COMMITTEE OF EXPERTS ON THE  
TRANSPORT OF DANGEROUS GOODS

Sub-Committee of Experts on the  
Transport of Dangerous Goods  
(Fourteenth session,  
Geneva, 8-19 December 1997,  
agenda item 4 (b))

GLOBAL HARMONIZATION OF SYSTEMS OF CLASSIFICATION  
AND LABELLING OF CHEMICALS

Physical Hazards

Joint ILO/UN Working Group on harmonized classification  
criteria for flammability and reactivity

Explosive properties

Transmitted by the Expert from Sweden

Introduction

During the previous meeting of the working group several delegates expressed their concern about products whose classifications are dependent of the packaging and mode of handling. If the harmonized classification system is based upon the transport packaging there is a great risk that the intrinsic properties of the products will be unrecognised. However, the discussions during the meeting were somewhat restrained since none of these delegates had put theirs thoughts on paper. The delegates were called upon to make written statements about theirs views and the Swedish delegate confirmed that he would do so.

GE.97-24048

**Examples**

To make this paper less academic we have chosen 3 products to exemplify our concerns. These products are Detonators, Nitrocellulose (nitrogen content > 12.6% and wetted with alcohol or water) and Airbags. All of them are products that have explosive properties and the classifications are dependent on the packaging, mode of handling and for the Nitrocellulose the amount of water/alcohol that are used to wet it.

Product	Transport		Other than transport	
	Possible Classifications		Possible Classifications	
	Packaged	Non-packaged	Packaged	Non-packaged
Detonators	1.1B 1.4B 1.4S	N.A.	1.1B 1.4B 1.4S	1.1.B
Airbags	1.4G 1.4S 9	N.A.	1.4G 1.4S	1.4G
Nitrocellulose, with < 25% water	1.1D	N.A.	1.1D	1.1D
Nitrocellulose, with < 25% alcohol	1.1D	N.A.	1.1D	1.1D
Nitrocellulose, with not less than 25% water	4.1	N.A.	1.1D	1.1D
Nitrocellulose, with not less than 25% alcohol	1.3C	N.A.	1.3C	1.1D

Note N.A. = Not allowed

**Discussion**

As the table above clearly illustrates we cannot avoid the fact that a products classification will be variable during the different modes of handling and once we open the packaging another change could occur.

This means that we have to bear in mind the fact that all transport-classifications are made with the product “as presented for transport”. However, once the transport comes to an end there is a possibility that the classification will change.

In Sweden we have recognised the problem and where applicable we suggest the use of two classifications, one for transport and another one for all other modes of handling.

The purpose of this paper is to illustrate the problem, which, for example, is rather common for explosives and de-sensitised explosives.
