

Commission on the Limits of the Continental Shelf

SUMMARY OF THE RECOMMENDATIONS OF THE COMMISSION ON THE LIMITS OF THE CONTINENTAL SHELF IN REGARD TO THE JOINT SUBMISSION MADE BY MAURITIUS AND SEYCHELLES CONCERNING THE MASCARENE PLATEAU REGION ON 1 DECEMBER 2008¹

Recommendations prepared by the Subcommittee established for the consideration
of the Joint Submission made by Mauritius and Seychelles

Adopted by the Subcommittee on 25 March 2011

Adopted by the Commission on 30 March 2011

¹ The aim of this Summary is to provide information which is not of confidential or proprietary nature in order to facilitate the function of the Secretary-General of the United Nations in accordance with CLCS/40/Rev.1, Annex III, Section V, Rule 11.3. This Summary is based on excerpts of the Recommendations and may refer to material not necessarily included either in the full Recommendations or this Summary.

LIST OF FIGURES

Figure 1. Locality maps showing the location and setting of the Mascarene Plateau region of the Joint Submission. The figure shows: **A.** The location of the Mascarene Plateau within the western Indian Ocean (based on an image derived from the ETOPO1 GRID); **B.** The regional tectonic setting (modified from Courtillot et al., 1986); and **C.** The main geomorphological features in the region (after Figure 2.1 of the Main Body).4

Figure 2. Map indicating the basis of the entitlement of the two coastal States to delineate the outer limits of the continental shelf beyond 200 M in the Mascarene Plateau region (modified from Figure 3.3_R of the Addendum to the Main Body). The map shows the locations and numbers of the relevant FOS points (yellow stars) as originally submitted and revised in the Addendum; the corresponding 60 M arcs (magenta) and the resulting 60 M distance formula line with its bridging lines (dark brown); the 200 M limits of Mauritius (red) and Seychelles (green line); and the agreed (treaty) boundary delimiting the respective exclusive economic zones of the two coastal States (purple line). Relevant morphological features and islands are labeled. 7

Figure 3. A. Bathymetric map of the Mascarene Plateau illustrating the submerged prolongation (continental margin) of the landmasses of Albatross Island (St. Brandon Group) on the Nazareth Bank (Mauritius), and Frégate Island on the Seychelles Bank (Seychelles), as defined by the FOS. The envelope of the FOS is indicated by the relevant (yellow) and supplementary (red and blue) FOS points. The supplementary FOS points are based on NGDC single beam bathymetric profiles (red) and on profiles extracted from ETOPO1 (blue). (Modified from Figure 2.32_R of the Addendum). **B.** 3D bathymetric view of the Mascarene Plateau from the north showing that the feature is composed of flat-topped banks with steep upper slopes that surmount a broad lower-slope pedestal with lower gradients (after Figure 3.1_R of the Addendum).8

Figure 4. A. 3D bathymetric image of the Mascarene Plateau region prepared by the Subcommittee using the global SRMT30 bathymetric grid in Fledermaus. It shows the morphological characteristics of the Plateau and its lower-slope pedestal and the very different characteristics of the deep ocean floor with its seafloor spreading fabric. Seafloor deeper than 3800 m has been shaded white and 100 m contours are shown. Also shown are the FOS points as originally submitted in the Addendum to the Joint Submission and revised during the period of examination by the Subcommittee (green); the agreed FOS points as contained in Table 1 of Annex I to these Recommendations (dark blue); and original FOS points MM-11 and MM-12 (light blue). **B.** 2D bathymetric image of the Mascarene Plateau region prepared by the Subcommittee using the "Gradient Band" analysis tool of Geocap and the SRMT30 bathymetric grid. It highlights the consistency of the agreed FOS locations with respect to major regional changes in seafloor gradient. FOS locations are coloured as in A above. It also shows the revised outer limit of the continental shelf (OLCS; black line), the 200 M limits of the two coastal States (green line) and the agreed (treaty) boundary delimiting the respective exclusive economic zones of the two coastal States (purple line).11

Figure 5. A. 3D bathymetric image of part of the western margin of the Mascarene Plateau prepared by the Subcommittee using the global SRMT30 bathymetric grid¹⁵ in Geocap. It shows the morphological characteristics of this part of the Plateau and its lower-slope pedestal as well as the locations of the bathymetric data from the Nansen 2009 and Indian 2008 surveys submitted (SMS_DOC_SC_003_13_10_10) to support the location of new FOS points Nansen1, Nansen2 and IMB08_3 (dark blue) along the outer edge of the lower-slope terrace. Also shown are FOS points MM-11 and MM-12 (light blue) as originally submitted in the Addendum to the Joint Submission. **B.** 2D bathymetric image of the same part of the Plateau prepared by the Subcommittee using the "Gradient Band" analysis tool of Geocap and the SRMT30 bathymetric grid. It indicates that the new FOS points occur at a major regional change in seafloor gradient. FOS locations are coloured as in A above. Also shown are the Nansen 2009 (black) and Indian 2008 (white) tracks used to determine the new FOS points; the 200 M limits of Mauritius (green line); and the 60 M distance formula arcs (red) constructed from the new FOS points indicating overlap of the outer edge of the continental margin with the 200 M limits of Mauritius.12

Figure 6. Map showing the final FOS points used to delineate the outer edge of the continental margin of the two coastal States beyond 200 M from the baselines from which the breadths of their territorial seas are measured in the eastern area of the Mascarene Plateau region. It also shows the overlap of the outer edge of the continental margin with the 200 M limits of Mauritius in the western area (modified from Fig4_1_RR.jpg as submitted by the two coastal States on 21 March 2011).13

Figure 7. Map showing the line and associated fixed points delineating the outer edge of the continental margin of the two coastal States beyond 200 M from the baselines from which the breadths of their territorial seas are measured in the Mascarene Plateau region. The map also shows the final agreed FOS points used to establish the outer edge of the

continental margin (submitted by the two coastal States as Fig4_2_RR. on 21 March 2011). Coordinates of the fixed points delineating the outer edge of the continental margin are given in Table 2, Annex I.16

Figure 8. Map showing the distance (orange) and depth (blue) constraint lines submitted by the two coastal States in the Mascarene Plateau region. The map also shows the relevant FOS points and associated 60 M arcs, and straight bridging lines used to delineate the outer edge of the continental margin (submitted by the two coastal States as Fig4_4_RR on 21 March 2011).18

Figure 9. Map showing the application of the combination of the distance (orange) and depth (blue) constraint lines to delineate the fixed points that establish the outer limits of the continental shelf in the Mascarene Plateau region. The map also shows the relevant FOS points (red stars) and the line (brown) delineating the outer edge of the continental margin where it extends beyond the outer limits of the continental shelf (submitted by the two coastal States as CM_constraints_2011_1 on 21 March 2011). 20

Figure 10. Map showing the outer limits of the continental shelf of the two coastal States beyond 200 M from the baselines from which the breadths of their territorial seas are measured in the Mascarene Plateau region. Coordinates of the fixed points delineating the outer limit of the continental shelf are given in Table 3, Annex I (submitted by the two coastal States as Fig5_2_RR on 21 March 2011).23

GENERAL LIST OF TERMS AND ABBREVIATIONS

Acronyms	
DOALOS	Division for Ocean Affairs and Law of the Sea, Office of Legal Affairs
FOS	Foot of the continental slope
Abbreviated Terms	
M	Nautical mile
200 M Limit	The line at 200 M from the baselines from which the breadth of the territorial sea is measured
FOS	Foot of the continental slope
FOS Points	Foot of the continental slope points
Critical FOS Points	Foot of the continental slope points that generate fixed formula points delineating the line that establishes the outer limits of the continental shelf
Relevant FOS point	Foot of the continental slope points that generate fixed formula points delineating the outer edge of the continental margin that are necessary for establishing the outer limits of the continental shelf
60 M Formula Points	Points determined from the application of article 76, paragraph 4(a)(ii), of the Convention (also informally referred to as Hedberg points)
Sediment Thickness Formula Points	Points determined from the application of article 76, paragraph 4(a)(i), of the Convention (also informally referred to as Gardiner points)
Depth Constraint	The constraint line constructed at 100 M from the 2500 metre isobaths in accordance with article 76, paragraphs 5 and 6, of the Convention
Distance Constraint	The constraint line constructed at 350 M from the baselines from which the breadth of the territorial sea is measured in accordance with article 76, paragraphs 5 and 6, of the Convention
The Guidelines	The Scientific and Technical Guidelines of the Commission (CLCS/11 and CLCS/11/Add.1)
The Commission	The Commission on the Limits of the Continental Shelf
The Convention	The United Nations Convention on the Law of the Sea of 10 December 1982
The Rules of Procedure	The Rules of Procedure of the Commission (CLCS/40/Rev.1)
The Secretary-General	The Secretary-General of the United Nations
Use of Terms	
Determine	the foot of the continental slope
Delineate	the outer edge of the continental margin (in terms of construction of the outer edge of the continental margin by establishing and connecting fixed points)
Delineate	the outer limits of the continental shelf (in terms of construction of the outer limits of the continental shelf by establishing and connecting fixed points)
Establish	the outer edge of the continental margin (in terms of following procedure in the convention for submitting the outer edge of the continental margin as basis for the outer limits of the continental shelf)
Establish	the outer limits of the continental shelf (in terms of following procedure in the convention including the submission of the outer limits of the continental shelf)

(page left intentionally blank)

I. INTRODUCTION

- 1 On 1 December 2008, in accordance with article 76, paragraph 8, of the United Nations Convention on the Law of the Sea of 10 December 1982, the Republic of Mauritius and the Republic of Seychelles jointly submitted to the Commission on the Limits of the Continental Shelf, through the Secretary-General of the United Nations, information on the limits of their continental shelf beyond 200 M from the baselines from which the breadths of their territorial seas are measured.
- 2 The presentation of the Joint Submission was made to the plenary of the twenty-third session on 26 March 2009. The Commission decided that, as provided for in article 5 of Annex II to the Convention and in rule 42 of the Rules of Procedure, the Joint Submission would be addressed through the establishment of a subcommission. The Commission, however, did not establish the subcommission for the consideration of the Joint Submission at the twenty-third session.¹ At the twenty-fourth session, the Commission decided that a subcommission to consider the Joint Submission would not be formed until two of the existing subcommissions² had submitted their recommendations to the Commission.³
- 3 On 12 March 2010, the two coastal States revised the original Joint Submission by submitting an “Addendum to Main Body of the Joint Submission to the Commission on the Limits of the Continental Shelf” (SMS-MB-DOC_Addendum - hereinafter referred to as “Addendum”) and a revised Executive Summary (SMS-ES-DOC_Rev).
- 4 At the twenty-fifth session, the Commission proceeded with establishing a subcommission to examine the Joint Submission in accordance with the established procedure.⁴
- 5 The Subcommission carried out its examination of the Joint Submission during the following sessions: twenty-fifth, twenty-sixth, resumed twenty-sixth and twenty-seventh. The Subcommission adopted its Recommendations on 25 March 2011, and submitted them to the Commission on 28 March 2011 for consideration and approval by the Commission.
- 6 On 29 March 2011, the Subcommission presented its Recommendations to the Commission and the Delegations made a presentation to the Commission in accordance with paragraph 52 and paragraph 15 of Annex III of the Rules of Procedure of the Commission.
- 7 The Commission prepared these Recommendations, which were adopted on 30 March 2011, taking into consideration the internal procedures and the methodology outlined in the following documents of the Commission: the Rules of Procedure; the Scientific and Technical Guidelines and article 6 of Annex II to the Convention.

¹ See CLCS/62, paragraphs 60-66.

² Namely, the Subcommissions which had been established to examine the Submissions made, respectively, by Barbados; the United Kingdom of Great Britain and Northern Ireland in respect of Ascension Island; Indonesia; and Japan.

³ See CLCS/64, paragraph 30.

⁴ See CLCS/42, paragraphs 19-20.

- 8 The Commission makes these Recommendations to Mauritius and Seychelles in fulfillment of its mandate as contained in article 76, paragraph 8, and articles 3 and 5 of Annex II to the Convention.
- 9 The Commission makes its recommendations recognising that the outer limits of the continental shelf as established by a coastal State on the basis of its recommendations shall be final and binding according to article 76, paragraph 8, of the Convention.

II. CONTENTS OF THE JOINT SUBMISSION

A. Original Joint Submission

- 10 The original Joint Submission received on 1 December 2008 contained: an Executive Summary; a Main Body which is the analytical and descriptive part (hereinafter referred to as “Main Body”); and Scientific and Technical Data.

B. Communications and additional material

- 11 The Delegations submitted an Addendum dated 12 March 2010, which revised the Joint Submission. Moreover, during the course of the examination of the Joint Submission, the Delegations submitted further material, in response to questions, requests for clarification and written preliminary considerations of the Subcommission.

III. GENERAL PRINCIPLES ON WHICH THESE RECOMMENDATIONS ARE BASED

- 12 The recommendations of the Commission are based on the scientific and technical data and other material provided by the two coastal States in relation to the implementation of article 76 of the Convention. The recommendations of the Commission only deal with issues related to article 76 and Annex II to the Convention and are without prejudice to matters relating to delimitation between States, or application of other parts of the Convention or any other treaties.

IV. RECOMMENDATIONS

- 13 The Joint Submission of Mauritius and Seychelles of 1 December 2008 relates to an area referred to by the two coastal States as the Mascarene Plateau region (Figure 1).

1. Description of the Mascarene Plateau region

- 14 The Mascarene Plateau region is located in the southwestern part of the Indian Ocean to the northeast of Madagascar. It is dominated by the Mascarene Plateau, which is a large, arcuate, composite seafloor high that lies between 4° S and 21° S and constitutes the submerged prolongation of the land masses of the two coastal States, Seychelles to the north and Mauritius to the south.
- 15 The Plateau extends north-south for over 2300 km from the granitic islands of the Seychelles that surmount Seychelles Bank, on a south-easterly trend through the Correira Bank Rise, to Saya de Malha Bank (that includes Ritchie Bank), and then on a south-south-westerly trend through the Nazareth Bank and the Cargados-Carajos Bank, with its surmounting islands of the St. Brandon Group (Cargados-Carajos Shoals), to the main island of Mauritius.

- 16 The understanding of the Commission, based on the data and material contained in the Joint Submission, is that the geological evolution of the Mascarene Plateau involved (i) several episodes of rifting and break-up of the Gondwana super-continent since the Jurassic; (ii) Large Igneous Province (LIP) magmatism associated with the emplacement of the Deccan flood basalts in the Late Cretaceous; (iii) further magmatism associated with the southward path of the Deccan-Réunion hotspot, and, finally, (iv) significant Tertiary carbonate platform development. All these events and processes contributed to the formation of the large, elongated, mid-ocean seafloor high that is now the Mascarene Plateau with its rectilinear margins, and deep, broad, low-gradient pedestal surmounted by narrower, steep-sided, flat-topped carbonate platforms.

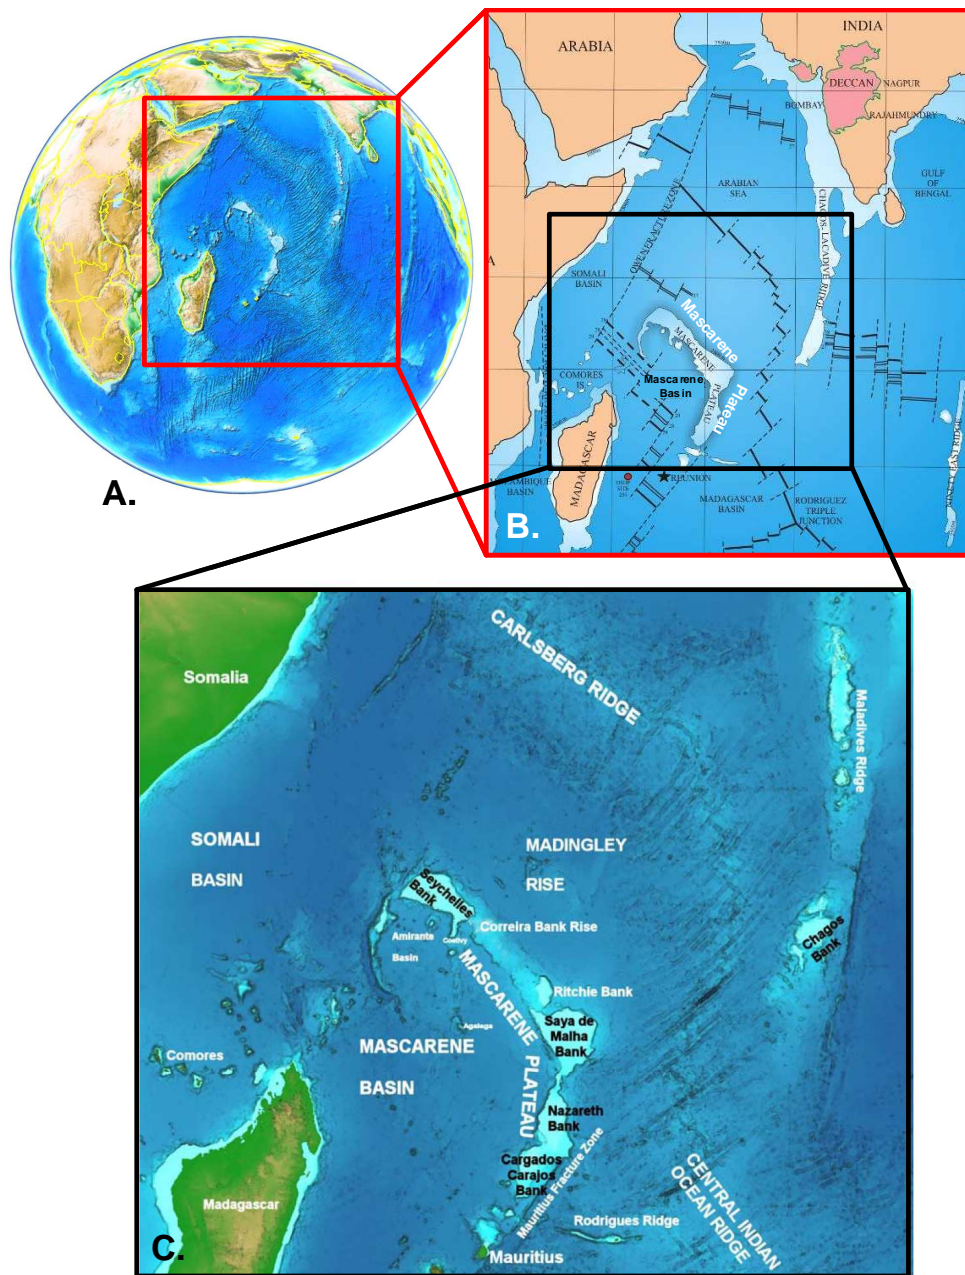

Figure 1. Locality maps showing the location and setting of the Mascarene Plateau region of the Joint Submission. The figure shows: **A.** The location of the Mascarene Plateau within the western Indian Ocean (based on an image derived from the ETOPO1 GRID⁵); **B.** The regional tectonic setting modified (from Courtillot et al., 1986)⁶; and **C.** The main geomorphological features in the region (after Figure 2.1 of the Main Body).

⁵ Amante, C. and Eakins, B. W., 2009 *ETOPO1 1 Arc-Minute Global Relief Model: Procedures, Data Sources and Analysis*. NOAA Technical Memorandum NESDIS NGDC-24.

⁶ Courtillot, V., Besse, J., Vandamme, D., Montigny, R., Jaeger, J.-J. and Capetta, H., 1986. *Deccan flood basalts at the Cretaceous/Tertiary boundary?* Earth Planetary Science Letters, 80, 361-374.

- 17 The Subcommittee views the Mascarene Plateau, from both a morphological and geological perspective, as being a complex and composite seafloor high.

2. Notes verbales submitted by other States

- 18 The Commission received no notes verbales from other States in relation to the Joint Submission.

3. Submerged prolongation of the landmass and entitlement to the continental shelf beyond 200 M

- 19 The outer edge of the continental margin, established from the FOS points in the Mascarene Plateau region by applying the provisions of article 76, paragraph 4, of the Convention extends beyond the 200 M limits of the two coastal States. On this basis, the Commission recognises the legal entitlement of the two coastal States to delineate the outer limits of their continental shelf beyond their 200 M limits in this region (Figure 2).

4. The determination of the foot of the continental slope

- 20 The FOS should be established in accordance with article 76, paragraph 4(b), of the Convention.

4.1 Considerations

- 21 In the original Joint Submission of 1 December 2008, the two coastal States included fourteen relevant FOS points (Table 3.1 of the Main Body). This was revised to thirteen relevant FOS points (MM-1, MM-2, MM-3_R, MM-5, MM-6, MM-7, MM-8, MM-9, MM-11, MM-12, F2, Fsk and V1412) in the Addendum (Table 3.1_R of the Addendum) (Figure 2). All of these FOS points were determined using measured bathymetric data.
- 22 The two coastal States determined the base of the continental slope throughout the Mascarene Plateau region on the basis of morphological and bathymetric evidence supplemented by geological and geophysical data in accordance with paragraph 5.4.6 of the Guidelines. All FOS points were determined on the basis of the maximum change in gradient at the base of the continental slope criterion using the morphological approach, and, as stated in the Joint Submission, “[n]o foot of slope points have been determined on the basis of evidence to the contrary criterion” (paragraph 1.10.7, Main Body).
- 23 The Mascarene Plateau, from both the morphological and geological perspective, is a complex and composite seafloor high. The two coastal States describe the Plateau as “*an elongated seafloor high with an overall morphology of a row of flat-topped shallow banks sitting on an elongated pedestal rising about 2500 m above the general abyssal depths at 4000 m. These banks generally have very steep slopes down to the general depths of the pedestal (approximately 1500 m). The slopes of the pedestal constituting the lower parts of the continental slope are generally less steep, particularly on the eastern flank of the Saya de Malha Bank, where the pedestal widens significantly*” (paragraph 3.2.6, Main Body) (Figure 3B).

- 24 As mentioned by the two coastal States, there is no geomorphological or geological evidence for substantial continental rise development throughout the region in the sense of paragraphs 5.4.4, 6.2.1 and 8.1.7 of the Guidelines. This reflects the isolated, mid-ocean location of the Mascarene Plateau and its small island land masses, and resultant sediment starvation of its margins. Consequently, the two coastal States have generally located the base of the continental slope where the lower slope associated with the pedestal of the Plateau merges with the deep ocean floor (paragraphs 3.2.6 - 3.2.8 of the Main Body, and paragraphs 3.1 and 3.2 of the Addendum to the Main Body) in accordance with paragraphs 5.4.4, 5.4.5 and 5.4.6 of the Guidelines.
- 25 Parts of both the eastern and western continental margins of the Mascarene Plateau extend beyond the 200 M limits of the two coastal States. Therefore, for the purposes of these Recommendations, the following considerations on the FOS have been divided into two parts – an eastern part that is associated with the eastern margin of the Plateau and lies east of the Correira Bank Rise, the Saya de Malha Bank and the Nazareth Bank; and a small western part that is associated with the western margin of the Plateau and lies southwest of the Saya de Malha Bank and northwest of the Nazareth Bank (Figures 2 and 3A).
- 26 Table 3.1_R of the Addendum contains a total of thirteen FOS points as follows:
- (i) Eleven FOS points (MM-1, MM-2, MM-3_R, MM-5, MM-6, MM-7, MM-8, MM-9, F2, Fsk, and V1412) that are associated with the eastern margin of the Mascarene Plateau (Figures 2 and 3). Two of these FOS points (MM-9 and F2) do not generate formula points beyond the 200 M limits of the two coastal States; and
 - (ii) two FOS points (MM-11 and MM-12) that are associated with the western margin of the Mascarene Plateau (Figures 2 and 3), and were submitted by the two coastal States to demonstrate overlap with the 200 M limits of Mauritius of the outer edge of the continental margin established by applying the provisions of article 76, paragraph 4, of the Convention.
- 27 With respect to the eastern margin of the Mascarene Plateau, relevant FOS points were located, from north to south, at the base of the continental slope associated with the Correira Bank Rise (MM-1 and MM-2), the Saya de Malha Bank (MM-3_R, MM-5, MM-6, MM-7, MM-8, and MM-9, and the Nazareth Bank (Fsk, F2 and V1412). (Figure 2).

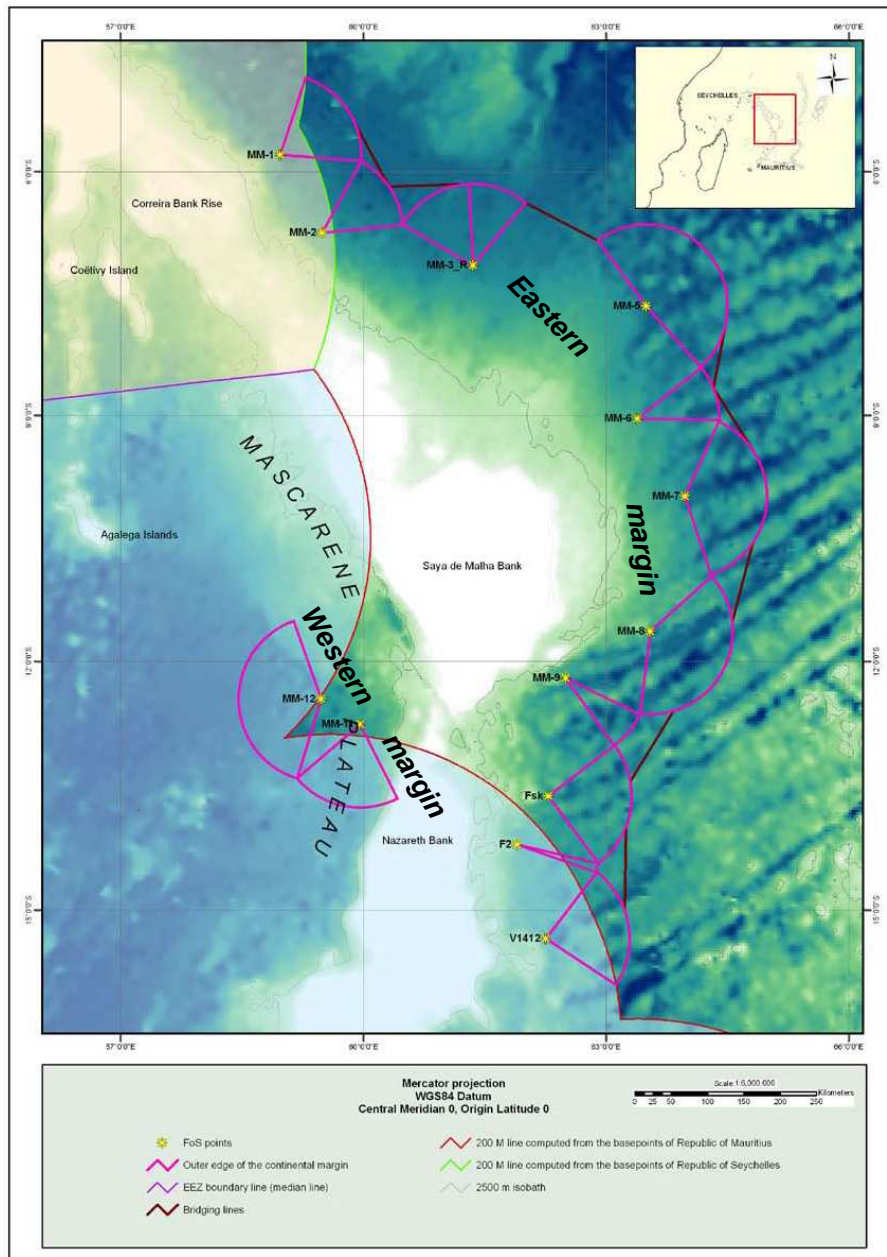

Figure 2. Map indicating the basis of the entitlement of the two coastal States to delineate the outer limits of the continental shelf beyond 200 M in the Mascarene Plateau region (modified from Figure 3.3_R of the Addendum to the Main Body). The map shows the locations and numbers of the relevant FOS points (yellow stars) as originally submitted and revised in the Addendum; the corresponding 60 M arcs (magenta) and the resulting 60 M distance formula line with its bridging lines (dark brown); the 200 M limits of Mauritius (red) and Seychelles (green line); and the agreed (treaty)⁷ delimiting the respective exclusive economic zones of the two coastal States (purple line). Relevant morphological features and islands are labeled.

⁷ Agreement between the Government of the Republic of Mauritius and the Government of the Republic of Seychelles on the Delimitation of the Exclusive Economic Zone between the two States, 29 July 2008.

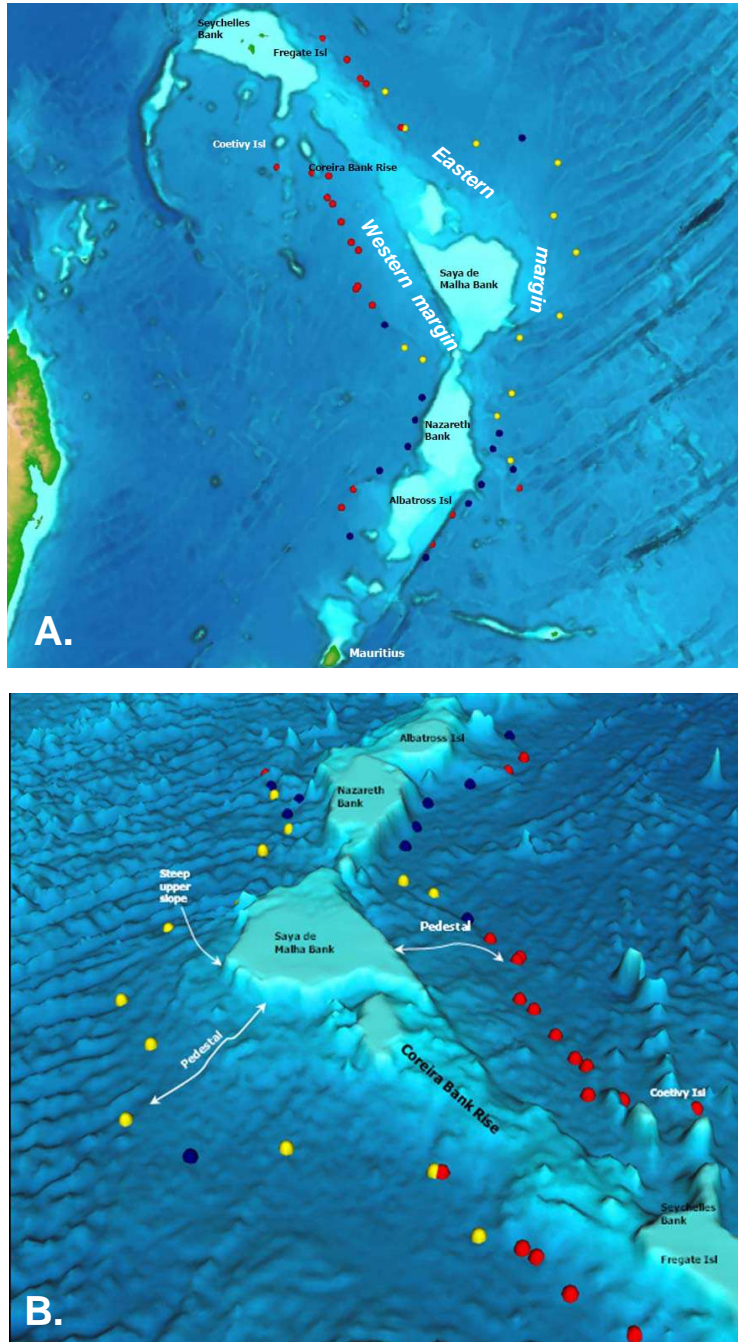

Figure 3. A. Bathymetric map of the Mascarene Plateau illustrating the submerged prolongation (continental margin) of the landmasses of Albatross Island (St. Brandon Group) on the Nazareth Bank (Mauritius), and Frégate Island on the Seychelles Bank (Seychelles), as defined by the FOS. The envelope of the FOS is indicated by the relevant (yellow) and supplementary (red and blue) FOS points. The supplementary FOS points are based on NGDC single beam bathymetric profiles (red) and on profiles extracted from ETOPO1 (blue). (Modified from Figure 2.32_R of the Addendum). **B.** 3D bathymetric view of the Mascarene Plateau from the north showing that the feature is composed of flat-topped banks with steep upper slopes that surmount a broad lower-slope pedestal with lower gradients (after Figure 3.1_R of the Addendum).

- 28 Along the northern part of the eastern margin of the Mascarene Plateau adjacent to the Correira Bank Rise and north of the Saya de Malha Bank, the two coastal States located the base of the continental slope where the relatively steep lower continental slope merges with the smooth deep ocean floor to the east. This zone can be readily identified on a morphological basis (Figure 4).
- 29 Along the central and southern parts of the eastern margin of the Mascarene Plateau to the north and east of Saya de Malha Bank, and east of the Nazareth Bank, the two coastal States located the base of the continental slope where the relatively rugged, lower-slope pedestal of the Mascarene Plateau merges with the deep ocean floor in the north, or the fracture zone topography of the Central Indian Ocean Ridge spreading system in the east (Figure 4). In the far south, to the east of the Saya de Malha and Nazareth banks, the lower slope is relatively steep and the base of the continental slope can be readily identified on a morphological basis. The Subcommittee noted that to the north and northeast of the Saya de Malha Bank, the location of the base of the continental slope is more difficult to determine because of: (i) a terraced and apparently eroded, low-gradient lower slope; (ii) the complicating effect of fracture zone morphology of different ages; and (iii) the often poor orientation of the single-beam bathymetric profiles with respect to the slope.
- 30 The Subcommittee agreed with the approach adopted by the two coastal States to identify the base of the continental slope along the eastern margin of the Mascarene Plateau, and, in general, with its location. In particular, it agreed with the locations of critical FOS points MM-2, MM-6, MM-7, MM-8, MM-9, Fsk, F2 and V1412, as originally submitted (Figures 2 and 6). However, the Subcommittee did not agree with the location of FOS points MM-1, MM-3_R, MM-5, as contained in the Addendum to the Main Body of the Joint Submission:
- (i) **MM 1:** the Subcommittee informed the two coastal States that it disagreed with the manner in which the Geocap analysis of the bathymetric profile that was used to determine this FOS point had been performed (SC_PRE_SMS_002_12_08_2010, SC_SMS_DOC_001_03_09_2010), and that in its view the FOS point should be located about 7 km to the west. The two coastal States subsequently agreed with this view and revised the location of the FOS point to MM-1_R in their document SMS_DOC_SC_003_13_10_10. The Subcommittee agreed with the location of revised FOS point MM-1_R (Figure 6).
 - (ii) **MM-3_R:** this FOS point lies to the north of the Saya de Malha Bank, where the location of the base of the low-gradient lower continental slope can be difficult to determine for the reasons set out in paragraph 29 above. The Subcommittee informed the two coastal States that this FOS point did not appear to lie at the base of the continental slope according to the criteria they had established as described in paragraph 29 above, and that it may have been located at level changes within the deep ocean floor (SC_PRE_SMS_002_12_08_2010, SC_SMS_DOC_001_03_09_2010). The Subcommittee also highlighted issues associated with the orientation of the single-beam bathymetric profile used to locate this FOS point and suggested that the two coastal States explore more landward possibilities associated with regionally significant inflection points in the gradient of the seafloor. The two coastal States agreed with the view of the Subcommittee and with its suggestion that new multibeam bathymetric data acquired by the Indian Navy in April 2010 and submitted by the two coastal States on 13 August 2010, be used to determine a revised location

for the FOS point. Following a series of interactions involving responses by the two coastal States (SMS_DOC_SC_003_13_10_10, SMS_DOC_SC_004_29_01_11, and “Presentation on replies to issues raised by the Subcommittee on 9th December, 2010” dated 15 March 2011) to the views of the Subcommittee (SC_PRE_SMS_002_12_08_2010, SC_SMS_DOC_001_03_09_2010, SC_PRE_SMS_004_09_12_2010), the two coastal States submitted a revised FOS point MM-3_RRR (SMS_DOC_SC_004_29_01_11). The Subcommittee agreed with the location of this revised FOS point (Figure 6).

- (iii) **MM-5:** this FOS point lies to the northeast of the Saya de Malha Bank, where the location of the base of the low-gradient lower continental slope can be difficult to determine for the reasons set out in paragraph 29 above. The Subcommittee informed the two coastal States that this FOS point does not appear to lie at the base of the continental slope according to the criteria they had established as described in paragraph 29 above, and that it may have been located at level changes within the deep ocean floor associated with fracture zones (SC_PRE_SMS_002_12_08_2010 and SC_SMS_DOC_001_03_09_2010). The Subcommittee also highlighted issues associated with critical gaps in the bathymetric data. The Subcommittee suggested that the two coastal States explore more landward possibilities for the FOS location associated with regionally significant inflection points in the gradient of the seafloor. The two coastal States agreed with the view of the Subcommittee, and revised the location landward of the critical data gap to new FOS point MM-5_R (SMS_DOC_SC_003_13_10_10). The Subcommittee agreed with the location of this revised FOS point (Figure 6).

- 31 With respect to the western margin of the Mascarene Plateau, relevant FOS points MM-11 and MM-12 are located in the area to the southwest of the Saya de Malha Bank and northwest of the Nazareth Bank (Figures 2, 3 and 5).
- 32 In this area of the western Mascarene Plateau the two coastal States located the base of the continental slope where the “*steeper, lower part of the slope merges with the deep ocean*” (paragraph 3.5.14.2, Main Body).
- 33 On the western margin of the northwesterly-trending northern part of the Mascarene Plateau, the pedestal underpinning the lower slope appears to broaden to the east of the Saya de Malha Bank and has the form of a lower-slope terrace (Figure 5). This terrace is associated with a relatively thin sediment layer that is conformable with the apparent basement. Furthermore the overall relief of the terrace generally mimics that of the apparent basement surface. In general, the western continental margin does not exhibit typical continental rise characteristics as indicated by: the sparse single channel seismic data in the north; the generally rugged seafloor of the deep margin, as imaged by single-beam and multibeam bathymetric data, that in places appears to be associated with major erosion by bottom currents; and the significant along-strike variability of the lower slope.

Figure 4. A. 3D bathymetric image of the Mascarene Plateau region prepared by the Subcommittee using the global SRMT30 bathymetric grid⁸ in Fledermaus. It shows the morphological characteristics of the Plateau and its lower-slope pedestal and the very different characteristics of the deep ocean floor with its seafloor spreading fabric. Seafloor deeper than 3800 m has been shaded white and 100 m contours are shown. Also shown are the FOS points as originally submitted in the Addendum to the Joint Submission and revised during the period of examination by the Subcommittee (green); the agreed FOS points as contained in Table 1 of Annex I to these Recommendations (dark blue); and original FOS points MM-11 and MM-12 (light blue). **B.** 2D bathymetric image of the Mascarene Plateau region prepared by the Subcommittee using the “Gradient Band” analysis tool of Geocap and the SRMT30 bathymetric grid. It highlights the consistency of the agreed FOS locations with respect to major regional changes in seafloor gradient. FOS locations are coloured as in A above. It also shows the revised outer limit of the continental shelf (OLCS; black line), the 200 M limits of the two coastal States (green line) and the agreed (treaty) boundary delimiting the respective exclusive economic zones of the two coastal States (purple line).

⁸ http://topex.ucsd.edu/WWW_html/srmt30_plus.html.

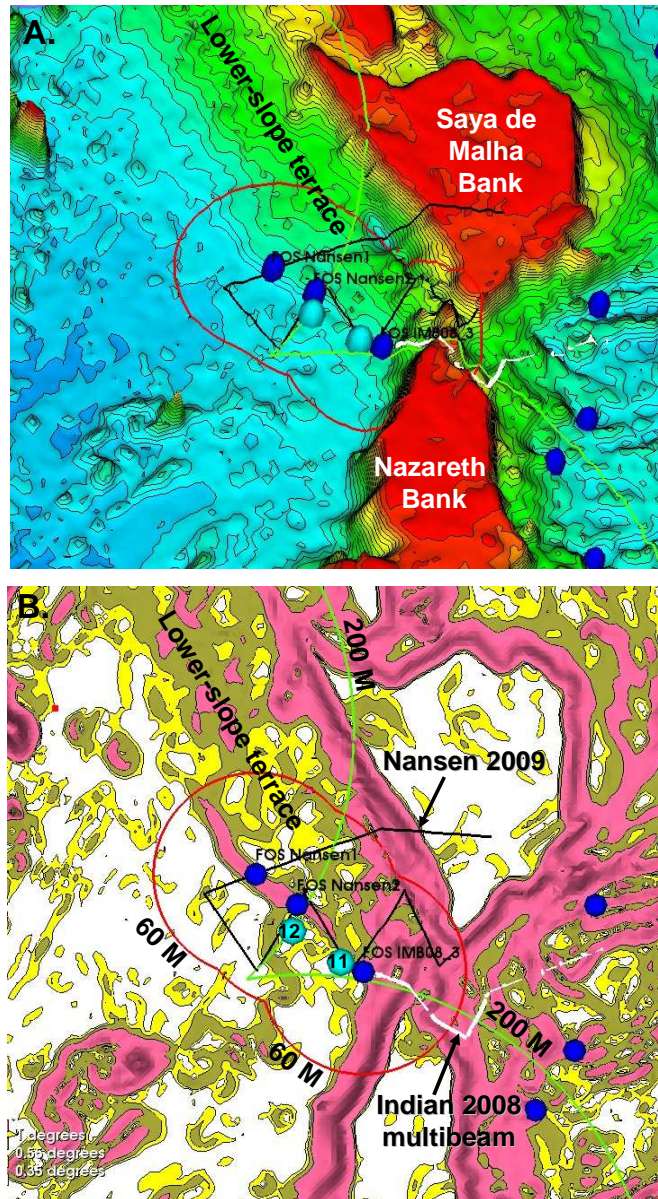

Figure 5. A. 3D bathymetric image of part of the western margin of the Mascarene Plateau prepared by the Subcommission using the global SRMT30 bathymetric grid¹⁵ in Geocap. It shows the morphological characteristics of this part of the Plateau and its lower-slope pedestal as well as the locations of the bathymetric data from the Nansen 2009 and Indian 2008 surveys submitted (SMS_DOC_SC_003_13_10_10) to support the location of new FOS points Nansen1, Nansen2 and IMB08_3 (dark blue) along the outer edge of the lower-slope terrace. Also shown are FOS points MM-11 and MM-12 (light blue) as originally submitted in the Addendum to the Joint Submission. **B.** 2D bathymetric image of the same part of the Plateau prepared by the Subcommission using the "Gradient Band" analysis tool of Geocap and the SRMT30 bathymetric grid. It indicates that the new FOS points occur at a major regional change in seafloor gradient. FOS locations are coloured as in A above. Also shown are the Nansen 2009 (black) and Indian 2008 (white) tracks used to determine the new FOS points; the 200 M limits of Mauritius (green line); and the 60 M distance formula arcs (red) constructed from the new FOS points indicating overlap of the outer edge of the continental margin with the 200 M limits of Mauritius.

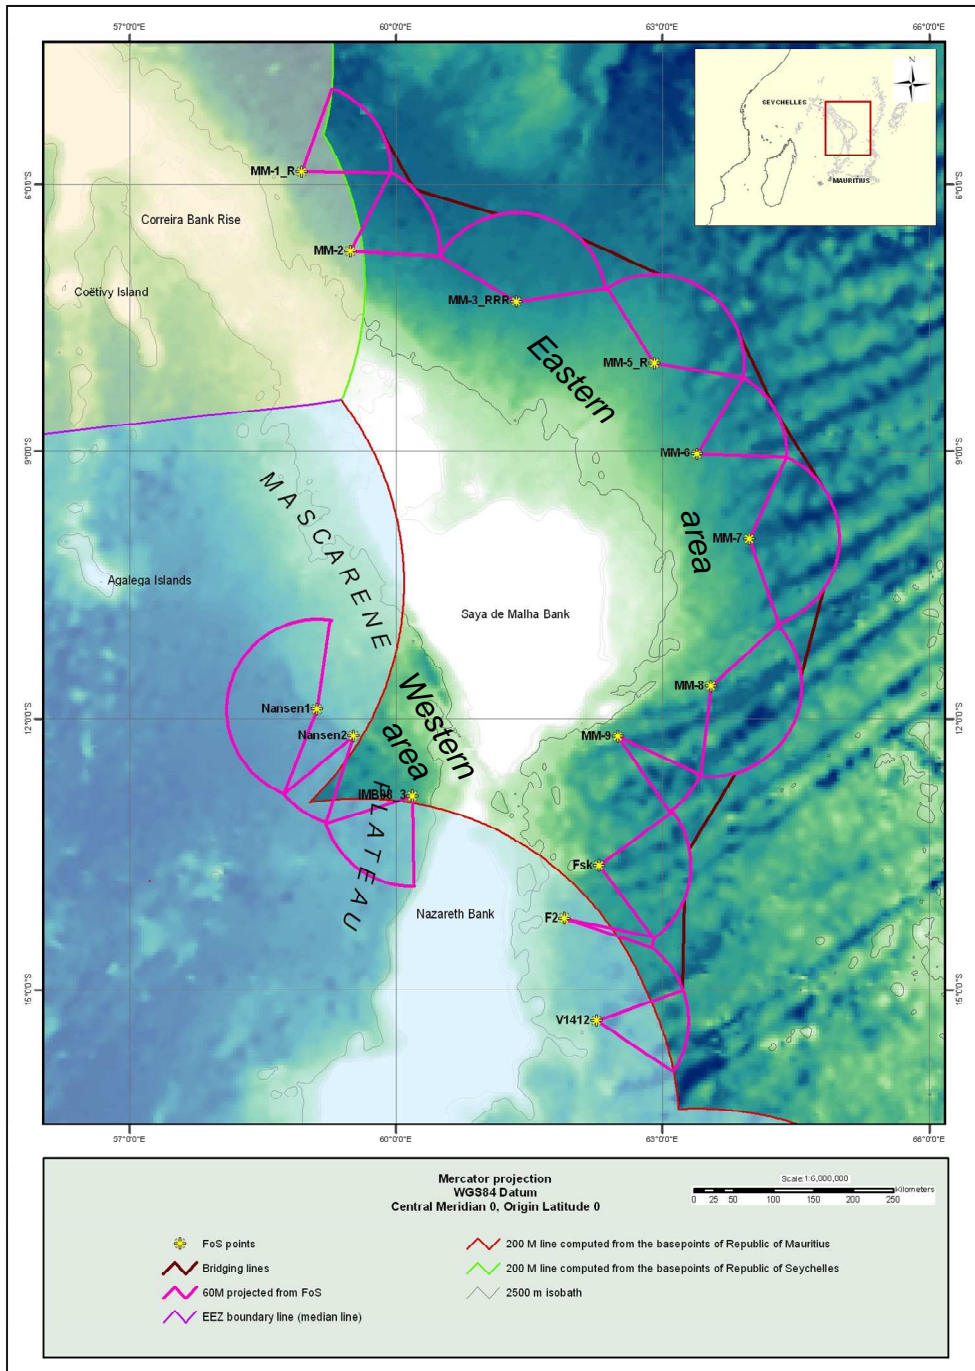

Figure 6. Map showing the final FOS points used to delineate the outer edge of the continental margin of the two coastal States beyond 200 M from the baselines from which the breadths of their territorial seas are measured in the eastern area of the Mascarene Plateau region. It also shows the overlap of the outer edge of the continental margin with the 200 M limits of Mauritius in the western area (modified from Fig4_1_RR.jpg as submitted by the two coastal States on 21 March 2011).

- 34 On the balance of the regional morphological, geological and geophysical evidence presented by the two coastal States, supported by information that the Subcommission had compiled itself from the international literature and public domain data portals, the Subcommission was of the view that that the 0.5°-0.6° gradient lower margin in the vicinity of FOS points MM-11 and MM-12 was more appropriately considered as continental slope rather than continental rise (SC_SMS_DOC_001_03_09_2010). However, in the absence of other supporting data such as seismic profiles, sub-bottom profiler data, substantial multi-beam bathymetry and backscatter data etc., the Subcommission was unable to confirm this view.
- 35 The two coastal States submitted Indian (*Investigator*) 2008 multibeam grids and newly obtained single-beam bathymetric data acquired by the vessel *Dr Fridtjof Nansen* in 2009 in support of their original base of continental slope zone on the western margin of the Mascarene Plateau in the vicinity of FOS points MM-11 and MM-12 (SMS_DOC_SC_003_13_10_10). Following examination of these new data sets, the Subcommission remained of the view that it could not verify FOS points MM-11 and MM-12 as valid FOS locations using only bathymetric data. However, the Subcommission indicated to the two coastal States that it could support an inner base of continental slope, which could be observed on the newly submitted Nansen 2009 and Indian 2008 data sets, on a morphological basis. This inner base of continental slope largely corresponded to the outer edge of the lower slope terrace. The Subcommission recognised that associated FOS points would also establish an outer edge of the continental margin that overlapped with the 200 M limits of Mauritius (SC_PRE_SMS_004_09_12_2010) (Figure 5).
- 36 Following the interactions described above, and notwithstanding their view that FOS points MM-11 and MM-12 were appropriately located, the two coastal States submitted three new FOS points (Nansen1, Nansen2 and IMB08_3) on the western margin of the Mascarene Plateau associated with the revised base of continental slope derived from the Nansen 2009 bathymetry data (SMS_DOC_SC_004_29_01_11). On the basis of the data and information contained in the Joint Submission, the additional data and material provided in the responses by the two coastal States, as well as other geological and geophysical data that it compiled itself from the international literature and public domain data portals, the Subcommission agreed with the way the locations of new FOS points Nansen1, Nansen2 and IMB08_3 were established (Figure 6).

4.2 Recommendations

- 37 Based on its consideration of the technical and scientific documentation contained in the Joint Submission and the additional information provided in documents referred to in paragraphs 30 to 36 above, the Commission concludes that, in the Mascarene Plateau region, the fourteen relevant FOS points listed in Table 1 of Annex I and shown in Figure 6, fulfill the requirements of article 76 of the Convention and Chapter 5 of the Guidelines. The Commission recommends that these FOS points should form the basis for the establishment of the outer edge of the continental margin in the Mascarene Plateau region. Additionally, the Commission recognises that the FOS points on the western margin of the Mascarene Plateau (Nansen1, Nansen2, IMB08_3) as listed in Table 1 of Annex I, establish an outer edge of the continental margin that overlaps to the west with the 200 M limits of Mauritius.

5. The establishment of the outer edge of the continental margin

- 38 In the Mascarene Plateau region there are two areas where the outer edge of the continental margin extends beyond the 200 M limits of the two coastal States: an eastern area associated with a large part of the eastern margin of the Mascarene Plateau; and a western area associated with a small part of the western margin of the Mascarene Plateau (Figures 2 and 6).
- 39 The outer edge of the continental margin of the two coastal States in the Mascarene Plateau region should, for the purposes of the Convention, be established in accordance with article 76, paragraphs 4 and 7, of the Convention.

5.1 The application of the 60 M distance formula

- 40 In the Mascarene Plateau region, the outer edge of the continental margin is based solely on fixed points on arcs constructed at a distance of not more than 60 M from FOS points on the both the eastern and western margins of the Mascarene Plateau, in accordance with the provision contained in article 76, paragraph 4(a)(ii), of the Convention.
- 41 The outer edge of the continental margin delineated in the eastern area of the Mascarene Plateau region is based on fixed points derived using the 60 M distance formula utilising FOS points along the eastern margin of the Plateau. The fixed points are CM 1 to CM 428 (Figures 6 and 7; Table 2, Annex I).
- 42 No fixed points are required to delineate the outer edge of the continental margin in the western area of the Mascarene Plateau region using the 60 M distance formula utilising FOS points along the western margin of the Plateau. In this area, the outer edge of the continental margin overlaps with the 200 M limits of Mauritius (Figure 6).
- 43 The Commission agrees with the way the fixed points delineating the outer edge of the continental margin have been established by the two coastal States in the eastern area of the Mascarene Plateau region. The Commission also agrees that in the western area of the Mascarene Plateau region the two coastal States have demonstrated the overlap of the outer edge of the continental margin with the 200 M limits of Mauritius.

5.2 Configuration of the Outer Edge of the Continental Margin

- 44 In the eastern area of the Mascarene Plateau region, the outer edge of the continental margin extends south-eastwards and north-westwards from the island land masses of Seychelles and Mauritius, respectively (Figures 3 and 7). It joins with the 200 M limits of Seychelles in the north and of Mauritius in the south.
- 45 In the western area of the Mascarene Plateau region, the outer edge of the continental margin of the two coastal States overlaps with the 200 M limits of Mauritius (Figure 6).

Figure 7. Map showing the line and associated fixed points delineating the outer edge of the continental margin of the two coastal States beyond 200 M from the baselines from which the breadths of their territorial seas are measured in the Mascarene Plateau region. The map also shows the final agreed FOS points used to establish the outer edge of the continental margin (submitted by the two coastal States as Fig4_2_RR. on 21 March 2011). Coordinates of the fixed points delineating the outer edge of the continental margin are given in Table 2, Annex I.

5.3 Recommendations

- 46 In the Mascarene Plateau region, the outer edge of the continental margin beyond 200 M is based on points on the 60 M arcs as described in section 5.1, in accordance with article 76, paragraph 7, of the Convention (Figure 7). The Commission recommends that these arcs and points are used as the basis for delineating the outer limits of the continental shelf in this region.

6. The delineation of the outer limits of the continental shelf

- 47 The outer limits of the continental shelf should be based on the established outer edge of the continental margin, taking into consideration the constraints contained in article 76, paragraphs 5 and 6, of the Convention.

6.1 The application of constraint criteria

- 48 The outer limits of the continental shelf cannot extend beyond the constraints as per the provisions contained in article 76, paragraph 5, of the Convention. Accordingly, the provision that the outer limits of the continental shelf may not exceed the distance constraint may be applied in all cases. Alternatively, the provision that the outer limits of the continental shelf may not exceed the depth constraint may be applied to those parts of the continental margin that are classified as natural components of that margin.
- 49 For the outer limits of the continental shelf in the Mascarene Plateau region, the two coastal States have invoked a combination of the distance and the depth constraints. In the northern and southern parts of the region, consideration of the outer limits of the continental shelf only involves an examination of the construction of the distance constraint line. However, in the central part, consideration of the outer limits also involves the application of depth constraint (Figures 8 and 9). In the view of the Commission, the application of the depth constraint requires the examination of whether the relevant seafloor highs in the central part of the Mascarene Plateau region may be considered as natural components of the continental margin of the land masses of the two coastal States.
- 50 The Commission notes that establishing the extent of the continental shelf beyond 200 M in the western area of the Mascarene Plateau region, where the outer edge of the continental margin of the two coastal States overlaps with the 200 M limits of Mauritius, also involves consideration of the constraint criteria (Figure 8).

6.1.1 The construction of the distance constraint line

- 51 The distance constraint line submitted by the two coastal States is constructed by arcs at 350 M distance from the baselines from which the breadths of the territorial seas of the two coastal States are measured (Figures 8). The Commission agrees with the procedure and methods applied by the two coastal States in the construction of this constraint line.

Figure 8. Map showing the distance (orange) and depth (blue) constraint lines submitted by the two coastal States in the Mascarene Plateau region. The map also shows the relevant FOS points and associated 60 M arcs, and straight bridging lines used to delineate the outer edge of the continental margin (submitted by the two coastal States as Fig4_4_RR on 21 March 2011).

6.1.2 The construction of the depth constraint line

- 52 For the two coastal States, the 2500 m isobaths on which the depth constraint line is based are mainly located along the eastern margin of the Mascarene Plateau. Along this margin, the most relevant isobaths are associated with the Saya de Malha Bank. The two coastal States have also determined a small number of 2500 m depth points along the western margin of the Mascarene Plateau near the junction of the Saya de Malha and Nazareth banks. Since both sets of measured 2500 m depth points used are associated with single continuous isobaths along both the eastern and western margins of the Plateau and lie landward of their respective FOS envelopes (Figure 8), they can be considered to conform to the general configuration of the continental margin.
- 53 Therefore, the application of these isobaths as a basis for the depth constraint is in accordance with paragraphs 4.4.1 and 4.4.2 of the Guidelines. The Commission recommends that the depth constraint lines for the continental margins of the two coastal States is constructed as submitted by the two coastal States (Figure 8).

6.1.3 Consideration and classification of submarine highs

- 54 The Joint Submission includes a substantial amount of scientific data and information concerning the morphology, geology, crustal structure, and related tectonics of the Mascarene Plateau. In examining the nature of the Mascarene Plateau, the Commission has also utilized international literature and information from public domain data portals.
- 55 The Mascarene Plateau is a morphologically continuous feature consisting of a series of banks and seafloor highs, namely the Seychelles Bank, the Correira Bank Rise, the Ritchie Bank, the Saya de Malha Bank, the Nazareth Bank and the Cargados-Carajos Bank. Evidence of modified continental crust beneath the Mascarene Plateau from Seychelles Bank to the Nazareth Bank can be derived from seismic refraction data, as well as from outcrops on some islands and drilling data from the northern part of the Mascarene Plateau. Drilling data also indicate that the continental basement was covered by Cenozoic volcanic rocks that were emplaced as a result of the Reunion hotspot activity, and were then overlain by a thick accumulation of late Cenozoic carbonate rocks. The above stratigraphy is consistent with the plate reconstruction model provided in the Joint Submission and with other plate reconstruction models published in international scientific journals. The Commission recognises that the Mascarene Plateau originated as a micro-continent between the Madagascar and Indian continents. It has a complex history involving several phases of rifting and continental break-up, subsequent hotspot volcanism and carbonate platform development. The Mascarene Plateau presently forms a continuous morphological feature with a composite geological structure that has developed through its evolution.
- 56 On the basis of its morphology and geology, as summarised in the previous paragraph, the Commission agrees that the Mascarene Plateau is a submarine elevation that is a natural component of the continental margin of the two coastal States in the sense of article 76, paragraph 6, of the Convention. Hence, to delineate the outer limits of the continental shelf the depth constraint may be applied to fixed points delineating the outer edge of the continental margin in accordance with article 76, paragraph 5, of the Convention.

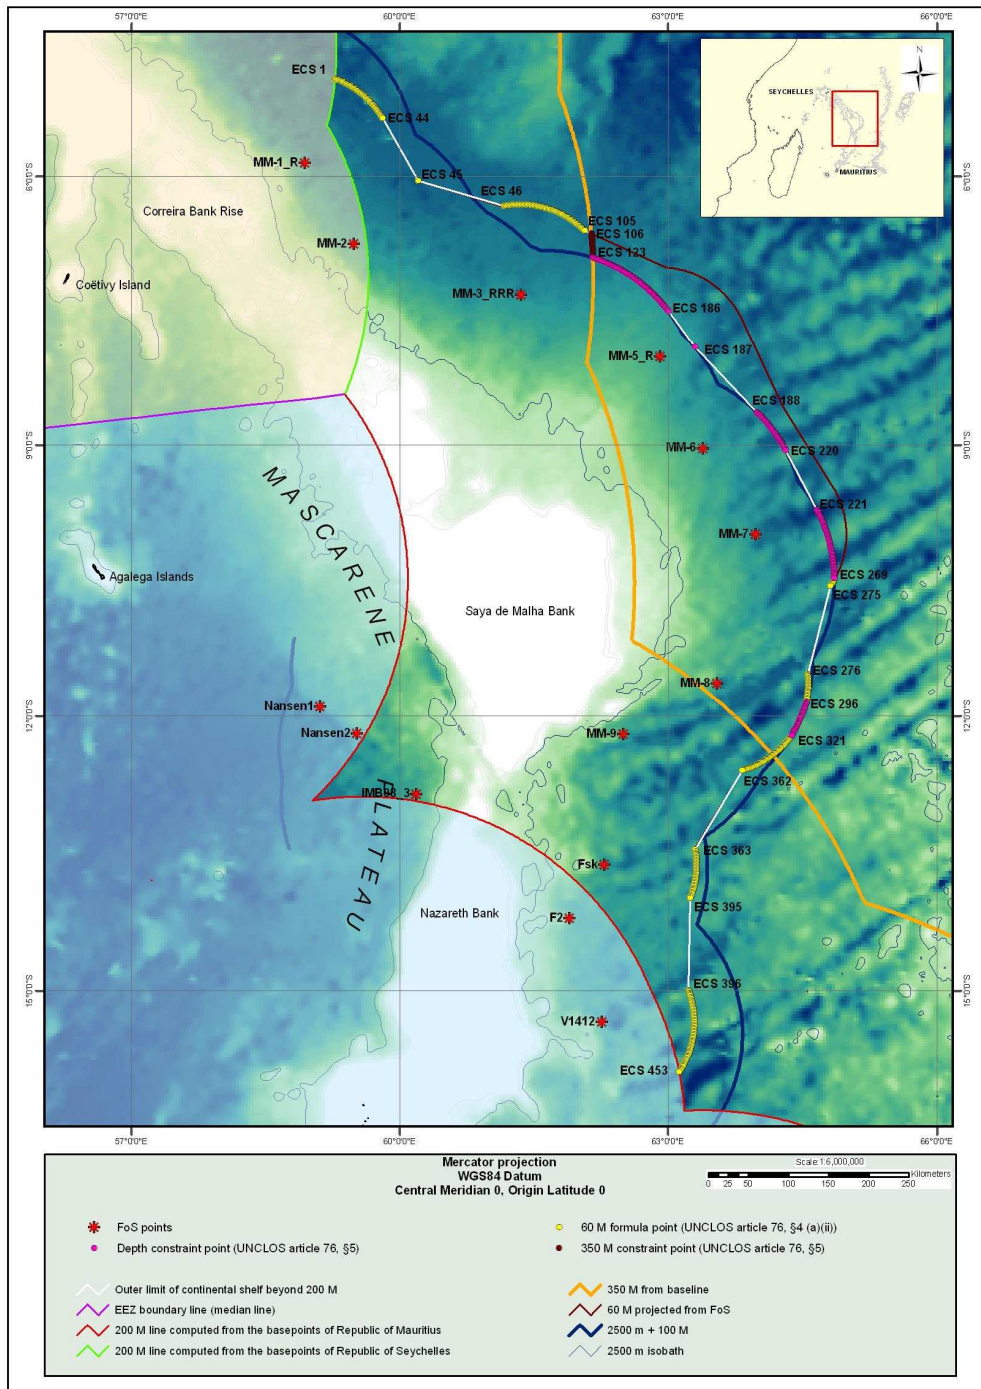

Figure 9. Map showing the application of the combination of the distance (orange) and depth (blue) constraint lines to delineate the fixed points that establish the outer limits of the continental shelf in the Mascarene Plateau region. The map also shows the relevant FOS points (red stars) and the line (brown) delineating the outer edge of the continental margin where it extends beyond the outer limits of the continental shelf (submitted by the two coastal States as CM_constraints_2011_1 on 21 March 2011).

6.1.4 The application of the combination of the distance and the depth constraints

- 57 In the Mascarene Plateau region, the two coastal States have applied a constraint line based on the combination of lines constructed by the application of both the distance and depth constraints contained in article 76, paragraph 5, of the Convention (see sections 6.1.1 and 6.1.2 above). The Commission agrees with the way this combined constraint line has been applied where the outer edge of the continental margin extends beyond the combined constraint line (Figures 8 and 9).
- 58 In the western area of the Mascarene Plateau region the two coastal States have constructed a small, valid section of depth constraint from measured 2500 m depth points on the adjacent western margin of the Plateau (Figures 8 and 9). The Commission recognises that this depth constraint line falls within the 200 M limits of Mauritius and lies beyond the relevant parts of the 60 M arcs that establish the outer edge of the continental margin in this area (Figure 8). The Commission acknowledges that the interaction of this constraint line with the outer edge of the continental margin confirms that the two coastal States have entitlement to continental shelf beyond 200 M arising from this part of the western margin of the Mascarene Plateau that extends up to the adjacent 200 M limits of Mauritius.

6.2 The outer limits of the continental shelf

- 59 The outer limits of the continental shelf in the Mascarene Plateau region, as contained in the Joint Submission of the two coastal States of 1 December 2008 and revised by the Addendum of 12 March 2010 (SMS-MB-DOC_Addendum) and further revised on 16 March 2011, consists of fixed points connected by straight lines not exceeding 60 M in length that lie along the eastern margin of the Plateau. The fixed points are listed in Table 3, Annex I, as submitted on 16 March 2011 (ECSpoints_march2011). The fixed points are established in accordance with the provisions contained in article 76, paragraphs 4(a)(ii) and 5, of the Convention and two fixed points located on the 200 M limits of the two coastal State's associated with Frégate Island of Seychelles in the north and St. Brandon Group of Islands of Mauritius in the south (ECS 1 and ECS 453, respectively; Figures 9 and 10).
- 60 The Commission confirms that the outer limits of the continental shelf beyond 200 M of the two coastal States arising from the central part of the western margin of the Mascarene Plateau extends up to the 200 M limits of Mauritius. No outer limit fixed points are required to be established in this area in accordance with article 76 of the Convention.
- 61 The full continental shelf of the two coastal States associated with both the eastern and western margins of the Mascarene Plateau extends beyond the 200 M limits of the two coastal States up to the outer limits of the continental shelf of the Mascarene Plateau region as shown in Figure 10.

6.3 Recommendations

- 62 The Commission agrees with the determination of the fixed points listed in Table 2, Annex I, and illustrated in Figure 7, establishing the outer edge of the continental margin in the Mascarene Plateau region. The Commission also agrees that in the western area of the Mascarene Plateau region the two coastal States have demonstrated the overlap of the outer edge of the continental margin with the 200

M limits of Mauritius (Figure 8) and have entitlement to continental shelf beyond 200 M that extends up to the 200 M limits of Mauritius (Figures 9 and 10). The Commission recommends that the delineation of the outer limits of the continental shelf of the two coastal States in the Mascarene Plateau region be established in accordance with article 76, paragraph 7, of the Convention by straight lines not exceeding 60 M in length, connecting fixed points, defined by coordinates of latitude and longitude as listed in Table 3, Annex I, and illustrated in Figure 10. The Commission recommends that the two coastal States proceed to establish the outer limits of the continental shelf in the Mascarene Plateau region from fixed point ECS 1 to fixed point ECS 453 accordingly.

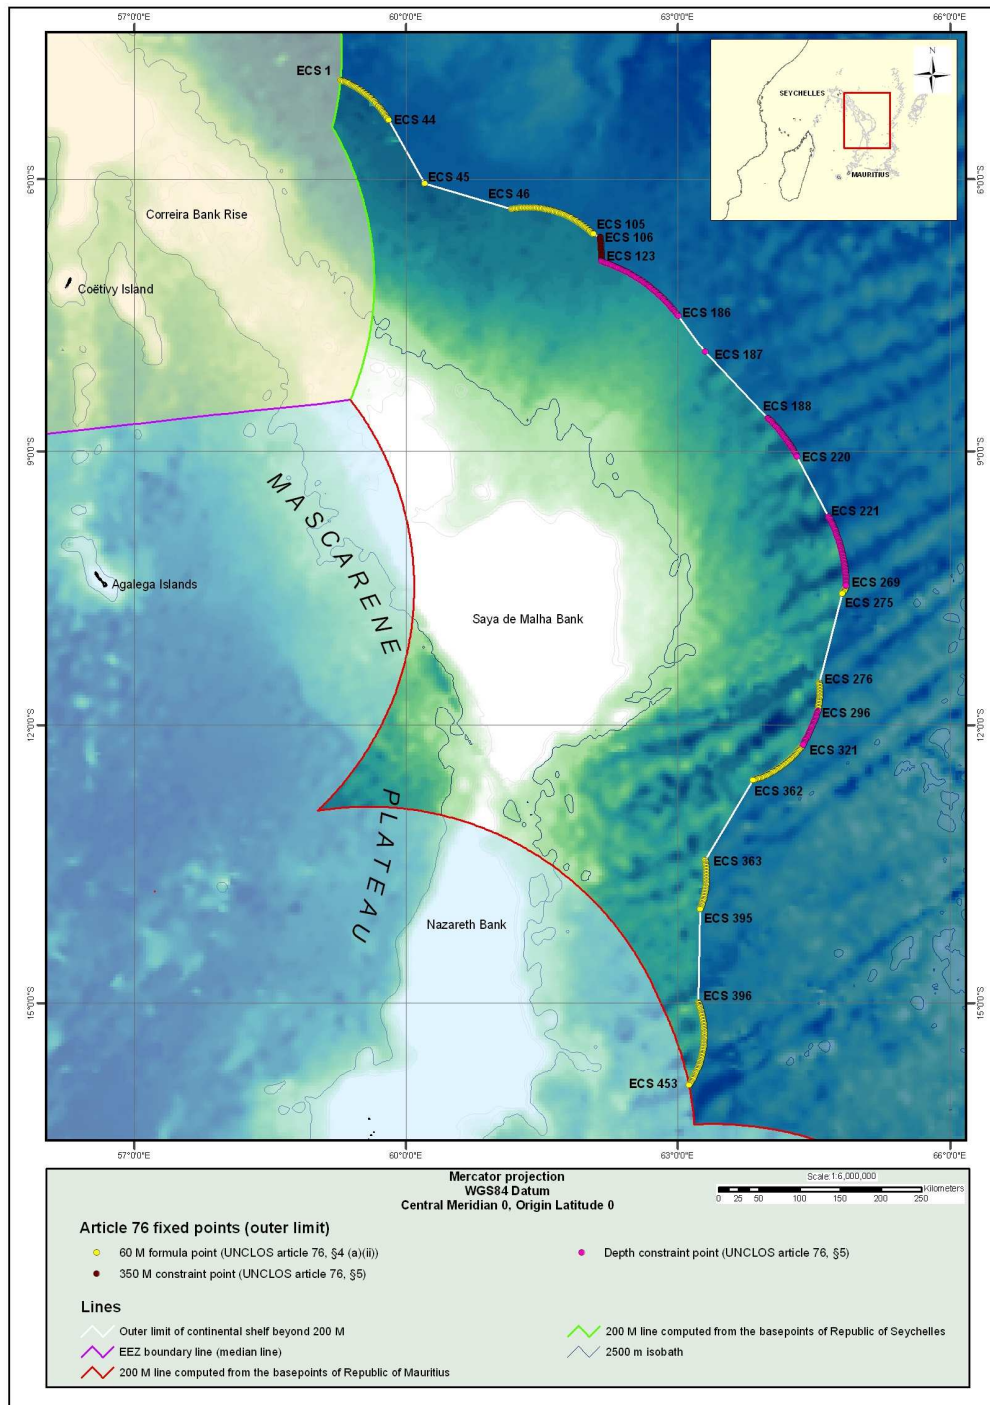

Figure 10. Map showing the outer limits of the continental shelf of the two coastal States beyond 200 M from the baselines from which the breadths of their territorial seas are measured in the Mascarene Plateau region. Coordinates of the fixed points delineating the outer limit of the continental shelf are given in Table 3, Annex I (submitted by the two coastal States as Fig5_2_RR on 21 March 2011).
