# **SELECTED DEMOGRAPHIC INDICATORS BY COUNTRY, 1950-2000:**

**Demographic estimates and projections as assessed in 1978**

**UNITED NATIONS**  
**New York, 1980**

#### **NOTE**

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term "country" as used in the text of this publication also refers, as appropriate, to territories or areas.

In some tables, the designations "more developed" and "less developed" regions are intended for statistical convenience and do not necessarily express a judgement about the stage reached by a particular country or area in the development process.

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document.

ST/ESA/SER.R/38

## PREFACE

The United Nations has been engaged in periodic reassessment of the global demographic situation and its future prospects since 1951, and the current assessment, which is the seventh in a row, was completed in collaboration with the regional commissions on the basis of data that became available to the Secretariat by the end of 1978. The results of this assessment are being published in a series of reports, each covering a different topic. The present publication is the third report. It contains selected demographic indicators for regions, countries and the world, which were obtained along with estimations and projections of population by age and sex. The two other reports are World Population Trends and Prospects by Country, 1950-2000: Summary Report of the 1978 Assessment (ST/ESA/SER.R/33) and World Population and Its Age-Sex Composition by Country, 1950-2000: Demographic Estimation and Projection as Assessed in 1978 (ESA/P/WP.65). A fourth report, entitled Long-Range Demographic Projections into the Twenty-second Century, is being prepared.

All the reports contain the final counts of the 1978 estimates and projections, except for the first one (World Population Trends ...), in which the figures may be slightly different because of the preliminary nature of the subject matter. Explanations on data, methods, assumptions, classifications and findings are included in the text of the present report.

Magnetic tapes containing the major results and assumptions associated with the present estimates and projections can be provided upon request. Inquiry about the tapes should be addressed to the Director of the Population Division, Department of International Economic and Social Affairs, United Nations, New York 10017. The charge for the tapes is around \$100.

## SUMMARY OF METHODS AND ASSUMPTIONS

### General approach

The global population estimates and projections, by country, presented in the present publication are the products of the seventh round of United Nations population projections 1/ and a revision of the demographic assessment prepared in 1973; they take into account new data, studies and national estimates which have become available since 1973.

For the period from 1950 to 1975, demographic estimates were prepared on the basis of data available to the United Nations Secretariat, including its regional commissions, by the end of 1978, with due adjustments and modifications to ensure comparability among countries. For the period from 1975 to 2000, projections are prepared in three variants - high, medium and low. Generally speaking, the medium variant represents those future demographic trends that seem most likely to occur in view of observed past demographic trends, expected social and economic progress, ongoing government policies and prevailing public attitudes towards population issues.

Since future trends in rates of fertility, mortality and migration might follow a wide range of paths under various conditions - thus warranting alternative assumptions for them - the high and low variants indicate the plausible, but not exhaustive, range of future deviations from the medium projections. As is usual in United Nations practice, catastrophes such as war, famine or epidemics, which would inevitably affect demographic trends, are not assumed in formulating the projections.

The basic method of projections used here - generally referred to as the component 2/ method - involves the following steps:

(a) Census and survey data concerning both age/sex structure of the population and levels and trends of fertility, mortality and international

---

1/ Previous United Nations population projections are published in the following publications: "The past and future growth of world population--a long-range view", Population Bulletin of the United Nations, No. 1 (December 1951) (United Nations publication, Sales No. 1952.XIII.2), pp. 1-12; "The past and future population of the world and its continents" and "Framework for future population estimates, 1950-1980, by world regions", in Proceedings of the World Population Conference, 1954, vol. III (United Nations publication, Sales No. 1955.XIII.8), pp. 265-282 and pp. 283-328; The Future Growth of World Population (United Nations publication, Sales No. 58.XIII.2); World Population Prospects as Assessed in 1963 (United Nations publication, Sales No. 66.XIII.2); World Population Prospects as Assessed in 1968 (United Nations publication, Sales No. 72.XIII.4); World Population Prospects as Assessed in 1973 (United Nations publication, Sales No. E.76.XIII.4).

2/ See Manual III: Methods for Population Projections by Sex and Age (United Nations publication, Sales No. 56.XIII.3).

migration are collected and evaluated; adjustments are made as needed, in order to arrive at acceptable measures of fertility, mortality and net migration as well as the age structure of the starting year populations which is compatible with other demographic measures;

(b) To estimate the number of survivors at the end of each five-year period, sex/age-specific survival ratios, which are usually computed from selected model life tables, are multiplied to the base year population;

(c) To estimate the number of births, assumed age-specific birth rates are multiplied by the corresponding number of women in the reproductive age groups. The estimated births are distributed by sex according to an assumed sex ratio at birth and then the numbers of survivors from these births at the end of each five-year period are estimated, by using appropriate survival ratios;

(d) The volume of net migration, if any, is estimated and incorporated into the projections.

The component method of projection was applied to all countries with population of about 300,000 or more as of 1975. For countries with less than 300,000 inhabitants, projections were made only for the total population, assuming various rates of growth.

#### Fertility assumptions

Fertility assumptions for the current population projections have been prepared taking into consideration the past and present fertility trends in each country. In addition, the following rules are generally assumed for countries with high fertility:

(a) Fertility level will generally decline as a country progresses in economic and social development;

(b) Existing or anticipated government policies and programmes as well as non-governmental activities, if any, designed to foster development will expedite the process of fertility decline;

(c) The fertility decline will be slow at the beginning, gain momentum, and then will be slow again as it nears replacement level. On the basis of observations of several countries that have gone through the transition, the decline is assumed to be most rapid between 2.5 - that is, the gross reproduction rate - and about 1.5;

(d) Cultural factors and value systems, which are widely diverse among the different geographical regions, must be taken into consideration as important conditioning factors in either facilitating or delaying the fertility decline.

Three variants of fertility assumptions for each quinquennial period from 1975 to 2000, given in terms of gross reproduction rates for individual countries, are presented in table A-6 in the annex to the present report. Table 1 on page 4 gives the overall view of the fertility assumptions adopted in the current round of projections, which is the summary for the major regions, derived from the individual country assumptions.

For the more developed regions as a whole - Northern America, Europe, the Soviet Union, Japan, Australia and New Zealand - it is assumed that the current fertility rate, which is on the average below the replacement level, will return to the replacement level after 1990, according to the medium variant assumptions. According to the high variant, the recovery will take place about 10 years earlier; according to the low variant, recovery to the replacement level during the present century is not foreseen. For the less developed regions as a whole, it is assumed that declining fertility trends will continue throughout the present century and that the gross reproduction rate, which is currently around 2.5, will decrease to 1.8, 1.6 and 1.6 by 1995-2000, according to the high, medium and low variants, respectively.

The diversity of fertility levels between regions and individual countries is notable. Among the eight major geographical regions, it is projected that Africa will be the last to exhibit significant fertility reduction. In North Africa, fertility decline has evidently started already, but most of the sub-Saharan countries in Africa do not seem to have shown the beginning of sustained fertility decline. Accordingly, it is assumed that such a change will take place in the 1980s at the earliest. On the other hand, it is projected that East Asia, which includes China, will continue its rapid fertility decline in the 1980s, reducing the fertility rate to the replacement level by around 1990, according to the medium variant.

Table 1. Summaries of fertility assumptions used in three variants of the current projections: gross reproduction rates, 1975-2000, by region

M, medium variant; H, high variant; L, low variant

Region	Variant	1975-1980	1980-1985	1985-1990	1990-1995	1995-2000

USSR	M	1.16	1.15	1.15	1.14	1.14
	H	1.16	1.21	1.24	1.24	1.24
	L	1.15	1.09	1.06	1.04	1.04

### Mortality assumptions

With respect to mortality trends, it is assumed that a quinquennial gain of 2.5 years in the expectation of life at birth will be made in many countries until life expectancy reaches 55 years, to be followed by a slowdown of the gain thereafter. However, the assumed future quinquennial gains are lowered to 2.0 or 1.5 years, instead of 2.5, for certain developing countries where recent evidence indicates a retardation of improvement in mortality levels. According to recent statistical records of certain developed countries, the maximum level of life expectancy attainable by all countries is assumed to be 73.5 years for men and 80.0 years for women.

Regional summaries of mortality assumptions, presented in table 2, are computed from the assumptions for individual countries which can be found in table A-6 in the annex. For the more developed regions as a whole, the expectation of life at birth, which is currently about 72 years, will, it is assumed, increase at a rate of 0.4 years per quinquennial period through the 1980s and 1990s, reaching 73.6 years in 1995-2000. In the meantime, the sex differentials in the expectation of life at birth will remain constant on the average at 7.2 years, leading to the assumptions of 70.1 years for men and 77.3 years for women for the 1995-2000 period. On the other hand, it is assumed that the quinquennial increment of the expectation of life at birth for the less developed regions as a whole will be around 2.0 years between 1975 and 2000, with minor fluctuations. Accordingly, the existing gap between the expectation of life at birth in the more developed and the less developed regions will, it is assumed, decrease from the current 17 years to 11 years towards the end of the present century.

Table 2. Summaries of mortality assumptions used in the current projections: expectation of life at birth for both sexes, 1975-2000, by region

Region	1975- 1980	1980- 1985	1985- 1990	1990- 1995	1995- 2000
World	57.4	59.2	61.0	62.6	64.4
More developed regions	71.9	72.3	72.8	73.2	73.6
Less developed regions:	55.1	57.0	59.1	61.0	63.0
Africa	48.7	51.0	53.3	55.6	57.9
Latin America	63.4	65.2	66.8	68.3	69.7
Northern America	73.2	73.6	73.8	74.0	74.3
East Asia	64.7	66.5	68.1	69.4	70.6
South Asia	51.8	54.1	56.4	58.7	61.0
Europe	71.9	72.6	73.2	73.8	74.2
Oceania	65.7	66.6	67.7	68.7	69.8
USSR	69.6	70.0	70.5	70.9	71.4

In the eight major geographical regions shown in table 2, it is assumed that the largest increase in the expectation of life at birth - of 9.2 years - will occur in Africa and South Asia in the coming 20 years, followed by 6.3 years in Latin America and 4.1 years in Oceania.

#### Migration assumptions

The existing statistics on international migration are in most cases insufficient for demographic analysis. Due to incomplete explanations given in the definitions, data are often inadequate even for assessing the net balance of migration for a country. Moreover, data on the sex/age composition of migrants are rarely available; if available, they are often incomplete. In spite of this difficulty, international migration has been drawing serious attention in recent years because of its demographic, social, economic and humanitarian implications. The general pattern of current international migration is one of workers seeking employment moving from poorer to richer countries, either between developing and developed areas or within one type of area. Recently, however, there has been a slow down in such movement within Europe as well as between Europe and other regions. There has been, however, a notable increase in international migration of population caused by political, religious, ethnic and other non-economic reasons.

Because of the complexity of its causes and the difficulty of anticipating future trends of international migration, it is assumed that the volume of net migration - if there is any at present - will, in the present projections, diminish progressively with the passage of time unless there are strong indications that the present level of migration will be sustained for a considerable period.

## EXPLANATION OF DEMOGRAPHIC TERMS USED

Most of the demographic terms used in this report are self-explanatory. Some of the more technical terms used in table A-6 of the annex are briefly explained below.

Dependency ratio (per 1,000): ratio of the combined child population under 15 years old and adult population of 65 and over to the population of intermediate age

Child-woman ratio: number of children under 5 years of age per 1,000 women aged 15-49 years

Sex ratio (100 women): number of men per 100 women

Median age: age which divides the population into two groups of equal size, one of which is younger and the other of which is older than the median

Proportion of urban population (percentage): Percentage of total population residing in urban areas. Estimates are taken from Patterns of Urban and Rural Growth (United Nations publication, Sales No. E.79.XIII.9)

Population density (per square kilometre): average population per square kilometre of land area of a country, delimited as of 1975

Rate of growth (percentage): average annual rate of population growth measured as an exponential rate of change for each five-year period

Natural increase rate (per 1,000): balance of crude birth rate and crude death rate

Crude birth rate: number of average annual births per 1,000 population

Crude death rate: number of average annual deaths per 1,000 population

Gross reproduction rate: measure of the reproduction of population expressed as an average number of daughters to be born to a cohort of women during their reproductive age, assuming no mortality and a fixed schedule of age-specific fertility rates. More specifically, it is the sum of age-specific fertility rates for the period multiplied by the proportion of the total births of girl babies.

Net reproduction rate: refined measure of the reproduction of population expressed as an average number of daughters that a cohort of new-born girl babies will bear during their lifetime, assuming a fixed schedule of age-specific fertility rates and a fixed set of mortality rates. In other words, it is the measure of the extent to which a cohort of newly born girls will replace themselves under a given schedule of age-specific fertility and mortality.

Total fertility rate: sum of the age-specific fertility rates over all ages of the child-bearing period. This measure gives the approximate magnitude of "completed family size", that is, the total number of children an average woman will bear in her lifetime.

General fertility rate: number of average annual births per 1,000 women aged 15-49 years

Life expectancy at birth (years): life-table function to indicate the expected average number of years to be lived by a newly born baby, assuming a fixed schedule of age-specific mortality rates

## SUMMARY OF FINDINGS

### A. Global population trends

The present study estimates that the world population in 1980 is 4.4 billion and will increase to 6.2 billion by 2000. The expected increase of 1.8 billion for the coming 20 years will be nearly equal to the increase during the past 30 years, from 1950 to 1980, which was 1.9 billion. In terms of absolute numbers, it is projected that the world population will grow at an annual rate of 86 million during the 1980s and of 92 million during the 1990s. These numbers are significantly greater than the average annual increases observed in the past three decades: 51 million in the 1950s, 65 million in the 1960s and 74 million in the 1970s. Incidentally, the annual increment of 80 million is nearly equal to the current population for Bangladesh, the eighth most populous country in the world.

In terms of growth rate, however, the rate of increase of total population for the world appears to have peaked in the early 1960s, and the growth trends entered a phase of gradual deceleration in about 1965. More specifically, the current (1980) annual rate of global population increase is estimated to be 1.8 per cent; it was less than 2.0 per cent in the 1960-1965 period, 1.9 per cent in 1965-1970 and 1.85 per cent in 1970-1975. The rate is expected to decline further, according to the medium variant of projection - to 1.7 per cent by 1990 and 1.5 per cent by 2000.

Since a demographic projection involves several assumptions about the uncertain future trends of fertility and mortality, the United Nations provides three variants of projection (high, medium and low), assuming plausible but not exhaustive ranges of variation in the future trends of fertility and mortality (see table 3). In comparison with the medium variant, cited in previous paragraphs, the high and the low variants put the projected global population for 2000 at 6.5 billion and 5.9 billion, respectively.

If the future should go along with the high variant, the annual addition to world population would be 97 million in the 1980s and 111 million in the 1990s; the average annual rate of growth would rise again to 2.0 per cent during the 1980s, then decline to 1.8 per cent towards the end of the century. On the other hand, the expected average annual increases under the low variant assumptions would be considerably lower: 93 million in the 1980s and 54 million in the 1990s. The rate of growth would continue to drop more rapidly, to 1.2 per cent per annum by the 1995-2000 period.

Since the fertility and mortality assumptions adopted in each of the three alternative projections are deemed plausible, in our judgement, a comparison of them indicates that current demographic situations are quite volatile. A wide range of possibilities as to future prospects for the size, composition and distribution of the global population must be entertained.

Table 3. World population growth according to three variants of projection, 1950-2000

Year	Population (millions)			Average annual rate of growth in the preceding five-year period (percentage)		
	Medium	High	Low	Medium	High	Low
1950	2 513	-	-	-	-	-
1955	2 745	-	-	1.76	-	-
1960	3 027	-	-	1.95	-	-

2000	6 199	6 509	5 856	1.56	1.82	1.23

B. Growth differentials among the major geographical areas

Significance of the global population trends cannot be fully understood unless the differences between different geographical regions with respect to the growth and distribution of population are appreciated. Broadly speaking, Asia - defined as all the countries of the Middle East and the Far East, excluding the Soviet Union, Australia, New Zealand and Oceania - has a population of 2.6 billion in 1980, which comprises 58 per cent of the world total. In relation to land area, the population of Asia is one of the densest: 93 persons per square kilometre and second only to that of Europe, which is 99 persons as of 1980. Europe (excluding the Soviet Union), Africa and Latin America each has roughly one tenth of the world population in 1980 - that is, 480 million, 470 million and 370 million, respectively. They are followed by the Soviet Union (including both European and Asian portions) and Northern America, where the current populations are estimated to be 270 million and 250 million, respectively, or roughly 6 per cent of the world total. Population density outside Europe and Asia is relatively low, ranging from 18 persons per square kilometre for Latin America to 12 for the Soviet Union (see table 4).

Table 4. Population trends and prospects in the major geographical areas of the world, 1950-2000 a/

Year	Africa	Latin America	Northern America	East Asia	South Asia	Europe	Oceania	USSR
Population (millions)								
1950	219	164	166	673	706	392	13	180
1960	275	215	199	816	867	425	16	214
1970	357	283	226	981	1 111	460	19	244
1980	469	368	246	1 136	1 422	484	23	267
1990	630	478	270	1 274	1 803	501	26	292
2000	828	608	290	1 406	2 205	520	30	312
Rate of increase (per cent) <sup>b/</sup>								
1950-1960	2.3	2.7	1.8	1.9	2.1	0.8	2.2	1.7
1960-1970	2.5	2.8	1.3	1.8	2.5	0.8	2.0	1.3
1970-1980	2.8	2.6	0.8	1.5	2.5	0.5	1.6	0.9

1990-2000	2.7	2.4	0.7	1.0	2.0	0.4	1.2	0.7

a/ For the countries in each major area, see the table of contents, under table A-6.

b/ Average annual rate of increase (exponential) for each decade.

Of these broad geographical areas, Africa, Latin America and Asia have shown higher rates of population growth in the 1970s than the world average of 1.8 per cent per annum - namely, 2.8, 2.6 and 2.0 per cent, respectively. On the other hand, Europe, Northern America and the Soviet Union recorded annual growth rates of less than 1 per cent - namely, 0.5, 0.8 and 0.9 per cent, respectively. Oceania, which includes Australia, New Zealand, Melanesia, Micronesia and Polynesia, has a population of 23 million, or 0.5 per cent of the world total, which is increasing at an intermediate rate of 1.6 per cent per annum.

In the coming 20 years, according to the present study, the rate of population growth is expected to decline only slightly in Africa and Latin America and moderately in Asia. In Africa it is projected that the population growth in the 1980s will rise to 3.0 per cent before it declines in the 1990s. On the other hand, growth rates for Northern America, Europe and the Soviet Union are expected to remain at the current low levels in the coming two decades. As a result, the distribution of the global population by broad geographical area will change in favour of Africa, Latin America and Asia. More specifically, it will become 13.4 per cent for Africa, an increase of 2.8 percentage points over 1980; 9.8 per cent for Latin America, or a 1.5 percentage point increase; 58.3 per cent for Asia, or a 0.4 percentage point increase; in contrast to 18.6 per cent, or a 4.5 percentage point decrease for the sum of Northern America, Europe, the Soviet Union and Oceania.

#### Contrast between the more developed and the less developed regions

The growth differentials among the major geographical areas of the world may be summarized as a contrast between the more developed regions and the less developed regions. In the present study the 8 major geographical areas are divided into 24 regions: five in Africa; four in Latin America; six in Asia; four in Europe; three regions in Oceania; and one each for Northern America and the Soviet Union. On the basis of demographic and other social and economic indicators, the 24 regions are classified into 7 more developed regions and 17 less developed regions. In the current classification, the less developed regions include all the regions of Africa, Asia (excluding Japan), Latin America and Oceania (excluding Australia and New Zealand), while the more developed regions include all the regions of Europe, the Soviet Union, Northern America and the regions just cited as being outside the less developed category.

As of 1980, the more developed regions have a population of 1.1 billion, or 26 per cent of the world total; for the less developed regions, the relevant figures are 3.3 billion, or 74 per cent of the total. In the three decades that are covered by the present study (1950-1980), the growth of population has been faster in less developed regions than in more developed regions. From 1955 through 1980, the annual rate of population growth for the less developed regions was more than 2.2 per cent, whereas the growth rate for the more developed regions dropped from 1.3 per cent in the 1950s to about 0.8 per cent in the 1970s - that is, to about one third the rate for the less developed regions (see table 5).

Table 5. Population trends and prospects in the more developed and the less developed regions, medium variant, 1950-2000

a/ Northern America, Japan, Eastern, Northern, Southern and Western Europe, Australia, New Zealand and USSR.

b/ All regions other than those specified in a/;

c/ Average annual rate of increase (exponential) in the preceding five-year period.

In terms of absolute numbers, the increase in population in the less developed regions during the 1970s was 656 million, or 89 per cent of the global population increase. The percentage share in the total global increment by the less developed regions increased from 78 per cent in the 1950s to 84 per cent in the 1960s. As a result, the share of the world total residing in the less developed regions has continuously increased from 67 per cent in 1950 to 69 per cent in 1960 to 71 per cent in 1970.

With respect to the future it is projected that the rate of population growth in the less developed regions will decline slightly, to 1.8 per cent per year by the year 2000, while in the more developed regions it is projected that it will drop further, to 0.5 per cent during the same period of time. Concomitantly, the share of the world total in the present less developed regions will increase further to 79 per cent by 2000, according to the medium variant of projection.

Among the 17 less developed regions, the highest current annual rates of growth are 3.3 per cent for Middle America, 3.1 per cent for Western Africa, and 2.9 per cent for Eastern Africa. After increasing slightly in 1980-1985, the rate of population growth in West and East Africa is expected to decline, reaching 2.9 and 3.0 per cent, respectively, during the period of 1995-2000. It is projected that the annual rate of population growth in Middle America will follow a steady downward trend between 1985 and 2000, reaching 2.9 per cent at the end of the century (see tables A-1 and A-2 in the annex).

The smallest rate of population growth among the less developed regions is expected in the regions of East Asia (excluding Japan), where it will decline from 1.3 per cent in 1975-1980 to less than 1.0 per cent in the quinquennium 1995-2000. Such a low rate of growth is mainly due to the projected trends for China, where the estimated annual rate of growth of 1.4 per cent in 1975-1980 will decline to slightly less than 1.0 per cent in 1995-2000. Meanwhile it is projected that in absolute numbers, the increase in China will be 33 per cent, from 895 million in 1975 to 1,190 million in the year 2000.

Among the more developed regions the lowest rates of population growth are found in Northern and Western Europe, where the average annual rates for 1975-1980 are 0.08 and 0.03 per cent, respectively. However, it is projected that the rates of population growth for these two regions will start to recover in the 1980s, reaching 0.22 and 0.28 per cent respectively, by the end of the century.

#### Global views on fertility and mortality trends

The gradual deceleration of the global population growth rate has been due to the lowering of birth rates in many parts of the world which are declining faster than death rates. As a requisite part of the present study, estimates of fertility and mortality rates for individual countries were collected, evaluated and adjusted for comparability, and then incorporated in the global estimates and projections. Admittedly, many developing countries did not have very reliable data from which demographic estimates could be derived. As discussed in the chapter on summary of methods and assumptions, the United Nations and its regional commissions have tried to overcome these deficiencies by means of various indirect, analytical and comparative methods.

In summary, the average crude birth rate for the world in 1975-1980 is estimated to be 29 per 1,000, and the crude death rate to be 11 per 1,000. The crude birth rate has been declining gradually over the past 30 years, according to the present estimates, from 36 per 1,000 in the 1950s to 33 in the 1960s to 31 in the early half of the 1970s. The crude death rate has also been declining - from 17 per 1,000 in the 1950s to 14 per 1,000 in the 1960s to 13 in the early 1970s (see tables A-3 and A-4 in the annex).

There has been a considerable gap between the more developed regions and the less developed regions regarding birth and death rates. According to the current study, the crude birth rate in the 1975-1980 period is estimated to be 16 per 1,000 for the more developed regions, or less than half of the 34 per 1,000 for the less developed regions. Estimates of crude death rates for 1975-1980 are 9 and 12 for the more developed regions and the less developed regions, respectively. The future decline of crude birth rates is expected to occur mainly in the less developed regions where the recent crude birth rate of 34 per 1,000 in 1975-1980 is expected to decline to 26 per 1,000 in 1995-2000. By contrast, it is projected that birth rates in the more developed regions will decline slightly, from 16 per 1,000 in 1975-1980 to 15 per 1,000 in 1995-2000.

If the eight major geographical areas are compared, Africa, South Asia and Latin America have distinctly higher crude birth rates than the rest of the world, and their birth rates for 1975-1980 are estimated to be 46, 39 and 35 per 1,000, respectively. It is in these three areas where large decreases in the crude birth rate are expected to take place in the two decades to come. By contrast, Northern America, Europe and the Soviet Union have relatively low crude birth rates - below 20 per 1,000, in 1975-1980. In between, there are two areas - namely, East Asia and Oceania - with intermediate levels of crude birth rate, that is, around 22 per 1,000 for 1975-1980.

According to the medium variant of the present projections, the crude birth rates will be in the range of 14 - 20 per 1,000 by 1995-2000 in five major areas, namely, Northern America, Europe, the Soviet Union, East Asia and Oceania; in South Asia and Latin America, for the same period they will decline to 27 and 30, respectively. On the other hand, it is projected that Africa will still have a birth rate of about 37 per 1,000 in 1995-2000.

The variations in crude death rates among the major geographical areas are less striking than those in crude birth rates. According to the present estimates, the highest crude death rates are 17 per 1,000 for Africa and 14 per 1,000 for South Asia; all the other areas have death rates ranging between 9 and 11 per 1,000. Of these, Europe has the third highest crude death rate, of 10.6 per 1,000, and Latin America has the lowest, of 8.4 per 1,000. The range in crude death rates among the major geographical areas will become narrower, according to the present projections, by 1995-2000 when the highest rate will be 10.7 for Europe and the lowest, 6.0 per 1,000 for Latin America. The closeness of crude death rates among areas is attributable to

the age structure of population: further aging of the population in the more developed regions, together with declining fertility rates in the less developed regions, is closing the gap.

If mortality levels are measured by the expectation of life at birth, which is a life-table function not affected by the age structure of population, the existing gap among the major geographical areas becomes more prominent. For 1975-1980, as shown in table 2, the lowest estimated average life expectancy is 48.7 years, for Africa; the highest is 71.9 years, for Europe. By 1995-2000 the gap will have narrowed somewhat, according to the present projections: to 57.9 years for Africa and 74.2 for Europe.

### Aging of population

The aging of population, which has long been acknowledged in the developed countries, apparently began on a world-wide basis in the 1970s. During the 1950s and 1960s, the age structure of population in the less developed regions in general was shifting towards the young, owing to the persistence of high fertility rates and a reduction in infant and child mortality rates. However, in many places the more recent decline in the fertility rate has reversed that trend, and aging appears likely to continue in the coming decades.

The aging of population is a demographic process in which the proportion of older population increases and that of younger population decreases. This has usually been caused by declining fertility rates combined with declining mortality rates. The age composition of population is sometimes affected by age-selective migration, especially in cases of national and subnational populations. A simple measure to show the aging of population would be the median age, which divides the population into two equal parts, one older and the other younger. The median age of the world population has decreased from 23.3 years in 1950 to 21.7 in 1970, apparently owing to the reduction in infant and child mortality rates among less developed regions; around 1970, the median age began to increase. The average median age for the world in 1980 is estimated to be 22.6 years; it is projected that it will increase to 25.3 years by 2000, according to the present study (see table 6).

As is to be expected from the diversity of demographic trends among countries and regions of the world, there are large differences in the levels of aging in various countries and regions. According to the present estimates for 1980, the Federal Republic of Germany has the highest median age (36.7 years), followed by Sweden (36.3 years). Certain African countries have very low median ages - for example, Liberia (16.2 years), and Nigeria (16.3 years). When all countries are grouped into two categories - the more developed and the less developed regions - the average median ages for 1980 are 31.4 and 20.0 years, respectively. In the more developed regions, the

Table 6. Median age of population for the world, the more developed regions and the less developed regions, 1950-2000

Year	World	More developed regions <u>a/</u>	Less developed regions <u>a/</u>
1950	23.3	28.2	21.1
1960	22.6	29.2	19.9
1970	21.7	30.2	19.1
1980	22.6	31.4	20.0
1990	23.9	33.5	21.5
2000	25.3	35.7	23.2

a/ For definition of "more developed regions" and "less developed regions", see table 5, footnotes a/ and b/.

average median age has continuously been rising since 1950, when it was 28.2 years. In the less developed regions the average median age decreased from 21.1 years in 1950 to 19.1 years in 1970, and then reversed itself.

The trend towards aging of population in the less developed regions, however, is not likely to narrow the gap in median ages with the more developed regions in the near future, because aging is increasing more rapidly in the more developed regions. The difference in the median age between the two regions has been continuously increasing - from 7.1 years in 1950 to 11.4 years in 1980 - and it is projected that it will increase further - to 12.5 years - in 2000.

As mentioned above, the aging of population has two aspects: a relative decrease in the young population and a relative increase in the elderly. The more developed and less developed regions show distinct trends regarding the two age groups. With respect to the more developed regions, the proportion of population aged 0-14 years is estimated to be 23 per cent. This figure may be compared with that of 39 per cent for the less developed region. The proportion has been declining in the more developed regions during the past two decades because the increase in the population aged 0-14 years was very slow in the 1960s and even negative in the 1970s. In the coming 20 years, the rate is not expected to exceed 0.3 per cent per annum. On the other hand, the elderly population, aged 65 and over, that constitutes 11 per cent of total population in 1980 in the more developed regions has been increasing at an annual

rate of around 2.3 per cent over the past 30 years. The rate of increase in the elderly population, however, is expected to slow down to 1.0 per cent in the 1980s and 1.6 per cent in the 1990s, owing to a peculiar age structure apparently caused by the Second World War. The percentage of total population aged 65 years and over in the more developed regions will be 13 per cent in 1995-2000 (see table 7).

Table 7. Distribution of population by broad age groups for the world, the more developed regions and the less developed regions, 1950-2000

Year	World			More developed regions <sup>a/</sup>			Less developed regions <sup>a/</sup>

<sup>a/</sup> For definition of "more developed regions" and "less developed regions", see table 5, footnotes <sup>a/</sup> and <sup>b/</sup>.

<sup>b/</sup> Percentage distribution of total population by age group for each regional group.

The proportion of the population aged 0-14 years, in the less developed regions declined slightly in the 1970s, from 42 per cent in 1970 to 39 per cent in 1980, and is expected to decline to 34 per cent in 2000. This decline is caused by the reduction in the fertility rate, which further reduced the growth rate of the young, from 2.5 per cent per annum in the 1960s to 1.6 per cent per annum in the 1970s. The proportion of elderly people (aged 65 and over) in the less developed regions is still relatively small - estimated to be 4 per cent of the total in 1980. But the rate of increase of the elderly, which was 2.7 per cent per annum in the 1970s, was higher and will continue to be higher in the near future than the growth rate of not only the young population aged 0-14 in the less developed regions, but also the elderly population in the more developed regions, indicating the potential importance of the aging problem in the former region.

Owing to changes in the age structure of population, the age dependency ratio - defined as the ratio of population of 0-14 years plus that of 65 years and over to the working-age population of 15-64 years, multiplied by 100 - started to decline on a world-wide basis in the 1970s. On the average for the world, the ratio rose from 66 in 1950 to 75 in 1970, then declined to 69 in 1980, and is expected to fall to 61 by 2000. The projected decline of the dependency ratios for the world is primarily the result of the rapid decline in the childhood dependency ratios, which overwhelmed the rising old-age dependency ratios. However, if attention is focused on the more developed regions alone, the dependency ratios will fluctuate in the coming decades as the result of off-setting effects of the childhood and the old-age dependency ratios (see table 8).

Table 8. Age dependency ratios for the world, the more developed regions and less developed regions, 1950-2000

Year	World			More developed regions <sup>a/</sup>			Less developed regions <sup>a/</sup>		
	Total	Child-hood	Old age	Total	Child-hood	Old age	Total	Child-hood	Old age
1950	66	58	8	55	43	12	72	66	7
1960	73	64	9	59	45	13	81	74	7
1970	75	65	10	59	44	16	83	76	7
1980	69	59	10	52	35	17	76	69	7
1990	65	55	10	51	33	18	70	63	7
2000	61	51	10	53	33	20	63	56	8

a/ For definition of "more developed regions" and "less developed regions, see table 5, footnotes a/ and b/.

**Note:**

The total dependency ratio is the sum of the childhood dependency ratio and the old age dependency ratio. The childhood dependency ratio is defined as the ratio of population aged 0-14 years to those aged 15-64 years, multiplied by 100. The old age dependency ratio is defined as the ratio of population aged 65 years and over to those aged 15-64 years, multiplied by 100.

Comparison of the present study with earlier ones

As was mentioned above, according to new projections and estimates, the total world population will reach 6,199 million in the year 2000 (see table 9). This is about 55 million below the previous projection, prepared in 1973. This downward adjustment is the net result of two factors: a downward adjustment of projected fertility rates, which reflects the recent declines observed in certain countries, both developed and developing; and an upward adjustment of the benchmark population of 1975 by 65 million, a large portion of which is due to the upward revision of the Chinese population in 1975 from 839 million to 895 million. (If allowances are made regarding changes in the benchmark population of 1975, the downward revision of the fertility assumption might have resulted in a reduction of the projected world population in the year 2000 by some 140 million.)

Table 9. Comparison of world population trends for 1950-2000, as assessed in 1973 and 1978

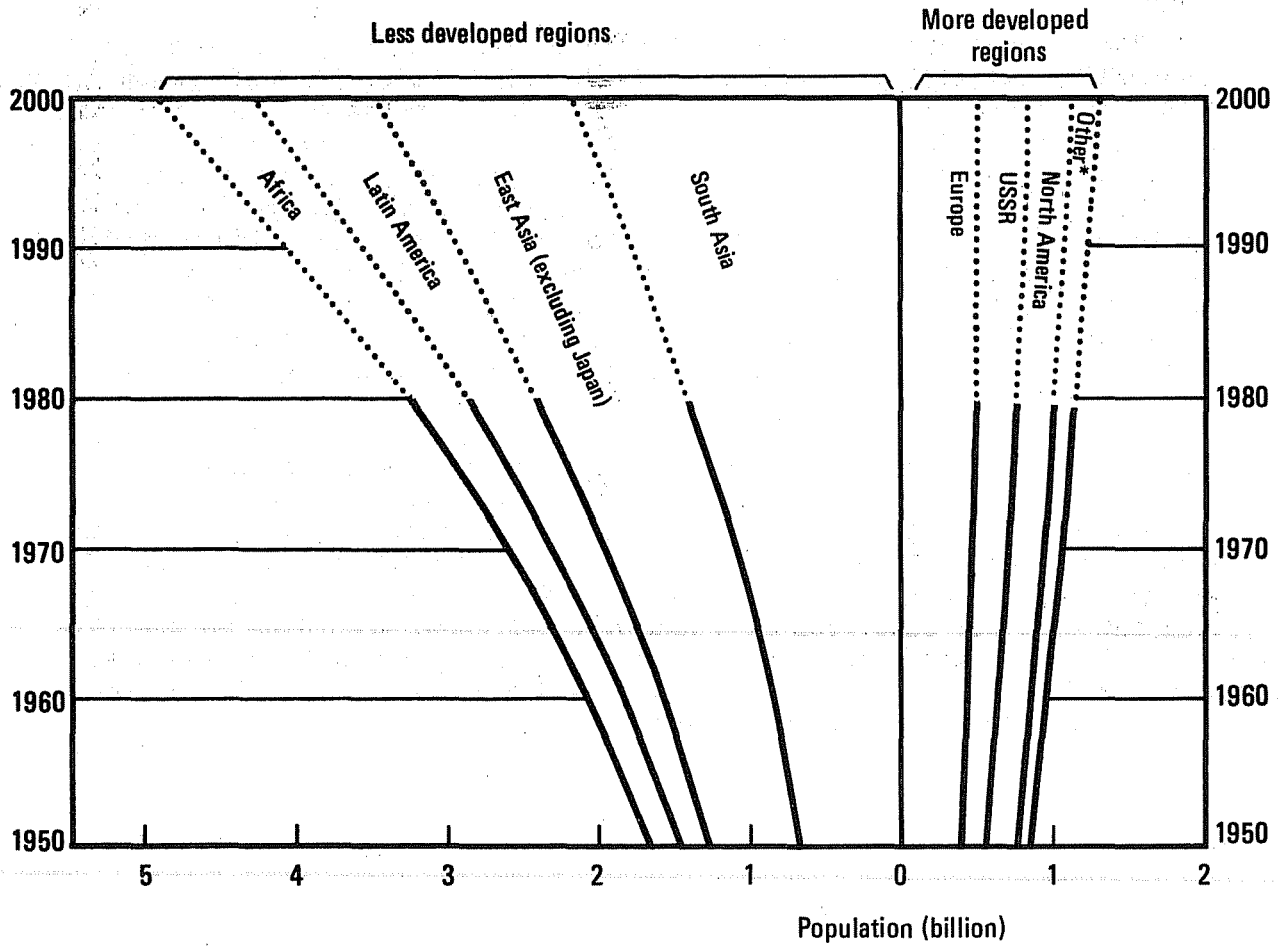

Year	As assessed in 1978		As assessed in 1973	
	Population (millions)	Rate of increase (percentage) <sup>a/</sup>	Population (millions)	Rate of increase (percentage)
1950	2 513	-	2 501	-
1955	2 745	1.77	2 722	1.69
1960	3 027	1.95	2 986	1.85
1965	3 344	1.99	3 288	1.93
1970	3 678	1.90	3 610	1.87
1975	4 033	1.84	3 968	1.89
1980	4 415	1.81	4 374	1.95
1985	4 830	1.80	4 817	1.93
1990	5 275	1.76	5 280	1.84
1995	5 733	1.66	5 763	1.75
2000	6 199	1.56	6 254	1.64

<sup>a/</sup> Average annual rate (exponential) for the preceding five years.

The current growth rate of 1.8 for the world is less than the rate provided by the 1973 projections, namely, 1.95. Reduced growth rates for the 1975-1980 period have been observed in almost all parts of the world, with the exception of Africa, where growth rates have been revised slightly upwards. Compared to the 1973 estimates, the rate of population growth in Africa as a whole is a bit higher in the current projections for the period 1975-1990 and lower at the end of the century. Changes for the 1975-1980 period were largest in Western Africa, with an increase from 2.75 per cent to 3.06 per cent. In Eastern, Middle and Northern Africa an upward revision of the growth rate was about one tenth of one percentage point for the 1975-1980 period, whereas a change was made slightly upward in Southern Africa.

There have been major changes for Europe regarding the current and future rates of population growth, compared to the 1973 estimates. Notable changes have been made concerning Northern and Western Europe, where the current rates of population growth have decreased from 0.43 and 0.46 per cent to 0.08 and 0.00 per cent, respectively. Projected growth rates for the two regions in the last quinquennium of the century are also required - to 0.22 and 0.28 per cent from 0.44 and 0.40 per cent, according to the 1973 projections. Slight downward adjustments in growth rate have also been made for Northern America, Australia, New Zealand and Japan, in accordance with recent demographic data available for the 1978 projections.
