Statistics Division

National Accounts Statistics: Main Aggregates and Detailed Tables, 2011

Part I

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which Members States of the United Nations draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and helps build national capacities through technical assistance.

NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas.

INTRODUCTION

1. This is the fifty-third issue of *National Accounts Statistics: Main Aggregates and Detailed Tables*^{1,2} showing detailed national accounts estimates for 204 countries and areas for the reporting years 2000 to 2011. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical offices. It is issued in accordance with the recommendation of the Statistical Commission at its first session³ that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

THE NATIONAL ACCOUNTS QUESTIONNAIRE

2. This publication is the thirteenth issue based on the United Nations National Accounts Questionnaire (NAQ) introduced in October 1999, which in turn is based on *the System of National Accounts 1993 (1993 SNA)*⁴.

3. The 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts (1968 SNA)*⁵, the Council in its resolution 1993/5 of 12 July 1993 recommends that Member States use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that Member States consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool. In 2003 the United Nations Statistical Commission (UNSC) called for an update of the 1993 SNA. The updated SNA, called *The System of National Accounts 2008*⁶, or in short the 2008 SNA, was finalised during 2009. It is expected that most countries would start submitting national accounts data according to the 2008 SNA from 2015 onwards. So far, only Australia and Timor-Leste have started submitting data according to the 2008 SNA.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the United Nations Regional Commissions, has designed the United Nations National Accounts Questionnaire (NAQ) based with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the United Nations Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UNSC has agreed that the scope and pace of the implementation of the 1993 SNA must be decided by each country according to its analytical and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

SCOPE OF THE QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditure in current and constant prices and on the relations among product, income, saving and net lending aggregates.

6. Part II (Tables 2.1 to 2.6) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities (ISIC^{7,8}). Tables 2.1 to 2.3 follow the ISIC Rev. 3 and are equivalent to Tables 2.4 to 2.6, which follow the ISIC Rev. 4, and countries can complete the appropriate tables according to the ISIC version they use for compiling their national accounts. Data can be provided either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O, for the ISIC Rev. 3; or A, B+C+D+E, C, F, G+H+I, J, K, L, M+N, O+P+Q and R+S+T, for the ISIC Rev. 4) or as single tabulation categories (Sections A to P for ISIC Rev. 3; and A to T, for ISIC Rev. 4) (one-digit level of ISIC). In the case of ISIC Section A, information at the two-digit level is requested for divisions 01, 02 (and 03, for the ISIC Rev. 4); whereas for ISIC Rev. 3 Section I information is requested for division 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according to the Classifications of Expenditure According to Purpose⁹. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10 divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure by households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC)^{10,11}. For the individual consumption expenditure by non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure by general government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.9) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e. the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Tables 5.1 and 5.2) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 (Table 5.1) or ISIC Rev. 4 (Table 5.2) as indicated in Part II above.

10. Countries are requested to update the data tables and complete them as comprehensively as possible. The tables are listed below:

Part I: Main aggregates

Table 1.1 Gross domestic product by expenditures at current prices

Table 1.2 Gross domestic product by expenditures at constant prices

Table 1.3 Relations among product, income, saving and net lending aggregates at current prices

Part II: Domestic production by industries

Table 2.1 Value added by industries at current prices (ISIC Rev. 3)

Table 2.2 Value added by industries at constant prices (ISIC Rev. 3)

Table 2.3 Output, gross value added and fixed assets by industries at current prices (ISIC Rev. 3)

Table 2.4 Value added by industries at current prices (ISIC Rev. 4)

Table 2.5 Value added by industries at constant prices (ISIC Rev. 4)

Table 2.6 Output, gross value added and fixed assets by industries at current prices (ISIC Rev. 4)

Part III: Classifications of expenditure according to purpose

Table 3.1 General government final consumption expenditure by function at current prices

Table 3.2 Individual consumption expenditures at current prices

Part IV: Integrated economic accounts

Table 4.1 Total economy (S.1)

Table 4.2 Rest of the world (S.2)

Table 4.3 Non-financial corporations (S.11)

Table 4.4 Financial corporations (S.12)

Table 4.5 General government (S.13)

Table 4.6 Households (S.14)

Table 4.7 Non-profit institutions serving households (S.15)

Table 4.8 Combined Sectors: Non-Financial and Financial Corporations (S.11 + S.12)

Table 4.9 Combined Sectors: Households and NPISH (S.14 + S.15)

Part V: Cross classification of gross value added by industries and institutional sectors

Table 5.1 Cross classification of gross value added by industries and institutional sectors (ISIC Rev. 3)

Table 5.2 Cross classification of gross value added by industries and institutional sectors (ISIC Rev. 4)

11. It should be noted that the NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it mainly serves to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly

the one-digit level of ISIC instead of the two-digit level of ISIC.

COLLECTION OF DATA

12. To collect the large volume of national accounts data, the Statistics Division annually sends a pre-filled NAQ to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical offices and from national source publications. Countries are also requested to provide a brief overview of the sources and methods to compile their national accounts.

13. In order to lighten the reporting burden of countries to different international and regional organizations the UNSD receives data from the Statistical Office of the European Commission (EUROSTAT), the Organisation for Economic Co-operation and Development (OECD), the United Nations Economic Commission for Europe (ECE) and the Caribbean Community (CARICOM) on behalf of their constituents. The UNSD, EUROSTAT and the OECD have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), all OECD countries submit data either to EUROSTAT or OECD but need not provide duplicate submissions. Member States of OECD which are not members of the European Community complete a subset of the ESA 1995 questionnaire. The ECE provides data for transition economies. CARICOM uses the NAQ to collect data from its Member States and provides it to UNSD. As a result, the United Nations questionnaire based on the 1993 SNA is sent to less than 160 countries, areas, and territories out of the 235 (of which only 204 have provided sufficient data to be published) included in the UNSD National Accounts database.

14. In order to create a comprehensive database based on the 1993 SNA, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database.

CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

15. The form and concepts of the statistical tables in the present publication generally conform to the recommendations by the 1993 SNA. A summary of the

conceptual framework and definitions of transactions is provided in chapter I of the present publication.

16. Although the NAQ collects data in the 1993 SNA format, countries may still use the 1968 SNA (or in some rare cases the 1953 SNA) guidelines to compile their national accounts. The UNSD evaluates the status of the conceptual adherence to the 1993 SNA from time to time.

17. The Series note at the top of each table indicates which SNA version is used by the given country to compile their national accounts. Series numbers below 100 relates to data according to the 1968 SNA data and series numbers 100 and above relates to data according to the 1993 SNA. Whenever 1968 SNA data are not replaced backwards for all years by a series of 1993 SNA data, the 1993 SNA data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA, a footnote is attached to the relevant tables.

18. In the tables with constant price data (Tables 1.2, 2.2 and 2.5), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is chain linked volume series where figures are given at prices of the previous year. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use chain linked volume series but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e. the total is not equivalent to the sum of its components. Also, constant price data, which are scaled up or down to a certain reference year in order to allow international comparison, are not additive.

19. In the present publication, the data for each country or area are presented in separate chapters, in alphabetical order, under uniform table headings and classifications of the 1993 SNA. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series note at the top of each table indicates the type of fiscal year used for any given series.

COMPARABILITY OF THE NATIONAL ESTIMATES

20. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this

end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted that the country notes not only refer to the latest data covered in this publication but to the country in general.

REVISIONS

21. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

NOMENCLATURE

22. The information for the countries and areas shown in this publication reflect what is available to the UNSD as of August 2012. Updated national accounts data are usually provided by countries to the UNSD between January and July. Data for the year 2011 is currently available for 105 countries and areas.

23. The data for the countries listed below are represented as follows:

China is published in this yearbook in three sections: China; China, Hong Kong Special Administrative Region; and China, Macao Special Administrative Region. The data for China excludes the special administrative regions of Hong Kong and Macao.

Serbia and Montenegro – The state union of Serbia and Montenegro dissolved in June 2006. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. Available data are shown for the individual republics.

Sudan and South Sudan – South Sudan seceded from Sudan in July 2011. Data for the former Sudan appear under “Sudan (up to 2011)”. Data for Sudan and South Sudan in

the new configuration (after July 2011) appear under the respective country names.

Tanzania – The data for Tanzania are published in two parts in this yearbook: mainland Tanzania and Zanzibar. Note that the data listed under Tanzania does not include Zanzibar.

SYMBOLS AND DATA DISPLAY

24. The following symbols have been employed:

Data not available..... [..]
Magnitude nil or less than five percent of the unit employed..... [0.0]
Decimal figures are always preceded by a point [.]

25. Each series version is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series version is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series note at the top of each table informs about the SNA version applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

26. Decimals in tables do not necessarily add to totals shown because of rounding.

GENERAL DISCLAIMER

27. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

28. Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation “country” appears in the headings of tables, it covers countries, territories, cities or areas

I. SYSTEM OF NATIONAL ACCOUNTS

1. The origins of the System of National Accounts (SNA) trace back to the 1947 Report of the Sub-Committee on National Income Statistics of the League of Nations Committee of Statistical Experts under the leadership of Richard Stone¹. At its first session in 1947, the United Nations Statistical Commission emphasized the need for international statistical standards for the compilation and updating of comparable statistics in support of a large array of policy needs. Specifically, the Commission recommended that the United Nations Statistical Office, in consultation with the interested specialized agencies, should work on guidelines for national accounts statistics (national income and expenditure), taking into consideration best practises and international comparability². In view of the emphasis on international statistical standards, the first national accounts standard was produced and published in 1953. The SNA was subsequently revised and updated in 1960, 1964, 1968 and 1993. In 2003 the Statistical Commission called for an update of the 1993 SNA. The System of National Accounts 2008³, (in short the 2008 SNA) was finalised in 2009. This chapter describes the concepts and definitions of the SNA as recommended by the 1993 SNA.

A. THE SNA AS A SYSTEM

2. The System of National Accounts is a statistical framework that provides a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA

includes an external account that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyse the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic product (GDP), which are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to

describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to chapter II of the 1993 SNA for a comprehensive overview of the System.

1. The sequence of accounts

Current accounts

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

Production account

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

Distribution and use of income accounts

8. These consist of a set of articulated accounts showing how incomes are:

Generated by production

Distributed to institutional units with claims on the value added created by production

Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes

Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from

production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward into the capital account, the first in the System's sequence of accumulation accounts.

Accumulation accounts

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).

The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.

A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

Balance sheets

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever

any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

2. *Activities and transactions*

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly the main sectors of the economy for which it is possible to compile the full sequence of accounts summarized in the previous section. Two main kinds of institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analysed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V of the 1993 SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the

economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the 1993 SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

1. Supply and use tables

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

2. Price and volume measures

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modelling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as targets for the formulation of economic policy-making. They are an essential part of the System, especially given the emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

1. The production boundary

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

Household production

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

(a) The production of agricultural goods by household enterprises for own final consumption;

(b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc;

(c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the

production of personal and domestic services by members of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

Other production boundary problems

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

2. The consumption boundary

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the

estimated values of the agricultural products consumed by households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

3. *The asset boundary*

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

4. *National boundaries*

29. The accounts of the System are compiled for resident institutional units grouped into institutional sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high-inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the

construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

1. Specific uses

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

Monitoring the behaviour of the economy

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of

the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

Macroeconomic analysis

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different economic variables by applying econometric methods to time series of data at both current and constant prices compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

Economic policy-making and decision-taking

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data.

The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees. Such agencies typically require very detailed national accounts data.

International comparisons

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

2. Flexibility of implementation and use

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the 1993 SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the 1993 SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the 1993 SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may

become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

3. The SNA as a coordinating framework for statistics

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind revisions of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the 1993 SNA, the harmonization process has been particularly effective in respect of balance of payments statistics, government finance statistics and money and banking statistics. Each of these three systems was updated to be consistent with the 1993 SNA to the fullest extent possible.

48. Various other revised international guidelines were issued at about the same time as the 1993 SNA. These include the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the 1993 SNA. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the 1993 SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

1. Final consumption, intermediate consumption and gross fixed capital formation

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption, whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

Training, research and development

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

Education

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practising - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

Repairs, maintenance and gross fixed capital formation

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or

prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

2. Interpretation of the distinction between consumption and gross fixed capital formation

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain

expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

Acquisitions

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

Actual final consumption of general government

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.

Actual final consumption of households

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

Actual final consumption of NPISHs

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

Additivity

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

Base period

The period that provides the weights for an index is described as the base period.

Basic price

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

C.i.f. price

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

Capital transfers

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred.

Chain indices

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

Changes in inventories (including work-in-progress)

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

Compensation of employees

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

Constant prices

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in “constant price terms”).

Consumption good or service

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

Consumption of fixed capital

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

Current transfers

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.

Deductible VAT

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

Disposals

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

Export subsidies

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

Export taxes

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

Exports of goods

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

Exports of services

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

F.o.b. price

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

Factor cost

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

Final consumption

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

Final consumption expenditure of government

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

Final consumption expenditure of households

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by

resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

Final consumption expenditure of NPISHs

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

Financial intermediation services indirectly measured (FISIM)

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

Fixed assets

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

Goods

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

Gross

The term “gross” is a common means of referring to values before deducting consumption of fixed capital (generally used as in “gross capital stock” or “gross domestic product”).

Gross capital formation

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

Gross domestic product - expenditure based

Expenditure-based gross domestic product is total final expenditures at purchasers’ prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

Gross domestic product - income based

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

Gross domestic product - output based

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross domestic product at market prices

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross fixed capital formation

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.

Gross national disposable income

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Gross national income (GNI)

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

Gross saving

Gross saving is gross disposable income less final consumption expenditure.

Gross value added

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Gross value added at basic prices

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

Gross value added at producers' prices

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

Import duties

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

Import subsidies

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

Imports of goods

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

Imports of services

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

Indirect taxes

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term “indirect taxes” is not used in 1993 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

Intermediate consumption

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

Inventories

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

Invoiced VAT

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

Market prices

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

Mixed income

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

Net

The term “net” is a common means of referring to values after deducting consumption of fixed capital (generally used as in “net capital stock” or “net domestic product”); it should be noted, however, that the term “net” can be

used in different contexts in the national accounts, such as “net income from abroad” which is the difference between two income flows.

Net income from abroad

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

Net lending

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as “net borrowing”.

Net national disposable income

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Net national income

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

Net saving

Net saving is net disposable income less final consumption expenditure.

Net value added

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Non-deductible VAT

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

Non-financial assets

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

Non-produced assets

Non-produced assets are non-financial assets that come into existence other than through processes of production.

Non-profit institutions serving households (NPISHs)

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

Non-resident

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

Operating surplus

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called “mixed income”).

Other subsidies on production

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (eg, subsidies on payroll or workforce or subsidies to reduce pollution).

Other subsidies on products

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1)

subsidies on products used domestically, (2) losses of government trading organisations, and (3) subsidies to public corporations and quasi-corporations.

Output

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

Producer's price

The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

Property income

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

Purchaser's price

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Resident

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

Services

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realised by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

Stocks

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as “inventories” in the System).

Subsidies

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

Taxes and duties on imports

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

Taxes on production and imports

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

Taxes on products

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a

result of their use for own consumption or own capital formation.

Transfer

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

Valuables

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

Value added - gross

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Value added - net

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Value added tax (VAT)

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

II. COUNTRY TABLES

Afghanistan

Source

The National Accounts department of the Central Statistics Office in Kabul, Afghanistan is responsible for maintaining the national accounts statistics for Afghanistan. The following tables have been prepared by the Central Statistics Office in Kabul, Afghanistan in reply to the United Nations national accounts questionnaire.

The official estimates of national accounts are published in an annual yearbook by the Central Statistics Office in Kabul, Afghanistan.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA), so far as the existing data would permit.

GDP by economic activity (in current and constant price) and GDP by expenditure have been compiled and published by the Central Statistics Office in Kabul, Afghanistan. GDP is estimated through the production approach.

Albania

Source

INSTAT is the most important agency for the collection of Albanian macro economic statistics. INSTAT undertakes most of the data collection and compilation, with the main exceptions being that balance of payments (Bop) and banking sector data are responsibility of the Bank of Albania (BOA), government statistics are collected by the Ministry of Finances (MOF) and agricultural statistics are collected by the Ministry of Agriculture and Food (MAF).

The estimation of the new ESA95-compliant national accounts is responsibility of the INSTAT's Section of National Accounts. Following the internal organisation of INSTAT, the National Accounts Sector is part of a new and larger entity, the Department of Statistics Production (which, in addition to the National Accounts sector includes also other sectors). Most of the basic statistics used in compiling the national accounts are produced by this Department and by other INSTAT Departments.

The current task of the National Accounts Section consists of preparing annual national accounts at current and constant prices, estimated both from the resources side (import, output, intermediate consumption and value added) and from the use side (export, final consumption, gross fixed capital formation, change in stocks).

General

Till 1990 (under old regime) all calculations of macro-economic indicators were based on the Albanian version of the System of Material Production. Statistics of National Incomes were confidential and were reported only to high members of government and of the party. Based on these results only some estimations of GDP in connection with U.N. were produced, which is in relation with the transformation from Albanian SMP indicators to SNA indicators. These estimations were published in the "Albanian Statistical Yearly book 1991".

Such calculation was no longer adopted at the end of 1991. When the whole system collapsed it was no longer possible to continue the registration of basic data, as a result, the data of SMP were not useful. Since 1991 no official data for GDP were provided: some estimation have been produced mainly by the IMF and Macroeconomic Unit in the Council of Ministers. Such estimates were based on previous calculations of the former Directorate of Statistic, today INSTAT.

The work on implementing the system of national accounts in INSTAT was undertaken in two stages. The main objective of the first stage in the implementation of SNA'93/ ESA'95 is the compilation of annual GDP data by production and expenditures approaches at current and constant prices. The objective of the second stage is the implementation of the full system of SNA'93/ESA'95. However, no definite timetable has been established so far for the second stage.

The compliance with ESA 1995 and SNA 1993 compilation of GDP data by production and expenditure at current and constant price has been improved thanks to two projects financed by the European Union and the International Monetary Fund, both started at the beginning of 2004 and accomplished at the beginning of 2006. Both programmes (EU and IMF) aimed at providing a general improvement in the accuracy of annual GDP estimation.

Methodology:

Overview of GDP Compilation

The basic approach can be summarized as follows:

a) The production-side estimates are mainly based on grossing up the enterprise figures from the surveys using numbers of enterprises. Estimation of labour input by combining sources from the labour demand side (businesses) and demographic sources play an essential role in producing the estimate of the non observed

economy.

b) Domestic demand is estimated by combining data on the supply of products with data on expenditure obtained from the household consumption surveys, special surveys and businesses' balance sheets.

c) The aggregates for general government, financial institutions and some public corporations are estimated from budgets or balance sheets and from other administrative sources (cash, not accrual).

d) The main approach used to estimate output for agriculture is "price x quantity".

e) A chain index system is used for valuations at constant prices.

Expenditure Approach

Source data are very limited for household consumption. Some information are derived from Household Budget Survey (HBS), based on COICOP classification. However, the HBS is not conducted regularly and does not cover the whole of Albania.

Given the lack of basic information, the final consumption of household are mainly estimated using the commodity flow approach. The starting point of the procedure used in the grossing up of the economic data relative to final household consumption is to assume the GDP (or Output) measure by production approach.

Final consumption of general government and non-profit institutions serving households (NPISHs) is valued as the sum of the costs incurred to produce those individual and collective services; it is equal to the difference between the output of general government and NPISHs and the value of the residual sales. The data sources for estimating final consumption of general government and NPISHs are the consolidated budget, GFS data, a special questionnaire worked out for NPISHs in 1998. Following this period a survey on NPISHs has not been carried out. In general, the latest data are modified using an annual growth rate.

Gross fixed capital formation is valued at purchaser price. Different data sources are used to estimate gross fixed capital formation: statistics available at ministries (Ministry of Agriculture and Food, Ministry of Public Work), balance sheets, foreign trade statistics, census of agriculture. An estimate of GFCF in construction has been obtained deducting from the output the component which is not defined as investment. The gross fixed capital formation in machinery and electrical equipment is equal with the value of domestic production plus imports minus exports.

The indicators used for deflating the gross fixed capital formation are listed below:

- Livestock: Volume Index
- Orchards and vineyards: Volume Index
- Forestry: Volume Index
- Construction: Construction Cost Index
- Geology: Volume Index and PPI
- Machinery and Equipment: UVI and PPI for and domestic production

The estimation methodology for change in inventories at constant price is highly dependent on the kind of information on inventories available. Due to the absence of a complete data set an indirect way to estimate change in inventories has been adopted; meaning that change in inventories, for a group of products, are calculated using the commodity flow method as the difference between total supply and total use.

Changes in inventories

At present, independent estimates on change in inventories are not available, but they are added in the resources and uses estimates of the item change in inventories and statistical discrepancies, which are published.

Exports and imports of goods and services

In accordance with the SNA'93 methodology the exports and imports of goods and services are valued at FOB and converted from foreign currencies using monthly exchange rates. Main data source for estimating net export is the balance of payments from the Bank of Albania.

On the basis of the existing data, a methodology to compute import and export of goods, broken down by branch of activity has been developed. The sources of data used are the custom declaration for the imports export of goods and the balance of payments for services. The indicators used for deflating import and export in goods and services are Unit Value Index for goods and CPI for services.

Income Approach

Not Applicable

Production Approach

The adopted classification of economic activity is the NACE Rev. 1, which is the official European classification and is coherent with the ESA95. The main data sources for agriculture are the different surveys conducted by the Ministry of Agriculture and Food (MAF) and the census of agriculture conducted in 1999 by INSTAT and MAF. In 2005 a general revision of the MAF survey has been conducted. In particular, the questionnaire has been reviewed in order to enlarge the information examined and to finalize it to the national accounts purposes. Tables on labour input, balance sheets and farm expenditures were added. These new pieces of information are important for compiling the Economic Account of Agriculture.

The elaboration of production was made directly: the quantity of production multiplied by the average price (there is no different prices for different uses). The own-account production of agricultural goods for own final consumption is included in the production account. For the estimation of the intermediate consumption we refer to the new questionnaire which allowed the quantification of the costs and included the expenses made over the year for seeds, chemical and natural fertilizers, electricity, water, paid services, fuel and other materials. The results obtained have allowed the construction of the resources and uses account for the agricultural sector. This is an important innovation for the Albanian statistical system, which improves the coherence between the supply and demand side estimates.

The non-agriculture market activities

The estimate of the output in non-agriculture market non financial activities is mainly based on the following main data sources:

1. Statistical Business register;
2. Annual structural statistics survey;
3. Balance sheets (loss and profit account);
4. VAT declaration (more in general fiscal register).
5. Other data from technical ministries, etc.

For each source, the internal coherence of individual data is checked by ascertaining that accounts are balanced, data in different tables are consistent and the main data are economically sound. External coherence of both sources is also checked for each year based on the identity of current accounts available in both sources.

The processing of data includes two main phases. In the first stage, the various files coming from surveys and balance sheets are revamped. The purpose is to get a common format; it is also an opportunity for checking the internal coherence of balance data and survey data. For large and medium enterprises internal discrepancies are reduced on a case-by-case basis. For smaller enterprises any internal discrepancies are eliminated by automatic adjustments. As a result it is possible to calculate the production, intermediate consumption and value added on the level of individual enterprises. After all these controls and adjustments, the micro-database file is created.

From a general point of view data are collected from enterprises, therefore an estimation base on local kind of economic activities is not performed. From a theoretical point of view this is an import drawback, but, in practice, it

does not cause a relevant bias in the estimates because, in Albania, enterprises with more than one activity are very limited.

For the financial institutions, value added is derived from accounting records for banking, and other financial institutions from statistics of the supervisory board for insurance.

Rent: These activities cover the actual rent and imputed rent as well. The first estimates of imputed rent (rent considered as being paid by the owners of dwellings) are based on the data of stock of dwellings and estimates of the rent paid per square meter. Actual rent covers the rent for publicly-owned dwellings and the rent paid to private owners who rent dwellings (also some information coming from the CPI compilation was used).

The value added of government services is estimated by adding the cost items obtained from accounting records provided by the Macro Economic Department in Ministry of Finances. In accordance with the SNA'93 rules output is evaluated at basic prices, that means without taxes on products and import but with subsidies on products and import. Based on the information coming from the consolidated budget and Government Financial Statistics (GFS), a breakdown of subsidies by activities was done, therefore the output was estimated at basic prices. Taking into account the legislation in place for the examined period and the SNA'93 methodology –using GFS data and those coming from the consolidated budget - taxes on products and imports were identified. The most relevant of those taxes are: Value added tax; Excises; Customs duties. It is important to stress that, at present, source data do not provide sufficient detail on production taxes to allow a proper evaluation of transaction. No adjustments are made to convert taxes and subsidies from cash to an accrual basis.

Intermediate costs are valued at purchaser prices and INSTAT, in line with ESA95, has an on going project to make appropriate adjustment to exclude deductible tax.

In order to estimate the non observed economy the Italian method (Labour Input Method) has been adapted to the Albanian situation, which has replaced the previous expert method. The labour input method consists of the comparison of the data coming from labour force survey conducted to the households and the data from surveys to enterprises. The procedure synthesized in this method allows to define a national account target population in terms of employed persons. Therefore it is possible to estimate the corresponding value added (as well as output and intermediate cost), for non-observed economy.

For data at constant prices, taking into account the availability of price / volume indices, different methods for deflation are used, both the single extrapolation of value added with the volume index of output and double deflation. The single extrapolation of value added with the volume index of output was mainly applied to the branches of services and the double deflation for the manufacturing industries, using the Producer Price Index. For construction and transport the deflation is done using volume indices available. In general, for each product in agriculture, for each year, the data on output and intermediate consumption in quantity and in prices are available. The estimates of the output and the intermediate consumption at prices of the previous year are obtained by multiplying the quantity at time t with prices of time $t-1$.

The volume of the value added within construction activity is obtained by deflating the value of the output of the production and intermediate consumption by the total of construction cost index (CCI). Using the CCI as a deflator for both output and intermediate consumption is an invalid method for measurement of volume of the construction.

Concerning internal trade activity the turnover was deflated with CPI for goods and then the volume index for turnover was used to extrapolate output. Other market services are mainly deflated using appropriate components of CPI. General government and NPISHs activities were deflated using the wage index as price index for gross value added and CPI to deflate intermediate consumption.

Source

Reply to the United Nations national accounts questionnaire from the Office National des Statistiques (ONS), Alger. Official estimates are published in "Comptes Economiques" by the Direction des Statistiques et de la Comptabilite Nationale, Secretariat d'Etat au Plan, and in the "Annuaire Statistique de L'Algerie" by ONS.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Andorra

Source

The preparation of national accounts statistics in Andorra is undertaken by the "Servei d'Estudis" at Andorra's Ministry of Finance. The data displayed have been submitted directly to the United Nations Statistics Division through the UN national accounts questionnaire.

General

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated only by production approach.

Production Approach

Gross value added of the economy is valued at basic prices and defined as the total productive activity of the resident units of production as measurable in monetary transactions. Since information enabling a direct computation of value added is not available for the majority of economic sectors, the "Servei d'Estudis" has made an estimation of this macroeconomic aggregate by means of an indirect method, which has been applied to all the economic sectors with exception of the banking sector. The indirect method multiplies the compensation of employees declared for each economic activity with the Andorran Social Security Fund "Caixa of Seguretat Social (CASS)" with a technical coefficient "VAB" (Gross Value Added/ Compensation of Employees at basic current prices) for each activity. This coefficient is calculated on the primary sector by the "Institut des Comptes Nationaux" (INR-ICN) from Belgium and the other sectors are calculated by the National Institute of Statistics of Spain (INE) from Canarias when estimating the regional accounts of Spain.

The value added for the financial sector is estimated on the basis of balance sheets and profit-and-loss statements of the banking organizations that operate in Andorra. The GDP value is computed by adding indirect taxes collected by the central administration to the Value Added. Computation of integrated institutional sector accounts has not been implemented since currently only rudimentary information is available, i.e. on the government sector and the household sector but not on the other sectors. GNI cannot be computed since data on transactions of the domestic sectors with the Rest of the World is not available.

Angola

Source

Data were produced by the Ministry of Planning of Angola and provided to the United Nations by the National Statistics Institute of Angola (INE - Angola). These data are official as of July 2012 and until a new set of National Accounts is compiled and published by INE, which is slated to happen by the end of 2012.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

GDP is compiled only according to the production approach. Value Added is measured at factor cost.

Argentina

Source

The preparation of national accounts statistics in Argentina is undertaken by Dirección Nacional de Cuentas Nacionales (DNCN) INDEC. The official estimates are published by the DNCN in "Economic Activity Press Release" and by the Ministerio de Economía in "Economic Report". In 1999, the publication "Sistema de Cuentas Nacionales, Año Base 1993" was presented and contains detailed description of the sources and methods used for the national accounts estimation, in accordance with the United Nations System of National Accounts 1993 (1993 SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, gross investment in construction and machinery and exports and imports of goods and services. The commodity-flow approach is used to estimate the current value of private final consumption expenditure and the gross investment in machinery and equipment by sector of origin, using indices of prices and quantities for sectors producing domestic and imported goods. Coefficients for the allocation of economic use are determined on the basis of the nature of the goods involved. Government final consumption expenditure is estimated in accordance with budgetary information from national, provincial and municipal government. Investment in construction is estimated with a physical volume index prepared as a weighted average of labor (data from the social security system) and material inputs into the construction industry.

The estimation of domestically produced capital goods is done on the basis of the industrial censuses. For the years between censuses, the data are updated through a combination of indexes of physical output and price indexes. Data on exports and imports of goods and services are obtained from the balance of payments accounts. Constant values of government consumption expenditure are obtained through deflating purchases of goods and services by the average of the wholesale and the consumer prices. Private consumption expenditure at constant prices is obtained with a commodity flow method. Construction cost is used by multiplying the price index with the constant values for construction to obtain current values. Domestic machinery and equipment products are deflated by the price index of producer prices or extrapolated by volume of production. Imported machinery and equipment are deflated by capital goods import price index. Price deflation is used for exports and imports of goods and services.

Income Approach

The estimates of compensation of employees are based on employment data and remuneration data (sources: social security system and Permanent Household Survey). Operating surplus is, in general, obtained as a residual.

Production Approach

The production approach is used to estimate value added of most industries. The basic statistics on agricultural production are obtained from the Secretaría de Agricultura y Ganadería, Pesca y Alimentación (SAGPyA), producers' associations and other relevant institutions. Livestock quantity estimates output are based on information provided by SAGPyA and other relevant institutions on the basis of surveys, administrative records and estimates on production and stocks for different species. Prices of outputs and inputs are collected within the framework of the INDEC prices indices system. For fishing and related services the data used is based on the deep-sea catches on quantities by species and by type of vessel, provided by the SAGPyA. Monthly data on prices by species are available from the INDEC system of wholesale price indices.

The data needed to calculate the value added of mines and quarries is provided by the SubSecretaría de Energía (quantities produced and prices of oil and gas) and the Secretaría de Minería (other minerals). The main data sources used in estimating industrial production are the monthly and annual surveys for the manufacturing industry and the industrialists' chambers and administrative data sources for some industries. Data on production at current prices as well as volume indices at the level of five digits of the industrial classification are obtained from the surveys. The other data sources vary according to the activity, although they are mainly data on quantities produced. The value added of supply of electricity, gas and water are provided by the enterprises, covering 100% of the industry in electricity and gas and the relevant enterprise in water. Prices are obtained from wholesale price index system of the INDEC.

Data on the physical volume index is prepared as a weighted average of labor (social security system) and material inputs into the construction industry are used to estimate the value of construction. Information on prices derived from the INDEC system of construction cost indices. Gross output of the trade sector is estimated through applying gross percentage mark-up rates to the value of goods recorded as entering the various marketing channels. The main sources are economic census of 1994, production from monthly industrial surveys and foreign trade statistics. Other data sources include the stocks of vehicles used to estimate vehicle repairs. The value of hotels at constant prices are based on trend movements of this industry estimated from press information, tourism flow data and the travel category in the balance of payments (Dirección Nacional de Cuentas Internacionales).

The value of restaurants at constant prices is derived from a demand corresponding to hotels and restaurants in the consumer price index. Different kinds of indicators are used for the estimates of land transport services depending on the type of service. Thus, indicators used include: the number of passengers and tons transported by railways, commodity flow data for road transport of goods, number of passengers transported by buses, demand functions for expenditure on taxis, etc. Relevant price indices for the corresponding items of transportation are available from the wholesale and consumer prices indexes compiled by the INDEC. Quarterly estimates for air transport are based on information (transported passengers and cargo) from Aerolíneas Argentinas (the largest airline) and consumer price indices compiled by the INDEC. Quarterly information from all airlines is used for the revised quarterly estimates.

The indicator used for the water transport industry is the income from freight by resident producers. Related services are estimated on the basis of a variety of indicators such as hotels and air transport (travel agencies), the commodity flow method (warehousing), export and import cargoes (port activities), number of crossing vehicles (tolls), etc. Prices indices from the wholesale and consumer price indices as well as tariffs for specific services are available. For communications the data used is based on financial information of the enterprises belonging to this sector and are available quarterly as a basis for the current price estimates. Volume indicators are calculated for telephone services based on the data reported by the telephone companies on the number of telephone lines in service, invoiced impulses, and minutes of international calls (incoming and outgoing). Relevant price indices from the system of wholesale price indices of the INDEC and specific tariff price indices for some of the communication services are available to deflate current price data.

The value added of financial intermediation is based on financial and quantity data of the banking system. Quantity data, and in some cases, also financial data, are available for others producers of financial services. Monthly data

on insurance premiums and quarterly financial statements are available for insurance companies. Value added in the real estate, renting and business activities, is estimated from the stock of dwellings and different indicators for each of the business services: number of deeds in Buenos Aires (real estate) or yield of the judicial tax (judicial activities). The value added of public administration and defense is based on compensation of employees on accrual basis from the execution of the national budget and are available from the integrated system of financial information (SIDIF). Data on the execution of the budget by the provincial and municipal governments are supplied by the Dirección Nacional de Coordinación Fiscal con las Provincias (Ministerio de Economía). Volume indices of employment (based on number of persons) for each of the government levels are available for the estimates at constant prices.

The value of public education is the same as for public administration plus full coverage financial and physical data from extra budgetary educational institutions. Estimates for the private education are compiled on the basis of labor (social security system). The value of public health is the same as for public administration. Volume indices are compiled based on quantities of services provided from administrative records. Quantity indicators related to outpatient consultations, emergency rooms and hospitalization are obtained from a sample of medical centers in Buenos Aires and major cities are the basis for the estimates for the private health industry. Price indices of drugs, wages and medical services are available from INDEC and SIJP. For other activities involving community, social and personal services, values are estimated on the basis of demand functions. The value of the domestic services is estimated on the basis of labor (Encuesta Permanente de Hogares of INDEC).

Armenia

Source

The Macroeconomic Indicators and National Accounts Division of the Republic of Armenia's National Statistical Service is responsible for compiling and disseminating official national accounts statistics. National accounts are disseminated in the following publications: Socio-Economic Situation of the Republic of Armenia (monthly publication); Statistical Yearbook of Armenia (annual publication); and National Accounts of Armenia (annual publication), as well as on the National Data Summary Page (NSDP) requested by SDDS (<http://docs.armstat.am/nsdp/>) and on NSS RA website as time series in spreadsheet files (<http://www.armstat.am/en/?nid=263>). Detailed information is available under "publications" on the website of the National Statistical Service of the Republic of Armenia: (<http://www.armstat.am/en/>).

General

The national accounts of Armenia are compiled in line with the key concepts, categories and notions of the methodological bases for the 1993 System of National Accounts. Schedules for the release of statistical publications (data) are contained in the annual statistical work programmes approved by the State Statistical Council of the Republic of Armenia. The annual programme is approved within one month following the adoption of the State budget by the National Assembly of the Republic of Armenia. A schedule for the release of data, which provides information on exact dates for the release of data three months in advance, is also available on the International Monetary Fund's Dissemination Standards Bulletin Board at the following website: <http://dsbb.imf.org>. The website includes the following: the Statistical Yearbook of Armenia (annual publication); the National Accounts of Armenia, 2010 (annual publication); and Quarterly GDP data. Note that quarterly data are published 90 days after the reporting quarter and annual national accounts are published one year after the reporting year (during the fourth quarter). GDP in constant prices were reported in different ways: With 1998 BY, 2005 BY, in prices of the same period of the previous year and in average prices of the previous year. The series version with the latest reported data are presented in constant price tables. In Armenian national accounts, the calendar year is used as the financial year.

Methodology:

Overview of GDP Compilation

The production approach is the basic method used for GDP compilation. For the production approach, assessments are based on various sources, although primarily on the surveys of the National Statistical Service of the Republic of Armenia. The National Statistical Service conducts monthly (cumulative), quarterly and annual surveys of organizations engaged in all types of economic activities apart from agriculture. In the case of agriculture, data are collected from a 7,600 sample survey of 335,000 farms and data are also taken from some 100 commercial organizations. These data sources are also supplemented using data from surveys of households. Other sources include reporting data from the Ministry of Finance for general government services and tax revenues and subsidies. Data from the Republic of Armenia's Central Bank and commercial banks are used for assessment of financial-sector data. For the expenditure approach, categories of expenditure are assessed on the basis of data from surveys of households; surveys of trade and paid services; the resource balance used for agricultural products; reports from the Ministry of Finance on general government consumption expenditure; company reports on capital formation and inventory changes; and balance-of-payments data. For the income approach, data for assessments are obtained from labour-force surveys conducted by the National Statistical Service; reports from the Ministry of Finance on taxes and subsidies; and the quarterly and annual financial reports of companies submitted to the National Statistical Service.

Expenditure Approach

Final-consumption expenditure is calculated using retail trade turnover data, which are adjusted to account for the amount of purchases in the informal market; expenditure on paid services; production for own consumption; and consumption expenditure by general government and non-profit institutions. Data are adjusted on the basis of

household surveys and, in part, on the need for an overall balance between GDP calculated using the production approach and the final-use method. Assessments in the previous year's prices are made through deflation of final consumption and capital formation in current prices using the appropriate price indexes. Fixed capital formation is mainly calculated on the basis of data from statistical reports on capital investments; expenditures for major repairs; expenditures on geological prospecting work; increases in the value of livestock; expenditures for computer software and databases; expenditures on literary and artistic original productions; and also includes State budget expenditures for the acquisition of non-expendable equipment and other items. Balance-of-payment data are also used. A change in inventories is calculated on the basis of data from the statistical reports of enterprises. A change in the value of inventories is defined as the difference between the goods entering inventories and those being withdrawn from them. The value of the goods as a result of price fluctuations during the period that they are held in inventories — i.e. the influence of price fluctuations (holding gains) — is excluded from the value of changes in inventories. Data on export and import of goods and services are derived from balance-of-payments data, which are compiled on the basis of data from customs statistics, with an adjustment made for "shuttle trade". GDP in constant prices is estimated on the basis of the average annual prices of 2005. Quarterly data in average annual prices are obtained by deflating, using the quarterly price index (by component). Until 1999, the base year was 1996. For the years 2000-2006 the base year was 1998. Since the year 2007, the base year has been 2005.

Income Approach

The income approach is used for the calculation of GDP on an annual basis only. Remuneration of employees includes pay and employers' social-security contributions. These are recorded on the basis of the accrued amounts. Pay includes all forms of remuneration, in cash or in kind, irrespective of the sources of funding. Taxes on production and import include taxes on goods and imports and other taxes on production. Subsidies are current non-refundable and non-returnable payments that the State makes to enterprises on the basis of the production, sale or import of goods and services. Gross operating surplus and gross mixed income include the portion of the value added that is retained by the manufacturers after deducting expenditures. Gross mixed income is also included from the household sector.

Production Approach

The output data submitted are adjusted for "non-recorded" activities and the hidden economy. Bearing in mind the incomplete coverage, the non-reporting of data and the supply of unreliable information, calculations are based on data on production output, the number of persons employed and the number of persons engaged in production, as derived from regular statistical reporting and labour-force surveys. Indirect macroeconomic methods are also employed using a combined information base. GDP is compiled in current prices, the prices of the previous year and constant prices (using 2005 as the base year). Data are valued in last year's prices using the double deflation method. These prices are based on volume, price and extrapolation indexes. In this instance, use is made of the indicator of the number of employees or other sectoral-activity indicators. GDP in constant prices is estimated on the basis of the average annual prices of 2005. Quarterly data in average annual prices are obtained by deflation, using the quarterly price index (by sector and component).

Overview of the Compilation of the Integrated Economic Accounts

Integrated economic accounts cover all transactions defined in the 1993 System of National Accounts within the entire territory of the Republic of Armenia. Illegal activities are excluded. A number of statistical indicators are evaluated related to the "non-recorded" part of the economy and the hidden economy, with the exception of illegal activities. The non-observed economy is estimated to account for approximately 25 per cent of GDP.

Institutional units are economic units that are capable of owning assets and entering into commitments in their own right. They are able to engage in all kinds of transactions and are central to decisions taken in all aspects of economic life. Institutional units are grouped into main institutional sectors on the basis of their principal functions, behaviour and objectives. A sector is a collection of institutional units which are similar from the point of view of their functions and financing sources.

The five sectors of the national economy are as follows: non-financial corporations; financial corporations; general government; non-profit institutions serving households; and households.

Non-financial corporations are institutional units whose principal activity is the production of market goods and non-financial services; Financial corporations are institutional units which are principally engaged in financial intermediation or in auxiliary financial activities; General government refers to institutional units which, in addition to fulfilling their political responsibilities and their role of economic regulation, produce principally non-market services for individual or collective consumption and redistribute income and wealth; Non-profit institutions serving households are legal entities which are principally engaged in the production of non-market services for households. Their status does not permit them to be a source of income, profit or other financial gain for the units that establish them. The main resources of these institutions are voluntary contributions from households; A household is a small group of persons who share the same living accommodation, who pool some, or all, of their income and wealth and who consume certain types of goods and services collectively, mainly housing and food. Units included in the households sector participate in production with their labour force and acquire goods and services in the market. Furthermore, households are sometimes owners of small unincorporated enterprises (farms, family restaurants, shops, etc.).

These unincorporated enterprises produce goods and services for sale in a market, but also sometimes partly for their own consumption. The financial outcome of the activity of unincorporated establishments is the mixed income, including both the surplus elements and the remaining remuneration of work. In order to reflect the interlinkages of the above-mentioned sectors with other countries, a nominal "rest of the world" sector was established, consisting of all non-resident institutional units that enter into transactions with residents of the national economy. A number of statistical indicators related to the "non-recorded" part of the economy and the hidden economy are evaluated, with the exception of illegal activities.

The non-observed economy is estimated to account for approximately 25 per cent of GDP. The "non-recorded" economy has been evaluated as part of GDP since 1994. It is evaluated using the production approach and the final-consumption method. Data on the number of employed and unemployed persons in the economy and on productivity are used to make readjustments and revaluations. Together with this data, indirect macroeconomic methods are also employed, i.e. all possible sources of information, such as the expert assessments of specialists, the results of surveys and questionnaires, and data from household surveys.

Methods of evaluation vary for the different economic sectors and the choice of method depends on the capacity of the information base. Data on the number of persons employed in the economy and the number of employed persons recorded in regular statistical reports are used for the calculations. These two sources are used to determine the actual number of persons employed for whom the necessary statistical information is lacking. It should be noted that, in order to calculate the number not recorded in statistical reports and to calculate labour productivity by economic sector, the number of employees in part-time employment and on enforced leave is excluded from the total number of employees. This number represents the number of "hidden unemployed". Calculations also take into account the number of workers engaged in job-sharing. All consolidated accounts are consistently compiled for all institutional sectors. There are not considered to be any remaining institutional sectors. There are no alignments or adjustments between capital and financial accounts with respect to net lending/borrowing.

Reply to the United Nations national accounts questionnaire from the Central Bureau of Statistics, Aruba. Official estimates are published by the Central Bureau of Statistics in the "National Accounts of Aruba, 2004 – 2009, preliminary figures".

General

The estimates shown in the following tables have been prepared in accordance with the System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Australia

Source

Reply to the United Nations national accounts questionnaire from the Australian Bureau of Statistics (ABS), Canberra. The official estimates are published in the ABS Australian System of National Accounts, (cat. no. 5204.0). The data for Australia was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

Since 2010 Australia compiles national accounts data according to the 2008 SNA, previously having prepared data in accordance with the international standards contained in the System of National Accounts, 1993 (1993 SNA). However, the tables in this publications are compiled according to the 1993 SNA. The detailed data compiled according to the 2008 SNA can be accessed via the ABS web site <http://www.abs.gov.au>. Detailed information on the compilation of the Australian national accounts is contained in the ABS publication Australian System of National Accounts: Concepts, Sources and Methods (cat. no. 5216.0). Quarterly estimates of the Australian national accounts are published on the first Wednesday of the third month following the reference quarter in Australian National Accounts: National Income, Expenditure and Product (cat. no. 5206.0). Annual estimates are released on the first Wednesday in November following the reference year in Australian System of National Accounts (cat. no. 5204.0). In addition, input-output tables are released in Australian National Accounts: Input-Output Tables (cat. no. 5209.0) and Australian National Accounts: Input-Output Tables (Commodity Details) (cat. no. 5215.0). Footnotes are provided when the scope and coverage of the estimates differ for conceptual or statistical reasons from the standards of the SNA93. Estimates relate to the fiscal year beginning 1 July, unless otherwise shown.

Methodology:

Overview of GDP Compilation

Gross domestic product (GDP) is estimated in Australia using three approaches: the income approach (I), the expenditure approach (E) and the production approach (P). A description of each approach is provided below.

While each of the I, E and P measures should, conceptually, provide the same estimate of GDP, if the three measures are compiled independently using different data sources, then different estimates result. From 1994-95, up to the year preceding the latest complete financial year, balanced supply (production) and use (demand) tables by commodity are compiled. The annual GDP (I, E and P) estimates are then benchmarked to these balanced supply-use estimates, ensuring the annual estimates using the I, E and P approaches are identical for the years for which supply and use tables are available.

Prior to 1994-95, and for the latest financial year and for quarterly estimates for all years, the estimates using each approach are based on independent sources, and there are differences between the income, expenditure and production estimates. Nevertheless, for these periods, a single estimate of GDP has been compiled. In chain volume terms, GDP is derived by averaging the chain volume estimates obtained from each of the three independent approaches. The current price estimate is obtained by reflatting the average chain volume estimate by the implicit price deflator derived from the expenditure-based estimates.

As a result of these methods, there is no statistical discrepancy for annual estimates from 1994-95 up to the year prior to the latest complete financial year. For years prior to 1994-95, and the latest financial year and for quarterly estimates for all years, statistical discrepancies exist between estimates based on the I, E and P approaches and the single estimate of GDP, in both current prices and volume terms.

Expenditure Approach

Government final consumption expenditure and public gross fixed capital formation are estimated from the accounting records of the government sector. Private final consumption expenditure on goods is mainly derived from information collected in retail censuses (held approximately every six years) as well as data on production, imports and exports, and motor vehicle registrations. The results of a monthly survey of retail sales are used to interpolate between census benchmarks and to extrapolate for the period since the last retail census. Benchmarks for dwellings rent are derived from population census data collected every five years. The consumer price index is used in conjunction with a perpetual inventory model of the stock of dwellings to interpolate between census year estimates and extrapolate from the most recent census. Estimates of expenditure on other services are based mainly on revenue or earnings data. Increase in inventories is based on book value levels of inventories reported in ABS economic censuses and surveys, taxation statistics and ABS Quarterly Business Indicator Surveys (QBIS) (less the inventory valuation adjustment). Estimates of private gross fixed capital expenditure are obtained from a quarterly collection of building and engineering construction statistics and from a quarterly survey of new capital expenditure by private businesses on plant and equipment. Exports and imports of goods are estimated from customs data while exports and imports of services are derived from transportation survey data and from data obtained as a by-product of the administration of foreign exchange transactions. Chain volume measures are derived quarterly with annual estimates obtained by summing the quarterly series. Government consumption expenditures are deflated by composite wage rate and material price indexes. Substantial use is made of consumer price indexes in the deflation of private final consumption expenditure. Estimates of gross fixed capital expenditure are deflated using (output) building price indexes for building; composite wage and material price indexes for engineering construction; producer price indexes and import price indexes for equipment; and quantity revaluation for real estate transfer expenses. For exports and imports, considerable use is made of the quantity revaluation technique with the remainder deflated using price indexes. Increase in inventories volume estimates are derived using detailed price indexes to revalue book value levels.

Income Approach

The components of indirect taxes (net) are estimated from government accounting records. Estimates of gross operating surplus are mainly based on annual ABS Economic Activity Survey (EAS) data supplemented by taxation statistics. The annual estimates are then moved on a quarterly basis using an indicator series [Company gross operating profits] from the ABS Quarterly QBIS. Gross mixed income (GMI), which denotes the income from unincorporated enterprises, is derived separately for the farm and non-farm sectors. Annual GMI for the non-farm sector is derived from taxation statistics supplemented with information from ABS and other sources and moved quarterly using a range of data relating to turnover (e.g. retail sales and building activity). GMI of farm unincorporated enterprises is derived using a range of ABS and non-ABS sources. Estimates of the consumption of fixed capital are derived at current replacement cost using the perpetual inventory method. Compensation of employees data for the private sector are based on ABS Economic Activity Survey data, moved quarterly using QBIS. Compensation of employees data for the public sector are currently based on a survey of employment and earnings.

Production Approach

GDP using the production approach is derived as the sum of gross value added for each industry, at basic prices, plus taxes less subsidies on products. The current price estimates of gross value added by industry are only produced annually. For years prior to 1994-95 the estimates were derived for the most part using the income approach only. For years from 1994-95 they have been derived in a supply-use framework and are in balance with the expenditure estimates on an annual basis for all years prior to the latest complete financial year. The annual benchmark estimates are based on ABS EAS data supplemented by taxation statistics.

Quarterly chain volume measures of gross value added by industry are derived by interpolating and extrapolating annual benchmarks using quarterly indicator series. Both the annual benchmarks and the quarterly indicators are calculated as chain volume measures. From 1994-95, the annual benchmarks are obtained from supply and use (S-U) tables compiled in the prices of the previous year.

Quarterly chain volume indicators of gross value added in the Australian national accounts are derived using three different methods:

- the output indicator method (the most common method);
- double deflation (used for Agriculture estimates); and
- the input indicator method

The method selected to obtain chain volume measures for a particular industry depends on the data available in respect of that industry.

In the Australian National Accounts, the QBIS data are used extensively for those industries for which the output indicator method is used. A range of other data is also used such as output volume data for certain industries, other ABS survey data (e.g. Retail Turnover Survey, Building Activity Survey, etc.), public finance data and other indicator data. More information can be provided on request.

^a Discrepancy between GNI and components equals to the statistical discrepancy reported in Table 2.1 (Value added by industries at current prices), to adjust GDP by production approach and GDP by expenditure approach.

^b Discrepancy between components and total which is equal to the statistical discrepancy to adjust GDP by expenditure approach and GDP by production approach.

^c Discrepancy between gross value, consumption of fixed capital, and net value.

Austria

Source

The preparation of annual national accounts statistics in Austria is undertaken by the Directorate of Macroeconomic Statistics at STATISTICS AUSTRIA, the Austrian National Statistical Office located in Vienna. The official estimates are published annually on the internet (www.statistik.at), as well as in the Statistical Yearbook. At present, a consistent time series is published back to 1976. All data are available in the yearly publication "Volkswirtschaftliche Gesamtrechnungen – Hauptergebnisse" as well as online (www.statistik.at). In January 2007, a revised version of the comprehensive methodological inventory on GDP compilation was submitted to EUROSTAT. The inventory describes in detail all methods applied in compiling the SNA accounts and exhibits numerical results. This detailed background information as well as other metadata such as quality reports and a quarterly NA inventory is also online available. The data provided to UNSD were received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Input-output tables have been published for the years 1961, 1964, 1976, 1995, and 2000. Supply-use tables are published every year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. On 1 January 1999 the conversion rate of the national currencies to the new currency Euro was irrevocably fixed and the Euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in Euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'Euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'Euro'. In the case of Austria the currency name for the data before 1999 is "1999 ATS Euro". For international comparisons, like for example when converting national data into US dollar the data before the Euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 13.7603 Austrian schilling. - The name of the currency of the newly submitted data is "1999 ATS Euro" for the data before 1999 and "Euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Austria, like for example all old data following the 1968 SNA is still in "Austrian schilling", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and expenditure approaches. The income approach is treated residually. Input-Output tables are compiled every five years, according to the respective European legislation. Supply-use tables are compiled each year and the results are taken as benchmark values for GDP compilation in current prices. The integration process in volume terms is currently under way. Since 2004 GDP and other transactions in real terms are compiled at prices of the previous year and the changes are presented as volume indices.

Expenditure Approach

The estimates of government final consumption expenditure are derived from production accounts compiled on the basis of the accounting records of the various authorities. The values of private expenditure on goods are mostly obtained by means of the commodity flow method, either by multiplying the quantity data by average consumer prices or by adding distributive margins and turnover tax and indirect taxes to the value of goods produced

domestically or imported. The sources of data include statistics on agricultural produce, industrial output data by commodities, data on energy and foreign trade by commodities, motor vehicle registration statistics, closed accounts for public transportation enterprises, communication, insurance and others. In addition, household budget surveys, carried out every five years, provide benchmark information. For price data the consumer price index is largely referred to. Own-account consumption is valued at producers' prices, for use of owner-occupied dwellings the corresponding market rents are imputed. For private expenditure on services, the estimates are mostly based on the respective production accounts as well as value added tax statistics. The data on increase in stocks are based on regular stock surveys covering almost all branches; those that are not covered are estimated. For gross fixed capital formation in machinery and electrical equipment, the value of domestic production plus imports minus exports is adjusted to include transport costs, trade margins, customs duties, etc. The estimates of transport equipment are based on registration statistics and are obtained by multiplying the quantity by the current prices. For construction, the gross value is derived from data on characteristic gross output, with additions for material supplied, non-characteristic construction (including own-account construction, e.g. residential buildings). The estimates of exports and imports of goods and services are based on foreign trade statistics and the balance of payments. Constant price estimates of government final consumption expenditure are based on deflation for intermediate consumption and non-commodity sales. Compensation of employees is in certain activities also deflated, for others quantum indicators are used. For private consumption expenditure, direct revaluation at base-year prices is used where information is available on quantities of commodities consumed. Otherwise, the current estimates are deflated by appropriate price indexes. This same method is used for increase in stocks, exports and imports of goods and services and for gross fixed capital formation.

Income Approach

Estimates of compensation of employees are based on contributions paid by employers to government funds and wage statistics, as well as structural business statistics. Direct information is available on compensation of government employees. Operating surplus/mixed income is basically derived as a residual item. Further information is gained from income tax statistics for unincorporated enterprises, independent professions and property. Corporate balance sheets and tax statistics are used for undistributed profits of corporations: for agriculture and forestry income is derived from the production account. In the case of the public sector, data are obtained from the accounting records of public bodies. Depreciation estimates of stocks are obtained either by using the perpetual inventory concept or, in some instances, are extrapolated by net output at constant prices and inflated by national accounts' price index for fixed capital formation. Indirect taxes and subsidies are obtained directly from the records of the various governments.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added of nearly all industries. The income approach is used to estimate value added of public administration and defence. The value added of agriculture is obtained by deducting the cost of all non-factor inputs from the gross value of production, which include an imputation for produce consumed on the farms. The calculations are based on production statistics for quantities, and on agricultural price surveys. Mining and quarrying, manufacturing, electricity, gas and water, construction, trade, transport, financial intermediation as well as business services are surveyed by annual structural business statistics. Benchmark estimates have been prepared for 1995, when the last full census was carried out and for 2000, for which the latest Input-output table was compiled. When necessary extrapolation is based on output statistics, sample survey and turnover statistics.

Estimates of restaurants and hotels are based on SBS information and additionally other suitable indicators (private accommodation) are used. For railways and air transportation and communication, additional information is derived from the accounts of concerned enterprises.

For the financial institutions, value added is derived from accounting records for banking and other financial institutions from statistics of the supervisory board for insurance. Data on real estate are obtained from decennial housing censuses and micro-census data on housing and rents. In the case of owner-occupied dwellings, rents paid for comparable dwellings are applied. The value added of government services is calculated by adding the cost items obtained from accounting records.

The estimates of other services are based on annual turnover statistics, value added tax statistics and various net to gross ratios obtained from the 1995 census of non-agricultural establishments. The value of domestic and health services is calculated by means of VAT, social security and wage statistics. For the constant price estimates, double deflation is used. A variety of price indices is used, such as: producer price index for agriculture, manufacturing and for selected business services, whole sale price index, consumer price index, PI for investment goods, collective wage index, construction price index. Volume indicators are created for some health services. In manufacturing, a combination of double deflation and fixed net ratios is applied. The turnover of wholesale and retail trade is deflated by appropriate price indexes. For the producers of government services, partly quantum indicators, partly suitable price (wage) indexes are used.

Azerbaijan

Source

The preparation of national accounts statistics in Azerbaijan is undertaken by the National Accounts Statistics Department at State Statistical Committee of Azerbaijan Republic, located in Baku. Data on national accounts statistics are published annually in "National Accounts of the Azerbaijan Republic" (Azeri and English), Statistical Yearbook - "Statistical Indicators of the Azerbaijan Republic" (Azeri and English), "Azerbaijan in figures" (Azeri and English), on the internet (www.azstat.org); quarterly in "Statistical review" (Azeri), monthly in "Socio-Economic Development" (Azeri) and Press-releases (Azeri).

General

The "System of National Accounts, 1993" (1993 SNA) provides the framework for compiling national accounts. The definitions and concepts of national accounts for the aggregates and balancing items are derived from 1993 SNA. The methodological issues of compilation of national accounts statistics recently published in "Methodology on statistics" (2002, 2003), "Compilation of national accounts by institutional sectors and definition of its indicators" (2005), "Estimation of GDP on base of supply and use tables data" (2006) and etc. The recording period for annual accounts is the calendar year. The previous year and 2001 serves as the base year for data series at constant prices.

Methodology:

Overview of GDP Compilation

GDP data are currently published using the national Classification of Types of Economic Activities based on NACE. GDP cover all resident units, including producers engaged in unrecorded activities. The contribution of the informal sector to GDP is estimated on the basis of budget and special surveys, and added to annual GDP by production activities. Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled.

Following the 1993 SNA all non-financial transactions are covered. The entire territory of the Azerbaijan Republic (exclude occupied territories) is covered. Special sample surveys are conducted to estimate unrecorded production not included in the regular national accounts compilation. For this purpose, the data from household budget surveys, retail trade turnover and transport, balance methods, the State Tax Committee and Customs Committee and other supervisory agencies are used.

Production output is valued at basic prices. Intermediate and final consumption are recorded at market prices. Gross fixed capital formation is recorded at market prices. Non-market production is valued on the basis of outlays. Imports and exports of goods and services are valued on an FOB basis. The monetary unit is Manat. Input-output tables were compiled for 2001 in 2006.

Expenditure Approach

Basic data sources for estimation of GDP through expenditure approach are: household Budget Surveys and surveys of retail trade; reports on incomes and expenditures of nonprofit institutions serving households; - annual budget report provided by MOF; reports on the balance sheets of enterprises and data on imports of capital (investment) goods, and on investment expenditures of government; reports on customs payments, and import and export of goods and services provided by the customs authorities; balance of payments data provided by the Central Bank of Azerbaijan (CBA).

Consumption expenditure of households is estimated from household surveys and goods turnover in retail trade. Final consumption of nonprofit institutions serving households consists of expenditures on services provided to households free of charge. Final consumption of government is estimated from current expenditure reported in the annual state budget.

Fixed capital formation is estimated from the expenditure of enterprises and organizations on capital investments, geological prospecting operations, etc. Changes in inventories include changes in inventories of raw materials and supplies, goods for resale, finished products, and unfinished production. Net exports (less imports of goods and services) are derived from customs data that are adjusted by the CBA according to the BOP methodology and include also the adjustments on "shuttle" trade.

Estimation of data in prices of the previous year: The data in current prices are deflated by the appropriate components of the available price indices. Final consumption of households is deflated by the CPI. Government final consumption is extrapolated using employment data. Imports and exports of goods and services are deflated using value indices for imports and exports. Gross fixed capital formation is deflated using mainly the price index for capital investment.

Production Approach

Basic data sources for estimation of GDP through production approach are: monthly, quarterly and annual reports on production and expenses submitted to the SSC by enterprises. In general, monthly reports cover large enterprises, while the annual surveys include small enterprises as well; quarterly household surveys; monthly and annual employment and wage surveys; annual banking statistics provided by the Central Bank of the Azerbaijan Republic (CBA); the budget report of the Ministry of Finance (MOF); reports on customs payments and taxes of the MOF.

Additionally, the following activity-specific sources are used:

Agriculture: Production data in physical terms and data on prices of agricultural products. For most farms the first set of data is submitted by reporting farms, and the second set of data is obtained from price surveys of farms. In the case of privately operated farms, the data on farm productivity and yield per acre are collected in surveys of these farms, and the prices data are collected separately from surveys. Agricultural output is estimated as the product of output of crops and animal husbandry and corresponding prices. Output includes the change in the value of unfinished production in crop farming and animal husbandry.

Industry: Monthly, quarterly and annual report forms on production and expenses submitted by enterprises on a monthly and annual basis. Estimates of production and production expenses of units engaged in individual entrepreneurial activity are compiled from household surveys. Industrial output is compiled from the data on total production as reported by enterprises, excluding intra-factory turnover, i.e. the value of finished and semi-finished goods used within the enterprise.

Construction: Monthly, quarterly and annual reports of construction companies on completed construction and capital investments, and annual income and expenditure statements. Large enterprises report on a monthly basis; small enterprises on a quarterly basis; and all enterprises are covered on an annual basis. Gross output of construction is determined from the purchasers' side, and includes the value of construction and installation work, operational drilling, and other capital work. Individual construction activity is estimated using records of city and local governments relating to new and additional construction.

Transportation: Monthly, quarterly and annual reports of transport companies on freight and passenger turnover, and reports on income and costs. Gross output of transportation includes output of enterprises in rail transport, highway transport, waterway transport, aviation, small (individual) transporters.

Communications: Reports on the (monetary value of) services provided and costs submitted by postal service enterprises and electrical communications services, and reports on the (monetary value of) services provided submitted by small enterprises.

Trade and public food service: Reports on turnover submitted by enterprises engaged in retail trade and public food services, and data of other economic units engaged in this activity. Special quarterly surveys of city markets

and trade fairs. Output of retail and wholesale trade is determined as the difference between the value of sales and the purchase value of goods.

Finance, credit, insurance: Quarterly and annual statistical reports of the banking sector, the annual report of the Central Bank, and quarterly and annual reports of insurance companies.

General government: Monthly reports on revenue and expenditure of the government (MOF) and consolidated annual report on the budget, quarterly and annual reports of Oil Fund and State Social Security Fund.

Health care, education, social sphere, and other services: Annual surveys of enterprises engaged in providing these services, and data on current expenditure from the monthly and annual budget reports of MOF.

Output of non-market services is determined from the cost side, mainly from expenditures reported in the annual budget, and includes consumption of fixed capital. Output of market services of self-supporting enterprises and state-supported enterprises, including services provided by private individuals, is determined from sales volume.

Estimation of data in prices of the previous year: In the case of commodity sectors, volume indices are used to derive the estimates at constant prices of the previous year. For services, extrapolation is done using employment indices.

Overview of the Compilation of the Integrated Economic Accounts

The national accounts of Azerbaijan are in line with the SNA-93. It concerns all main definitions, including identification of boundaries of production activity, assets and liabilities. The following accounts are compiled: Goods and services; Production; Generation of the income; Distributions of primary incomes; Secondary distribution of income; Use of disposable income; and Accumulation accounts. There is a statistical discrepancy between balancing item of the Capital account and corresponding item of the Financial account.

The accounts are compiling for the following institutional sectors:

- Non-financial corporations;
- Financial corporations;
- General government;
- Households;
- Non-profit institutions serving households.

The account "Rest of the world" is also compiled for covering transactions with non-resident units. The "Rest of the world" accounts are compiled on the base of BOP data produced by the Central Bank of Azerbaijan. Institutional units are included in different sectors of economy in accordance with their functions and SNA-93 requirements.

The following data sources are used for the compilation of the integrated accounts in Azerbaijan: the data of the statistical reports of the enterprises and non-profit institutions; the data of the Central Bank and bank statistics; balance of payment; the report of the Ministry of the Finance on execution of the state budget, data from the Ministry of Taxes; the data of the State Social Protection Fund, State Oil Fund; the data from the households budgets survey, and also special sample surveys conducted in the different branches of economy.

The interrelation of indicators in the accounts of each institutional sector is made in the integrated table reflecting main intersectoral flows in economy.

Bahamas

Source

Department of Statistics within the Ministry of Finance is responsible for the compilation of the official national accounts statistics. Dissemination of the official national accounts statistics is in (a) Annual Report "The National Accounts Report" published during June/July of the year and (b) Online: www.statistics.bahamas.gov.bs and www.centralbankbahamas.com (after October of the year).

General

The latest estimates shown in the following tables (1989 to 2007) are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Overview of GDP Compilation:

The national accounts are primarily compiled by the production approach. It is also calculated by the expenditure approach. FISIM is applied as a whole rather than shared across the industries. Output is recorded at producer prices.

Supply & Use Tables:

The Department of Statistics created a Supply & Use Table for 2007.

In order to provide a series of years which allow for calculation of a GDP growth rate and in-depth analysis by local and international organizations, we calculated the years prior to and after 2007 using the original changes at the industry and sector levels, in an effort to ensure that the original economic relationships remain correctly reflected in the accounts.

The National Accounts Section periodically undertakes revisions to the data and in 2010 estimates for the GDP for 1997 to 2009 were revised based on the 2007 SUT and updated and improved benchmark data.

The updated benchmark data that facilitated the production of the 2007 SUT tables were:

1. The Introduction in 2008 of an extended Tourist Expenditure Survey which provided much more detailed information on tourist expenditures. It also raised significantly the overall level of tourist expenditure and thus Exports.
2. The Department of Statistics 2006 Household Expenditure Survey - which gathered information a wide list of household expenditure commodities. This also raised the overall level of Private Final Consumption Expenditure.
3. The Department of Statistics Economic Census was conducted for 2007 which had complete coverage, expanded the Business Register and gave more accurate estimates and changed the level of a number of industries.
4. The Department of Statistics is creating a Tourism Satellite Account for The Bahamas utilizing the 2007 SUT which gave insight into consumption and revenue patterns of the industries.

Industrial Classification:

The Industry grouping has been changed from International Standard Industrial Classification Rev 3 to International Standard Industrial Classification Rev 4.

Expenditure Approach

Government Final Consumption Expenditure is derived from an analysis of the Treasury Accounts. Private final consumption expenditure of residents has many constituent elements. A major part of the total was derived from the establishment survey and consists of revenue in retail trade, adjusted for sales made for purposes of gross fixed capital formation and sales made to other businesses. The revenues of hotels, restaurants and service establishments, medical and dental practices as well as revenues derived from personal expenditure on the services of accountants, lawyers and architects and the expenditure of charitable organizations as well as associations of individuals such as labor unions were all included. Gross paid and imputed residential rents for household accommodation was derived mainly from the census of population and labor force surveys. Paid and imputed service charges for personal banking and insurance services were also included. An estimate for expenditure in the informal economy was made.

The change in stocks data were obtained from records of public corporations and the establishment survey in retail and wholesale trade. Since, at the moment, no knowledge of inventory accounting practices exists nor are there any price indexes measuring the change in the value of inventories, these estimates must be considered rough approximations to the true change in the value of inventories. Presently no data exist in areas other than outlined above. The values of residential building construction and of other construction were based on the establishment surveys in the construction industry. Purchases of machinery and equipment were derived from detailed import data adjusted for custom duties and mark-ups. The value of exports and imports of goods and services are anchored to the balance of trade and balance of payment data estimated by the Department of Statistics and the Central Bank of the Bahamas respectively. The tourism data is based on Ministry of Tourism figures for expenditure by tourists.

Production Approach

GDP is estimated based on the aggregate estimate of gross revenue and intermediate consumption for each economic activity as defined by ISIC. Unless otherwise stated these data were derived from questionnaires asking for such detail as gross revenue, salaries and wages, expenses incurred in carrying out the business etc. These questionnaires were sent out to all commercial establishments. An establishment is defined as a unit of business that can give information on its gross revenue and specified items of cost. Most industries are covered by the Department of Statistics (DOS) "Business Establishment Survey".

For the largest entities in the various industries the survey is a census, while for the smaller entities a scientifically generated sample survey is used. Data in the agriculture and fishing industries were constructed from information obtained from the Departments of Fisheries and Agriculture. The financial industry data is obtained mainly from the Registrar of Insurance and from the Central Bank of the Bahamas who normally gather financial data from the insurance companies and banking institutions, respectively. The major portion of information for public administration, public education, and public health came from the treasury accounts of the government of the Bahamas. The industrial total thus derived is based on output at producer's prices minus intermediate consumption at purchaser's prices which yield gross value added at producer prices for each industry. The indirect taxes are subtracted and subsidies added in industries where it was possible to link these items, for example casino taxes were applied to the Casino Industry under Other Community Industry. For indirect taxes such as import duties that could not be distributed by industry these are deducted as a lump sum. The FISIM was also deducted as a lump sum. These calculations produce gross value added at factor cost. To derive gross value added at market prices, we then add in total indirect taxes, subtract the total subsidies and add in the statistical discrepancy to arrive at gross value added at market prices. The taxes less subsidies on products mainly represent the import taxes. Constant prices are calculated using a fixed base year of 2006.

Bahrain

Source

The estimates are published by the Central Informatics Organization in the "National Accounts of Bahrain". The following tables have been prepared from replies to the UN National Accounts Questionnaire by the Ministry of Finance and National Economy. 2001 is the base year for data at constant prices.

General

The estimates shown in the following tables have been prepared by the Statistics Department in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Barbados

Source

Reply to the United Nations national accounts questionnaire from the Barbados Statistical Service, Bridgetown, St. Michael. Official estimates are provided by the Statistical Service and published in the "Annual Statistical Digest" of the Central Bank of Barbados.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Belarus

Source

Annual statements are compiled by the Ministry of Statistics and Analysis in accordance with the system of national accounts of Belarus. Official statements (assessments) are published on a quarterly basis on the website of the Ministry, www.belstat.gov.by, and also in printed form, in the Russian and English languages. These include:

- Quarterly Statistical Bulletin;
- Quarterly statements of gross domestic product (GDP);
- Statistical Yearbook of Belarus;
- The National Accounts of the Republic of Belarus yearbook;
- The Republic of Belarus in Figures.

General

All national accounts data of the Republic of Belarus are compiled in accordance with the concepts and definitions of the System of National Accounts of 1993 (SNA 1993).

The methodology for the calculation of national accounts is described in detail in the publications “Methodological regulations on statistics”, first edition (1999) and second edition (2003), and in summary form in other national accounts publications.

In accordance with the regulations on the processing and presentation of GDP data, the final annual assessment of GDP is performed in December of the year following the reporting year. Detailed quarterly assessments of GDP are prepared 90 days after the end of each reporting quarter. Final quarterly assessments of GDP are performed in December of the year following the reporting year.

The calendar year is used as the financial year.

For constant price estimates, calculations are performed using the prices of the preceding year. The volume index is measured by the chain-link method, with a fixed base year that changes every five years. The current base year is 2005.

Methodology:

Overview of GDP Compilation

The primary method of estimating GDP is the production approach. GDP is also estimated using the expenditure approach. Additionally, input-output tables are compiled annually.

Expenditure Approach

Household final consumption expenditure includes expenditure on the purchase of consumer goods and services; and expenditure on the consumption of goods and services produced by households for their own final consumption.

Household final consumption expenditure is expressed in purchaser prices and is determined based on household sample surveys. The data from household surveys are adjusted to allow for various systemic errors (i.e., a reduction in the consumption of alcoholic beverages or cigarettes; or the household sample not being representative of the population).

The consumption of goods and services produced by households for their own final consumption includes the value of produce from farms (and private subsidiary plots) and the imputed value of services related to owner occupied dwellings. The value of goods produced by households for their own final consumption is determined

based on household sample surveys.

Government final consumption expenditure includes expenditure on consumer goods and services for both individual consumption and collective consumption. Such expenditure is financed from budgetary resources.

Individual goods and services provided by State institutions include education; culture and art; cinematography; media; healthcare and physical training; social policy; some household services; and other services.

Collective consumption expenditures provided by State institutions includes expenditure on general-purpose State bodies; law enforcement and security; scientific research; pension benefits; and other services. Government final consumption expenditure on collective services reflects the value of non-market services of such institutions, which is taken as equal to their current expenditure including consumption of fixed capital.

Information on government final consumption expenditure is derived from the consolidated budget performance report of the Republic of Belarus; the annual report of the Social Security Fund; and from surveys.

Gross fixed capital formation is taken into account at the time right of ownership is transferred to the institutional unit that intends to use it in production.

Ongoing construction using internal resources is included in the gross fixed capital formation of the builder as the work is carried out.

Equipment with a long production cycle (ships, transmission lines, etc.) is included in fixed capital formation at the time of delivery to the client.

The value of livestock is determined based on the number of livestock at the start and end of the year and the prices for each type of livestock.

The calculation of gross fixed capital formation is based on data from State statistical reports.

A change in inventories is defined as the difference between the goods entering inventories and the goods being withdrawn from them. In this regard, goods are valued at the prevailing market price at the time of entry or withdrawal. Purchased inventories are valued at the price paid by the purchaser. Inventories produced internally are valued at basic prices. In order to exclude the influence of price fluctuations (holding gains) during the period that inventories are held, the value of inventories is recalculated at the beginning and end of the accounting period using the mid-price for the accounting period with a corrective formula. To allow for variations in inventories and prices over the course of the year, the calculations are made at quarterly intervals; the size of the change in inventories for the year is the sum of the quarterly data.

Exports and imports of goods and services are based on foreign trade statistics and the balance of payments of the Republic of Belarus.

GDP at constant prices is determined as the aggregate of the components of GDP at constant prices. To compute the constant price for household final consumption expenditure, the sector is divided into groups of goods and services in accordance with the international Classification of Individual Consumption by Purpose (COICOP) and each value is deflated by the corresponding consumer price index. To compute the constant price for government final consumption expenditure and NPISH final consumption expenditure (classified by type of services), the value for type of service is imputed using the production account at current prices for the preceding year according and the volume index of the corresponding type of services.

Gross fixed capital formation at constant prices is calculated as the aggregate of the component elements of gross fixed capital formation converted to constant prices. The elements of gross fixed capital formation are converted to constant price by deflating the current prices using the corresponding price indexes.

For changes in inventories at constant prices, data at current prices are allocated in accordance with the sectoral structure based on the data of the input-output tables for the previous year; the data are then deflated using the price indexes of the corresponding sectors.

For both exports of goods and imports of goods, the value at constant prices is imputed using the value of exports (or imports) of goods at current prices for the preceding year and the volume index for the export (or import) of goods.

For both exports of services and imports of services, the value at constant prices is imputed using the value of exports (or imports) of services at current prices for the preceding year and the volume index. The volume index for exports (or imports) of services are calculated based on the value of the exports (or imports) of services and the export (or import) of services price index in United States dollars.

Income Approach

Compensation of employees is comprised of two basic components: wages, and deductions by employers for State social insurance.

Wages include remuneration for work performed and time worked; incentive pay (bonuses and supplementary pay for specialized skills, grade, length of service, etc.); compensatory pay (supplementary pay for hazardous working conditions, remuneration for work performed on days off, on public holidays, etc.); and remuneration for time not worked.

Employers' State social insurance deductions may be calculated on an actual or imputed basis. Actual social insurance deductions include payments made by employers to the Social Security Fund and to the State Employment Assistance Fund. Imputed social insurance deductions include social benefits paid by employers directly to their employees, former employees or their eligible dependents out of their own resources.

Information for the calculation of labour remuneration is derived from surveys of organizations and other administrative sources.

Information regarding taxes and subsidies on production and imports is derived from the consolidated budget performance report of the Republic of Belarus.

Gross operating surplus and gross mixed income are calculated as residuals.

Calculation of GDP by income is only performed at current prices.

Production Approach

GDP is reported at market prices. The production approach is used to measure the value added by all sectors in terms of the difference between output and intermediate consumption.

The output of the business sector includes the value of goods produced by industrial enterprises; subsidiary industrial production entities and small businesses; and the value of industrial goods produced in households.

The output of the agriculture sector includes the output of agricultural enterprises, farms, private subsidiary plots and enterprises providing services to agriculture.

The output of the construction sector includes the value of building and installation work; design and survey work; major repair work on buildings and installations; and the value of individual dwellings and other structures built with internal resources.

The output of the transport sector includes income from the transport of goods and passengers; income from

subsidiary transport activity (loading and unloading operations, operation of storage facilities, etc.); and the value of work on the repair and maintenance of highways. Calculations are performed by type of transport.

The output of the wholesale and retail trade; and restaurants sector includes both domestic (wholesale and retail) and foreign trade, and restaurants.

The output of the wholesale and retail trade sector is measured by the size of the commercial markup (gross income), which is the difference between the sale price of goods and the purchase price of goods.

The output of the restaurants sector is equivalent to the trade turnover of public catering (in other words, in addition to gross income it includes the value of the produce used in food preparation).

The output of the real estate sector includes services in connection with the operation of housing, including hostels (other than hostels for visitors). The output for market housing services is determined using the amount of operating expenditure paid. The output for non-market housing services is based on the current costs of servicing housing.

Information on the calculation of output and intermediate consumption for the above-mentioned sectors is derived from surveys of organizations and households.

The output of the health; education; and other community, social and personal services sectors includes the value of market services and the value of services financed from budgetary resources. Output and intermediate consumption of market services is based on State statistical reports. Output and intermediate consumption of non-market services is based on the consolidated budget performance report.

The double deflation method is used to estimate the value added by sectors at constant prices. For the output of each sector, the constant price value is imputed using the corresponding volume index (business; agriculture; wholesale and retail trade; transport), or by deflation using the corresponding price index (construction, market services). The index of the number of persons employed in each sector of the economy is used in the imputation of non-market services at constant prices.

Intermediate consumption is converted to constant prices by summing the components of intermediate consumption at constant prices. Each component of intermediate consumption is converted to constant prices by deflation using the corresponding price index.

Overview of the Compilation of the Integrated Economic Accounts

The production account compilation methods are fully in compliance with the System of National Accounts of 1993.

The source data are consistent with the definitions, the scope of statistical coverage and the classifications in the System of National Accounts of 1993. The source data are derived from surveys of organizations; household surveys; the consolidated budget performance report of the State; the National Bank of the Republic of Belarus; and other administrative sources.

National accounts in the Republic of Belarus are broken down into the following institutional sectors:

- Non-financial corporations;
- Financial institutions;
- State institutions;
- Households;
- Non-profit institutions serving households.

A full sequence of accounts is compiled for all institutional sectors.

A full financial account is not currently compiled in the Republic of Belarus. The Ministry of Statistics and Analysis assesses domestic and external financial accounts based on data from the National Bank of the Republic of Belarus. The net lending/borrowing data received are compared with the capital account data, but no adjustments are made.

Sectors are grouped on the basis of their functions in the economic process and also their sources of financing. This method of classification is the primary means by which sectors are grouped in the Republic of Belarus.

Belgium

Source

The national accounts are produced under the responsibility of The Institute of National Accounts (INA) which was created by the Law of 21 December 1994 on the reform of the Belgian statistical apparatus. The INA is charged with compiling the following statistics and forecasts:

- real and financial national accounts;
- quarterly national accounts;
- regional accounts;
- detailed quarterly accounts of general government;
- input-output tables;
- international trade statistics;
- economic forecasts for the federal budget.

The INA does not have any staff of its own, but coordinates the tasks of three associated institutions:

- the National Statistical Institute (NSI), which is responsible for collecting the basic data (apart from data on international trade);
- the Federal Planning Office (FPO), which compiles the input-output tables and budget forecasts;
- the National Bank of Belgium (NBB), which compiles annual real and financial national accounts, quarterly accounts, regional accounts, international trade statistics (including the collection of basic data) and, in cooperation with the FPO, the detailed accounts of general government.

The official estimates are published on the internet (www.nbb.be) and through several publications referred on that same website. The data provided to UNSD were received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The Belgian national accounts are in accordance with the concepts and methodology prescribed in the 1993 SNA and the ESA 1995. A complete methodological inventory on GNI compilation, including a numerical example for 2003, is available on the website of the National Bank.

The timetable for publishing the non-financial annual national accounts is as follows: Industry tables and sector accounts will be published in October for the years $t-1$, $t-2$, $t-3$. Supply and use table (SUT) will be published on December of each year for the year $t-3$. Input-output tables are compiled every five years (from 2000 onwards).

The main reason for current revisions is that more exhaustive or more reliable source data become available than when the previous estimate was made. The revisions therefore relate mainly to the most recent year.

Not all the revision items identified for the accounts are actually carried out, but only those which do not cause a break in the series. Exceptions are revisions which are necessitated by adjustments which have to be made immediately pursuant to European Directives (e.g. Directives on excessive government deficits or on contributions to the European Union's own resources).

Current revisions to the national accounts, other than revisions resulting from European Directives, are made with effect from the date on which the last deadline for the reporting tables expired. The reporting tables and their deadlines are laid down in the ESA 95 transmission programme. The last deadline is for the supply and use table: $t + 36$ months. This means that, as of that date, no further current revisions are carried out and that GDP and GNI are definitive (until the next occasional revision, cf. *infra*). Current revisions of the annual accounts and quarterly accounts are synchronized. Quarters in a year for which annual aggregates have already been published are only revised as part of a revision of the annual aggregates (October).

For the period for which no further current revisions can be made, new data or improved methods can of course

become available after the definitive accounts have been compiled. The revisions to which this can give rise are only performed on an occasional basis, however. Occasional revisions can also be prompted by the application of new concepts (e.g. ESA 95 concepts) or amended classifications. Occasional revisions are not performed at any pre-determined frequency, nor is there any particular period to which revisions have to relate. As a general rule, occasional revisions go as far back in time as possible, so as to preserve the consistency of the series.

In Belgium, recent occasional revisions were carried out in connection with the introduction of ESA 95 (in 1998) and in 2005. In future, revisions will be carried out in line with the common revisions policy to be agreed on between the Member States and Eurostat.

In October 2006 the volume measurement has been switched from fixed prices (2000) to chain volume measurement, from 1995 onwards.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and the expenditure approach, and the production approach is the dominant one.

Expenditure Approach

The consumer expenditure of households is obtained mainly from the annual Household Budget Survey (HBS), administrative data and specific surveys. Administrative data are used mainly for estimating the consumption of alcoholic beverages and tobacco products, purchases of cars and spending on health care.

The HBS provides the data based on the concept of final national consumption (final consumption by Belgian households). Because the supply and use table is integrated on territorial lines, the figures have to be converted from the national concept to the domestic concept of final consumption (final household consumption on Belgian territory). To this end, balance of payments data are used. Tourist expenditure abroad by households which are resident in Belgium is not included in the HBS, whereas final consumer expenditure by non-residents in Belgium (obtained from the balance of payments) is added to final consumption (by resident households) in Belgium.

The consumer expenditure of general government is based on administrative sources. This item is subdivided into individual final consumption (P31S13), i.e. expenditure in respect of which the consumer is identifiable, and collective consumption (P32S13).

Individual consumer expenditure (P31S13) includes general government expenditure on goods and services produced by market producers with a view to providing them (without processing) to households in the form of social transfers in kind (D6311+D63121+D63131). In Belgium, the latter are especially important, since all hospitals, rest homes, and reception centers for the disabled, whether privately or publicly owned, are market producers.

The main sources are accounting data from budget turn-outs. They can differ, depending on the sub sector in question: payment orders in the case of the Federal Government (S1311) and the Communities and Regions (S1312), spending commitments for local government (S1313) and economic charges borne by social security funds (S1314).

Final consumer expenditure by NPISHs is equal to the sum of their non-market output (P13) and their expenditure on goods and services produced by market producers with a view to making them available to households in the form of social transfers in kind (D63131).

Three main sources are used to estimate fixed capital formation are the annual enterprise accounts, VAT returns and the structural business surveys. Additional sources are used only for certain 'special' estimates, e.g.

investments in dwellings, software and agriculture. The detailed general government accounts are used to estimate investments in the general government sector.

Specific estimates are made for dwellings, literary, software and artistic originals, and for farmers.

The balance of payments and international trade statistics form the basis for the calculations of imports and exports of goods and services.

Original chain constant price estimates are referenced to 2007 and have been re-referenced to the price levels of 2000 in order to allow international comparisons. The resulting chain constant price estimates are not additive.

Income Approach

No independent estimate of GDP is made from the income perspective. The estimate of value added in basic prices and its income components, compensation of employees (D1), net other taxes/subsidies on production (D29-D39), gross operating surplus/mixed income (B2g/B3g), is done simultaneously, with B2g+B3g being determined as a balancing item.

Compensation of employees (D1) is estimated by a combined use of accounting information (annual accounts, specific accounting documents for the financial sector, general government accounts) and information on paid social contributions. The totals for D29 and D39 are available from the general government account and the rest of the world account. These totals are distributed over sectors and industries, taking account of the type of taxes and subsidies.

Production Approach

The output-side estimate of GDP is based largely on the business register, which is compiled by the National Statistical Institute. This database includes all economic agents which are active in Belgium. The basic information for the register is provided by a number of government departments (Value added tax (VAT)-Administration, National Social Security Office (NSSO), National Register) which manage partial files of units for their own purposes (enterprises which are liable for VAT, enterprises/employers and legal persons). The NSI compiles the business register by combining the identifiers in the source files.

On the basis of this register, the NBB compiles an annual 'directory' which includes all enterprises (corporations, self-employed persons, non-profit associations) and the identification numbers and characteristics which are relevant to the national accounts.

By combining the following characteristics, it is possible to calculate ESA 95 variables in detail, and select the most appropriate basic source:

- NACE code (determines the industry to which the unit is classified);
- category (determines which basic source is used to estimate a unit's activities);
- institutional sector code (determines the institutional sector to which the unit is classified) .

The units for the general government sector (S13) are obtained from an exhaustive list, which is updated annually. As the estimate of value added in the general government sector is based on specific source material, aggregates for these units are calculated differently to those for market producers.

Sector codes are assigned to the units in the directory largely via an automated procedure. By combining the NACE code and the significance of certain digits in the identification number, it is possible to determine the sector code of units which are not part of general government.

The aggregates (e.g. turnover, acquisitions, wages and salaries) for these units are calculated using a standardized method. The variables in the various source files are always aggregated on the basis of the characteristics (NACE code, sector code) in the directory. This ensures that results which are calculated from different sources are mutually comparable. Basic aggregates at national level are always calculated at industry

level and per institutional sector. This ensures a completely integrated calculation at industry and sector levels.

All relevant administrative and survey data for non-financial corporations (S11) and unincorporated enterprises (S14) are stored at enterprise level in an 'enterprise database'. In the case of corporations in the processing industry, for example, we have at our disposal the annual accounts, total wage bill as derived from the NSSO-return, turnover, current purchases of goods and services and investments as recorded in VAT returns, industrial output as recorded in Prodcum (Community survey of industrial output) and the structural business survey data.

The calculation method employed in ESA 95 makes full use of administrative data. The most important administrative sources are the annual accounts compiled by non-financial corporations, VAT returns by enterprises which are liable for VAT and NSSO returns submitted by employers.

In Belgium, almost all limited-liability corporations (public limited companies, cooperatives, etc.) are required to make their accounts public by filing them with the NBB's Central Balance Sheet Office in a standardized form which is laid down by law. The annual accounts file is therefore the preferred source for estimating ESA 95 aggregates in the output and primary generation of income accounts of non-financial corporations.

All enterprises with a turnover of more than 0.5 million EUR must comply with the 'Minimum Standardized Accounts System'. This accounting plan (introduced by Royal Decree in 1983) implements the Law on the financial records and annual accounts of enterprises, which dates from 1975. The Law on financial records lays down the content of the various headings in the balance sheet and profit-and-loss account (revenues and costs). In this way, enterprises' accounting plans can be translated into the transactions defined for ESA 95.

The activities of most non-financial corporations (the supply of goods and services) are subject to VAT. Only a small number of activities are exempt from VAT (e.g. legal and medical services and rents on immovable property). The VAT returns can be used to derive turnover (proxy for P1), current acquisitions of goods and services (proxy for P2) and acquisitions of investment goods (proxy for P51). In most industries, the information on turnover and current purchases is used to estimate the value added of units in sector S14 which are liable for VAT, and to estimate the activities of corporations for which (usable) annual accounts are not available.

All employers established in Belgium are required to submit a quarterly return to the NSSO. The returns are used to calculate the social contributions payable. The information contained in the returns makes it possible to calculate the compensation of employees. Total wage bill is used, in some service industries, to estimate the value added of corporations with no annual accounts and non-profit associations in sector S11.

Financial institutions (S12) and general government (S13) use specific types of financial accounts which have to be translated into national accounts aggregates.

The value added of non-market non-profit associations (S15) is estimated by means of a combination of administrative data (NSSO total wage bill) and survey data. In recent years, a special survey of non-profit associations has been carried out for national accounts purposes.

National accounts aggregates are compiled in two stages. First there is the transition from micro-economic aggregates to administrative aggregates at a rather detailed level. After several quality checks the administrative aggregates are converted into national accounts aggregates. All adjustments and reclassifications have a counterpart, which may be recorded in the operating account or elsewhere. In this way, the overall consistency of the sector account is maintained.

The information necessary for making these adjustments is available either from the annual accounts or from the structure survey, or in the form of exogenous data in accounts S13 (taxes/subsidies on products and other taxes/subsidies on production) and S12 (insurance premiums received and insurance claims paid).

For all industries volume is compiled using the double deflation method. Chain volume measurement has been applied since 2007.

Source

Reply to the United Nations national accounts questionnaire from the Central Planning Unit, Ministry of Finance and Economic Planning, Belize. Official estimates are published in "National Accounts Statistics". Information on sources and methods of estimation are published in "National Accounts Statistics - Sources and Methods" and in "Economic Accounts of the Public Sector".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Benin

Source

Official aggregates have been published by the Institut National de la Statistique et de l'Analyse Économique (INSAE) since 1982 and are prepared annually. The following tables have been prepared from replies to the UN National Accounts Questionnaire by INSAE.

General

The aggregates have been calculated using the 1968 System of National Accounts (1968 SNA). In 2001 INSAE began updating its procedures and establishing national accounts according to the 1993 SNA for the base year (1999), the first current year (2000), and the second current year (2001), which is still being aggregated. National accounts estimates which follow the 1993 SNA methodology have not been validated, and thus have not been released. Currently two methodologies are being applied concurrently to establish national accounts in Benin:

1. The 1968 SNA, which takes into account the West African Economic and Monetary Union (UEMOA) regulation recommending the most-comparable GDP approach (referred to in this document as the most-comparable approach);
2. The 1993 SNA methodology used for compiling national accounts with the ERETES module (referred to in this document as the ERETES model), which Benin set up with technical support by national accounting experts from the Observatoire économique et statistique d'Afrique subsaharienne (Economic and Statistical Observatory of Sub-Saharan Africa - AFRISTAT).

Methodology:

Overview of GDP Compilation

1. The most-comparable approach

Since 1 January 2003, UEMOA Regulation No. 11/2002/CM of 19 September 2002 has been in force in the eight UEMOA member countries. The aim is to make the GDP's of the UEMOA countries more comparable; this will allow greater comparability of the agreed upon variables within the convergence criteria.

Under the terms of the regulation, any modification to an estimate of GDP must be based on:

- (1) Assessments of rental charges;
- (2) Estimation of household-financed construction as a component of gross fixed capital formation;
- (3) Inclusion of consumption of fixed capital in the calculation of the output of government services;
- (4) Consideration of operations linked to external assistance;
- (5) Entry of the $n/n+1$ crop year production under the n calendar year;
- (6) Extension of the meaning of "government services" to include the local communities and social security funds.

Where Benin is concerned, there have been modifications in connection with points (3) and (5) above, the other points having already been taken into account in the compilation of the GDP. Concerning point (3), consumption of fixed capital was included in the calculation of the output of government services. Regarding point (5), the production of cottonseed in the $n/n+1$ crop year was entered under the $n+1$ calendar year, and it will have to be moved back to the n calendar year.

In Benin, GDP is estimated using the most-comparable approach according to the expenditure approach and the production approach. The National Accounts Service of INSAE does not compile the GDP according to the income approach.

It should be noted that, when elaborating national accounts using the 1968 SNA, once the data have been collected and processed, resources and uses are balanced before going on to elaborate the input-output table and

the total economy table, which are equivalent to the supply and use table and the integrated economic accounts table in the 1993 SNA.

2. The ERETES model

The establishment of national accounts depends entirely on the availability of statistics that give an account of the totality of a country's economic life. Whatever is available, however, has to be used, because the different ways of approaching the same phenomenon more often than not provide some additional information. The reliability of each source must be verified. Concomitantly, the content of the sources must be interpreted and allocated to national accounting classifications. Lastly, the information has to be codified according to the attributes selected for inclusion in the database using a load table.

The data sources are prepared for use in subsequent operations. Preliminary adjustments are necessary in order to:

- Make the sources compatible with the requirements of national accounts, especially by taking into account data derived from other sources (as in the case of inventories and inventory changes);
- Obtain a more homogeneous picture of the available data by balancing the various sources (as in the case of jobs and labour);
- Establish the most detailed possible breakdown of the data for industries, products, operations or sectors, if that can be done at the outset (as in the case of taxes on imports and production).

Two complementary and recurrent approaches are used alternatively:

- A decentralized approach, which contrasts classified data along several lines:
 - In the supply and use table, the balance between resources and uses are contrasted with the production and generation of income accounts by industry;
 - In the integrated economic accounts table, operations are contrasted by means of the “from whom to whom” matrix;
 - this work is done in the local offices;
- A centralized approach, which enables the findings generated by the decentralized analysis to be validated, and the results obtained from the data on institutional sector accounts to be contrasted.

When using the analytical approach, it is acceptable throughout to allow entries to diverge on either side of the equation, in the following areas:

- In the supply and use table, by allowing the possibility of a discrepancy between supply and demand (as seen in the industrial input-output table [Tableau des échanges inter-industriels (TEI)] in the case of intermediate consumption);
- In other tables, by using provisional items.

Once satisfactory information has been obtained for industries, products, operations and institutional sectors, the next step is to begin to aggregate it, in the course of which the following operations are done:

- Correction of the industrial input-output table;
- Correlation with the sector accounts;
- Correction of the integrated economic accounts table;
- Finalization of the tables representing the central framework of the System: the supply and use table and the integrated economic accounts table;
- Readyng the results for publication;
- Data preparation with a view to starting on the accounts for the following year.

The results are presented in the form of two aggregate tables under the System: the supply and use table and the integrated economic accounts table. ERETES produces the tables in a Microsoft Excel format.

Bermuda

Source

The preparation of the annual national accounts statistics in Bermuda is undertaken by the Government of Bermuda Department of Statistics in Hamilton, Bermuda. The official statistics are published annually on the internet (www.statistics.gov.bm) as well as in the Ministry of Finance's annual Economic Review publication. Official statistics on Bermuda's Balance of Payments (BOP) are compiled on a quarterly basis by the Department of Statistics and are available on the internet (www.statistics.gov.bm).

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (SNA 1993). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The conversion to SNA 1993 from 1968 SNA took place in 1998 and included the development of an Industrial Classification system as well as a classification system for transactions and other economic flows. The compilation of GDP was also converted from an expenditure approach to the production approach at this time. One major deviation from the SNA 1993 is the treatment of the International Business Sector in Bermuda. Strictly speaking, according to the SNA 1993 this sector should be classified as resident. However, they earn income mainly through transactions that are unrelated to the Bermudian economy and far outstrip the capacity of the economy to generate them. Unlike other business units, the output of international business entities (IBEs) is not defined according to the specific goods and services produced but according to the manner in which the IBEs are organized. The insurance, financial and other services produced by these "offshore" business units are not seen as accruing to the Bermudian economy; hence, their output has been imputed based on expenditure and employment in the domestic economy. Even if the actual output of IBEs could be regarded as domestic output, in the absence of statistical reporting requirements by the Bermuda Monetary Authority, problems of measurement would still arise. Measuring output in terms of expenditure and employment in the domestic economy is a reasonable approach but it means that IBEs are treated as "partly resident", a concept that has no counterpart in the SNA 1993 or the Balance of Payments Manual of the International Monetary Fund. The GDP by industry estimates are available on a calendar year basis from 1996 to 2010. The data have been revised back to 1996 with each year's publication. At this point in time, there is no revision policy in place. The GDP estimates are compiled in Bermuda dollars (\$BD). The Bermuda dollar is on par with the United States dollar. The base year for the constant dollar GDP estimates is 2006. Responsibility for the compilation of the BOP estimates was transferred from the Bermuda Monetary Authority to the Department of Statistics in 2006. At that time the Department updated the framework to follow the guidelines laid out by the International Monetary Authority in the 5th Edition of the Balance of Payments Manual. The BOP estimates are compiled in Bermuda dollars (\$BD).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Personal consumption estimates using the expenditure approach are also compiled each year. Supply and use Tables have been prepared for the years 1996, 1997, 2004 and 2008 in accordance with the SNA 1993 guidelines. The Bermuda Industrial Classification System (BCEA) is based on ISIC Rev 3.1 and for the most part, maintains its structure, nomenclature and industrial sequence. However, there are differences; the most important difference between the two systems is that BCEA identifies international business activity as a separate economic category. International business activity, which by amalgamating financial and non-financial business units, cuts across two institutional sectors.

Production Approach

The table of Gross Domestic Product by Industry is compiled at market prices. The production approach is used to estimate virtually all industries. The income approach is used to estimate value-added of the public administration

sector and non-profit organizations. The main data source for the production of GDP by industry is the Department of Statistics' annual Economic Activity Survey (EAS). This survey covers approximately 1,500 survey respondents out a total universe of over 6,000 businesses and organizations. This survey is sent to all sectors of the economy except for the public administration sector. A set of 15 unique questionnaires covering income and expense items are sent each year to the various sectors of the economy. The response rate to this survey has been in excess of 90% for the last two years. The data is blown-up to represent the complete universe using the results from the annual Employment Survey, which provides census data on employment for each industry. For the international business sector, value-added is produced by combining compensation of employees and net taxes on production (payroll tax and other taxes and licences). For the agriculture industry, most of the reliance for gross output and intermediate expenses estimates is placed on the EAS. Administrative data on crop production are virtually non-existent. No quantitative information is available from the traditional sources for such data from the Department of Conservation Services. The fishing industry is surveyed every second year using the EAS. The off-survey year gross output is compiled using administrative data on the fish and lobster catch from the Department of Environment Protection. The mining and quarrying industry has significantly reduced in size and its output is now included in the construction industry. Gross output and intermediate consumption estimates are based on the results from the EAS. The manufacturing sector encompasses a wide range of activities, many of which are undertaken on a small scale in Bermuda. The share of manufacturing in GDP is estimated in 2010 at just 1.3%. Gross output and intermediate consumption estimates are based on the results for the EAS. The value-added for the electricity, gas and water supply industry was compiled using the results of the EAS as well as administrative data for government enterprises. Public financial records are also used as a cross-check against the survey data. The value-added for the construction industry was compiled using the results of the EAS as well as administrative data for government enterprises. The value-added for the wholesale and retail industry was compiled using the results of the EAS. Results from the monthly Retail Sales survey was also used to cross-check the data. The value-added for the hotel and restaurant industry was compiled using the results of the EAS. Results from the quarterly Hotel Gross Receipts and Employment surveys were also used to cross-check the data. The value-added for the transport and telecommunications industry was compiled using the results of the EAS as well as administrative data for government enterprises for the provision of bus services, marine and port services, airport operation and national post activities. Estimates of private sector activity in transport and communications were based essentially on EAS data. The value-added for the finance industry was compiled using the results of the EAS. It is important to note here that the coverage in the EAS for the finance industry is 100% for a number of the sub-sectors and no blow-ups are required. The value-added for the real-estate industry was compiled using the results of the EAS as well as administrative data for government enterprises. The compilation of value-added for the owner-occupied dwellings did not incorporate the EAS data. Instead estimates for gross rent were computed by multiplying extrapolated benchmark on housing stock (2000 Census), using data on annual residential completions by extrapolated benchmark data on average rents (2004 Household Expenditure Survey) using the rent component of the CPI. The gross output component of the non-residential building rentals was compiled using the summation of the expenditure in all other sectors of the economy. The value-added for the business activities industry was compiled using the results of the EAS. The convention of measuring gross output in government services (and public administration) as production cost, i.e. the sum of compensation of employees, net indirect taxes, intermediate consumption and consumption of fixed capital (depreciation) was followed. However, no estimates of consumption of fixed capital have been made for government as the required administrative detail is not available. The administrative data for government services is provided by the Accountant General's office. No estimation is required in this industry as actual financial results are provided. The value-added for the education, health and social work industry was compiled using the results of the EAS as well as administrative data for government enterprises. In addition, non-profit institutions serving households or non-market producers utilized the production cost approach to measure their gross output. The value-added for the community, social and personal services industry was compiled using the results of the EAS as well as administrative data for government enterprises. In addition, non-profit institutions or non-market producers utilized the production cost approach to measure their gross output. For private households with employed persons, wages received by these employees constitute the value of the services provided. Since no intermediate consumption is computed for this household activity, compensation of employees = gross value added = gross output. Wages and salaries were derived from administrative employment records on payroll tax. Data on charities was obtained from the EAS as well as administrative data (audited financial statements) from the Registry

General. The value-added for the international business industry was compiled using the results of the EAS for those businesses with a physical presence in Bermuda. For those businesses without a physical presence, a gross-up procedure is utilized to produce estimates on taxes and licence fees, bank charges and professional services. The constant-dollar GDP estimates are compiled either by deflating current price estimates with a price index (Consumer Price Index being the most prevalent methodology) or by extrapolating base year estimates with a volume index.

Bhutan

Source

The National Statistics Bureau of the Royal Government of Bhutan is responsible for compiling and publishing national accounts statistics for the Royal Government of Bhutan. The official estimates were published by the Royal Government of Bhutan in the National Accounts Statistics publication (available at <http://www.nsb.gov.bt>).

General

The system of national accounts in Bhutan is based on the methodological frame work of 1968 and 1993 System of national accounts. We have distributed the FISIM across the sectors using the information available with the central Bank on loans and deposits. We have also estimate the expenses on soft wares of the government to be added to the capital formation of the government which was treated as the intermediate consumption (1968 SNA).

Methodology:

Overview of GDP Compilation

The GDP in Bhutan is calculated by using production and expenditure approaches. GDP by Production is calculated at market prices i.e sum of all the gross value added generated by the various sectors of the resident producers plus indirect taxes less of subsidies on products.

In case of expenditure approach, GDP is the sum of all the expenses on final consumption expenditure of private and government, Gross domestic capital formation and net exports.

The country has not tried with the Income approach due to lack of detailed breakdown of information.

The GDP estimates are brought out annually both in current and in constant prices. The base year is 2000. Each contributing sector has the deflator to convert the current estimate to constant 2000 prices.

The reporting period is the calendar year. Usually there are few agencies were their reports relates to fiscal year but they are converted to calendar by taking the average of 2 years.

Expenditure Approach

According to the System of National Accounts (SNA), the three main aggregate uses of GDP are consumption and investment of government; private households; and net export. The final consumption expenditure is divided into private household final consumption and government final consumption expenditures. Private household final consumption expenditure was estimated based on the Household Income and Expenditure Survey (HIES) of 2000, 2003 and 2007. 2003 and 2007 household Income and Expenditure surveys were called as Bhutan Living Standard Survey (BLSS). The estimates are then interpolated between the surveys and constant price estimates are extrapolated using population and consumer price index. The sets of data were adjusted for under coverage.

The main source of information to estimate the government final consumption is the annual budget documents of the Ministry of Finance. The estimates of gross domestic capital formation (GDCF) consist of purchase of machinery and equipments; construction activities; and change in stock. For machinery and equipment, the sources of data are mainly from trade documents and in absence of trade documents historical trends are used.

Production Approach

The agriculture industry consists of crops, animal husbandry and forest. The Ministry of Agriculture carried out the agricultural census in 2000 and the contribution by the sector to the GDP are based on the census results.

The mining and quarrying industry has been treated as a primary industry, since no separate information on

extraction and processing of minerals are available. The information are being made available by the department of geology of mines.

The manufacturing industry has been subdivided into forest based, agro based, cement based and chemical based industries. The majority of registered industries under the manufacturing industry are cement, food, basic iron and steel, wood based industries. It also covers other small-unregistered industries such as weaving, thangka painting and clay work etc. However, the cement industry is the dominant manufacturing industry in the country.

The electricity industry is subdivided into electricity and water. Gas supply, which is mainly the refilling of LPG cylinder, has been merged with the wholesale and retail trade. Electricity in Bhutan is generated from hydropower plants, and the generation of power purely depends on the availability of rainfall during the monsoon season and the snowfall in winters.

The transport, storage and communication industry is subdivided into transport by Air, buses, trucks, taxis and telecommunications. The main sources of information are from RSTA, Bhutan Telecom Annual Report, Druk Air Annual Report and Department of Revenue and Custom's sales turnover information. In case of trucks and taxis, their revenues are extrapolated by using the parameters obtained through case studies or sometimes the past trends are being applied.

The finance, insurance and real-estate industry covers activities of the Central Bank, commercial banks, agricultural credit institution (BDFC), investment companies etc. Also included are the renting, management and operation of real-estate activities. The required information to estimate the gross value of output, intermediate consumption and components of value added of the financial institutions were compiled from the annual reports published by them. Current price estimates of financial institutions were converted to constant price by using the composite index of lending rates, deposit rates and consumer price index. In case of real-estates, the activities are broken down into two parts: rural and urban dwellings. To estimate the gross output of rural dwellings, the receipts from the rural house tax was used as the bases and for the urban dwellings the BLSS 2003 were used as the bases.

The community and social services (general government) industry produces services by engaging in activities such as public administration, defense, sanitary, education, medical and welfare services. The main source of information is the Annual Budget documents of the Ministry of Finance. In SNA, the gross output of the government is defined as equal to its cost of production (i.e. the sum of intermediate consumption, compensation of employees and consumption of fixed capital). The private, social and recreational services industry includes services such as private health, recreation, personal etc. The main sources of information to estimate its contribution to the total GDP was the Bhutan Living Standard Survey 2003. Estimates were moved forward with the help of population growth and the consumer price index.

Bolivia

Source

Bolivia's national accounts were first calculated in the 1950s by the Ministry of Planning and Coordination. These calculations later became the responsibility of the Central Bank of Bolivia and, in 1988, the National Institute of Statistics took responsibility for preparing the national accounts, incorporating a number of methodological considerations from revision 4, which would subsequently become the 1993 System of National Accounts (1993 SNA), using 1990 as the base year, yet without implementing the 1993 SNA.

General

The information given in the attached tables was prepared in accordance with the concepts and definitions of the United Nations 1968 SNA, which is an integrated, coherent and flexible set of macroeconomic accounts designed for purposes of economic analysis, decision-taking and policymaking.

Methodology:

Overview of GDP Compilation

Gross domestic product (GDP) is estimated using the production approach. The economic transactions that occur in the input-output ratio are summarized and consolidated in standardized worksheets that are used to prepare the output tables and the supply and use balances, which are then synthesized in the input-output matrix with the 35 economic activities and 35 products detailed below.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure which is obtained as a residual. The estimates of the government final consumption expenditure are based on the annual government accounts furnished by the respective government agencies. Increase in stocks estimates are based on information obtained from the enterprises. For public capital information, estimates are obtained from financial statements of the public institutions. The estimates are classified by type of goods and subdivisions of the public sector. For the estimates of private capital formation, the Instituto Nacional de Estadística requests detailed information from the enterprises. The estimates of imported machinery and equipment are based on c.i.f. import values classified by use or economic destination. Trade margins and transport expenses are then added. The estimation of domestically produced capital goods is done on the basis of annual industrial statistics. Data on exports of goods and services are obtained from the balance of payments accounts. The value of non-monetary gold export is added to the f.o.b. figures while imports are estimated by the Banco Central. For the constant price estimates, government expenditure on wages and salaries are revalued at base-year prices while purchases of goods and services are deflated by implicit price or cost-of-living indexes. The estimates of private consumption expenditure are obtained as a residual. For the remaining items, price deflation is used.

Income Approach

The cost structure of the gross domestic product has not been estimated since 1969.

Production Approach

Agricultural activities, according to the national accounts nomenclature, consist of the following economic activities: non-industrial agricultural products; industrial agricultural products; coca; livestock products; and forestry, hunting and fishing. For agricultural output, information on production volume (land area, yield and output by crop, number of head per species of livestock, cubic metres of forest species extracted, etc.) was based on the results of the agricultural census and the national agricultural survey carried out by the National Institute of Statistics. The national agricultural survey was performed in various years up until 1997; the data from the surveys were recorded at the departmental level. This is supplemented with information from the administrative records of

the following institutions: Ministry of Agriculture and Rural Affairs; Bolivian Agricultural Technology Institute, now the Bolivian Agricultural Technology System; Research Centre on Tropical Agriculture (Santa Cruz); Inter-American Institute for Cooperation on Agriculture (IICA); Chambers of agriculture; Producers' associations; Specialized publications (special studies and news articles); National Food Security Monitoring and Early Warning System; Stockbreeders' Federation; Poultry Producers' Association; Dairy Farmers' Association; Superintendency of Forests; Chamber of Forestry; National Forest Information System; Centre for Forest Development; Environmental Defence League; and Centre for Fisheries Development.

Hydrocarbons activities, according to the national accounts nomenclature, consist of the following products: crude petroleum and natural gas (including construction of wells by companies exploring petroleum and natural gas deposits). These exploration services have been included since 1997, as recommended in revision 4 of the 1993 SNA, and are reported under construction and business services. The allocation of output (to intermediate consumption, gross fixed capital formation, changes in inventories and exports) in physical terms is valued on the basis of the respective prices of each product. Petroleum and gas output is treated as intermediate consumption (petroleum and gas for refined products) and gross fixed capital formation, which consists of the drilling of new wells and the deepening of old wells to improve output; this work is performed by capitalized companies following exploration. Changes in inventories measure variations in inventories of petroleum and gas extracted and stored for refining or export. Taxes (on products) on petroleum, gas, imports and exports at well-head prices are included to yield figures for supply and demand at purchaser's prices. Lastly, supply and use balances are obtained at current and constant prices, using 1990 as the base year. The sources of information on this activity are the monthly reports of the State petroleum company Yacimientos Petrolíferos Fiscales Bolivianos (YPFB), the financial and economic analyses of the Finance and Accounting Office of the Accounting and Costs Department of YPFB, the annual sales report of the Marketing Business Unit of YPFB, the Statistical Bulletin on External Trade of the Central Bank of Bolivia and administrative records of Andina S.A. and Chaco (firms created with the capitalization of YPFB).

Mining activities, according to the national accounts nomenclature, consist of metallic and non-metallic minerals (divisions 10 to 14 of the International Standard Industrial Classification (ISIC), revision 3, Mining and quarrying). This activity includes two product groups: metallic minerals; and non-metallic minerals. The allocation of output (to intermediate consumption, gross fixed capital formation, changes in inventories and exports) in physical terms is valued on the basis of the respective prices of each product. Mineral output is treated as intermediate consumption (ore for smelting); export data are obtained from external trade data by product, and the value of smuggled gold is also calculated. Supply and use balances are calculated by origin (domestic and imported), taking into account the taxes on products and imports that are levied on groups of mineral products, as well as trade margins. This yields figures for supply and demand at purchaser's prices, in current values and constant 1990 values. The sources of information used are the statistical yearbook of mining and metallurgy of the Office of the Deputy Minister of Mining and Metallurgy, the annual report of the National Association of Medium-scale Miners, the National Federation of Mining Cooperatives, the magazine published by Gold Field Mineral Services, Ltd., the annual survey of the manufacturing industry, administrative records and the construction cost index.

Food and beverage manufacturing activities, according to the national accounts nomenclature, consist of the following activities: fresh and processed meats; dairy products; mill and bakery products; sugar and confectionery products; miscellaneous food products; and beverages. The output of each activity of the food manufacturing industry is calculated from three main sources of information: annual survey of the manufacturing industry, formerly the Single Economic Form; quarterly survey of the manufacturing industry (physical volume index of the manufacturing industry, sales volume index, manufacturing industry producer price index and other indices derived from the survey); and data on agricultural inputs taken from national accounts information on agricultural activity (agro-industrial chains).

Other manufacturing activities, according to the national accounts nomenclature, consist of the following: manufactured tobacco; textiles; apparel; leather and leather products; wood and wood products; paper, paper products and printing and publishing; chemicals and chemical products; refined petroleum products; non-metallic mineral products; basic metal products; metal products; machinery and equipment; and miscellaneous

manufactured articles. The sources of information used to obtain output volume and prices include the following: annual survey of the manufacturing industry; quarterly survey of the manufacturing industry (physical volume index of the manufacturing industry, sales volume index, manufacturing industry producer price index and other indices derived from the survey); data on agricultural inputs taken from national accounts information on agricultural activity (agro-industrial chains); survey on margins and channels; household budget survey; import and export lists; associations and chambers of producers; reports on trends in respect of various products and on economic activity; the information bulletin of the Superintendency of Hydrocarbons; the annual sales report of YPFB; the yearbook and statistical bulletin of the National Secretariat of Mining and Metallurgy (now the Office of the Deputy Minister of Mining and Metallurgy); Vinto Metallurgical Company records; external records on the metal products, machinery and equipment sector (taking into account the fact that 90 per cent of the products in this category are imported); and the directory of the census of economic establishments and new companies. For the valuation of output and of the other macroeconomic variables taken into account in the supply and use balance (except imports), the following sources of price information are used: annual average prices from the annual survey of the manufacturing industry; quarterly average producer prices in the manufacturing industry; average prices from the consumer price survey; monthly and annual international average prices; and the construction cost survey.

Electricity, gas and water activities, according to the national accounts nomenclature, consist of the following: electricity (including the generation, collection and transmission of electric energy for use by household, industrial and commercial users); gas (including the distribution of gaseous fuels through a system of mains to household, industrial, commercial or other users and excluding the transportation by pipeline of gaseous fuels on a fee or contract basis); and water (including the collection, purification and distribution of water to household, industrial, commercial or other users and excluding irrigation system operation for agricultural purposes and treatment of wastewater in order to prevent pollution). The determination of the gross value of production involves, the generation of a production volume table showing, on the basis of the data obtained from source documents (financial statements of companies, cooperatives, etc.), the behaviour of production in terms of volume. The valuation of this volume using price index data gives the gross value of production at current prices; the value at constant prices is determined using chain indices. Intermediate consumption and final consumption are based on consumption data by category (electricity and water), from which the level of intermediate consumption and the amount corresponding to final consumption are obtained. In the case of gas (10-kilo cylinders), owing to the characteristics of this product, all production is used for final consumption. Determination of imports and exports: import and export data are taken from information sources pertaining to the external sector. Taxes: tax figures are determined by the Department of Institutional Units on the basis of information from the National Tax System. The sources of the information used to calculate production volume and prices are as follows: Office of the Deputy Minister of Energy and Hydrocarbons; Superintendency of Energy; Superintendency of Hydrocarbons; gas volume indicators prepared by the National Institute of Statistics; water distribution companies, by department; National Institute of Statistics, Department of Administrative Records; and water volume indicators prepared by the National Institute of Statistics.

Construction activities, according to the national accounts nomenclature, include the following: the execution of projects such as buildings and civil engineering works by general and specialized contractors (construction firms that work primarily on a contract basis). Although the supply of goods and services in this activity generally consists of domestic output and imports, the sole component of supply is domestic output. Such output is valued at producer prices, since it includes taxes and does not include trade margins, as these goods are produced on a contract basis by a producer (contractor) for a purchaser (contracting party), with no possibility of commercial intermediation. Construction output is treated as gross fixed capital formation and intermediate consumption. The entire value of new construction projects, whether residential buildings, non-residential buildings or civil engineering works, is recorded under gross fixed capital formation because such projects entail the addition of new tangible fixed assets to the economy. The same is true of major maintenance expenses for civil engineering works, since they make it possible to extend or maintain the service life of built assets. Ordinary maintenance and repairs performed on residential buildings (dwellings) and non-residential buildings (business, industry and services) are considered intermediate consumption because they do not change the asset's performance, capacity or expected service life; they simply maintain it for the length of its useful life. The sources of information on this activity are the following: municipal governments; building, maintenance, repair and demolition permits for

dwellings and other buildings issued by the mayors' offices of the country's major cities; National Institute of Statistics; construction cost index by type of dwelling; foreign direct investment by purpose, disaggregated into capitalized companies, gas pipelines and other investments; Ministry of Finance; public investment budget and budget performance; institutional, sectoral, regional and project distribution from the National Public Investment System; cash operations of the non-financial public sector reported by the Fiscal Programming Unit; financial statements of capitalized companies; and reports, bulletins, papers from various information sources.

Wholesale and retail trade activities include establishments classified under divisions 51 and 52 (classes 5110 to 5260) of ISIC (revision 3), which correspond to wholesale and retail trade, except of motor vehicles and motorcycles, and repair of personal and household goods.

Transport activities, for the purpose of national accounts, are defined as the transport margin necessary to convert figures valued at producer prices into the prices paid by purchasers. According to the 1993 SNA, the output of transportation is measured by the value of the amounts receivable for transporting goods or persons. Storage services make it possible for a good available at a given point in time to differ in quality from the same good available at an earlier point in time if its supply and demand conditions change in the meanwhile. This service can thus be viewed as transportation over time rather than space. The sources of information on this activity include the financial statements of public, private and capitalized passenger and cargo transportation companies; companies providing transport-related services such as air and land terminals; companies that provide highway services in exchange for the collection of tolls; travel and tourism agencies; customs dispatchers; companies providing storage services; departmental and national information on motor vehicles, by type of service and vehicle from the Single Register of Motor Vehicles; municipal ordinances and other provisions regulating urban public transport and charges; bulletins, papers and reports issued by various deputy ministers' offices and Government divisions concerned with land, air and river transport.

Communications activities consist of services to the public through local and long-distance telephone, telegraph, telex and cellular telephone communications. It also includes the transmission of images, sound, Internet service and other data via cable. Also included in this activity are postal and courier services (transport and delivery of mail, sale of postage stamps, mailbox rental services, etc.). The sources of information on this activity include the following: financial statements of telecommunications companies (Entel, Telecel, AES, Viva GSM, COMTECO, COTAS and Bolivia Tel); financial statements of telephone companies and cooperatives; financial statements of the Bolivian postal service (Empresa de Correos de Bolivia); administrative records of the National Rural Telecommunications Service; and financial statements of private courier companies.

Financial activities consist of the following subsectors: the Central Bank of Bolivia; Monetary financial institutions (private commercial banks and foreign banks); other financial intermediaries (cooperative banks, mutual institutions, State funds, mixed funds, private funds, bonded warehouses, financial service companies); and insurance and reinsurance companies. The services provided by insurance companies consist of granting insurance policies to economic agents. These companies collect insurance premiums with which they finance the payment of claims arising from damage or loss suffered by the various agents of the economy. This also includes all activities to provide coverage against the consequences of specified events to which economic agents are exposed. The sources of information on this activity include administrative records or financial statements of the following financial institutions: Central Bank of Bolivia, consolidated banking sector, consolidated other financial intermediaries and consolidated insurance sector.

Business services activities involve the establishments classified in divisions 70, 71, 72, 73 and 74 (classes 7020 to 7499) of ISIC (revision 3), which correspond to real estate, renting and business activities. This category comprises nine product groups: real estate, renting of agricultural machinery and equipment, renting of construction and civil engineering machinery and equipment and architectural and engineering services, renting of other machinery and equipment, computer activities, accounting and legal activities, architectural and engineering activities, advertising, and other activities. The information used for the calculation of macroeconomic variables and for the groups of which the activity is comprised was taken from output tables prepared by experts at the Department of National Accounts, from which price indices, volume indices and values were obtained for each

economic activity, in addition to the records and fees of professionals in the various associations and the consumer price survey.

Housing ownership activities include the establishments classified in division 70, class 7010, of ISIC (revision 3), which corresponds to real estate, within the national accounts product classification. This includes the exploitation of dwellings, parts of buildings and/or apartments, in their various forms of tenancy, whether occupied by the owners or by third parties. This means that owners, while they do not pay rent for the use of the dwelling, are treated as owners of fictitious (unincorporated) enterprises that produce housing services for their own consumption. The output of this economic activity excludes the exploitation of buildings or parts of buildings for non-residential purposes, such as hotels, rooming houses and other lodging places. The sources of information used for the calculation of macroeconomic variables and for the groups of which the activity is comprised are as follows: National Population and Housing Census (inter-census rate), 1992, National Institute of Statistics; Household budget survey, National Institute of Statistics; and Consumer price survey from the National Institute of Statistics.

Community, social and personal services activities are classified in division 80 of ISIC (revision 3) and consist of the following six groups: education services; health services; recreational services; repair services; basic sanitation services (refuse disposal); and other services. The sources of information include: the Department of Social Statistics of the National Institute of Statistics; the Institute's household budget survey; motor vehicle data by department; the Institute's census of economic establishments; budget performance data (expenditure) for the central Administration, decentralized entities and municipal governments; and administrative records of the Internal Revenue Service.

Restaurants and hotels activities include the establishments classified in division 55 (classes 5510 and 5520) of ISIC (revision 3), which corresponds to hotels and restaurants. The restaurant activity involves the sale of prepared foods and drinks for immediate consumption on the premises in establishments such as restaurants, cafés, lunch counters and refreshment stands. Also included are catering activities and take-out activities, as well as the operation of dining cars. Sale through vending machines is excluded, as are the above-mentioned activities carried out in connection with the provision of lodging. The hotel activity includes the provision on a fee basis of short-term lodging, camping space and camping facilities, whether open to the general public or restricted to members of a particular organization, as well as restaurant services provided in connection with the provision of lodging. Included also is the operation of sleeping cars. Activities in this class are those usually offered by hotels, motels, inns, school dormitories, residence halls, rooming houses, guest homes and houses, shelters, etc. The information used for the calculation of economic variables and for the group corresponding to this economic activity are obtained from restaurants, national accounts data on changes in the volume of activity in the food sector, international tourism data, the population growth rate in urban areas, hotels, and national and international tourism data from the National Institute of Statistics, Department of Administrative Records.

Domestic services activities include the activities of private households employing all kinds of domestic personnel such as maids, cooks, waiters, valets, butlers, laundresses, gardeners, gatekeepers, chauffeurs, baby-sitters, etc.

Public administration activities provide non-traded services to the community (collective services), which by definition are non-market services. The output of non-market services is valued as the sum of intermediate consumption and value added, minus market output. The sources of information on this activity are as follows: budget performance information; financial statements of institutions; cash operations; and general budget of the nation. The bulk of the revenues received by public administrations come from mandatory contributions (taxes, social security contributions, etc.), local transfers and external transfers. Public administrations are classified into the following: central administration; local and regional administration, and social security.

Bosnia and Herzegovina

Source

The statistical system of Bosnia and Herzegovina (BiH) encompasses Agency for Statistics of Bosnia and Herzegovina (BHAS), the Central Bank of Bosnia and Herzegovina (CBBH) and other official producers of statistics at the level of Bosnia and Herzegovina; Federal Office of Statistics of Federation of Bosnia and Herzegovina (FOS) and Institute for Statistics of Republika Srpska (RZS) at the entity level, and other official producers of statistics in Federation of Bosnia and Herzegovina and Republika Srpska. At the level of Brcko District, Brcko Branch is organized as a part of the Agency for Statistics of Bosnia and Herzegovina, and together with other producers of statistics in Brcko District, it is a part of the statistical system of FBiH.

Agency for Statistics of Bosnia and Herzegovina, according to the Law on Statistics of Bosnia and Herzegovina, is a state institution competent to process, disseminate and endorse statistics of Bosnia and Herzegovina, perform international representation and co-operation with organizations and other bodies and fulfill the international obligations of Bosnia and Herzegovina in the field of statistics.

General

The compilation of the National Accounts in Bosnia and Herzegovina is based on methodology recommended by the United Nations the System of National Accounts 1993 (SNA) and the European system of Accounts 95 (ESA95) since 1996. In the period until 1991, as in all former republics of ex-Yugoslavia, the concept of material production was used, that is calculation of only material production and services related to production. There are no reliable estimates of GDP for the war period 1992 – 1995.

Implementation of the System according to the SNA/ESA methodology in Bosnia and Herzegovina is in the initial phase. Currently, production account is compiled only, following the activities of production of goods and services, as it is defined within system. Its balancing item is gross value added, and is defined as the value of output less value of intermediate consumption.

The compilation of production account for Bosnia and Herzegovina is performed in all statistical institutions of BiH at the same time. Entities' institutes for statistics and Brcko Branch compile the production account for all residential institutional units in their respective territories, apart from the general government institutional units and the Central Bank of BiH, for which the production account is compiled by the Agency for Statistics of BiH. The components of the production account are allocated to entities' production accounts by using keys for the distribution of indirect taxes.

Methodology:

Overview of GDP Compilation

Statistical institutions in BiH compile GDP by the production and by the expenditure approach at current and constant prices (at previous year prices). GDP by the production approach is the primary approach determining GDP and the volume growth of annual GDP.

Expenditure Approach

Gross domestic product by the expenditure approach is measured as total domestic final consumption corrected by external trade balance with the rest of the world. Each components of GDP by expenditure can be estimated using a variety of data sources and techniques, with the aim of obtaining as comprehensive measure as possible of the level of economic activity.

The first estimates of GDP by the expenditure approach in BiH have been compiled at the level of country as a whole instead of aggregating the macroeconomic data compiled by the entities as it is done with the estimates of GDP by production. This approach was followed because balance of payments estimates are only available for the

country as a whole. Moreover, estimates of expenditures on final uses rely significantly on detailed data on imports and exports, which are likely to be more reliable when referred to the country as a whole than to the entities. This is because the allocation of imports and exports to the entities in accordance with the residence of the importer/exporter does not necessarily reflect the residence of the final user of goods imported or the origin of the exports.

The year 2004 was chosen as the starting reference period for the construction of the series based on the availability of source data. The year 2004 is the first year for which data from a household budget survey with countrywide coverage became available, thus providing an important data source for estimating household's consumption. That year is also the first one for which foreign trade data were compiled with countrywide coverage, based on uniform customs declarations submitted to the Indirect Taxation Authority.

GDP by the expenditure approach has been estimated at current prices since 2004 and at constant prices since 2005, thus permitting measuring of the volume growth rates between two years. Estimates at constant prices are also undermined by the lack of necessary price indices: there are no price indices available for import and export of goods, no countrywide producer indices, no countrywide retail price index, no price indices for construction output, and compilation of the consumer price index (CPI) started only with the data of January 2005.

The estimate of the main components of the expenditure GDP is based on statistical surveys, administrative data sources and balance of payments statistics prepared by the Central Bank of Bosnia and Herzegovina.

Estimates of household consumption expenditure for the year 2004 are partially based on the results of the household budget survey for that year and on data on foreign trade and domestic production of consumer goods and services. Estimates for the years for which no household budget survey data are available, are based on imports and domestic production statistics and/or extrapolation of the 2004 estimates using relevant indicators. The estimates are based on the analysis of the data collected and processed by the statistical institutions of BiH on the execution of the budgets by all government institutions comprising the state, the entities, cantons, local authorities, and extra budgetary funds. It also includes the expenditures of the health and pension funds. Consumption is measured as the sum of the production costs (compensation of employees, consumption of goods and services for production, other taxes on production, and consumption of fixed capital).

The survey on the gross fixed capital formation has been carried out annually since 2004 by statistical institutions in Bosnia and Herzegovina. The survey covers all legal units and detailed data on product groups of tangible and intangible fixed assets and costs associated with acquisition of non-produced non-financial assets (land improvement work and transaction costs of ownership of non-produced non-financial assets). In the survey gross fixed capital formation is divided into acquisitions of new assets, acquisition of existing assets and disposals of existing assets.

The Public investment Program of Bosnia and Herzegovina (PIP) includes the projects contained in the Public Investment Program of Institutions of Bosnia and Herzegovina, the Public investment Program of the Federation of Bosnia and Herzegovina, the Public Investment Program of the Republic of Srpska and the List of prioritized Public Investment Projects in Brcko District of Bosnia and Herzegovina. The data from this source were used for estimation the part of gross fixed capital formation financed by donors and credits, which is not covered by the investment survey.

Calculation of changes in inventories is based on accounting statement data. For the compilation of GDP by expenditure, the entities statistical offices have provided data on inventories. Only data for enterprises have been available. Inventories consist the following categories: finished goods, work in progress, trade goods and raw materials and supplies. Estimates of changes in inventories were taken as the differences between the opening and closing book values reported by enterprises and government institutions. No attempt was made for adjusting the data in order to eliminate holding gains (part of the change in value due to changes in prices during the time the inventories are held by producers in the year of reference) due to the lack of appropriate price indices.

The estimates of total imports and exports of goods and services were taken from the corresponding estimates of balance of payment statistics compiled by the CBBH. Imports and exports of services, in accordance with the definitions of the national accounts, do not include payments between residents and non-residents related to primary income (income from property and labor). The main data sources for external trade statistics are custom declarations collected by the Indirect Taxation Authority of BH and taken over by Agency for Statistics. The external trade statistics data are produced and published on a monthly basis. The import data are valued in c.i.f. prices and export data in f.o.b. prices.

Compilation of the balance of payment statistics in Bosnia and Herzegovina is the responsibility of the Central Bank of Bosnia and Herzegovina.

Estimates at constant prices

Estimates of GDP by expenditure were calculated at prices of the previous year, thus allowing the comparison of the data between these two years on a quantitative basis (after eliminating the effect of changes in prices). The implicit deflators of the aggregate and its component are of a Paasche type, which implies that they reflect not only changes in prices but also changes in the composition of the expenditures between the years compared.

Income Approach

Rough experimental calculation of GDP by income approach started for the first time at the beginning of 2008. According to the Work plan, data on section level for period 2005-2009 were published in December 2010.

The data sources for the calculation of income categories are the same as for GDP by production approach.

Sources of data for taxes on production and subsidies on production are detailed lists of taxes and subsidies delivered by Ministry of Finance and budgetary statistics. The item, consumption of fixed capital, does not exist in financial statements for direct budget users, so the experts from the National Accounts department have estimated this item.

Operating surplus is the residual category of value added in financial and non-financial corporations and in activities of households (imputed rentals of dwellings). As output of dwelling activities of owner-occupiers is estimated by the cost approach and gross operating surplus is the sum of consumption of fixed capital and net operating surplus

Mixed income is the residual category in the calculation of value added of unincorporated enterprises. Gross mixed income is revenue of self-employed for their engagement in the production process. The category is estimated separately for household agriculture production and for unincorporated enterprises.

GDP by income approach is calculated on an annual basis and current prices.

Production Approach

Aggregate countrywide estimates of gross domestic product based on the production approach are prepared by the Agency for Statistics of Bosnia and Herzegovina based on the data compiled separately for the two Entities, Federation of Bosnia and Herzegovina and Republika Srpska, and for Brcko District. These estimates are compiled by the respective entities' institutes of statistics and by Bureau of Statistics of Brcko District (the Branch of the BHAS since 2005).

Estimates of GDP by production are prepared at detailed level of the European classification of economic activities (NACE rev. 1.1) and disseminated at the division level. According to the Work plan, data on the division level for the period 2000-2010 were published in December 2011.

Value added by activity is calculated as the difference between the value of output and intermediate consumption. Value added is compiled at basic prices, therefore net taxes on products and imports are added to the total in

order to obtain the estimate of GDP at market prices.

GDP estimates by production approach were revised in 2007 with the publication of the series for the period 2003-2006 including an estimate for the non-observed economy (NOE) and dwelling services for owner occupied dwellings. These adjustments for exhaustiveness were carried out following the tabular approach recommended by OECD-EUROSTAT for NOE, and user cost approach for imputed rentals. A backward revision of the series back to the year 2000 is published in 2010. Compilation of the GDP by production approach at constant prices (at prices of previous year) started in 2006, referring to the period 2004 – 2006. In 2008, the estimates of GDP by production approach at constant prices (at prices of previous year) were compiled for period 2000 – 2003 and the data series for the period 2000 – 2007 were published.

The calculation process of gross domestic product (GDP) by production approach can be explained in two steps. In the first step, gross value added (GVA) at basic prices of all activities is calculated as the difference between output at basic prices and intermediate consumption at purchasers' prices. Allocation of FISIM by activities is not done, so entire GVA is corrected for that amount. In the second step, taxes on products are added, while subsidies on products are deducted from the total GVA for all activities, in order to get GDP at market prices. Subsidies on products and taxes on products are not classified by activities and institutional sectors.

First results for GDP by production approach at the level of A60 Classification of activities are published in the middle of July of the current year, while final data are published in bulletin at the end of current year. Classification of activities is consistent and in accordance with the European Classification of Economic Activities NACE Rev.1.1.

The estimate of dwelling services was based on the methodology proposed by OECD. The estimate was based on the cost approach as sum of intermediate consumption, consumption of fixed capital, taxes on production and operating surplus. The estimate was made for 2004 (2004-benchmark year). The inclusion of these estimates of dwelling services in the GDP official estimates would increase the comparability of the GDP compiled in B&H and with that compiled in other countries.

Intermediate consumption is evaluated at purchasers' prices. Intermediate consumption is calculated as a sum of costs of materials and raw materials, fuel and energy costs, costs of production services and non-material costs.

The GDP calculation at constant prices was done and published for the first time in 2004, with continuous expert support and direct involvement of IMF's consultant for the real sector in BiH. On the basis of the same methodology, the data series for the period 2001-2007 were calculated. For the first time, the calculation at constant prices was done at the A60 level of activities for 2007. The real growth rate at the A60 level is released at the same time as GDP at current prices, by production approach in the middle of July.

For the GDP calculation at constant prices the single deflation method or the single extrapolation method for output was used, depending on available indicators. The use of single indicator implies the assumption of fixed I/O coefficients of the base year (the previous year).

Main indicators used for the annual calculation of constant prices are volume indices, CPI and number of employees' indices taken over from branch statistics.

Botswana

Source

The national accounts Statistics in Botswana are prepared by the National Accounts Statistics Unit (NASU), which is a unit within the Economic Statistics Division of the Central Statistics Office (CSO) of the Ministry of Finance and Development Planning, Gaborone. Official estimates together with methodological notes are published in a series of reports entitled "National Accounts of Botswana". The following statistical sources are used to compile the National Accounts Statistics of Botswana: Census of Production and Distribution (CPD) - annually, Census of Construction and Manufacturing (CMC) - annually, Survey of Recent Trends (SRT) - quarterly, Agriculture Statistics - annually, Government Accounts (Central and local), External Trade Statistics - quarterly, Balance of Payments Statistics - annually, Household Income and Expenditure, Survey (HIES)-1993/94 (every 10 years), Price Statistics - quarterly, Employment Statistics - twice a year, Transport Statistics - quarterly, Mine Statistics - quarterly, Population Projections (every 10 years). The following tables have been prepared from the successive replies to the United Nations national accounts questionnaire.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). These include the adoption of some of the terminology of the 1993 SNA, such as Financial Intermediation Services Indirectly Measured (FISIM). The classification of taxes has also been brought into line with the 1993 SNA and reclassification of mineral exploration costs from current to capital expenditure.

The previous estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). The most detailed description of the sources and methods used for the national accounts estimation is found in the twenty-first edition of the report published in March 2000 for the fiscal year 1994/95. Data starting 1989 is reported with fiscal year beginning on 1st of July of the previous year to the 30th June of the current year. Previously, data was reported with fiscal year beginning on 1st July of the current year to the 30th June of the following year. This data was adjusted to conform with the new fiscal year. The new data is indicated by the start of new series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

The GDP by kind of economic activity is prepared at market prices. The production approach is used to estimate value of almost all industries. The income approach is used for some sub-groups of private services and for producers of government services.

Expenditure Approach

Estimate of final expenditure on GDP may be obtained in two ways. First output of goods and services can be traced through the economy from the original producer to final uses; this is known as commodity flow approach. Alternatively, the receipt and expenditure of the various economic transactions of the system can be looked at directly in order to identify the expenditures that are final and this is referred to as direct estimation of final expenditure. In Botswana national accounts, direct estimation is used for most of the expenditure components. All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure which is obtained as a residual. The estimates of the government final consumption expenditure are based on annual statements of the accounts of central and local governments. Changes in stocks are estimated on the basis of Census of Production & Distribution (CPD) for all the sectors of the economy. Gross fixed capital formation of the government sector is estimated from the government accounts and of the private sector from the CPD. Included in the capital formation estimates are the cost of land clearings

and imputed values of new huts. The estimates of imports and exports of goods and services are based on balance-of-payments data. Exports and imports of goods have to be adjusted for duty content, in accordance with the Southern African Customs Union agreement.

Income Approach

Estimates of compensation of employees are obtained from the Census of Production and Distribution (CPD). Data on payment of wages and salaries are distinguished whether paid to residents or to non-residents and are also classified by type. The main source for estimating consumption of fixed capital formation in the private sector is the CPD. For government assets, straight - line depreciation is applied, the constant percentage varying for different types of assets. Indirect taxes are extracted from the Accountant General's annual statements of accounts, the CPD and the Trade Statistics Unit.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of almost all industries. The income approach is used for some sub-groups of private services and for producers of government services. For the traditional farming of the agricultural sector, the main source used for crops is the annual agricultural sample survey and for cattle, the sources used include Household Income and Expenditures Surveys (HIESs) and annual reports of Botswana Meat Commission. The method has been to obtain quantities of production from the above mentioned sources and apply unit values. Data from the 1985/86 and 1993/94 HIESes also provided information on milk production for own use and the value of meat consumed. From the two surveys, detailed input-output activity analysis of the traditional farming sector has been conducted. For the freehold farmers, the main source has been the CPD and to some extent the annual agricultural survey. For the non-respondents, a grossing-up is made by reference to other farms of the same type.

The estimates for the mining sector are obtained from the Census of Manufacturing and Construction (CMC) which covers all the primary industries. For the manufacturing sector which is dominated by about three sub-industries, the source is the CMC and quarterly survey of Industrial Production. The two above mentioned sources cover all the primary industries, whilst the rest of the sectors are covered by the CPD. This came into effect in 1989. Both the CMC and the CPD gives information for estimating the cost of intermediate consumption. All the government industries go to their respective sectors. For construction, the private contractors and brigades are covered by the CMC. Estimates of construction outlays for sites and services are supplied by city and town councils whilst rural huts construction estimates are imputed on the basis of the HIES data. Estimates of construction carried out by the government departments are derived from the analysis of government accounts.

The main source of information for the trade sector is the CPD. The data obtained from this source is grossed-up to allow for under-coverage. Gross margins are estimated as the difference between sales and purchases of goods for resale. Taxes levied on imported goods are treated as indirect taxes collected by the trade sector. As far as the transport sector is concerned, the source of data is the CPD. The major contributor is post and telecommunication (30 to 40 percent of value added). Gross output of financial institutions is made up of the actual sales of services and an imputed service charge. Estimates for producers of government services are based on the Annual Statements of Accounts of the central and local governments. For the constant price estimates, the CPD data are deflated by a cost-of-living index.

Source

Reply to the United Nations national accounts questionnaire from the Instituto Brasileiro de Geografia e Estatística, Departamento de Contas Nacionais (DECNA), Rio de Janeiro. The official estimates are published by DECNA in a series of entitled "Conjuntura Economica" and Sistema de Contas Nacionais Brasil".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

British Virgin Islands

Source

Reply to the United Nations national accounts questionnaire from the Development Planning Unit, Premier's Office, Tortola. The official estimates are published in "National Accounts Statistics", by the Development Planning Unit. Employment data is published in Employment and Earnings Statistics Report.

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Expenditure Approach

GDP by expenditure is the sum of final consumption at purchasers' prices, gross capital formation (acquisition less disposals of fixed assets and valuables at purchasers' prices plus the net change in inventories) and net exports of goods and services (exports of goods and services at purchasers' prices less imports of goods and services at purchasers' prices).

Income Approach

GDP by income paid to the factors of production, which equals labour, capital and taxes on production and imports.

Production Approach

Value added is calculated separately for each activity at basic prices. The sum of the values added by activity (at basic prices) and taxes on products is equal to GDP at producers' prices for the entire economy. GDP is thus the sum of the values added produced by resident productive units in a given time period, adjusted for the relevant taxes. Value added is defined as the difference between output at basic prices and intermediate consumption, plus taxes on products. In the British Virgin Islands, the only taxes on products are import duties and hotel accommodation taxes. In addition, there are no value added taxes which implies that GDP at producers' prices equals GDP at market prices.

Brunei Darussalam

Source

The preparation of annual and quarterly national accounts statistics in Brunei Darussalam is undertaken by the Department of Statistics (DOS), Department of Economic Planning and Development (JPKE), Prime Minister's Office, Brunei Darussalam. The official annual estimates are published in the Annual National Accounts (ANA) and the Brunei Darussalam Statistical Yearbook (BDSYB) publications; while the quarterly estimates are released through the Quarterly Gross Domestic Product reports on the internet (www.depd.gov.bn) and published in the Brunei Darussalam Quarterly Statistical Indicators (BDQSI) publication.

General

The latest estimates shown in the following tables are based on the new national accounts series for Brunei Darussalam. On 14 August 2006, the Department of Economic Planning and Development (JPKE) announced the new rebased and revised national accounts series for Brunei Darussalam, particularly the estimates of the Gross Domestic Product (GDP). The new GDP series, with 2000 as the base year, is consistent with the latest international guidelines as outlined in the 1993 System of National Accounts (1993 SNA). The previous 1974-based GDP series followed the 1968 SNA.

During the overall revision of the national accounts statistics for Brunei Darussalam, the following improvements were undertaken:

- a) Establishing new benchmark levels of GDP by production approach;
- b) Compilation of GDP by expenditure approach;
- c) Changing to a new base year (2000 = 100);
- d) Compilation of quarterly GDP by production and expenditure;
- e) Developing new methodology for the national accounts compilation; and
- f) Incorporating changes as recommended in System of National Accounts 1993 (1993 SNA).

The new series was released in the Annual National Accounts, 2000 – 2004 (2000=100) publication. The publication provides technical notes which include definitions of national accounting terms, brief explanations of the different approaches used to compile GDP, as well as an outline of data sources and methodology used in the estimation. To facilitate users' needs for a longer time series, the estimated GDP back series covering the years 1985 – 1999, both by production and expenditure is also included in the publication.

Methodology:

Overview of GDP Compilation

GDP is estimated mainly by the production approach. GDP by expenditure approach is also compiled. A statistical discrepancy is added to the GDP by expenditure to record the difference in the GDP values obtained from the production and expenditure approaches. GDP by income approach is currently not compiled

Expenditure Approach

The commodity flow approach is used for the estimation of personal consumption expenditure (PCE) and gross fixed capital formation (GFCF). Total supply consists of local production and imports of goods and services, adjusted for trade and transport mark-up and tax mark-up. For local output, results from the 2002 Economic Census (EC) and estimates of output based on the results of the QSB were used. While imports of goods are from the external trade statistics (ETS) that of services were derived from the balance of payments (BOP). ETS is used for the supply of imported commodities since it contains more detailed information than the BOP.

For the construction sector, the value of construction which was reported in EC and extrapolated using the indicators based on QSB was evaluated using the building materials approach. This is a variant of the commodity

flow approach wherein the quantity and value of construction materials was used as indicator of the trends in the construction sector.

Estimation of government final expenditures as well as the gross value added originating from the government services sector is done by identifying from the available detailed government expenditures, those that fall under value added and intermediate consumption of the government sector. For example, the contribution of government services to GDP is defined as expenditures on personal services including government employees' additional benefits such as free housing. Intermediate inputs are those referring to selected recurrent expenditures such as fuels, supplies and materials and other purchased services; while the rest of the recurrent expenditures are classified as current transfers and capital formation. GVA of the government is deflated using CPI all items.

Imports and exports of goods are direct estimates from ETS; while that of exports and imports of services are from the estimates of the same items in the BOP. Imports of goods at constant prices were computed by dividing the current price estimates with the corresponding import price indices. Import price indices were constructed using unit values (value of imports divided by quantity of imports) from ETS.

Income Approach

GDP by income approach is currently not compiled.

Production Approach

The benchmark gross value added (GVA) of private businesses were derived mostly from the results of the 2002 EC. For the following years, the main bulk of information used in the production accounts was obtained from the results of the Quarterly Survey of Businesses (QSB). QSB is a short survey of medium and large enterprises in the country and thus effectively represents almost 60 per cent of the total value added in the economy. Data on basic indicators such as revenue, employment and compensation were asked in the survey for each quarter of the reference period.

For sectors which are included in the 2002 EC, gross output (GO) is calculated as the value of sales or revenue adjusted with changes in the inventories of finished goods (own produced). GVA is estimated by deducting from output the value of inputs or intermediate consumption (IC) used in the production process.

For the estimation of output for sectors with data on quantity of production such as for agriculture, mining and liquefied natural gas (LNG) manufacturing; output is defined as quantity of production multiplied with producers' prices. GVA is estimated by multiplying output with a gross value added ratio (GVAR). GVAR is computed using data from 2002 EC.

For sectors with data on volume of production, the constant price estimates are estimated by valuing current period production at base year prices. A composite index consisting of average compensation index and all items consumer price index (CPI) weighted by value added shares was used to deflate the GVA of some sectors. Some deflators were constructed from the components of CPI, while others were developed as specific-purpose price indices such as export price indices.

Bulgaria

Source

The national accounts of Bulgaria are prepared each year by the Macroeconomic statistics Directorate of the National Statistics Institute (NSI) based in Sofia, Bulgaria. Results have been issued in several official publications. Since 1995 the National Statistics Institute (NSI) of Bulgaria presents the annual specialized publication "Main Macroeconomics Indicators for the Bulgaria". The publication presents time series data for Bulgaria's gross domestic product (GDP) for the 1995-2010 period; main indicators characterizing the economy's development since 1995; main per capita aggregates for the 2006-2010 period. For the main GDP aggregates by the production and by the final expenditure approaches, previous year based volume indices, previous year based deflators, ratios and relative shares are published as well. The Production and Generation of income accounts are presented by economic sector and economic activity groupings. Sector accounts are presented in the publication. The publication includes annual financial national accounts. Data on the National accounts for Bulgaria are published in the Statistical Yearbook of Bulgaria, Statistical reference Book of the Republic of Bulgaria, Bulgaria - social - economic development, etc. The results are also available on the NSI website www.nsi.bg.

General

National accounts for Bulgaria are compiled according to the 1993 System of National Accounts (1993 SNA) and the 1995 European System of Accounts (ESA95). The main data sources for compilation of GDP estimates by production approach are exhaustive annual institutional units' reports - non-financial enterprises, financial enterprises, non-profit institutions - which contains accounting documents (Balance Sheet, Report on revenues and expenditures, monetary flows) with annexes of statistical reports with accountant data transformation into national accounts economic indicators and structure business statistics. "Small business" (firms which have single entry book-keeping and which annual turnover is under level for registration on the Low on VAT) is studied exhaustively with shortened questionnaire for their all activity. Gross output, intermediate consumption and value added estimates for agriculture activity are based on the information from economic accounts made by Agriculture Division and data from Household budget survey for informal activity of households as well as production produced by households for own final consumption. Administrative information for taxes/subsidies on products and imports is received by Ministry of Finance, Budget and Treasury Department, summary information by National Revenue Agency at the Ministry of Finance as well. Individual consumption of households is estimated on the base of data from regular monthly households' budget sample survey and data from annual survey about retail trade sales. Specific administrative information is used for some expenditure's estimation. The main sources of information for estimates of gross capital formation are balance sheets of enterprises (non-financial and financial enterprises), General Government institutions' trial balances, non-profit institutions serving households' balance sheets, statistical surveys on investment activity. Data sources for foreign trade are administrative data from customs declarations of enterprises which import and export goods.

The National Statistical Institute has elaborated financial accounts on the basis of data drawn from standardised questionnaires collected by National Statistical Institute as well as data from other institutions such as the Bulgarian National Bank, the Ministry of Finance, the Central Depository, etc.

The Bulgarian national financial accounts are prepared in accordance with European System of Accounts 1995 (ESA95) guidelines. Financial accounts deal with the financial transactions taking place between institutional units (sectors). The sectorisation is identical to the one used for non-financial accounts.

Methodology:

Overview of GDP Compilation

The Gross domestic product for Bulgaria is a balanced estimate of the data calculated independently by production approach and by final expenditure approach. Production approach and final expenditure approach are independent from the point of view of data sources while income approach is principally based on the same

primary data as the production approach.

Primary annual data for GDP based on quarterly estimates are compiled 75 days after the end of the reference period. As of this date regular revision of preliminary GDP data for the preceding year on the base of annual exhaustive statistical, accounting and other administrative information. Final GDP estimates are ready after compilation of Supply – Use Table.

In accordance with revision policy time series of national accounts data can be revised in the result of applying a new methodology and procedures and basic changes in the sources and methods of compiling of GDP aggregates as well. In 2010 national accounts data for the period 1995-2010 have been revised. The data presented are the result of plan of the National Statistical Programme for 2010 major revision of GDP data. The revised data include the following elements:

- additional assessments of non-observed economy (underground activities, tips and shuttle trade), based on a survey conducted within the twinning project "Sustainable Development of National Statistical System";
- allocation of the Financial Intermediation Services Indirectly Measured (FISIM) to users, for the period 1995-2010, in accordance with Regulation 448/98 and Commission Regulation 1889/2002. FISIM reflect the financial transactions carried out between institutional sectors (non-financial corporations, government, households, non-profit institutions serving households) and commercial banks (resident and non-resident).
- introduction of the method of modified cash basis for taxes and social and health security contributions for the period 1995-2010, in accordance with Regulation No 2516/2000 on taxes and social security contributions. By applying this method a consistency between the time of the transactions in the economy, representing the tax basis, and the time of their recording in the system of national accounts is ensured.

Expenditure Approach

GDP by final expenditure is calculated as a sum of individual consumption, collective consumption, gross fixed capital formation, changes in inventories, net exports of goods and services.

Individual consumption is measured by:

- a) Household final consumption expenditure includes purchases of goods and services except those bought for intermediate use; goods produced by households for their own final consumption; purchases of services, fully or partially paid; imputed rent of owner occupied dwellings; income in kind. Since 1996 individual consumption of households is calculated according to the national concept (i.e. including the consumption of residents abroad and excluding the consumption of non-residents within the economic territory of the country). Since 1997, household final consumption expenditure is calculated in accordance with COICOP – Classification of Individual Consumption by Purpose, which is used in 1993 SNA and ESA95. The consumption expenditure is presented for 12 main divisions;
- b) Final consumption expenditure of non-profit institutions serving households (NPISHs) includes expenditures of trade unions, religious organisations, charities and other NPISHs rendering goods and services to households free of charge (or at economically insignificant prices);
- c) Government final consumption expenditure includes expenditures incurred by the state budget for the provision of individual services free of charge to households (such as: health, social insurance, education, sports, culture and arts).

Collective consumption is measured by the final consumption expenditure of government on collective services provided to the society as a whole. These are services for maintenance of settlements; fundamental science and scientific services; government administration; defence; and security.

Gross fixed capital formation includes the investments for the following types of fixed assets: tangible fixed assets

(permanent crops, productive and draught animals, buildings, machinery and equipment, transport facilities, agricultural equipment); and intangible fixed assets (R&D products, software, mineral exploration and construction research and design). Gross fixed capital formation is measured by expenditures on acquisition of fixed assets (including uncompleted construction) less the revenues from sales of existing fixed tangible assets.

Inventories consist of materials and supplies; work-in-progress, finished goods and goods for resale; young animals and animals for fattening. Four quarterly estimates for holding gains/losses and changes in inventories are made and the annual values are computed as the sum of the quarterly figures. The holding gains for work-in-progress and finished goods are excluded from the estimates of gross output in the production account. Since 1997, the intermediate consumption is adjusted by the value of holding gains for raw materials and supplies. Changes in inventories included in GDP by final expenditure are based on information for all four types of inventories.

The value of inventories by type and by activity, at the beginning and at the end of the corresponding quarter is deflated by the specific price index and transformed into average preceding year prices. The difference between the deflated values (end minus beginning of the period) represents the estimate of the physical change of the corresponding type of inventory at constant prices. The change of inventories at quarterly current prices is obtained through inverse inflation by the price index for the quarter in question.

Note that the values of holding gains/losses are not eliminated for the period 1991-1993 at current prices and for the period 1992-1994 at preceding year prices.

Net exports of goods and services are measured by the difference between the exports and imports of goods and services. Exports and imports are valued f.o.b.

Income Approach

The generation of income account is compiled in parallel with the production account and shows the activity, economic and institutional sector in which the primary incomes originate. Gross value added is the resource of this account.

Gross operating surplus and/or mixed income is a balancing item, which is estimated as a difference between gross value added at basic prices and compensation of employees and net taxes on production.

Compensation of employees includes the total remuneration, in cash or in kind, payable by an enterprise to an employee in return for work done by the latter during the accounting period, employers' social contributions (actual and imputed), health insurance contributions and contributions to Unemployment Fund according to the present labour legislation.

The item other taxes on production, net represents unrequited payments of the employers to the state budget less subsidies granted by the state budget to the economic units. Until 2000 it consists only of subsidies granted, while since 2001 onwards other taxes on production are included as well.

Capital account shows how savings and capital transfers are used for net acquisition of non-financial assets. Balancing item is Net lending(+)/Net borrowing(-) and it shows the position of each institutional sector in respect of the others and of the economy in respect of the Rest of the world, as lender or borrower.

The Rest of the world accounts (External transaction accounts) are presented as well. These are "External account of goods and services", "External account of primary incomes and current transfers" and "Capital account".

Production Approach

From 1995 the data are presented according to NACE Rev. 2. In compliance with Commission Regulation (EU)715/2010 of 10 August 2010 amending Council Regulation (EC) 2223/96 as regards adaptations following the

revision of the statistical classification of economic activities NACE Rev.2, national accounts are obliged to implement in September 2011, NACE Rev.2 according to the Data Transmission Programme of Eurostat. Data for the Production account and Generation of income account by activity are presented according to A21 level.

Overview of the Compilation of the Integrated Economic Accounts

The institutional sectors cover the institutional units-residents within the economic territory of the country. Data by institutional sector are formed on the basis of re-grouping of the data compiled by activities in respect of economic aims, functions and behavior of economic units.

The non-financial corporations sector consists of all units producing market goods and non-financial services in order to make profit. They hold a full set of bookkeeping accounts, including the bookkeeping balance sheet.

The financial corporations sector consists of all resident units engaged in financial intermediation or in auxiliary financial services, which are closely related to financial intermediation. Financial units are the Bulgarian National Bank, commercial banks, brokers' houses, exchange offices, insurance institutions, pension funds, stock exchanges, and others.

The general Government sector consists of the government legal entities rendering individual and collective services to households and the society as a whole (central government - ministries and authorities; local government - local authorities), as well as the enterprises financed and controlled by the government and central funds for social security.

The Non-profit institutions serving households sector consists of legal or social entities created for the purpose of producing goods and services whose status does not permit them to be a source of income, profit or other financial gain for the units that establish, control or finance them. They may be created for charitable, philanthropic or welfare purposes to provide goods or services to other persons in need; or they may be intended to provide services for fees that are not economically significant, but not for profit. Although they may provide services to groups for persons or institutional units, by convention they are deemed to produce only individual services and not collective services. These are the trade unions, the political, the religious and the charity organizations, the foundations etc. financed by the contributions of their members.

The households sector consists of all households-residents irrespective of the number of their members and type. All households are consumers of goods and services. Some of them are producers mainly for their own consumption. This sector includes also unincorporated units producing for the market that can not be referred to "Non-financial corporations" sector. The units owned by resident persons with single-entry bookkeeping are also included here.

The rest of the world sector consists of all non-resident institutional units that enter into transactions with resident units or have other economic links with resident units.

From the production side, GDP at market prices is calculated as a sum of the gross value added at basic prices for the economy as a whole and the adjustments. The latter includes net taxes on products plus non-deductible VAT plus import duties. Gross output is shown on the resource side of the Production account and covers the market output, the output produced for own final use (including housing services produced for owner occupiers) and non-market output. Gross output consists of: goods and services sold including barter transactions; goods and services used for payment in kind; goods and services supplied to another establishment belonging to the same enterprise or to a non-market producer; resales of goods minus their book value; goods and services produced by the households for their own final use; imputed rent for owner occupied dwellings; goods and services retained by their owners for own final consumption or gross fixed capital formation; goods and services supplied free or sold at prices that are not economically significant to other institutional units; change in inventories of finished goods and work-in-progress. The gross output is valued at basic prices, which do not include net taxes on products as distinct

from the producers' prices. Until 1996 the subsidies given by the state budget are treated as so called "other subsidies on production" and do not affect basic prices. Subsidies are included in the basic prices since 1996.

The Holding gains/losses are accumulated in the value of inventories of finished goods and work-in-progress due to the high inflation i.e. they are not a result of production activity. Since 1994 onwards data on gross output exclude the holding gains/losses.

Intermediate consumption shown on the use side of the Production account is valued at purchasers' prices and consists of: goods and services consumed as inputs in the process of production i.e. they may be either transformed or used up in the production process; goods and services provided to employees while on active duty; small tools and equipment used exclusively, or mainly at work; current repair and maintenance; OR purchased external services, e.g. research and development, staff training, marketing, advertising, communications, rentals, subscriptions etc.

Gross value added is a balancing item of the Production account between the gross output and the intermediate consumption. The item Net taxes on products covers taxes on products less subsidies on products granted by the state budget for certain goods and services, produced by non-financial units. Non-deductible VAT is the VAT payable by a purchaser, which is not deductible from his own VAT liability, if any. It is equal to the estimated value of VAT due to be paid to the state budget, reduced by the reimbursed tax to the taxpayers or by the deducted tax against other tax liabilities.

Non-financial accounts for General Government sector are compiled according to the Commission Regulation 1500/2000, which provides list of main aggregates of the transactions, realized by General Government sector and coded according to ESA'95. The publication contains data not only for General Government sector (S13) as well as for its sub sectors – Central Government (S1311), Local Government (S1313) and Social Security Funds (S1314).

Data for General Government sector are introduced in three types of tables: "Main aggregates of General Government sector" in which general government revenue and expenditure are presented following the structure of institutional sectors and balancing items; "Taxes and social contributions by sub-sectors of General Government" which consists of more detailed data regarding taxes and social contributions recorded under the resource side; and "General government expenditure by function" which presents expenditure data distributed according COFOG classification.

Main sources for elaboration of General Government accounts are:

- a) execution of the consolidated state budget and state unit's reports;
- b) additional administrative information from Ministry of Finance for taxes on accrual bases according to ESA95 requirements and recording the transactions on accrual bases;
- c) administrative information from other ministries and agencies for these fees which are consider as taxes.

The financial accounts consider the following financial instruments (which can be both assets and liabilities for the institutional sub-sectors): Monetary gold and Special drawing rights (F.1); Currency and deposits (F.2); Securities other than shares (F.3); Loans (F.4); Shares and other equity (F.5); Insurance technical reserves (F.6); and Other accounts receivable/ payable (F.7).

Burkina Faso

Source

The Burkina Faso national accounts are prepared by the Service of economic accounts and macroeconomic analysis (SCEAM) of the National Institute of Statistics and Demography (INSD). The elaboration of the national accounts in Burkina Faso takes into consideration the recommendations relating to publication of the Observatoire économique et statistique d'Afrique subsaharienne (AFRISTAT) and also include volume and price index tables as an aid to better understanding of trends in values, often caused by real growth and price variation.

There are two types of national accounts publication. The first presents the various tables of the Revised National Accounts, together with a brief summary of methodology; the second analyses trends in the main aggregates and ratios of the national accounts. The latter, titled Synthesis of Economic Activity ("synthèse de l'activité économique"), is a condensed analysis (less than 8 pages) of the economic activity for the latest fiscal year available.

These national accounts publications and data are available on the INSD website (<http://www.insd.bf>). More detailed results are available from SCEAM.

General

Burkina Faso adopted the System of National Accounts, 1993 (SNA93), in 2001. The transfer to the new system was made possible thanks to a programme of national accounts harmonization and modernization for the States of the West African Economic and Monetary Union (WAEMU), financed by the Regional Statistical Support Programme (PARSTAT). With technical support from the Observatoire économique et statistique d'Afrique subsaharienne, this programme enabled INSD to use the ERETES module for preparing national accounts. ERETES is software that consolidated the use of SNA93 through full integration of SNA93 concepts, definitions and methods.

Before the new system was implemented, 1985 had been taken as the base year. With the introduction of SNA93, 1999 was chosen as the new base year because of the abundance of recent data: the 1996 census, a major survey in 1998, a less detailed survey of the informal sector in 1997, an industrial and commercial census in 1998, and so forth.

The most recent publication of national accounts, the fourth since Burkina Faso adopted SNA93, covers ten years of accounts (1999 to 2008) prepared using the new system and with 1999 as the base year. The previous publications covered the accounts from 1999 to 2005, the accounts from 1999 to 2001 (prepared using SNA93), but also the old gross domestic product (GDP) series (from 1985 to 1998), retroactively extrapolated to match the new concepts and definitions in SNA93 and the new base year (1999).

Methodology:

Overview of GDP Compilation

A classification list of 41 types of activity was prepared on the basis of the Activities Classification of AFRISTAT Member States (NAEMA) and of the country's current situation. A classification list of 69 products, adapted from the Products Classification of AFRISTAT Member States (NOPEMA), was established. While these two classifications were used to assist in preparing the national accounts, they did not appear in the published version.

The WAEMU classification of activities was used for the published accounts. A bridge was established between the classification used in preparation and that of WAEMU to allow industry accounts and the GDP table to be presented in the form required by the new classification.

Calculation of GDP uses the three approaches (expenditure-based, income-based and output or

production-based). By establishing a supply and use table for each output and an industry-by-industry generation of income account, a GDP figure based on these three approaches can be generated, using the ERETES module.

Expenditure Approach

Compiling the value of production using the expenditure approach consists of totalling all expenditure on consumption or use of goods and services during the period under consideration, as follows: households' consumption expenditure on goods and services; private and public sector investment expenditure; Governments' current expenditure; changes in inventories; exports less imports.

GDP at market prices = Final consumption expenditure + Gross fixed capital formation + Changes in stocks + Exports – Imports.

Income Approach

This approach consists of totalling all income from generation of income accounts, taxes less subsidies on production and imports in the course of the year.

GDP at market prices = Compensation of employees + Taxes on production and imports – Subsidies on production + Gross operating surplus (including Mixed income).

Production Approach

The underlying concept of GDP is that it should measure the total value added by all the institutional units of the economy. It is defined as comprising the sum of the value added by all resident producers, plus all taxes, less all subsidies on production.

The value added (or production) approach, which is the most complex, consists first of adding together, at each stage of transformation of a good, the value that the activity has added to the materials necessary to create that good; that is, the difference for a sector of activity between the value of its production and its purchases of materials or intermediate products (goods and services). At that point all taxes, less subsidies on products, are added to arrive at the GDP figure.

GDP at market prices = Sum of the value added (at basic prices) of all branches of activity + Taxes on products – Subsidies on products.

Overview of the Compilation of the Integrated Economic Accounts

Since the adoption of SNA93 in 2001, the preparation and dissemination of the institutional sector accounts and of the table of the integrated economic accounts have formed a part of the various publications.

The classification used in Burkina Faso comprises the following institutional sectors: non-financial corporations; financial corporations; Government units and non-profit institutions serving households (NPISH); households; rest of the world.

Reply to the United Nations national accounts questionnaire from the National Institute of Statistics, Ministry of Planning. The official estimates are prepared by the National Institute of Statistics (NIS), Ministry of Planning, with technical assistance from the Asian Development Bank (ADB).

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Cameroon

Source

The national accounts of Cameroon are prepared each year by the Subdirectorate of National Accounts and Statistical Digests of the National Statistics Institute (INS) based in Yaoundé, Cameroon. Results have been issued in several official publications since 1994, which was when work started on the modernization and revision of the national accounts and the transition was made from the 1968 version to the 1993 version of the System of National Accounts (SNA).

The first publications, entitled "National Accounts of Cameroon using 1993 SNA", were issued in April 1999, April 2000 and May 2002 and included the series of accounts from 1989/90 to 2000/01. Subsequently, two technical evaluation missions of the International Monetary Fund (IMF), which took place from 29 September to 9 October 2003 and from 6 to 17 December 2004, audited the methodology used to prepare the accounts and the quality of the data. Following these missions, the IMF experts concluded that the methodology used was in conformity with 1993 SNA and that the results obtained could be published and used.

Accordingly, the most recent publication, entitled "National accounts of Cameroon for 1993-2003 using 1993 SNA", was issued in August 2005. A CD-ROM was produced for distribution and may be consulted. The results are also available on the INS website www.statistics-cameroon.org.

General

Prior to 1994, national accounts estimates were prepared using 1968 SNA. Thus the input-output tables were published for the period from 1965/66 to 1988/89. The national accounts are now prepared using the new System of National Accounts adopted by the United Nations in 1993 (1993 SNA). The preparation comprises six main stages: (i) classification and inventory of sources - this is a one-time operation, performed when the base year is selected, which is in theory changed every 10 years; (ii) collection and processing of data sources; (iii) reconciliation (cross-checking of various data sources for each operation involving goods and services and allocation); (iv) analytical work including compilation of supply-use balances, branch accounts and accounts of institutional sectors (who-to-whom matrix); (v) preparation of digests; and (vi) post-digest work (preparation of the next exercise).

Methodology guidelines describing these different stages have been published and a summary is given in the latest national accounts published in August 2005. This series differs from previous ones because of the transition from the budget year (July/June) to the calendar year (January/December), in compliance with the rules of the Central African Economic and Monetary Community (CEMAC), the accounting plan of the Organization for the Harmonization of Business Law in Africa (OHADA) and the IMF requirements specified in the General Data Dissemination System (GDDS).

In addition, there are new classifications of activities and products in compliance with revision 3 of the International Standard Industrial Classification of All Economic Activities (ISIC) and the new Central Product Classification (CPC): activities are classified at two levels (44 branches and 102 sub-branches); the classification of products is linked to that of activities and includes 3 levels and 287 products at the greatest level of detail.

The summary tables generally published are:

- Supply and use tables, formerly known as input-output tables in 1968 SNA, valued at current prices and at constant prices for 1993 and 2000;
- Integrated economic tables, formerly called comprehensive economic tables in 1968 SNA.

Since 1994, national accounts have been prepared by microcomputing using the ERE/TES system. This software was developed with the support of the French cooperation agency and the European Union. The ERE/TES module

has three main functions:

- A database comprising: (i) storage space for two years of data, facilitating comparisons; and (ii) working tables for compilation of the supply-use balance, branch accounts and the who-to-whom matrix;
- A management system for coordinating an exercise of preparing national accounts, by assigning tasks among team members and networking;
- Methodological guidelines for compilation of accounts using a plan of the various stages of work, help screens for each stage and assistance in monitoring work done.

It also has subsidiary functions, for instance for the publication of summary tables and of any other information available in the database.

Methodology:

Overview of GDP Compilation

In Cameroon, GDP is calculated using the following three approaches: production, expenditure and income. The first two approaches use data from the supply and use tables, while the third uses data from the integrated economic tables. The process involves parallel estimations of goods and services transactions and distribution operations. The estimates of these different operations are then cross-checked in the working tables (supply-use balances, branch accounts and who-to-whom matrix). Supply-use balances are compiled for each of the 287 products classified as products of Cameroon and branch accounts for each of the 102 branches into which activities in Cameroon are classified. The who-to-whom matrix is prepared for the various operations covered by the integrated economic tables. For each distribution operation, the goal is to match institutional sectors that provide goods and services and those that receive.

Expenditure Approach

The final consumption expenditures of public administrations and non-profit institutions serving households (NPISH) are derived from estimates of their non-merchandise production, which is in turn calculated from data from various government and private sources. Final consumption expenditures are also classified into separate individual and collective non-merchandise categories.

Final consumption household expenditures are of two types: merchandise and non-merchandise. The data sources used to date are: (i) the 1984 budget consumer survey; (ii) the 1993 and 1994 1-2-3 survey of employment, the informal sector and consumption; (iii) the 1996 Cameroonian household survey (ECAM I); and (iv) the 2001 Cameroonian household survey (ECAM II). The volume index by product is estimated while the price index by product is derived from the national price index. These indices are then used to calculate final consumption levels at constant and current prices for a given year.

The gross fixed private capital formation is derived largely from the statistical and tax declarations of companies. The variables noted concern, inter alia, the value of land, non-residential buildings, residential buildings, other types of construction, plantations, transportation equipment, farming equipment, and plant and equipment under construction. The accounts also cover the different stocks of products (raw materials, products in manufacture, finished products and products for resale).

Gross fixed capital formation is obtained from documents on the credit situation that describe central government expenditures, government accounts, financial statements or operating accounts of decentralized public administrations, communal budgets and communal administrative accounts for local collectivities and international assistance the data on which is provided by the Caisse Autonome d'Amortissement (CAA) and the United Nations Development Programme (UNDP).

Figures for imports and exports of goods and services are obtained from customs and balance of payments statistics. A conversion table is prepared to convert the foreign trade data submitted under the Harmonized Commodity Description and Coding System (HS) to the corresponding national accounts product classification. Price indices are calculated from trends in unit values and the volume index from the ratio between the value and price indices. The balance of payments is prepared by the Ministry of the Economy and Finance and a conversion table is prepared to establish equivalences between its product classifications and those used in the national accounts.

Income Approach

Data on workers' wages and taxes net of subsidies on the production of non-financial and financial companies are obtained from the statistical and tax declarations of companies. With regard to the central government, the same data is obtained from monthly wage figures, the table of financial operations of the State, and from the accounts of local collectivities and public establishments. Data for the household sector is obtained from the statistical and tax declarations of individual entrepreneurs and/or from analysis of the informal sector survey results. The combined gross surplus from operations and income is obtained from the balance between the value added from the production account of each institutional sector and the above elements. It should be noted, lastly, that sector accounts are prepared at current prices only.

Production Approach

Data on the merchandise and non-merchandise production and on intermediate consumption in the different economic sectors are obtained from various sources. Data on production are at base prices while data on intermediate consumption are at acquisition prices.

Data on the production of subsistence and industrial export crops are obtained from the statistics of the Ministry of Agriculture and Rural Development. The value is calculated using data from the survey on the price formation of subsistence crops carried out by the National Statistics Institute and the export unit prices or world prices.

Data on livestock and fisheries are obtained from the Ministry of Fisheries and Animal Industries. In the absence of data on changes in the size of herds, the model used is based on the final consumption of meat and the rate of transformation from cattle on the hoof to meat.

Data on the production and intermediate consumption of agroforestry and forestry development and from the extractive and manufacturing industries, among others, are obtained from the statistical and tax declarations of enterprises in these sectors. It should be noted that the statistical and tax declaration is prepared each year by enterprises in the formal sector reporting on their financial and accounting situation.

Data on the production of banks and microfinance, insurance and insurance brokerage institutions are also obtained from the statistical and tax declarations and from the insurance market report prepared annually by the Ministry of the Economy and Finance.

The value of the non-merchandise production of public administrations is calculated from the wage bill, intermediate consumption and other taxes less any subsidies on production and fixed capital consumption. Data is also obtained from the various public administration records referred to above.

Data on the various types of taxes, including value-added tax, customs charges and export taxes, is obtained from government accounts, which cover income from government administrations, public financial statistics, tax statements and Cameroonian financial legislation.

Given the size of the informal economy of Cameroon, two matrices of production and intermediate consumption by sector of activity are also prepared in order to reflect the value created by this sector of the economy. The data sources used to date are the 1993 and 1994 1-2-3 surveys and the 2005 informal sector employment survey (EESI).

In the absence of source data, employment data and estimates of the consistency of technical coefficients and labour productivity (level of production divided by jobs) are sometimes used. Where possible, volume indices are calculated from changes in quantity and the price index is often calculated from the consumer price index.

Canada

Source

The preparation of national accounts statistics in Canada is undertaken by Statistics Canada, Ottawa. Official estimates are published by Statistics Canada quarterly in "National Income and Expenditure Accounts", Catalogue 13-001. Statistics Canada also publishes annual input-output tables at current prices in "The Input-Output Structure of the Canadian Economy", Catalogue 15-201. Monthly estimates of Gross Domestic Product by industry in chained dollars are published in "Gross Domestic Product by Industry" Catalogue 15-001-XIE (English) and 15-001-XIF (French). Quarterly statistics on flows of funds are published in "Financial Flow Accounts" Catalogue 13-014 and quarterly estimates of balance sheets in "National Balance Sheet Accounts" Catalogue 13-214. The monthly, quarterly and annual GDP in chained (1997) dollars is published in "Gross Domestic Product by Industry" Catalogue 15-001-XIE. These data can also be found online at www.statcan.ca.

Detailed sources and methods are published in "Gross Domestic Product by Industry: Sources and Methods" Catalogue 15-547-XIE (English) and Catalogue 15-547-XIF (French) and in "Gross Domestic Product by Industry: Sources and Methods with Industry Details" Catalogue 15-548-XWE (English) and Catalogue 15-548-XWF (French). In addition, detailed sources and methods are published in "A Guide to the Financial Flow and National Balance Sheet Accounts" Catalogue 13-585e (English) and 13-585f (French). A detailed description of the sources and methods used for the Income and Expenditure Accounts estimation is found in "Guide to the Income and Expenditure Accounts" Catalogue 13-603E (English) and 13-603f (French). A detailed description of the sources and methods used for obtaining the Input-Output Accounts in constant prices can be found in "A Guide to Deflating the Input-Output Accounts: Sources and methods" Catalogue 15F0077GIE. Reply to the national accounts questionnaire was received through the Organisation for Economic Co-operation and Development (OECD), Paris, France.

General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the 1993 SNA, a footnote provides explanation. A discussion of these differences is found in Lal, K. "Remaining Differences Between the 1997 Canadian System of National Accounts and the 1993 International System of National Accounts, Statistics Canada, 1998" as well as Lal, K. "Measurement of Output, Value Added, GDP in Canada and the United States: Similarities and Differences, Statistics Canada, 2003." From 1961, chain constant dollars are referenced to the year 2002 and are not additive.

Methodology:

Overview of GDP Compilation

In the Canadian System of National Accounts, activity is geared towards compiling data according to three different programs:

- 1) The annual Input-Output Accounts, where data are compiled using a value-added approach by sector and by industry. Data are presented in three main tables for Canada and its provinces and territories: the output, input and final demand tables. Provincial/territorial tables are linked through an interprovincial flows table that shows each jurisdiction's exports to, and imports from, other provinces and territories as well as abroad; National tables are produced on an annual basis, beginning with the 1961 reference year. Provincial tables are produced annually (starting with the 1997 reference year) and released with the national tables in November of each year with a 34 month lag from the reference year.
- 2) The quarterly Income and Expenditure Accounts, for which data by sector are reconciled with the Input-Output Accounts in benchmark years and projected using various surveys and administrative data for more current time

periods. A statistical discrepancy, balances the two approaches. The Accounts portray income arising from production, final expenditure on that production and redistribution of income through intersectoral transfers. Capital finance accounts show saving and non-financial investment of each sector, thus yielding their respective lending capacity or borrowing requirements. Initial estimates for a given quarter are released 60 days after the end of a reference quarter. These are subject to revision when estimates for subsequent quarters of the same calendar year are released and once a year in the following four years. Annual Provincial Income and Expenditure Accounts are released in two stages: in April of each year, when estimates for the preceding year are published, and in November of each year when four years' of data are revised and released.

3) The monthly GDP Estimates, which are chained volume estimates with a 1997 reference year. From the reference year forward, the monthly estimates are benchmarked to annually chained Fisher volume indexes of GDP obtained from the constant-price input-output tables, to the most recent year in which the latter are available. More current data are derived by chaining a fixed-weight Laspeyres volume index to the prior period. The fixed weights are the industry output and input prices from the most recent year available.

Canadian basic prices do not correspond exactly to international basic prices. The concept of modified basic prices is used, instead. The modified basic price of a product is equal to the price receivable from the purchaser minus any transport margins and trade margins at the time of delivery of the product to the purchaser and any taxes on products. It excludes any subsidy receivable by the producer. In Canada, the modified basic price is the subsidized price on products, while in the 1993 SNA it is the actual price plus subsidies.

Expenditure Approach

Benchmark estimates of consumer expenditure have been based on the decennial Censuses of Merchandising and Services and on the retail commodity survey of 1974 and 1989 as well as the annual Family Expenditure Survey. More recently, mostly from 1997 onward, the benchmark estimates rely on the annual and monthly Retail Trade Survey and the quarterly Retail Commodity Survey as well as the annual Survey of Household Spending. These estimates are first adjusted to include commodities purchased through non-retail trade outlets and then broken down into trade groupings. For the non-census years, the benchmark estimates of each trade group are interpolated or projected by using the movement of sales of equivalent kind-of-business groupings. For non-retail trade groups, surveys of wholesale trade and service industries are used. Estimates of consumer expenditure on services such as transport, health care and education are based on annual surveys or published reports.

Government final consumption expenditure is based on public accounts and financial records and statements of government bodies. At the federal and provincial levels, the figures are derived by eliminating from total government budgetary expenditure all outlays that are not made directly to purchase new goods and services. At the local level, the estimates are built up directly on a gross basis from the data sources, subtracting revenues from sales of goods and services.

Comprehensive figures on the quantities of physical stocks held on farms and grains in commercial channels are available from the Agriculture Division of Statistics Canada. Inventories held by government agencies are obtained from government records. Estimates of inventory book values of non-farm business are based on annual censuses or sample surveys.

The estimates of gross fixed capital investment are based on the results of annual surveys which are published in "Private and Public Investment in Canada: Outlook" reports. Data are available separately for non-residential construction and machinery and equipment. Residential construction estimates are derived from housing starts as counted by Canada Mortgage and Housing Corporation, building permit values and monthly work-put-in-place coefficients.

The estimates of exports and imports of goods and services are based on information available in the balance of payments. For merchandise, the import and export figures are obtained from customs entries while for services, the estimates draw upon a number of sources such as surveys of business firms and Statistics Canada's international travel surveys.

Constant dollar values of government consumption expenditure are obtained through extrapolating base-year wages and salaries by total hours worked data and through deflating other current expenditure by base-weighted price indexes. Price deflation is also used for private final consumption expenditure, non farm stocks, non residential construction and machinery and equipment, and exports and imports of goods and services. The constant price series for farm inventories is derived by valuing the physical quantities of stocks in prices from the base period chosen. For residential construction, the estimates are derived by deflating current dollar component estimates with price indexes. Exports and imports of merchandise are each revalued by specially constructed current-weighted indexes.

Income Approach

The general method used in the preparation of the labour income estimates consists of calculating the payments made on labour account by the various industrial groups and summing the results. The estimates are based on monthly and annual samples of full-coverage surveys conducted by Statistics Canada, decennial or quinquennial censuses and published statements of governments. A principal benchmark source of information is the tabulation of total wages and salaries submitted by employers with respect to employees' earnings, which is undertaken by the Canada Revenue Agency in connection with the administration of the Income Tax Act.

Estimates of corporation profits are obtained from the Survey of Quarterly Financial Statistics for Enterprises (for which annual data are based on tax data from the Canada Revenue Agency). Estimates of interest and miscellaneous investment income are based on information obtained from various sources such as the Canada Revenue Agency, the Bank of Canada, accounts and financial statements of governments and others. For unincorporated business, estimates are obtained either through direct inquiry, subtracting expenses from gross income or through applying the ratio of net to gross income based on survey or income tax data. The estimates of depreciation are calculated on an original cost valuation basis with a close link to the figures of book depreciation reported in the accounting records of business firms. For the government sector, capital consumption allowances are imputed while for the agricultural and housing sectors, replacement cost estimates of capital consumption are prepared from estimates of fixed reproducible capital at market values. The estimates of indirect taxes are based on accounting records of the various levels of government. Subsidies consist of federal and provincial production subsidies.

Production Approach

In the Canadian Input-Output Accounts, gross domestic product is prepared by sector at basic prices and is classified by industry on the basis of establishment data. Estimates are compiled using the value-added approach. The input-output tables (in current and constant prices) are produced on an annual basis.

Outputs, intermediate inputs and inventory data of the Agriculture industries are estimated from farm cash receipts and farm operating expenses available from Statistics Canada's agriculture economic statistics program. GDP is estimated using the production approach. The output of Services Incidental to Agriculture is estimated using demand side data.

Estimates for Mining and Oil and Gas extraction are based on census data (mines) and annual sample surveys. Outputs and intermediate inputs are estimated using the survey data and GDP is obtained residually. The individual components of GDP are estimated from the survey data and reconciliation with estimates derived from the income-approach.

Output estimates for the Fishing and Trapping industries are based on annual survey statistics and administrative data while the intermediate inputs are estimated based on benchmark data available occasionally. Total GDP is estimated using the value added approach while the individual components of GDP are estimated using income statistics.

Estimates for Logging and Forestry, Manufacturing, Wholesale, Retail and Business and Personal service industries including Real Estate Lessors and Brokers are based on annual sample surveys that provide financial

and production statistics for these industries. Outputs and intermediate inputs are estimated using the survey data and GDP is obtained residually. The individual components of GDP are estimated from the survey data and reconciliation with estimates derived from the income-approach.

The Construction industries in the Canadian Input-Output Accounts are comprised of contract and own-account construction activity. The outputs are derived from an annual sample survey of capital expenditures. Value added for construction is estimated using the income-approach while intermediate inputs are estimated using benchmark cost estimates from different types of construction projects. The estimates include adjustments for own account wages and materials for construction activity.

The estimates of outputs and intermediate inputs for Utilities industries are based on annual surveys of production and administrative data. GDP is estimated residually using the value added approach.

For financial institutions, outputs, intermediate inputs, and value added are derived from the accounting records of banks and other financial institutions from statistics of the Office of the Superintendent of Financial Institutions.

In the Canadian Input-Output Accounts, market as well as non-market producers are shown in the supply and use table. Non-market outputs are derived as the sum of costs which are obtained from administrative sources.

For the estimates of GDP at constant prices, a double deflation approach is used for the business sector industries. The double deflation approach consists of taking the difference between gross output at constant prices and the sum of intermediate inputs and net taxes on products at constant prices. For producers of government services and producers of private non-profit services to households, various indicators, such as hours worked, are used to extrapolate or deflate directly value added.

Sources of deflators include a number of measured prices such as Industrial Product Price Indexes for the output of manufactured goods, accounting, engineering consulting and traveller accommodation for some business services. Machinery and Equipment Price Indexes are used to deflate the machinery and equipment commodity. Import deflators, which are largely based on trade data, are used to deflate import commodities. Consumer commodities bought by households are deflated using the Consumer Price Index. Other deflators are constructed using various approaches, as unit value indexes for primary commodities based on quantity and value data. Information on ton-kilometers and values are used for truck and rail transportation deflators.

The Fisher index, which is the geometric average of Laspeyres and Paasche indexes, is used as the official measure of volume changes of GDP. The Input-Output estimates of GDP by industry in constant prices serve as annual benchmarks for the monthly GDP by industry.

Source

Reply to the United Nations national accounts questionnaire from the Ministerio da Coordenacao Economica, Direccao Geral de Estatistica. The official estimates are published in "Boletim Anual de Estatistica" and "Boletim de Contas Nacionais".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Cayman Islands

Source

Annual National accounts are compiled and disseminated by the Economics and Statistics Office of the Government of the Cayman Islands, Grand Cayman. The official estimates are published by the Statistics Office in its publication "The Cayman Islands' System of National Accounts". This report is also posted on the internet at www.eso.ky. In addition to the figures, technical guidelines and definitions from the SNA manual are incorporated in various sections of the report. Detailed sources and methods are also included. The Cayman Islands Compendium of Statistics and the Annual and Quarterly Economics Reports also carry portions of the national accounts estimates.

General

The estimates shown in the tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. The Cayman Islands is currently still developing its national accounts and have now added the income approach to its compilation of GDP estimation. So now both the production and income approaches are being carried out. Estimates using the both production and income approaches were done at current prices for the years 2006 to 2010 and at constant prices using the production approach for the years 2006 to 2010. We are currently working on the expenditure approach and it is our intention to have it ready at current prices by the end of 2012. The compilation of GDP estimates is presented and is classified in accordance with the International Standards Industrial Classification (Revision 4). All industries and their sub-industries are measured in terms of their value added or direct contribution to the Gross Domestic Product (GDP) for the years 2006 to 2010 with 2007 being the base year.

Methodology:

Overview of GDP Compilation

The Cayman Islands' SNA have expanded its estimation of the Gross Domestic Product (GDP) to include the income approach. The production approach is done whereby the GDP is obtained by summing the value added of all industries and the income approach is calculated by summing all the income accruing to the factors of production. The total value of the Cayman Islands' GDP pertains to all entities that have physical presence in the Cayman Islands and therefore excludes entities registered in the Cayman Islands but have no physical presence in the country. The Cayman Islands' economy is an offshore driven economy. The current and constant price estimates of GDP are valued in both basic and market prices. Gross value added has been revised and is now presented by type of economic activities according to ISIC Revision 4. Financial intermediation services indirectly measured (FISIM) is calculated separately and not distributed by type of economic activity. Taxes and subsidies are dealt with in accordance with the Government Finance Statistics Manual 2001. Imports are recorded at c.i.f. and exports at f.o.b. values. All transactions including government are recorded on an accrual basis.

Income Approach

This approach of measuring GDP is calculated by the summation of all the incomes accruing to the factors of production, that is, compensation of employees, consumption of fixed capital, net taxes on production and imports and operating surplus. The balancing item, the operating surplus is derived by subtracting the production expenses from the gross output. In the case of the Cayman Islands, depreciation is used as a proxy for the consumption of fixed capital. The data for the generation of income account are collected through the annual national accounts survey which captures data for both the production and generation of income. The survey data are supplemented by data from the government department and agencies, for example, tax data from the Ministry of Finance.

Production Approach

This approach calculates GDP as the sum of the value added of all industries. This is the difference between gross output of producers and the value of their intermediate inputs. Gross domestic product is calculated at both basic

and market prices. The value of GDP is obtained by calculating the sum of the gross value added for each industry at basic prices. Net taxes (taxes less subsidies) on products and imports are then added to the basic prices to derive estimates of GDP at market prices.

Data Sources

Gross value added at current and constant prices was compiled using data from a variety of primary and/or secondary sources. The main source of primary data was the Annual National Accounts Survey. The Annual National Accounts Survey is designed primarily to collect information from active business units on their income and expenditure. Other data sources were the consumer price index (CPI), Labour Force Survey (LFS), Survey of Living Conditions (SLC) and the Household Budget Survey (HBS). Other secondary data sources consist mainly of administrative records and data generated as by-products of the administrative process. Revenue and expenditure accounts of government and statutory agencies, merchandise trade data, and specified data from the Cayman Islands Monetary Authority (CIMA) comprised the main secondary data sources. The estimates of gross value added at current prices were derived by compiling and analyzing data at very low levels. For most industries, manufacturing, finance and insurance services, transport, storage and communication, etc., survey data and other administrative data were adequate to compile the GDP estimates in the standard way but for a few such as construction and wholesale and retail trade a commodity approach was employed. Gross output for owner-occupied dwellings was computed using the owner-occupied housing stock and estimated average rent. At constant prices, production is measured in terms of prices relating to the base period.

The base period used in the Cayman Islands is 2007. The consumer price index (CPI) was predominantly used in computing gross value added at constant 2007 prices. The gross value added of a number of industries, at current prices, was deflated by the prices of CPI items, or groups of items. The single indicator method was the deflation method used for the Cayman Islands System of National Accounts. There are no producer price indices. Extrapolation of the base year gross value added by a volume index based on gross output was used to deflate most of the estimates. Direct volume measures were applied where data were available. A weighted wage index computed from data on government employment was applied to public administration and other non-market government production.

Reply to the United Nations National Accounts Questionnaire from the Direction Générale de la Statistique, des Études Économiques et Sociales (DGSEES) of the Ministère de l'Économie, du Plan et de la Coopération Internationale, Bangui.

General

The estimates shown in the following tables have been prepared and adjusted by the Direction Générale de la Statistique, des Études Économiques et Sociales (DGSEES) in accordance with a hybrid between the United Nations System of National Accounts 1968 (1968 SNA) and the United Nations System of National Accounts 1993 (1993 SNA). That means that some aspects of the 1993 SNA have been implemented, but the move over to this SNA version is not complete. Previously, data have been compiled according to the 1968 SNA. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique, des Etudes Economiques et Démographiques du Ministère de l'Economie et du Plan, BP 453, Tel 00235 2523164, inseed@intned.td, N'Djaména.

National account publications are made annually in the form of bulletin with comments. The most recent publication is that of 2005. The publication can be obtained from the site www.inseed-tchad.org.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. Nevertheless, the SNA93 is not implemented thoroughly. The process of applying SNA93 completely is underway using ERETES module and 2005 as base year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. At the year n, data from the data year n-2 are considered final, data for year n-1 are provisional, and the data for year n are forecasts. Official data are published every June. The reporting period is the calendar year.

Methodology:

Overview of GDP Compilation

The main approach applied to estimate GDP is the production approach. Compensation of employee data is obtained from surveys or derived as residuals when data is not available.

Expenditure Approach

Household consumption expenditure is estimated based on the Consumption budget Survey 1995, INSEED. Government consumption expenditure is obtained from Government budget. Gross fixed capital is obtained from DSF. Changes in inventory is calculated as a residual except for the agricultural industry. External trade is obtained from the central bank. Data by economic activity is not available.

Production Approach

Data is collected from service producers of basic statistics.

Chile

Source

The Central Bank of Chile (Banco Central de Chile) prepares Chile's national accounts. Official estimates are published in "Cuentas Nacionales de Chile" (<http://www.bcentral.cl/publicaciones/indexextema.htm>). The information on methods and sources that follows is primarily based on detailed information that the Central Bank has sent to the United Nations. An updated methodological summary can be found on the IMF's Dissemination Standards Bulletin Board (see <http://dsbb.imf.org/Applications/web/basepagesmreport/?strcode=CHL&strcat=NAG00>). The Central Bank of Chile's new national accounts series uses a base year of 2003 for constant prices. Background information on how constant price statistics were compiled is available in: "National Accounts of Chile 2003 Benchmark Compilation" (www.bcentral.cl/eng/publications/statistics/integrated/pdf/naccount2003_com.pdf).

General

The national accounts have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Prior to 1996, estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). A general vision of the Chilean national accounts and the current situation is disseminated in <http://www.bcentral.cl/estadisticas-economicas/metodologias-estadisticas/cn.htm> (Spanish).

The Central Bank primarily uses the goods and services accounts, which backstop to the accounts of the institutional sectors. The goods and services accounts are compiled around two concepts: benchmark compilation and follow-up compilation (yearly and quarterly). The first one supplies the "best levels" and the last one gives the "best change" of the goods and services accounts.

Methodology:

Overview of GDP Compilation

The Central Bank primarily uses the production approach to estimate Gross Domestic Product, except for external trade flows, which are estimated using the expenditure approach. Detailed methods by each approach are disseminated in http://www.bcentral.cl/estadisticas-economicas/metodologias-estadisticas/metodologias_detalladas.htm (Spanish). Furthermore, in the Report of the Observance of Standards and Codes (IMF), http://www.bcentral.cl/estadisticas-economicas/publicaciones-estadisticas/pdf/ROSC_2007.pdf (English)

Expenditure Approach

The expenditure approach is used to estimate exports and imports of goods and services. Data comes from balance of payments statements prepared by the Central Bank. General government expenditure on final consumption comes mainly from reports by the National Comptroller's Office (Contraloría General de la República). For lack of direct data, the remaining GDP expenditure components are estimated using a two-step procedure, which starts by estimating hypothetical use of domestic and imported products, separately and in detail. The hypotheses cover intermediate consumption, final consumption and fixed capital formation. In the case of finished and unfinished manufactured goods, inventory changes are estimated. The second step involves balancing supply and use. This step consists of comparing for each product, the supply hypotheses to partial data on intermediate absorption, fixed capital formation, and inventories change. The Bank uses both current and constant prices to ensure volume and price components are consistent. Depending on the product, at the end of the balancing process, minor discrepancies may be imputed to changes in inventories, intermediate consumption or private consumption.

Income Approach

Wage and salary estimates come mostly from company financial statements, economic surveys and relevant tax records from the Internal Revenue Service (Servicio de Impuestos Internos, SII). Employers' contributions to social

security schemes and wages and salaries paid in kind are included in the estimates. Operating surplus is obtained as a residual. Data on consumption of fixed capital are obtained from accounting statements, company surveys and relevant income tax records. This is reconciled with estimates of fixed assets, by type of capital and useful life. For indirect taxes, the Bank uses published fiscal statements by type of tax.

Production Approach

Generally speaking, constant prices are estimated using three approaches: full information, a method based on extrapolation with quantitative indicator indices (single indicator) for some sectors, and by double deflation method for others. Production is valued at producer prices and intermediate consumption using purchasing prices. Intermediate consumption is calculated on an annual basis only. For quarterly data, estimates are based on the assumption that, to the most broken-up possible level, the relation between output and value added remains stable over the year. Supply and use tables are estimated both quarterly and annually. Naturally, degrees of freedom are major for the annual balancing.

For agriculture, livestock and forestry, constant and current price data on output and intermediate consumption are generally extrapolated from volume and price indicators. Value added is obtained by a difference. Annual surveys on seeding and harvesting are conducted by the National Statistics Institute (Instituto Nacional de Estadística, INE). INE figures for manufacturing production linked to agriculture and detailed data on exports (from the national custom's service) are used to estimate agricultural production. Statistics on livestock and meat processing (from INE) are used to estimate livestock production. Statistics on wood manufacturing production (from INE) are used to estimate forestry production. For quarterly data, volume indicators mainly reflect a product approach, for that reason, the industry output is obtained through the production matrix given the product's levels. For annual data, and for revised quarterly figures, direct production indicators are used. For fishing, monthly aggregate data on catches from the national fishery service (SERNAPESCA, which forms part of the Ministry of the Economy) and detailed data on fishery exports from the national custom's service are used. For quarterly data, annual volume indicators are obtained, mainly using a product approach. For revised quarterly figures, detailed data on catches and harvests are used.

For mining, annual data is based on production and sales figures for the different minerals produced in Chile, intermediate consumption and added value components, all provided by the main mining companies and obtained through Central Bank of Chile surveys, company balance sheets and annual reports. Statistics also come from specialized bodies, such as the Chilean Copper Commission (Comisión Chilena del Cobre, Cochilco) and the National Geology and Mining Service (Servicio Nacional de Geología y Minería, Sernageomin). Direct volume indicators are used both for annual and quarterly data.

For the manufacturing industry, annual accounts are primarily produced for manufacturing sectors using two calculation methods: i) the "product method", which uses production and product supply figures to calculate statistics in a price per quantity measure. The base information comes from bodies specializing in national, agricultural, planning, fisheries and other data collection (Instituto Nacional de Estadísticas, Servicio Agrícola y Ganadero, Oficina de Estudios y Planificación Agraria, Servicio Nacional de Pesca, among others). ii) The "industry method", which uses accounting data from company financial statements, economic surveys and tax data. The main sources include the national manufacturing survey (Encuesta Nacional Industrial Annual, ENIA) and income tax data from internal revenue (SII). To estimate quarterly accounts, quantitative indicators are used from the physical sales and production index (Índice de producción y venta física, IPVF) prepared by the National Statistics Bureau (INE).

For electricity, gas and water supply, the annual account is based on information about the main companies' production and sales, obtained using Central Bank surveys, balance sheets and annual reports. Moreover, figures from specialized bodies are also available, among them the centers of dispatch of energy (Centros de Despacho Económico de Carga, CDEC), the national energy commission (Comisión Nacional de Energía, CNE), and the Superintendency of Sanitary Services (Superintendencia de Servicios Sanitarios, SISS). For electric power-related activities, technical coefficients distinguish between the technology used to generate electricity and the contribution of power generation made to value added.

For construction, engineering works output comes straight from nominal spending on construction as part of projects carried out by public and private institutions, and corporations. Output value at constant prices is estimated by deflating the nominal production value using a price index. The source is the construction investment survey applied to public and private companies. To measure building works, output at constant prices is derived from the area built and costs per square meter for the base year. The area effectively constructed is obtained by applying expenditure-time curves to the area approved for building during a given period. The nominal production value is determined identically, except by the use of costs per square meter for the current year. Then, the price deflator is implicit. Sources include building permits and INE.

For wholesale and retail trade, the production account at current prices is compiled using the product and industry methods. The former is based on the flow of relevant domestic and imported goods and services obtained from the supply estimate in the Supply-Use Table, for which sales margins (expressed as rates and established in the 2003 Benchmark Compilation) per product are obtained. The latter is based on income tax information from Internal Revenue (Servicio de Impuestos Internos) and the trade survey (ECOM) applied by INE. VAT data from SII is also used; financial statements from the sector's main companies are used for comparison's sake. For estimates covering specific points in time, VAT data from SII, a survey on the sale of consumer goods, INE's manufactured goods sales index, and the Chamber of Commerce sales index are used. To reach constant prices, price indexes (complemented by quantity indices) are used to deflate.

For transport and communications, production information at current prices, for those subsectors for which information is available, reflects the sum of revenue. This is the case with rail, air and maritime transport; and some activities included under associated services, such as highway concessions, ports, airports, gas and oil pipelines. For other transport-related activities (customs, cargo and others), the information comes from a sample of companies. To measure at both annual and quarterly constant prices, passenger/kilometer and tons/kilometer indicators are used for air and rail transport, while maritime transport figures are obtained by deflating production at current prices. For ground transportation of cargo, annual and quarterly accounts are estimated with a volume of the production index, of the industries demanders (índice de volumen de la producción de las industrias demandantes). To measure ground transportation of passengers, annual surveys of the interurban transport are used, along with information on the fleet available for public urban transport use and service prices. For communications, the double deflation method is used to calculate statistics in constant prices. Data at current prices are obtained from business information; mainly economic surveys and accounting reports. Market reports on sales from sector authorities and the INE form the basis for extrapolating the main production and intermediate consumption figures.

For financial intermediation and insurance, the production account is calculated using the industry method, that is, complete direct information is available for all companies involved in this sector. For monetary intermediaries, output mainly includes: i) the difference between interest on loans or received and on deposits or paid out, that is financial intermediation services indirectly measured (FISIM); ii) actual commissions charged on services provided. Intermediate consumption is obtained from financial statements. To calculate production at constant prices from monetary activities, we apply a quantitative index based on bank sector assets and liabilities, directly associated with financial intermediation, and deflated using a general price index. For insurance companies, output is based on the difference between the direct premium and direct claim, plus the change in technical reserves. Moreover, the profitability of investment representative of technical reserves is included, under the concept of supplementary premium. Quantitative indices used to develop the gross value of production at constant prices for financial activity involved in insurance plans include: i) for life insurance, the number of policies outstanding; ii) for general insurance, the number of policies issued, both weighted by type of risk; and iii) for health insurance institutions (ISAPRES), the index used is the current number of affiliates. Sources of information are the respective supervisory bodies (Superintendency of Banks, Securities and Insurance, Health, and Pension Fund Managers or AFPs).

For dwellings, the value used is for total rent, including imputed rents on owner-occupied houses. The annual output at constant prices for housing property is obtained by applying a quantity index (obtained by adding the

annual net building area approved and start-ups to the estimated stock from the Benchmark Compilation) to the base year output. The nominal output is estimated by applying price indices to output at constant prices.

For public administration and defense, public sector annual output at current and constant prices is determined by adding up costs. The information comes from income and spending figures included in public sector budgetary statements reported by the national comptroller's office (Contraloría General de la República). This makes it possible to determine intermediate consumption, wages and taxes. Consumption of fixed capital at current prices is determined by inflating estimated consumption of fixed capital at constant prices by price index. To determine the production account at constant prices, a combination of the two methods is used: deflation to obtain real intermediate consumption and extrapolation using a volume index (IQ) for actual staff, by occupational category, to determine aggregate value.

For education, the nominal production account is calculated based on the industry method, whether through censuses or samples, which are then projected onto the universe. Sources include the Ministry of Education, school surveys, budgetary statements from the municipal sector and the national comptroller's office, and financial statements from post-secondary institutions. For health, the nominal production account for public health is calculated using the industry census method, since information is available for all of the agents involved. Sources include the national comptroller's office and budgetary statements presented by the public health institute (Estados de la Situación Presupuestaria, Instituto de Salud Pública, ISP).

For private health, the main information sources are internal revenue (SII) tax registries and surveys applied by the Central Bank. Production at constant prices is estimated by deflating value indices. Intermediate consumption is obtained using the single indicator method that is extrapolated by output. For hotels and restaurants, the main information sources are structural surveys on tourism provided by the National Statistic Bureau (Instituto Nacional de Estadísticas, INE) and internal revenue tax registries. The output at constant prices is determined by deflating value indices. Intermediate consumption and value added are extrapolated using output as a single indicator.

For other services, the main sources are surveys on services, provided by the National Statistic Bureau (Instituto Nacional de Estadísticas, INE) and Internal Revenue registries. Output at constant prices are obtained through deflation, except in the case of domestic service for which a volume index is obtained based on the number of people employed in domestic service and the price comes from the wage index. For non-profits, output is calculated using the sum of costs, using information from financial statements. Intermediate consumption is extrapolated using output as a single indicator.

Overview of the Compilation of the Integrated Economic Accounts

The Central Bank compiles the integrated economic accounts for the following institutional sectors:

1. Financial Corporations Sector
2. Non Financial Corporations Sector
3. Private Non Financial Corporations who are in the stock exchange
4. Public Non Financial Corporations
5. General Government
6. Households
7. Rest of the World.

The accounts compiled in an integral way are the following:

- A. Current Account
 - Production Account (I)
 - Primary Distribution of Income Account (II.1)
 - Secondary Distribution of Income Account (II.2)
 - Redistribution of Income in Kind Account (II.3)
 - Use of Income Account (II.4)

Savings, obtained as a balancing item of the current account, is the connection with de accumulation accounts.

B. Accumulation account

Capital Account (III.1)

Financial Account (III.2)

INFORMATION SOURCES

Financial Institutions:

- Financial statements and correspondent items notes of banks, credit unions and corporations related.
- Financial statements of insurances companies and of life
- Financial statements of AFP, ISAPRES and other intermediaries and financial auxiliaries.

General government:

- Budgetary and patrimonial statements provided by the General Comptrollership of the Republic

Rest of the world:

Balance of payments and attachments

External debt of the BCCH

Rest of Economy:

Financial statements of the non financial enterprises.

Publication of financial information made by the Superintendence of Stock Exchange.

GENERAL METHODS

In general terms, the institutional accounts are compiled by institutional unit, or groups of them. For the corporations the accounts are compiled from the financial statements, and they include the production accounts, income and expenditure accounts, accumulation a financial transactions account in an integrated shape. The last implied that the final balance of the different accounts, that are the beginning item of the next account, remain balanced.

The methodology includes the analysis and classification of each financial statement's item according to national accounts. This implies to affect the accounting flows in order to determine the transactions of national accounts, in accordance with the recommendations of the SNA.

Most of the information proceeds of the accounting statements of the statistical units already be these companies or societies, government organisms or other entities. These data are submitted to a process of selection, adjusting and depuration through a detailed job on every one of the accounting records, in order to compile the economic integrated accounts.

The current accounts transactions are obtained from the earning statements and complementary information when they exist, the financial flows are compiled from the differences between two consecutive balance sheets, adjusted with the information given in the notes of the financial statements. However, not all the items recommended by the SNA93 can be compiled from the financial statements, given the insufficient breakdown of these.

The basic adjustments required to transform the accounting data in national accounts information are:

- Treatment of the monetary correction, readjustments and other accounting records extracted of valuations from the different transactions to the required for national accounts.
- Treatments of the constituted stock of provisions to prevent risks in the financial and physical assets
- Treatment of the charge offs of physical and financial assets.

The balancing procedure

The accounts, compiled in an integrated shape are balanced with “whom-to-whom” matrices considering 19 institutional sectors. Each financial instrument previously defined and each transaction of the current account is balanced.

Hierarchy of sources

In order to carry out the balancing process, hierarchies of sources are established. For each transaction, some criteria are defined about the arbitrages necessary to do. The process is made in a bottom-up approach, initially between two sectors in pairs, or preliminary balancing. It simplifies the general balancing process made with the “whom-to-whom” matrices

Some criteria using in the arbitrages

Some of the main criteria using in the arbitrages are the following:

a) Central Bank / Rest of the World

The flows determined for the rest of the world prevail in general. Except the international institutions contributions, and the current accounts for reimbursements of mutual credits.

b) Central Bank / General Government

The breakdown of the Central Bank prevails.

c) Central Bank / Commercial Banks

In the case of the assets of Commercial Banks / liabilities of the Central Bank prevails (i) the level of assets of the commercial banks for the financial investments in instruments of the Central Bank and (ii) the liabilities of the Central Bank in the deposits of the commercial banks.

For the liabilities of Commercial Banks / assets of the Central Bank, the total level of the Central Bank prevails, which distributes itself for instruments according to the information of the commercial banks (from the balancing process they derive imputations for the banks in liquidation and for the subordinated debt).

d) International Reserve.

The economic flows are determined with the monthly data of the International Investment Position of every one of their components, the ones that become converted to national currency to the average exchange rate for every month. The differences that happen with the changes of the balances of Central bank statement fall under reconciliations (price or volume).

f) External Debt

In the estimate of external debt prevail in general the results in the rest-of-the-world account.

g) Commercial Banks / Commercial Banks

Levels and the classification for instrument prevail that they determine themselves according to the assets of the banks (from this balancing they derive imputations for the banks in liquidation).

SECTORIAL METHODS

HOUSEHOLD ACCOUNT

The household account, as institutional sector is compiled from the year 1996. Their sources and methods are different to other institutional sectors. From 2003 onwards, the households' savings are determined exogenously as the contributions to the pension funds.

Different methods are used for the transactions accounts, for example:

- The interests received and paid are estimated from the assets and liabilities of the other institutional sectors.
- The surplus and the mixed income use tributary information.
- Some specific items of the homes, like of social security, taxes, yields derived of the pension funds and life insurances, house subsidy delivered by the government, are assigned directly.
- The dividends received for the homes are the final departure
- Fixed capital investment corresponds principally to the investment in houses.

ASSETS

- They are those originating of the liabilities of banks and financiers classified by juridical organization of the creditor.
 - The pension funds and the reserves of life insurances.
- There isn't full information about equity investments and in bonds, for example.

LIABILITIES

The liabilities are the obtained from assets of banks and financiers for juridical organization of the debtor and for nature of the transaction:

- Mortgage loans for house
- Consumer and general-purpose loans
- Loans granted by the public administration

Finally the Net Lending is obtained from the financial accounts. This record is balanced with the estimation from the current an accumulation accounts. From 1996 onwards, the last estimation is accepted, so the assets of the financial accounts are adjusted correspondingly.

REST OF THE WORLD

The rest of the World account is compiled from the quarterly balance of payments. The flows are converted to local currency, given the quarterly average exchange rate. The items are classified according national accounts criteria. And they are balanced with the Central Bank for all the transactions between them.
