereemonts on economic collaboration with Funeary ond Romania which provide, intor alia, for filty pur cent. The eficct of Soviet participation in meny branches of economic life in these countries has yet to be seen.

## 2. REVIVAI OR MULTILATERAI TRADE

iile cannot exaggerate the importance of reviving multilateral trade both amorg European countries and between Europe and the rest of the world if full European prosperity is to be attained.

The Economic and Social Council by its resolution of the 5 th March 1946 announcing its intention of calling an Internationel Conrerence on trade and employment whioh has associated itself with the initiative taken by the U.S. Government in their proposals published on 6 th December, 1345, has pronounced in favour of multilateralism as a permanent system or trade. The I.T.O. proposals referred to aim at the expansion of international trade and full employment, especially through the reauction of all barriers to trade by mutual agreement between countries concerned and more particularly seek to eliminate those forms of trade interference which tare a discriminatory form.

It is recognised that in the conditi ms existing in the immediate post-liberation period there may have been no practical alternative to the system or bilateral agreements or a "compensation" type by which the continental European countries have sought to rebuild their trade with one another: and it is possible that ror a transitional period a number of agreements of this lrind may be justifiable and even desirable: Taking a longer view, however, it is clear that bilateralism can never represent more than a second best, if only because it prevents trade from being built up on the basis of competitive efficiency and the most economic international division of labour.

We recognise that the promptitude with which particular countries finc themselves in a position fully to accept the principles of multilateralism will depend in large measure on the speed with which they restore their financial stability and recover their productive capacity and their ability to export. The period of delay or transition will in its turn be vitally afected by the extent to which outside credit assistance can be made available while home production unavoidably lacs - a point to which we return under Recommendation below.

What is of importance is that any measures taken during the transitional period involving restrictive and especially discriminatory practices should be clearly recognised as purely temporary oxpedients, and should be based on purely commercial considerations. There can be no question, in our view, that if permanently oersisted in, such arrangements would prove a serious obstacle to the maximisation of trade within those areas and of European trade as a whole. The inherent dangers of restrictive agreements are well exemplified by the series of clearing agreements concluded by Nazi Germany with her neighbours in South Eastern Europe.

The rate of economic reoovery and the development of European trade on a multilateral basis will also depend on the rehabilitation of public finance in each country, through the adoption of adeguate measures for the collection of taxes and control of Stato expenditure, the stabilisation of prices ank the establishment of rates of exchange which more nearly
equate internal and external price levels. Many devasted countries have already taken drastic measures to restore confidence in their respoctive currencies. When the necessary degree of stability has been reached, it will be possible for each country to become a member of the Internationsl Monetary $\mathrm{F} u$ und and for its currency to enjoy the advantages of irce convcrtibility with other stable currencies.

In the framework of world trado contemplated by the sponsors of the International Trade organisation, room has been specifically enviseged for various kinds of national economy. Whether those economies are based on free competition, on planing, or on a combination of the two principlos, the dogroe to which particular nations will decide to plan ahead their foreign trade for a period of years will rost entirely with themselves. What is insisted on is that in making thoir plans they should steer away from policies and practices of an exclusive and discriminatory character and worl constantly for the achievement of an international trading system based on the fair and equitable treatment by all countries of each others' commerce.
3. SHORT TERM PROBLIMMS

The recovcry of Europe depends in the last resort upon an increase in production to pre-war levels and beyond. No such increase in production can bo achieved unless supplies of foodstuffs, raw materials and rehabilitation equipment can be accuired in quantities adequato to increase the productivity of labour and the rebuilding of shattered industries. Some of the current shortages can be assisted by the better distribution of goods within Europe itself and it is recomnended that Europen Governments in collaboration with existing regional bodies notably E. E.C.E. and E. C.O., should take all possible steps to that end. It must, however, be recognised that before the war Europe, whether including or excluding the United Kingdom, was already on balance a heavy importer of goods. The gap was bridged by interest on overseas investments and to a limited extent by fresh commercial borrowing, Her whole economy rested on the import level of foodstuffs and raw materials so obtained. Decline in European production due to the war and the disappearance of many other assets available to liuropean countries for earning foreign exchange has increased the adverse trade balance both by reducing the volume of exports and by increasing the neod for imports.

While an exact quantitative appraisal of the balance of payments for 1947 must be the subject of meticulous expert studies for which time has not been available, it is, nevortheless, clonr to us from the information which has been assembled that the economy of Jurope as a whole cannot be placod voon a sutiaractory footing in 1947 without outside assistance to finarce ossontial imports. We accordingly endorse tho recomnendation mado by the U.I.R.R.A. Council at its recent session that the Goncral nssombly of the United liations should "forthwith ostrblish or dosignate such agency or arencies as it may docm aproprinte whose functions shall includo:

## 29

(a) A review of the needs in 1947 for financing urgent imports of the basic essentials of life, particularly food and supplics for agricultural production, after the termination of $U . N . R, R, A$. programnes to the extent that they cannot otherwise be met and
(b) The making of recomendations as to the financial assistance that might be required to meet such needs as are found to exist as a result of foreign exchonge djfficultios which cannot be dealt with by existing agencies."

We recommend rurther that the agency established or designated by the Gonoral Assembly of the United Nations shoulà comprise a small body of independent experts charged with the particular task of preparjng before the end of November 1946 a detailed analytical study of the prospective balance of payments position in 1947 for all countries of Europe which anticipate a serious difficulty in financing essential imports during that year.

## 4. POST-WAR ECONOMIC CO-OPERATION II EUROPE

1. 

Apart from external assistance there is clearly need for effective machinery for mutual co-operation and assistance in the economic field between the European nations themselves in dealing with those problems of Turopean reconstruction which require concorted action.
2. The urgent problems of the period immediately following the liberation of the enemy occupied countries which have demanded such concerted action include the allocation of European supplies of goods in critically short world supply, the restoration of transport and the distribution of power and gas supplics.
3. To provide machinery for co-operation in these spheres E.C.O., E.T.C.I. and E.C.I.T.O., wore sct up and these temporary European inter-Governmental organisations although restricted in membership, authority and functions and without formal relationships with world organisations, have been responsible for achieving a useřul measure oi concerted action in the field of the most pressing short term problems of European reconstruction.
4. At the same time it is anticipated that there will be longer term probloms of European reconstruction which may lend themselves to concorted action by the countries of Europe because they are problems directly affecting European countries only or which though they may be Eully solved only as part of world wide problems may nevertheless usefully be discussed in their European aspects by the European
countries in concert.
(i) the Economic and Social Council should give
consideration to the cstablishment of $a$
co-ordinating body which might be called the
Economic Council for Europe

> to facilitate concerted action with respect to the imnciate problems of reconstruction such as arc at presont the responsibility of $\mathbb{E}, C . O_{0}, E \in \mathbb{E}, \mathbb{E}$. and $E, C, I \cdot T, O$, and
(b) to provide a form for discussion of such longer term problems as lond themselves to concerted action on a European basis.

That E.C.O., E.E.C.E. and E.C.I.I.O. continue until such time as their activities can be effectively taken over by the Economic Council for Europe.
(iii) That the scope and organisation of the proposed Economic Council for Europe should be worlsed out, and from time to time reviowed, in the light of the development of other international
 I.T.O.) working in the same fiold, and more particularly of such regional boaies for Europe as those agencies may set up.
6. Membership of the Council would be confined to European members of the United Nations or other members whose governments derive authority in Europe rron responsibilities of occupation. Non-European members of the United Nations would have the right to send observers to the Council and such subordinatc bodics as it may vstablish, and the Council should at its discretion associate with those bodies European countries not members of the United Nations.
7. The Council and its subordinate bodies, although set up and supervised by the Economic and Social Council, would be empowered to make recommendations and to report direct to its members, obsorver governments or any world organisations to which it micht be formally related, on any matter within their competence. The European Council, however, would keep its world parent body informed of its activities, and would refer to that body any questions relating to the world economy as a whole, and at the same time be assigned tasks within its competence and scope by the parent body.
8. As indicatcd in paragraph 5 (iii) it would be necessary to secure the closest integration, if not identification, of the Council's subordinate bodics with European regional offices of international agoncios working in tho same field, (sce paragraph 5 (iii) above). In principlo, this integration at the European level should reflect the close relationship established between U.ī.O. and the Specialised Agencies at the worid level.
9. It is suggested that the scope and functions of the Economic Council for Europe should be reviewed after three years in the light of experience gained and circumstances then prevailing.

## APDTDIX 'A'

## THE UTITED KINGDOM

Then the war ended the United Kingdon forces had been maintainin;, Por nearyy six years, active hostilities against the fris povers on air, sea sad land fronts which eventually stretched about three-aumtors or the way round the globe and from the Arctic to well below the Fouator. This oidespread and lonch sustained eforet had most substantisl battle ad civilian casualuies and great sacmifices in new investment maintenance and consumption; it had also involved a large net transier to others of Wealth accumulated overseas during many veers of peaceful comerce. slthough faced with immense economje burdens and problems of its omn, the Juited Kinedom, without waitins ror the end of the war, became, throurh UNRRA, the second Jargest contributor to the immediate relief of wardevastated United Tetions and others in Europe and the Far East. Immediately after the war the United Kingdom gave extensive prionitiew for the production of goods for export, and by retaininy strict econonic controle and rationing st hone was aule to nake available to other countries a larger proportion of its total industrial output than any cther netion. By so doins the vaited Kingdom has not onjy begun to restore its orm balance of parments, but has sulostantielly assisted vorld recovery, and the resumption or international trade.
2. The $\operatorname{tn}$ ited Kingdom mast, thererore, be considered in this Report fron several angles - as one of the countries most hovvily devastated bü enemy bombardment; as one of those nost burdened with sacrifices arisins out of the modilisation and deployment accainst the enemy of vast land, sea and air forces; as a country mich made a unique var contribution in sponding accumulated foreign investments to $\wp a i n$ time for the full United Uations eriort to be built up; es the second largest contributor to UnRik relief; as a creat sind early postwor provider of necessamy goods through the well-triod methods of trade wich must increasinsi; be relied on as the source of rorld economic reconstruction and prosperity; and rinally as a country camping through a rapid anc succossful economic recovery and well launched on post-war olicies oi full employment, advanced social nervices and orpanding comsumpton wich should contribute towards achieving the economic and social purposes of the jnited Mations.
3. The cost of the war to the united Kingdom has been, in round figures, 226,000 million, or $\$ 10$ bilion. Jhis means that timo, wra and energe to the tune of over $\$ 100$ billion, which micht have been apent in improving the standard of living of the people of the United Iningdom, was instear spent in strivine fox victory which was at last achieved.

To put the matter in anothor, and perhaps more striking vay, $44,500,000$ man years vere put into the United Kingdor Armed porees and the production of maintions up to the end of the rar, and thus were not available to maintain and jinprove the British standard of living. Vast krmed porces cannot be domobilised in the twinklins of an eye, and hucvy expenaiture, whether it is counted in money or in man years, has neen devoted to mon-productive defence expenditure at hone and overseas since the end of the wax. Pach oit this expenditures such as the heavy cost of occunyine large parts of Germany, represents a purther British contioution torards meetine the burdens of maintainins woxla security.
l.t the peak of the wir, ten million people out of a working population of twenty-two million, were engaged in fighting and in muntions psoduction. Out of sizteen million momen, seven million vere in the scrvices, wholetime civill defence or industry.
4. The British wor effort altered the whole pattern of national life. The ountity of both wheat sin potatces harvested in 1943 was mo than dombe tho pre-war average. Macnesiun production increased to more than eleven times the pre-war rate, while the jroduction of may articles, such as motor-cass and reirigerctors yas completely suspended.
5. No arithmetic of human sufterincs can esteblish exactily the relative ar losses as betueen the fllies. But after many weeks of deliberation, agrocnent was reached thot the innted Kincdom is entitled to clain 30\% of the Gemman reparation available to the eighteen countries represented at the Paris Reparations Conierence. Four million houses throurhout the towns and countryside of the Whited Kingorn were destroyed or damaded; thich represents nearly three out of every ton of the houses wich existed in 1939. Perhaps a simple ficure liko this brines home the extent net the danace supfered evon more clearly than the estimate that the total cost of physical damase to property anountod to 1,300 million on pre-wai values, and that the extent to which projerty has deteriorated owing to failuro to preserve a nomaj standsed or maintenance amounts to not less than a eurther 31,000 million. Howses which have been destroyed or danared can be re-built or repaired, although this will take o. lon while. But lives which have been losi are imeplaceable. United Kingrom fatal casualties anountod to 385,000 and the number of wounded or seriously injured to 383,000 .
6.

The foundations of tho U.K. 's nomal economic life are a hish desree of industrial specialisation, a culstantial dependence upon imported roodstafis and raw naterials, and the mantenance of a volume of export trade and of other sources of forelin exchance errang adecrate to pay for those imports. Berore the orr, the 0. K . vas dopendent on imports for ton-thixds of the food consumed by its people, and anart mom coal, for tho bulk on the rav: matorials used By its industice. But the U.K. paider anch requirements by the procseds on its axports and by the a arinces of its shippincend other services rendered to overseas countries and of itis investiments abroad.
7. The effect of the war was to bring about a severe dislocation or the U.K. position in several respects, which will inevitably take some zears to remedt; namely, loss of exports, lons of overseas investments; loss of shippince, increase of nverseas debt, and loss of roserves; hence the necessity for finencial ansistence to put the U.K. on its foet, in the fom or loans from the U.S.A. and Canada to a limit of $\$ 3,750$ million and $\neq 1,250$ million respectively.
8. Loss of mporta. The loss of U.K. export trade durine tho var was to a larse extent the consequence of a deliverate act of poli.cy. An atteript to maintain U.K. export trade at a high lovel would have stood in tho way of the full degree nobilisution of man-power, production, and materials for the airect var emort which the aituation of the J.K. required as being the base of operations nearest to Gemany. But iood, mantions, ond rav materisls atill had to be imported. The operation of Lend Lease from the U.G. fitutual Aid and other contributions from Canaáa, ond aterling credits from other countics. nade this compatinle with the de likerate abandoment of the export trade. The decision, that the U.K. should ja efrect digregard the maintenance of export trade in favour oi the maximun concentration of resources on the armed forces and war industris undoubtedy constituted a rational and proper allocation of effort between the hllies wich was willingly accepted by the U.K. in the interests of winning the war. But the outcome has been that British export trade shrank to less tian one-thira of its pre-war volume, and despite some recovery, may be expected to cover in 1946 not more than one-half of the essential expenditure of the country on the purchase of a minimuan volume of imports and on other necossary paymente overseas. Thus, with the end of the war and the termination of Lend Lease and itutual lid a period of acute difriculty mint be raced until the reconversion of industry, the release oir men-power and the recovery and expansion ox export mankets have negun to result in a substantial Il IG: of exports.

## 9. Loss of shipins. Nore than half of the pre-mar

 tonnase of Brition merchant shipping was lost during the war. fllowing for now milding in the war, U. K. -owned tonnage is now less than threo-unarters or the pre-war fisures. Jntil the fleet has been expanded and carrying trades abandoned in the War have been recovered, the uet income available from shipping services to suplement U.K. purchasing power abroad will be creatiy below prowar level.10. Ioss of Overseas Investmente. Finally, there is one Torm of loss which has been nurfercd by the trited Kingdom, and by the United Kincton alone anong the illies. Since Soptember, 1933, the position of the United Kingdom on intemational capital accmatt has deteriomated by sone 65,000 million, ow of billion. This represents over 0100 or $\$ 400$ per head. It is estimated that the net incore froun overseas investments in 145 will be less than hals that received in 1933. This reflects the extensive liuuidation of foreisn securities, the reparation of loans by overseas debtors, and the increased interest pajments to hulders of stosins debts carsed by he heaver mar expenditure winch tie ti.K. hes had to incur ovorseas. Thus.
nearly all the maketablo U.S. dollar socuritice on U.K. nationals yoro conculsoiply ocquirua for sulo or plodeinc in orace to finance the murchase of innitions and tho construction of ner planta in the U. S. before the oporation or the Lond Lasse -ict.
11. Tho Incruabe of Oversucs Dubt. - Tho jatorval or tinc which must incvitably olapos, botore tho wort trade con be rocovorad ind tho loss of incomo from invostiants and shipping can bo mado cood, vould heve brourht ebout a pesition of sorious dieficuldy for the T.K., von if ovorsces oxponditure had ronainud at pro-ve luvuls. But the usicuncios or the war invelvca the U. $K$. in cnomous coble canditure ovimsoas. Lerge inilitary foreas had to bo maintaince in the widde Eist to ongego the Gomban thore: even larcor Porees operatca acainst the Jopanoso in Buma ono the For Bast. Supplios on an immase scalo had to bo a: quirou in addition to those furnishod uncor Iend Ivaso ond ratuel Aid to sustain thess roress. Nill this involvci a grost outpouring of owondituro in local currincics, particularly in India, woypt and palustinc, whether on troon pay, tho buildine of aerodromes, railways aroade, or the payment or local lahour, on on the acquisition of supplics. Such owonditurc could be coverca only to a linibod catont by cxports or hy the liguidation of invostames; tie rosult has bera that tho U. X. has incurece nucc dobes in the rom of cocninalated storling balances.

## APPENDIX 'B'

## IEMORANDUM ON THE ECONOATC SITUATION IN GEFIMAYY AS AFFEGTING EUROPEAN RECORISTRUCTION

1. No survey of post-war European economic reconstruction would be complete without an examination of the present and future position of Germany whose structure will differ very considerably from the Germany of 1939. It is not the object of the Sub-Comission on Devastiated Areas to make a study of Germany under the same toms of reference as Allies or cven other ex cnemies, but it is essential to tako cogrizance of her position under the Controlling Powers in order that other countries may inke the necessary adjustments to their own economies.
2. In speaking of Germany the area under consideration in this paper is that which is subject to the authority of the Allied Control Comission, i.e. the Altreich less the territory lying to the cast of the Oder-Western Neisse line.
3. It is proposed to consider this subject in two parts, the short term aspect and the long tern aspect.

## Part I. Short Term Aspect

4. The period under review in considering the short term aspect is up to the end of 1948.
5. Gominy through her ow fault is probably more devastated than any other country as a result of the war. There are two basic limiting factors in that country today which condition the life and prospects of the inhooitants and which affect Europe as a wholc. They are food and coal. No less important to the Germar. but of less direct intcrnational signiricance is the problem of housing. It is worth examining these matters in some detail. Germany in pre-war yoars was only about $90 \%$ self-sufficiont in food supplies. If the eventual Peace Treaty with Cemany confirms the loss of torritory lying to the cast of the Oder-Western Neisse line, this vill deprive her of about $25 \%$ of her agricultural land producing a large surplus of cercals, potatocs and livestock products which were consumed in Western Germany. The population of the new Germany, on the othor hand, would be little less then it was before the war. The upkeep of the British and American Zones is at present costing the two Governments concemed about $£ 130 \mathrm{million}$ : alrost all of this represents the excess of imports over exports fron the two Zonos. The greater part of the imports consists of food. Even so, food irworts are fer fron adequate owing to the world shortage of supplies. The most that can

Uu done is to give the nomai consumor a àaily ration anounting to about 1200 calories which is littlo more then half the quantity considered by UNRRA to bo ossential to maintain a healthy population. Higher ration scales are in force for cortain categorics of wurkers but thesc scalos are still too low and the effect has been to restrict very considerably industrial effort.
6. The coal ficlds of Gemany, and particularly those in the British Zone, are vital to the industrial recovery of Furope. Since the surrender a high proportion of the coal producod has been exported and has been a valuable contribution to a measure of conomic recovery in recipient countries. The present level of production is, however, ertirely inadequate ana strenuous efforts to increase output have lately had Iittle effect. The rcason for this, apart from the shortage of food mentioned above, is that it has been found impossible in practice to revive one industry in comparative isolation without also rehabilitating to a ecrtain degroc thosi activities which ere ancillary to the coal industry or those on which the industry itsclf depends for essential supplics. horecver, in the absence of consumer goods there is little incentive to increase production and the probled is further aggravated by the inadequacy of howine acsomodation. An ingrovent in these conaitions is indispensable to an increased output of conl and cannot be achieved without increasing the consumption of coal in Gomany. A quadripartite Comittee of experts appointed at the instance of the Council of Foreign linisters is at present considering moans whercby the production of coal in Gormany can be increased. Pending the subnission of its findings torards the end of August coal exports are being maintained despite the facts that the present level of exports
(a) acts as a deterrent to an increase in the production of coalg and
(b) imposes a heavy burden on U.S. and British taxpayers.
7. It is a pre-requisite ut prosperity and well-being in Europe that Germany should achieve as rapidly as possible an conony which is viable as the result of her om efforts rather than relying un financial contrioutions fron the U.S. and British nations which cre not expected to continue indefinitely. In default of Germeny chtaining a balanced economy she is likely to suffer a conmate breikdum with serious consequences for the rest of Europe. It is therofore the object of the Occupying Authorities to achieve a balance of payments and to balance the Geram budget. The problera is roally one of finding " way of increasing exports to pay for minimurn essential imports. Imports will rimarily consist of staple food products and raw materials for fortilizers and
other essentials. There con be no import of pre-war luxury foodstuffs and ... consumer goods, and European countries which provided these for Gemany before the war must look for other custoners. Nifost of the wheat which has to be imported comes from the dollar erea and it is necessary to ensure that Germany receives sufficient dollors for her exports to pay for these irports. 8. Germany is able to export very littlc in the way of menufactured goods at present due prinarily to the shortage of coal. Her iuajor exports must, therefore, be largely confined to raw materials of which potash, tiraber and coal will form the greater port. It is in the interests of Europe as a whole that German exports should be increased as rapidly as possible.

## Part II. Long Tera Aspect

9. On the 27 th March, 1946 the Allied Control Council in Berlin agreed the plan for Reparations and the level of Post-War German Economy. The main assumptions under-lying this plan are:
(a) that the population of post-war Germany will be 66.5 million;
(b) that Germany will be treated as a single economic unit;
(c) that exports fron Gernany will be acceptable in the international markets.
(a) that the Western frontiers of Gomany remain unchanged.

It has been frequently stated that it is the policy of His Majesty's Government that Gcrmany should be treated as a single econcaic unit. This is not at present being carried. out.
10. The guiding principles of the plan may be summarized as follows:
(a) Elimination of the German war potential and the industriol disarmament of Germany.
(b) Payment of reparations to the countries which had suffered fron German aggression.
(c) Development of agricultural and peaceful industries.
(d) Maintenanoe in Germany of average living standards not exceeding the average standard of living of European countries (excluding the United Kingdon and the Union of Soviet Socialist Republics).
(c) Retention in Germany, after payment of reparations, of sufficient resources to cnable her to maintain herself without extornal assistance;
11. The plan divides the industries of Germany into three broad classes, those which are to be prohibited entirely on grounds of war potenticls, those whose output is to be restricted, and other. The agreer.ent reached. with respect to exports and irports vas as follows:-
(a) That the value of exports fron Gemany shall be planned as PM 3000 milion ( 1936 velue) for 1949 , and that sufficient industrial capacity sholl be retained to produce goods to this value and cover the internal reouirements in Gormany in accordance with the Potsdom Declaration.
(b) That appoved imports will rot excecd Rii 3000 inillion (1936 value) as compared with Rid 4, 200 million in 1936.
(c) That of the total proceeds fron exports, it is estimated that not Fcre than Raf - 500 million can be utilised to pay for irmorts of food and fodler if this will be required with the understanding that, after all imports is roved by the Sontrol Council are paid for, any portion of that sum not nueded for food and fodder will be used to pay for costs of occupation and services such as transport, insurances, etc.
12. Following the approvel of this plan (subject to the four basic assumptions in paragreph 9) it was agreed that the existing capacities of the separate branch of production should be determinel and a list compiled of enterprises aveilable for roparations which represents the capacity renaining in excess of that yermitted under the plan.
3. There are certcin clear inferences to be drawn fron this plan. Firstly, there will be a substantial overall decline in the aeneral lovel of German Eroduction (estimated at obout $40-45 \%$ of 1938 level). Secondly, the restrictions rmposed upon Gormany's war potential industries will substantially reduce her Emportance as an exporter of stcel, enginecring and chemical products. Firdly, because of the restrictions imposed on war potontial industrics and 0. Gorman's necd to mantain hor injorts at some $70 \%$ of pre-war level an emonsion will be nucossary in the exports of geaceful industrics. The effect o: these develoments on the rest of Europe are bound to be considerable, tiough their full impact will be to some extent mitigated by the implementation O. the reparation programe which involvas the transfer of certain capital assots from Germany to other European countries.

$$
-4=
$$

14. Although under the Level of Industry Plan Germany's standards are to be reduced to the average of Europe excluaing the U.S.S.R. and U. $\mathrm{K}_{\mathrm{g}}$, this provision was intended as a yardstick by which to deterine the type and quantity of roparation deliveries and will only operate during the reparation period. Thereafter it is to be expected that Gerany by hor own efforts will be able to affoct an increase in her standard of livine and in the level of peaceful incustrial production; this should result in in expension of her foreign trade. Noverthuless, the linitations on steel and encineering capacity will undoubtedly act $a s$ a brak on this devclopment and for sone yesrs to come Gemany will be concorned with roducing the cost of her imports which can only be brought about by a rooriontation of bor aricultural and industrial economy.
15. There is no osceping the froct that these changes in the pattern of Germ conow wil result in a disiocation in the cononic life of neighbouring countries whether the plan is integrally carried out or partially modified. It must, however, be reconiscd thet the majority of restrictions on German production which arc enviseged under the Plan have to sone extent already been brought about as a result of the Allica bombing during the war years or are ussential on security grounds. The not effect of these neasurus will be so to roduce the Goman standard as to make it difficult to make any mejor adjustmonts in the Gcman position with a view to alleviating the difficultios of other European countries. Any further restrictions of peacotime industries which wero designed to reduce the jostwar cometition with si:ailar industries in neighouring countries would lenve Gomany with only less than a bare subsistence level. 16. In the Appendix to this peper are set out in considerable detail an ustinate of the changes that are likely to occur in the Geman import and cxport traie in accordance with the Level of Irdustry Plan.

## IMRORTS

$$
\text { 1. Food } \quad \text { ainincixx }
$$

For many years the cost on necessary inported food must dominato remany's import account. Provision has been made for a maximum of RI 3500 million at 1936 prices to be wonded in tris way and if the cmphosis on the development of agriculture in the naxt few yeers leads to good rocress in restoring prerar yiclds and beginnex, to build up livestoole numbors, there is rasor to expect that imports to tiris vilue togother with indigenous production will provide an ajuquate diot for the fombin pulation thourh one considerably below prowrar atandard in quality. Corneny vill cortainly not bo ablo to afford to pay for importis on anything lige the pro-vor seale of tho moro exponsive types of food stuffs such as fruit, vegetables, dairy products ond tobacco. The reduction in imports of smi-luxury foodstuffs will mean a considorable loss of marksts to Holland, Itoly, Domark and the Bollew countrios. It rey woll bo that in course of timo Gomany will bucceed in producing for hornof the hich-cost somi-Iuxury foods and aight cren bocome in a position to oxport these in competition with tho countrios montinned abovo.

## 2. Fortilisers

As a conscquenco of the cvontual supprossion of the synthetic amonia procoss and of othor moanuros of industricl disamament, the import requirement of 'hosphtios and nitrugenous fertilisers will be considernbly hicher than in 1936, the fomer perhape shoring a three fold increasc and the latter, when supplius are avajlatig in the morla nurket, rising to perhaps 250 millions compared with Gout II million Reichnarks in 1936.

## 3. Inur hatorials

Turning to imports of raw metorials, since Germany in the intorests of conserving foreign oxchange rill mure a noxinun use of scrap and exploit her Dim ronouroos of motallic ons and also becuse the lavel of the notallurgical and onginooring inaustrios will be roducod, $\therefore$ roduction to about ono third of the 1936 value nay bu lookod for im the imports of non-forrous motals, serap and alloys and notallic ores. It is dipficult at this stage to assoss in any dotail tho offect upon the export trado of othor Europern countries. imonce
those possibly arfected are Swoden, Norway, France, Yugoslavia, Grooco, Holland and Belgiun. In tho $20 s e$ of sroden the affect may be sorious though thore should be some compensoting advantare in that the reparations machinory made available from Gomeny to othor countries should open the maket of those countries to ${ }^{3}$ wdish orc.

## 4. Liquid fuels and Lubricants

Owing to loss of terreitory, the roduced scalc of inustry in genoral and the severo roduction in production or motor vohiclus, a roduction may bo expected in imports of liquid fucls ana lubricnents. The production of syathotic oil is to be prohibitod, hovever, and indigenous resoureos in Nurth West Grmany, oven if fully exploitod cannot noct all roquirenents. A rough estinnto ajeht put tha long tom imports at $60 \%$ of 1936. Tho iuropean countries mainly arfectod are Rounania and indirectly Holland and the United Kingdon.

## 5. Chomicals.

Chmical raimerials, rosin, copal and shellac, wre obtainod by Gomany from a varicty oi countrics. The ristrictions on the futuro output of the Chomical and Chomico Technical industrios will rosult in a reduction of thoso imports by i.bout half compared with jure-inor.

The production of synthetic ruober in Gemany is to bo prohibitod while on the other hend requinements aill frall as a rosult of the decrease in production of motor vohiclos and the genoral reduction in the lovol of industry. In consuquence German's future import roquiromonts may be expocted to bo rather loss then haf tho 1936 luvel. This does not affect any Buropean country oxcopt, indirectly Hollanä and tho Unitod. Kingdon.
6. Ball nd Rollor Buarings

The production of bell and rollor bearings is eventually to io prohibitod on grounds of inkustrial disamancot. Imports in 1936 were negligible and porhaps 35 million Roichmarks at 1936 value micht be roguirod in future to meet total German noeds. Swoden andthe Unitud Kingdom are the main Europoon countrios fron wich thas suplics might bo dram.

## 7. Hides and Footwor

It has buen ostimetod thet prosuction of boots and shous in 1949 will bo at $70 \%$ of 1936 levols. This calculation is basci on the lowor standard of Iiving which muct provail in post-war Gomany. Production, however, my
exceed this estimate unless ntherwise determined by the Control Council. Similar remarks apply to pulp and paper and to textiles and apparel which are dealt with below. Indigencus suppies of hides and skins will also be below pre-war levels and on balance import requirements are also estimated at $70 \%$ of 1936. Germany before the war drew her supplies of sole leather mainly Irom Latin America and of upper leather from a number of European and other countries.
8. Timber

Her forests constitute one of the major natural assets left to Germany and she will be expected to utilize them to the maximum economic extent. In the catalogue of minimum essential imperts, therefore, little more than cortain spucial types of wood e.g. tropical woods for furniture-making are included. The result may well be to cut imports to under 10,5 of 1936 value. The Surcpean countries mainly affected are Scandinavia, Russia, Austria, GechoSlovakia, Poland and Yugo-Slavia.
9. Toxtiles.

Production of textiles in 1949 hes been estimated at 10 kilograms per head including a kilcgrams for export; this is a reduction to $77 \%$ of 1936 by weight of fibres. Allowing for the limitation placed on the production $8 f$ synthetic fibres (185,000 tons per ennum) the future value of textile fibres imported may be assessean about half the 1936 figure for fibres and yarns. Juropean contries mainly affected are the United Kingdom, Belgium, Holland, Switzerland, Italy, fustria, Czechn-Slovakio and Iurkey.
10. The foregoing list covers most of the impnrtant catocories of future essential imports othor than technical oils and fats which may be expeoted to romain at about pro-war levels and row fur pelas which may be reduced to, say, 40\%. Thure will, howevor, be a large number of other specialised items, the import of which will be found necessary to meet shortages in domestic production, for excmple, certain mcchinery, heavy forgings, wood-pulp and some miscellaneous manufactures. In the most general terms these imports may be put at about co-third of pre-wr and the effect of the reduction wili be widespread.
11. The overall effect on Germany's import account may be summ rised as follows :-

Food and feeding stuffs up to n meximum of 1,500 millions compared.
with 1,485 millions in 1936; all other imports, 1,500 millions-comored with 2,733 millions in 1936. The figures for 1949 tre in terms of 1936 values.

3XPOETS
12. As a result of the restriction of metallurgical engineering and heavy chemical industries on grounds of industrial disarmament, Germany's exports under these heads may be expected to suffer a drastic reduction compared with pre-war. Iron and steel products and mechnical engineering mey perhaps foll to just over one-sixth of the value in 1936; electricrl equipinent to perhops one-holf; vehicles to about one-siath and chemical and chemic-technicel products to under one-half. Within these broad categories, moreover, there would be a change of omphasis; for example, the enginooring products would mainly be light and medium rather then hervy and would not include mochine tools; the vehicles will consist meinly of bicycles; and while phermeceuticals might be at approximately pre-war levels, dyestuffs and heavy chemicals would be drastically cut. There is hardly a. ccuntry in Lurcpe which will not be effected by these changes although the incidence of reparations may in some crses compensate by the transfer of productive capecity from Germeny to other countries.
13. The optical and precision instruments industry in Germany is restricted to $70 \%$ of 1936 but is nevertheless erpected to contribute almost as much to the export account as pre-war.
14. The restriction of production of non-ferrous metals in Germeny on grounds of industrial disamament will cause a reduction in her exports of non-ferrous metals products to between ons-quarter and one-third of the pre-war figure and it is probable that the exports will be concentrated in the higher-valued finished products.
15. To counterbalance these curtailments, Germany will have to seek an expansion in her exports of products from the relatively poaceful industries where no restrictions heve been imposed - for example, wooden goods (including furniture); stones, clays and other quarry products; ceramics, glass and glassware; leather goods; books and stationery and paper goods; toys and musical instruments; textiles rnd epporel. In some of these cases there will be a conflict of interest between satisfying the demands of hor own population for post-war reconstruction and the need to earn foreign exchange.
16. In cadition to the foregoing, an increase in the exports of coal and coke of
about one-chimteremi of othor minoral products (mainly potash) of about onom half are anticipatud.
17. Dipoxts of eloctric power are also cxpected to noke some contribution of foroign oxchange comparod with a nogligiblo anount prowar. The Levol of Industry Plan providus for $4,00,000$ tons of papor for oxport, which woull moan a roduction of about ono-sixth in tho valuo of oxports undor tine heni:ing of paper and canlbuand compared with 1936.
18. Tluca romins a miscollnous groun of oxports which wro veluge in 1936 at about 250 million Roiohsmak and a airailar allownce should be made for 1949 althoudt the composition of the miscollancous group wouid not nocossarily be the same. In sum totol, the oxporta on 12 m 3000 milinons in 1949 (at 1936 valuos) compare with Rri 4,768 rillions in 1936.
19. Two tables are aponad whoting Gemony's imports and exports in 1936 by inajor oatogories and the principal countrios involved.

## 54

The conclusions and recommendations attached are circulated for inclusion in the Draft Report al ready subnittod by the United Kingdom Delegation to the Drafting Sul-Comittee of the Inmporary Sun-Comission for the Relief and Reconstruction Di Devastated Areas.

## PAKEITHAM.

FOREIGN OFFICE, S.W.I.
$30 \operatorname{th}$ August. 1946.

## PARI III - CONCLUSIQIS AND RICOMMETDATIONS.

## 1. Food and Acriculture

Throushout Durope tile harvest of 1946 will be better than a year aco. In nearly every country devastated by the war tie production of cereals and potatoes will be hicher than in 1945, and in some of the countries that had enceptionally low yields last year, there will be an increase of the order of $50 \%$. In spite of this inprovement total grain production of European countries involved in the gar (excluding U.S.S.R. and the U.K.) will still be about $20 \%$ below the pre-war level; and in the countries that have sufered most it will be many jears before the pre-war numbers of livestock are restored.
2. The Sub-Comission has been impressed with the important part that UNRRA has plaved in preventinc widespread famine and promotine the initial stages of asricultural rehailitation. It is in agrement with the resolutions passed by tize UNIRA Council at its Fiftin Seseion, and endorses the opinion that urcent action is necessary to ensure tinat internetional cooperation is continued in this field. The Sub-Comission also associates itself with the recomendation that F.s.O. should seek to provide "the maximum technical assistance in the expeditious reestablishment of agricultural production" in the liberated oountries; and that suitably qualified UNRRA staff should be utilised by F.A.O. and by other organisations taking over the activities of UNRRA.
3. The sub-Commission urges the importance of making 6pecial efforts to collect the maximun amount of food from the conine harvest for the non-farm population, either by tifetening up State collection schemes, wherever ther are in force, or by providing preniums or other incentives to producers to market their crops.
4. The Sub-Comission is confident that as iransport and facilities for mutual trade are restored, those European countries that have a surplus of spain, sugar and other foodstufes will be able to pla a larger part than last year in meeting the needs of neighbouring countries which have a food deficit.
5. We have been struck with the varietre of rationing sustens and price control measures in different countries and the varyine de rees of success with which the:- are administered. This is no dount larely duc to differences in the degree of food shortage and inflationaro pressure in the various countrics. We suecest that, as food supplies improve and inflation is cinccted, it may be desirable to expand the scope of free markets and to limit attengts at control to essential comblities which can in ract be efficientle controlled.

## CoaI.

6. The restoration of the prewar level of coal production is the most important condition of European recovery. The combined production or the seven largest producing countries.
includinc the Untted Kingdom is still about $25 \%$ below the pre-war lovel, and the output or the Ruhr and Saar mines is less than hall what it was in 1939. The claief obstacles to be overcome are the shortage or skilled workers, the low rate of output per man-shift, arrears of maintenance, lack of equipment and transport difficultics.
7. The Sub-Comission has noted and endorses the recomandations of the Conference held in Paris in May, 1946, under the auspices of the European Coal Organisation at which the remedial measures deaigned to overcame these obstacles were discussed. The main functions of the European Coal Orcanisation is to ensure tine equitable distribution of all available coal between its member countries. So lons as present shortages continue, some such orecanisation is clearly necessary. We therefore recomend the continuation of this body until such tine as its activities can be effectively taken over by the Econonic Council ior Europe.

## Transpont

8. At the conclusion of hostilities the European transport systen was virtually paralysed and it is bound to take many rears to restore it to its pre-war level. But in spite of the chaotic conditions left by the war a marked ingrovement has taken place during the past twelve months. ince its inception in May, 1946, the European Central Inland 'rransport Organisation has performed a most useful role in securing the cooperation or railwas administrations, and the Sub-Commission emphasises the need for the continued cxistence of this organisation until such time as its activities can be effectively taken over by the Econonic Council for Europe.
9. The Sub-Comission desires to stress the urgent need for speeding up and giving a high priority to the repair and re-equipment of the European main railpoads, including the lines carrying international traffic through Germany.
10. The Sub-Comission recommends that, in considering the needs for further financial assistance to devastated countries, special priority should be given to loans for the reconstruction of ports, railroads and inland waterways, and for the financing of imports of locomotives and wagons.
11. In the interests of speedier economic recovery, we attach the preatest importance to the removal of obstacles which are impeding the revival of European inlañ transport, whether by road, rail or inland waterway. To this end, we recomend that the fullest use should be made of the technical services of international bodies such as the European Central Inland Transport Organisation. From the point of vicit of economic recovery of countries devastated by the war, we cannot exaggerate the urgent importance of resolving the political problens which hamper the restoration of international traffic, particularly on the Danube.

57

ANNEXES B;C;D; MISSING NOT IN U.N. LIBRARY SET

It is difficult to compare the position of countries which suffered the tragic fate of being occupied by the enemy with that of countrics which escaped this tragedy. It would be altogether wrong to draw from the facts now presented the inference that the United Kingdom has emerged from the war as an impoverished power, which no longer has the means to take a leading part in the vorid's affairs as it has done since the beginning of the eighteenth century. The real wealth of the country consists in its soil, its mines and its industrial equipment and, even more, in the industrial skill and intelligence of its workers and the enterprise show in trade and industry, whether by public bodies or by private firms. Judged by these standards, the United Kingdom is entitled to look to the future with every confidence.

On the other hand, the facts given show the intensity of the war effort of the United Kingdom and the sacrifices which this intensity of effort involved, both in the economic and in the financial sphere.

The cost of the war to the United Kingdom has been, in round figures, $£ 26,000$ million, or $\$ 104$ billion. This means that time, work and energy to the ture of over $\$ 100$ billion dollars, which might have been spent in improving the standard of living of the people of the United Kingdom, was instead spent in striving for victory which was at last achieved.

To put the matter in another, and perhaps more striking way, $44,500,000$ man years were spent in the Armed Forces and in the production of munitions up to the end of the war, and thue were not available to maintain and improve our standord of living. Vast Amed Forces cannot be demobilised in the twinkling of an eye, and heavy expenditure, whether you count it in money or in man years, has been devoted to non-productive defence expenditure since the end of the war.

There are many other ways in which the intensity or our war effort can bo illustratod. At the peak of the war ten million people out of our working population of twenty-two million, were engaged in fichting and in munitions production. Out of sixteen million women, seven million were in the Services, whole-time civil defence or industry.

Our war effort altered the whole pattern of our life. The quantity of both wheat and potatoes harvested in 1943 was more thon double the pre-war average. Magnesium production increased to more than eleven times the pre-war rate, while the production of many articles, such as motorcars and refrigorators was completely suspended.

No arithmetic of human sufforing can establish exactly the relative war losses as between the Allies. But after many weeks of deliberation, agreement was reached that the United Kingdom is entitled to claim $28 \%$ of the German reparation available to the eightcen countries ropresented at the Paris

Thas anthoritative anciysis of the natter was as rollows:m
Wo Th, hin the Transitional PGiode

The tmaditato proplom is aha diroct bugacy of tho $\mathrm{U}_{\mathrm{f}} \mathrm{K}$. effort in the weo mo fondations of the U. K. 's iommal conomic lifo are a high dugec of maustias wheialisations a suistuntial dopondenco upon tmpored hoodetnafis and waw materialis, and the meintenane of a volume or suone trade

 depondent on Lmposts for wrowthinds of the trood consumed by its peon? ance apent frou conl, for tho balk of the raw materials uscd by its tadustrios. But tile J. Ko paid for such requifements by the wooceds of itis emonta and by the carnings of its shippine and othor survious rendera to overseas combries and ote its investmente aboad.

The effoct of the war vas to briag about a severe dislocation of the UeFs position in several rospeots, which will inevitably tike sona yonas to poncidy namply joss of exports, loss of oversens investnems, loss of shaping, increase of ovorsuas ciobt, and loss of resonves.

Loss of exportes - Tho loss of U. m oxpont trado during the war was to a Iare atmb the conscquma of a doliborato act of polieys An attenge to mainsan U. m . export trade at a hich level troula havo stood in thu way of tho fuil dagree mobilisation of manomot, proutction, nua mownts for the direct war effort which the situation of the It K , witured as being/
being the base of onerations nearost to Grmany, But food, munitions, and raw inaterials still had to be importod. The operation of Lend Lease from the $3 . G$. intual Aid and other contributions from canada, and sterling cueite fron other countries, made this compatible with the deliberato absndonment of the export trade. The decisions that the U.K. should in offect disrogard the maintenance of export trede in favour of the raximum concentration of resources on the armed forces and war industry, undoubtedly constituted a rational and proper allocation of effort between the Allies which was willingly acceptud by the U.N. in the intorests of winning the war. But the outcome has been that British export trade shrank to less than ono-third of its premar volume, and, despite some recovery, may be expected to cover in 1946 not more than one-half of the asse ial exponditure of the country on the purchase of a i.inimun volume of imports and on other nocessary paynents overseas. Thus with the end of the war and the teraination of Lend Laase and matual Aid a poriod of acute difficulty must be raced until the reconversion of industry, the rolease of manpower and the recovery and expansion of export markets have begun to result in a substantial flow of exports.

Loss of shipping, - More than halr of tho piewwar tonnage of British merchant shipping was lost during the war. Allowing for new building in the war, U. Kowned tonnage is now less than three-quarters of the pre-war figure, Until the fleet has been expanded and carrying trades abandoned in the war have been recovered, the net income available from shipping servicos to supplement $U$. K . purchasing power abroad will be greatly below pre-war level.

Loss of Overseas Investinents, - It is estimated that the net incorie from overseas investments in 1945 will be less than half that received in 1938, This reflects the extonsive liquidation of foreign securities, the repatriation of loans by overseas debtors, and the increasea interest payments to holders of sterling debts caused by the heavy war expenditure which the U.K. has had to incur overseas. Thus nearly all the marketable U.S. dollar securities of $U$. $K$. nationals were compulsorily acquired for sale or pledging in ordon to finance the purchase of raunitions and the constrution oi war plants in the U.S.A. before the operation of the liend Loase Act.

The Increase of Overseas Delot. - The interval of time which must inevitably elapse, before the export trade cen be recovered and the loss of income from investments and shipping can be made good, would have brought about a position of serious ditficulty for the U. K., even if oversoas expenditure had remained at pre-war levels. But the exigencies of the war Involved the $U . K$. in enormous cash expenditure overseas. Large military forces had to be maintained in the ifjale Best to engage the Germans there: even larger forces operated against the Japanese in Burma and the Far east. Supplios on an immense scale had to be acquired in addition to those furnished under Lend Lease and phtual Aid to sustain these foreos. All this involved a great outpouring of expenditure in local currencies, particularly/
particularly in India, Egypt and Palestine, whethor on troop pay, the building of aerodromos, railways on woads, or tho payment of local labour, or on the acquisition of supplies. Such expenditure could be covorod only to a inimi iod oxtent by exports or by the liquidation of investinents; the result has been that the U.K. has incurred huge debts in the form of accumulated sterling balancos. Nor can this substantial burdon of overseas payments be brought to an ond with the day of victory. There will inevitably remain heavy comitments to be met overseas before all British troops can be withdrawn from the distant fronts on which thoy have been engaged. Thus apart altogether from the repament of the war debts a further substantial, though temporary, burden of current expenditure abroad has to bo sustained at a time when British exports and other sources of oversoss incone are quite insufficient to financo even an import programe on the barest minimum levol.

- Loss of Reserves. - Nor has tho U.K. sufficiont reserves from which to fill the gap. The gold and dollar holdings of the U.K. and of the other countries in the Sterling Area were mobilised and freely spent in the early critical days of 1939-1941 mainly for the purchase of vital war supplies from the U.S.A. During April, 1941, soon after the passage of tho Lend Lease Act, but beforc its offects conid iu felt, the reserves fell to only $£ 3$ million. They have row to some extent been built up again largely because the pay of U . s . forces in the sterling Area brought considerablo dollar sums into the country, a state of affairs which of course ceases with, or soon after, the end of hostilities. But they are stili below the pre-war level, and are manifestiy inadequate in relation to the immediate needs of the U. $K$. itsolf and to the problem of releasing the accumulated stwining balances.

But in presenting a statement of one's losses it is an advantage to be able to rely on the impartial testimony of a friend. The following is an extract from the statement made by Mr. Secretary Vinson, as he then was, before the House Banking and Currency Committee on May 14th 1946.

England is a country that nust live by imports. Twom thirds of the food consumed by the British people and virtually all of the basic raw materials, excopt coal, used in British industry must be purchased abroad. As a consequence, England is a great importing country. She is the best customer of the United States and of a score of other countries.,

## angland's international economic position has been

 seriously distorted by the war. For five years. Bneland was the principal target of the cuftwaffe, as well as the principal base of operations of the western allies agginst Germany. Her life was at stake, and ours. The punishmont which sho took - and which she handed out - wrote stirring chaptors in the history of free inen.... During the war. Fngland had little time to think of her export trade. She devotod every resourco which she could mobilize to her defenso and to the attack on the enemy. British exports fell until, b: 19ht? they wero only/only 30 percent of their prewar volume. The men roleased from the export industries were put to work at war production or were inducted into the armed forces.

Lend-lease from the United states and mutual aid from Canada filled part of the gap between hor wartime noeds mostly for our comion cause - and her curront supply of forvign oxchange. Nevertheless, she had to draw heavily on her accumulatod roreign exchange resources, and strain hor crodit abroad in order to secure her essential war imports. She sold $\$ 4.5$ billion of her foreign investments; she reduced her gold and dollar roserves by $\$ 615$ million; and she incurred foreign debts which now amount to more than $\$ 13$ billion, very largely blocked sterling balances held by foreigners in London. As a result of her war offort, Britain's international financial position doteriorated by about 817 billion from 1939 to 1945.
foanwhile, Britain's earnings abroad from shipping and other services have also been sharply reduced. Because ot enemy sinkings, the British morchant marine is one-fourth smaller than before the war, in spite of the large building program. The earnings from financial and commercial servicos have fallen off along with England's trade and shipping. With the recovery of world trade, these services will again expand and become an important part of Eingland's fureign business.

Before the war the British people were able to oatm enough from their exports and their services to forelgrers to purchase abroad the food and rew materials essential to their economy. In 1938, about one-half of Britain's imports was paid for by tho export of British goods. About one-fourth was paid for by services of tho British merchant marine, insurance companies, and other financial and comnercial institutions. An additional one-fourth was paid for out of the net income of British capital investinents abroad.

The British people have industriously set about to restore their international oconomic position. They are reconverting their war industifies to civilian production. They are making a detormined effort to increase their industrial efficioncy. They are exporting as much as they can without depriving thenselves of the essentials of life. These are problens which the British people must work out for thenselves over the next few yuars.

## ANNEX 'A' <br> STATISTICS RELATING TO WAR - EFFORT

- aND WAR Damage.

The following is a summary of effort expended and las sustained by the United Kingdom (including the Channel Islands) in the war against Germany, Italy and Japan.
(i) Physical Damage to Property

| - \& stg. millions |  |
| :---: | :---: |
| $\begin{gathered} \text { (at } 1938 \\ \text { replacement } \\ \text { values) } \end{gathered}$ | (at current values) |
| Industry and Commerce 352 | 536 |
| Ocean and Coastwise Shipping (including cargoes) | 694 |
| Harbours and Ports 19 | 30 |
| Railways and Inland Water Transport. 23 | 36 |
| Roads and Highways 4 | 6 |
| Agriculture 3 | 5 |
| Public Institutions and Municipal Enterprises | 115 |
|  | 89 |
| Houses and Buildings not otherwise included $312$ | 526 |
| Other Material, Damages and Losses 16 | 25 |
| Total 1,301 | 2,062 |

(ii) Budgetary Expenses

The following table shows the budgetary cost of the war to the U.K.

1. Var period

September 1939 - April 1945 21,800
May 11945-Mid-August $1945 \quad 1,310$
?. Pre-War Period January 1938-August 1939625
3. $\frac{\text { Post-Var Period }}{\text { Mid-August } 1945}$ - March 1946 2,125
4. Channel Isles (Budgetary expenses and costs of occupation)
25,875
(iii) Man Years

These figures cover the period from September 1939 to the end of hostilities only.

In Armed Forces (including Civil Defence and Merchant Navy) 24.5 millions

In munitions etc. production 20.0 millions
(iv) Loss of Life and Injuries

As in the case of (iii) above these figures extend only from September 1939 to the end of hostilities.
(i) KILLED Armed Forces 290 Civilians 96386 thousands
(ii) WOUNDED or ) Armed Forces 279 SERIOUSLY
INJURED $\{$ Civilians $104 \quad 383$ thousands
(v) Overseas Disinv stment

Net sale of assets and increases in liabilities to countries abroad has been as follows:-

|  | £ millions |
| :--- | :---: |
| 1939 (Sept.-December) | 210 |
| 1940 | 804 |
| 1941 | 816 |
| 1942 | 656 |
| 1943 | 682 |
| 1944 | 651 |
| 1945 |  |
|  | $\underline{4,636}$ |

It has been assumed that oversoas disinvestment for 1939 and 1945 was wholly at tributable to the war.

1st Auguste 1946.

```
