1. Introduction

Iceland ratified the 1982 United Nations Convention on the Law of the Sea (hereinafter "the Convention") on 21 June 1985 and it entered into force on 16 November 1994.

The present submission is made in accordance with article 76 of the Convention and article 4 of Annex II to the Convention, taking into account the Decision of the Eleventh Meeting of States Parties to the Convention regarding the date of commencement of the ten-year period for making submissions to the Commission on the Limits of the Continental Shelf (hereinafter "the Commission"), the Rules of Procedure of the Commission and the Scientific and Technical Guidelines of the Commission. The submission contains information on the outer limits of the continental shelf of Iceland beyond 200 nautical miles (M) from the baselines from which the breadth of the territorial sea is measured.

The Icelandic continental shelf encompasses three different areas beyond 200 nautical miles: Reykjanes Ridge, the Hatton-Rockall area and the Ægir Basin area.

The rights of the coastal State over the continental shelf are inherent; they exist *ipso facto* and *ab initio*, as reflected in article 77 of the Convention.

Pursuant to paragraph 3 of Annex I to the Rules of Procedure of the Commission, a submission may be made by a coastal State for a portion of its continental shelf in order not to prejudice questions relating to the delimitation of boundaries between States in any other portion or portions of the continental shelf for which a submission may be made later, notwithstanding the provisions regarding the ten-year period established by article 4 of Annex II to the Convention.

This submission is a partial submission in accordance with the aforementioned paragraph. It is limited to the continental shelf of Iceland in the Ægir Basin area, the delimitation of which has been agreed upon provisionally by Iceland, Denmark on behalf of the Faroe Islands and Norway, and in the western and southern parts of Reykjanes Ridge which are not subject to overlapping claims by any other States. The submission does not cover the continental shelf of Iceland in the Hatton-Rockall area, which is subject to overlapping claims by Denmark on behalf of the Faroe Islands, Ireland and the United Kingdom. Quadrilateral discussions between the parties to resolve the dispute in the Hatton-Rockall area have taken place on a regular basis since 2001 and are ongoing. The submission does not either cover the eastern part of Reykjanes Ridge, which potentially overlaps the Hatton-Rockall area. A submission for both these areas will be made at a later stage.

The preparation of the submission began in 2000. It included acquisition of bathymetric data, along with processing, analysis and interpretation of these data. The preparation was carried out by the National Commission on the Limits of the Continental Shelf (NCLCS), under the direction of the Ministry for Foreign Affairs and with representatives from the Ministry of

Industry, the National Energy Authority, Iceland GeoSurvey and the Icelandic Coast Guard, Hydrographic Department. The technical preparation of the submission was primarily carried out by Iceland GeoSurvey.

The submission consists of three separate parts:

- I. Executive Summary.
- II. Main Body.
- III. Supporting Scientific and Technical Data (Electronic Supplement).

2. Bathymetry and geological processes

Iceland has the unique position of being the largest subaerial part of the mid-oceanic ridge system worldwide. A distinct feature of the spreading ridges south and north of Iceland, Reykjanes Ridge and Kolbeinsey Ridge, is their anomalously shallow bathymetry when compared to mid-oceanic ridges in general (Figure 1). The spreading ridges are directly connected to the Icelandic land mass, morphologically, tectonically and with respect to geological history and crustal characteristics. Furthermore, a shallow aseismic ridge runs transverse to the Mid-Atlantic Ridge from Greenland, through Iceland, to the Faroe Islands. The existence of Iceland, and the shallow bathymetry of Reykjanes Ridge, the Greenland-Iceland-Faroe Ridge, as well as Kolbeinsey Ridge and Iceland Plateau, are due to the interaction of the Mid-Atlantic Ridge with a hotspot, an area of excessive mantle upwelling. The upwelling is responsible for the high rising topography and ocean depth anomalies associated with buoyant mantle materials and thick crust, over large part of the North Atlantic. This swell of the Icelandic hotspot extends southwards along the complete length of Reykjanes Ridge to the Charlie-Gibbs Fracture Zone (referred to as Heljargjá in Iceland).

The hotspot – ridge interaction has been the major factor in the morphological and geological evolution of the North Atlantic. The focus of spreading has shifted several times. A major rift jump from the now extinct Ægir Ridge in the Ægir Basin towards Kolbeinsey Ridge north of Iceland appears responsible for isolating a continental fragment, the Jan Mayen micro-continent, in the northern North Atlantic. The submerged natural prolongation of the Icelandic land mass comprises parts formed in a relatively simple manner, similar to ongoing plate spreading in Iceland today, as well as parts shaped by a complex history of rift relocation, continental stretching and continental fragmentation. All these structures are formed by the common process of plate divergence and its interaction with excessive mantle upwelling in association with the Iceland hotspot.

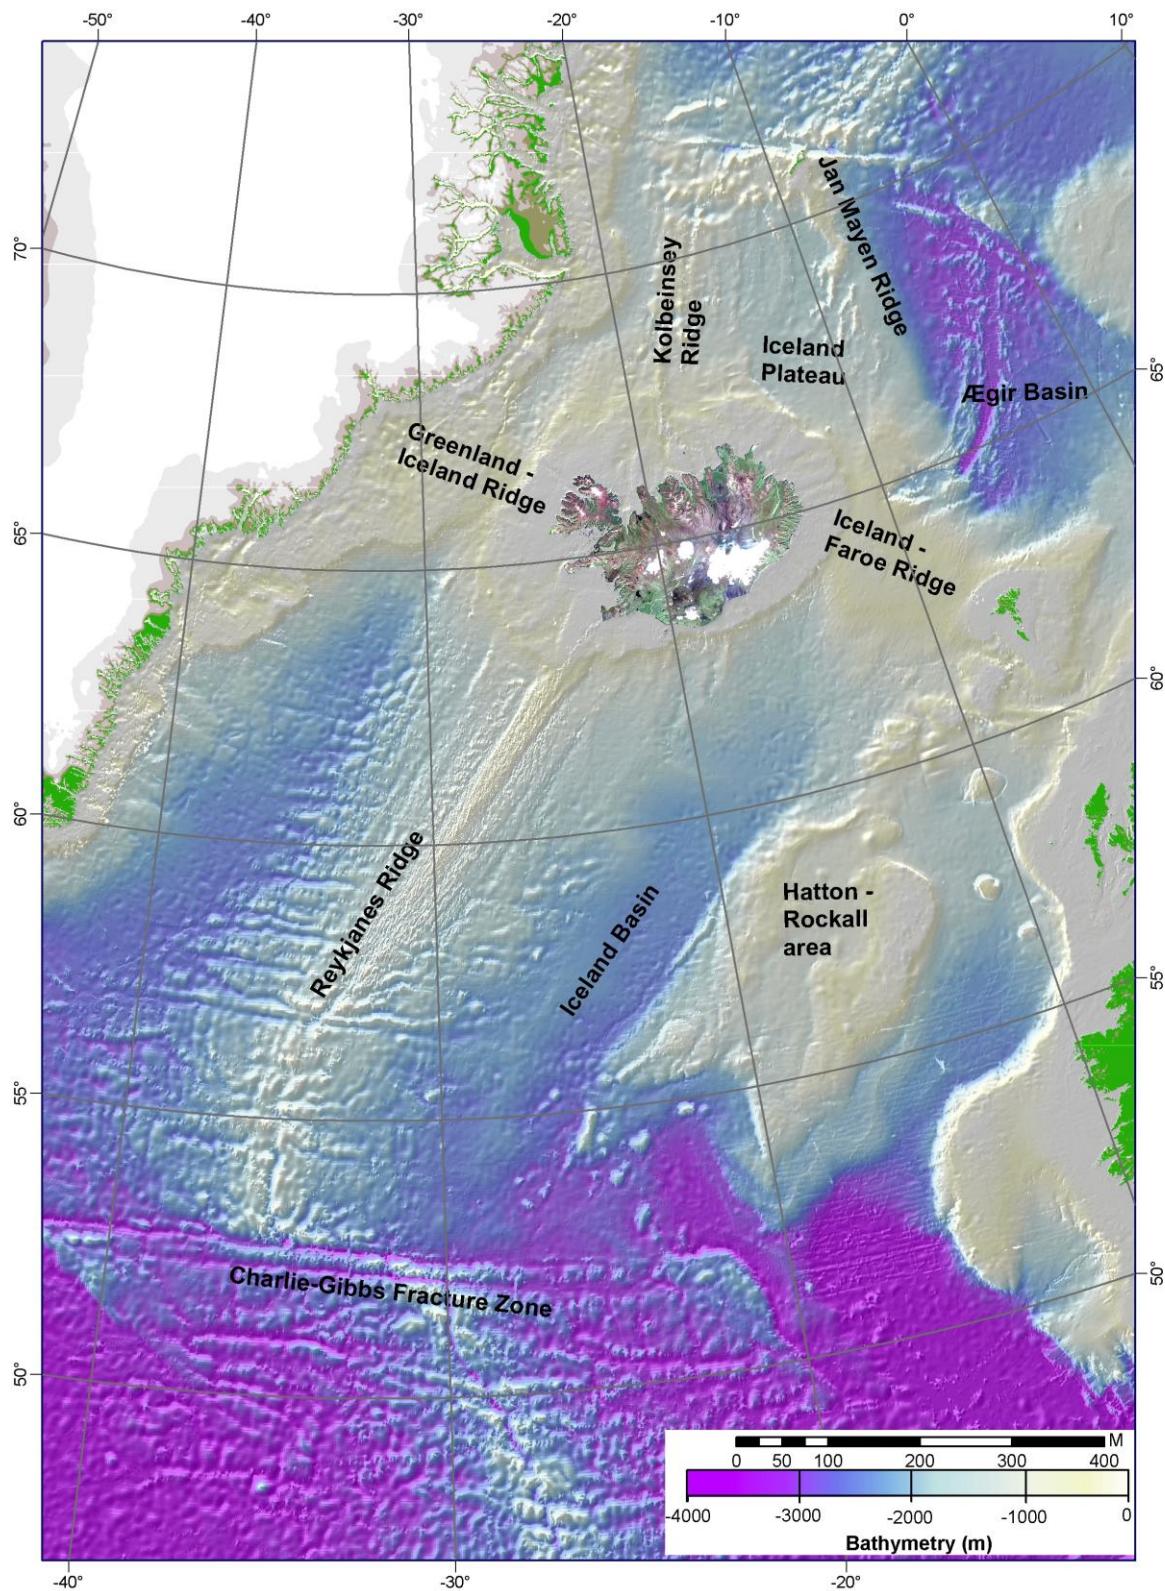

Figure 1. Overview of the ocean floor around Iceland.

3. Provisions of article 76 invoked in support of the submission

The provisions of article 76 invoked in delineating the outer limits of the Icelandic continental shelf are paragraphs 1, 3, 4(a)(ii), 4(b), 5 and 7.

4. Absence of disputes

4.1. Ægir Basin

On 20 September 2006 an agreement was made in the form of Agreed Minutes between Iceland, Denmark on behalf of the Faroe Islands, and Norway on the delimitation of the continental shelf beyond 200 M between Iceland, the Faroe Islands and Norway in the Ægir Basin area. In the Agreed Minutes, this area is referred to as the southern part of the Banana Hole.

According to the Agreed Minutes, each State has to document, through a submission to the Commission, that the area of its continental shelf beyond 200 M corresponds in size, as a minimum, to the area that falls to the same State according to the Agreed Minutes.

Pursuant to the Agreed Minutes, when one State submits documentation concerning the outer limits of its continental shelf in the southern part of the Banana Hole to the Commission, the other States will notify the Secretary-General of the United Nations, in accordance with the Rules of Procedure of the Commission, that they do not object to the Commission considering the documentation and making recommendations on this basis, without prejudice to the submission of documentation by these States at a later stage or to the question of bilateral delimitations of the continental shelf between the three States.

Following the procedures set out in article 76, paragraph 8, of the Convention, the States will finalize the delimitation of the continental shelf in the area through three bilateral agreements.

4.2. Reykjanes Ridge

In accordance with paragraph 2(a) of Annex 1 to the Rules of Procedure, Iceland wishes to inform the Commission that the continental shelf outside 200 M in the western and southern parts of Reykjanes Ridge does not overlap continental shelves of other States and is therefore not the subject of dispute between Iceland and any other State.

The submission does not cover the eastern part of Reykjanes Ridge, as it potentially overlaps the Hatton-Rockall area which is in dispute. A submission for these areas will be made at a later stage in accordance with paragraph 3 of Annex I to the Rules of Procedure.

5. Description of the outer limits of the continental shelf

5.1. Ægir Basin

The outer limits of the continental shelf in the Ægir Basin area have been determined using the foot of slope + 60 M formula (FOS + 60 M, so-called Hedberg formula). The results are given in Appendix 1 and Figure 2.

The first and southernmost fixed point, ICE-AE-OL-1, is calculated as the intersection point of the relevant foot of slope + 60 M arc with the Faroe Islands exclusive economic zone (EEZ). From there northwards, the foot of slope + 60 M arcs are used, bridging over indentations in overlapping arcs, using geodesic lines between points that never exceed 60 M. The last and northernmost fixed point, ICE-AE-OL-56, is calculated in a similar manner as the first point where the relevant foot of slope + 60 M arc intersects with the Jan Mayen exclusive economic zone.

A total of 56 fixed points and connecting lines define the outer limits. These points do not exceed the 350 M constraint nor the 2500 m isobath + 100 M constraint.

5.2. Western and southern parts of Reykjanes Ridge

The outer limits of the continental shelf in the western and southern parts of Reykjanes Ridge have been determined using the foot of slope + 60 M formula. The results are given in Appendix 2 and Figure 3.

In the northwestern part of Reykjanes Ridge, the outer limits of the Icelandic continental shelf generally coincide with the limits of the exclusive economic zone of Greenland, since the foot of slope + 60 M arcs extend into it. Between 61.45–61.02°N, however, the outer limits lie just outside the Greenland EEZ. The first and northernmost fixed point, ICE-RR-OL-1, is calculated as the intersection point of a line between foot of slope + 60 M points with the Greenland EEZ. Fixed point ICE-RR-OL-2 lies on a foot of slope + 60 M arc outside the Greenland EEZ, and fixed point ICE-RR-OL-3 is calculated as the intersection point of a line between foot of slope + 60 M points with the Greenland EEZ. From there the outer limits again follow the Greenland EEZ until 57.10°N, where a line between foot of slope + 60 M points intersects with it.

From there southwards, the foot of slope + 60 M arcs are used, bridging over indentations in overlapping arcs, using geodesic lines between points that never exceed 60 M. The 2500 m isobath + 100 M constraint is in some cases applied and defines the outer limit. The last fixed point, ICE-RR-OL-319, is on the 2500 m isobath + 100 M constraint line.

A total of 319 fixed points and connecting lines define the outer limits.

6. Commission Members who provided advice during the preparation of the submission

Iceland was assisted in the preparation of this submission by Mr. Harald Brekke, member of the Commission (1997-present). No advice was provided by any other member of the Commission.
