## PREFACE

The estimates and projections prepared by the Population Division of the Department of International Economic and Social Affairs of the United Nations Secretariat and set out in the present report are based on the results of the 1980 assessment of demographic trends, which is the eighth round of such assessments undertaken by the United Nations. The various figures presented are derived from demographic data that had become available by the middle of 1980; consequently, the population estimates and projections in the present report supersede those that were previously published by the United Nations.\* Where national estimates of demographic data for recent years became available after the present projections were completed, these estimates will be incorporated in the next revision of the United Nations population projections, which is scheduled for 1982. Although the responsibility for the present report rests primarily with the United Nations Secretariat, it was greatly facilitated by the close co-operation among the United Nations bodies, particularly the regional commissions.

In interpreting the current estimates and applying them to practical use, it should be understood that all population projections may deviate from actual trends, as the future trends of birth and death rates and migratory movements cannot be predicted precisely. The aim of these estimates is to provide an assessment of plausible prospects for the population of each country in the light of available information. Like all projections, these figures will require revision as new information becomes available.

Magnetic tapes containing the major results and assumptions associated with the present estimates and projections can be provided upon request. Inquiry about the tapes should be addressed to the Director of the Population Division, Department of International Economic and Social Affairs, United Nations, New York, N.Y., 10017. The charge for the tapes is around \$100.

### **Explanatory notes**

The following symbols have been used in the tables throughout the report:

Three dots ( . . . ) indicate that data are not available or are not separately reported;

A dash (—) indicates that the amount is nil or negligible;

A blank in a table indicates that the item is not applicable;

A minus sign (–) indicates a deficit or decrease, except as indicated;

A full stop (.) is used to indicate decimals.

Use of a hyphen between dates representing years, e.g. 1970-1975, signifies the period from 1 July of the beginning year to 1 July of the end year.

Annual rates of growth or change, unless otherwise stated, refer to annual exponential rates.

Details and percentages in tables do not necessarily add to totals, because of rounding.

## INTRODUCTION

### THE CURRENT REVISION OF POPULATION PROJECTIONS BY SEX AND AGE

The importance of demographic estimates and projections in planning for social and economic development is recognized universally. At local, state, national, and international levels, demographic estimates and projections are among the basic ingredients for effective development planning. Education, housing, employment, health care, and food production are only a few of the many areas that rely on such figures. It is difficult, in fact, to imagine a planning situation where demographic estimates and projections do not play a fundamental role.

Since its inception, the United Nations has attempted to provide up-to-date and comparable estimates and projections of major demographic variables for the countries, areas, and regions of the world. Between 1950 and 1978, the United Nations completed seven rounds of its demographic assessment, that is, in 1951, 1954, 1957, 1963, 1968, 1973, and 1978. The present report is based on the results of the eighth round or 1980 assessment of demographic trends.

As has been the case previously, the population estimates and projections presented in this report are prepared for the world, the more developed and less developed regions, 8 major areas and 24 regions,<sup>1</sup> and 210 countries, territories, and areas. Estimates and projections are generally provided for each quinquennial year or each quinquennial period between 1950 and 2025.

The majority of figures in the present report are based on available national data that have been evaluated and, whenever necessary, adjusted for deficiencies and inconsistencies. In the case of those countries where sufficient national data do not exist, the necessary levels and/or rates are assumed that appear as much as possible to be appropriate for the country in question and are consistent with any existing information. For each country an age-sex structure is determined for the base year of 1975 that is internally consistent and in line with current levels of fertility, mortality, and migration. Figures for regions, areas, less developed and more developed regions, and the world as a whole are the sums of the

<sup>1</sup> For convenience in presenting global demographic trends, the Population Division of the Department of International Economic and Social Affairs of the United Nations Secretariat has been using the three levels of country classification mentioned in the text, of which the last two are essentially geographical groupings. The bisection of the 24 regions into the "less developed" and the "more developed" regions has also been made on the basis of demographic and other social and economic indicators. The less developed regions include all regions of Africa, Asia (excluding "Japan"), Latin America and Oceania (excluding "Australia and New Zealand"). The more developed regions include all regions of Europe, the Union of Soviet Socialist Republics, Northern America and the regions just cited as being outside the less developed category. In Latin America, "Temperate South America", which was formerly included among the more developed regions, is currently included among the less developed regions.

derived estimates and projections for the individual countries that constitute the specific grouping.

The approach used in preparing the country projections is the same as was used in previous projections, that is, the component method.<sup>2</sup> In brief, this method involves the separate projection of the number of males and females in each five-year age group based on a schedule of age-sex probabilities of survival. Births are determined according to an assumed schedule of age-specific birth rates applied to the corresponding number of women in the reproductive age groups; these births, after the sex ratio at birth and appropriate survival probabilities have been applied, are then added to the projected age-sex structure. Finally, the age-sex distribution of the net number of migrants is estimated and incorporated in the projected population figures.

As has been the tradition in the past, four variants of projections were prepared in the 1980 assessment: the medium, high, low, and constant variants. Selected results of the first three variants are provided in the statistical tables annexed to the present report. The distinctions among these three variants are largely due to the differences in assumed future fertility rates; however, varying assumptions are also adopted on future mortality and migration rates when such differentiations seem appropriate. In general, the medium variant represents future demographic trends that seem more likely to occur considering observed past demographic trends, expected social and economic progress, ongoing government policies and prevailing public attitudes toward population issues. In contrast, the high and low variants indicate the plausible, but not exhaustive, range of future deviations from the medium variant projections because future fertility, mortality, and migration rates could take alternative courses under various conditions. As usual in United Nations projections, no catastrophes such as wars, famines, and epidemics that would inevitably affect demographic trends are hypothesized in the formulation of future assumptions.

The present report gives summaries of the assumptions, methods, and major results of the 1980 round of estimates and projections. The tables in the annex provide, for regions and countries, the total population and annual rate of growth, crude birth and death rates, gross reproduction rate, and life expectancy at birth for males, females, and both sexes combined for the period 1950-2025. In addition, because of their usefulness to social and economic planners, annual mid-year population figures are shown for the period 1975-1992.

Owing to the limitations of space, the presentation in this report of all the detailed tables of demographic indicators derived from the current projections is not practical. However, many of these results, including the population classified by sex and five-year age groups, are to be published in the near future by the Population

placed on computer magnetic tapes; and arrangements may be made, upon request, to send copies to interested Governments, agencies, and research workers at a nominal cost.

## I. METHODS AND ASSUMPTIONS

The methods used in producing the estimates and projections in the present report are similar to those that were used in previous assessments, particularly the most recent ones.<sup>3</sup> This assessment takes into account new data, studies, and national statistics that were available by the middle of 1980. It also differs from earlier reports in that the projection period, which was generally from 1950 to the year 2000, has been extended to the year 2025.

For the period from 1950 to 1975, demographic estimates were prepared on the basis of available data on total population, age and sex structure, and levels of fertility and mortality for different time periods. The data were evaluated and, if necessary, adjusted to ensure comparability among countries. When a first reliable census or survey was taken for a country after 1950, the population was projected backwards in order to obtain estimates back to 1950. Accordingly, for each country an adjusted age-sex structure for the base year 1975 has been obtained that is internally consistent and compatible with the country's recent levels of fertility, mortality, and migration.

As was stated earlier, the basic method of population projection used here is the component method. The first step in this method is the successive applications of age- and sex-specific survival rates to the base year population in order to calculate the number of survivors in each age-sex category at the end of each five-year period. The assumed schedule of age-sex survival rates is based on national life tables or model life tables<sup>4</sup> when reliable data are not available. However, it is known that the age patterns of mortality in many populations are quite different from those given in model life tables. Therefore, when a population had a set of reasonably reliable mor-

tality rates classified by age, such information was used along with the model life tables to derive the needed survival rates for the projections.

The second step is determining the number of births that will occur during the five-year period. Assumed age-specific fertility rates are applied to the corresponding number of females in the reproductive age groups to produce the total number of births. These births are distributed by sex according to an assumed sex-ratio at birth; then the number of survivors from these births at the end of each five-year period is calculated using survival probabilities.

Finally, the net number of migrants, i.e., immigrants minus emigrants, if any, is estimated and incorporated into the projected figures. The net migrants, classified by age and sex in the same manner as the base population data, are added to or subtracted from the projected age-sex distribution at the end of each five-year period.

The component method of projection was used for all countries with a population generally of about 300,000 or more as of 1975. For smaller countries, the projections were prepared for the total population only by applying assumed rates of growth.

Fertility assumptions take into consideration past and present fertility trends in each country. For countries with currently high fertility, it is generally assumed that (a) fertility will decline as economic and social development takes place; (b) existing or anticipated government policies and programmes as well as non-governmental activities aimed at such a goal will expedite the process of fertility decline; and (c) once the decline begins, it will begin slowly, gain momentum, and then slow down its speed again. For those countries with fertility levels near or below the replacement level, it is assumed that fertility will begin to converge to a replacement level starting from the end of this century.

With respect to mortality trends, a quinquennial gain of 2.5 years in the expectation of life at birth is assumed until that expectation reaches 55 years, followed by a slowdown of the gain thereafter. However, the assumed future quinquennial gains are lowered to 2 or 1.5 years, instead of 2.5, for some developing countries where recent evidence indicates a retardation of improvement in mortality levels. For those countries where life expectancy has already reached a high level, the maximum level of life expectancy at birth that could be attained is increased to 73.5 years for males and 80 years for females in accordance with recent statistical records in some developed countries.

Primarily owing to the difficulties of anticipating future patterns of international migration, the volume of net migration — if there is any significant amount at present — is assumed to diminish progressively with the passage of time unless there are strong indications that current levels will continue for a considerable time to come.

<sup>3</sup> Previous United Nations population estimates and projections are published in the following publications: "The past and future growth of world population — a long-range view", *Population Bulletin of the United Nations, No. 1 (December 1951)* (United Nations publication, Sales No. 1952.XIII.2), pp. 1-12; "The past and future population of the world and its continents" and "Framework for future population estimates, 1950-1980, by world regions", *Proceedings of the World Population Conference, 1954*, vol. <sup>4</sup> The model life tables prepared by Coale and Demeny were used, when appropriate, along with the model life tables of the United Nations. See Ansley J. Coale and Paul Demeny, *Regional Model Life Tables and Stable Populations* (Princeton, N.J., Princeton University Press, 1966); and *Manual III: Methods for Population Projections by Sex and Age* (United Nations publication, Sales No. 1956.XIII.3).

Although population estimates and projections presented in this report are shown mostly for each quinquennial year, annual mid-year estimates and projections which are consistent with the medium variant of the projections have been presented for the period from 1975 to 1992 for the total population only. An osculatory

interpolation formula, namely Beers's six-term ordinary formula, is used to interpolate the quinquennial figures.<sup>5</sup>

## II. RESULTS

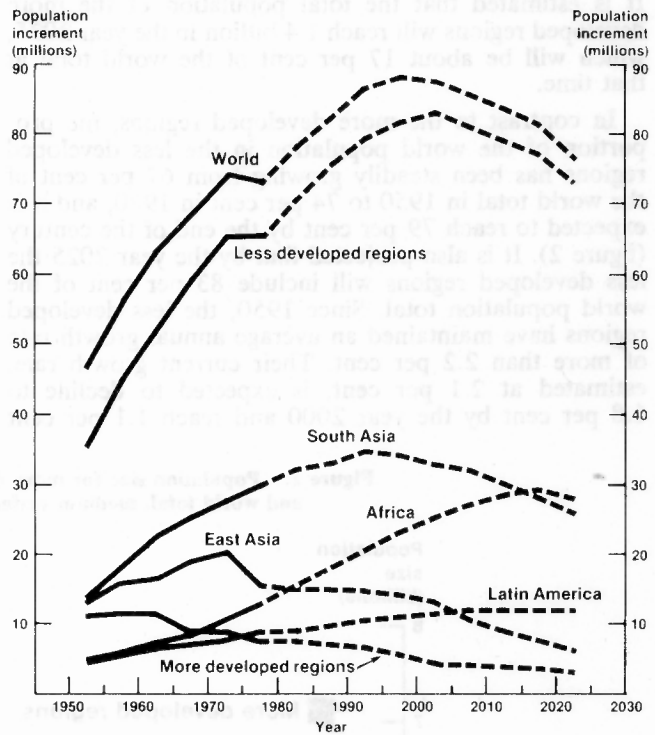

### A. POPULATION TRENDS

According to the 1980 estimates and projections, the total population of the world is approximately 4,432 million in 1980 with an annual rate of growth of 1.7 per cent. This rate appears to be consistent with the gradual declining trend of the growth rate that started around the middle of the 1960s when the total population of the world was growing at an estimated rate of 2 per cent annually. In the present projections (medium variant), it is assumed that the growth rate of the world population will be reduced to 1.5 per cent by the end of the present century and to 1 per cent by 2025. Accordingly, it is projected that the world population will increase to 6.1 billion in 2000 and 8.2 billion in 2025 (table 1).

Despite the apparent reduction in the rate of population growth in the 1970s and the future, the annual increment to the total world population has been generally increasing to the current level of about 75 million persons per year (figure 1). For the earliest period covered in the present report, that is from 1950 to 1955, the average annual increment in total world population was about 46.4 million, which is approximately 62 per cent of the current annual increment. The largest annual increment, 88.4 million persons, is expected to occur between 1995 and the year 2000. Thereafter, the annual addition of people to the world population will decrease and by the year 2025 the annual increment is expected to be again about 75 million persons.

The significance of the global population trends cannot be understood without recognition of the diversity in

the growth trends existing between the more and less developed regions. Today the more developed regions account for 1.13 billion people, or approximately one fourth of the world total, and are growing at an annual rate of 0.7 per cent. This relatively low annual increase will further decline to 0.44 per cent in 2000 and is projected to reach 0.24 per cent by 2025. In terms of absolute numbers, the annual increase of the more developed regions' population will be around 7.3 million from 1975 to 2000 and 3.6 million from 2000 to 2025, which is much lower than the average annual increase of 10.5 million during the period from 1950 to 1975 (figure 1). It is estimated that the total population of the more developed regions will reach 1.4 billion in the year 2025, which will be about 17 per cent of the world total at that time.

In contrast to the more developed regions, the proportion of the world population in the less developed regions has been steadily growing from 67 per cent of the world total in 1950 to 74 per cent in 1980, and it is expected to reach 79 per cent by the end of the century (figure 2). It is also projected that by the year 2025 the less developed regions will include 83 per cent of the world population total. Since 1950, the less developed regions have maintained an average annual growth rate of more than 2.2 per cent. Their current growth rate, estimated at 2.1 per cent, is expected to decline to 1.8 per cent by the year 2000 and reach 1.1 per cent

by 2025. In terms of size, however, the proportional contribution of the less developed regions to the population size of the world is increasing. Whereas in the period from 1950 to 1955 about 75 per cent of the world population increase occurred in less developed countries, the contribution of the less developed countries by the year 2025 will be about 95 per cent of the world total increment. From a population size of around 2.1 billion in 1960 the less developed regions have grown to 3.3 billion in 1980 and are projected to be about 4.9 billion by the end of the century and 6.9 billion in 2025.

Of the world's eight major areas, the highest average annual rate of population growth today is in Africa, 2.9 per cent (table 2). Africa's growth rate was 2.1 per cent in 1950, reached 2.9 per cent in 1980, and is estimated to grow about 3 per cent annually until the end of the century. Thereafter, the growth rate is expected to decline to 1.9 per cent by 2025. Accordingly, it is anticipated that the population of Africa, which is currently about 470 million, will increase to 853 million in the year 2000 and 1,542 million in 2025.

Despite the reduction in the growth rate of South Asia from 2.2 per cent in 1975-1980 to 1.7 per cent in 1995-2000, and 1 per cent in 2020-2025, in absolute terms its growth will be the largest in the world during the next 45 years (table 2). Because of its sheer size combined with a relatively high rate of growth, South Asia will contribute more than 32 million people a year dur-

ing the final 20 years of this century and about 30 million per annum from 2000 to 2025, which will constitute 39.3 and 35.3 per cent, respectively, of the total annual population increase in the world during these two periods. The total population of South Asia is projected to be 2.1 billion in 2000 and 2.8 billion in 2025, which is about twice its current size.

According to the 1980 revised population estimates, the average annual growth rate of East Asia fell from 2.02 per cent in 1970-1975 to 1.4 per cent in 1975-1980. This is the largest decline estimated for any major region or area of the world for this period. Since nearly 85 per cent of this region's population is accounted for by China, demographic trends in China virtually dictate the trends for the region as a whole. The sharp decline in the population growth rate of China is expected to continue, reaching 1.05 per cent in the year 2000 and steadily declining to approximately 0.39 per cent by 2025. From these rates, it is anticipated that the population of East Asia will increase to 1.4 billion by the year 2000 and 1.7 billion by 2025.

The Northern American region is composed principally of Canada and the United States of America, with the latter containing about 90 per cent of the total population, which in 1980 was 248 million. The combined growth rate for the two countries was 0.95 in 1975-1980. It is projected to remain at or slightly above this level through 1995, then to decline to 0.42 per cent in 2020-2025 when it will be among the lowest regional growth rates. By that time, the population of this region is expected to increase to 299 million, which is approximately a 21 per cent gain over its current size.

Europe is clearly the slowest growing region of the world. Its rate of growth has steadily declined from 0.79 per cent in 1950-1955 to 0.4 per cent in 1975-1980. It is expected to reach 0.24 per cent in 1995-2000 and finally estimated to have virtually zero growth by 2025 (table 5). Accordingly, Europe's total population of 484 million in 1980 is expected to grow to 512 million in 2000, and 522 million in 2025.

In the Oceania region, 79 per cent of which is made up of Australia and New Zealand, the growth rate is also steadily decreasing. For example, the growth rate declined from 2.25 per cent in 1950-1955 to 1.47 in 1975-1980; the rate is expected to continue to decline and to reach approximately 1 per cent by the year 2000 and 0.6 per cent by 2025. If these growth rates turn out to be correct, the total current population of Oceania, which is 22.8 million, will be about 36.1 million in 2025.

Demographic characteristics of the Union of Soviet Socialist Republics are very similar to those of the Northern American region. In 1980 the total population of the country was 265 million and growing at 0.93 per cent per annum; it is estimated that, by the end of the century, the population will increase to 310 million. Furthermore, by the year 2025 the annual rate of growth is projected to slow down to 0.5 per cent and the population is expected to reach 355 million.

As a result of the differential growth rates among the eight major areas of the world, the percentage distribution of the world population has undergone noteworthy changes since 1950 (table 3). Whereas Africa, Latin America, and South Asia have increased their proportions by several percentage points, the proportions for Northern America, Europe, and the Soviet Union have decreased by between 1 and 4 per cent; the percentages for East Asia and Oceania, however, have remained virtually unchanged. These trends are expected to continue throughout the last two decades of the present century and into the first quarter of the twenty-first century, except that the proportion in East Asia will decline sharply, from 26.5 per cent in 1980 to 24 per cent in 2000, and to 20.9 per cent in the year 2025.

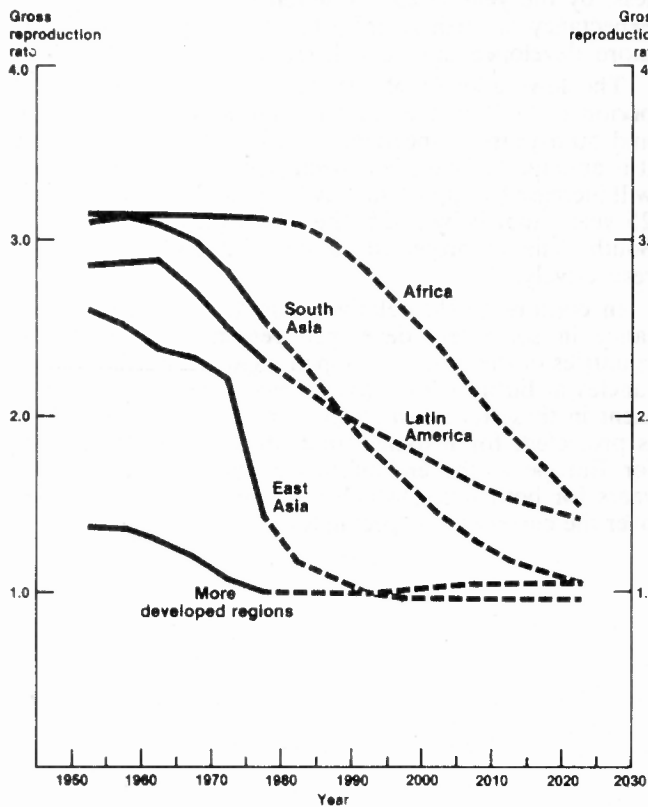

## B. FERTILITY TRENDS

For the world as a whole, the new estimates and projections indicate a slow but steady decline of the crude birth rate from 36.3 per 1,000 in 1950-1955 to 28.5 in 1975-1980, then to 23.9 in 1995-2000, and finally to 17.9 in 2020-2025 (table 4). In terms of the gross reproduction rate (a measure of the reproduction of a

population expressed as an average number of daughters that would be born to a cohort of women during their reproductive ages, assuming no mortality and a fixed schedule of age-specific fertility rates) the world would experience a fertility decline from 1.92 in 1975-1980 to 1.46 in 1995-2000 and 1.15 in 2020-2025. Since 1950, it is estimated that the gross reproduction rate increased, reached its peak of 2.21 in 1970-1975, and has been steadily declining.

The decline in fertility during the latter part of this century would accrue mainly in the less developed regions (figure 3). For example, whereas the gross repro-

duction rate for the more developed regions would remain essentially unchanged between 1980 and 2000, it would decline from 2.15 to 1.42 in the less developed regions. In addition, by 2025 the gross reproduction rates for the more developed and less developed regions are expected to be relatively close to each other — 1.04 and 1.17, respectively.

Of the eight major geographic regions, Africa, South Asia, and Latin America had the highest gross reproduction rates in 1975-1980 — 3.13, 2.57, and 2.24, respectively. In contrast, gross reproduction rates below 1 are found in Northern America, 0.94, and Europe, 0.96. By 2025, only Africa and Latin America are expected to have gross reproduction rates significantly greater than replacement, that is, 1.49 and 1.35, respectively.

### C. MORTALITY TRENDS

During the last several decades trends in mortality throughout the world have covered a very wide range. At the global level, the world enjoyed an appreciable reduction in mortality and increase in life expectancy at birth from 47.1 years in 1950-1955 to 57.5 years in 1975-1980 (table 5). Life expectancy at birth is projected to further increase to 63.9 in 1995-2000 and 70.4 in 2020-2025. As is apparent from these figures, the pace of increase in life expectancy is expected to decline from 11.3 years of gain in the period from 1950 to 1980 to 6.7 between 1980 and 2000.

As was the case with fertility, the largest gains in mortality reduction have accrued among the less developed regions (figure 4). For example, between 1950 and 1980 the gain in life expectancy at birth for the less developed regions was 1.36 years as compared to 7 years for the more developed regions. It is anticipated that between 1980 and 2000 the major improvements in life expectancy will continue to occur in the less developed regions; more specifically, whereas the more developed

regions will gain 1.8 years in their life expectancy at birth the less developed regions will gain 7.2 years. Nevertheless, by the year 2025 a difference of 5.8 years in life expectancy at birth is projected to remain between the more developed and less developed regions.

The lowest levels of life expectancy at birth in the period 1975-1980 are in Africa and South Asia — 48.6 and 50.6 years, respectively. During the next 20 years, it is anticipated that life expectancy in these two regions will increase by approximately 9 years and after a further 25 years, that is by 2025, life expectancy in Africa and South Asia is projected to be 67.2 and 68.6 years, respectively.

In contrast to the relatively low levels of life expectancy in some less developed regions, nearly all the countries of the more developed regions have life expectancies at birth of 70 years or more. Any future increment in these levels would naturally be rather small. It is projected, for instance, that life expectancy at birth for Europe at the end of this century would be 74.5 years for both sexes, which is an increase of 2.1 years over the current life expectancy.
