## Commission on Population and Development

Fifty-fourth session

19–23 April 2021

Population, food security, nutrition and  
sustainable development

### Statement submitted by FEMM Foundation, a non-governmental organization in special consultative status with the Economic and Social Council<sup>1</sup>

The Secretary-General has received the following statement, which is being circulated in accordance with paragraphs 36 and 37 of Economic and Social Council resolution 1996/31.

---

<sup>1</sup> The present statement is issued without formal editing.

## Statement

The FEMM Foundation is a knowledge-based health program for women inspired by women's right to be informed participants in their own healthcare and to make voluntary decisions based on options, information, and understanding. The Foundation is dedicated to health education, medical research, and improving reproductive health care to advance women's health. FEMM's work includes health education for women, medical training for doctors, and reproductive health research which undergirds all of our work.

International law recognizes a right to the "highest attainable standard of health." The Sustainable Development Goals reflect this in their commitment to health in Goal 3. Health is also closely linked with nutrition, a link reflected in the General Assembly Resolution *The World We Want*, which envisions "... a world free of poverty, hunger, disease and want". Poor nutrition's impact on health is clear. However, health also can affect the ability to ensure adequate nutrition, through the ability to care for oneself, seek gainful employment, or process nutritious foods well. Certain health conditions, including some linked to hormones, also require particular nutrition programs. FEMM offers care to women that addresses these health needs complementarily to nutrition and promotes sustainable development.

Hormonal health is linked to overall health, and therefore sexual and reproductive health are important components of achieving the highest attainable standard of healthcare. Similarly, knowledge about sexual and reproductive health can enable women to effectively make informed choices for themselves and for their future generations. The care offered to women must incorporate scientific advances to reflect improvements in understanding of women's hormonal health. Programs designed to provide this care, however, must always respect the cultural, religious, and other ethical concerns of women in order to best meet their needs and those of their families.

Understanding one's own body is essential for good health and empowers women and girls to be informed participants in their care. Women also often accept as normal symptoms such as irregular bleeding, pain, depression, mood swings, and weight gain, nor realizing that these are often signs of underlying hormonal imbalances and abnormalities. Even when women do seek medical care, most health care providers and programs struggle to diagnose them and often can only treat the symptoms. A strong commitment to women's health must ensure that science and evidence-based approaches, including new approaches, are provided, in consultation with individuals for whom they are prepared, in order to respect religious, cultural, ethical, and health concerns.

FEMM has developed an app to help women take control of their health. The FEMM App is available free of charge and is now available in English, Spanish, and a growing number of other languages, on both iPhone and Android platforms. Women who use the FEMM App can track their observations and symptoms to better understand their bodies and health. Just as each woman is different, so are her observations and experiences, which is why the app is completely customizable. Women can track as much or as little as they like and add symptoms and observations. It also provides insights into what a woman is experiencing in her cycle and can flag potential health concerns and connect women with medical professionals for treatment.

FEMM also enables women to make informed choices about family planning. Family planning and information about reproductive and sexual health must be accurate and respect cultural, religious, and ethical beliefs. Programs focused on providing commodities often fail to ensure that women have the education needed to

understand their bodies and what they are using and may not always respect their values and priorities.

Information-based health education and medical care is uniquely well suited to meet these needs while respecting individual choices and values. FEMM offers reproductive and hormonal education and helps women to understand the way various family planning methods work and their potential side effects. It educates women about the science of their bodies, how to identify when they are fertile, and how to achieve or avoid pregnancy. It also can demystify how women and girls' bodies work, combating stigma and promoting understanding and respect.

FEMM's researchers have rethought women's health. They have found that a woman's hormonal health is intrinsically linked with her overall health. They have developed better diagnostic criteria to identify conditions that are currently treated mainly at the symptomatic level and treat them at the roots. They are even discovering links with conditions not typically considered related to reproductive health. FEMM is rethinking the health of contemporary women in ways that will help them to take charge of their health and thrive in their communities.

Women and girls also need good healthcare to meet their needs when they do identify health concerns. FEMM's Medical Management program trains doctors to diagnose and treat reproductive health problems, with a holistic view of a woman's body that incorporates recent research on the complex hormonal interactions between different body systems. This interaction, and the delicacy of the hormonal activity in a woman's body, is essential to the experience of health in the entire female body. FEMM has developed innovative protocols that allow doctors to identify underlying problems with precision and treat them effectively. This medical support provides treatments that help women to live healthy lives.

FEMM is low-cost and meets the underlying needs of women. Comprehensive health care for women can now be provided through basic health delivery systems, making this approach to women's health more effective, cheaper to deliver, and providing stronger health outcomes for women. Even women who have not completed schooling can learn to monitor their signs of health. Understanding women's bodies will also combat stigma and myths associated with normal biological processes such as menstruation.

We know that informed decisions lead to healthier decisions, and that women play a key role in family and community health outcomes. Through FEMM's innovative programs, women will be empowered to take charge of their healthcare, and health systems will be able to meet their needs. Moreover, we affirm that contraceptives are not synonymous with family planning, and efforts to meet family planning needs should not focus on contraceptives alone. Modern family planning methods and programs should include knowledge-based family planning, such as fertility awareness, which is based on modern science and has proved effective. We affirm that this will lead to the achievement of sustainable development.

FEMM's programs are ready to be incorporated into health systems in support of sustainable development, and FEMM is ready to assist in implementing them. The knowledge gained through FEMM can allow women to identify underlying health concerns and to achieve or avoid pregnancy. When people attain the highest level of health they can, they are able to thrive and partake in their communities, ensuring equality for women and girls and helping achieve sustainable development. FEMM is prepared to assist the Commission and the Member States to meet this goal.
