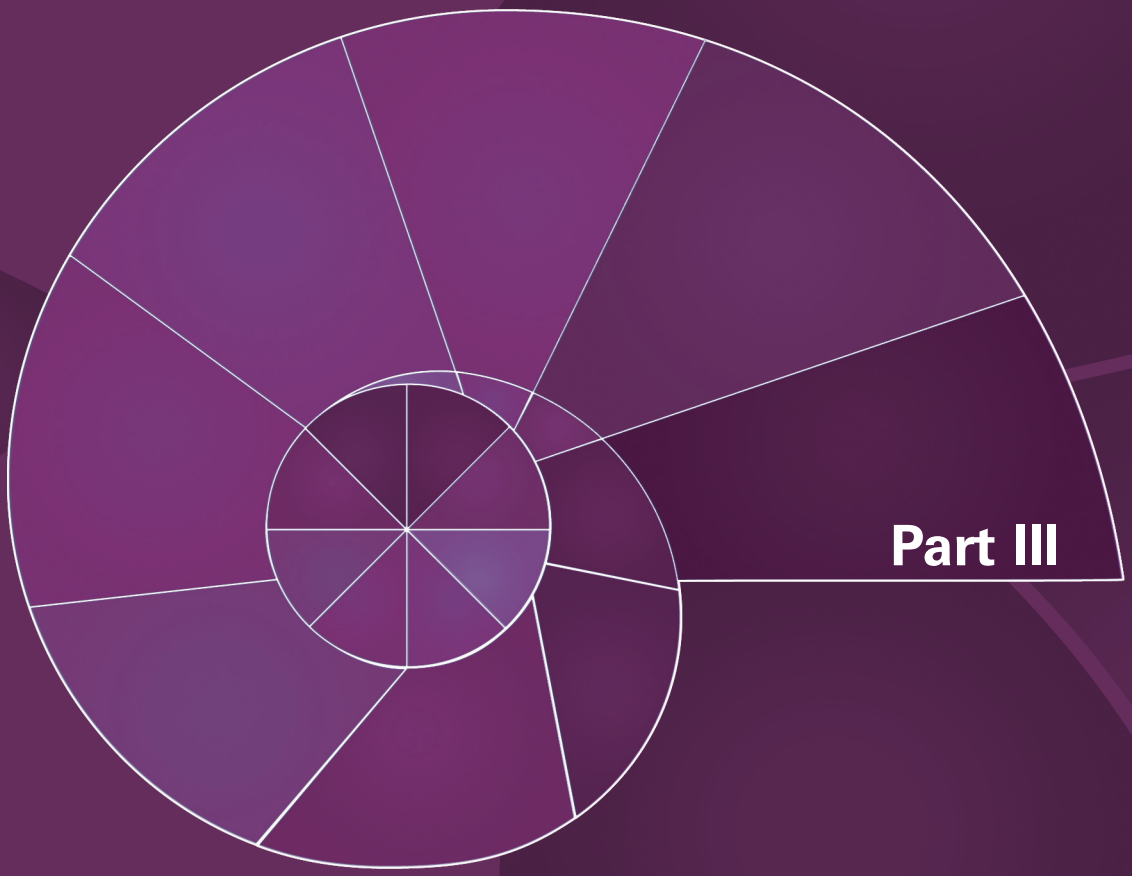
National Accounts Statistics: Main Aggregates and Detailed Tables, 2011



Part III

United Nations
New York, 2012.

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which Members States of the United Nations draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and helps build national capacities through technical assistance.

NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Where the designation "country or area" appears in the headings of tables, it covers countries, territories, cities or areas.

INTRODUCTION

1. This is the fifty-third issue of *National Accounts Statistics: Main Aggregates and Detailed Tables*[1,2] showing detailed national accounts estimates for 204 countries and areas for the reporting years 2000 to 2011. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical offices. It is issued in accordance with the recommendation of the Statistical Commission at its first session[3] that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

THE NATIONAL ACCOUNTS QUESTIONNAIRE

2. This publication is the thirteenth issue based on the United Nations National Accounts Questionnaire (NAQ) introduced in October 1999, which in turn is based on *the System of National Accounts 1993 (1993 SNA)*[4].

3. The 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts* (1968 SNA)[5], the Council in its resolution 1993/5 of 12 July 1993 recommends that Member States use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that Member States consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool. In 2003 the United Nations Statistical Commission (UNSC) called for an update of the 1993 SNA. The updated SNA, called The System of National Accounts 2008[6], or in short the 2008 SNA, was finalised during 2009. It is expected that most countries would start submitting national accounts data according to the 2008 SNA from 2015 onwards. So far, only Australia and Timor-Leste have started submitting data according to the 2008 SNA.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the United Nations Regional Commissions, has designed the United Nations National Accounts Questionnaire (NAQ) based with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the United Nations Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UNSC has agreed that the scope and pace of the implementation of the 1993 SNA must be decided by each country according to its analytical and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

SCOPE OF THE QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditure in current and constant prices and on the relations among product, income, saving and net lending aggregates.

6. Part II (Tables 2.1 to 2.6) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities (ISIC[7,8]). Tables 2.1 to 2.3 follow the ISIC Rev. 3 and are equivalent to Tables 2.4 to 2.6, which follow the ISIC Rev. 4, and countries can complete the appropriate tables according to the ISIC version they use for compiling their national accounts. Data can be provided either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O, for the ISIC Rev. 3; or A, B+C+D+E, C, F, G+H+I, J, K, L, M+N, O+P+Q and R+S+T, for the ISIC Rev. 4) or as single tabulation categories (Sections A to P for ISIC Rev. 3; and A to T, for ISIC Rev. 4) (one-digit level of ISIC). In the case of ISIC Section A, information at the two-digit level is requested for divisions 01, 02 (and 03, for the ISIC Rev. 4); whereas for ISIC Rev. 3 Section I information is requested for division 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according to the Classifications of Expenditure According to Purpose[9]. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10 divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure by households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC)[10,11]. For the individual consumption expenditure by non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure by general government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.9) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e. the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Tables 5.1 and 5.2) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 (Table 5.1) or ISIC Rev. 4 (Table 5.2) as indicated in Part II above.

10. Countries are requested to update the data tables and complete them as comprehensively as possible. The tables are listed below:

Part I: Main aggregates

Table 1.1 Gross domestic product by expenditures at current prices
Table 1.2 Gross domestic product by expenditures at constant prices
Table 1.3 Relations among product, income, saving and net lending aggregates at current prices

Part II: Domestic production by industries

Table 2.1 Value added by industries at current prices (ISIC Rev. 3)
Table 2.2 Value added by industries at constant prices (ISIC Rev. 3)
Table 2.3 Output, gross value added and fixed assets by industries at current prices (ISIC Rev. 3)
Table 2.4 Value added by industries at current prices (ISIC Rev. 4)
Table 2.5 Value added by industries at constant prices (ISIC Rev. 4)
Table 2.6 Output, gross value added and fixed assets by industries at current prices (ISIC Rev. 4)

Part III: Classifications of expenditure according to purpose

Table 3.1 General government final consumption expenditure by function at current prices
Table 3.2 Individual consumption expenditures at current prices

Part IV: Integrated economic accounts

Table 4.1 Total economy (S.1)
Table 4.2 Rest of the world (S.2)
Table 4.3 Non-financial corporations (S.11)
Table 4.4 Financial corporations (S.12)
Table 4.5 General government (S.13)
Table 4.6 Households (S.14)
Table 4.7 Non-profit institutions serving households (S.15)
Table 4.8 Combined Sectors: Non-Financial and Financial Corporations (S.11 + S.12)
Table 4.9 Combined Sectors: Households and NPISH (S.14 + S.15)

Part V: Cross classification of gross value added by industries and institutional sectors

Table 5.1 Cross classification of gross value added by industries and institutional sectors (ISIC Rev. 3)
Table 5.2 Cross classification of gross value added by industries and institutional sectors (ISIC Rev. 4)

11. It should be noted that the NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it mainly serves to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly

the one-digit level of ISIC instead of the two-digit level of ISIC.

COLLECTION OF DATA

12. To collect the large volume of national accounts data, the Statistics Division annually sends a pre-filled NAQ to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical offices and from national source publications. Countries are also requested to provide a brief overview of the sources and methods to compile their national accounts.

13. In order to lighten the reporting burden of countries to different international and regional organizations the UNSD receives data from the Statistical Office of the European Commission (EUROSTAT), the Organisation for Economic Co-operation and Development (OECD), the United Nations Economic Commission for Europe (ECE) and the Caribbean Community (CARICOM) on behalf of their constituents. The UNSD, EUROSTAT and the OECD have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), all OECD countries submit data either to EUROSTAT or OECD but need not provide duplicate submissions. Member States of OECD which are not members of the European Community complete a sub-set of the ESA 1995 questionnaire. The ECE provides data for transition economies. CARICOM uses the NAQ to collect data from its Member States and provides it to UNSD. As a result, the United Nations questionnaire based on the 1993 SNA is sent to less than 160 countries, areas, and territories out of the 235 (of which only 204 have provided sufficient data to be published) included in the UNSD National Accounts database.

14. In order to create a comprehensive database based on the 1993 SNA, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database.

CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

15. The form and concepts of the statistical tables in the present publication generally conform to the recommendations by the 1993 SNA. A summary of the conceptual framework and definitions of transactions is provided in chapter I of the present publication.

16. Although the NAQ collects data in the 1993 SNA format, countries may still use the 1968 SNA (or in some rare cases the 1953 SNA) guidelines to compile their national accounts. The UNSD evaluates the status of the conceptual adherence to the 1993 SNA from time to time.

17. The Series note at the top of each table indicates which SNA version is used by the given country to compile their national accounts. Series numbers below 100 relates to data according to the 1968 SNA data and series numbers 100 and above relates to data according to the 1993 SNA. Whenever 1968 SNA data are not replaced backwards for all years by a series of 1993 SNA data, the 1993 SNA data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA, a footnote is attached to the relevant tables.

18. In the tables with constant price data (Tables 1.2, 2.2 and 2.5), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is chain linked volume series where figures are given at prices of the previous year. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use chain linked volume series but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e. the total is not equivalent to the sum of its components. Also, constant price data, which are scaled up or down to a certain reference year in order to allow international comparison, are not additive.

19. In the present publication, the data for each country or area are presented in separate chapters, in alphabetical order, under uniform table headings and classifications of the 1993 SNA. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series note at the top of each table indicates the type of fiscal year used for any given series.

COMPARABILITY OF THE NATIONAL ESTIMATES

20. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this

end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted that the country notes not only refer to the latest data covered in this publication but to the country in general.

REVISIONS

21. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

NOMENCLATURE

22. The information for the countries and areas shown in this publication reflect what is available to the UNSD as of August 2012. Updated national accounts data are usually provided by countries to the UNSD between January and July. Data for the year 2011 is currently available for 105 countries and areas.

23. The data for the countries listed below are represented as follows:

China is published in this yearbook in three sections: China; China, Hong Kong Special Administrative Region; and China, Macao Special Administrative Region. The data for China excludes the special administrative regions of Hong Kong and Macao.

Serbia and Montenegro – The state union of Serbia and Montenegro dissolved in June 2006. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. Available data are shown for the individual republics.

Sudan and South Sudan – South Sudan seceded from Sudan in July 2011. Data for the former Sudan appear under "Sudan (up to 2011)". Data for Sudan and South Sudan in the new configuration (after July 2011) appear under the respective country names.

Tanzania – The data for Tanzania are published in two parts in this yearbook: mainland Tanzania and Zanzibar. Note that the data listed under Tanzania does not include Zanzibar.

SYMBOLS AND DATA DISPLAY

24. The following symbols have been employed:

Data not available..... [**…**]

Magnitude nil or less than five percent of the unit employed..... [**0.0**]

Decimal figures are always preceded by a point [**.**]

25. Each series version is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series version is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series note at the top of each table informs about the SNA version applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

26. Decimals in tables do not necessarily add to totals shown because of rounding.

GENERAL DISCLAIMER

27. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

28. Where the designation "country or area" appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation "country" appears in the headings of tables, it covers countries, territories, cities or areas

I. SYSTEM OF NATIONAL ACCOUNTS

1. The origins of the System of National Accounts (SNA) trace back to the 1947 Report of the Sub-Committee on National Income Statistics of the League of Nations Committee of Statistical Experts under the leadership of Richard Stone[1]. At its first session in 1947, the United Nations Statistical Commission emphasized the need for international statistical standards for the compilation and updating of comparable statistics in support of a large array of policy needs. Specifically, the Commission recommended that the United Nations Statistical Office, in consultation with the interested specialized agencies, should work on guidelines for national accounts statistics (national income and expenditure), taking into consideration best practises and international comparability[2]. In view of the emphasis on international statistical standards, the first national accounts standard was produced and published in 1953. The SNA was subsequently revised and updated in 1960, 1964, 1968 and 1993. In 2003 the Statistical Commission called for an update of the 1993 SNA. The System of National Accounts 2008[3], (in short the 2008 SNA) was finalised in 2009. This chapter describes the concepts and definitions of the SNA as recommended by the 1993 SNA.

A. THE SNA AS A SYSTEM

2. The System of National Accounts is a statistical framework that provides a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA includes an external account that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyse the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic product (GDP), which are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to

describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to chapter II of the 1993 SNA for a comprehensive overview of the System.

1. The sequence of accounts

Current accounts

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

Production account

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

Distribution and use of income accounts

8. These consist of a set of articulated accounts showing how incomes are:

> Generated by production
>
> Distributed to institutional units with claims on the value added created by production
>
> Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes
>
> Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward into the capital account, the first in the System's sequence of accumulation accounts.

Accumulation accounts

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

> The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).
>
> The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.
>
> A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

Balance sheets

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever

any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

2. Activities and transactions

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly the main sectors of the economy for which it is possible to compile the full sequence of accounts summarized in the previous section. Two main kinds of institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analysed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V of the 1993 SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the

economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the 1993 SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

1. Supply and use tables

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

2. Price and volume measures

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modelling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as targets for the formulation of economic policy-making. They are an essential part of the System, especially given the emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

1. The production boundary

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

Household production

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

(a) The production of agricultural goods by household enterprises for own final consumption;

(b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc;

(c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the production of personal and domestic services by members of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

Other production boundary problems

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

2. The consumption boundary

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the

estimated values of the agricultural products consumed by households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

3. The asset boundary

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

4. National boundaries

29. The accounts of the System are compiled for resident institutional units grouped into institutional sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high- inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the

construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

1. Specific uses

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

Monitoring the behaviour of the economy

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

Macroeconomic analysis

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different economic variables by applying econometric methods to time series of data at both current and constant prices compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

Economic policy-making and decision-taking

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data.

The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees. Such agencies typically require very detailed national accounts data.

International comparisons

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

2. Flexibility of implementation and use

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the 1993 SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the 1993 SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the 1993 SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may

become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

3. The SNA as a coordinating framework for statistics

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind revisions of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the 1993 SNA, the harmonization process has been particularly effective in respect of balance of payments statistics, government finance statistics and money and banking statistics. Each of these three systems was updated to be consistent with the 1993 SNA to the fullest extent possible.

48. Various other revised international guidelines were issued at about the same time as the 1993 SNA. These include the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the 1993 SNA. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the 1993 SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

1. Final consumption, intermediate consumption and gross fixed capital formation

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption, whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

Training, research and development

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

Education

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practising - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

Repairs, maintenance and gross fixed capital formation

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or

prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

2. Interpretation of the distinction between consumption and gross fixed capital formation

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

Acquisitions

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

Actual final consumption of general government

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.

Actual final consumption of households

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

Actual final consumption of NPISHs

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

Additivity

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

Base period

The period that provides the weights for an index is described as the base period.

Basic price

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

C.i.f. price

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

Capital transfers

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred.

Chain indices

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

Changes in inventories (including work-in-progress)

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

Compensation of employees

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

Constant prices

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in "constant price terms").

Consumption good or service

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

Consumption of fixed capital

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

Current transfers

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.

Deductible VAT

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

Disposals

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

Export subsidies

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

Export taxes

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

Exports of goods

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

Exports of services

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

F.o.b. price

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

Factor cost

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

Final consumption

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

Final consumption expenditure of government

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

Final consumption expenditure of households

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

Final consumption expenditure of NPISHs

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

Financial intermediation services indirectly measured (FISIM)

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

Fixed assets

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

Goods

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

Gross

The term “gross” is a common means of referring to values before deducting consumption of fixed capital (generally used as in “gross capital stock” or “gross domestic product”).

Gross capital formation

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

Gross domestic product - expenditure based

Expenditure-based gross domestic product is total final expenditures at purchasers’ prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

Gross domestic product - income based

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

Gross domestic product - output based

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsides on imports, plus all non-deductible VAT (or similar taxes).

Gross domestic product at market prices

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsides on imports, plus all non-deductible VAT (or similar taxes).

Gross fixed capital formation

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.

Gross national disposable income

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Gross national income (GNI)

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

Gross saving

Gross saving is gross disposable income less final consumption expenditure.

Gross value added

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Gross value added at basic prices

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

Gross value added at producers' prices

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

Import duties

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

Import subsidies

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

Imports of goods

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

Imports of services

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

Indirect taxes

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term "indirect taxes" is not used in 1993 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

Intermediate consumption

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

Inventories

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

Invoiced VAT

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

Market prices

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

Mixed income

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

Net

The term "net" is a common means of referring to values after deducting consumption of fixed capital (generally used as in "net capital stock" or "net domestic product"); it should be noted, however, that the term "net" can be used in different contexts in the national accounts, such as "net income from abroad" which is the difference between two income flows.

Net income from abroad

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

Net lending

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as "net borrowing".

Net national disposable income

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Net national income

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

Net saving

Net saving is net disposable income less final consumption expenditure.

Net value added

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Non-deductible VAT

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

Non-financial assets

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

Non-produced assets

Non-produced assets are non-financial assets that come into existence other than through processes of production.

Non-profit institutions serving households (NPISHs)

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

Non-resident

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

Operating surplus

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called "mixed income").

Other subsidies on production

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (eg, subsidies on payroll or workforce or subsidies to reduce pollution).

Other subsidies on products

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1) subsidies on products used domestically, (2) losses of government trading organisations, and (3) subsidies to public corporations and quasi-corporations.

Output

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

Producer's price

The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

Property income

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

Purchaser's price

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Resident

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

Services

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realised by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

Stocks

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as "inventories" in the System).

Subsidies

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

Taxes and duties on imports

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

Taxes on production and imports

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

Taxes on products

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation.

Transfer

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

Valuables

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

Value added - gross

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Value added - net

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Value added tax (VAT)

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

II. COUNTRY TABLES

India

Source
Reply to the United Nations national accounts questionnaire from the National Accounts Division of the Central Statistical Organization (CSO), Ministry of Statistics and Programme Implementation, New Delhi.

General
The estimates shown in the following tables have been prepared in accordance with the System of National Accounts 1993 (1993 SNA).The estimates relate to fiscal year beginning 1 April. CSO has introduced the new series of National Accounts Statistics with base year 2004-05 in place of the previous series with base year 1999-00. The changes made in terms of concepts, definitions, procedures and sources of data are given in the brochure released by CSO in March 2010 which is also available at www.mospi.gov.in. When the scope and coverage of the estimates differ for conceptual and statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach for the commodity producing sectors and a combination of production and income approaches for the services sectors.

Expenditure Approach
The commodity-flow approach is used to estimate private final consumption expenditure whereas the estimate of gross fixed capital formation is based on both by commodity-flow and the expenditure approach. Estimates of government consumption expenditure are mainly obtained from budget documents and annual reports of the government bodies.

Estimates of private expenditure on goods are obtained from commodity production data adjusted for change in stocks and foreign trade and reduced by intermediate consumption and government final consumption and by the quantities used for capital formation. Private expenditure on services is estimated as the value of the total output for each kind of service reduced by the estimated expenditures on service by government and the business.

Estimates of increase in stocks for the public sector and organized (i.e. larger or modern) private industries are based on government budget documents and annual accounts and reports of industries respectively. Estimates of change in stocks of unorganized private industries are based on sample survey data, data on bank advances and margins and on livestock censuses. For gross fixed capital formation, estimates of construction are compiled using data from a number of sources such as dispatches of cement and steel for domestic consumption, sample surveys and government budget documents and the All-India debt and investment surveys. For machinery and equipment, estimates are based on the annual survey of industries, foreign trade statistics, customs and excise revenue statements, data on trade, transport and other charges collected from leading manufacturing firms. The estimates of exports and imports of goods and services are based on balance of payment statistics. For the constant price estimates changes in stocks of livestock, mining and foodgrains are valued at 2004-05 prices. For government expenditure, private expenditure on services, increase in stock for other sectors and gross fixed capital formation and exports & imports, the current values are deflated by relevant price indexes and unit value indices.

Income Approach
Estimates of compensation of employees are based on budget documents, annual reports of enterprises, income and expenditure accounts of institutions and companies and sample surveys. Estimates of operating surplus are based on the sources used for compensation of employees. Consumption of fixed capital is estimated for each industry separately on the basis of estimated value of capital stock and the expected age of various types of assets by following the perpetual inventory method. The sources include the All-India debt and investment

surveys, livestock censuses, budget documents and annual accounts. Estimates of indirect taxes and subsidies are based on accounts and annual reports of government bodies.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added for all commodity producing sectors and moving the benchmark estimates for unregistered manufacturing. Value added of construction is based on a combination of commodity-flow and expenditure approaches. A combination of production and income approaches are used for all other sectors.

The production estimates of principal agricultural crops are based on administrative records which give crop acreage statistics and the results of the random sample crop-cutting surveys conducted by the respective state government agencies which give the yield estimates. The wholesale prices in the primary markets are used to evaluate the total production of each commodity. The annual estimates of livestock products are based on the livestock population by type and the correponding average yield rate of estimate through the annual integrated sample survey conducted by the state government agencies. Intermediate consumption is estimated by using a variety of sources such as the cost of cultivation studies conducted by the central government, the National Sample Survey Organization (NSSO), the All-India debt and investment survey, marketing reports and other administration based statistics. Estimates of the gross outputof minerals are based on data available from the Indian Bureau of Mines and the state governments.

For large-scale manufacturing, estimates are prepared for 20 industry groups based on the Annual Surveys of Industries (ASI). Benchmark estimates for the household and non-household unregistered manufacturing and other unorganised portions of trade, transport etc. are prepared using data on value added per worker derived from the follow-up surveys of economic census of CSO and NSSO and estimated working force. For other years, estimates are extrapolated by means of indicators of physical output or input and prices. Estimates of pucca construction are compiled by the commodity flow approach using data on steel and cement production, foreign trade statistics, customs and excise revenue, etc. The estimates of kutcha construction (from locally available materials) are based on expenditure data from NSSO, debt and investment surveys and other sources. For public sector trade, transport, administration, banks etc., estimates are based on the analysis of budget documents and annual accounts.

The estimates of gross rents for urban dwellings are based on the number of dwellings and estimated gross rental value per dwelling obtained from the NSSO surveys on consumer expenditure. For rural dwellings, it is based on cost approach.

For the constant price estimates, double deflation is used for the agriculture and mining sectors. Current values of large-scale manufacturing and construction are deflated by price indexes. For unregistered manufacturing, electricity, gas and water, trade, transport, ownership of dwellings and other services, value added is extrapolated by quantity indexes. Current price estimates of public administration are deflated with the consumer price index of industrial workers to obtain the constant price estimates.

Indonesia

Source
Reply to the United Nations national accounts questionnaire from BPS-Statistics Indonesia , Jakarta. Official estimates are published annually in the "National Accounts Statistics".

General
The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual and statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach. Until 1998 Timor L'este was integral part of the economic area of Indonesia and is therefore included in the estimates. From 1999 onwards the region is systematically excluded from the national accounts.

Expenditure Approach
The expenditure approach is used to estimate private final consumption, government final consumption, exports and imports of goods and services. Private final consumption expenditure is estimated using Socio-Economic Survey (Susenas) data. The commodity-flow approach is used for gross fixed capital formation. The main sources of data for the estimation of central government consumption expenditure are the budgetary accounts of the Department of Finance, while local governments provide data directly to the BPS-Statistics Indonesia. Benchmark data for capital formation are based on statistics of imports and domestic production of construction materials and machinery and equipment. For other years, import of machineries and equipments are obtained from import statistics, while domestic production is compiled by using production and implicit price indexes to extrapolate the benchmark estimates. The input-output ratios for buildings and structures have been established for 2000 on the basis of special surveys on construction projects in that year. Other years' estimates are extrapolated by quantity and price indexes of domestic production and imports of construction materials. Estimates of exports and imports of goods and services are obtained from foreign trade and balance of payment statistics. For the constant price estimates, current values of private expenditure items are deflated by the consumer price index, government expenditure items are deflated by the consumer price index and by the wholesale price index. For gross fixed capital formation referring to buildings and structures, the benchmark values are extrapolated by quantity indicators of domestic production and volume indicators of imports of construction materials. Values of exports and imports are deflated by the corresponding unit value price indices.

Income Approach
Consumption of fixed capital for manufacturing, electricity, gas and water, is estimated from information available at the CBS. For other sectors the estimates are based on the results of special surveys. The main sources of data for net indirect taxes are the budgetary accounts of the central and local governments. Compensation of employees together with operating surplus is obtained as a residual.

Production Approach
The table on gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most of the industries. The income approach is used for government and domestic services while gross output of trade and construction is estimated on the basis of the commodity-flow approach.

For agriculture, food crops production is compiled on the basis of information relating to area harvested and average yield for each crop obtained from the BPS-Statistics Indonesia. The prices used are based on farm-gate prices obtained from annual surveys. Production of commercial and estate crops, livestock, forestry, and fishery are obtained from the departments concerned. For main food crops, commercial and estate crops, livestock, forestry, and fishery the value of intermediate inputs is based on cost-structure surveys. The most important mining commodity is crude petroleum for which production data are available for all enterprises concerned. Estimates of prices and input costs are compiled on the basis of returns furnished by the largest firm. For the base-year 2000, data on output and input structure of manufacturing have been compiled for each industry group from statistics maintained by the BPS-Statistics Indonesia and from surveys and other studies undertaken. For other years industrial production indexes are compiled on the basis of output of selected manufactured products.

For gross output of construction, the information on imports of construction materials is obtained from commodity imports statistics whereas estimates of domestically produced materials are based on the annual industrial surveys. The average ratios of intermediate inputs to gross output are based on data gathered from surveys. Gross output of the trade sector is calculated by multiplying estimates of the producers' values of the marketed surplus of agricultural products, domestically produced manufactured goods, selected mining and quarrying products and the cost of imported goods by the percentage distribution mark-ups gathered from special surveys. Estimates for other years are extrapolated by a quantity index of marketed surplus traded and an implicit price index. For railway transport, the annual reports of the State Railway Company constitute the main source of data for estimating gross output, intermediate input and value added. For road transport, gross output and input values are estimated by multiplying the average earning of each type of vehicle by the corresponding number of vehicles. For other transports, estimates are based on cost-structure surveys and data from concerned authorities and companies.

The information of gross output and value added of the banking sector is based on the data compiled annually by the Bank of Indonesia supplemented by special inquiries for other financial intermediaries. Basic data relating to real estate and business services are limited and rough procedures are adopted by using information gathered from the special surveys. For government services, estimates are obtained from current budget expenditure and information furnished by local bodies. Estimates of other services are calculated for the year 2000 as the benchmark year, and estimates of other years are extrapolated by using employment and price indicators. For the constant price estimates, revalution is used for the agricultural sector, while value added of public administration and defence, is deflated by a moving average of the consumer price index. In all other sectors value added is extrapolated by various quantity indicators and indices.

Iran, Islamic Republic of

Source
The National Accounts Department, Bank Markazi Jomhouri Islami Iran, Tehran provided notes on Methodology and data reflected in the tables under series 100. These estimates are published in the annual bulletin "Bank Markazi Jomhouri Islami Iran, Economic Report and Balance Sheet". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General
The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Detailed data as well as description of sources and methods used for national accounts estimation are published in the latest volume of the National Accounts of Iran, 1974-1987. Input-output tables have been compiled for the years 1965, 1969, 1973 and 1984. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach.

Expenditure Approach
The expenditure approach is used to estimate all components of gross domestic product by expenditure type except gross fixed capital formation in machinery which is calculated mainly by commodity-flow approach. Estimates for government final consumption expenditure are based on records from all sectors of general government. Private final consumption expenditure is estimated using data from family budget surveys. The estimates of gross fixed capital formation in private construction are derived from annual surveys on construction. The data on investment in construction by the public sector is obtained from the accounts of different government units. The capital formation in machinery and equipment is estimated through commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of goods and services are obtained from the balance of payments accounts and foreign trade statistics. For the constant price estimates all items of gross domestic product by expenditure type are deflated by appropriate price indices.

Income Approach
The estimates of compensation of employees are obtained in the process of estimating value added by industrial origin. Consumption of fixed capital is estimated according to useful lifetime of different type of capital goods. Operating surplus is obtained as a residual. Estimates of indirect taxes and subsidies are based on government accounts.

Production Approach
Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared at factor values. The production approach is used to estimate the value added of most industries. The income approach is used for producers of government services, communication and part of other services. The agricultural estimates are based on annual surveys of agriculture, carried out by Ministry of Agriculture. The estimates are checked using the results of the annual family budget surveys. Data on the production of red meat are based on information supplied by slaughter houses in urban areas and on the results of expenditure surveys in rural areas. The data are then converted to current price estimates by using wholesale price index. Statistics concerning forestry and fishing are obtained from concerned agencies.

Mining estimates are based on annual sample surveys and the 1991 Census of Mining. The value added of oil sector is derived from the reports of the Ministry of Oil. The manufacturing estimates for large establishments which employ 10 workers or more are based on the results of the annual surveys of manufacturing. For small establishments, estimates are derived using the sample surveys of 1986 and information from other sources. The estimates of electricity, gas and water are based on information obtained from the government accounts. Estimates for private construction in the urban areas are obtained from the results of Bank Markazi's annual surveys with adjustments made to cover contractors' profits which are not included in the surveys. As for the rural areas, the results of 1973 Survey of Rural Construction by the Statistical Center of Iran are extrapolated using information concerning construction in small towns.

For trade sector the gross margin is calculated using the results or survey of wholesale and retail trade in the urban areas. Estimates for transport sector are generally based on the sample surveys by Bank Markazi Jomhouri Islami Iran and financial statements of the government organizations involved. The value added of financial institutions and insurance is obtained directly from the financial statements of concerned institutions. The estimates for dwellings are based on data obtained from family budget surveys and imputations are made for owner-occupied dwellings. For producers of government services estimates are derived from government accounts. Estimates for social and personal services are based on information from various sources mainly the family budget surveys. For constant price estimates, the current values are deflated by an appropriate price index for each kind of economic activity.

Iraq

Source
The Iraq National Accounts are compiled and disseminated by the National Accounts Department of the Central Statistical Organization (CSO) at the Ministry of Planning. CSO located in Baghdad. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The National Accounts estimates are published on the website (www.iraqcosit.org), as well as in the Annual Statistical Abstract.

General
The latest estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Latest Input – Output tables have been published in 1988. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following illustrates the recent changes and improvements made in the methodology: Estimates for animals products, are based on the new agriculture census 2001. In addition, old coefficients used in the estimation of animal production have been updated based on discussion with officials from the Ministry of Agriculture.

For Other Mining and Quarrying, the results of an establishment survey of the private sector that was conducted on 2003 have been used. For data on Electricity and Water, private production of electricity was included. The imported building materials used by public enterprises have been estimated based on market exchange rate. The results of a survey on road passengers transport conducted on 2003 have been used to update estimates of the related sector. The results of the household income and expenditure survey conducted in 2007 are used to estimate the input for ownerships of dwellings.

Public Health & Education has been excluded from the public administration and defence. The imported good of the government have been evaluated based on market exchange rate. The methodology has been changed, and results of the household income and expenditure survey conducted in 2007 are used, replacing the old estimates that were based on the household income and expenditure survey conducted in 2002. New deflators have been used, in particular, volume deflators such as index numbers of manufacturing production, index number of government employees to deflate the current value added of the government activity. The deflators have been updated. GFCF is estimated according to current market prices.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled.

Expenditure Approach
Government consumption is estimated from the government accounts. Private household consumption is estimated from the data of the Household socio economic survey. Gross Fixed Capital Formation: all data are obtained from government accounts, public Balance Sheet Accounts, manufacturing surveys, and construction output. Estimates are made for the rest of the activities. Exports and Imports of goods and services data are obtained from Central Bank. Changes in stocks are estimated as residual.

Income Approach
The estimates of compensation of employees in the public sector are obtained from the Balance Sheet Accounts of the government and companies. For the private sector, the data are obtained from both service surveys and internal trade surveys. Operating surplus is obtained as a residual. The data on indirect taxes and subsidies are obtained from the actual accounts of the government or from the final accounts of the establishments of the public sector.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at factor cost. Data on cultivated area, production by crop, and prices are provided by the Agricultural Statistics Department of CSO in cooperation with the Ministry of Agriculture. Intermediate consumption is estimated based on information obtained from administrative data. The output for Fishing is estimated based on quantity sold in the wholesale fish markets of the governorates of Iraq. The Department of National Accounts estimates the quantity sold outside wholesale fish markets and the production for own use. The quantity sold outside wholesale fish markets is estimated 20 % of the quantity sold inside such markets. Production for own use is estimated based on information obtained from the 2007 Household Income & Expenditure Survey.

Oil production is estimated based on volume, quantity and price data provided by the Ministry of Oil. The intermediate consumption is also provided by the Ministry of Oil. For sulphur and phosphate the estimation is based on the profit and loss accounts of the concerned public enterprises. Annual establishment's survey is the source of data to estimate the production account. Large scale establishments (30 employees or more) and medium size (10-29 employees) are covered on complete enumeration while small establishments (< 10 employees) are sampled. The value added is deflated by manufacturing volume production index.

Data source for Electricity and Water are the financial statements and profit and loss accounts of all public companies producing electricity and water. For Transportation, Communication and Storage, the public establishment production accounts are estimated by using annual financial statements. Private transport is estimated based on administrative data obtained from traffic police as well as studies on revenue and cost of vehicle. As for communication, the communication companies provide data to CSO and therefore, are included from the estimates. Private establishments working in storage activity are not included in the estimates.

The source data for public construction sector are the financial statements of public establishments. Private construction sector is estimated using the number of building permits issued by the administrative authorities. CSO conducts an annual survey on a sample of construction sites to measure the actual value of production. In addition, the department adopting fixed ratio to estimate the profit margin of the private sector. The estimations include illegal construction activities (building without permits) based on special studies.

The data source for public sector is the financial statements of publicly owned establishments. Private sector activities are estimated from the annual survey and business services, hotels, reports received from consumer cooperatives. For trade activity the National Accounts Department uses the commodity flow method. The source of data for banks and insurance companies is the Balance Sheet Accounts. The 2007 Household socio economic survey is used to estimate the production accounts of this activity. The government budget is the source of data of Public Administration and Defence.

Ireland

Source

The preparation of national accounts statistics in Ireland is undertaken by the Central Statistical Office (CSO), Dublin. The official estimates are published annually in "National Income and Expenditure" and quarterly in “Quarterly National Accounts”. These publications can be accessed on the website www.cso.ie and contain details of estimation methods used. In 2002 a complete methodological inventory on GDP compilation was submitted by the CSO to EUROSTAT and was followed more recently by a second GNI inventory at end 2006. The inventory describes in detail all methods used in compiling the national accounts statistics. Additionally, in April 2007 Financial and Non-Financial Institutional Sector Accounts were published for the first time for the years 2002 – 2005 see www.cso.ie for details. The data were received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates prepared according to the 1968 SNA are provided in the former national currency Irish pound. The following presentation of sources and methods is mainly based on a report entitled "Basic statistics needed for the ESA accounts and tables: present situation and prospects for improvements" prepared by the Statistical Office of the European Communities in 1976 and on information received from Ireland's Central Statistics Office. Official input-output tables have been published in respect of the years 1964, 1969, 1975, 1998 and 2000. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Ireland the currency name for the data before 1999 is "1999 IEP euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = .787564 Irish pound. The name of the currency of the newly submitted data is "1999 IEP euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Ireland, like for example all old data following the 1968 SNA is still in "Irish pound", although this is not specifically indicated in the tables. The CSO’s practice in the past has been to incorporate revisions and updates to the national accounts on an on-going basis whenever a new series of results are being published.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income & expenditure approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The main sources used in the compilation of Household final consumption include trade and production data in the commodity flow approach, fiscal data from the Revenue

Commissioners, Household Budget Surveys and the Census of Population for the rent estimation. Other sources include administrative data and direct inquiries to some of the main public service providers. Government final consumption expenditure is estimated from the accounts of the various government bodies such as the ministries, the local authorities and health boards, extra-budgetary funds and the Industrial Development Authority. The main sources used in the compilation of Gross Fixed Capital Formation are administrative and fiscal data, surveys, direct information and trade and production data in the commodity flow method. Administrative data, direct inquiries (including the Quarterly Stocks Inquiry) and surveys are the main sources used in estimating changes in inventories. The estimates of imports and exports of goods and services are obtained from balance-of-payments, special studies and surveys. For the constant price estimates, direct revaluation at base-year prices is used for items of private final consumption expenditure where quantity data are available. For all other components of GDP by expenditure type, price deflation is used.

Income Approach

Compensation of employees is estimated by assigning an income to each person classified as an employee in the labour market statistics derived from the Quarterly National Household Survey (QNHS). The QNHS results are annualised to provide control totals for the numbers of employees in each branch. To convert from the residence basis used in the QNHS to the domestic concept used in the national accounts, an adjustment is made for persons employed by embassies and international organisations. The earnings information used in the calculations is largely derived from statistical surveys and administrative records. The statistical surveys include the Census of Industrial Production and the Annual Services Inquiries. For public sector employees, including most teachers and health service workers, the remuneration estimates are taken from public accounts and from information provided by Government Departments. Operating surplus is calculated from returns made to the revenue authorities and from government accounts. Depreciation is based on the perpetual inventory method for the agricultural sector. For private enterprises, it is taken as the income tax wear-and-tear and other allowances. Indirect taxes and subsidies are estimated from the government accounts.

Production Approach

Before the implementation of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. The income approach is used to estimate the value added of all industries except agriculture, for which the production approach is used. Annual estimates of agricultural output are calculated on a commodity basis for crops, livestock and livestock products. The data on quantities and values are obtained from various sources such as Department of Agriculture and Central Statistics Office. The total quantities purchased and amounts paid by the purchasers for important agricultural items such as wheat and barley are available from various inquiries and adjusted for marketing margins and transport costs. For live exports, f.o.b. export value less an allowance for marketing margins, is taken as the output value. For the remaining items market prices are used as the basis for evaluation. Input data are obtained through the Department of Agriculture for fertilizers. Data for seeds are compiled indirectly from acreages and seedling rates. Own-account consumption of food and fuel is evaluated at agricultural prices. For mining, quarrying and manufacturing enterprises employing more than three persons, the estimates are based on annual censuses. Quarterly surveys of turnover and employment are conducted for manufacturing and services. For small-scale manufacturing, the number of persons engaged, which is derived as the difference between population census data and data from the production census, interpolated for intercensal years and projected forward, are multiplied by average income per person. The estimates of electricity, gas and water and of construction are based on annual inquiries. For trade, censuses of distribution provide benchmark data for turnover, purchase of products, wages and salaries and intermediate inputs. For intervening years, monthly turnover figures from a sample of 2,500 establishments are used together with annual estimates of the number of employees and trends in earnings. For restaurants and hotels, annual surveys and revenue data are used. Transport is mainly provided by public enterprises and data are obtained from published accounts. Data obtained from annual reports, direct surveys on wages and salaries and revenue statistics are used for the estimates of the financial sector. For real estate and business services, data from population census, imputed average income and revenue accounts are used. The imputed rent of owner-occupied dwellings is taken as the average rent paid for similar dwellings in similar locations. Estimates of other private services are based on the results of inquiries into wages and salaries and on trends in operating surplus taken from revenue data. Data on government services are obtained from the government accounts. For the constant price estimates, double

deflation is used for agriculture. Value added of all other economic activity sectors of GDP is extrapolated by a quantity index.

Israel

Source
The preparation of national accounts statistics in Israel is undertaken by the Central Bureau of Statistics, Jerusalem. The official estimates are published annually by the CBS in the "Statistical Abstract of Israel" and in the "Current Briefings in Statistics". The CBS publishes also quarterly estimates of the GDP through the expenditure approach in the "Monthly Bulletin of Statistics". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General
The estimates since 1995 shown in the data tables have been prepared in compliance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the 1968 SNA. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, the differences are explained in footnotes to the relevant tables.

The estimates of the Gross Domestic Product and its components at constant prices are calculated each year, at the prices of the previous year, and presented in the tables as chained estimates at 2005 prices, to allow comparisons between non-consecutive years. Because of chaining, estimates for each category of the GDP do not add up to the total GDP.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated both through the expenditure and production approaches. The expenditure approach is considered more reliable, and thus a statistical discrepancy will balance the GDP estimated from the production approach. Annual series on domestic product by the income approach are also presented, although the aggregate is not obtained independently, since net operating surplus is derived by deducting from the GDP, at basic prices, compensation of employed persons, consumption of fixed capital and other taxes on production (net).

Expenditure Approach
General government consumption expenditure: The estimates for central government are based on the analysis of the Accountant General's reports, the budget provisions, and complementary data received from the Ministries of Finance and Defense, which provide monthly, quarterly, and annual reports. The quarterly data for the local authorities, national institutions, and non-profit institutions are based on data from alternative sources, mainly the NII's monthly wage data and the Treasury's monthly data on transfers to these institutions. Annual financial and budget accounts of local authorities and related institutions are used to prepare final estimates. Data on number of employees and hours worked are obtained from the ministries' and the NII's wage files and from the quarterly labor force surveys of the CBS. For the constant price estimates, wages and salaries are extrapolated using changes in the labor inputs. Purchases of goods and services are deflated by relevant components of the consumer or wholesale price index.

Private consumption expenditure: The main data sources for the components of household final consumption expenditure are:

(i) Flow of goods and services: calculated on the basis of monthly data on quantities and consumer prices. The sources for monthly data on quantities are (a) for meat, fish, eggs, and fruits and vegetables; supply to the local market by the Agricultural Produce Marketing Board (about 90 % of total supply) and production for own use from agricultural surveys; (b) reports of Israel Electric Corporation (IEC) and fuel companies for electricity and fuel; (c) monthly surveys of the Central Bureau of Statistics (CBS) on the supply of durable goods to the domestic market and person-nights in hotels; and (d) reports of the Ministry of Health on the number of hospitalization days in

commercial hospitals. Prices for electricity are obtained from the ISC. Prices for all the other items listed above are taken from the relevant prices collected for the consumer price indices.

(ii) Household expenditure survey (HES): This source is used for consumption of housing services, business and personal services, part of the food products for which data on quantity marketed are not obtained, and industrial products other than food products or fuel. Since 1997 the HES is conducted annually, in years before that each 5 years until 1992/93. The survey frame is the municipal tax (Arnona) file. Before 1997 the sample represented only urban households, and estimates for non-urban households were added based on the composition of these households. Since 1997 the sample also covers non-urban households.

The extrapolation and interpolation are based on indicators, such as domestic sales in the relevant industrial branches (3-digit) obtained from monthly industry surveys (see the summary methodology for production index) conducted by the CBS (around 20% of household consumption); VAT revenues from communication and recreational services; quarterly data on revenues from financial data collected by the CBS covering domestic transport, hotel, postal, private hospital, and broadcasting services; administrative data on floor area of completed dwellings updating the stock of dwellings; monthly data on number of departures and entries of Israeli residents from the Ministry of the Interior; and the import of consumer goods (around 13% of household consumption). The latter is measured on the basis of the classification of imported goods between consumer, capital, and intermediate goods mainly based on the results of the "Import Destination Survey" conducted in 1988, although the destinations for some important goods such as PC’s, vehicles have been checked in recent years.

Relevant components of producer and import price indices are used to derive volume extrapolators, and relevant consumer price indices are used to convert the volume measures into estimates at current prices.

(iii) Direct purchases by foreign residents in the domestic market and by Israelis abroad: Estimates are obtained from the "Travel" item in the Balance of Payments, after deduction of an estimate for business expenditures. Final consumption expenditure of NPISHs: Data are obtained from an annual survey of NPISHs which covers all NPISHs employing two or more employees. The survey sample includes about 2000 institutions - all large institutions and a representative sample of smaller institutions by purpose. Data on wages reported to the National Insurance Institute (NII) are used to derive preliminary estimates based on the annual survey.

Estimates of changes in inventories in agriculture, fuel and government strategic stocks are prepared by multiplying quantity changes in inventory stocks by their average prices. Regular quarterly and annual surveys are used to estimate inventory changes for industry and wholesale trade. The data obtained are adjusted to approximate the value of the physical change in stocks. The estimates of changes in inventories include the value of unsold production (mainly software and R&D) of the start-up companies, estimated on the basis of data on investments of the Venture Capital Funds in these companies.

Gross fixed capital formation in construction is calculated basing on quantitative data on the area under construction and average per unit costs; for the general government and public non-financial enterprises, financial data on construction carried out are used. The estimates of imported machinery and equipment are based on the foreign trade statistics using the customs tariff description to identify the relevant items, while estimates of locally produced goods are based on a monthly report of sales by product obtained from a sample of the producers. The estimates of exports and imports of goods and services are based on foreign trade statistics and balance of payments data.

Income Approach

Estimates of compensation of employees were obtained by summing up compensation of employees in each industry based on industry surveys such as the Manufacturing Survey. For industries where surveys were not conducted, estimates were based on administrative reports, such as: employers’ reports to the NII or reports from the Accountant General. The estimate of consumption of fixed capital was calculated using the perpetual inventory method.

Production Approach

The table of gross domestic product by industry is prepared at basic prices. All taxes less subsidies on products are estimated at total economy level only and not by industry.

Agriculture, hunting, and forestry, Fishing - Output from Annual Census of Agriculture carried out by the Ministry of Agriculture and the CBS- Intermediate consumption is estimated (based on imports, domestic supply of fertilizer, etc.) - Wage data from the National Insurance Institute (NII). Preliminary estimates based on Monthly statistics on production of agricultural goods.

For mining and manufacturing (excluding diamond industry) the estimates are based on industrial surveys carried out annually. For years not covered by industrial surveys estimates are interpolated and extrapolated using current production indices. For the diamond industry the estimates, at current and constant prices, are obtained using data on imports and exports of diamonds of the various types. Estimates of the output are calculated for each type of diamond separately.

Estimates for Electricity, gas, and water supply are based on annual financial statements from the electricity company, gas companies, and on revenue data from VAT. Changes of value added, at constant prices, were obtained assuming fixed input-output ratios from the latest input-output table, and using indicators of the output: water output measured at cubic meters and electricity supplied at KWhours.

The estimates for construction are obtained by using the financial and quantitative data on the main components of the industry’s output: investments in buildings and in other construction works (roads, pipe lines, railway tracks, cable laying and other building works) and construction for defense purposes. It was assumed that there was a constant ratio between input and output, at constant prices, in the main types of construction.

Estimates for Commerce, restaurants and hotels are based on annual Trade and Services surveys and Hotel surveys. For years not covered by annual surveys estimates are interpolated and extrapolated using current VAT indices, and indicators on tourism, such as Guest-nights in hotels.

Estimates for Transport, Storage and Communications are based on annual Trade and Services surveys. For years not covered by annual surveys estimates are interpolated and extrapolated using financial reports for some industries, VAT indices on revenue, or indicators such as data on kilometers traveled by taxis and trucks, loads hauled by ships, number of passengers in domestic airlines.

Estimates for the financing and insurance industries are based on consolidated reports prepared by the supervisor of banks and the supervisor of insurance.

Estimates for renting (including imputed rents in own-occupied dwellings) are based on benchmark estimate for residential rent, extrapolated by the change in the value of inventories of dwellings.

For other services, estimates are derived from a sample of income tax files, VAT revenue data and manpower data.

Italy

Source

The preparation of national accounts statistics in Italy is undertaken by the Istituto Nazionale di Statistica (Istat), Rome. The official estimates are published annually on the website (www.istat.it) and also published in the "Contabilità Nazionale" Yearbook. In 2003, a complete methodological inventory on GDP compilation for the benchmark year 1992 was submitted by Istat to EUROSTAT. This inventory describes in detail all methods applied in compiling the SNA accounts and exhibits numerical results. The update of the inventory, describing sources and methods for the last benchmark year (2000) estimates will be soon available. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Input-output tables have been published for the years 1959, 1965, 1972, 1975, 1982, 1985, 1988, 1992, and 2000. From 2005 are also available supply and use tables which refer to the time series 1995-2004. The estimates prepared according to the 1968 SNA are provided in the former national currency Italian lira. The following presentation on sources and method is based mainly on information contained in the “2003 Inventory on GDP compilation” submitted by the Istituto Nazionale di Statistica to Eurostat and on the updates of this document which will be published by International Institutions. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Italy the currency name for the data before 1999 is "1999 ITL euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 1936.27 Italian lira. - The name of the currency of the newly submitted data is "1999 ITL euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Italy, like for example all old data following the 1968 SNA is still in "Italian lira", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

The European System of National and Regional Accounts underlines the fact that the annual national accounts aggregates should be derived from an input-output framework. A complete coherence between national accounts and the input-output framework by means of Supply and Use Tables (SUT) should be guaranteed in reference to the year of estimate considered to be definitive. The Italian approach at the basis of the integrated estimate of the national accounts aggregates and of the supply and use tables is based on the analysis, correction and, finally, balancing of the discrepancies among the supply and use aggregates, independently estimated, and includes the construction of a constraint system that allows the simultaneous balancing of all the accounts and tables, which compose the supply and use tables framework at purchaser’s prices and at basic prices. With the 2005 benchmark revision previous year prices calculations and chains’ indices have been introduced for the constant prices evaluations.

Expenditure Approach

The expenditure approach relates to the estimates of final consumption, increase in stocks and exports and imports of goods and services. The private consumption estimates are obtained from a complex integration of different sources (the commodity flows method, households' budget survey, sales indicators in commercial businesses, multi-purpose survey, other quantity and price indicators by specific items). Households' budget quarterly survey covers 28,000 households by rotation with 7000 new families each quarter. Surveys carried out by the Banca d'Italia provide consumption data for non-resident households on the domestic market and for residents abroad. A similar approach, a complex integration of different sources (the commodity flows method, the expenditure method, quantity and price indicators by specific items), is used to estimate gross fixed capital formation. For General government the estimations are based on Government units data coming from the Rendiconto generale dello Stato, Other central government units budget reporting, Local government units budget reporting and/or profit and loss accounts and Social Security Funds budget reporting. For some local government units there exist specific Istat's surveys used for the calculation of the aggregates. The main statistical source used for estimating changes in stocks is the value added surveys conducted for all enterprises in the industrial construction, trade and transport sectors that employ more than 20 persons. The stocks relate to industrial products only. For construction and building, the Istituto Nazionale di Statistica conducts specific surveys such as surveys on residential buildings and on public works. The estimates of exports and imports of goods and services are based mainly on the balance-of-payments and foreign trade statistics. For the constant price estimates, most of the items of GDP by expenditure type are deflated by appropriate price indexes except for non market services (General Government and Non profit Institutions serving Households) for which output (quantity indicators) and input based methods are used. Government building depreciation is estimated as a certain percentage of the stock value at constant prices. Private consumption of own-produced food and stock increases of agricultural products are revalued at base-year prices. Gross rent is extrapolated by the number of dwelling units.

Income Approach

Income approach is applied for all the sectors of national economy but it can be considered suitable for the integrated approach to GDP estimates only for specific segments of the economy, namely the estimates of value added produced by non market industries and domestic services. Compensation of employees is estimated through use of the value-added survey and a survey carried out by the Ministry of Labour and Social Security for the industrial sector, minimum contractual wages and survey of the compensation of permanent employees for the agricultural sector, surveys and inquiries carried out by other institutes for the service sector and other indirect evaluation for sectors not covered by surveys. Information on operating surplus is obtained from the value-added surveys and from actual interest received and paid by the various sectors. Depreciation is valued on the basis of time series of gross fixed capital formation at constant prices by product and by branch of economic activity. Constant prices of 1970 are estimated by using the perpetual inventory method, assuming that the devaluation of the product is constant during its economic life. Estimates of indirect taxes and subsidies are obtained from government sources. Taxes linked to production and imports are broken down by branch according to the type of tax. Data on subsidies are classified by branch on the basis of the recipients indicated in the government budgets.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most of the industries. This is supplemented by the income approach for industries to which the value added surveys are applied. Statistics on agricultural production prices, etc. are derived from current agricultural surveys. Several surveys are presently carried out referring to Regional Agricultural Departments information and databases. Crop surveys of major products are conducted annually. Information on gross marketable livestock production is available separately for major items. For forestry, a quarterly survey supplies data on production and prices. Monthly surveys of products unloaded in Italian ports are used for estimating value added of fishing. For the industrial activity sector, the estimates are based on value added surveys and the product surveys. Two main annual business surveys conducted by Istat are the Survey of Economic and Financial Accounts (SCI) for enterprises with 100 or more persons employed and the Survey of Small and Medium Enterprises (PMI) for those with up to 100 persons

employed. These two structural business statistics (SBS) surveys are the main base of information for the economic activities in manufacturing and private services. The SCI is an exhaustive survey covering, since 1998, close to 10,000 enterprises. It collects data concerning profit and loss accounts, balance sheets, and employment. The results are available 18 months after the reference year. The PMI is a stratified simple random sample survey stratified by four-digit ATECO, region, and size class. The sample is about 108,000 enterprises or 2.8 percent of the target population. Grossing up is done on the basis of number of workers and number of enterprises. The main variables collected are the same as for the SCI. In addition, the industrial sector survey PRODCOM should be mentioned. The PRODCOM survey is conducted as a result of a EU regulation dating from 1993 and is directed at units belonging to the extractive and manufacturing industries. Included are all local units of enterprises of 20 workers and over, and a sample of the enterprises with three to 19 workers. The two-page questionnaire collects information by type of product on output and energy consumption in volume terms and, where appropriate, in values. Provisional data are available after six months, final data are available 18 months after the reference year. The surveys used for the manufacturing sector are also used for construction for the trade sector, the transport sector. Additional information is supplied directly by the relevant firms and public agencies. For the financial institutions, annual surveys are carried out which covers 97 per cent of the activity. Special calculations are made for institutions not covered. Estimates of the production of government services are based on data compiled by the Ragioneria generale dello Stato (for the input indicators related to civil servants) and data coming from surveys of the Istituto Nazionale di Statistica and other surveys, produced by other institutions belonging to the National Statistical System such as the Ministry of Health and the Ministry of Education and University, for the output methods (quantity indicators). Other market services are valued integrating SCI and PMI surveys with different sources like the results of family budgets surveys or the expenditure approach. For the constant price estimates, price deflation is used for community, social and personal services. Double deflation is used for all the other sectors. Output is either deflated by appropriate indexes or is extrapolated by quantum indexes while input is deflated by price indexes.

Jamaica

Source

Reply to the United Nations national accounts questionnaire from the Statistical Institute of Jamaica, Kingston. Official estimates and information on concepts, sources and methods of estimation utilized are published annually by the Department in "National Income and Product".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Japan

Source
The preparation of national accounts in Japan is undertaken by the Economic and Social Research Institute of the Cabinet Office (former Economic Planning Agency), Tokyo. Official estimates are published in "Annual Report on National Accounts." The data for Japan was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General
The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Whenever the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following presentation of sources and methods is mainly based on information from "A System of National Accounts in Japan" published by the Economic and Social Research Institute. Input-output tables have been published by the Ministry of Internal Affairs and Communications (former Management and Coordination Agency).

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the expenditure approach.

Expenditure Approach
Using the commodity flow method, output, intermediate consumption by industry, household final consumption expenditure, gross capital formation, exports and imports are estimated for each of approximately 2,200 commodities. Shipment estimates are derived directly or indirectly from statistics such as Crop Survey, Census of Manufactures, Current Production Statistics Survey, Establishment Census, and Census of Commerce. Distribution channels and constant coefficients such as the distribution ratios, transportation fee rates, and trade margin rates are decided for each of the commodities based on the information of the Input-output Table. Services produced and consumed by the producers of government services and private non-profit services to households are estimated separately based on the settlement of accounts of governments, on the Survey of Private Non-profit Institutions and other sources. Gross domestic expenditure is obtained by adding up final consumption expenditure, gross fixed capital formation, increase in stocks, and current external transactions. Exports and imports are estimated by the estimation method for external transactions, which rearranges the Balance of Payments Statistics in consideration of its consistency with the SNA. For final consumption expenditure of households, calendar-year figures are estimated by the commodity flow method.

Each commodity is classified into one of the elements of a 43-objects x 5-uses matrix. Each element of the matrix corresponds to one of the four types of expenditure. Quarterly figures are estimated by distributing the calendar-year figure through the combined figures of both supply side and demand side. Supply-side figures are estimated by a modified commodity flow method. (The number of commodities are aggregated into 90). Demand-side figures are estimated by source data such as the Family Income and Expenditure Survey, the Survey of Household Economy, and the National Survey of Family Income and Expenditure. For gross capital formation, quarterly figures are estimated in the same way as final consumption expenditure of households. The calendar-year figure is distributed into quarterly figures through the combined figures of both supply side and demand side. Sectoral figures are estimated by breaking down the calendar-year figures estimated by the commodity flow method, on the basis of sectoral figures estimated through the expenditure approach, which uses settlements of accounts of government, Financial Statements Statistics of Corporations by Industry and so on for gross fixed capital formation. For increase in stocks, Financial Statements Statistics of Corporations by Industry are mainly used.

Gross domestic product at constant prices is estimated by the chain-linked method (reference year: 2000). The minimum unit of price indexes is called a basic unit deflator, which corresponds to the approximately 400 commodities aggregated from the approximately 2,200 commodities used for the commodity flow method. Series at constant prices are obtained by dividing the nominal values of the 400 commodities by the basic unit deflators for each demand item. In other words, constant value is estimated using a chain-weighted Paasche-type deflator weighted by 400 commodities. Government services and private non-profit services to households at constant price are estimated using deflators by activities that correspond respectively to six activities of government services and two activities of private non-profit services to households.

Income Approach

Wages and salaries are estimated separately for the three groups of agriculture, forestry and fisheries, government services, and other industries. Concerning the other industries, quarterly cash allowances to employees by industries are calculated by multiplying the per-head wage by the number of employees. In this case, the number of employees is based on the "Population Census" conducted every five years and is interpolated midway through the five-year period by trends observed from the "Labor Force Survey," while the cash allowances per head are mainly based on the "Monthly Labor Survey." Cash allowances to officers are estimated by multiplying the number of officers by the difference between the per-head allowances of both officers and regular employees, which are obtained from the "Financial Statements of Corporations by Industry", and the per-head allowances of regular employees. Employers' contributions to social security schemes are estimated on the basis of the operational reports of these schemes. Employers' contributions to others and payments in kind are estimated on the basis of settlements of accounts of the central government and local governments data on taxation, business and housing survey data on payments for housing. The operating surplus is estimated through a production approach (value-added method) as a residual item, and is distributed to each institutional sector according to the ratios of operating profits to the total by type of income-earning subject (after inventory valuation adjustment). The ratios are estimated on the basis of statistical data such as "Financial Statements of Corporations by Industry." Consumption of fixed capital consists of loss from wear and tear (depreciation) and estimated damage from fire, typhoons, floods, and other accidents. Depreciation is estimated on the basis of "Financial Statements of Corporations by Industry", "Financial Statistics of Local Public Enterprises" and other sources. Accidental damage is estimated by making use of settlements of accounts of insurance companies and other entities. Indirect taxes and subsidies are estimated on the basis of settlements of accounts of central and local governments. Except for consumption of fixed capital, we do not calculate constant price data of the above-mentioned.

Production Approach

The gross domestic product by type of economic activity is prepared at market prices, i.e. producers' values. The output of each of the 83 industry groups is estimated from the "V" table (a make matrix for commodity by activity), of which total control is given as the output of the 2,126 commodities estimated by the commodity flow method. The intermediate input of each industry group is estimated from the "U" table (a use matrix for commodity by activity), in the base year which is compiled from "Input-output Table" and the "V" table, and from the "U" table in the mid-year, which is separately compiled from the information of the cost structure estimated for about □ to 15 items every year. The value added and its component items by industry are estimated by subtracting the intermediate input from the output. The output, intermediate input, value added and its component items by the producers of government services and by the producers of private non-profit services to households are separately estimated by using the settlement of accounts of government, survey of private non-profit institutions, and other sources. Gross domestic product by industry at constant prices is estimated by the double deflation technique. Output by industry is estimated from the "V" table at constant prices, which is obtained by dividing the output of each commodity by its output deflator. The intermediate input by industry is estimated from the "U" table at constant prices, which is obtained by dividing the intermediate input of each commodity by its input deflator.

[a] Includes financial intermediation services indirectly measured (FISIM).
[b] Excludes the statistical discrepancy between expenditure-based and production-based GDP amounts.
[c] Discrepancy between total economy and sum of domestic sectors since data by domestic sectors exclude the statistical discrepancy that links GDP by expenditure approach and GDP by production approach.

Jordan

Source
The preparation of national accounts statistics in the Hashemite Kingdom of Jordan is undertaken by the Department of Statistics, Amman. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The most recent data have been provided by the Department of Statistics. The annual national accounts statistics are published in the annual Yearbook and on the DOS website - www.dos.gov.jo.

General
The annual official estimates together with methodological notes are published in a series of publications entitled "National Accounts". A comprehensive description of the concepts and definitions underlying the various tables is contained in "The National Accounts 1976-2002", published in 2004 by the Department of Statistics. The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA).

The DoS compiled "Input-output tables, 2006" which were published in 2010; the tables include 81 sectors for the Jordanian economy.

Methodology:

Overview of GDP Compilation
Gross Domestic Product is estimated mainly through the production approach.

Expenditure Approach
All components of Gross Domestic Product by expenditure type are estimated separately except private consumption expenditure which is estimated residually.

The estimates of government final consumption expenditure are obtained from the records of the Ministry of Finance, Independent Agencies and municipalities.

Estimates of Gross Fixed Capital Formation are obtained from the data of the economic and agricultural surveys which are conducted annually by DoS; other data are taken from different government budgets.

Estimates of changes in inventory depend on the same sources used to obtain Gross Fixed Capital Formation.

The DoS estimate the data of exports and imports of goods. These data are taken from the Department of Customs by the custom form, and aggregated in the DoS. Exports and imports of services are taken from the Central Bank; these data are mentioned in tables of balance of payment.

Gross Domestic Product by expenditure at constant prices is not estimated.

Income Approach
The sources and methods applied in estimating the cost-structure by components of gross domestic product are based on the breakdown of income estimates obtained from the annual surveys.

All items in this approach are calculated depending on the previous sources mentioned and other government sources, except for Net Operating Surplus, which is estimated as a residual.

Production Approach

The estimates of gross domestic product by kind of economic activity are compiled at basic prices which recommended by SNA 1993. The production approach is used to estimate the value added of all industries, they are:

• Annual agricultural sample surveys are undertaken on a country-wide basis providing production estimates for crops. The quantities obtained from these surveys are valued at farm prices collected from the farmers through a monthly survey. Livestock estimates are obtained through sample surveys covering the organized farms and unorganized sector.

• DoS executed a general establishment census for all economic surveys for 2011. The last census was conducted in 2006 which provides frames for all economic surveys:

• Annual industry survey is the source of the data for, mining and quarrying, manufacturing, and electricity activities.

• The annual construction survey covers the organized sector; which depends on formal contractors, whereas the estimate of unorganized sector depends on the complementary quarterly survey and organized sector.

• Annual internal trade survey covers wholesale and retail trade activity. Data for hotels and restaurants sector is derived from annual services survey.

• The transport activities are covered through two surveys; the first survey covers the organized sector which includes all establishments performing the activities of road, sea, air transport, in addition to post and telecommunications. The second survey covers unorganized sector which includes goods shipment and passengers transport.

• Annual financial and insurance survey collects date to estimate the financial and insurance activities, for business services we derived data from services survey, finally real estate data depend on household expenditure survey.

• Annual services surveys cover all other services activities.

• Gross domestic product by kind of economic activity at constant prices is estimated with a base year 1994; the base year will be updated after the completion of the census of establishment.

• As regard for SNA 1993 Double Deflation method is used, to obtain the constant price estimates by deflating the values of both gross output and intermediate consumption separately. But in the cases where it is impossible to use the double deflator due to lack of convenient price indices to deflate the intermediate consumption, other methods were applied, such as extrapolation method in which the intermediate consumption of 1994 was extrapolated using gross output at constant prices as volume indicator.

Kazakhstan

Source

Reply to the United Nations national accounts questionnaire from the State Committee of the Republic of Kazakhstan on Statistics and Analysis. The latest data for Kazakhstan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Kazakhstan has changed in 1993 from the Russian ruble to Kazakh tenge. One tenge equals 500 Russian rubles (see World Bank "Statistical Handbook for the States of the FSU, 1996"). Data in series 150 and 200 for 1990-1992 (1990-1993 for data at constant prices) were compiled in Russian rubles and converted to tenge. Starting 1993 (1994 for data at constant prices), data were compiled in tenge.

Kenya

Source
The national accounts are compiled and disseminated by the national accounts section of the Kenya National Bureau of Statistics. The definitions and concepts are based on United Nations System of National Accounts of 1993. Data are presented in millions of Kenya shillings. The Department adopted the SNA 1993 in 2005 and provided revision of National accounts statistics based on the new system (SNA 1993) back to 1996. The official estimates are published annually in the "Economic survey" and "Statistical Abstract". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General
The estimates are generally in accordance with the concepts, classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Accounts 1968 (1968 SNA). A full revision of previous estimates for the years 1996-2004 were published in 2005, implementing enhanced methods and new data sources for National Accounts estimates. A full revision of previous estimates for the years 1972-1975 were published in 1976, implementing improved methods and sources of estimation. Input-output tables for 1967 and 1971 were published in 1972 and 1976 respectively in "Input-Output Tables for Kenya". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled.

Expenditure Approach
The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. A combination of the commodity-flow and expenditure approaches is used to estimate gross capital formation. The estimates of government final consumption expenditure are derived from the accounts of the central and local government, the East African Community, the relevant statutory boards and the National Security Fund. All accounts are prepared on a cash basis. Private final consumption expenditure is made up of final consumption expenditure by households and by non-profit institutions serving households. This is derived in the commodity flows. Currently, changes in inventories are estimated only in a few commodity flows: For a few minerals, as a balancing item between output and exports; for crude petroleum and refined petroleum products, based on quantitative data on supply and use.

Gross fixed capital formation is derived in the commodity flows, which allow disaggregation by type of asset: Buildings and structures, transport equipment, other machinery and equipment, cultivated assets, and intangible assets. Estimates are also made of GFCF by general government.

Imports of goods and services comprise sales and grants of goods and services by non-residents to residents. Imports of goods are valued c.i.f in the source data as well as in the commodity flows. Total imports of goods are valued f.o.b. by deducting an adjustment for c.i.f./f.o.b. This is all considered to be imported freight and insurance services. The major source for imports of goods is customs data delivered by the Customs Department and processed by the CBS using the Eurotrace software. Separate commodity flows are compiled for each BEC-category. Re-exports are also available by BEC and are recorded as exports in the commodity flows.

Consumption of fixed capital is then estimated assuming a linear depreciation in the capital stock; for example, for an asset with a life span of 10 years, the capital consumption for a year is 10% of the value of the capital stock.

For Building and structures: 40 years. For Transport and machinery: 10 years. For Other machinery and equipment: 10 years. For cultivated assets: 10 years.

Exports and imports of goods and services are based on foreign trade reports and balance of payments estimates. For the constant price estimates, government expenditure on wages and salaries are extrapolated by an index of employment, while purchases of goods and services are deflated by various price indexes.

Income Approach

Wages and salaries paid in most industries are obtained from the annual surveys of employees and self-employed persons. Other sources include the integrated rural survey for small farms, logger licenses and wage rate for forestry, reports and special surveys for transport, government accounts for the government sector and annual questionnaires for the private non-profit services. Information on indirect taxes and subsidies is obtained from concerned enterprises and from government records. Operating surplus, including consumption of fixed capital, is obtained as a residual.

Production Approach

The Kenya National Bureau of Statistics (KNBS) maintains a central register of establishments (the business register). The Register serves as the frame on which surveys of the formal sector are based. Due to the dynamism of the economy, the rate of entry and exit of firms is high and this makes the tracking of the firms difficult. There is also a problem of non-response. In addition, the following new data sources, which were previously not used for the national accounts estimates, have been included: The 1997 Welfare Monitoring Survey (WMS 1997); The 1998 Labour Force Survey (LFS 1998); The 1999 National Micro and Small Enterprise Survey (MSE 1999); and The 1999 Population Census. A recent survey of manufacturing, carried out by Kenya Institute of Public Policy Research and Analysis (KIPPRA) has also been used.

The estimates for central government are based on accounting records, provisional budget and revised budget estimates published or unpublished. These records undergo a considerable amount of analysis before being used for national accounts compilation. Since the Government data are recorded in fiscal years, adjustments are made by taking the average of two fiscal years to represent the calendar year. The estimates for local government are based on accounts from local authorities gathered by the CBS. Constant prices are derived by extrapolation with employment numbers.

Agriculture: Estimates are product based instead of being based on data from agricultural holdings (establishments), and output data are derived from commodity flows. Growing of cereals and other edible crops is principally done by small-scale holdings, i.e. household enterprises. Therefore, benchmarks for production for own consumptions have been derived from household surveys (WMS 1997) and additional sources for marketed produce are used for maize, wheat, barley and rice. At present there are no estimates of hunting. Tea and coffee production are estimated from data on deliveries to respective marketing boards. Livestock production is measured from returns compiled by department of Livestock Production. Marketed milk data is obtained from the Dairy Board of Kenya and Kenya Co-operative Creameries (KCC). Marketed maize and wheat data is obtained from National Cereals and Produce Board and millers while an estimate of total production is obtained from the Ministry of Agriculture. Estimates of the small-scale farmers are based on the past bench mark data, which have been brought forward with indicators for large-scale farming. Intermediate consumption is based on data collected from agricultural suppliers. Constant prices are estimated by double deflation using price and volume data from the sources mentioned above.

Forestry: The Forestry Department supplies data on its wages and numbers employed, which are the basis for the estimates for forestry operated by government. The estimates for private logging are based on royalties and other payments from the private sector. Estimates at constant prices are derived from quantitative data on trees felled and areas planted. The non-monetary sector is estimated through extrapolation of an old benchmark (time use survey 1972) by the changes in rural population and by applying an average rural wage.

Fishing: Marketed output both at current and constant prices, are based on data from the Fisheries Department on

fish landed by quantities and values. Constant prices are derived using catches of the four major categories as volume indicators. Intermediate consumption is assumed to be 35% of output based on the 1998 Labour Force Survey. Unreported output (includes production for own-consumption) is assumed to be 10 per cent of market output.

Compensation of employees; A benchmark for 1998 has been calculated by multiplying average earning with an approximate number of employees based on the 1998 Labour Force Survey. Compensation of employees is assumed to have a fixed ratio to output.

Mining and quarrying: The estimates are based on data on production obtained from the Mines and Geology Department. These data include values and quantities of ores and minerals and are used for estimates of output and value added at current and constant prices.

Manufacturing: A benchmark estimate of output for 2001 (the base year) based on various sources and judgmental estimates is used The ratio of intermediate consumption over output is estimated on the basis of KIPPRA survey data and other sources for some sub-sectors. Constant prices are calculated by extrapolation using volume index for manufacturing. Thus, single deflation is used assuming a fixed ratio of intermediate consumption over output. The Monthly Survey of Industrial Production (MSIP) collects data on quantities and value of output for major products. Current prices are then derived from constant values by reflating with various price indices, normally the same for output and intermediate consumption. However, for some sub-sectors the current estimates have been used as provided by the source data. Compensation of employees is calculated on the basis of the annual Labour Enumeration Survey (LES). Finally, 10% are added to take into account the social contributions. A commodity flow is compiled for each sub-sector. Exports are from the foreign trade statistics

Electricity and water: The annual reports of KPLC and KenGen contain both financial and quantitative data for all operators. These data are for financial years ending 30 June. Calendar years are calculated as the average of two adjacent financial years. Output at constant prices is calculated by extrapolation with the quantities sold broken down by the different categories of users. Compensation of employees (COE) for KPLC and KenGen is derived from the relevant items in the income statements. For IPP (Independent Power Producer), EPP (Emergency Power Producer) and REP (Rural Electrification Programme) COE is assumed to be the same ratio over output as for KenGen. Water: Central government includes services provided for rural water schemes, while local government is responsible for distribution of water to households, industries and other consumers. Sum of cost approach is used to compute the output at constant and current prices. Intermediate consumption is deflated by CPI, non-food excl. VAT. Compensation of employees is deflated with a salary index derived from earnings and employment in local government according to the LES. Water collection: all household without piped water are assumed to collect water. Output is computed as product of number of households, average time spent per day (WMS 1997), and earning per day (based on gazetted monthly basic minimum wage for Agriculture, unskilled labour under 18 years) for 360 days per year. Constant prices are calculated by multiplication with the minimum wage for the base year.

Construction: The estimates both at current and constant prices are based on the commodity flow approach. Imports sorted by Broad Economic Categories (BEC) include a category for industrial supplies, among which goods mainly used for input in construction have been identified. This is recorded as intermediate consumption by market producers with deduction of intermediate consumption by central government. Supply from domestic producers originates mainly in quarrying and certain sub-sectors of manufacturing. Additions have been made for inputs not typical for construction (for example fuel). A fixed ratio of value added to intermediate consumption at constant prices is used to derive output, value added and intermediate consumptions. Compensation of employees is based on the annual Labour Enumeration Survey. Current prices are then derived by reflation with the total building cost index. Own account construction: A benchmark for 2003 has been estimated separately for the two house types by multiplying the costs with number of households and dividing with the average life span. The cost for replacement of the roof for type 1) has been added. An addition of 10% has been made for the building of ancillary structures such as kitchens and latrines. Annual estimates at constant prices are derived by projecting with the annual growth of households. Current prices are derived by reflation: valued added with an

index based on the gazetted minimum wage for rural workers and intermediate consumption with the average of the building cost index for timber and hardware. Sum of cost approach is used for the government account.

Wholesale and Retail trade; repairs: Output is calculated as the sum of trade margins in the commodity flows both at current and constant prices. An addition of 10% is made for a likely underestimation of margins on goods sold for intermediate consumption and for services that are not included in the trade margins. Intermediate consumption is estimated at 54% of output (derived from 1999 SME survey). Repairs: Output. A benchmark for 2001 estimated by multiplying the number of cars with assumed average cost for repair and maintenance is extrapolated with the number of vehicles for the estimates of constant prices. Current prices are derived by reflation with CPI, transport. Intermediate consumption is estimated at 55% of output. Compensation of employees (including repair activities) is estimated by extrapolating with employment numbers then reflating with the gazetted minimum wage.

Hotels and restaurants: Hotels Output. The estimates are based on average room rates and volume indicators. Intermediate consumption is 65% of output both at current and constant prices. Compensation of employees is 45% of valued added. Constant prices are derived by deflation with the average of CPI, all items and the exchange rate for US Dollars. Restaurants output: A benchmark at constant prices is projected forwards with the volume index for hotels. Current prices are then derived by reflation with an index calculated as the average of CPI, food and CPI, alcoholic beverages. Intermediate consumption is assumed at 75% of output; 70% of this is assumed to be food. Compensation of employees is estimated at 80% of valued added. Informal sector: A benchmark for the year 1998 is based on the 1998 LFS. The annual increase at constant prices is assumed at 4% and CPI, all items is the deflator. Compensation of employees is estimated at 10% of valued added.

Transport and Communication: Estimates are done separately for railway, road passenger and freight, pipeline, water and air transport. In addition, estimations for harbours, airports, auxiliary transport activities and communication are provided. Railway transport: All the necessary data are available from the income statement provided by Railway Corporation. Various volume indicators are used to derive constant estimates. Intermediate consumption at constant prices is assumed to move with output. Road passenger: Estimates are based on 2001 benchmark output for 2001 (matatu industry). The annual increase at constant prices is assumed to be equal to the population growth while current prices are derived by reflation with CPI, transport. Intermediate consumption is assumed at 58% of output both at current and constant prices. A benchmark estimate of output for 2001 is based on annual survey of transport (taxis, buses, tour operators). Freight transport: A benchmark estimate of output for 2001 is estimated on the basis of an indirect indicator, the sales of diesel. Ratios of intermediate consumption and compensation of employees over output are according to annual survey of freight transport. A volume index is calculated as a straight average of the quantities of diesel sold and trade margins at constant prices. For transport via pipeline all necessary data is available from the Kenya pipeline company. Water transport: Estimates are based on annual survey of transport. For the estimates at constant prices a volume index is used, calculated as the average of employment and net registered tonnage. All necessary data are available from Kenya Ports Authority on the activities at the habours. Constant price estimates are calculated using a volume index which is computed as a weighted average of number of ships (25%), tonnes of exports (15%), and tonnes of imports (60%). Intermediate consumption at constant prices is assumed to follow output.

Communication: Information contained in the respective companies' annual reports and surveys are used to generate the required variables. Relevant CPI indices are used to deflate.

Financial Intermediation: Current price data on financial intermediaries are timely and detailed. Questionnaires are sent out to financial institutions and the response is complete. Annual reports of all the companies are used as a complimentary data source. Estimates of insurance companies, agents and brokers are based on wages and salaries obtained from the employment survey. Constant prices for both financial intermediaries and insurance are derived by deflating with CPI non-food excluding VAT. Output of insurance services at constant prices is calculated by volume extrapolation (employment index adjusted by 1% for productivity)

Real Estate, Renting and Business services: The estimates are based on the number of households in different

types of houses according to the 1989 and 1999 population censuses. Rental values are either obtained from price collection or imputed. Output is calculated by multiplying the rental values with the number of households in each category. Constant prices are calculated by projection with the number of households. Intermediate consumption is estimated at 10% of output for modern houses and 5% for other houses. No intermediate consumption is calculated for traditional houses. Renting and Business services: The estimate based on benchmark is projected at constant prices with a volume index calculated as changes in employment (LES) with an addition for an annual increase in productivity with 2%. Intermediate consumption is estimated at 28% of output and Compensation of employees at 60% of value added.

Government account: Output is calculated as sum of costs. Constant prices estimates as the sum of costs: Intermediate consumption is derived by deflation with CPI, non-food excluding VAT. Compensation of employees is extrapolated with employment in the public sector according to LES. Public administration and defense: Three sub-sectors of government public administration and defense services: central government, local government, and social security institutions and output is based on sum of cost approach. Output at constant prices as the sum of costs: Intermediate consumption is derived by deflation with CPI, non-food excluding VAT. Compensation of employees is extrapolated with employment in the public sector according to LES (Government services; Law and order; Defense; and Other public administration).

Education: Private sector (Primary and secondary education): The estimates at current prices are based on the number of private schools. Output at current prices is calculated as the sum of intermediate consumption and compensation of employees. Consumption of fixed capital and surplus are ignored. Compensation of employees is calculated as the percentage of private and secondary schools, of the government schools, is multiplied with the compensation of employees in government schools. Intermediate consumption is assumed at 30% of compensation of employees. Output at constant prices is calculated by extrapolation with enrolment numbers with a higher weight for a secondary school student. Intermediate consumption is deflated with CPI, non-food excluding VAT. Tertiary education (Private): The estimates at current prices are based on enrolment numbers in private teacher training colleges, technical schools and universities. The average cost per student is assumed to be 10% higher than in the public counterparts. Output at current prices is then calculated as the sum of intermediate consumption and compensation of employees. Consumption of fixed capital and operating surplus is ignored. Output at constant prices is calculated by extrapolation with enrolment numbers. Intermediate consumption is deflated with CPI, non-food excluding VAT. Government (some of cost approach is used): The major part of government schools are sponsored by the Teachers' Salary Commission. This is a statutory body, which pays the salaries. Local authorities also operate some schools. Central government operates teachers' training colleges and some technical schools. The universities are statutory bodies that are controlled and mainly financed by central government

Health and social work: Private sector: Based on 1996 output, the constant price output is brought forward with employment numbers according to the annual Labour Enumeration Survey (LES). CPI, medical services is used for reflation. Intermediate consumption is assumed at 30% of output at constant prices and reflated with of CPI, non-food excluding VAT and CPI, medical services. Compensation of employees (a benchmark based on 1998 LFS) is brought forward with employment numbers and the CPI, non-food. Government: Public health facilities are operated mainly by central government but some health activities are also carried out by local government. Output at constant prices is calculated as the sum of costs: Intermediate consumption is derived by deflation with CPI, non-food excluding VAT. Compensation of employees is extrapolated with employment in the public sector according to LES.

Other services: Private: Estimates based on 2001 benchmark for output. At constant prices, this is projected with a volume index calculated as changes in employment according the annual Labour Enumeration Survey (LES) with an addition of an annual increase of 2% in order to take changes in productivity and the informal sector into account Intermediate consumption is estimated at 34% of output and Compensation of employees at 60% of value added. Government (sum of cost approach): Minor activities are carried out by central government in field of culture. The major part includes the activities of local government in the fields of sewage and refuses collection. Output at constant prices is calculated as the sum of costs: Intermediate consumption is derived by deflation with

CPI, non-food excluding VAT. Compensation of employees is deflated with a salary index.

Domestic services: A benchmark has been calculated for 1998. Number of persons employed in domestic work is available from the 1998 Labour Force Survey and has been multiplied with the gazetted minimum wage for a general labourer, other municipalities. Employment is assumed to have increased with 2% per year since 1990 and the average salary to change with the gazetted minimum wage. Meals during work are assumed at 40% of the wages at constant prices; this is reflated with CPI, food.

Kiribati

Source
Reply to the United Nations national accounts questionnaire from the Planning Office, Ministry of Finance, Tarawa.

General
The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (SNA 1993) so far as the existing data would permit. It should be noted that the estimates for 1972-1974 include data for Tuvalu (former Ellice Islands).

The national accounts statistics for Kiribati is produced on an annual basis. However, the current estimates are limited to Gross Domestic Product (GDP) at current and constant 2006 prices, using the production approach – i.e. GDP(P), and current price Gross National Income (GNI). The GDP estimates are compiled and disseminated at a broad industry level, based on the International Standard Industry Classification, Revision 2 (ISIC Rev. 2).

The previous coverage of economic activity was largely restricted to the formal sector. With the exception of copra cutters production, commercial fishing, and owner-occupied dwellings, most household and informal sector economic activities are not covered. As a result, the previous estimates significantly underestimate GDP(P). The current estimates however reviewed the 2006 HIES results and tried to cover the under-coverage amounts relating to household sector gross value added.

The main sources included the 2006 HIES results, 2000 and 2005 Population Census data, revised GFS data, and revised BOP statistics. The most significant changes to the estimates were for the Agriculture and forestry industry, Fishing industry, and Owner-occupied dwellings (OOD). This was due almost entirely to the incorporation of the 2006 HIES expenditure and income estimates relating to subsistence agriculture and fishing (i.e. production for own consumption), production for domestic sales, and a much higher HIES imputed rents value for OOD.

Korea, Republic of

Source
The preparation of annual national accounts statistics in the Republic of Korea is undertaken by the Economic Statistics Department at the Bank of Korea (BOK), the central bank located in Seoul. The official estimates are published annually on the internet (http://ecos.bok.or.kr), as well as in "National Accounts". The data provided to UNSD were received through the Organization for Economic Co-operation and Development (OECD), Paris.

General
The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The official estimates and methodological notes on sources and methods are published annually by the Bank of Korea (BOK) in "National Accounts". Input-Output tables have been compiled and published by BOK as well. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Original estimates at constant prices are currently based on the year 2005.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled. Input-Output tables are currently not compiled annually but at a lower frequency.

Expenditure Approach
For final consumption expenditure by household, the estimates are mostly obtained by means of the commodity flow method using Input-Output tables. The estimation of some items such as grains, meat, tobacco and motor cars, however, are compiled directly. The sources of data include industrial output data by commodities, data on foreign trade by commodities, statistics on agricultural produce, motor cars sales statistics and others. The estimates of final consumption expenditure by general government are derived from government fiscal data.

For gross fixed capital formation in construction and agriculture, the values are derived from data industrial output and external trade. The estimates of facilities and intangible fixed assets are based on commodity flow method and converted to current price estimates using producer price index and output deflator by commodities.

For change in inventories, commodity flow method is largely used for inventories of distribution, agricultural goods and ships. On the other hand, increase in inventories of mineral and manufactured goods, livestock products, crude oil and buildings are compiled directly using various data from relating industry.

The estimates of imports and exports of goods and services are based on balance of payments. For the constant price estimates, price deflation is used for final consumption expenditure by general government, imports and exports of goods and services. The values of final consumption expenditure by household and gross fixed capital formation are based on constant value of production, imports and exports and change in inventories.

Income Approach
The estimates of compensation of employees and consumption of fixed capital are compiled on the basis of the accounting records of the various entities by industry. For taxes and subsidies on production are broadly derived from tax statistics. Operating surplus is basically derived as a residual item.

Production Approach
The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate the value added of most industries.

The value added of agriculture is obtained by deducting the cost of all inputs from the output value which are estimated by multiplying the quantities of production by the corresponding prices. The source data are supplied by the Ministry of Agriculture & Forestry. The financial data contained in the "Yearbook of Agriculture and Forestry Statistics" are used to obtain the value added of agricultural services. The value added of forestry and that of fisheries are obtained by multiplying the value of production by the value added ratio calculated from the Input-Output tables.

Value added data of the mining and manufacturing are estimated by applying the value added ratio to current value of output. Value added ratios are calculated from the Input-Output tables and the financial statement analysis of enterprises. For mining, the values of output are estimated by multiplying quantity data of production which are obtained from statistics on mining products by unit prices collected from mineral products sales statistics.

Value added of electricity, gas and water supply is derived from the financial records of concerned enterprises.

Value added of the construction is obtained by multiplying the construction output of each sector by a corresponding value added ratio. The construction output is estimated by multiplying total floor area by construction unit cost for the private and public sector, derived from fiscal data. The construction unit cost and value added ratio are calculated from the Input-Output tables.

Value added of the trade is estimated by multiplying total mark-up by the value added ratio calculated from the Input-Output tables. For restaurants and hotels, value added is extrapolated from the base year value added by volume indicators and revalued at current prices.

Value added of railway and air transportation and communication is derived directly from the respective financial data while for other transportation and storage, the estimates are extrapolated using the rate of increase in the service activity index.

The value added of financial intermediation and real-estate is obtained from financial data and taxation data, respectively. For business services, value added is estimated by multiplying output data which are based on the service activity index by the value added ratios. For the private services, estimates are calculated in a similar way to business services. The sources of data include Statistical Yearbook of Education and Yearbook of Public Health and Social Statistics.

For the constant price estimates, double deflation method is largely used. Current price output and intermediate consumption data are deflated by appropriate price indexes such as the consumer price index, the producer price index and the import deflator.

[a] Discrepancy between components and total.

Kuwait

Source

Reply to the United Nations national accounts questionnaire from the Central Office of Statistics, Ministry of Planning, Kuwait City. Official estimates are published by the same Office in "National Accounts Statistics". This is the twenty-second issue of the annual publication entitled “National Accounts Statistics” which presents time-series estimates of principal national accounting aggregates and their components. This publication presents the estimates for the years 1995 to 2002.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Estimates refer to calendar year. For the purpose of deriving estimates on a calendar year basis, government accounts were readjusted from fiscal to calendar year using closed accounts for fiscal years and periodic (monthly) statements of actual expenditure. For establishments in the petroleum sector which follow the fiscal year for their accounting, estimates were made for calendar year on the basis of data available for production, sales, exports, salaries and wages, materials purchased, capital formation etc. Basic data for most of the other enterprises and foreign trade statistics were available for calendar years.

Imputed bank and insurance service charges have been derived on the basis of actual data made available by the survey that carried out and special questionnaires that sent to these banks and insurance companies.

Methodology:

Overview of GDP Compilation

Basic data for the compilation of national accounts were drawn from the following sources: a) Annual Survey of Establishments, conducted by the Central Statistical Office (CSO) for the years 1995 to 2002; b) Annual Survey of Holdings, 1994-95 to 2001-2002; c) Closed Accounts of the Government, Ministry of Finance, 1994-95 to 2002-2003; d) Periodic (monthly) Statements to Actual Expenditure, 1994-95 to 2002-2003; e) Annual Foreign Trade Statistics, 1995 to 2002; f) Balance of Payments Estimates, Central Bank of Kuwait, 2000 to 2004; g) Annual Reports of the Central Bank of Kuwait, 1995 to 2002; h) Survey Results Income, expenditure and consumption, 1999-2000; i) Annual Statistical Abstract, CSO, 1995 to 2002; j) Consumer Price Index Numbers, Revised Series, (1995=100) 1995-2002; k) Wholesale Price Index Numbers, Revised Series, (1995=100) 1995-2002; l) Annual Reports of Ministries/Departments of the Government, 1995 to 2002; m) Annual Reports of various share-holding companies, 1995 to 2002. Estimates of GDP at constant prices are available by kind of activity and by type of expenditure.

The year 1995 has been taken as base for constant price estimates. The constant price estimates have been derived from current price series by deflation or by extrapolation on the basis of physical indicators

Expenditure Approach

Government final consumption expenditure ‘Government’ excludes the industrial activities such as generation and distribution of electricity, production and supply of water, communications, ports and crude petroleum production, marketing etc., which are undertaken directly by the various departments/ministries of the government, government enterprises and public corporations. Government final consumption expenditure is obtained as the sum of compensation of employees, intermediate consumption of goods and services and consumption of fixed capital less sales of ‘other goods and services’.

Private final consumption expenditure estimates presented here are obtained as residuals from total GDP after allowing for all other components.

Exports of goods and services include in addition to exports as recorded in foreign trade statistics, various services rendered by resident producers to agencies outside in the form of freight, insurance, travel, transportation etc. It also includes purchases in the country by extra-territorial organisations such as embassies and non-resident persons. Imports of goods and services include in addition to the value of goods imported or recorded in the foreign trade statistics, travel, transportation and direct purchases abroad by government and residents of the country. The relevant estimates for the services components for exports and imports are taken from balance of payments statistics compiled by the Central Bank of Kuwait with a downward adjustment for the item – government services (debit). This item which refers to the payment of consultancy services, expenditure of Kuwaiti embassies abroad etc. was to be overestimated in the Balance of Payments statistics. The figures of imports of goods and services presented in this publication are therefore lower than those in the previous issues of this publication.

Regarding GDP by type of expenditure at current prices, estimates concerning government final consumption expenditure, exports and imports of goods and services are obtained from firm data and hence are more reliable than other components. For gross fixed capital formation, the portion concerning government services and government enterprises can be considered accurate as they are based on closed accounts but for private gross fixed capital formation assumptions had to be made. Estimates for changes in stocks are based on the results of the years 1995 to 2002. Gross capital formation has been obtained as a residual and is bound to be affected by the lack of reliability in the estimates of other components.

Production Approach

GDP at producers' values is obtained as the difference between gross output valued at producers prices (that is, at prices prevailing at the units) and value of goods and services consumed in the process of production at purchasers' prices (that is, at prices paid by the purchaser).

Estimates of GDP at current prices reflect changes in quantities as well as prices of outputs and inputs. In studies on economic growth, interest mainly centers around the changes that take place in the volume of goods and services produced, that is, in real product measures. In constant price estimates, price effects are isolated so that the figures represent only changes in the physical volume of goods and services produced. The year 1995 has been taken as base for constant price estimates. The constant price estimates have been derived from current price series by deflation or by extrapolation on the basis of physical indicators

Estimates of GDP originating from activities such as electricity and gas, water, communications, public administration and defence, governmental education, health, social, community, recreational and cultural services are based on data from the closed account of government besides of changing the methodology of estimating of GDP of electricity and water depending on the actual cost of production not on the revenue as in the previous method. With respect to data of real estate depends on services publication also the results of the survey of income, expenditure and consumption of households that carried out 1999-2000.

The base year for the compilation of constant prices estimates has been shifted from 1984 to 1995, 2000. Timeseries data on GDP at constant (1995, 2000) prices show the changes in value added due to change in volume of production. Public sector include producers of government services and producing units completely owned by the government such as electricity generation and distribution, water production and distribution (except water tankers), communication (post, telephone and telegraph), port public authority, Shuaiba Board, Civil Aviation Department, Kuwait Petroleum Corporation, and its subsidiaries, Kuwait Airways etc.

Indirect taxes are defined as taxes chargeable to the cost of production sale of goods and services. The include (a) import and export duties, (b) excise, sales, entertainment and turnover taxes, (c) real estate and land taxes, (d) motor vehicle, driving test, license, airport and passport fees when paid by the producers and (e) the operating surplus of government fiscal monopolies on such items as tobacco. Import duties are levied on the output of

foreign producers, hence they are not shown by kind of activity but as a separate item in the tables. Other indirect taxes are distributed by kind of activity.

Imputed bank and insurance service charges have been derived on the basis of actual data made available by the survey that carried out and special questionnaires that sent to these banks and insurance companies.

Source

The official statistics of national accounts for Kyrgyzstan are compiled and disseminated by the National Statistical Committee of the Kyrgyz Republic.

The statistical publications on national accounts are:
- National accounts for the Kyrgyz Republic, 1990-1994;
- National accounts tables for the Kyrgyz Republic, with assistance from the Statistics Directorate, OECD, 1990-1995;
- National accounts for the Kyrgyz Republic: 1993-1997; 1998-2002; 2003-2007; 2004-2008; 2005-2009; 2006-2010.
- Input-output balance of production and use of good and services of the Kyrgyz Republic (“INPUT-OUTPUT TABLE”), 2000, 2001, 2002, 2003, 2005, 2006, 2008, 2009, 2010.

Basic information on national accounts is also posted on the web site of the National Statistical Committee www.stat.kg

General

The system of national accounts used in the Kyrgyz Republic is based on the methodological principles of the international standard System of National Accounts (SNA), adopted in 1993 by the Commission of the European Communities, the United Nations, the International Monetary Fund, the World Bank and the Organisation for Economic Co-operation and Development (1993 SNA).

According to this standard, the basic method for recording economic transactions is the “accrual method”, which is also used for the SNA of Kyrgyzstan. The national accounts have been prepared using this standard since 1990. The national accounts are compiled using data from government statistical observations, administrative bodies, banking and financial statistics and balance-of-payments statistics.

The methodology for the compilation of national accounts is described (in Russian) on the official website of the National Statistical Committee of the Kyrgyz Republic and includes:
- Methodology for calculating gross domestic product (GDP) using the production method;
- Methodology for calculating gross domestic product (GDP) on an income basis;
- Methodology for calculating gross domestic product (GDP) using the end use method;
- Methodology for compiling the primary income distribution account;
- Methodology for compiling the secondary income distribution account;
- Methodology for compiling summary indicators for the system of national accounts;
- Method for determining inventory profit and changes in inventories;
- Method for determining individual indicators of national wealth;
- Methodology for measuring the non-observed economy;
- Methodology and method for calculating the gross regional product (GRP) in current and comparable prices;
- Method for compiling input-output tables;
- Method for compiling quarterly national accounts.

Below are the main changes in the methodology for compiling the national accounts of the Kyrgyz Republic:
- In 2000, transition to the Kyrgyz Republic's State Classification of Types of Economic Activity, which is based on the Eurostat NACE;
- In 1993, currency unit change from the rouble to the som;
- The base year for calculations in constant prices is 2000;
- The financial year is the calendar year.
- Data on national accounts aggregates (for GDP) are provided in constant prices in the form of:
- Linked index numbers of physical volume, deflator indices and value indices in previous year prices (starting in

1991);
- Indices of physical volume, deflator indices and value indices in constant 2000 prices.

Methodology:

Overview of GDP Compilation

In the Kyrgyz Republic, three methods are used to calculate GDP:
1) The production method;
2) The income (distributive) method;
3) The final use method (expenditure).

The production method of calculating GDP is used at the stage of production of goods and services.

GDP at market prices is defined by the production method as the sum of the gross value added by resident producers, plus net taxes (less subsidies) on products.

GDP is defined by the income method as the sum of compensation of employees, gross profits and gross mixed income, as well as taxes on production and imports, less subsidies. This is a subsidiary method of calculation, because gross profits and mixed income are defined as the sum of primary income distributed by resident economic units among producers of goods and services.

GDP is defined by the expenditure method as the sum of final consumption at purchasers' prices, gross capital formation and net exports and imports of goods and services.

Expenditure Approach

Gross domestic product, calculated by the final use method, includes the institutional sectors of the national economy on the final consumption of goods and services, gross capital formation and net (less imports) exports of goods and services.
Final consumption expenditure is the cost of units of the economy to purchase goods and services that are used directly to meet the current individual and collective needs.

Final consumption expenditure of households include the cost of goods and services at their own expense, goods and services received as income in kind, production for own consumption. Their calculation is based on data on the volume of retail trade and market services informed in population surveys of living standards of households. The main sources of data include statistics on trade and services, balance sheet data of agricultural products, data from sample surveys on the structure of household expenditures, according to the international classification COICOP.

Final consumption expenditure by general government sector is funded from the state budget, pension fund and social insurance funds. The estimates are based on data from the report on State budget performance and the report of the pension fund and the social insurance funds in accordance with the Classification of General Government Expenditure by Purpose (COFOG).

Individual consumption expenditure by the government sector includes current expenditure by central and local general government connected with the granting of benefits to the public for the purchase of commodities (medicines and medical supplies, transportation, sanatorium and convalescent home services, etc.) and by budget institutions engaged in non-market production of goods and services of a personal nature.

Collective consumption expenditure by the government sector includes current expenditure by general government on the production of non-market goods and services supplied to society as a whole.

Final consumption expenditure by non-profit institutions serving households (NPISHs) include the costs of public

organizations related to the production of individual non-market goods and services, as well as providing market products to households free or at discounted prices. The main sources of financing of current expenditure are member contributions, donations and other transfers.

Calculations are based on statistical information in accordance with the International Classification of Expenditure by Non-Profit Institutions Serving Households, by purpose.

Gross fixed capital formation includes investments in fixed capital and spending on major repairs to fixed assets, equipment and durable items by public sector agencies using budget resources, expenditures on geological prospecting, increase in the value of the main livestock herds and so on. The increase in the value of the main livestock herds is determined from the balance of fixed assets, taking the remaining value (adjusted for depreciation) as the difference between acquisitions and disposals.

Changes in inventories are defined as the difference between the value of inventories at the end and the beginning of the year and are estimated in average annual prices of the current year, excluding holding gains. Inventories include stocks of raw materials, finished goods, goods for resale and work in progress. The main sources of information are financial indicators from business statistics.

The value of exports and imports of goods and services is determined on the basis of statistics of foreign trade and balance of payments of the Kyrgyz Republic.

Income Approach

Compensation of employees include all types of remuneration for labour, including various premiums, enhanced payments and special allowances in cash or in kind. They include contributions to social insurance funds, income tax and other statutory deductions. When wages are paid in kind, goods and services provided to employees are valued at market prices. Wages are calculated using statistical and administrative data and take into account non-observed economic activity.

Actual social contributions include payments made by employers to a pension fund or a medical and social insurance fund and are measured by additions to the payroll for all types of social insurance. They are calculated by using cross-sectional surveys of enterprises, information on State budget performance and the accounts of the relevant social insurance funds.

Imputed employer contributions to social insurance are paid by employers directly to employees, former employees or their entitled dependants out of their own resources without involving a third party.

Other taxes on production include payments by enterprises and organizations to budgetary and extrabudgetary funds connected with the use of factors of production, as well as payments for licences and permits to engage in any production activity and other compulsory payments required for the activity of resident production units.

Other subsidies on production are given to enterprises by general government because of their production activity. Other taxes and subsidies on production are calculated on the basis of cross-sectoral surveys of enterprises and information on the performance of the State budget of the Kyrgyz Republic.

Gross profits and mixed income are a balancing item.

Production Approach

GDP is defined by the production method as the sum of the value added of all institutional sectors of the economy and all types of economic activity in basic prices, including taxes on products but excluding subsidies on products.

Output is the total cost of goods and services produced by the resident unit in the economy in the reporting period. It includes non-observed economic activity.

Market output is estimated on the basis of direct data on production output (work, services) or incomings from sales. Non-market output of products for own final use is estimated on the basis of market prices for comparable goods and services or of current expenditure on their production.

Output is calculated by means of cross-sectional surveys of enterprises, industry statistics, reports on State budget performance and administrative information.

Intermediate consumption consists of the value of goods and services which are transformed or used up by the production process during the reporting period. It does not include consumption of fixed capital. It does include as a separate item consumption of financial intermediation services indirectly measured (FISIM).

Gross value added is calculated on an industry basis as the difference between the output of goods and services and intermediate consumption. It is calculated in basic prices. Gross value added is adjusted for the value of the services of financial intermediaries not allocated among users of such services.

Tax on products is levied in proportion to the amount and cost of goods and services produced, sold or imported by residents.

Subsidies on products are current unrequited payments from the State budget to enterprises which produce certain types of goods and services.

Taxes and subsidies on products are calculated on the basis of reports on State budget performance by income.

Calculations of output, intermediate consumption and gross value added are produced by type of economic activity in accordance with the State Classification of Types of Economic Activity (NACE Rev. 1).

Calculations are also made by institutional sector of the economy.

Overview of the Compilation of the Integrated Economic Accounts

The system of national accounts of the Kyrgyz Republic currently includes the following accounts: goods and services; production; income generation; distribution of primary income; distribution of secondary income; redistribution of income in kind; use of disposable income; use of adjusted disposable income; capital.

The accounts are compiled by institutional sector of the economy, in accordance with the Classification of Institutional Sectors of the Economy of the Kyrgyz Republic, which reflects the specificities of the legislation and economy of the Kyrgyz Republic in the sector:
- Non-financial corporations;
- Financial institutions;
- General government;
- Households;
- NPISHs.

In order to reflect transactions with non-resident units, "Rest of the world" accounts are compiled, which include all institutional non-resident units involved in economic dealings with resident units. The "Rest of the world" accounts are based on balance-of- payments data compiled by the National Bank of the Kyrgyz Republic.

[a] Excludes financial intermediation services indirectly measured (FISIM) but FISIM is not distributed to uses (i.e. is included in the tables by industry).

Lao People's Democratic Republic

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Center (or Department of Statistics, DOS) of Lao PDR. The National Statistical Center is a department under the Ministry of Planning and Investment, which is responsible for the collection and dissemination of statistics and operates as the coordinating agency for statistical activities in Lao PDR.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

The results imply the consistency, coherence and balance of economy through the production accounts, goods and services accounts and generation of income accounts. Moreover, GDP are aggregated by ISIC 3.1 for economic activity and by COICOP for expenditure approach.

Methodology:

Overview of GDP Compilation

The GDP by expenditure approach is available officially from 2002 to 2005 in both constant and current prices; data for 2009 is only available in current prices.

The GDP by production approach is available from 2002 to 2011; the data for the years 2006 to 2009 will be revised subsequently.

The base year is 2002.

Production Approach

For most industries, the estimates are prepared by major groups of products. However, no standard classification on activities, such as International Standards Industrial Classification of All Economic Activities (ISIC) is used at present.

Agriculture, fisheries, and forestry:
Crops: Data quantity of production, by districts, of crops, fruits, and vegetables are available from Ministry of Agriculture and Forestry (MAF). These data are compiled at the district level by district offices of the MAF on the basis of reports from Village Heads and observations by District Offices about crops in their area.
Livestock: The available data refer to stocks of animals, which are compiled by District Offices of the MAF based on reports from Village Veterinary Workers.
Forestry: Quantities of timbers and logs are obtained from MAF.

Mining and quarrying; manufacturing and electricity: Ministry of Industry and Handicrafts collects data quantity of production though its District Office from large, medium and small enterprises registered with data District Offices. All large enterprises and most medium – size enterprises usually report. However the response from small enterprise (employing less than 10 person) is very poor, particularly in areas where small enterprises are concentrated data collected quarterly on a cumulative basis. As the data are collected during the last month of each quarter, the reported data include planned rather than actual production for the last month of the reporting period. Also the data are the collected on a fiscal year basis.

Construction: No data exist on construction activity. Government capital expenditures are used as a proxy for measuring value added in construction.

Transport, communication, and postal services: The Ministry of Communication, Transport, Post and Construction (MCTPC) collects data on physical volumes related to freight and passenger transports, provincial offices of the MCTPC obtain data mostly from transport association.

Wholesale and retail trade: Agriculture production, manufacturing production, and imports are used as proxies for measuring the contribution of wholesale and retail trade.

Banking: The Bank of Lao P.D.R. collects and provides to the NSC data on incomes and expenditure of all banks.

Ownership of dwelling: A benchmark estimate prepared for 1990 is extrapolated on the basis if growth rates in construction.

Public administration: Data on wages and salaries from the government account from the basis for calculating value added.

Non-profit institutions: No data are available. Inflow of foreign transfers under technical assistance is used as a basis for estimating value added.

Hotel and Restaurant: Data from the balance of payment on receipts from travel service are used as one indicator for estimating value added.

Other service: The benchmark estimate for 1990 is extrapolated using developments in estimate value added for hotel and restaurant and non-profit institutions.

Data on prices: Only the consumer price index, which is used extensively in the national accounts compilation is available.

Latvia

Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Bureau of Latvia, Riga.

Official statistics for the national accounts are compiled and disseminated by the Central Statistical Bureau of Latvia.

Statistical publications on national accounts issues are listed below: Macroeconomic Indicators of Latvia, National Accounts of Latvia, and Statistical Yearbook of Latvia.

On the 40th day after the end of the period (quarter) Flash Estimate of Gross Domestic Product is published. On the 70th day after the end of the period (quarter) press release on GDP change rate and value is published.

Basic information on national accounts is also available on the official website of the Central Statistical Bureau of Latvia: www.csb.gov.lv.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), as well as the European System of National and Regional Accounts (1995 ESA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Lebanon

Source
Reply to the United Nations national accounts questionnaire from the Administration Centrale de la Statistique, Conseil des ministres du plan, Beyrouth. The official estimates were published annually by the Administration Centrale de la Statistique in "Les Comptes Economiques". Estimates were published in the Lebanon's Economic Accounts 1997-2002 by the Ministry of Economy and Trade. Latest data are published in the Economic Accounts of Lebanon 2009, by the Economic Accounts Mission, Presidency of the Council of Ministers.

General
The latest estimates have been compiled by the Economic Accounts Mission, Presidency of the Council of Ministers following the United Nations System of National Accounts 1993 (1993 SNA). In early 2002, the Lebanese Government assigned a special team in the Ministry of Economy and Trade the task of compiling the national accounts for year 1997 till 2002, requesting technical assistance from the French National Institute of Statistics and Economic Studies. This team completed its mission in July 2005. In December 2005, the prime minister extended the mission of the team to compile national accounts for the year 2003 till 2005 in the presidency of the council of ministers.

Year 1997 was chosen to be the base year because the data for the year 1997 are sufficiently complete to allow the compilation of the main accounts describing all aspects of the economic life of the country. Moreover, 1997 may be considered a “normal” year – in that economic activity returned to a normal volume after the period of major project launches to rebuild the infrastructure destroyed by the war, and had not yet felt the effects of the world recession that appeared in subsequent years – and thus can serve as a base year for the construction of economic accounts. Accordingly, four publications were issued: one for year 1997 issued in year 2003 and one for years 1997 till 2002 in year 2005 and one for year 2003 issued in year 2006 and the publication of year 2004 issued in 2007.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production and expenditure approach mainly composed of the goods and services account. Income approach was adopted with the production and expenditure approach in estimating year 1997 because data were available but afterwards income approach of GDP was mentioned briefly in all the publications that followed.

The economic accounts of Lebanon are in compliance with concepts and definitions of the international system of national accounts as revised in 1993. However at the present development stage of national statistics, it is not possible to establish all the accounts considered in the system. In particular, accounts of institutional units can be elaborated in a satisfactory way only for the central government and the financial institutions. Consequently, the economic accounts 1998-2002 are composed of the goods and services account and institutional units accounts limited to the central government and banks. Integrated accounts for the whole of the economy and the rest of the world were established in a simplified way.

Central government accounts are established according to the standard system of national accounts on the basis of the State closing accounts and Treasury transactions accounts. Additional tables explain the changeover from the budgetary accounts nomenclature to the standardized nomenclature of national accounts. Accounts of financial institutions (banks) are established on the basis of balance sheets and “profit and loss” accounts communicated by the Banque du Liban.

Expenditure Approach

On the basis of 1997 figures, the value of goods used as intermediate products is estimated during the following years thanks to indicators provided by intermediate goods imports and to indicators of such goods production. This estimate is modified thereafter when carrying out successive accounts balancing. The final consumption is estimated in the same manner as the intermediate consumption: use of indices provided by imports analysis and output indices of products for private use. Moreover, a first exogenous estimate of food consumption is made, based on an assumption of population growth by 1.3% per year and of price elasticity between -1.5 and 0 according to the product. Just as for the intermediate consumption, these first estimates are corrected when carrying out the accounts balancing.

Estimation of gross fixed capital formation for the years 1998-2002 is entirely based on the evolution of equipment goods imports intended for different production sectors and on construction and public works estimates. The breakdown of equipment goods between household use (recorded in final consumption) and professional use (recorded in gross fixed capital formation) contributes to a less arbitrary estimation.

Customs statistics give in principle the value of goods exports. However, customs declarations proved to be clearly underestimated. Significant corrections were made to 1997 statistical data. The same correction coefficients were applied to 1998-2002 series with some supplementary modifications introduced during the accounts balancing. Exports of services are estimated roughly on the basis of some indicators: accounts of the telecommunications Direction, flows of transit and re-exports.

Changes in inventories are not directly covered by statistics. This item was introduced to regularize some variations, which looked abnormal. In particular, the very strong peak of imports in 2001 after a period of fall and before a fall again in 2002 can only be explained by a change in inventories. The magnitude of this move results from the arbitration carried out during the accounts balancing. Except for rare exceptions, the agriculture Ministry agriculture provides output estimates according to the 1997 agricultural census and yearly agriculture surveys. The electricity output is estimated in volume by statistics on overall consumption in kWh and in value by applying a unit value index. Water output is estimated by analyzing evolutions of main water offices accounts. The output of other industrial goods is estimated mainly thanks to indices of raw material imports. For agro alimentary industry products, the local output of agricultural products intended for manufacturing was also taken account. The construction value was estimated using a composite index made up with data on local cement sales and raw material imports for construction.

The services output is estimated on the basis of the 1997 accounts by using various indicators: movements in ports and airport and oil consumption for transports; accounts of Post and telecommunications authorities for the communication sector; number of marriages for housing services; arrivals of tourists and population growth rate for the hotels and restaurants activity (and also the special sales tax on restaurants); school statistics for education; drugs imports and expenses of social security health department and of the health ministry the health services; data from banks and insurances for the financial services; State closing accounts for the non-market services.

Imports data are provided by customs statistics. Very few modifications were brought to these statistics since the Customs has a close control of importers declarations. The few modifications are as follows: Gold ingots and banknotes imports are excluded from goods and services accounts. Only a small proportion of gold used in jewellery-making was reintroduced thereafter. The ministry for energy and oil provided oil products imports data. Minor material errors were corrected when computing unit values. Taxes on imports include customs duties, excise duties and VAT since 2002. They are drawn from customs statistics.

Lesotho

Source

The preparation of national accounts statistics in Lesotho is undertaken by the Bureau of Statistics, Maseru. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The official estimates together with methodological notes on sources and methods are published in a series of reports entitled "National Accounts". Beginning 1980, the estimates have been revised utilizing new sources of information. The most important of which is the 1986/87 Household Budget Survey. The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

The Bureau of Statistics have revised and rebased the national accounts of Lesotho. The base year for estimates at constant prices has been updated to 2004; previously it was 1995. The methodology has been reviewed, and new sources have been used. This publication presents main tables for the years 1998-2007: gross domestic product (GDP) by activity; GDP by expenditure; and the derivation of main national accounting aggregates. Revised estimates of GDP by activity are available back to 1982 and are available at the website of the Bureau of Statistics in an Excel file for download. Besides, an experimental GDP by expenditure series prior to 1998 can be made available for specific purposes on request.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure, consisting of wages and salaries and purchases of goods and services, is obtained from government accounts. The government expenditure is classified by the type of service provided by the central authorities. Private consumption and gross fixed capital formation are now estimated within the framework of a supply and use table. It has not been possible to balance supply and use completely, hence the discrepancy in the tables on GDP by expenditure. The 2003 household budget survey has been important in this process. Increase in stocks is estimated mainly from questionnaires and surveys carried out for the agricultural sector. Gross fixed capital formation consists of the value of purchases and own-account construction of fixed assets by government, private and public enterprises, individuals and non-profit institutions. Various sources such as questionnaires and imports of building materials are used to collect the information. The gross capital formation in plant machinery and vehicles of the new series is assumed to be 1.2 times the imports of capital goods. Total exports and imports of goods and services have been aligned with the balance of payments, which has been reviewed recently. Estimates of exports and imports of merchandise are obtained from foreign trade statistics with adjustments made for differences in coverage and valuation. Exports are recorded f.o.b. at the border of Lesotho and imports are also recorded f.o.b. at the point of dispatch. The estimates of import and export at constant prices have been improved by using detailed South Africa production price indices as well some other data. For the

estimates of GDP at constant prices, household consumption is obtained as a residual. The estimates of gross capital formation and the imports and exports of goods and services are calculated by using the relevant import price indexes.

Income Approach

Wages and salaries are derived from the government accounts and other returns. Estimates of operating surplus are derived as residuals from the production accounts of all sectors. Depreciation is obtained from returned questionnaires and no estimate is available for the government or subsistence sectors. Indirect taxes consist mainly of revenue received by Lesotho as a member of the customs agreement with Botswana, South Africa and Swaziland. Subsidy figures consist of government contributions to defray part of the operating expenses of government and other enterprises.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of the different industries except for producers of government services in which case the income approach is used. The agricultural division of the Bureau of Statistics carries out regular annual surveys. The 1970 census of agriculture and the 1973 agricultural survey are used to derive estimates of cereal production, assuming a wastage of six per cent during the various stages of harvest. The 1967-69 rural household survey is used for fruit and vegetable production estimates. For livestock, balance sheets prepared by the agricultural division of the Bureau of Statistics provide changes in stock estimates, to which the average values for different types of livestock are applied. For the new series, the annual crop survey and annual livestock survey supply information on quantities produced. The price information for the crop is available from the Ministry of Agriculture while the price movement for livestock is deducted from retail price index. For meat production, average carcass weights are applied to the number of livestock slaughtered which are obtained from the Ministry of Health and annual production surveys.

Detailed income statements have been used for an improved estimated of mining for the years from 2004. The value of diamonds sold to licensed dealers by diggers is regarded as the value of diamonds exported from Lesotho. The receipts from diamonds are regarded as a contribution by the mining sector to GDP. Data on quantities and values of diamonds are obtained monthly from the Department of Mines and Geology. For manufacturing, data are derived from questionnaires prepared specially for manufacturing enterprises while data for handicrafts are based on the 1967-1969 rural household consumption and expenditure survey. For years 1980-1985, the estimates of manufacturing have been reconciled with the Yearbook of Industrial Statistics 1987. The estimates of the years after 1985 are based on industrial survey and survey of industrial production.

Data for electricity and water are obtained from the balance sheets of the electricity corporation and accounts of the concerned ministry. Special questionnaires filled in by building contractors are used for the construction sector. Estimates of own-account contribution are included. For the new series, value added of construction is a fixed proportion of the input of building material which is based on import statistics. For the trade sector, questionnaires are used for large enterprises while the results of a survey conducted in 1970-1971 are used for small enterprises. Estimates of the public transport and communication sector are based on government accounts supplemented by inquiries while estimates of private transport are obtained from the concerned enterprises.

For the financial sector, the output of the Central Bank is now calculated as the sum of costs including an estimated profit margin. The insurance industry is calculated on the basis of detailed financial statements, which were not previously available. Financial services indirectly measured (FISIM) has now been allocated to households and government. For ownership of dwellings, government accounts provide information for the public sector while questionnaires returned by businesses and institutions are used for the private sector. The 1972-73 urban household survey is used to estimate imputed rent. Information relating to general government services is obtained from the government accounts. Data on other services are obtained through questionnaires and special inquiries. The estimates of GDP by kind of economic activity at constant prices are calculated by using relevant price indexes for most of the industries.

The 2003 household budget survey has provided benchmark estimates for a number of small scale activities.

Previously, imputed import duties were recorded as taxes on products. This is not in line with international recommendations. The revised estimates include only the import duties actually collected by Lesotho on imports from outside the Southern African Customs Union (SACU).

Liberia

Source

The preparation of national accounts statistics in Liberia is undertaken by the Liberia Institute of Statistics and Geo-Information Services (LISGIS). The accounts are published annually in “Survey of Liberia". A description of the sources and methods used for the national accounts estimation is found in "Sources and Methods of Estimation of National Product, 1970-1973", along with the 1981-1986 series.

An up-date of the “New Series and Methodology for Estimating Gross Domestic Product, 1973" was published in 1975, 1978 and 1987 respectively.

General

The estimates are generally in accordance with the classifications and definitions recommended in the 1968 United Nations System of National Accounts (SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The accounts are based on a calendar year (Jan.—Dec.). Given the level of support from the Government and other development partners, there is a plan to revise the estimates, after the conduct of an Establishment Census, where a survey frame for the conduct of National accounts survey will be based. The 1987 publication on sources & methods is the latest publication; data are obtained upon request from the Liberia Institute of Statistics. In order to revise the series of accounts, LISGIS will conduct an Establishment Census. The results of the exercise will provide an opportunity to draw up a sample frame for National Accounts annual survey, which is expected to be conducted in 2008.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure and gross fixed capital formation. The main sources used for estimating government final consumption expenditure are the monthly revenue and expenditure reports contained in "Government Accounts of Liberia". For private expenditure on imported goods, the c.i.f. value and import duties are obtained directly from the import statistics of consumer goods while the trade and transport margin is put at 35 per cent of the c.i.f. value. For local production, estimates are obtained from the production statistics of goods and services. Changes in stocks are estimated for iron-ore only. The sources used are the annual reports of the iron-ore companies and an analysis based on the difference between production and exports. The estimate is obtained by finding the difference between the quantities produced and the quantities exported and applying the average export prices.

Gross fixed capital formation is estimated as value of local production plus imports minus exports plus transport costs, trade mark-ups, duties paid, etc. For machinery and equipment, the estimates are based on foreign trade statistics. For construction, the estimates are prepared by analysing import and local production of construction materials, the data of which are obtained from import statistics and the survey of establishments. The estimates of imports and exports of goods and services are based on the foreign trade statistics. Figures on exports and

imports are supplemented by estimates for non-factor services. Constant price series of government expenditure is estimated by using employment data to extrapolate the base-year figures. The base-year value for stocks of iron-ore is extrapolated by using a volume indicator. For the remaining components of GDP by expenditure type, the current values are deflated by price indexes.

Income Approach

The estimates of compensation of employees, operating surplus and consumption of fixed capital are obtained from income tax files, replies to the national accounts questionnaires and from annual reports and financial accounts. The estimates of indirect taxes and subsidies are based on income tax returns for the main activities.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The income approach is used to estimate the value added of most industries. When data are available, the production and expenditure approaches are also used. For the agricultural sector, value added of rubber production is estimated from the financial accounts of the rubber concessions, the income tax statements of all rubber companies, and from information obtained from local rubber farmers. For other agricultural crops and fishing, value added is obtained from the income tax files. The value added of forestry is based on an input-output study of the industry, using the national accounts surveys. For the mining of iron-ore, value added is obtained directly from the financial accounts of the companies. Information on production components of manufacturing is obtained from income tax files, semi-annual questionnaires and other supplementary series. An extrapolation is made for non-reporting establishments. The value added of electricity, gas and water is obtained directly from the annual reports and accounts of concerned enterprises and their replies to the national accounts questionnaires.

Estimates of the construction sector are derived mainly by using the commodity-flow approach. Domestic production of commodities used in construction is estimated and adjusted for exports, imports and changes in stocks and supplementary data on transport costs, dealers' margins, etc. is added. The value of imported construction materials and production statistics of locally produced construction are obtained. Information on substantial development of land undertaken is supplied by the companies. A combination of the production approach and the income approach is used for the trade sector. The output is equal to the gross margin. The income tax data and the technique of extrapolation are used to arrive at value added. The extrapolation process involves separating the large establishments from the others, extrapolating the value added by the change registered by comparable establishments and finally identifying new establishments and treating them as an additional contributor to value added. The estimates of the transport sector are derived from various sources such as national accounts questionnaires, income tax files and reports of the motor vehicle division.

The gross output of the financial sector is equal to the sum of actual service charges and imputed service charges. The data required for the value added are obtained through a questionnaire. The estimates of real estate and ownership of dwellings are obtained by extrapolating the 1999/2000 LDHS (Liberia Demographic & Health survey) estimate by means of the population growth rate and the rent component of the consumer price index. For producers of government services, the main source is the detailed analysis of the government accounts. The value added of other private services are extrapolated by the change in compensation of employees, interest, depreciation and operating surplus obtained from the income tax files. For the constant price estimates, price deflation is used for manufacturing, construction and trade sectors. For the remaining sectors, value added is extrapolated by using volume indexes.

Libya

Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Office. The preparation of national accounts statistics in Libya is undertaken by the Ministry of Planning, Tripoli.

General

The estimates shown in the following table have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Reply to the United Nations National Accounts Questionnaire from the Office of Statistics, Vaduz.

General

The national accounts data shown in the tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (SNA 1993). Work on the Liechtenstein National Accounts began in 1997 for the year 1998. The Liechtenstein National Accounts combine the production approach and the income approach and show the results for the five sectors of the national economy. For conceptual reasons the sectors Households (S.14) and Non-profit institutions serving households (S.15) are combined. The official figures are published on the internet (www.as.llv.li). The main publications on National Accounts are the annual "Volkswirtschaftliche Gesamtrechnung" and the annual “Schätzrechnung Bruttoinlandsprodukt”. Some results are also published in the Statistical Yearbook and the booklet "Liechtenstein in Figures."

[a] Data for this year refers to provisional data.

Lithuania

Source
National accounts are compiled by the Lithuanian Department of Statistics (or Statistics Lithuania). Annual and quarterly national accounts aggregates are produced and disseminated. The short-term information is available on the web site of Statistics Lithuania www.stat.gov.lt, in press releases and database. The annual one, in addition, is also available in the printed publications: Statistical Year book of Lithuania, National Accounts of Lithuania.

General
National Accounts in Lithuania have been compiled since 1992 on the basis of the 1993 System of National Accounts (1993 SNA), as well as the European System of National and Regional Accounts (ESA 1995), which is broadly consistent as regards definitions, accounting rules and classifications. One of the main indicators in the System of National Accounts, Gross domestic product (GDP), is available annually since 1990 and quarterly - since 1995. Gross national income (GNI), disposable national income, saving and net borrowing are calculated applying the Balance of Payments data, which reflect transactions with the rest of the world. The calculation started from 1993 with the introduction of Balance of Payments in Lithuania. Aiming at presentation of indicators, which characterise regional development, calculation of Regional GDP started in 1998.

The GDP is calculated quarterly and annually by production, expenditure and income approaches. The GDP breakdown by kind of economic activities is classified using NACE rev.2. The annual data are disseminated according to the industry breakdowns A64 introduced by the implementation of NACE rev.2 . The quarterly data are more aggregated. The growth rates of national accounts aggregates are measured using chain-linking method. So, the nominal value, value at previous year prices and chain-linked volume of aggregates are available. The supply-use and input-output tables are also produced at A64 industry breakdown and CPA classifications. The set of non-financial and financial accounts by institutional sectors are compiled and published every year. The time series are available since 1995.

Methodology:

Overview of GDP Compilation
The GDP in Lithuania is compiled with quarterly and annual periodicity. The data sets published at quarterly and annual level differ by the availability of breakdowns or the level of details. The flash estimate of quarterly GDP is published at t+30 days without any breakdowns (only nominal and real values and the growth rate), while the second estimate at t+60 days includes GDP estimates by three approaches, breakdown of value added by 10 groups of kind of activities (A10) by NACE rev. 2, all expenditure and income components at national level as well as the Wages and salaries (D.11) with the breakdown of A10. The annual set of information is disseminated at t+9 months (preliminary data) and at t+21 months (final data). The annual data includes more detailed breakdowns than the quarterly: information by kind of economic activities are provided to users at the level of A38 (preliminary) and A64 (final); households final consumption expenditure are broken down by 47 COICOP groups , Gross fixed capital formation is broken down by kind of economic activities (A38 and A64) as well as by type of assets. All components of GDP calculation by income approach are available at the same level of details by kind of economic activity as for production approach.

Expenditure Approach
All GDP expenditure components are estimated separately and the variety of sources are used for that. The main sources for the measurement of Household Final Consumption Expenditure are the Retail trade surveys and nine surveys on specific services. The latter include surveys of real estate activities, renting, computer services, business services, education, health and social work, sewage and sanitation activities, recreational and cultural activities, and of other service activities.

The Household Budget Survey (HBS) was cancelled in 2009, however the data from the latest survey is used as

the benchmark for estimates of some consumption expenditure categories. In addition to that, information based on Labour Cost survey, agriculture products balances, survey from insurance companies, output data and other statistical sources are used. The results at current and constant prices are published by COICOP divisions and groups (12 divisions and 47 groups at the annual level).

Final consumption expenditure by general government is estimated on the base of administrative data sources. The Ministry of Finance provides data on the central and local budgets for the Final Expenditure of Government estimation. In addition, quarterly and annual reports on the Social Security Fund, the Compulsory Health Insurance Fund and other extra-budgetary funds are provided directly to the Statistics Lithuania by the institutions involved. Annual and quarterly surveys are used for public hospitals and for two other units.

The Investment survey (questionnaire KS-02, covering enterprises and budgetary institutions), the Structural business surveys of non-financial and financial corporations, the survey on Buildings permits and the survey on Real estate are the sources for Gross Fixed Capital Formation estimates. These sources do not cover all institutional sectors, therefore information from the Ministry of Finance, the Ministry of Agriculture and the Social Security and Health Insurance Funds are used in addition. Based on the listed data sources GFCF by kind of activities as well as by type of assets is measured. Changes in inventories are based on the Structural business survey, on the reports of Agricultural partnerships and on the survey of Farmer's farms. Holding gains/losses are calculated using information on changes in stocks derived from mentioned sources combining them with a range of price indices, and suitable assumptions about stock-holding periods.

Data on exports and imports are used from the Balance of Payments compiled by the Bank of Lithuania. The information on exports and imports of goods is based on the Customs declarations. Estimates for exports and imports of services are based on a survey that Statistics Lithuania carried out under the authority of the Central Bank.

Additional surveys are done on tourism and international transport services. Information on foreign visitors and departing residents is obtained from the Border Police. Several other sources are also used. The Balance of Payments department of the Bank of Lithuania makes semifinal adjustments to the exports and imports figures, and finaly they are adjusted for FISIM by national accountants. Both exports and imports are expressed in f.o.b. prices. The value of GDP by expenditure approach is balanced with the result of GDP, estimated by the production approach. During this balancing process a limited number of indicators are adjusted. This concerns some groups of goods and services of the household final consumption and, mainly, changes in inventories.

Income Approach

The income approach is not an independent approach in Lithuania, since operating surplus and mixed income are derived as the residual between GDP via the production approach and the other components of the income approach. The income approach uses to some extent the same enterprise data sources as the production approach. However, after comparison with alternative data sources, these alternatives are used in several cases. Estimates for wages and salaries in the Non- financial corporation sector (S.11) come mainly from the Structural business survey (SBS) and are compared with data obtained in the Wages and salaries survey. Estimates of wages and salaries in kind are based on data of the Household Budget Survey and the Labour Cost Survey. For the calculation of other taxes and subsidies in the S.11 sector, the administrative data sources are used as well as SBS data. The PIM method is used for calculation of consumption of fixed capital. This is in line with the requirements of ESA'95.

Production Approach

The production approach is the main when the GDP is compiled in Lithuania. The main source of information for calculation of output, intermediate consumption and value added by kind of economic activity is the Structural business survey. It provides the background information for estimates for Non-financial corporation sector and partly for the Households. The calculation of output in agriculture is based on information from the economic accounts for agriculture. The estimates for financial corporations are based mainly on information received from the supervising institutions.

The main source of information for General government sector is administrative records, which are provided by the Ministry of Finance. Only several units from surveys are added to ensure the coverage of all institutions that belong to the General government sector. Since all they are non-market producers the output is estimated as the sum of costs. The main data source for estimates of output of NPISHs is a special survey of Non-profit institutions. It covers the main cost elements such as the compensation of employees, social security contributions, consumption of fixed capital, purchases of goods and services and sales.

Some necessary adjustments (adjustment for holding gains / losses, allocation of FISIM and etc.) are made to the source data in order to get output, intermediate consumption and value added in line with the ESA'95 requirements. The output and value added is valued at basic prices. The output produced in the non-observed economy is also estimated and included into the appropriate production by activities. As it is mentioned above the growth rates are calculated using chain-linking technique. All values at previous year prices are linked into the chain with the reference year of 2005. For the estimates of quarterly growth rates the annual overlap method is applied.

Overview of the Compilation of the Integrated Economic Accounts

The whole set of non-financial and financial accounts (including balance sheets) for five domestic institutional sectors, whole economy and the rest of the world are compiled. The balancing item Net lending/ borrowing (B.9) received from both sides is compared, nevertheless the discrepancies are not removed and are published for each institutional sector. The variety of sources is used to measure the transactions between the sectors. Majority of them is listed above when the description of GDP calculation is provided. Transactions in the accounts are valued on an accrual basis, adjusted for FISIM, and consolidated according the requirements of ESA'95.

Luxembourg

Source

Reply to the United Nations national accounts questionnaire from the Service Central de la Statistique et des Etudes Economiques, Ministere de L'Economie Nationale, Luxembourg. The official estimates and descriptions are published by the Service in "Cahiers Economiques", Serie B, Comptes Nationaux. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. The estimates prepared according to the 1968 SNA are provided in the former national currency Luxembourg franc. The newly submitted constant price data which are compiled according to the 1993 SNA are not additive.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Luxembourg the currency name for the data before 1999 is "1999 LUF euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 40.3399 Luxembourg franc. - The name of the currency of the newly submitted data is "1999 LUF euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Luxembourg, like for example all old data following the 1968 SNA is still in "Luxembourg franc", although this is not specifically indicated in the tables.

Madagascar

Source

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique et de la Recherche Economique, Ministere des Finances et du Commerce, Tananarive.

General

The official estimates of Madagascar have been adjusted by the Institut National de la Statistique et de la Recherche Economique to conform to the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Malawi

Source

The preparation of national accounts statistics in Malawi is undertaken by the National Statistical Office. The official estimates are published in a series of reports entitled "National Accounts Report".

General

In 2008, a new series of national accounts is presented starting from year 2002, with data that follows the United Nations System of National Accounts 1993 (1993 SNA). National accounts for Malawi are compiled on an annual calendar year basis using supply and use tables (SUT) in current and previous year's prices. These tables record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries.

Preliminary estimates for the years following the latest SUT are compiled using the production approach. Indicators for output of the various activities are applied to value added from the SUT. In this questionnaire, 2008, 2009, 2010 and 2011 are preliminary based on the 2007 SUT.

Methodology:

Overview of GDP Compilation

The supply and use table utilizes all existing economic statistics and administrative data sources for Malawi in a systematic and standardized way for the national accounts compilation. The important data sources are Crop estimates, Annual Economic Surveys (AES), Government budgets and accounts, Tax data, External Trade statistics, Integrated Household Surveys and Consumer price indices.

Expenditure Approach

The main data source for household final consumption within the SUT framework is the Integrated Household Surveys and the product balancing (the commodity flow method). Government consumption is calculated as output of government less fees.

Gross fixed capital formation estimates are based on AES and government accounts. During the product balancing process, the private investments are adjusted based on supply side information. Changes in stocks are estimated using the commodity-flow method.

Imports and exports of general merchandise goods and services contained in national accounts are consistent with estimates in the Balance Of Payments. The primary source for goods is the foreign trade statistics prepared by the Foreign Trade section of the NSO on the basis of data on import and export declarations for goods as collected by Malawi Revenue Authority (MRA). For services imports, data are compiled monthly by the RBM based on Exchange Control forms (E-form) that are completed for purchases of foreign currency from authorized dealers. Export estimates are based on business interviews with enterprises involved in foreign transactions.

Production Approach

Output and intermediate consumption of industries is obtained from various surveys and administrative data sources. For agriculture, forestry and fishing the main data sources are the Crop estimates survey and the AES for large estates. Other data sources include the Tobacco Control Commission (TCC), Tea Association of Malawi (TAMA), Department of Fisheries and Department of Forestry.

Market producers which cover among others the following industries: mining and quarrying; manufacturing;

electricity, gas and water; building and construction; distribution and trade; passenger and freight transport; banking and financial services; and other services, use AES as their main data source for large scale companies. For the medium and small scale businesses, the Medium Business Economic Survey (MBES) conducted in 1998 and the IHS 2 were used as benchmarks. Output of public administration and defence is obtained from government accounts.

Malaysia

Source
Reply to the United Nations national accounts questionnaire from the Department of Statistics, Putrajaya. The official estimates are published in a series of reports entitled "Annual National Accounts Gross Domestic Product (GDP)".

General
Malaysia national accounts statistics has been rebased to a base year of 2005. Hence, this year's "Annual National Accounts Gross Domestic Product (GDP)" replaces the 2000 base year series which had been in used for the period of 2000 until 2010. Since 1970, estimates are available in both current and constant prices. The initial constant price series published was valued at 1970 prices, for the period of 1971 to 1983.

Subsequently, the valuation of the constant series was updated to 1978 prices; and this series is available from 1978 up to 1997. The series was again updated to 1987 prices; and this series is available from 1987 to 2006. The series was again updated to 2000 prices; and this series is available from 2000 to 2010. The rebasing exercise of the production and expenditure account enable improvements in matters relating to the practice and compliance to the concepts and guidelines of the manual on the compilation of System of National Accounts 1993 (1993 SNA) and System of National Accounts 2008 (2008 SNA) which were released by the United Nations. Beside that, improvements on changes of methodology, data sources, revision on data, updates on classification and published detailed data have also been implemented.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through two national accounting transactions, the production approach and the expenditure approach.

Expenditure Approach
The expenditure approach, in combination with the commodity-flow approach, is used to estimate expenditure aggregates. Government final consumption expenditure is based on public accounts and financial records and statements of the government bodies. Benchmark estimates of private final consumption expenditure are derived from detailed commodity balancing for the final accounts year. Between final accounts years, estimates of private consumption expenditure have been made by allocating the available supply of consumer goods and services from import and local production to the various consumption component items. Gross fixed capital formation includes not only construction, machinery and equipment but also investment in plantation and smallholders' perennial crops. Exports and imports of goods and services are estimated from customs returns and balance of payments returns. In the process of compiling the constant price series, the Producer Price Index and the Consumer Price Index are used as deflators. For the producers of government services, an average price index of material inputs, as well as a weighted index for salary revisions, has been utilized.

Production Approach
The production approach is used to estimate the value added by kind of economic activity. A detailed commodity-flow approach has been adopted for the reference years 1971, 1973, 1978, 1983, 1987, 2000 and 2005 to derive value added by sector. For those years in between, national accounts estimates are compiled based extensively on volume indicators of production. The indicators are used to extrapolate base year value added by sector/sub-sectors. Current monthly/annual statistics for agricultural crops, manufacturing, mining and other service sectors form the basis for computation of the value added. For producers of government services, the value added is derived from preliminary estimates of the expenditure obtained from the Accountant General's Office.

Maldives

Source
Reply to the United Nations national accounts questionnaire from the National Accounts Unit, National Accounts & Economic Statistics Section, Department of National Planning, Ministry of Finance and Treasury of the Republic of Maldives.

General
The latest data shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

The national accounts data for Maldives was first compiled in the year 1997 based on the classification of the United Nations System of National Accounts, and with the technical assistance from the Asian Development Bank to improve the national accounts statistics of Maldives.

The fiscal year is the Western calendar year.

Methodology:

Overview of GDP Compilation
Gross Domestic Product for Maldives is compiled using the production approach. The GDP estimates have been prepared from the base year, 2003. The base-line 2003 figures have been taken from the Supply and Use Tables for that year.

Although the current price estimates were calculated at industry level for the 1995 series for earlier years, this had to be discontinued due to lack of required data. Henceforth the current price GDP in the 1995 series was calculated using constant price estimate of GDP which were inflated using a combined index of CPI, PPI and government wage index. In the 2003 series the current-price estimates of GDP are based on the actual performance of the various sectors instead of the indicators used in the constant-price series.

As mining industry is negligible, it is included in the agriculture industry.

[a] Includes Mining and quarrying.
[b] At producers' prices.

Mali

Source

Reply to the United Nations national accounts questionnaire from the Direction Nationale de la Statistique et de l'Informatique, Ministere du Plan, Bamako, Mali. Official estimates are published by the Direction Nationale annually in "Comptes Economiques du Mali". On 1 June 1984, Mali joined the French Community in Africa of which the legal tender is CFA francs. Two Mali francs is equivalent to one CFA franc.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Malta

Source
The National Accounts of the Maltese Islands are compiled and published by the National Accounts Unit within the Economic Statistics Division of the National Statistics Office (NSO). The NSO is the executive arm of the Malta Statistics Authority, which was set up by Act XXIV of 2000 and came into force in March 2001. National Accounts data are published in detailed quarterly news releases ten weeks after the end of the quarter under review. These news releases and all the data are available online on the NSO's official website: www.nso.gov.mt. In addition to the quarterly news releases, the National Accounts Unit also publishes, from time to time, documents explaining the revisions carried out in the data.

General
Malta adopted the European System of National and Regional Accounts (ESA95), which is fully compatible with the System of National Accounts (SNA93). This process started when Malta re-applied to join the European Union in September 1998. At the same time, the old system was phased out and was discontinued in the first half of 2004.

Data based on the ESA95 methodology is now available annually from 1995 onwards and quarterly from 2000 onwards. Constant price estimates are available from 2000 onwards. The base year is a moving one, with the chained Laspeyres method being used; however the reference year is 2000. A full description of the sources and methods used for the compilation of the Gross National Income is available in a publication entitled Gross National Income Inventory (ESA95), a 355-page document which is available online: www.nso.gov.mt. As from 1st January 2008, Malta joined the Euro Area and adopted the Euro as its official currency, replacing the Maltese Lira (Lm). In May 2005, the exchange rate was fixed with 1 Euro being equivalent to Lm0.4293.

Methodology:

Overview of GDP Compilation
The three approaches to GDP are all shown in the quarterly news releases. The GDP level is benchmarked with the Production Approach, whilst the Expenditure Approach is used for deflating the GDP. The Production measure is the sum of value added for the Maltese economy plus taxes less subsidies on products. For market producers, value added is derived as the difference between gross output and intermediate consumption. On the other hand, value added for non-market producers is calculated as the sum of compensation of employees, other taxes less subsidies on production and consumption of fixed capital.

GDP from the Expenditure approach is the sum of final consumption for households, general government and non-profit institutions serving households (NPISH), gross fixed capital formation, valuables, changes in inventories and exports less imports. This approach is worked independently from the Production Approach and the resulting statistical discrepancy in the GDP level is allocated to 'changes in inventories'.

The Income measure is made up of the different uses to which value added is put. It consists of compensation of employees, other taxes less subsidies on production, gross operating surplus and mixed income. To obtain GDP at market prices, taxes less subsidies on products are also added, as for the production approach. The variables for this approach are derived from the other two approaches.

Expenditure Approach
The Expenditure Approach measures total expenditure on final goods and services produced in the domestic territory, or, alternatively, the sum of final uses of goods and services by resident institutional units plus exports less imports of goods and services. Final consumption expenditure by households consists of three broad categories: locally produced consumer goods, imported consumer goods, and services to consumers. Household

final consumption expenditure in the domestic market consists of expenditure in Malta by residents and non-residents. Expenditure abroad by residents is added while expenditure by tourists in Malta is deducted to arrive at the total final consumption expenditure estimate. The commodity flow method is used extensively for imported and locally manufactured goods while services are covered by extensive enquiries and use of existing data.

Non-profit institutions serving households' (NPISH) final consumption expenditure has been calculated for the first time in 1995 and classified using the COPNI classification. An exhaustive list of the units falling under this sector is available from the Business Register, and data are derived from financial accounts and other data sources such as surveys. Detailed statements of the government's recurrent expenditure are obtained on a quarterly basis from the Treasury Department and classified in line with SNA93. Extra-budgetary units are surveyed quarterly too. Detailed information on local councils' expenditure is available from the quarterly accounts, which are mandatory. Government recurrent expenditure is classified by COFOG.

Gross fixed capital formation consists of two broad categories: machinery (including transport equipment and other fixtures) and construction (including transfer payments on land and buildings). Data on imported goods that constitute capital formation are available from the International Trade Statistics Unit. Locally produced capital goods and installation costs are derived from the monthly survey of the manufacturing industry. Own or subcontracted installation costs incurred by government are derived from quarterly surveys. Inventories are broken down into four: materials and supplies, work-in-progress, finished goods and goods for resale. Data is derived from a quarterly stock survey, which is carried out by NSO. This item includes a statistical discrepancy, which is the difference between the GDP level estimated using the Production Approach and the aggregates from the Expenditure Approach. Therefore changes in this item do not necessarily imply movements in inventories.

Exports and income received from abroad are derived from the credit side of the Balance of Payments, and include exports of merchandise including ship repairing, freight, transshipment activities within the Malta Freeport, port services such as stores, bunker oil, fuel and port dues, registration fees, passenger service charges, route air navigation charges, air and sea fares, non-residents expenditure in Malta, income of residents from investments abroad, non-residents' reinvested earnings and diplomatic expenditure in Malta. Imports and income paid abroad are derived from the debit side of the Balance of Payments and include imported merchandise, freight and insurance, air and sea passenger fares, port services such as stores, bunker oil, fuel and port dues, expenditure by residents abroad, non-residents' income from investments in Malta and diplomatic expenditure.

Income Approach

The Income Approach adds all income earned by resident individuals or corporations in the production of goods and services and is therefore the sum of uses in the generation of income account for the total economy. This approach does not provide an independent estimate of GDP, since operating surplus is derived as a residual. Taxes on production and imports are levied by general government relating to the production and import of goods and services, the employment of labor, the ownership or use of land, buildings or other assets used in production. Subsidies are current unrequited payments that the Maltese government makes to resident producers. These are subsidies given independent of the quantity or value of the goods and services produced or sold.

Gross operating surplus represents the income which the units obtain from their own use of their production facilities, in other words value added less compensation of employees less taxes on production payable plus subsidies receivable. For non-market production, gross operating surplus is equal to the consumption of fixed capital. Mixed income is the term used for the generation of income by unincorporated enterprises (sole traders) owned by members of households and in which the owner also works without receiving a wage or salary.

Production Approach

The basic elements of the Production Approach are output and intermediate consumption, with value added as the balancing item, recorded in the production account of the system. In Malta, the production approach is the main approach to estimate GDP. Both production and intermediate consumption are shown in monetary terms. For production basic prices are used whilst for intermediate consumption market prices are shown.

The production boundary is defined as any activity carried out by an institutional unit that uses inputs of material, labour and capital to produce output of goods and services. Purely natural processes of production are excluded. The production boundary includes production of individual and collective services by government, own-account production of housing services by owner-occupiers, and production of goods for own final consumption. It includes the production of services by paid domestic staff, and in principle production forbidden by law, and production from which the revenues are not declared to the fiscal authorities. Theoretically, products used for intermediate consumption are recorded and valued at the time they enter the process of production. They are valued at purchasers' prices. In practice, however, purchases intended to be used as inputs and the changes in the amounts of such goods held in inventory are recorded. To arrive at intermediate consumption, changes in inventories of inputs are subtracted from purchases. Value Added is a balancing item: output less intermediate consumption.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Mauritius

Source
The preparation of national accounts statistics in Mauritius is undertaken by Statistics Mauritius (SM), Port Louis. The official estimates are published annually in "National Accounts of Mauritius". The estimates are also published in Economic and Social Indicators on a quarterly basis. All publications of the CSO can be downloaded from the office website (http://statsmauritius.gov.mu). Concepts and definitions, sources of data and methods of estimation appear in the “National Accounts of Mauritius” publication.

General
The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the 1993 System of the National Accounts (1993 SNA). In fact, Mauritius started the compilation of national accounts based on the 1993 SNA in April 2001. Previous estimates were according to the 1968 SNA. For comparability purposes, statistics based on both systems are available for the period 1990 to 1998. These series are available on Statistics Mauritius website.

In addition to the change in the system of the National Accounts, the office has also adopted the latest revision of industrial classification, that is, the International Standard Industrial Classification of Economic Activities ISIC, Revision 3 of 1990, for the classification of economic activities. As from April 2001 economic activities are classified according to a National Standard Industrial Classification (NSIC), which is an adapted version of ISIC Revision 3. This change in classification affected the value added of some industry groups but did not affect the overall Gross Domestic Product (GDP).

FISIM was previously recorded as the intermediate consumption of a nominal industry. As from December 2010 it is now allocated to users and a series has been worked out as from 1999.

Methodology:

Overview of GDP Compilation
Gross Domestic Product is estimated using the three methods; production, income and expenditure. Input-Output tables are currently not compiled annually, but every five year based on the results of the Census of Economic Activities (CEA) and Household budget survey (HBS) conducted every five years.

Expenditure Approach
The latest sources of data for private expenditure on goods include the 2000 Census of Population, the 2006/07 Household Budget Survey (HBS), Continuous Multipurpose Household Surveys (CMPHS), annual trade reports and local production statistics. Expenditure on services and private expenditure abroad are estimated on the basis of data from the HBS and balance of payments.

Government consumption expenditure is equal to the output of General Government, calculated at cost less goods and services sold plus expenditure on social benefits in kind. Data are available from the Accountant General Department.

The main data source for investment in buildings (residential and non residential) is the local authorities which provide statistics on isues of building permits for new buildings, additions and reconstructions. Data for residential buildings is mainly obtained from records of building permits issued by local authorities.

In the public sector, investment on residential buildings are obtained from the National Housing Development Company (NHDC), while the financial reports provide estimates on capital expenditure incurred in the construction of non-residential buildings and other construction work. Costs of large construction projects are estimated from data obtained from survey.

For machinery and equipment, external trade is the main source of data. These imported goods are at c.i.f value and are brought to purchasers' prices by the addition of taxes on imports, landing cost, transportation cost, wholesale and retail margins and in some cases, installation cost.

Establishment producing machinery and equipment are surveyed and their output provides data on investment in local machinery and equipment. Estimates of exports and imports of goods and services are based on external trade statistics and balance of payment figures. Exports and imports of services are worked out by the Bank of Mauritius and are adjusted for FISIM by SM.

Current price estimates of the different components of GDP from the expenditure side are deflated by appropriate. indices to obtain growth rates. It should be noted that increase in inventories include any discrepancy between the production and expenditure approach.

Income Approach

In order to compute value added through the income approach, information on compensation of employees for large establishments is obtained through annual surveys and for small establishments, the CEA and Agricultural Cost of Production (ACOPS) results are used. Other sources are National Pension Scheme and Population Census data.

Wages and salaries for the public are obtained from accounts prepared by the Accountant General's Department. Operating surplus is estimated from annual survey data for large establishments while estimates for small establishments are based on the results of the CEA. All aggregates are given on a gross basis. Data on taxes on production and imports are obtained from the Treasury Accounting System.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added of most industries. The expenditure approach is used for some private services and for government services.

For the agricultural sector, estimates are made on an item-by-item basis using annual statistical returns, annual surveys and reports supplemented by direct inquiries among producers and distributors.

Sources used for sugarcane production are annual production, price of sugar, annual production accounts and survey of sugar factories. Sugar milling estimates are based on annual production, price of sugar, annual production accounts and survey of sugar factories.

The estimates for mining and quarrying refer to salt production, sand and stone quarries and are based on information collected from quarterly surveys.

The main sources for manufacturing are Trade Statistics, turnover from the Value Added
Tax (VAT) from the Mauritius Revenue Authority (MRA) and level of stock from quarterly surveys. Value added for manufacturing is then estimated based on gross output compiled from these sources and last annual technical ratio.

The estimates of electricity and water are compiled form accounts from Central Electricity Board (CEB) and Central Water Authority. For Independent Power Producers value added is derived from the value of electricity purchased by CEB.

Private construction estimate is based on building permits (from Municipalities and district councils) and maintenance expenditure by households from latest HBS. For public construction value added, capital expenditure and maintenance expenditure, data from Accountant General Department are used.

For wholesale & retail trade, information is obtained from trade statistics, local production from agriculture statistics and industrial statistics. The main sources of data for hotels and restaurants are: Bank of Mauritius for tourism receipts, CEA for benchmarking purposes, HBS for information on Mauritian expenditure and Passport and Immigration Office for tourist arrivals.

For transport, storage and communications, data are obtained from an annual survey of establishments of this sector.

For the financial sector, the sources of information are mainly the questionnaires sent to banks (including Central Bank), insurance companies and other financial institutions. Figures available from their annual reports are also used.

The estimates for ownership of dwellings are based on the 2000 Housing Census and records of building permits issued.

For public administration and defence, education and health services detailed information is available from the expenditure of Central Government from the Accountant General Department authorities.

For private education services, estimates are based on annual data on enrolment from the Ministry of Education and Private schools and Training Board.

Annual value added for private health services are computed using available production accounts of clinics and supplemented with indicators on private practitioners.

Growth rates are derived by deflating current values by appropriate price indexes. For the constant price estimates, double deflation is used where data are available. As this method requires extensive data on both inputs and outputs which in practice are very difficult to obtain, other methods using “proxy indicators” are used to indicate volume changes. The proxy indicators most often used are: (i) Physical quantities of goods produced, (ii) Physical quantities of materials used, (iii) Employment.

As most industries produce a large number of heterogeneous products, it is not possible to obtain separate physical output or input series. The value series are most often deflated by an appropriate price index to obtain the growth rates. The indices normally are: (i) Producer Price Index (PPI), (ii) Consumer Price Index (CPI), (iii) Construction Price Index, (iv) Wage/Salary Index and (v) Import/Export Price Index.

Mexico

Source
The preparation of National Accounts Statistics in Mexico is undertaken by the General Director of National Accounts Economic Statistics of the National Institute of Statistics, Geography and Information (Instituto Nacional de Estadística, Geografía e Informática), México. Official estimates are published by National Institute annually in "System of National Accounts of Mexico". Reply to the United Nations national accounts questionnaire was received through the Organization for Economic Co-operation and Development (OECD), Paris, France.

General
The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach.

Expenditure Approach
The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The estimates of gross fixed capital formation are largely based on the commodity-flow approach, such as private final consumption expenditure. The estimates of government consumption expenditure are based on government accounts.

For the private consumption expenditure and the gross fixed capital formation the values from 1993 are extrapolated by value indexes for each of the principal components. The indexes are constructed by using special quantity and price indexes. Exports and imports of goods are estimated from the tables of external transactions, which is based on the balance of payments. For the calculation of constant prices, general government expenditure in goods and services is deflated by a specially constructed price index and the value added is extrapolated by occupation index. The private consumption expenditure in constant prices is extrapolated with a quantity index. Gross domestic investment is also extrapolated by quantity index by kind of asset. Imports of goods and services are deflated by specially constructed price indexes and exports are extrapolated with quantity index.

Income Approach
The estimates of compensation of employees for general government, petroleum and electricity production, financial institutions and partly for the transport and communications sectors are based on direct current information on wages, salaries, etc. In the case of manufacturing, mining and private services the estimates are based on surveys that include wages and salaries. For construction, trade and agriculture, employment is extrapolated by production indexes and indexes of average wages. The estimates of consumption of fixed capital, are based on an approximation to the perpetual inventory methods. Each year depreciation of the capital stock, valued at replacement cost, is estimated, based on assumptions regarding the economic life replacement cost, based on assumptions regarding the economic life of the fixed assets. Government accounts are used in the estimation of indirect taxes and subsidies. Operating surplus is estimated as a residual.

Production Approach

The table of value added by kind of economic activity is prepared at basic prices, and the gross domestic product at market prices. The production approach is used to estimate value added of all industries with 1993 base year. The income approach or the expenditure approach is used for some sectors. The estimation of gross output, intermediate consumption and value added is 1993 base year from which extrapolations are made by means of value indexes. These value indexes are, in general, the products of price indexes and volume indexes. The volume index for agricultural production is based on statistics of gross output of more than 196 commodities. The index for livestock production is based on statistics of animals slaughtered for domestic consumption and export; live animals exported and inventory changes. The intermediate consumption of agricultural and livestock production is calculated updating the value of the principal components and commodities used (1993). For petroleum and other mining, the volume indexes are based on data from enterprises and a survey. The intermediate consumption is calculated updating the value of the principal components and commodities used, based on various surveys (1993). The volume index for manufacturing, which covers 250 activities, is based on data from the special survey and through direct inquiries to industry associations and manufacturers. Input is extrapolated by value indicators. The index for construction is compiled on the basis of the apparent consumption of some construction material. Fixed input-output coefficients are used (1993). The volume index for trade is based on estimates of trade margins on locally produced and imported goods. Gross margins are based on data from the commercial censuses and special surveys. Input is extrapolated by a weighed value index. The volume index for transport and communications is based on data from the concerned authorities and companies. Value added of financial institutions and insurance is estimated through the income approach. The real estate output is extrapolated by value index for housing construction and industrial rents. Fixed input-output coefficients are used at constant prices. Current prices are obtained through the use of a specially constructed price index of principal commodities and a quantity index. The population censuses and household budget surveys are used to impute the rents of owner-occupied dwellings. The public administration and defense is extrapolated by an index of occupation of the government employees. The input of the base year is extrapolated by quantity indexes in all sectors except for the electricity, construction, restaurants and hotels, financing and services sectors, in which cases either deflation by price indexes is done or constant input-output coefficients are assumed. In the community, social and personal services sector, various approaches are used to estimate output in constant prices, such as double deflation, extrapolation of value added and deflation by price indexes.

The Office of Statistics, Budget & Economic Management, Overseas Development Assistance & Compact Management in Palikir, Micronesia is responsible for maintaining the national accounts statistics for the Federated States of Micronesia (FSM). The national accounts statistics were compiled by an external consultant under a grant provided by the United States Department of Interior, Office of Insular Affairs.

The official estimates of the 2006 national accounts statistics were published by the United States Department of Agriculture (USDA) Graduate School. The FSM Compact Economic Report – FY 2006 was provided to the United Nations by the Office of Statistics, Budget & Economic Management, Overseas Development Assistance & Compact Management. The following tables have been prepared by the United Nations National Accounts section using the aforementioned publication.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA), so far as the existing data would permit.

National accounts statistics are compiled during the Federated States of Micronesia fiscal year, which begins on October 1st and ends on September 30th. GDP is estimated using the income approach. Annual national account income statistics are estimated based on available data.

Monaco

Source

The Department of Finance and the Economy of the Principality set up a working group, led by the Office of the Director for Economic Growth, to survey the territory and list the economic agents and the statistical factors necessary to the compilation of financial aggregates. In that connection, certain factors that contribute to the compilation of GDP made it necessary to conduct a national statistical survey.

General

The European System of National and Regional Accounts (ESA 95), which came into effect in 1999 and is, for the most part, consistent with the United Nations System of National Accounts (1993 SNA), establishes a framework that ensures the consistency of evaluations within the European Union.

In order to ensure comparability and transparency in its relations with the international community, and as far as the available information allows, the Principality used ESA 95 in developing tools for measuring national wealth: gross domestic product (GDP) and gross national income (GNI).

Methodology:

Overview of GDP Compilation

The GDP calculation is done using the income approach. A survey is conducted to obtain the data for Gross Operating Surplus. The major accounting balances show the macroeconomic consistency of this decision.

The GDP calculated in that fashion is expressed in “value”: in other words, in current euros.

To assess the “real” growth of aggregates, the effect of price variation should be isolated from the “volume” effect. In order to do that, the “value” GDP is deflated by the average price variation observed over the past year. The result is the “volume” GDP.

The price index used for these calculations is that of France published by INSEE. GDP in volume will be calculated based on the change in the index of consumer prices of the year 2005. This is also the base year for calculating economic aggregates of the Principality, since it is the first year of GDP calculations.

Income Approach

The overall gross operating surplus was obtained by extrapolation, using the same methodology for the three years. It was possible to include some data on the corporations that did not respond, especially with regard to their legal form, their sector and subsector of activity and, in some cases, their workforce. For the 2007 GDP, and for the 2006 and 2005 GDP calculations, the data for the gross operating surplus of Monaco’s economic agents were obtained through a survey.

First, the discriminant variables in gross operating surplus were determined on the basis of the information submitted by the responding corporations. Statistical analysis established five discriminant variables:

1. The size of the enterprise: the 100 largest enterprises were handled separately so that their atypical nature would not skew the extrapolation to non-responding corporations;
2. The legal form;
3. The sector of activity;
4. The corporation’s workforce; and

5. The payroll.

However, the information available for the non-responding corporations did not allow us to use all these explanatory variables. For example, statistical analysis shows that the number of employees seems to be a discriminating variable for gross operating surplus. But that information could not be used because the number of employees was rarely available for the non-responding corporations. As a result, work was refocused on the known variables for those corporations: legal form and sector and subsector of activity.

Second, the results of the discriminant analyses were corrected for the bias introduced by atypical values. For one legal form and one subsector of activity, 90 per cent of the data were kept for extrapolation. The goal was to have a more stable estimate of gross operating surplus, that was not skewed by enterprises atypical for a given class. Extrapolation could proceed once the average estimates of gross operating surplus for each class was corrected using the information available for non-responding corporations.

Production Approach

Through the analyses carried out to date by most of Monaco's administrative authorities, 16 economic sectors of activity in the Principality have been identified.

Structural assumptions for the calculation of the gross domestic product by sector:
- For wages, the Statistics and Economic Studies Division relied on the aggregates reported by social security administrations and the Association for Employment in Industry and Trade for each of the sectors identified.
- The gross operating surplus for each was extrapolated using the same method as for the overall GDP calculation (c.f. supra).
- Subsidies were allocated and weighted for each of the sectors, according to their type and application.
- Several analyses of the distribution of taxes by sector were conducted and, on that basis, the following rules for their breakdown were set out: A small portion of the value added tax collected is comprised of a "miscellaneous" account and a "not broken down by sector" account. It was agreed that for those two items a proportionality factor corresponding to the known fraction, by sector, of the value added tax collected could be used.

It was also agreed that this proportionality factor could be used for all the other items listed below:
– Transfers by France to the shared value added tax account;
– Import duties;
– Annual ship naturalization fees;
– Excise tax on petroleum products and tobacco excise duties;
– Profits from the tobacco monopoly;
– Leasing fees;
– Stamp duties;
– Taxes on insurance contracts;
– Alcohol excise duty; and
– Taxes levied on company vehicles.

However, it was agreed to include the "real estate value added tax" and "real estate transaction taxes" budget items in the real estate sector.

GDP in current and constant euros:
- In order to compile the GDP in constant euros, a revaluation or inflation index was applied to the 2007 aggregates. Taking the characteristics and geographic situation of the Principality's territory into account, it was decided to rely on the data and assumptions used to compile the GDP of France, published by its National Institute of Statistics and Economic Studies.
- Annual accounts at constant prices (also called "volume") with base year 2000 are presented "in prices for the preceding year, chained, base year 2000".

The goal of this presentation is to give users of the aggregates the best time series at constant prices. Changes in

aggregates at constant prices are more easily interpreted when the year of the constant prices is relatively close to the year of the prices under review. For this reason, changes in aggregates at constant prices in annual national accounts for a given year are systematically calculated by taking the current price aggregates for the previous year as a base and applying to them the price changes of the previous year. These series are first set at 100 in 2000 and then multiplied by the current price value of the aggregate in 2000, simultaneously giving users the scale of the aggregate. The base year for the aggregate is 2005. It is compiled in “value” - in other words, in current euros - and is calculated “per capita”. In light of the specificities of the territory of Monaco, the population used in the calculation includes both the resident and the “presently employed” population.

Mongolia

Source
National accounts are compiled and disseminated by the National Statistical Office of Mongolia. Annual and quarterly national accounts are compiled and disseminated through the monthly bulletin and the yearbook of Mongolia. Data on Gross Domestic Product are also posted on the website of the National Statistical Office: www.nso.mn.

General
The System of National Accounts used in Mongolia is based on the methodological framework of the 1993 System of National Accounts (1993 SNA). Since 1995, GDP estimates have been calculated using 1993 SNA indicators. Prior to 1995, Mongolia used the concept of National Economic Balance (NEB). From 1995 through 2010, economic activity was classified according to the International Standard Industrial Classification of All Economic Activity (ISIC 3); as of 2011, the ISIC 4 was used. Macroeconomic indicators are calculated for 18 types of economic activity.

Symmetric input-output tables have been published for the years of 1966, 1970, 1977, 1983, 1987, 2000 and 2005. Supply and use tables were published for 2005.

The last methodological revision was completed in 2010, covering the series from 1990. The main purpose was data series benchmarked to supply-use table for 2005 and FISIM allocated to users and sectors and implemented ISIC4 classification. Revised data are available for GDP by production approach from 1990, GDP by expenditure and by income approaches from 2000.

The Classification of Individual Consumption According to Purpose (COICOP), the Classification of the Functions of Government (COFOG), the International Standard Industrial Classification of All Economic Activity (ISIC), and Harmonized Commodity Description and Coding Systems (HS) are used to calculate GDP from the expenditure side.

The National Statistical Office (NSO) revised its methodology for compiling national accounts and for estimating GDP and GNI in 2007. They are available in the website. Also, NSO published a special publication on the national accounts of Mongolia for the period 1960-2010. Preliminary quarterly estimates of GDP are prepared using the production approach and disseminated by the NSO five weeks after the end of the reporting period. The quarterly data are calculated at current and constant 2005 prices. The full set of indicators of the national accounts system is published in the annual compendium on the national accounts. The reporting period is the calendar year. The base year for calculations of indices in constant prices is 2005.

Methodology:

Overview of GDP Compilation
In Mongolia, GDP is calculated using three approaches: production, expenditure and income. GDP is estimated separately by the production and by the expenditure approaches. GDP by income approach is estimated at the same time and with the same data sources while as GDP by the production approach is done and with net operating surplus/mixed income as balancing item. The main method of compiling GDP indicators is the production approach. Production-based GDP is calculated at market prices as the sum of the gross value added generated by resident producers plus net taxes (excluding subsidies) on products. Using the expenditure approach, GDP is calculated as all final expenditure in purchasers' prices plus gross fixed capital formation and net exports of goods and services.

Quarterly GDP is compiled and disseminated in current and constant 2005 prices. The calculation is made in market prices. Seasonal adjustment estimates are experimental and for estimation using Demetra + software.

Disaggregated GDP data derived from using the production method is presented in both current and constant prices: Gross value added disaggregated by type of economic activity (18 types of activity) at basic prices; and Taxes on products less subsidies on products. Most transactions are recorded on an accrual basis, with the exception of current expenditure and income of government agencies which are recorded on a cash basis. Output is estimated in basic prices. Intermediate and final consumption are valued at purchase's prices. Gross fixed capital formation is recorded in market prices. Imports and exports of goods and services are estimated at unit prices (f.o.b.). Indicators of GDP based on the production method and categories of expenditure are estimated at current and constant 2005 prices; using the income method, the categories are estimated only at current prices.

Expenditure Approach

The main sources of data are Socio-economic surveys (household budget survey), foreign trade statistics, agricultural and industrial statistics, the state budget performance report, balance of payments data and investment statistics.

GDP by components of final use comprises expenditures by institutional sectors of the national economy on the final use of goods and services, gross capital formation and exports, excluding imports of goods and services.

Final consumption expenditures are expenditures by institutional units to acquire goods and services which are used directly to satisfy current individual and collective needs.

Household final consumption expenditures include expenditures on goods and services in kind; purchased, receipt free, and production for own consumption. They are estimated in accordance with the International Classification of Individual Consumption by Purpose (COICOP), using data from Household Socio-Economic Surveys. Some expenditure of goods and services are adjusted based on foreign trade, agriculture statistics, CPI and other industry surveys.

General government final consumption expenditure is financed by the State budget, the pension fund and the social security fund. They are estimated in accordance with the Classification of the Functions of Government (COFOG), based on expenditure reports on State and local budget performance (execution), and pension fund and social security fund reports.
Final consumption expenditures of non-profit institutions serving households (NPISH) include expenditures of social organizations related to the production of individual non-market goods and services. The estimate is based on annual data.

Gross fixed capital formation is valued on the basis of the total cost of fixed assets acquired by producers (deducting what has been consumed and valuation) in the reporting period. They are estimated in accordance with the produced non-financial asset classification, using data from annual data of enterprises and financial report of enterprises.

The changes in inventories are calculated as the difference between the value of stocks at the beginning and end of the period, valued in market prices for the period. Inventories include raw materials, work-in-progress, finished goods and goods for resale.

The value of exports and imports of goods and services is determined from Balance of payments from the Central bank of Mongolia.

For the estimation of the GDP by expenditure approach at constant price, we have used various price and volume indicators. Household final consumption expenditure is mainly deflated by consumer price indices. Government consumption expenditure is deflated by implicit deflators (corresponding deflators of GDP by production approach) and consumer price indices. NPISH consumption expenditure and changes in inventories are deflated by implicit deflators. Gross capital formation is deflated: implicit deflators, consumer price indices, import goods indices.

Exports and imports of goods are deflated by the unit value indices (Paasche indices). For exports and imports of services are the CPI and CPI of China are used, respectively.

Income Approach

GDP by the income approach is estimated at the same time as GDP by the production approach. To a large extent the data sources for primary income categories calculation are the same as GDP by production approach.

Basic data for the calculation of compensation of employees are taken from annual accounting statements.

The main data source for calculation of taxes and subsidies on production and imports is the report of the Ministry of Finance on State budget performance. Also, detailed tax data from tax and custom authorities are used for the calculation.

For non-financial and financial corporations and market housing activities of households, net operating surplus is residual category of value added. In non-market activities gross operating surplus equals the consumption of fixed capital (for the general government consumption of fixed capital is not estimated).

For own-account production of housing services of owner-occupiers consumption of fixed capital is not estimated. Gross mixed income is a residual category of value added in un-incorporated enterprises of the household sector.

Income-based GDP is only calculated on an annual basis and at current prices.

Production Approach

Using the production method, GDP is calculated in market prices. Its value is obtained by calculating the sum of the gross value added in each sector (in basic prices) plus net taxes (less subsidies) on products and imports. Gross value added is a production indicator defined as output less intermediate consumption for the corresponding type of activity (sector). The primary data sources are:
(a) The annual and quarterly reports on income and expenditure of State and private enterprises, which includes all types of enterprises;
(b) The labor force survey and other surveys carried out by the NSO;
(c) Employment and wage surveys;
(d) Banking statistics provided by the Central Bank of Mongolia and commercial banks;
(e) The report on State budget performance prepared by the Ministry of Finance;
(f) Customs payments and tax reports provided by the tax and customs services, respectively.

Livestock census (annual) data and data from administrative sources are also used.

The output indicator is determined on the basis of sectorial statistical data (statistics on industry; agriculture; construction; commerce; transport and communications and so on) and business statistics, and the content is harmonized with the SNA production boundaries. GDP estimates at fixed year's prices. The base year is 2005. For individual types of economic activity, the extrapolation method using volume or employment indices is used. The deflation method includes commercial services (CPI components).

Overview of the Compilation of the Integrated Economic Accounts

In accordance with the concepts of the 1993 SNA, the data processed include the set of accounts for the economy as a whole, the five institutional sectors of the domestic economy and the rest of the world. Flows (transactions) between institutional units are recorded at the time when claims and obligations arise, are transformed or are cancelled, that is, on an accrual basis. Indicators of flows between institutional units and stocks (assets) are estimated at current market prices as agreed by the participants. Calculations of production, income generation, income use and capital transactions are made directly for institutional sectors of the domestic economy. The "rest of the world" accounts are compiled on the basis of data from the balance of payments.

The national accounts estimates include a full set of accounts for each of the five institutional sectors. All the indicators, from the production account to the capital account, are calculated for each sector of the economy (non-financial corporations, financial institutions, general government, NPISH and households). The “rest of the world” accounts are compiled separately. Data for non-financial corporations are based on the annual reports on income and expenditure of State and private sector corporations. Data on financial institutions are based on the annual statistical reports of commercial banks and the insurance industry. Data on general government are based on the annual performance reports for the State budget. Data on households and NPISHs are based on the annual household budget surveys and other specialized surveys. The “rest of the world” data are based on the balance of payments of Mongolia.
