Source

Reply to the United Nations national accounts questionnaire from the National Institute of Statistics, Ministry of Planning. The official estimates are prepared by the National Institute of Statistics (NIS), Ministry of Planning, with technical assistance from the Asian Development Bank (ADB).

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Cameroon

Source

Reply to the United Nations national accounts questionnaire from the Direction de la Statistique et de la Comptabilite Nationale, Ministere de l'Economie et des Finances, Yaounde. Official estimates are published annually in "Comptes de la Nation". The latest series was published in "Les Comptes Nationaux du Cameroun - Selon le SCN 93", April 1999.

General

The latest estimates shown in the following tables have been prepared in accordance with the System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Canada

Source

The preparation of national accounts statistics in Canada is undertaken by Statistics Canada, Ottawa. Official estimates are published by Statistics Canada quarterly and annually in "National Income and Expenditure Accounts", Catalogues 13-001 and 13-201. Statistics Canada also publishes annual input-output tables at current and constant prices in "The Input-Output Structure of the Canadian Economy", Catalogue 15-201; quarterly statistics on flows of funds in "Financial Flow Accounts" Catalogue 13-014; and annual estimates of balance sheets in "National Balance Sheet Accounts" Catalogue 13-214. Detailed sources and methods are published in "A Guide to the Financial Flow and National Balance Sheet Accounts" Catalogue 13-585e (English) and 13-585f (French). A detailed description of the sources and methods used for the national accounts estimation is found in "Guide to the Income and Expenditure Accounts" Catalogue 13-603E (English) and 13-603f (French). Reply to the national accounts questionnaire was received through the Organisation for Economic Co-operation and Development (OECD), Paris, France.

General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. From 1981, original chain constant prices are based on the year 1997 and are not additive.

Methodology:

Overview of GDP Compilation

All components of gross domestic production by expenditure type are estimated through the expenditure approach.

Expenditure Approach

Government final consumption expenditure is based on public accounts and financial records and statements of the government bodies. At the federal and provincial levels, the figures are derived by eliminating from total government budgetary expenditure on all outlays that are not made directly to purchase new goods and services. At the local level, the estimates are built up directly on a gross basis from the data sources, subtracting revenues from sales of goods and services. Benchmark estimates of consumption expenditure are based on the censuses of merchandising and services conducted in 1951, 1961, 1966, and 1971 and on the retail commodity survey of 1974 and 1989 as well as the Family Expenditure Surveys (most recently in 1986, 1990 and 1992). These estimates are first adjusted to include commodities purchased through non-retail trade outlets and then broken down into trade groupings. For the non-census years, the benchmark estimates of each trade group are interpolated or projected by using the movement of sales of equivalent kind-of-business groupings. For non-retail trade groups, surveys of wholesale trade and service industries are used. Estimates of consumer expenditure on services such as transport, health care and education are based on annual surveys or published reports. Comprehensive figures on the quantities of physical stocks held on farms and grains in commercial channels are available from the Agriculture Division of Statistics Canada. Inventories held by government agencies are obtained from government records. Estimates of inventory book values of non-farm business are based on annual censuses or sample surveys. The estimates of gross fixed capital investment are based on the results of annual surveys which are published in "Private and Public Investment in Canada: Outlook" reports. Data are available separately for non-residential construction and machinery and equipment. Residential construction are derived from housing starts as counted by Canada Mortgage and Housing Corporation, building permit values and quarterly work-put-in-place coefficients. The estimates of exports and imports of goods and services are based on information available in the balance of payments. For merchandise, the import and export figures are obtained from customs entries while for services, the estimates draw upon a number of sources such as surveys of business firms and Statistics Canada's international travel surveys. Constant dollar values of government

consumption expenditure are obtained through extrapolating base-year wages and salaries by employment data and through deflating other current expenditure by base-weighted price indexes. Price deflation is also used for private final consumption expenditure, non-farm stocks, non-residential construction and machinery and equipment, and exports and imports of goods and services. The constant price series for farm inventories is derived by valuing the physical quantities of stocks in prices from the base period chosen. For residential construction, the estimates are derived by deflating current dollar component estimates with price indexes. Exports and imports of merchandise are each revalued by specially constructed current-weighted indexes.

Income Approach

The general method used in the preparation of the labour income estimates consists of calculating the payments made on labour account by the various industrial groups and summing the results. The estimates are based on monthly and annual samples of full-coverage surveys conducted by Statistics Canada, decennial or quinquennial censuses and published statements of governments. A principal benchmark source of information is the tabulation of total wages and salaries submitted by employers with respect to employees' earnings. Undertaken by the Revenue Canada -- Taxation in connection with the administration of the Income Tax Act. The estimates of corporation profits are obtained from the publication "Financial Statistics for Enterprises". Estimates of interest and miscellaneous investment income are based on information obtained from various sources such as Revenue Canada -- Taxation, the Bank of Canada, accounts and financial statements of governments and others. For unincorporated business, estimates are obtained either through direct inquiry, projections from benchmark data, subtracting expenses from gross income or through applying the ratio of net to gross income based on survey or income tax data. The estimates of depreciation are calculated on an original cost valuation basis with a close link to the figures of book depreciation reported in the accounting records of business firms. For the government sector, capital consumption allowances are imputed while for the agricultural and housing sectors, replacement cost estimates of capital consumption are prepared from estimates of fixed reproducible capital at market values. The estimates of indirect taxes are based on accounting records of the various levels of government. Subsidies consist of federal and provincial production subsidies.

Production Approach

The table of gross domestic product of economic activity is prepared in factor values. The income approach is used to estimate the value added of the various industries, except in the case of agriculture, for which the income approach is combined with the activity. The components of GDP at factor cost are classified by industry on the basis of establishment data. Wages, salaries and supplementary labour income as well as net incomes of farms and non-farm unincorporated businesses, corporation profits and capital consumption allowances are built up by assembling data on an industry-by-industry basis. Certain imputations are made to include non-market activities. They are allocated to their appropriate industry of origin. For the estimates at constant prices, double deflation is used for agriculture, manufacturing, electricity and railway and air transport. Price deflation is used for non-residential and other engineering construction, road transport and advertising services. For producers of government services and producers of private non-profit services to households, various indicators are used to extrapolate or deflate value added. For the remaining industries, value added is extrapolated by various quantity indicators or indexes.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Refers to Net Mixed Income.

^c Discrepancy between components and net value since one or more components have not been revised.

^d Account does not balance.

^e Discrepancy between the total economy and the domestic sector accounts.

^f Discrepancy with equivalent item in Table 1.3: Relations among Product, Income, Savings and Net Lending Aggregates.

^g Discrepancy with equivalent item in Table 1.3: Relations among Product, Income, Savings and Net Lending Aggregates. Discrepancy between the total economy and the domestic sector accounts.

^h Net lending in the financial account has not been reconciled with Net lending in the capital account.

^a Refers to Net Mixed Income.

^b Discrepancy with equivalent item in Table 4.1: Total economy, since data have not been revised.

^c Discrepancy between components and net value.

Cape Verde

Source

Reply to the United Nations national accounts questionnaire from the Ministerio da Coordenacao Economica, Direccao Geral de Estatistica. The official estimates are published in "Boletim Anual de Estatistica" and "Boletim de Contas Nacionais".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Reply to the United Nations national accounts questionnaire from the Sous-Direction de la Statistique, Direction du Plan et du Developpement, Ministere des Finances, de l'Economie et du Plan, Ndjamena.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Chile

Source

The preparation of national accounts statistics in Chile is undertaken by Banco Central de Chile, Santiago. The official estimates are published in "Cuentas Nacionales de Chile". The following presentation of sources and methods is mainly based on a detailed description received by the United Nations from the Oficina de Planificación Nacional (ODEPLAN). However, descriptions can also be found in "Cuentas Nacionales de Chile, 1960-1975", published in 1976.

General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, exports and imports of goods and services and capital formation in new construction. The commodity-flow approach is used to estimate other construction. Private final consumption expenditure is estimated as a residual. Data on government consumption expenditure is obtained i.e through special inquiries and direct information from the concerned authorities. Values of locally produced and imported capital goods are adjusted by coefficients by type of capital goods to arrive at purchasers' values. Estimates of exports and imports of goods and services are obtained from the balance of payments statements prepared by the Central Bank. To arrive at constant prices, value added of government services is deflated by index of wages and salaries. Purchases of goods and services are deflated by the wholesale price index and the price index of intermediate imported goods. For private consumption expenditure most domestically produced items are deflated by appropriate components of the consumer price index. Imported goods are deflated by the price index of imported consumer goods. For gross fixed capital formation, buildings and other construction are devalued using double deflation. Base year estimates of transport equipment, machinery and equipment are extrapolated by a quantity index for each industrial group, except for imports which are deflated by price indexes of imported capital goods. Price deflation is used for exports and imports of goods and services.

Income Approach

Wages and salaries are in most cases estimated from company accounts and/or direct information from the enterprises. Employers' contributions to social security schemes as well as wages and salaries in kind are included in the estimates. Operating surplus is obtained as a residual. Depreciation data are obtained from accounting statements of enterprises or computed from data of fixed assets by type of capital and useful life time. For indirect taxes, published fiscal statements by type of tax, are used.

Production Approach

This table is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most industries. The income approach is however used for government services, business services and domestic services. The general method of estimating gross value of agricultural production involves the use of physical quantities of production together with the respective wholesale or producers' prices. Quantities of

livestock production are obtained from published data and directly from Instituto Nacional de Estadística (INE). The estimates include both marketed and non-marketed production. The inputs into agriculture and forestry are based on information from the suppliers of input products. The estimates for the mining and quarrying sector are mainly based on data on sales and change in stocks, but in some cases on physical production valued at average sales price or on expenditure data in the construction and industrial sectors. For manufacturing, the required statistics for companies with 1 to 49 employees are found in their annual industrial declarations. For units with 50 or more employees, the industrial yearbook of INE is used. The gross value of construction in the public sector is obtained from accounts of the respective institutions. For the private sector the construction expenditure on all buildings is calculated on the basis of the municipal building permits. In order to estimate intermediate consumption and the components of value added, cost-structure by type of construction are applied to the gross value of production. Estimates of private sector trade is made on the basis of a continuous survey. For public enterprises, information provided in their accounting statements and in their budget statements is used. For transport, information is based on accounts, sales data and on the stock of motor vehicles. The production and input estimates for financial institutions and corporations, real estate and insurance are made possible through data from the Superintendencia de Bancos. Benchmark estimates for actual rents paid and imputed rent for owner-occupied dwellings have been made on the basis of the housing censuses in 1960 and 1970. These estimates are projected annually by a value index which combines the increase in physical stock with a price index for rent. For public administration and defense, budgets and accounts provide the required basic data. For the constant price estimates, double deflation is used in the agricultural sector, the output value is extrapolated by quantity indexes by product, whereas intermediate inputs are deflated by an index of input prices. Value added of fishing, mining and quarrying, manufacturing and electricity is extrapolated by quantity indexes of production. Double deflation is used for construction, current gross values are deflated by price indexes for each type of construction. For intermediate consumption, input structures are used. For trade, value added of the base year is extrapolated by a quantity index. Double deflation is used for the transport and financing, insurance, real estate and business services sector. For transport, current output is deflated separately for different uses and types of transport. For financial institutions, output is deflated by an implicit price index for expenditure. Output of ownership of dwellings is extrapolated by an index based on the change in the housing stock, whereas inputs are deflated by the value index for repairs. For community, social and personal services, double deflation is used.

^a Discrepancy between Total Economy and domestic sectors since value for the Total Economy excludes FISIM.

^b Discrepancy between Total Economy and Domestic Sectors as Total Economy includes FISIM, but domestic sectors exclude it.

^c Refers to Net Domestic Product. Excludes consumption of fixed capital.

- ^d Includes Financial intermediation services indirectly measured (FISIM).
^e Excludes consumption of fixed capital.
^f Excludes Household final consumption expenditure.
^g Discrepancy between Total Economy and the sum of domestic sectors.

China

Source

Reply to the United Nations national accounts questionnaire from the National Bureau of Statistics, International Statistical Information Center, Beijing. Official estimates are published monthly by the Bureau in the "China Monthly Economic Indicators" bulletin.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions. The data displayed refer to Mainland China only. Data for Hong Kong Special Administrative Region and Macao Special Administrative Region are stored separately in the UN national accounts database and published as individual territories.

China, Hong Kong SAR

Source

Reply to the United Nations national accounts questionnaire from the Census and Statistics Department, Hong Kong. Earlier replies were received from the Overseas Development Administration, Foreign and Commonwealth Office, London. The official estimates together with methodological notes have been published in a series of annual publications titled "Gross Domestic Product".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). HKSAR adopts an incremental approach in implementing those new guidelines in the SNA 1993. Some of the new guidelines had been implemented in preparing the estimates under the "10" series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, this is indicated by a footnote in the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated through the expenditure approach and production approach.

Expenditure Approach

The commodity-flow approach is used for compiling private final consumption expenditure and gross capital formation in machinery and equipment, supplemented by data collected from annual economic surveys. Goods for private consumption are mainly from imports, for which detailed trade statistics are available. Trade statistics of retained imports are complemented by data from the household expenditure surveys, census/surveys of manufacturing establishments, sample surveys on sales of business establishments, administrative data and other sources. Estimated of food produced domestically for local consumption are compiled from data provided by the Agriculture, Fisheries and Conservation Department and other government departments. Imported and domestically produced commodities are reported in importers' and producers' values, respectively, and the retail value is arrived at by adding transport expenses and distributors' margins. Government consumption expenditure data up to 1972 were obtained from the annual reports of the Director of Accounting Services which provided data on the actual expenditure of individual departments by financial year ending 31 March. Since 1973, quarterly figures have been available from the Treasury and adjustment to a calendar year basis is no longer required. The estimates relate to current expenditure on goods and services by government departments not engaged in market activities. Estimates of changes in inventories of distributors and manufacturers have been compiled based on results of the censuses/surveys of manufacturing establishments and distributive trades. Information on quantities of hydrocarbon oils kept in stock by oil companies are obtained from the Electrical and Mechanical Services Department. For gross fixed capital formation, investment in machinery and equipment is based mainly on the value of retained imports of capital goods, with a percentage added to allow for transport, assembly charges and installation expenses and distributors' margins. Estimates of domestically manufactured machinery and equipment locally purchased are calculated from results of the censuses/surveys of manufacturing establishments. Private sector investment in building and construction prior to 1979 is based on the monthly statistical returns of the Building Ordinance Office. From 1979, it is based on the results of Annual Survey of Building, Construction and Real Estate Sectors while investment in the government sector is obtained from an analysis of the accounts of government departments. Estimates of business investment in computer software are derived from data collected through annual economic surveys whereas corresponding estimates for the public sector are compiled from records of government accounts as well as returns of quasi-government institutions and public corporations. Exports and imports of merchandise are obtained from detailed external trade statistics. Estimates of residents' expenditure abroad (an imported service) are based on administrative data and household surveys. Expenditure of visitors in Hong Kong (an exported service) is based on data provided by the Hong Kong Tourism Board.

Expenditure of employees of extra-territorial bodies and their dependents in Hong Kong is estimated based on the number of such persons staying in Hong Kong and their average expenditure. Extra-territorial bodies include foreign consulates and trade commissions (the UK troops were also included before July 1997). Data on expenditure abroad of overseas offices and miscellaneous expenditure abroad of the government are obtained from the government accounts. The Annual Survey of Banks, Deposit-taking Companies, Restricted Licence Banks and Representative Offices of Foreign Banks has been conducted since the reference year 1980 to collect data on imports and exports of banking services. Estimates of the other services categories are mainly based on data collected from the Annual Survey of Imports and Exports of Services, supplemented by administrative data. The Annual Survey of Imports and Exports of Services was launched starting from the reference year 1978. For earlier years, the estimates were compiled with reference to imports and exports of goods and data from the Annual Survey of Imports and Exports of Services for reference year 1978. For the constant price estimates, price deflation is used for most of the expenditure items. The current values are deflated by various price indexes such as specially constructed salary rate index, consumer price indexes, tourist price index, cost index of building and construction, overall index of unit values of exports and imports, etc. For changes in inventories, unit value index of imports as well as the consumer price index of appropriate commodity groups are used.

Income Approach

The main components of the table: compensation of employees and operating surplus are compiled using the same source of data for compiling GDP by the production approach. Data, available since 1980, are based on information collected from economic censuses/surveys conducted for the various major economic sectors.

Production Approach

The production approach is used to estimate the value of production of individual economic activities. The value of production is measured by value added. Annual data series at current prices which are available since 1980 are compiled mainly based on information collected from economic censuses/surveys conducted for the various major economic sectors and administrative records. For the data series at constant prices, annual figures which are available since 2000 are the sum of the quarterly figures of the reference year. Quarterly constant price value added for various economic sectors in Hong Kong is generally compiled using four methods: (a) single extrapolation of base year value added by deflated gross output measures e.g. business receipts deflated by PPI; (b) single extrapolation of base year value added by volume/quantity measures such as volume of trade and physical units of outputs; (c) single extrapolation of base year value added by input indicators such as number of hours worked; (d) double indicators methods. Data sources for compiling quarterly constant price value added for various economic sectors mainly include quarterly and monthly surveys on industrial/business establishments and on households, government accounts, and administrative data from government departments and other organizations.

| Equals: GROSS DOMESTIC PRODUCT | 99083.1 ^a | 104515.4 ^a | 108576.4 ^a | 113252.4 ^a | 118996.6 ^a | 113083.8 ^a | 116947.4 ^a | 128833.8 | 129430.6 | 131874.3 | 136121.3 | |

^a In making reference to constant price GDP and its components for the years before 2000, it should be noted that since each component for each year is re-referenced to 2000 independently of other components and aggregates at different levels, the sum of these re-referenced components are not equal to the re-referenced aggregates and to the GDP. Although the lack of additive consistency appears to be an inconvenience, it is inevitable if the correct weighting is to be maintained, a practice adopted by statistical authorities worldwide.

^a At factor cost.

^b Includes Gross mixed income and FISIM.

^c Data up to 1995 are based on a set of composite employment estimates which are derived by reconciling employment statistics obtained from the Quarterly Survey of Employment and Vacancies and the General Household Survey. Moreover, data refer to the average of the four quarterly estimates of the year. The industrial classification is based on the Hong Kong Standard Industrial Classification which is based on ISIC Rev. 2 with local adaptation. From the year 1996 onwards, data are based on the results of the "2001 Population Census" in which the "resident population" approach is used as the benchmark population data.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Colombia

Source

Reply to the United Nations national accounts questionnaire from the Departamento Administrativo Nacional de Estadística (DANE), Bogotá. Official estimates and some methodological notes are published in "Cuentas Nacionales de Colombia" (Revision 3).

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, exports and imports of goods and services, part of increase in stocks and gross fixed capital formation in construction. For other gross fixed capital formation, the commodity-flow approach is used. Private final consumption expenditure and part of increase in stocks are obtained as a residual. The estimates of government final consumption expenditures are based on official sources such as Informe Financiero de la Contraloría General de la República. The estimates of private consumption expenditure are obtained as a residual except for the benchmark year 1970 which were based on results from the family budget survey conducted that year. The estimates for changes in stocks are based on information obtained from various sources such as manufacturing surveys, commercial census, and the Federación Nacional de Cafeteros. For gross fixed capital formation, the c.i.f. values of imported capital goods in the foreign trade statistics are adjusted to include customs duties, other taxes and transport and insurance costs. Adjustments are also made for trade margins and installation costs on goods passing through trade channels. For domestic production, estimates are based on manufacturing surveys. Estimates of capital formation in construction are obtained as by-product in the calculation of the construction sector's contribution to Gross domestic product whereas investments in the government sector is obtained from the government accounts. The estimates of exports and imports of goods are derived from foreign trade statistics while that of services are derived from the balance of payments. For the constant price estimates, current values of government expenditure and gross fixed capital formation estimates are deflated by appropriate price indexes. Estimates of private consumption expenditure at constant prices are obtained as a residual. No specific information is available for the remaining expenditure items.

Income Approach

The estimates of compensation of employees are obtained in the process of estimating value added by industrial origin. The estimates are obtained from the statistical surveys held in 1970 and from accounting data. In the case of agriculture, hunting, forestry and fishing, the estimates are based on projections from census data on employment and statistics of average wages and salaries. Depreciation of assets owned by general government are not included in the estimates. Operating surplus is obtained as a residual and no information is available for the estimates of consumption of fixed capital and of net indirect taxes.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of almost all industries. The income approach is used to estimate the value added of producers of government services and some private services, while the expenditure approach is used for ownership of dwellings. Gross output of the trade sector is estimated by the commodity-flow approach. For agriculture, the gross value of production is obtained by multiplying the output of each commodity by the price paid to producers. The production and price data are derived from agricultural sample surveys and from various concerned institutions. The Federacion Nacional de Cafeteros supplies information on data for coffee. For livestock, the estimates are based on statistics of government controlled slaughterings and net exports with rough estimates made for uncontrolled slaughterings. Data for the petroleum industry are obtained directly from the oil companies. Information on the output and value of minerals is available from censuses of mines and concerned institutions. For manufacturing, results of surveys carried out by the Departamento Administrativo Nacional de Estadística are used. The estimates are projected by applying volume and price indexes to both output and input. The basic data for electricity, gas and water are obtained from concerned enterprises and surveys. Coefficients calculated from these surveys are used to estimate value added of plants not covered. For urban construction, estimates are derived from building permits issued while rural construction estimates are based on an estimation of economic life of existing constructions and on demographic data. Estimates of public construction are obtained from the government records. For the trade sector, value added is based on estimates of the flow of goods through trade channels. The gross margins are based on data provided by the Banco de la Republica or recalculated from the Commercial Census 1967. The mark-ups are kept constant over the period of analysis. For transport, estimates are based on information provided by the Banco de la Republica. Data to measure the contribution of the communication sector are obtained by direct inquiries. Estimates for the financial institutions are obtained directly from the enterprises concerned through the Superintendencia Bancaria. The contribution of the government sector is measured by the wages and salaries paid to employees. Value added of other private services is estimated by the Banco de la Republica using the results of the census of services in 1970. Constant input-output ratios have been assumed. For the constant price estimates, value added of the majority of industries is extrapolated by quantity index for output. For ownership of dwellings and producers of government services, value added is deflated by an index of rents and an index of wages and salaries, respectively.

Cook Islands

Source

Reply to the United Nations national accounts questionnaire from the Statistical Office, Ministry of Finance and Economic Management, Rarotonga, Cook Islands. The first comprehensive estimates of gross domestic product for the period 1982-1986 was published in "National Accounts of the Cook Islands, 1982-1986" in September 1990. This was the result of the joint efforts of the Statistics Office of Cook Islands with the Asian Development Bank.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Costa Rica

Source

Reply to the United Nations national accounts questionnaire from the Banco Central de Costa Rica, Departamento de Estudios Economicos, Seccion Cuentas Nacionales, San Jose. Official estimates are published in "Cifras de Cuentas Nacionales de Costa Rica".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Cote d'Ivoire

Source

Reply to the United Nations national accounts questionnaire and communication from the Direction des Études de Développement, Ministère du Plan, Abidjan. The official estimates are published annually in "Comptes de la Nation".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Croatia

Source

Reply to the United Nations national accounts questionnaire from the Central Bureau of Statistics. The latest data for Croatia was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). The official estimates and detailed description on the concepts, sources and methods of estimation used in the compilation of national accounts estimates are published in "National Accounts of the Republic of Croatia and the "Statistical Yearbook of the Republic of Croatia"

Cuba

Source

Official estimates are published by the Oficina Nacional de Estadísticas, Habana in "Anuario Estadístico de Cuba".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Cyprus

Source

The preparation of national accounts statistics in Cyprus is undertaken by the Statistical Service, Ministry of Finance, Nicosia. The official estimates are published annually in the "National accounts" and the "Statistical Abstract", issued by the same Service. The following tables have been prepared from successive replies to the United Nations National Accounts Questionnaire.

General

Information on concepts, sources and methods of estimation used can be found in the "History and Analysis of the Methodology of National Accounts in Cyprus", published in 1977 and covers the period 1960-1975 and the "New National Accounts of Cyprus 1976-1983", published in 1985 and covers the years 1976 and after. The latest estimates (data 1995 onwards) have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA which is compatible to ESA 95). Previously the estimates were prepared generally in accordance with the classifications and definitions of the United Nations System of National Accounts 1968 (1968 SNA). For the years 1950-1975, the 1958 SNA was used, for the period 1976-1994 the 1968 SNA was used, while since 1995 onwards the SNA 1993 was applied. To compare national accounts estimates based on the 1993 SNA and those based on the 1968 SNA, the following differences should be taken into consideration: (1) under the 1993 SNA, the valuation of the output of insurance services has changed e.g. inclusion of revenues from investment of technical reserves, (2) introduction of the concept of financial leasing, (3) mineral exploration and computer software expenses are, under 1993 SNA, recorded as capital formation, (4) capital consumption is also recorded for infrastructural work of government

Methodology:

Overview of GDP Compilation

Geographical coverage of the national accounts of Cyprus is limited to government controlled areas. Prior to 1976, gross domestic product was estimated through a combination of the income and the production methods. Since 1976, GDP is solely estimated through the production method. The data for the years 1995-2003 have been compiled using a balanced system of accounts based on both production and expenditure approach.

Expenditure Approach

The expenditure method is used to estimate all the components of the expenditure account (i.e. government and private final consumption expenditure, capital formation, stocks and imports and exports of goods and services). Sources of data are the treasury report for government financial accounts, the publications of the Statistical Service on Household Budget Survey and annual data on Imports and Exports. The Central Bank of Cyprus provide detailed data on balance of payments and its components. For constant price estimates the total cost of living allowance index is used to deflate wages and salaries in government final consumption expenditure and partial price indices from the consumer price index are used to deflate the private final consumption expenditure. For the other expenditure items, various price deflators are used.

Income Approach

Separate estimates for compensation of employees and operating surplus were not available prior to 1976. Since 1976, separate estimates for compensation of employees and operating surplus are compiled from annual production surveys and other secondary sources. These estimates are published in the "National Accounts". The estimate of consumption of fixed capital was until 1995 based on a fixed percentage (10.5%) of the gross national product. Recently, this is calculated based on the existing capital stock, using the Perpetual Inventory Method (PIM). Net indirect taxes are available in the Financial Report, issued by the Treasury Department.

Production Approach

Agricultural estimates were based mainly on ad-hoc inquiries of the Ministry of Agriculture and Natural Resources for years prior to 1969. From 1969 to 1974, estimates were derived from area sample surveys conducted twice a year. From 1975, the area sample was replaced by an annual survey of crop and livestock holders. Data on fishing and forestry are supplied by the fisheries and forestry departments respectively. Estimates for mining and quarrying, manufacturing and electricity, gas and water are derived from the annual industrial production surveys and the censuses of industrial production held every five years since 1956. Construction sector consists of public and private construction. Public construction estimates are compiled from the annual financial report of the Treasury Department and the annual reports of semi-government organizations and local government authorities. For private construction the data are derived from the annual construction surveys conducted since 1978 and based on the building permits. While since 1987, an additional economic survey is conducted through building contractors. Prior to 1981, wholesale and retail trade estimates were based on gross trade margins, calculated through the commodity flow method. Since the 1981 Census of Wholesale and Retail, estimates are derived from an annual survey. For transport, prior to 1980, estimates were based on extrapolation of value added by using indices of the number of buses in use and bus fares, rented cars and fares as well as the number of taxis and their revenues. For lorry transport, estimates were based on the transport margins derived from the commodity flow method. Estimates for port services and civil aviation were compiled from the annual financial report of the Treasury Department and for Cyprus Airways data were obtained regularly from their annual report. For storage, data were compiled from ad-hoc inquiries collected through the agricultural surveys and later by conducting special surveys. For communication, estimates were obtained for postal services from the financial report and for the Cyprus Telecommunication Authority data were compiled from its annual report. Since 1980 estimates are based on annual economic surveys on all activities of the transport sector. Data on financial institutions are collected by the Central Bank of Cyprus. Data on insurance activities are extracted from the records of the Office of the Supervisor of Insurance Companies and ad-hoc surveys conducted by the Statistical Service. Data on real estate are based on land and buildings transfer fees and ad-hoc surveys. Data on business services are derived from annual economic surveys. The main source of information for public administration and defence and public services is the annual financial report of the Treasury Department and annual returns submitted by the local authorities. Estimates for the private services are derived from the annual services survey. For the constant price estimates, the double deflation method is used for all items of agricultural outputs and inputs to arrive at value added estimates. Special price deflators for each category and or product items are constructed for both the output and inputs. Prior to 1976, value added was deflated by using a combination of indices for the remaining industries. Quantity indices for mining and quarrying, manufacturing and construction, price indices for wholesale and retail trade, base year average prices for electricity, gas and water, employment and wage rate indices for all the other services sectors. Since 1976, double deflation method of output and inputs is used. For producers of government services, the cost of living allowance index is used to deflate their value added which comprises mainly of compensation of employees.

Czech Republic

Source

Reply to the United Nations national accounts questionnaire from the Czech Statistical Office (CSO), Prague. The official estimates are published in the "National Accounts", SCO. The data for the Czech Republic was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions. Original constant prices are based on the year 1995.

^a Discrepancy between components and total.

^b Discrepancy between Total Economy and the sum of domestic sectors.

^c Discrepancy with equivalent item in Table 2.3 Output, gross value added and fixed assets by industries. Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^d Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^e Mixed income, net. Excludes consumption of fixed capital.

^f Discrepancy between total economy and components as displayed in sub-item tables.

^g Discrepancy between total economy and components as displayed in sub-item tables. Discrepancy with equivalent item in Table 1.3: Relations among product, income, saving, and net lending aggregates.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

^c Account does not balance.

^d Discrepancy with equivalent item in Table 4.1 Total Economy.

^e Discrepancy between components and total.

Denmark

Source

The preparation of national accounts statistics in Denmark is undertaken by the Statistics Denmark, Copenhagen. The official estimates are published in "Nationalregnskabsstatistik", Danmarks Statistik. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates have been prepared in accordance with the concept and definitions recommended in System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables. The following presentation of sources and methods is mainly based on a report prepared by the Statistical Office of the European Communities in 1976 entitled "Base statistics needed for the ESA accounts and tables: present situation and prospects for improvements" and on "Input-output tabeller for Danmark 1966" published by Danmarks Statistik in 1973.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. The national accounts for Denmark cover only the southern part of the kingdom and therefore exclude the Faeroer Islands and Greenland.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. The commodity-flow approach is used for private final consumption expenditure and gross fixed capital formation. The estimates of government consumption expenditure are mainly based on the accounts of the central and local government and on social security funds. The estimates of private consumption expenditure, using the commodity-flow method, have a time-lag of two years. Therefore, short-term estimates are made, using turnover statistics for the retail trade. This is supplemented by family budget surveys which are conducted every five years. Changes in stocks are estimated on the basis of inventory statistics. For gross fixed capital formation, information is classified by product and by ownership branch. The valuation is made net of deductible value added tax. Estimates of investments in buildings are based partly on data available on construction starts, work under construction and work completed and partly on information from accounting data. Estimates of investments in machinery and equipment are based on production and foreign trade statistics adjusted to include gross margins, duties etc. Exports and imports of goods and services are estimated mainly from the balance-of-payments and foreign trade statistics. Special surveys are available for shipping and for payments to and receipts from the rest of the world by Danish enterprises. For the constant price estimates, price indexes arrived at for the supply of goods and services, broken down into 4,000 groups, are used for all components of Gross domestic product by expenditure type except that of exports for which the indexes for domestic output are used.

Income Approach

Data on the compensation of employees are taken directly from the annual surveys on current transactions. For consumption of fixed capital, only rough estimates are made. Total indirect taxes and subsidies are obtained from government accounts. Operating surplus is estimated as a residual.

Production Approach

Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. The production approach is used to estimate the value added of almost all industries. The income approach is used to estimate the value added of producers of government services, parts of business services and other private services. The gross output of the trade sector is primarily estimated by means of the commodity-flow approach. The estimates of agricultural production are based on product-by-product data in terms of volume and prices which are obtained from the annual agricultural statistics. The estimates of gross output are supplemented by survey data on total costs and cost structure. For forestry and fishing, the main sources used are the annual agricultural reports and the annual reports of the Ministry of Fisheries. For manufacturing, estimates are based on an annual survey covering all enterprises employing 20 or more persons and on a quarterly survey on the turnover of 4,000 products. Censuses taken in 1966 and 1975 provide a product-by-product breakdown of intermediate inputs. The value added tax returns of enterprises are used to make estimates for small enterprises and services not covered by direct surveys. For electricity, gas and water, the estimates are based on annual electricity statistics, accounting statistics of the municipalities and on local government reports, respectively. For private construction, various sources are used such as an annual accounting survey and investment statistics. Construction in the public sector is estimated from government accounts. The estimates of gross trade and transport margins are based on data obtained from a sample survey of trade enterprises adjusted for under coverage, mark-ups and other non-available margins. Another method used is to estimate the size of the gross margins of each commodity and its share in the distributive channel. These estimates are partly based on information from the Price Directorate. For restaurants and hotels, value added tax statistics are used. For the transport sector, the information is taken from the accounts of the enterprises concerned except road transport which makes use of the value added tax returns. For the financial sector, the balance sheets and complete accounts of the companies' current transactions are used. A benchmark survey of housing rents is carried out every five years. For intervening years, changes in the average rent and total stock of residential buildings are used. Rents of rented dwellings are used for the imputation of rents of owner-occupied dwellings. Value added tax statistics, population census and accounting data of advertising services are used for the business services sector. The main sources for the producers of government services are the account of the central and local government and social security funds. For other services, value added tax statistics are used except for professions like doctors and dentists, for which social security data are used. For the constant price estimates, double deflation is used. The data are deflated by means of a price index related to each of the 4,000 groups of goods and services. The price indexes are applied to domestic output as well as imports.

Djibouti

Source

Reply to the United Nations national accounts questionnaire from Direction Nationale de la Statistique, Djibouti. The official estimates are published by the Direction Nationale de la Statistique in "Annuaire Statistique de Djibouti" and "Comptes Nationaux de Djibouti, 1990-1998".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Reply to the United Nations national accounts questionnaire from the Ministry of Finance, Trade and Industry, Roseau.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Dominican Republic

Source

Reply to the United Nations national accounts from the Banco Central de la Republica Dominicana, Santo Domingo. The official estimates are published by the Banco Central in the series "Cuentas Nacionales, Producto Nacional Bruto", which also includes a detailed description of the sources and methods used for the national accounts estimation. Beginning 1984, estimates for imports and exports of goods and services were converted from dollars to pesos by using the annual average exchange rates fixed by the Central Bank.

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. Gross fixed capital formation is mainly estimated by the commodity-flow method, whereas private final consumption expenditure is taken as a residual, which also includes changes in stocks which could not be computed directly. Government consumption expenditure data for the central government is obtained from the Ministry of Finance and the National Budget Office. For gross fixed capital formation, import statistics are utilized for capital goods such as machinery, equipment and transport and communication equipment, since no such products are produced locally. To the import values are added customs duties, surcharges, mark-ups, etc. The data on exports and imports of goods and services are taken from the publication on balance of payments, prepared by the Central Bank. For the calculation of constant prices, price deflation is used for government consumption expenditure. Compensation of employees is deflated by means of the cost of living index, whereas for government purchases and sales general price indexes are used. Constant value of private consumption expenditure is obtained as a residual. The value of construction is deflated by a construction costs index. In the case of rural dwellings base-year prices are multiplied by number of dwellings built. The import price index is used as a deflator for exports and imports of goods and services.

Income Approach

The data on indirect taxes and subsidies are based on the annual reports of the Ministry of Finance and on information from the Treasury and the National Budget Office.

Production Approach

The production approach is the basic method of estimation used for most sectors. The income approach is used for trade, transport and communication, finance, general government and other services. In agriculture, gross output is estimated by multiplying the quantities harvested by the average price paid to the producers. Quantity data are available from the agricultural censuses of 1950, 1960 and 1970 and from estimates by the Banco Agrícola, the Ministry of Agriculture and others. Own-account consumption is included in the production series. Data on the volume of livestock production is provided by the Ministry of Agriculture, which also estimates the quantity of unreported slaughter and herd changes in livestock. The basic information for calculating gross output

of the mining and quarrying sector is obtained directly from the reports on production and sales of enterprises. For manufacturing, the main source of information is the series of annual bulletins of industrial statistics. The value of construction for 1960, which is taken as a benchmark, is extrapolated by means of a value index. This index is a combination of a price index of construction costs and an index of main materials used. Value added is obtained by applying to gross output a coefficient representing the ratio of gross factor income. Data for the trade sector are available from the first national trade census carried out in 1955, and from total wholesale and retail sales figures published periodically by the National Statistical Office. Wages and salaries are calculated by combining average remunerations series with sectoral employment series. The Dominican merchant marine and the Dominican airline provide the data needed to estimate incomes, inputs and value added for shipping and air transport. For land transport the information obtained include data from transport enterprises and surveys among owners of trucks and taxis. For financial institutions the estimates are based on complete accounting information which is available for all banks and finance companies and most insurance companies. Value added of ownership of dwellings is taken as the difference between gross rents paid or imputed based on census data and the inputs for maintenance, upkeep and management and property taxes. For public administration and defence, data are obtained from government authorities, publications and from independent institutions. For other private services, data on the number of persons employed and mean income are used. The benchmark data are extrapolated according to a specially constructed income index. For the computation of constant prices, the value added for agriculture is estimated by a revaluation at base-year prices of the harvested quantities. In the case of livestock products, estimates of annual changes in average meat yield per animal are utilized. For mining and quarrying, value added is estimated by revaluating the different minerals at their respective 1962 prices. Value added of manufacturing is extrapolated by a quantity index of output. Current values of public and private construction are deflated by means of an index of construction costs. Wholesale and retail sales of locally produced and imported goods are deflated using the respective price indexes. For transport, storage and communication, value added is extrapolated by quantity index of output. For financial institutions, value added is extrapolated by quantity indicators of personnel employed. For ownership of dwellings the indicator used is the number of urban and rural dwellings. Value added for public administration, defence and other services is extrapolated by an indicator of the number of personnel employed.

Ecuador

Source

Reply to the United Nations national accounts questionnaire from the Subgerencia de Cuentas Nacionales, Banco Central del Ecuador, Quito. The official estimates are published annually in "Memoria del Gerente General del Banco Central del Ecuador".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). These data are denominated in sucres. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Egypt

Source

The preparation of national accounts statistics in Egypt is undertaken by the Ministry of Planning, Cairo. Official estimates are published in the annual "Statistical Yearbook" published by the same agency. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. Some tables have been updated from 1987 onwards using the "Economic Bulletin", Vol. 52 No. 1, 1999 of the National Bank of Egypt. The data from 1996 onwards have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). An input-output table for the year 1966-67 has been completed by CAPMAS. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. The estimates of government final consumption expenditure are based on government budgets and accounts. For private consumption expenditures, the estimates are based on family budgets and household expenditure surveys. The Department of Statistics prepares data on inventories of cotton, covering both commercial stocks and stocks of spinning industry. Other sources of information for changes in stocks include data collected regularly by the Ministry of Supply. For gross fixed capital formation, the government sector is estimated directly together with government consumption expenditure. The private sector estimate is obtained by deducting the government estimate from total capital formation. Capital formation in machinery and equipment is estimated through the commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of merchandise are generally based on foreign trade statistics. The estimates of GDP by expenditure type in constant prices are prepared by the CAPMAS on the basis of official index numbers of prices and quantities.

Income Approach

The estimates of wages and salaries are based on government accounts and on various sectoral surveys. No specific information is available for operating surplus, which is computed as a gross estimate, i.e., including consumption of fixed capital. Indirect taxes and subsidies are separately available for all economic units in the compulsory standard accounts for public enterprises and in the economic surveys for the private sector.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is used to estimate value added of community, social and personal services. The Ministry of Agriculture collects, through annual sample surveys, data on crop area, yield and crop-cutting. Livestock data are obtained through special censuses every two years and prices received by farmers are collected annually. The estimated acreage of each of the main crops is multiplied by average productivity of the basic area of measurement. The gross output is evaluated at farm-gate prices and estimates of intermediate consumption are based on data collected from the co-operative societies and from censuses. For the industrial activity sector, annual statistics on industrial production, capital formation,

employment, wages and salaries are available for industrial establishments with ten workers or more which form the organized sector of the economy. For the non-organized sector, estimates are made by using data from industrial censuses and by studying the cost-structure of each industry, productivity and degree of mechanization. The output of construction is estimated indirectly from the input side by means of employment data and data on intermediate consumption. The value of gross output and components of value added are obtained by using the relationship between available data on intermediate consumption and primary inputs in organized enterprises and applying this relationship on the estimated intermediate consumption of this industry. For trade, annual basic statistics are available for establishments with five or more workers, while those with less than five workers are covered by sample surveys conducted every three years. Estimates for restaurants are made by using data on establishments, wages and salaries, working hours and data from sample surveys. Estimates for hotels are obtained through annual questionnaires. Data on input, output and other elements of large-scale transport are available through annual accounts. For unorganized transport, estimates are based on information on the number of establishments and workers, on wages and salaries and on other sources. Indicators such as input ratios are used to estimate value added. Gross output and input of public financial institutions and insurance companies are based on data collected annually. The estimates of real estate, business services, and imputed rents of owner-occupied dwellings are based on family budget surveys. The government accounts provide information to estimate government services. Annual data are available for non-profit institutions serving households. For the service activities of unincorporated enterprises, gross output and inputs are estimated by using available censuses of establishments, wages and salaries statistics. The constant prices of GDP by kind of economic activity are estimated by CAPMAS on the basis of official index numbers of prices and quantities such as wholesale prices, consumer prices and quantities of imported and exported merchandise.

El Salvador

Source

The preparation of national accounts statistics in El Salvador is undertaken by the Departamento de Cuentas Macroeconomicas (formerly Departamento de Investigaciones Economicas) del Banco Central, San Salvador. The official estimates are published monthly in "Revista Mensual". A detailed description of the sources and methods used for the national accounts estimation is contained in "Metodologia de Cuentas Nacionales de los Países Centroamericanos" published by the Consejo Monetario Centroamericano Secretaria Ejecutiva in October 1976. Emploment data are compiled by the Dirección General de Estadísticas y Censos.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides clarification.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The commodity-flow approach supplemented by the expenditure approach is used for private final consumption expenditure and gross fixed capital formation. The estimates of government consumption expenditure are obtained directly from government sources. For private consumption expenditure, the commodity-flow approach is used with adjustments made for distribution and other costs which are included in the retail value. The estimates of increase in stocks are based on information on stored agricultural products, the stocks of the manufacturing and trade industries and the stocks of public construction. Private capital formation is estimated on the basis of data on domestically produced and imported capital goods and on statistics of construction and repair work. The imports data are adjusted to include import duties, trade margins and installation costs. For public expenditure on capital formation, data are obtained from official sources. Data on exports and imports of goods and services are obtained from the balance of payments. Export data on coffee are obtained from the Compania Salvadorena de Cafe, while other merchandise data are furnished by the Direccion General de Estadistica y Censos. Gross domestic product by expenditure at constant prices is not estimated.

Income Approach

Compensation of employees, combined with operating surplus, is obtained as a residual. The estimates of net indirect taxes are derived from the government accounts. No specific information is available on how consumption of fixed capital is estimated.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most industries. The income approach is used for domestic services and public administration and defence while an indirect method is used for the trade sector. The agricultural data, which are provided by Ministerio de Agricultura y Ganaderia, are obtained through various periodic surveys. Data on the coffee harvest are supplied by the Compania Salvadorena de Cafe while coffee prices are taken from the Compania de Cafe's export prices. Information on the production of cotton is provided by the Cooperativa Algodonera Salvadorena Ltda. The gross value of production is calculated by

applying producers' prices to the quantity of each commodity produced. For the livestock sector, information is obtained from the Direccion General de Estadistica y Censos, external trade data and through direct studies on prices. Value added of forestry and logging is estimated by means of indirect methods. For the mining and quarrying sector, the estimates are based on 1961 census figures combined with a volume index constructed from square-meter construction data and on price index. The gross value of production in manufacturing is based on the results of annual surveys and industrial censuses held every five years. Estimates for small-scale manufacturing is extrapolated from census data. The estimates for electricity are based on industrial census results and on information furnished by the concerned agencies. For private construction, the information is obtained from the Direccion General de Estadistica y Censos. The basic sources include permits issued for urban construction. Rural population figures are used to determine the number of new dwellings in rural areas. The estimates for public construction are obtained from concerned institutions. For both public and private constructions, intermediate consumption is determined by using a fixed percentage of gross value of production. Gross output of the trade sector is determined on the basis of the values of domestic and imported goods marketed. The gross value of production of domestic goods and the c.i.f. values of imported goods are adjusted for changes in stocks and trade margin are added. An estimate of inputs, which is made from survey based on percentages for electricity, transport, etc., is deducted from the total gross value of production to arrive at value added. Estimates of restaurants and hotels are interpolated and extrapolated on the basis of census figures. The enterprises concerned with road transport are classified into international, inter-departmental, urban and interurban transport. A sample from each category is taken in order to obtain average figures for estimating receipts per ton, which are multiplied by quantity figures to arrive at gross value of production and value added. For railways, air transport and communication, information is obtained directly from concerned companies. The estimates of the financial sector are based on financial statements furnished by the banks and insurance companies. Imputation is made for service charges by deducting interest from investment income. The estimate of ownership of dwellings are based on the number of urban and rural dwellings obtained from the population censuses and rents data from surveys, and using the cost of living index as an inflator. Ten percent of the gross value of production are deducted for inputs. The estimates of government services are based on information published by the Ministerio de Hacienda. For other services such as education, hospitals, religion, the estimates are obtained from concerned institutions or from publications such as Indicadores Economicas and Boletin Estadistico. For domestic services, the annual average wages for four regional areas of the country are applied to an estimate of the number of persons engaged. The latter is based on the 1961 census figures and average growth rates while the wage is estimated annually, applying the cost of living index. For the constant price estimates, value added for the agricultural, electricity, trade, transport and financial sectors is estimated by using volume or quantity indexes. Double deflation is used for the manufacturing sector. Price deflation is used for mining and quarrying, construction, restaurants and hotels and government services. For domestic services, wages paid in the base year are applied to the number employed in the current year.

Estonia

Source

Reply to the United Nations national accounts questionnaire from the State Statistical Office of Estonia, Tallinn. The official estimates are published in the "National Accounts in Estonia". The latest data was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Previously the estimates have been prepared in accordance with the United Nations document entitled "Comparison of the System of National Accounts and the System of Balances of the National Economy, Part 1: Conceptual Relationships" (F.20) for the years 1980-1990. For the years beginning 1991, the estimates are in accordance with the 1993 System of National Accounts. On June 20, 1992 Estonia shifted from the Soviet rouble to the Estonian kroon at a rate of 10 roubles equal to 1 kroon. All estimates shown in the following tables accordingly were converted to Estonian kroon.

^a Excludes financial intermediation services indirectly measured (FISIM).

^b Includes Financial intermediation services indirectly measured (FISIM).

^c Discrepancy between Total Economy and Domestic Sectors as Total Economy includes FISIM, but domestic sectors exclude it.

^d Discrepancy with equivalent item in Table 2.3 Output, gross value added and fixed assets by industries.

^e Includes Other subsidies on production.

^f Discrepancy with equivalent item in Table 1.3: Relations among product, income, saving, and net lending aggregates.

^g Account does not balance.

^h Discrepancy between Total Economy and the sum of domestic sectors.

ⁱ Total economy does not sum up to institutional sectors.

^j Discrepancy with equivalent item in Table 1.3: Relations among product, income, saving, and net lending aggregates. Discrepancy between Total Economy and the sum of domestic sectors.

Ethiopia

Source

The preparation of national accounts statistics in Ethiopia is undertaken by the Central Statistical Office, Addis Ababa. The official estimates with methodological notes are published annually in the "Statistical Abstract". Data from 1987 onwards has been obtained from "Statistical Abstract" 1997 edition published by Central Statistical Authority of Ethiopia and "Quarterly Bulletin" Vol. 14, No. 4, Fourth Quarter, 1998/99; Vol. 12, No. 1, First Quarter, 1996/97 and Vol. 12, No. 4, Fourth Quarter, 1996/97 published by National Bank of Ethiopia. The data for Ethiopia excludes Eritrea.

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations Systems of National Accounts 1968 (1968 SNA). The Ethiopian fiscal year which is from June to July has been used for all estimates except the "External Transactions" table. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach, is also used for estimating gross fixed capital formation. Private consumption expenditure is obtained as a residual which also includes increase in stocks. Government final consumption expenditure, consisting of compensation of employees and net purchases of goods and services, is obtained from the annual budgetary revenue and expenditure report, from the Ministry of Finance and from municipalities. These sources are also used for estimating the public sector's capital formation in building and construction. The estimates of private construction in urban areas are based on building permits which are adjusted for timing by taking the average of the last two years and adding 5 percent for underreporting. Other urban private construction is estimated by applying the ratio of per capita consumption expenditure in Addis Ababa to the per capita consumption expenditure in other urban areas. Construction in the rural areas is estimated by multiplying the assumed number of tukuls built in a given year by an assumed average cost per tukul. For capital formation in machinery and equipment, import statistics are used. To the import values are added import duties, transport costs, trade margins and installation costs. The data on exports and imports of goods and services are obtained from the external trade statistics. Gross domestic product by expenditure type at constant prices is not estimated.

Income Approach

The cost-structure of the gross domestic product is not estimated.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is also used in measuring the output of the modern sectors of the economy such as the industrial activity and the services sectors. The estimates of the value added of agriculture for the benchmark years 1961-1963 are based on various sources such as population figures, assumed per capita consumption of food grains and wholesale prices. Recent years' estimates are also based on qualitative crop surveys and surveys on cultivated area. The net output by type of plant product is multiplied by wholesale prices adjusted for trade and transport margins. The 1961-1963

benchmark estimates of livestock production were based on the number of livestock by type, on gross output and on value added. For subsequent years, gross output and value added are derived by applying growth factors linked to the population growth rate. For forestry, the sources include the Forestry Department, the survey of wood-working industries, family budget studies in 1967/68 and the annual surveys of manufacturing industries. Value added is derived by deducting 10 percent from gross value of production of industrial wood and firewood. The Ministry of Mines and the annual budgetary reports provide data for the mining sector. The value of production is estimated by multiplying the quantity produced of each mineral product by its average price. The source of data for large-scale manufacturing is the annual surveys of manufacturing industries. Values added is obtained by deducting the cost of inputs of raw materials, fuel and energy from the gross value of production. For small-scale manufacturing and handicraft, value added is derived by assuming that the growth rate is half of the one observed for output of large-scale manufacturing. Data for electricity are obtained from annual returns to questionnaires submitted to concerned enterprises. Data on the number of building permits issued, the 1968 household expenditure survey and population estimates are used to estimate the value of construction in the private sector. The total value of Addis Ababa building permits is adjusted for timing and under-reporting. Work done in other towns is estimated by applying the ratio of per capita consumption expenditure in Addis Ababa to the per capita consumption expenditure in other towns. For the public sector, data are obtained from the budgetary revenue and expenditure reports as well as from questionnaires sent to municipalities and public agencies. The gross trade margin of imported goods is estimated at 15 per cent of the value of imports based on the 1963 trade inquiry. Similar assumptions are made for locally produced goods. Value added in the transport sector is based on the annual reports of concerned enterprises for the railway, water and air transports. For road transport, data on passenger or ton kilometres, registration statistics, and passenger fares and freight rates are used. For the financial institutions, the profit and loss statement and the annual reports of concerned institutions are used. Benchmark estimates for 1961-1963 are available for ownership of dwellings. The gross rental income of the urban areas is obtained by multiplying the total number of housing units by assumed actual and imputed average annual rental rates, while for the rural areas the total number of "tukuls" is multiplied by the assumed average value per "tukul". Value added of public administration and defence is equal to total wages and salaries paid to government employees, including payment in kind. The sources of data include annual reports and questionnaires sent to different agencies. For other government services such as education and health, value added is based on government reports. Value added per student enrolled in non-governmental schools is estimated as two-thirds of the value added per student in government schools. The value of domestic services is obtained by multiplying the number of employees by assumed average pay rates. For the constant price estimates, the current net output of plant products in the agricultural sector is revalued at base-year producer prices. For livestock, water supply and construction, value added at current factor costs is assumed to be equal to the value added at constant factor costs. Price indexes are used to deflate the current value added of mining and quarrying, small-scale manufacturing, trade, finance and most of the services sectors. For large-scale manufacturing, electricity, transport and domestic services, value added is extrapolated by volume indexes.

Fiji

Source

Reply to the United Nations national accounts questionnaire from the Bureau of Statistics, Suva.

General

The estimates shown in the following tables have been prepared in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). The official estimates together with methodological notes are published in a series of reports titled "National Accounts Studies". The third volume of this series, "The National Accounts of Fiji 1968-1972" contains a detailed description of the sources and methods used for the national accounts estimation. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure which is mostly based on the commodity-flow approach. The estimates of government final consumption expenditure are based on the annual report "An Economic and Functional Classification of Government Accounts". For private consumption expenditure estimates, all imported items valued at landed cost from foreign trade statistics and producers' values from industrial censuses are grossed up by margins established in the 1970 Census of Distribution and Services. Special estimates are made for those items after consumer expenditure, such as food, electricity, gas and water, medical services and recreations, which are not covered by the commodity-flow approach. For these estimates data from the household budget survey in 1972, income tax statistics and the 1970 census of distribution are used. Estimates of gross capital formation for the private industry are based on surveys of capital investment, for government industry and producers of government services the estimates are derived from government account and for the producers of private non-profit services to households from the 1970/1971 survey of non-profit making institutions. Value of imports and exports of goods and services are obtained from the balance of payments and annual shipping and aircraft statistics. For the constant price estimates, the current values of expenditure items are deflated by various price indexes such as consumer price index, index of rural produce prices, implicit price index of value added of building and construction, trade index of exports, etc.

Income Approach

Estimates of the cost-structure of gross domestic product are made from the various sectoral surveys and taxation data. Estimates of indirect taxes and subsidies are based on government accounts.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market price, i.e. producers' values. The production approach is used to estimate value added of most industries, such as agriculture, mining, manufacturing, electricity, gas and water, construction, and for the trade sector in combination with the commodity-flow approach. The income approach is used to estimate value added of restaurants and hotels and most of the subsectors of the service industries. For agricultural sector, the total output of sugarcane and copra are estimated from material inputs revealed by annual industrial censuses. The benchmark estimates of substance output is based on the 1968 Agricultural Census, the 1965 Rural-Urban Household Expenditure Survey and Bureau of Statistics data. The annual increases are based on estimates of population growth and an index of

rural produce prices. For other agricultural produce gross output is based on 1968 and 1972 household budget surveys and intermediate consumption is based on case studies. The gross output and intermediate consumption of the industrial activity sectors are based on annual industrial censuses carried out since 1970. Estimates of gross output, intermediate consumption and compensation of employees of private construction are obtained from annual censuses of building and construction conducted annually since 1970. Government bodies engaged in construction are covered through their annual reports and operating budgets. For the trade sector, the estimates are based on statistics from the Inland Revenue Departments and on the Census of Distribution 1970. The producers' values and c.i.f. import values are grossed up by the margin established in the 1970 Census of Distribution. Banking estimates are obtained from income tax statistics while insurance estimates are derived from annual surveys. Imputed rent per urban household is derived from the household budget survey in 1968, grossed up by the consumer price index for rent and the growth in urban population. For rural areas, an estimated rent has been assumed in 1968 and grossed up annually by a rural price factor and growth in rural population. Estimates for producers of government services are based on the operating budgets and government accounts and finance. Other services estimates are derived from income tax statistics, the 1970/71 survey of non-profit institutions and 1970 Census of Distribution and Services. For the constant price estimates, the general approach used for the major crops of agriculture, industrial activity, transport, insurance and private services is extrapolated. Value added is extrapolated by production indexes. Price deflation is used for construction, trade, restaurants and hotels, real estate, banking and producers of government services, the current value being deflated by various price indexes such as consumer price index, index of wage rates, etc.

^a Derived from available data.

Finland

Source

The data for Finland was provided by Statistics Finland, Helsinki, and received through the Organisation for Economic Co-operation and Development (OECD), Paris. Official estimates are published annually in "Kansantalouden Tilipinto" issued by the same office. Information on concepts, sources and methods of estimation utilized can be found in "Heikki Sourama-Olli Saariaho, Kansantalouden tilinipito, Rakenne, Maaritelmat ja luokitukset", Central Statistical Office of Finland, Studies No. 63, Helsinki, 1980. The data displayed in Series 300 correspond to the revised series published by Statistics Finland in January 2003. They are available from 1995 and have been linked backwards by OECD with former series in order to obtain time series without break.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates prepared according to the 1968 SNA are provided in the former national currency Finish markka. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Finland the currency name for the data before 1999 is "1999 FIM euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 5.94573 Finish markka. - The name of the currency of the newly submitted data is "1999 FIM euro" for the data before 1999 and "euro" for the data from 1999 on. Previously submitted data for Finland, like all data following the 1968 SNA is in "Finish markka", although this is not specifically indicated in the tables.
