NATIONAL FARM DATA HANDBOOK SYRIAN ARAB REPUBLIC 1994

UNITED NATIONS
New York, 1995

95-0047

All tables, figures and maps have been reproduced as submitted.

Preface

The objective of this National Farm Data Handbook is to facilitate the use of existing farm data for planning, policy analysis and project design. The handbook contains standard input/output data on crops and livestock for the major agro-ecological zones in the Syrian Arab Republic for the crop year 1993/1994.

Of the numerous potential uses of such data, the most important are:

- Agricultural policy analysis
- Agricultural sector planning
- Regional rural development planning
- Preparation of agricultural projects
- Planning agricultural support services
- Teaching and training.

This handbook is not designed for use in planning individual farms. These input/output data are too generalized for planning and managing individual farms or devising specific extension recommendations, which should be based on more detailed data on the specific nature of a site or farming system.

This handbook was prepared by the Joint ESCWA/FAO Agriculture Division and the Agricultural Policy Department of the Syrian Ministry of Agriculture and Agrarian Reform, in cooperation with FAO. Data was collected from existing information and those generated through numerous farm surveys. Gaps were then filled by interviewing farmers and field agricultural officers in the agro-ecological zones. Data are therefore not to be considered official statistics.

The Economic and Social Commission for Western Asia (ESCWA) would like to express its gratitude to Mr. Nahi Al-Shaibany, Director, Department of Agricultural Economics, Ministry of Agriculture and Agrarian Reform, as well as Messrs. Mohammed Khazma and Hassan Sowar. ESCWA also extends its thanks to Messrs. Naser Alebeod, Samir Grad, Haytham Haydar and Amer Jabarin.

I. GENERAL FEATURES OF THE SYRIAN ARAB REPUBLIC

A. LOCATION AND AREA

The Syrian Arab Republic lies at the eastern end of the Mediterranean. The total area is 18,518,000 ha. Topographically, the Syrian Arab Republic can be divided into four regions:

- (a) The coastal region between mountains and the sea;
- (b) The mountains and the highlands extending from north to south parallel to the Mediterranean coast;
- (c) The plains or interior, located east of the highlands and including the plains of Damascus, Homs, Hamah, Aleppo, Al-Hassakeh, and Dara'a;
- (d) The *badiyah* and the desert plains located in the southeastern part of the country, bordering Jordan and Iraq.

B. CLIMATE

The climate of the Syrian Arab Republic is Mediterranean, with rainy winters, dry summers and two short seasons in between. According to rainfall level, the country is divided into four climatical regions, which is compatible with the above-mentioned topographical classification. The coastal region is characterized by high precipitation in winter and moderate temperatures and high humidity in summer. The mountains, about 1,000 metres above sea level, are characterized by heavy rainfall (exceeding 1,000 millimetres in winter and moderate weather in summer). The plains are characterized by moderate to low rainfall in winter and dryness and high temperatures in summer, with significant changes in daily temperatures. The *badiyah* region is characterized by low rainfall in winter and hot and dry summers.

Relative humidity during summer ranges from 20 to 50 per cent in the internal regions and between 70 and 80 per cent in the coastal regions. During winter relative humidity ranges between 60 and 70 per cent in the internal regions and in the costal regions. The desert region has the lowest relative humidity.

Eastern winds blow during winter on the eastern parts and northern winds blow on northern and north-western parts, while the western and south-western winds blow on the rest of the country. During summer, northern winds blow on north-eastern parts, while the western and south-western winds blow on the rest of the country.

The majority of the Syrian Arab Republic is exposed to high variability in daily temperature. The maximum difference in daily temperature can be as high as 32 C° in the interior and about 13 C° in the coastal region.

Snow falls on mountains with an elevation of 1,500 metres above sea level, while areas located between 800 and 1,500 metres above sea level receive a mixture of rain and snow during the winter season.

C. MOUNTAINS, RIVERS, AND LAKES

In general, the majority of mountains are located in the western areas of the country. Mountain density and elevation decrease towards the east.

NATIONAL FARM DATA HANDBOOK

Several national and international rivers are found in the Syrian Arab Republic. The following are the most important:

River	Length in km		Annual flow (m ³ /sec)		
	Total	In the Syrian Arab Republic	Average	Maximum	Minimum
Euphrates	2 330	600	482.0	1 143.0	43.0
Khabour	442	442	28.2	36.6	36.6
Khalej	124	100	9.6	11.3	24.5
Blekh	116	116	NA	NA	NA
Asai	485	366	7.6	11.5	4.8
N-Kabeer	96	89	7.7	36.9	NA
Assen	6	6	14.0	20.1	6.4
Barda	81	81	10.0	57.5	0.1
Awaj	70	70	2.3	25.5	0.1
Yarmouk	42	32	5.7	200.0	1.5
S-Kabeer	86	56	NA	NA	NA

Several natural and artificial lakes are also found in the Syrian Arab Republic, among which are the following:

Lake name	Location	Area (km ²)
Al-Assad	near Althourah	674
Jbool	near Aleppo	239
Kutainah	near Homs	81
Al-Otayka	near Damascus	11
Mzareeb	near Dara'a	1
Al-bath	near Arakah	27
Massadah	near Kunaitarah	1

D. POPULATION

The population of the Syrian Arab Republic in 1992 totalled about 12.5 million and is expected to reach 17 million by the year 2000. The population growth rate is currently estimated at 3.36 per cent. The labour force totalled about 1,645,000 in urban areas and 1,605,000 in rural areas. The agricultural labour force in 1992 totalled about 756,000, which constituted about 23 per cent of the total labour force. About 25 per cent of agricultural labourers are women, and about 32 per cent of agricultural labour consists of family labour.

II. THE AGRICULTURAL SECTOR

The average contribution of the agricultural sector to the GDP from 1970 to 1992 was around 18.6 per cent, with the lowest (16.3 per cent) in 1985, and the highest (19.6 per cent) in 1970. The average contribution during that period was SP 24.27 billion. The agricultural sector production had increased from about SP 9.1 billion in 1970 to SP 32.8 billion in 1992 over 260 per cent).

The agricultural sector is important in terms of natural resources, especially water, arable land and labour. The sector is a major source of income, foreign exchange and employment in the Syrian Arab Republic. Agriculture employs around 23 per cent of the labour force and accounts for nearly 20 per cent of GDP. Agricultural products constitute over 60 per cent of non-oil exports. Agro-industries contribute around 25 per cent of the country's output and account for an estimated 50 per cent of the jobs in the manufacturing sector.

According to the 1981 census, arable land owned and registered in the Syrian Arab Republic is distributed among 532,691 holdings, with a total area of 4,901,860 ha. Table 1 shows the distribution of land holdings by area. Figure I shows that 75.4 per cent of the holdings cover less than 10 ha each. Table 2 and figure II demonstrate that the largest average holding area is in Al-Rakka Governorate followed by Al-Hassakeh.

Irrigated agriculture contribute by more than 50 per cent of the total value of agricultural production, on about 15 per cent of the cultivated land. Cotton, sugar beet and a significant amount of wheat are produced in the irrigated areas. The sources of irrigation water are mainly rivers, deep and shallow wells and other surface water resources.

Natural resources, labour, capital and management are available in good proportions in Syrian agriculture.

A. LAND USE

Agricultural land in the Syrian Arab Republic is classified into two categories based on land use and soil type (see tables 3 and 4). Land classification based on use is further classified into four groups. In 1993, the land area of each group was as follows:

Cultivable land	5,939,000 ha
Uncultivable land	3,777,000 ha
Pasture and steppe land	8,217,000 ha
Forests	585,000 ha
Total area	18,518,000 ha

Cultivable land is classified into reclaimed and unclaimed land amounting to 5,424,000 and 513,000 ha, respectively. The uncultivable land is mainly used for buildings and services.

Based on soil type, Syrian land is classified into the following:

Red Mediterranean soils	850,000 ha
Reddish-dark brown soils	2,217,000 ha
Yellowish-brown soils	4,782,000 ha
Desert soils	4,244,000 ha

NATIONAL FARM DATA HANDBOOK

Gypsum soils	5,528,000 ha
Others	897,000 ha
Total	18,518,000 ha

Table 1. THE DISTRIBUTION OF LAND HOLDINGS IN THE SYRIAN ARAB REPUBLIC ACCORDING TO CATEGORIES

Holding categories (hectare)	Number of holdings	Area (hectare)	Average holding area (hectare)	Area of category (percentage)	Number of holdings per category (percentage)
Less than 10 hectare	401 649	1 151 937	2.87	23.5	75.4
10-100 hectare	126 780	2 877 392	22.7	58.7	23.8
Greater than 100	4 262	872 531	204.72	17.8	0.8
Total	532 691	4 901 860	9.20	100	100

Table 2. THE DISTRIBUTION OF LAND HOLDINGS IN THE SYRIAN ARAB REPUBLIC ACCORDING TO GOVERNORATES

Governorate	Number of holdings	Area (hectare)	Average holding area (hectare)	Area of category (percentage)	Number of holdings per category (percentage)
Sweida	15 792	132 811	8.41	2.71	2.96
Dar'a	20 857	200 644	9.62	4.09	3.92
Quneitra	2 264	11 773	5.20	0.24	0.43

Homs	40 107	338 503	8.44	6.91	7.53
Hama	51 063	404 930	7.93	8.26	9.59
Idleb	46 985	251 840	5.36	5.14	8.82
Tartous	92 278	205 780	2.23	4.20	17.32
Lattakia	36 525	70 493	1.93	1.44	6.86
Aleppo	85 927	937 464	10.91	19.12	16.13
Al-Rakka	21 598	646 860	29.95	13.20	4.05
Dair-Ezzor	26 525	116 445	4.39	2.38	4.98
Al-Hassake	55 162	1 407 183	25.51	28.71	10.36
Total	532 691	4 901 860	9.20	100	100

The reclaimed land can also be classified, according to its productivity, into irrigated and rain-fed land. In 1993 irrigated areas totalled 1,013,000 ha, of which 124,000 ha were planted with trees and 889,000 ha were planted with annual crops. Rain-fed areas totalled 3,925,000 ha divided into five settlement zones. The boundaries are mainly drawn on the basis of the rainfall patterns. These zones are:

(a) First settlement zone:^{1/} with average annual rainfall greater than 350 mm. It is subdivided into two sub-zones:

^{1/} The area of the first settlement zone is 2.698 million ha (about 14.6 per cent of the total area). In 1993, the actual cultivated area in the first settlement zone was 1.750 million ha. The cropping pattern included 373,300 ha of trees and 693,000 ha of field crops (mainly wheat, barley, lentils, and chick-peas).

SYRIAN ARAB REPUBLIC

NATIONAL FARM DATA HANDBOOK

(a) First settlement zone:^{2/} with average annual rainfall greater than 350 mm. It is subdivided into two sub-zones:

- (i) a sub-zone with rainfall greater than 600 mm where rain-fed crops are grown without any risk;
- (ii) a sub-zone with rainfall between 350 and 600 mm where only two seasons out of three are secured;

(b) Second settlement zone: with average annual rainfall between 250 and 350 mm. Two out of three seasons are secured in this zone. Its total area is 2.473 million ha. In 1993, the actual cultivated area in this zone was 1.358 million ha, of which 143,000 ha were planted with fruit trees and 1.215 million ha with field crops (mainly wheat, barley, lentils and chick-peas);

(c) Third settlement zone: with average annual rainfall greater than 250 mm in more than half of the seasons. The total area of the zone is 1.306 million ha. The actual cultivated area in 1993 was 830,000 ha, of which 617,000 ha were planted with fruit trees and 596,000 ha in field crops (mainly wheat, barley, lentils and chick-peas);

(d) Fourth settlement zone: with average annual rainfall between 200 and 250 mm in more than half of the seasons. The area under this zone is about 1.833 million ha, of which 592,000 ha were cultivated in 1993. Of these, 7,000 ha were planted with trees and 585,000 ha were planted with field crops (mainly wheat, barley, lentils and chick-peas);

(e) Fifth settlement zone: with average annual rainfall of less than 200 mm in more than half of the seasons. It is considered as rangeland and desert areas and covers 1.0111 million ha (about 55.1 per cent of the total area of the Syrian Arab Republic).

For each settlement zone, the ideal crops and cropping patterns are determined centrally after extensive consultation between the local civil authorities and the respective bodies in the farming community. The selection is based not only on strict agro-climatic factors but also on other criteria related to national objectives and policies, such as self-sufficiency in staple food commodities, adequate supplies or raw materials for existing agro-processing plants.

B. IRRIGATION WATER

The sources for irrigation water in the Syrian Arab Republic are:

Surface water	16,477,000 m ³
Springs	3,693,000 m ³
<u>Renewable underground</u>	<u>2,321,000 m³</u>
Total	22,491,000 m ³

^{2/} The area of the first settlement zone is 2.698 million ha (about 14.6 per cent of the total area). In 1993, the actual cultivated area in the first settlement zone was 1.750 million ha. The cropping pattern included 373,300 ha of trees and 693,000 ha of field crops (mainly wheat, barley, lentils, and chick-peas).

SYRIAN ARAB REPUBLIC

Annual rainfall in the Syrian Arab Republic amounts to 45,000,000,000 m³ of water; however, most of it either evaporates or recharges the groundwater. Only 9 per cent of the rainfall flows as surface water.

There are 16 rivers and tributaries in the Syrian Arab Republic, the largest being the Euphrates with a length, in the Syrian Arab Republic, of 602 km and an average flow of 1,042 m³/sec. The Al-Khabour River and its tributaries extend 405 km, with an average flow of 3 m³/sec., while the Orantes and its tributaries run some 325 km in the Syrian Arab Republic and flow at an average rate of 51 m³/sec.

There are 141 dams in the Syrian Arab Republic with a storage capacity of 25,693,000,000 m³. The largest dam is located at Al-Tabka on the Euphrates. It forms Al-Assad Lake with a storage capacity of 11,200,000,000 m³. Approximately 640,000 ha of land are planned for irrigation with water from this dam. Medium-sized dams include Al-Resten (225 million m³), Mouhardeh (50 million m³) and Taldo (15.5 million m³). There are some 20 dams classified as small, the largest of which is Dara'a, with a storage capacity of 15 million m³. The majority of these dams are located near Homs and Hama.

Apart from Al-Assad Lake, there are five lakes in the Syrian Arab Republic, the largest being Lake Jabboul near Aleppo (surface area about 239 km²) while Lake Qattineh near Homs is the principal lake in the Syrian Arab Republic that remains full throughout the year.

C. FORESTRY

In comparison with other countries in the Middle East, the Syrian Arab Republic is considered one of the richest in forests. Forests and woodland areas cover about 585,000 ha, of which 309,000 ha are located in the first settlement zone. Forests are concentrated in the higher-rainfall zones of Homs, Lattakia and Idleb, where they normally occupy land which is unsuitable for agriculture (steep slopes and poor soils)

D. INPUT USE

Several laws govern the rights to use natural agricultural resources. These laws grant Syrian citizens the right to benefit from all natural resources such as water and land. Available information on input use in agriculture reveals a doubling of the quantity of fertilizers used in Syrian agriculture between 1980 and 1990. The number of tractors more than doubled during that period, and the use of pumps, seed drills and sprayers has increased rapidly.

E. AGRICULTURAL PRODUCTION

Plant production contributes about 64 per cent of the total value of agricultural production in the Syrian Arab Republic, while animal production provides 36 per cent of the total value of agricultural production. In 1993, the cultivated areas included about 4 million ha in the rain-fed regions and 1 million ha under irrigation.

Plant production in the Syrian Arab Republic is classified into six groups as follows:

(a) *Cereals*: including wheat, barley, maize and sorghum. In the 1992-1993 production season, areas cultivated with cereals under irrigation and rain-fed conditions totalled 625,000 ha and 3 million ha, respectively;

NATIONAL FARM DATA HANDBOOK

(b) *Legumes*: including lentils, chick-peas, peas, broad beans and vetch. The lentil is the dominant crop inasmuch as it occupies more than 50 per cent of the cultivated areas in legumes annually. In the 1992-1993 production season, areas cultivated with legumes under irrigation and rain-fed conditions totalled 9,000 ha and 190,000 ha, respectively;

(c) *Industrial crops*: including cotton, sugar beet, peanuts, soybeans and sesame. The majority of these crops are produced under irrigation. In the 1992-1993 production season, areas planted with industrial crops totalled 260,000 ha under irrigation and 190,000 ha under rain-fed conditions;

(d) *Forage crops*: including alfalfa, grazing barley, grazing maize and grazing vetch. The cultivated areas amounted to 38,000 ha and 56,000 ha under irrigation and rain-fed conditions, respectively;

(e) *Vegetables*, which are produced in winter and summer, constitute the largest group with regard to types (mainly potatoes, onions, tomatoes, eggplant and peppers). In the 1992-1993 production season, 148,000 ha and 67,000 ha were cultivated in vegetables under irrigation and rain-fed conditions, respectively;

(f) *Fruit trees* include mainly olives, grapes, apples, citrus, apricots and pistachios. In the 1992-1993 production season, the cultivated areas under irrigation and rain-fed conditions totalled 124,000 ha and 548,000 ha, respectively. The country has about 215 million trees, most of which were planted in the last two decades.

F. CROPPING PATTERN AND CROP ROTATIONS

1. *Irrigated areas*

There is wide variation in cropping patterns in the irrigated areas owing to the number of water sources available and the agro-climatical conditions. Strategic crops such as wheat and cotton are concentrated in the northern and the eastern parts of the country. More than 50 per cent of the wheat and cotton produced in the country comes from Al-Hassakeh Governorate. However, production of winter vegetables is centred in the coastal region, while summer vegetables are produced mainly in the internal plains, especially in the middle and southern regions. Irrigated fruit trees such as citrus are mainly found in the coastal region.

In 1993, the total irrigated area was 1,013,000 ha, of which 124,000 ha were planted with fruit trees and the remaining 889,000 ha were planted with field crops and vegetables. Production intensity in field crops reaches 120 per cent; therefore, the 889,000 irrigated hectares become 1,066,000 ha, of which 676,000 ha are planted with winter field crops and vegetables and 390,000 ha are planted with summer field crops and vegetables.

2. *Rain-fed areas*

Rain-fed areas in the Syrian Arab Republic are mainly cultivated with field crops and fruit trees. In 1991, the total planted area devoted to fruit trees and field crops amounted to 3,925,000 ha in the five agro-climatical zones. The actual cultivated area in the first settlement zone was 98 per cent of the total arable area. The actual cultivated areas of the total arable lands in settlement zones two, three, four, and five reached 88.5 per cent, 81 per cent, 70 per cent and 52 per cent, respectively.

SYRIAN ARAB REPUBLIC

G. ECONOMICS OF AGRICULTURAL PRODUCTION

The economics of production are determined by costs and returns, which is closely linked to the level of labour rates, the cost of hired machinery and the cost of inputs. Returns are linked mainly to price levels. The Government has specified the following objectives for the agricultural sector:

- (a) To improve food self-sufficiency, especially in cereals production;
- (b) To provide the agro-industry with the required raw materials;
- (c) To expand livestock production; and
- (d) To encourage producers to develop production through vertical and horizontal expansion and improve input and support services (equipment, extension).

III. PLANT PRODUCTION

A. MAIN CROPS

As mentioned above, wheat, barley, lentils, chick-peas and sugar beet are the main winter crops in the Syrian Arab Republic, while cotton, maize and sunflower are the main summer crops (table 5).

1. Wheat

Wheat is produced in both irrigated and rain-fed areas. The high-yielding wheat varieties are used in irrigated areas.

Wheat production fluctuated during the period 1983-1992. It was about 1.6 million tons in 1983 but dropped to 1.1 million tons in 1984; however, it recovered afterwards to reach about 2 million tons in 1990 and about 3 million tons in 1992. The lowest production figure was about 1 million tons in 1989. The Syrian Arab Republic imports small amounts of soft wheat to be mixed with the local hard wheat so as to enrich its quality. Wheat exports are negligible.

The General Organization for Trading and Processing of Grains (GOTPG) has a monopoly on grain trade and is the sole legal purchasing organization.

In terms of grain traded, Al-Hassakeh Governorate is by far the most important area. Since government authorization is required for selling to other governorates and for export, illegal domestic and border sales occur, but the extent is not known. The major part of un-traded grains is retained on the farms for household needs. Figure III summarizes the marketing channels of wheat in the Syrian Arab Republic.

The largest quantity of wheat is delivered to the GOTPG in bags. The Cereals Office makes arrangements to purchase grain directly from some producers, particularly small farmers, and collect the grains at the farm.

Direct supply of grain to the central storage silos is not practised. The operation of the silo plants is the responsibility of the General Company for Elevators (GCE). Most of the wheat is delivered from storage silos to the General Company for Trade and Grain Processing (GCTGP), which sells the flour to the General Institution for Consumption (GIC).

Since, in the past, the Syrian Arab Republic has not been self-sufficient in wheat, the GOTPG imports wheat and wheat flour to supplement local production. Owing to the shortage in milling capacity, most wheat is imported as flour and delivered directly to the GCE. The primary reason for not delivering imported flour directly to bakeries is that imported flour is usually mixed with locally produced flour before delivery.

Consumers purchase baked bread mainly in bakeries owned by the General Company for Baking. The rest is purchased from private bakeries. The GIC sells grain as flour to consumers, while local traders sell only grains.

2. Barley

Barley is produced mainly under rain-fed conditions. About one third of it is produced in the third settlement zone.

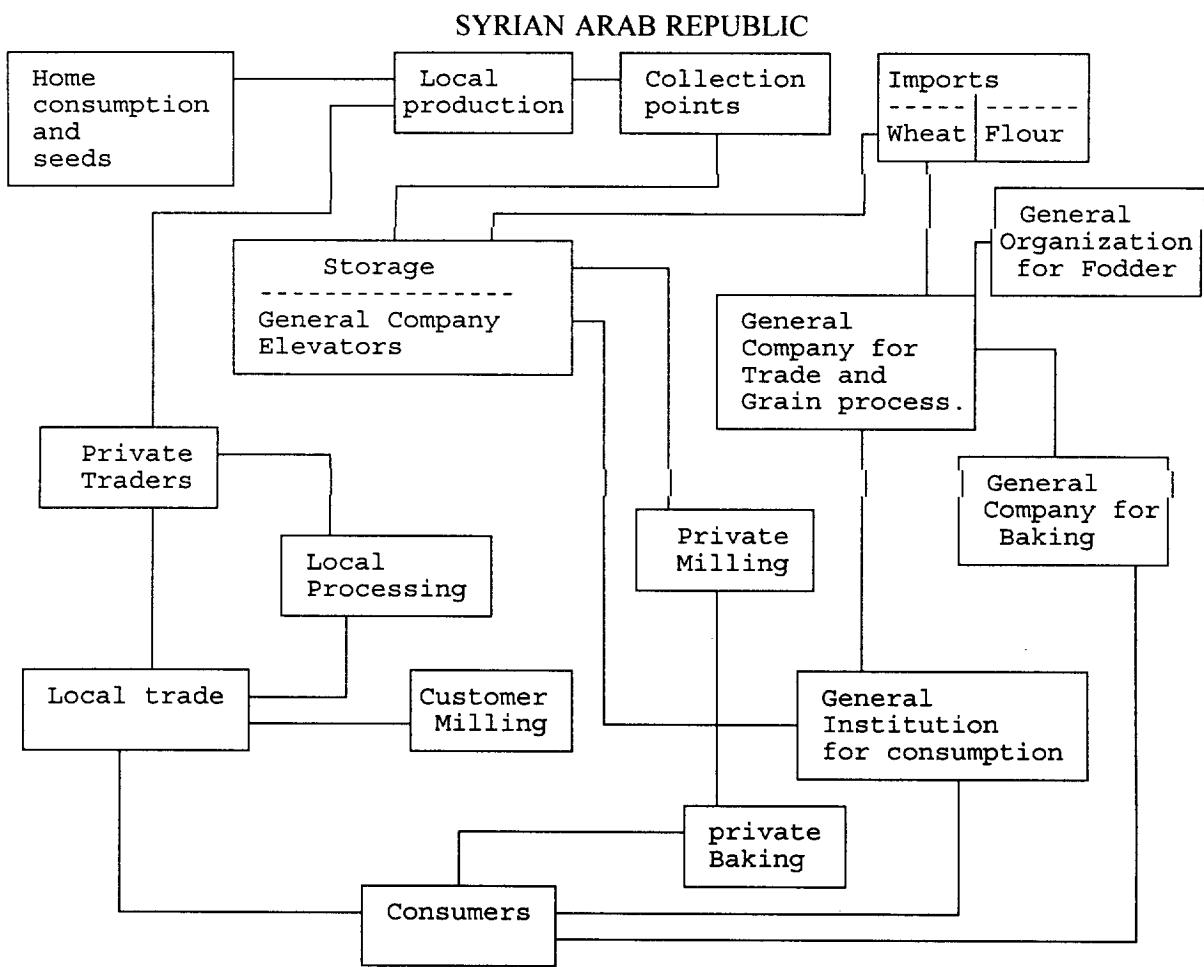

Figure III. MARKETING CHANNELS FOR WHEAT

Barley production witnesses more fluctuation than that of wheat. The highest production was about 2.8 million tons in 1988, and the lowest was 279,000 tons in 1989. Production of barley in 1992 reached about 1.1 million tons.

The largest quantity imported was about 299,000 tons in 1984. There were no imports in 1986, 1989, or 1990. On the other hand, the Syrian Arab Republic exported a small quantity in 1983 (57,000 tons) and in 1988 (177,000 tons). The GOTPG also purchases barley at prices fixed by the Higher Agricultural Council (HAC). GOTPG centres are open from the middle of May until September. A premium is given for deliveries before and after the main harvest period to avoid the peak period. Private trade in barley is restricted, and transport of barley without a GOTPG certificate between the governorates is not permitted.

Most of the barley purchased by GOTPG is sold to the General Organization for Feeds (GOF) (figure IV), which sometimes pays prices lower than the GOTPG purchasing price. The GOF sells grains to owners of sheep and cattle and to poultry farms.

3. Lentils

During the period 1983 to 1992, lentil production witnessed intense fluctuation. The highest level of production occurred in 1988 (171,000 tons), and the lowest (36,000 tons) in 1984. No lentils were imported

NATIONAL FARM DATA HANDBOOK

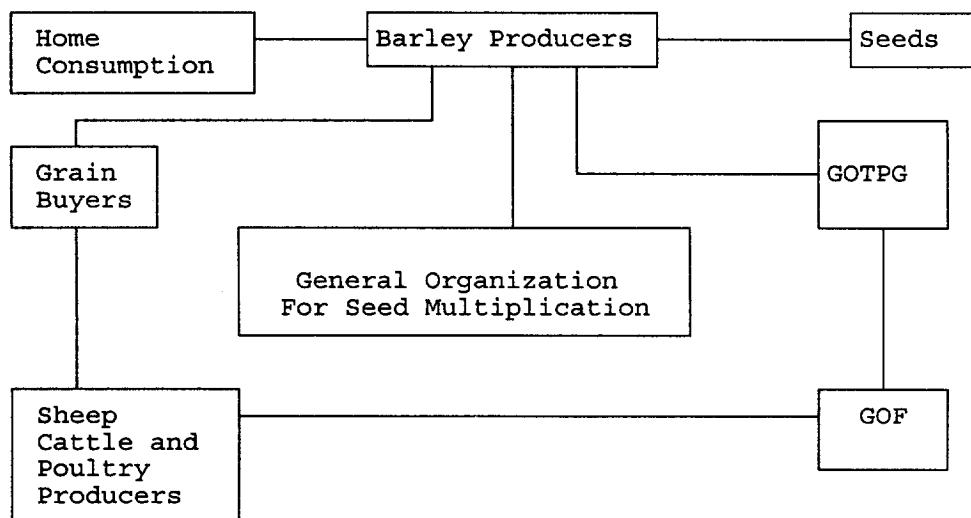

Figure IV. MARKETING CHANNELS FOR BARLEY

during the period 1983 to 1992, but there were varying levels of exports. The largest quantity (95,000 tons) was exported in 1989, while exports in 1984 were nil.

In 1990, about 63 per cent of lentil production was sold to the GCTGP, which sells most of it to the GIC. This institution, in turn, sells it to the consumers.

4. Chick-peas

Chick-pea production also fluctuated during the period 1983 to 1992, with the lowest level (13,000 tons) in 1989 and the highest (74,000 tons) in 1992. The Syrian Arab Republic is self-sufficient in chick-peas. It has not imported any quantities of chick-peas, and exports have come to a virtual halt since 1990.

Only small quantities of chick-peas were delivered to the GOTPG in 1989 (about 7,300 tons) and 1990 (about 3,000 tons). The GOTPG sold most of the procured quantities to the GIC, which, in turn, sold it to the consumers.

5. Maize

The Syrian Arab Republic is far from self-sufficiency in maize production; the average production during the period 1989 to 1991 (the highest production period) was about 174,000 tons, while the apparent demand during the same period was 378,000 tons. Thus, the self-sufficiency ratio during that period was about 45 per cent.

Demand for maize has significantly increased during the past two decades owing mainly to the expansion of poultry production. Maize is produced as an intensive crop after irrigated winter crops. Maize production is expected to increase during the coming years in order to achieve self-sufficiency.

NATIONAL FARM DATA HANDBOOK

Yields differ from one region to another. In Hama, Aleppo and Al-Hassakeh, yields have reached 3,500, 4,500 and 4,000 kg per hectare, respectively.

Maize marketing follows the same pattern as barley, except that there is no role for the General Organization for Seed Multiplication.

6. *Sugar beet*

Although sugar beet production is regulated by government policies, it has fluctuated greatly during the period 1989 to 1992. The highest level of production was 1,365,000 tons in 1992, and the lowest was 187,000 tons in 1989.

Production is delivered to the processing factories owned by the Government. Sugar is then sold to the GIC, which, in turn, sells it to consumers. Sugar beet pulp is sold to the GOF, which sells it to sheep and cattle owners. The molasses is used in the production of alcoholic drinks.

7. *Cotton*

Cotton is the main agricultural cash crop in the Syrian Arab Republic, and until 1974 it was the most exported product. Currently, it is second to oil in foreign exchange earnings. The highest level of production of cotton lint was 555,000 tons in 1991. In 1992 it dropped to 55,000 tons.

Marketing of cotton has been the responsibility of the Cotton Marketing Organization (CMO) since 1965, when this activity was nationalized. The role of CMO is to procure cotton seeds and gin and market lint cotton and the by-products of ginning. Currently, about 50 per cent of lint production is exported, and most of the remainder is used by the Syrian textile industry. All cotton seeds (except small quantities supplied to farmers through the Cooperative Agricultural Bank [CAB] as loans) are transferred to the State-owned company for vegetable oil processing. Oil is then sold to the Union of Food Industries, which sells it to consumers. Control of the cotton industry by the State begins with the issuance of licences to farmers to grow cotton, and this control continues through to the marketing system (figure V).

Cotton is a product in which the Syrian Arab Republic has a clear competitive advantage in production and marketing.^{3/} The product is profitable at all levels and brings a good price in international markets. Partly because it is hand-picked, it is normally priced above the average international price of cotton having comparable grade and stable length.

8. *Sunflower seeds*

Production of this crop was introduced to the country in 1988, starting with small areas of 5,000 ha. To encourage farmers to expand this crop, the Government offered good price of 16 SP/kg. Yields of this crop increased from 1,500 kg per hectare in 1988 to 2,000 kg per hectare in 1993. Production is expected to increase in the future.

^{3/} United States Department of Agriculture (USDA) and United States Agency for International Development (USAID), "Agricultural Sector Assessment—Agricultural Marketing Annex", vol. 4, 1980, p. 72.

SYRIAN ARAB REPUBLIC

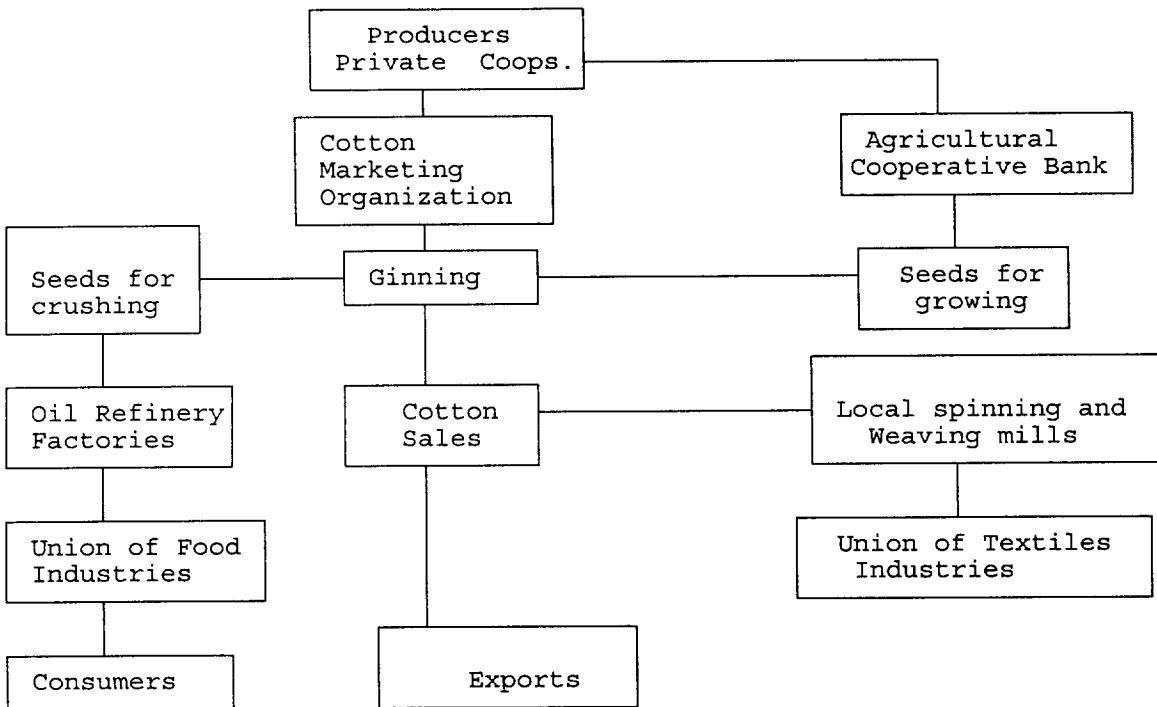

Figure V. MARKETING CHANNELS FOR COTTON

9. *Soybeans*

This crop was introduced to the Syrian Arab Republic in 1988 along with the sunflower. In the first stage, yields varied between producers even in the same location owing to lack of experience. Later, with the help of extension agents and cooperation among different groups, yields improved significantly. In 1992, soybean yields reached 2,100 kilograms per hectare in Hama, 2,000 in Aleppo and 1,800 in Al-Hassakeh.

10. *Onions*

Onion, produced mainly in the middle regions of the Syrian Arab Republic, is considered one of the most important vegetable crops. It is also one of the crops whose price is not controlled by the Government. As a result, onion prices vary sharply from one production season to another and from year to year.

11. *Tomatoes*

Tomatoes are cultivated during the spring and summer seasons. It is also produced during winter in greenhouses. The majority of winter tomatoes and greenhouse tomatoes and a significant amount of summer tomatoes are produced in the coastal region. Tomato prices fluctuate continuously owing to market supply and demand. A significant portion of summer tomatoes are processed into tomato paste and juice.

NATIONAL FARM DATA HANDBOOK

12. *Potatoes*

The potato crop is considered a strategic crop in the Syrian Arab Republic. The annual cultivated area ranges from 20,000 to 23,000 ha, and production varies from 370,000 to 450,000 tons. Potatoes are produced in spring, summer and fall.

The annual cultivated area of spring potatoes varies from 7,000 to 9,000 ha, and yields also vary from 25 to 42 tons per hectare. Spring potatoes are produced mainly in Aleppo, Homs, Tartous and Hama. Seeds are planted in December and January and harvested from April to June.

About 60 per cent of summer potatoes are produced in Damascus Governorate. The annual cultivated area ranges from 2,000 to 3,000 ha. It is planted in April and harvested from September to November.

Fall is the major production season for potatoes, compared with spring and summer. Fall potatoes are mainly produced in Homs, Hama and Idleb. The annual cultivated area ranges from 9,000 to 14,000 ha. Potatoes are planted in June and July and harvested from January to April.

It is worth noting that potatoes are available year-round owing to the three production seasons.

13. *Protected agriculture*

Protected agriculture started in the Syrian Arab Republic in 1976 to meet the demand for off-season vegetables. The number of greenhouses during the last 10 years has been increasing continuously. In 1994, the number of greenhouses was 45,000, of which two thirds were found in the coastal region.

Tomatoes, eggplant, peppers, pineapples and flowers are the major crops produced in greenhouses. Long- and short-season crops are produced in greenhouses:

- (a) Long-season crops are vegetables planted in October and harvested from December to June;
- (b) Short-season crops are vegetables planted in September and harvested from October to November.

14. *Fruit trees*

In the last two decades, the Syrian Arab Republic has witnessed a significant expansion in the planting of fruit trees, both rain-fed (mainly almonds, olives and pistachios) and irrigated (mainly citrus). Olives cover more than 50 per cent of the total area planted with fruit trees. The expansion in the planting of olive trees took place in areas with relatively low rainfall and relatively poor soil conditions. The major expansion in citrus took place in the coastal plains, with guidance and support from the Government. Citrus in this region is irrigated from wells and surface water that are provided through government projects.

						200.00	200.00

The first year establishment costs includes ploughing, removal of stones, and flating. These costs vary according to land types as follows:

- A- Costs for flat and stone free land = 1500 SP/Dunum
- B- Costs for flat with stones land = 3000 SP/Dunum
- C- Costs for rough and stone free land = 1700 SP/Dunum
- D- Costs for rough with stones land = 4500 SP/Dunum

The first year establishment costs includes ploughing, removal of stones, and

flating. These costs vary according to land types as follows:

- A- Costs for flat and stone free land = 1500 SP/Dunum
- B- Costs for flat with stones land = 3000 SP/Dunum
- C- Costs for rough and stone free land = 1700 SP/Dunum
- D- Costs for rough with stones land = 4500 SP/Dunum

						2000.00	2000.00

The first year establishment costs includes ploughing, removal of stones, and flating. These costs vary according to land types as follows:

- A- Costs for flat and stone free land = 1500 SP/Dunum
- B- Costs for flat with stones land = 3000 SP/Dunum
- C- Costs for rough and stone free land = 1700 SP/Dunum
- D- Costs for rough with stones land = 4500 SP/Dunum

	Land rent	Dunum	1.00	2500.00	2500.00	17500.00	17500.00	2500.00	2500.00

The first year establishment costs includes ploughing, removal of stones, and flating. These costs vary according to land types as follows:

- A- Costs for flat and stone free land = 1500 SP/Dunum
- B- Costs for flat with stones land = 3000 SP/Dunum
- C- Costs for rough and stone free land = 1700 SP/Dunum
- D- Costs for rough with stones land = 4500 SP/Dunum

IV. ANIMAL PRODUCTION

A. MAJOR ANIMAL PRODUCTION ACTIVITIES

The Government of the Syrian Arab Republic has accorded high priority to the development of the livestock subsector. One of the objectives of the Sixth Five-Year Plan was to increase the annual growth rate of output to 7.7 percent. The Plan's strategies included support for research and development to improve the productivity of local breeds in milk and meat through cross-breeding and selection.

The Awassi is the only breed of sheep in the Syrian Arab Republic. It is a multi-purpose animal for meat, milk and wool production. The total number of sheep increased from 9.3 million in 1980 to 14.7 million in 1992. Sheep are an integral part of the production systems in the dry land farming zones.

The total number of cattle increased from 766,000 in 1982 to 799,000 in 1992, of which milking cows constituted about 44 per cent. These can be further subdivided as follows:

- 47 per cent local milking cows;
- 28 per cent imported milking cows;
- 20 per cent mixed milking cows; and
- 5 per cent Chami milking cows.

The goat population reached about 1.157 million head in 1992 and consists of two main breeds, the Chami goat and the black mountain goat.

Numbers of poultry have fluctuated from 13 to 18 million birds during the period 1982 to 1992. In 1992, egg layers constituted 66 per cent and produced 1.758 million eggs, while broiler meat production reached 83,000 tons.

B. INPUT/OUTPUT TABLES (AT FARMGATE PRICES)
FOR ANIMAL PRODUCTION ENTERPRISES

Activity : Sheep Raising (Sarehee)

Input-output data & gross margin for keeping 100 ews over one year

VI. SCIENTIFIC NAMES OF CROPS

CROP	SCIENTIFIC NAME
Almond	<i>Amygdalus communis L.</i>
Apple	<i>Malus sylvestris Min</i>
Apricot	<i>Prunus armeniaca</i>
Barley	<i>Hordeum SPP.</i>
Broad bean	<i>Vicia faba</i>
Cherry	<i>Prunus avium</i>
Chick-pea	<i>Cicer arietinum L.</i>
Citrus	<i>Citrus SPP.</i>
Cotton	<i>Gossypium arboreum</i>
Cucumber	<i>Cucumis sativus</i>
Eggplant	<i>Solanum melongena L.</i>
Grape	<i>Vitis vinifera</i>
Lentil	<i>Lens esculentus</i>
Musk melon	<i>Cucumis melo</i>
Olive	<i>Olea europea</i>
Peach	<i>Prunus persica</i>
Peanut	<i>Arachis hypogaea</i>
Pistachio	<i>Pistacia vera</i>
Potato	<i>Solanum tuberosum L.</i>
Soybean	<i>Glycine max</i>
Sugar beet	<i>Beta vulgaris</i>
Sunflower	<i>Helianthus annus</i>
Tobacco	<i>Nicotiana tabaccum</i>
Tomato	<i>Lycopersicon esculentum Mill</i>
Water melon	<i>Citrullus vulgaris L.</i>
Wheat	<i>Triticum</i>

L. = author

SPP. = different species

VII. GLOSSARY

Activity: A process using a particular, defined technology combining input factors to generate a particular type of output. Thus, the wheat enterprise on a particular farm may involve two activities of a high-yielding variety of wheat and a local variety of wheat, or barley harvested by harvester and manually harvested. Activities may be classified in various ways, such as by function (productive, intermediate or marketing) or by type of product (animal or crop).

Activity budget: A budget for an activity, a statement of the technical and economic characteristics of an activity.

Activity gross income: The market value of the output of an activity over a specified accounting period (usually a year), whether that output is sold or not.

Activity gross margin: Activity gross income minus the direct variable costs attributable to the activity.

Farmgate price: The price paid for input or received from output as measured at the farmgate, which is the point in product flow at which the farmer relinquishes full control over output or where the farmer gains full control over input. It serves to establish a point in input or output flow where a unique price can be determined.

Farming system zones: Zones which are defined in terms of common features from an agricultural point of view. For different purposes these features will differ but may involve such factors as climate, soil resources, land use, ethnic grouping and market access.

Gross margin per cubic metre of water (1): Gross margin in Syrian pounds divided by water requirement in cubic metres per hectare or dunum.

Gross margin per cubic metre of water (2): Gross margin plus the cost of irrigation water divided by the water requirement in cubic metres per hectare or dunum.

Gross margin per man-hour (1): Gross margin in Syrian pounds divided by labour requirement in man/hr.

Gross margin per man-hour (2): Gross margin plus the cost of the labour factor divided by the labour requirement in man/hr.

Input/output data: Data relating the level of crop or livestock output to (different) levels of input use, usually expressed in physical terms but may also be expressed in value terms.

Man-hour equivalent: A unit of measurement of labour input, requirement or availability, usually assumed to represent the work accomplished by an adult male worker in one hour. It is used as the basis for aggregating the supply or availability of labour from individuals of different ages and sexes.

Net crop yield: This measures crop yield per hectare (or other land unit) in the field, minus harvest losses and, where appropriate, storage losses.

NATIONAL FARM DATA HANDBOOK

Return to capital: Total gross output in Syrian pounds divided by the total variable cost of each activity.

Target area: A group of farmers within an agro-ecological zone whose farms are sufficiently similar and who follow sufficiently similar practices that a given recommendation is applicable to the entire group.

Variable costs: Components of total farm costs that are variable in the sense of changing according to the scale of the activity or enterprise in which they are incurred. They may be in the form of direct or indirect costs.

Working capital: Capital needed for the month-to-month running of a farm, as distinct from investment capital. Specified in accounting terms as current assets less current liabilities.
