^a Discrepancy between components and total.

^b Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^c Mixed income, net. Excludes consumption of fixed capital.

^d Account does not balance.

^e Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

France

Source

The preparation of national accounts statistics in France is undertaken by the Institut National de la Statistique et des Etudes Economiques (INSEE), Paris, with the co-operation of some other administrative bodies. The official estimates are published in "Comptes de la Nation", INSEE which is issued annually on June in the "INSEE-Resultats" series. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The estimates are generally in accordance with the classifications and definitions recommended in the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. The estimates are elaborated according to French classifications and The estimates prepared according to the 1968 SNA are provided in the former national currency guidelines of the "Systeme Elargi de Comptabilite Nationale", which is the French version of the "European System of Integrated Economic Accounts" (ESA). The estimates prepared according to the 1968 SNA are provided in the former national currency French franc. The latest data input-output tables valued at market prices are an integral part of the French national accounts and are published every year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Chain indices are used to measure volume growth and the resulting chained constant prices data, 1995 base, are not additive. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of France the currency name for the data before 1999 is "1999 FRF euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 6.55957 French franc. - The name of the currency of the newly submitted data is "1999 FRF euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for France, like old data following the 1968 SNA is still in "French franc", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

The economic territory for which the French national accounts are compiled includes the so-called "overseas departments" (French Guyana, Guadeloupe, Martinique, and Réunion), and excludes other kinds of overseas territories (e.g. New Caledonia). Some units located in the other overseas territories may be included in the French economic territory to the extent that they constitute military bases or scientific stations. E.g. the military base located in French Polynesia is included in the French economic territory while French Polynesia as such does not. The same holds for scientific stations situated on the Antarctic continent. Gross domestic product (GDP) is estimated through three different approaches: the production, the expenditure and the income approach, which are used to derive GDP by kind of economic activity, by expenditure and by cost structure, respectively. The input-output table allows a partial synthesis between the production and the expenditure approaches. The final synthesis is based on the production accounts by industry. It actually concerns a part of the national economy only: some accounts (government and private non-profit administrations, financial institutions, insurance

companies, large public corporations) which are integratedly built for the industries and for the corresponding sectors are taken to be final and are not questioned at this stage. Reconciling estimates relating to industries and to sectors is performed by distributing value added discrepancies among them or adjusting the global value added estimate: in this case, the distribution of total supply between intermediate consumption and final uses is revised and/or production accounts are corrected for institutional sectors which are considered to be questionable.

Expenditure Approach

For each commodity of the input-output table classification, a commodity-flow balance is built, generally by aggregating and completing balances elaborated at a more detailed level of the classification. Sources allowing the household private consumption to be estimated are infra-annual inquiries on production combined with foreign trade data at a very detailed level of the classification, households surveys and specific informations relating to such expenses as health or dwelling. Estimates relating to goods are compared with informations about the retail trade turnover. Gross fixed capital formation estimates proceed from the commodity flow balances compared with informations originating in the investors business accounts at a rather aggregated level. Changes in producers stocks come from the breakdown, by product, of stocks held at the beginning and at the end of the year by enterprises and from an estimate of the holding gains accruing on goods held in stock. Users and trade stocks are estimated by composing intermediate and households consumptions estimates in the commodity flows. Foreign trade comes from the customs statistics and the balance of payments services exchanges, completed by some ad-hoc sources.

Income Approach

Three basic sources are used to estimate the cost-components of the different institutional sectors. First, individual accounting data which are not adjusted: government administrations, large public corporations, financial institutions and insurance companies. Second, data on firms (non-financial corporations excluding large public corporations and private unincorporated non-agricultural enterprises) originating from fiscal informations which are adjusted to take into account absences, tax cheating and evading and made consistent with corresponding data obtain from the first source. Third, statistics not originating in the centralization of individual accounting data: unincorporated agricultural enterprises, some productions of households (rental services of dwellings, self consumption of agricultural products, domestic services), private non-profit institutions.

Production Approach

The estimates of the production of non-financial and non-agricultural firms by industry, except large public national firm start from the sales as reported in the firms' fiscal returns. The part of the production which is not properly reported in the sales - inter-establishment deliveries, production for own capital formation, subcontracting and processing of customers owned materials - is added up in order to obtain non-stocked production estimates. Accounting data of financial institutions, insurance companies and large public corporations which are processed separately make it possible to estimate the output of the corresponding industries. Agriculture production indirectly estimated from products sources while trade output is estimated from trade margins by product and type of use. The estimates of the production of government industries come from data supplied by concerned units. Non-market services output is obtained as the sum of the costs. With the exception of some rows or columns, or more generally of some cells, of the intermediate consumptions table, the intermediate consumptions are calculated, for current year in an indirect way, that is, the principle consists in projecting the preceding year table assuming that the technical coefficients remain unchanged at constant prices. The adding up of the estimates in row, i.e., the projected total intermediate consumption for each product, is compared with the intermediate demand as estimated from the commodity-flow balances (see gross domestic product by expenditure).

^a Includes FISIM but FISIM is not included in Intermediate consumption of the other domestic sectors.

^b Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^c Mixed income, net. Excludes consumption of fixed capital.

^d Not equal to the sum of corresponding components in the domestic sector accounts as one or more of the components have not been revised.

^e Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

^c Statistical discrepancy between data for this year(s) and the sum of the corresponding items of Sectors S.14 and S.15.

Georgia

Source

The latest data was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note the changes in the official currency of Georgia. The reported data for the years 1990-1992 is in Russian ruble, 1993-1994 in coupon, and from 1995 onwards in lari.

Germany

Source

The data was provided by the Federal Statistical Office (Statistisches Bundesamt), Wiesbaden and received through the Organization for Economic Co-operation and Development (OECD), Paris. The official estimates are published in "Volkswirtschaftliche Gesamtrechnungen, Fachserie 18, Reihe 1.3", Statistisches Bundesamt.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The Official estimates are published in the monthly bulletin 'Wirtschaft und Statistik'. Detailed data as well as description of the sources and methods used for the national accounts estimation are published annually in Fachserie 18 'Volkswirtschaftliche Gesamtrechnungen', Reihe 1.3 'Statistisches Bundesamt'. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The statistics for Germany in this publication refer to Germany after unification. Official data for Germany after unification are available only from 1991 onwards. In this publication, the OECD has estimated some national accounts aggregates for the whole of Germany back to 1970 in order to calculate the various zones totals. These estimates are based on statistics published by the Statistisches Bundesamt in July 2002 and by the East German Statistical Office in 1990 for period 1980-89. They are also based on the ratios of the aggregates of West Germany and the whole of Germany. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Germany the currency name for the data before 1999 is "1999 DEM euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 1.95583 deutsche mark. - The name of the currency of the newly submitted data is "1999 DEM euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Germany, like for example all old data following the 1968 SNA is still in "deutsche mark", although this is not specifically indicated in the tables.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

Ghana

Source

The preparation of national accounts statistics in Ghana is undertaken by the Central Bureau of Statistics, Accra. The official estimates are published by the bureau in the "Economic Survey". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data from 1992 to 1996 has been taken from "Quarterly Digest of Statistics", Dec. 1997, of the Statistical Service of Ghana.

General

A detailed description of the sources and methods used for the national accounts estimation is contained in the publications "Sources and Methods of Estimation of National Income at Current Prices in Ghana" and "National Income of Ghana at Constant Prices". The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). Work relating to input-output analysis is being done at present. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

Gross fixed capital formation is estimated by using the commodity-flow approach. A combination of commodity-flow and expenditure approach is used for increase in stock. Private consumption expenditure is treated as a residual. Gross fixed capital formation is classified according to type of capital goods and not according to kind of economic activity. The estimates of increase in stocks are mainly based on special inquiries into the stocks held by selected kinds of producers and distributors. Adjustment is made to arrive at estimates on the equivalent of physical changes in the stocks, valued at average market prices during the period of account. Government consumption expenditure is estimated on a cash basis from government records. These records are reclassified according to government purposes. It is feasible to distinguish between acquisition for military purposes and for civilian purposes which exclude durable goods. Sales of goods and services by government to the public are subtracted from total expenditure. Exports and imports of goods and services are mainly estimated from foreign trade statistics of merchandise trade supplemented by information from the Central Bank. For the constant price estimates, no specific information is available for government consumption expenditure, but wages and salaries paid by government are extrapolated by index numbers of employment. For gross capital formation, current values are deflated by appropriate price indexes. In the case of commodity trade, current values are deflated by Paasche indexes of prices specially prepared for this purpose. Private consumption expenditure is obtained as a residual.

Income Approach

In estimating the cost structure components of gross domestic product, the perpetual inventory method is used for estimating consumption of fixed capital. Indirect taxes net of subsidies are obtained by analysing the taxes on production and expenditure in the revenue account of the government. The domestic factor income is obtained as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices i.e., producers values. The value added of the majority of industries is estimated through the production approach. A combination of the commodity-flow approach and the expenditure approach is used for the construction sector. For the

agricultural sector, statistics of the Ghana Cocoa Marketing Board is the main source of information for the estimation of cocoa, which is the most important crop in Ghana. For other principal crops, information is collected through annual sample surveys. The production of crop is estimated as the product of area sown and yield per acre. The intermediate consumption is estimated on the basis of a small-scale survey in 1969 and projected on the basis of movements in acreage and prices of the crops. Data on gross output of forestry and logging are obtained from the Forestry Department while for intermediate consumption, a small-scale sample survey has been carried out in a bench-mark year and a constant input ratio applied for subsequent years. Annual establishment surveys are undertaken on a census basis for mining, large-scale manufacturing and electricity and water supply. In the case of manufacturing, the surveys provide detailed information on inputs and outputs for commodity-flow purposes. A sample survey was carried out in 1963 for small-scale and medium-scale manufacturing. The data collected formed the basis for the estimates in the subsequent years by using per worker input and output in the benchmark year and projected employment data, extrapolated from population census. For the construction sector, data on works undertaken by the government are obtained by analysing the government accounts. Information on domestic production, imports and exports of construction materials, trade and transport margins and cost-composition of the total expenditure are available to prepare estimates of gross output. The gross margins of wholesale and retail trade estimates are based partly on spotchecks in a benchmark year and partly on sample survey, while gross receipts and intermediate consumption estimates are based on income tax records and annual surveys. For the services sectors, information is generally obtained from the institutions concerned. The rental value of residential dwellings are imputed on the basis of cost components, estimated from the record of the Ministry of Local Government. For the constant price estimates, the general approach used for agriculture, industrial activity, electricity, gas and water and construction sectors is double deflation. The value added of the trade, transport and financial services is extrapolated by quantity indexes. Different kinds of price indexes are used to deflate the value added of restaurants and hotels as well as the education and recreational services.

Greece

Source

The preparation of national accounts statistics in Greece is undertaken by the National Statistical Service of Greece, Athens. Official estimates are published in a series of reports entitled "National Accounts of Greece". The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. The estimates prepared according to the 1968 SNA are provided in the former national currency drachma. Input-output tables have been published for the years 1958 and 1970 in "National Accounts of Greece 1970-1976". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Chain indices are used to measure volume growth. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. Greece joined the EMU on 1 January 2001 as 12th country and the above applies for Greece from 2001 on. In the case of Greece the currency name for the data before 2001 is "2001 GRD euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 340.750 drachma. - The name of the currency of the newly submitted data is "2001 GRD euro" for the data before 2001 and "euro" for the data from 2001 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Greece, like for example all old data following the 1968 SNA is still in "drachma", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach, is also used to estimate gross capital formation. Private final consumption expenditure is estimated on the basis of the direct expenditure approach. The estimates of government final consumption expenditure are obtained from the accounts of the different government units. For private consumption expenditure, sources include the household budget surveys, tax statistics and other statistical sources. In estimating increase in stocks, delayed information from the manufacturing and mining surveys is used to supplement the commodity-flow method. Estimates of investments in private buildings are based on building permits that have been issued, while for the public sector construction, estimates are derived from government budgetary accounts and replies from public enterprises and public funds. Information from the annual manufacturing and mining surveys as well as investments by large industrial units, public enterprises and public funds are used for machinery and equipment. Own-account construction is covered by information on loans granted for such construction works. For exports and imports of goods and services, foreign trade statistics based on the special trade principle are used. For the constant price estimates, price

indices are used to deflate the wages and salaries of government employees. For the private expenditure, the annual quantities of food, fuel, light and water charges are multiplied by average base-year prices. Expenditure on other private goods and services are deflated by appropriate price indexes. Value added of residential and non-residential buildings is extrapolated by specially constructed indicators. For other components of gross capital formation, price deflation is used. The base-year values of exports and imports of merchandise are extrapolated by volume indexes while other goods and services are deflated by mean value index of exports and imports.

Income Approach

Estimates of compensation of employees for various services such as finance, insurance and transport are estimated by using data derived from questionnaires sent to them by the National Accounts Service. For manufacturing and mining, data are derived from the annual industrial surveys. The employers' contributions are estimated by using data derived from statements of the social insurance funds. Capital consumption is estimated as a percentage of the corresponding capital stock figure for each industry and type of assets. The current-price estimates of capital stock and depreciation are calculated on a replacement cost basis. The estimates of indirect taxes and subsidies are obtained from government accounts. Operating surplus is calculated as a residual.

Production Approach

Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is used for lignite mining, electricity, gas and water and parts of the service sectors such as transportation, communication, health and education, and miscellaneous services. For agricultural and animal breeding, the estimate of production is based on annual surveys conducted by the National Statistical Office of Greece. Intermediate consumption estimates are based on data taken from various sources such as Ministry of Agriculture and the Public Power Corporation. Agricultural product prices refer to prices obtained by farmers. The estimates of mining and quarrying and manufacturing are based on the annual survey of industrial establishments. The information from the survey is available within 2-3 years, meanwhile, value added is extrapolated by the index of industrial production and the wholesale price index. Value added of electricity, gas and water is estimated on the basis of annual questionnaires sent to the concerned enterprises. For construction, gross value is obtained from investment data of buildings and other construction to which values of military construction and repairs are added. The estimates of gross trade margins for agricultural products are based on traded quantities valued at the difference between consumers' and producers' prices. For industrial and imported products, percentages of gross trade margins are applied to the traded values at current prices. Intermediate consumption estimates are based on a survey conducted in 1970 for the compilation of the input-output table. Value added of transport and communication and finance and insurance services is based on data compiled through questionnaires sent to the concerned enterprises. For ownership of dwellings, the estimation of real or imputed rent is carried out at constant prices, based on the number of dwelling rooms existing and the average annual rent expenditure in a benchmark year. These data are obtained from dwelling censuses and household budget surveys. Estimates concerning government services are obtained from general government accounts. For private health and educational services, only wages and salaries data are available. Value added of hotel is based on surveys conducted every three years by the National Accounts Service, while that of restaurants is based on data obtained from household budget surveys. For other services, employment data as well as data on average remuneration per person employed or data derived from taxation returns are used. For the constant price estimates, double deflation is used for agriculture and electricity. For water, construction, transport and hotels, value added is extrapolated by quantity indicators. For the remaining sectors of the industries, price deflation is used.

^a Statistical discrepancy with the equivalent item in table 2.1 Value Added by Industries.

^b Includes FISIM but FISIM is not included in Intermediate consumption of the other domestic sectors.

^c Includes Mixed Income, Gross.

^d Mixed income, net. Excludes consumption of fixed capital.

^e Discrepancy with equivalent item in Table 1.1. GDP by Expenditures.

^f Discrepancy with equivalent item in Table 1.3: Relations among product, income, saving, and net lending aggregates.

Source

Reply to the United Nations national accounts questionnaire from the Institut Haitien de Statistique, Port-au-Prince. The official estimates are published by the Institut in "Le Bulletin de Statistique Supplement Annuel de l'Institut".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Honduras

Source

The preparation of national accounts statistics in Honduras is undertaken by the Departamento de Estudios Economicos, Banco Central de Honduras, Tegucigalpa, D.C. The official estimates are published in "Cuentas Nacionales". A detailed description of sources and methods used for the national accounts estimation is found in "Metodologia de cuentas nacionales de los paises centroamericanos" issued by the Consejo Monetario Centroamericano in October 1976.

General

The estimates shown in the following tables have prepared in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used for private final consumption expenditure and for gross capital formation. Government final consumption expenditure is estimated on the basis of government accounts. Changes in stocks are estimated on the basis of information obtained from various sectors such as the banana industry, the mines, the petroleum sector and the trade enterprises. Private investment consists of gross value of production in the construction sector, plus imports and domestic production of capital goods which are adjusted to purchasers' values. Public investment is estimated from public sector data on settlements by type of construction and classes of machinery and equipment. The estimates of exports and imports of goods and services are based on the balance of payment data. Private consumption expenditure is estimated as a residual. For the constant price estimates, private final consumption expenditure is estimated as a residual while all other items of GDP by expenditure type are deflated by various price indexes.

Income Approach

Estimates of labour income are derived from sources such as censuses and surveys, supplemented by information on wages and salaries paid by various government agencies and other public bodies. Estimates of profits of enterprises and professional incomes are obtained from the Direccion General del Impuesto sobre la Renta. Estimates of interest and dividend payments received by household and private non-profit institutions are derived as a residual. Indirect taxes and subsidies are estimated on the basis of government sources. For consumption of fixed capital, no specific information is available.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is, however, used to estimate value added of producers of government services, part of the transport sectors and other private services. For the agricultural crop production, information is obtained directly from the most important export enterprises while for other products, estimates are obtained from consumption per capita data adjusted for exports and imports. Surveys are conducted to obtain information on basic production of grains. Agricultural censuses were held in 1953, 1965 and 1974. The Instituto Hondureno del Cafe provides complete information for coffee production. The banana companies in the northern zone are visited annually while for the rest of the country, consumption per

capita data are taken into account together with prices collected from native producers. Livestock production information is gathered from the most important producers with adjustments made for clandestine or uncontrolled transaction. Inputs are estimated as 30 percent of the gross value of production. The production in the forestry sector is calculated as a function of household and industrial consumption of firewood, and extrapolated by an index. The estimates of fishing are calculated on the basis of information from the Direccion General de Pesca, the foreign trade statistics and per capita consumption data. For metal mining, the statistical information is obtained directly while estimates for non-metallic mineral are based on inputs used in the construction sector using certain coefficients derived from analysis of construction costs. The estimates of manufacturing are based on censuses, surveys and sample data provided by the Direccion General de Industrias and the Departamento de Estudios Industriales. Information on electricity, gas and water is obtained directly from concerned enterprises. The data available cover gross values of production, aggregated values, physical production, installed capacity and personal occupation. Information on public construction is taken directly from the municipalities. Based on the information obtained from them, a sample is taken from which the growth of private construction can be measured. The population and housing censuses are also taken into account for dwellings. For the trade sector, the estimates are based on the gross value of agricultural and industrial production by item. The value of imports and exports are estimated from foreign trade statistics and information received from the Direccion de Tributacion Directa. In estimating road transport, information on registered vehicles for rental is used. Data on income and expenditure by type of vehicle, depreciation and profits are obtained. Information for financial institutions is obtained from the Superintendencia de Bancos, which provides financial statements for all banks in the system and insurance companies. The estimates of ownership of dwellings are based on census information for 1949, 1961 and 1974 covering the number of dwellings and the average rents paid and imputed. For producers of government services, information is obtained directly from the Contaduria General de la Nacion and the Asesoría Técnica Municipal. For private services, use is made of employment data, classified by type of service rendered and data on average wages and salaries from other information sources. For domestic services, data on employment and wages are basis for estimating the value added with 75 per cent added to the cash figures for board and lodging as wages and salaries in kind. For the constant price estimates, value added of the agricultural sector is either extrapolated by quantity indexes for output or deflated by price indexes. For the industrial activity sector, trade, transport and storage, financial institutions and insurance and private services, value added is extrapolated by quantity index. For the remaining sectors, current values are deflated by various price indexes.

Hungary

Source

Reply to the United Nations national accounts questionnaire from the Hungarian Central Statistical Office. The official estimates are published in the "Magyarország Nemzeti Szamlai", KSH. The data for Hungary was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which therefore often show small differences to the new data compiled in accordance to the 1993 SNA. The description of the sources and methods used for the national accounts estimation are published in the joint OECD/HCSO publication: "National Accounts for Hungary - Sources, Methods and Estimations". As a general rule the statistical units are institutional units. Only the government production is shown by establishments. Substantial changes were introduced in the compilation of national accounts from 1991. The most important ones are as follows: (a) the output of financial intermediaries was measured on cost level before the revision, presently the service charges are accounted as the output of this sector; (b) owner-occupied dwellings are valued on imputed market rents (prior to 1991 they were accounted on costs); (c) consumption of fixed capital in the government sector is based on replacement cost (prior to 1991 they were based on historical costs); (d) financial leasing and capital contribution in kind are included in gross fixed capital formation. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in 1993 SNA, a footnote is indicated to the relevant tables. Original constant prices are based on years 1995, 1998 and 2000. Moreover, data in the integrated sectors generally display discrepancies between the domestic sectors and the total economy due to data consolidation procedures used by the Statistical Office. It should be noted that the equality between the sum of domestic sectors and total economy does not hold valid when data are consolidated because consolidation involves the elimination of various certain debtor/creditor relationships which occur between two transactions belonging to the same institutional sector or sub-sector.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated from three approaches: production, expenditure and cost structure (income side). The main approach used for the estimation of GDP is the production approach.

Expenditure Approach

The expenditure approach is used to estimate all expenditure type components of GDP. Government final consumption expenditure is based on records from all subsectors of general government. Private final consumption expenditure is estimated mainly from household budget survey and partly from trade statistics. The main sources for estimation of gross fixed capital formation are the investment surveys. Exports and imports of goods are based on customs declaration, while exports and imports of services are obtained from the balance of payments. For the calculation of constant prices, price deflation is used for all expenditure groups.

Income Approach

Compensation of employees is estimated from tax declarations of corporations, income tax declarations, labour surveys, financial data for general government and social security statistics. Taxes and subsidies on products are taken directly from the general government accounts.

Production Approach

The table of value added by kind of activity is prepared at basic prices. The main sources of the estimation at current prices are: financial tax reports of corporations, state budget, income tax statistics, agricultural statistics, reports of financial intermediaries and nonprofit surveys. Double deflation is used for the calculations at constant prices, except agriculture and trade margin. Government production is an exception where the cost elements are deflated.

^a Discrepancy between components and total.

^b Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^c Mixed income, net. Excludes consumption of fixed capital.

^d Net lending in the financial account and Net lending in the capital account have not been reconciled.

Iceland

Source

The preparation of national accounts statistics in Iceland is undertaken by the National Economic Institute, Reykjavik. The official estimates are published once or twice a year in The Icelandic Economy and in more detail but irregularly in a special series National Accounts Publications. A detailed description of the sources and methods is found in that series on national accounts especially in No. 13. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach. The production approach is used in estimating GDP by kind of economic activity as well as cost-structure of GDP as described below. The difference between the two methods is explicitly presented as "statistical discrepancy" on the cost components side of GDP. On the expenditure side there are two sets of data (1990-1997 and 1997onwards) which have been linked in 1997 to obtain time series without break.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure is mainly based on government accounts. Estimates of private consumption expenditure are based on various sources. A vital source is the import of consumer goods plus import duties and trade and transport margin. The Agricultural Production Board is the source for the estimate of consumption of domestically produced agricultural products. A considerable part of the consumption of services is derived from the Industrial Statistics and the Family Expenditure Survey which is used as a weight in consumer price index. Gross capital formation is based on import of investment goods, direct inquiries to the main constructors and domestical producers of investment goods and government accounts. Exports and imports of goods and services are estimated from foreign trade statistics and balance of payment statistics. Price deflation is used for most of the expenditure items in arriving at constant prices. Various price indices are used.

Income Approach

(See "Gross domestic product by kind of economic activity" below.)

Production Approach

The production approach is used to estimate both cost-structure of domestic product and gross domestic product by kind of activity. The main source are the annual accounts of enterprises. From the tax assessments data a sample of establishments is drawn from almost every single branch of industry. The sample is drawn from the tax records presenting the total value of wages and salaries of all employees and calculated income of self-employed. These amounts are classified by enterprises and establishments within each enterprise which enables breakdown by activity within enterprises. A sample of annual reports of enterprises, including operating accounts and balance sheets, are compiled from tax authorities. After processing these sources the samples are blown-up according to the total value of wages and salaries statistics on turnover as well as other vital administrative registers in each branch of industry. The operating account as presented in operating accounts of the firms is not suitable for national accounting purposes. One of the reason is the price increases during the year and therefore adjustments are made for the effects of inflation on the valuation of stocks at the beginning and the end of a year. By

introducing a new concept "stock appreciation", an attempt is made to correct the value of the stocks at the beginning and end of each year in such a way that both items are revalued at the annual average prices instead of prices at the beginning and end of year. By doing this the increase in stocks during the year is valued at the annual average prices and that value item replaces the former increase in stocks valued at prices in the beginning and the end of year respectively. For the constant price estimates the general approach for almost all industries is the deflation of the gross output or extrapolation of base year value of output. Double-deflation is not used except in the case of the fishing industry.

India

Source

Reply to the United Nations national accounts questionnaire from the National Accounts Division of the Central Statistical Organization (CSO), Department of Statistics, Ministry of Planning and Programme Implementation, New Delhi. Official estimates are published annually in the "National Accounts Statistics".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates relate to fiscal year beginning 1 April. The sources of data and methodology followed are given in "National Accounts Statistics - Sources and Methods", 1989. When the scope and coverage of the estimates differ for conceptual and statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach for the commodity producing sectors and income approach for the services sectors.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure whereas the estimate of gross fixed capital formation is based on the expenditure approach. Estimates of government consumption expenditure are mainly obtained from budget documents and annual reports of the government bodies. Estimates of private expenditure on goods are obtained from commodity production data adjusted for change in stocks and foreign trade and reduced by intermediate consumption and government final consumption and by the quantities used for capital formation. Private expenditure on services is estimated as the value of the total output for each kind of service reduced by the estimated expenditures on service by government and the business. Estimates of increase in stocks for the public sector and organized (i.e. larger or modern) private industries are based on government budget documents and annual accounts and reports of industries respectively. Estimates of change in stocks of unorganized private industries are based on sample survey data, data on bank advances and margins and on livestock censuses. For gross fixed capital formation, estimates of construction are compiled using data from a number of sources such as annual survey of industries, dispatches of cement for domestic consumption, sample surveys and government budget documents and the All-India debt and investment surveys. These estimates are extrapolated by the relevant indicators. For machinery and equipment, estimates are based on the annual survey of industries, foreign trade statistics, customs and excise revenue statements, data on trade, transport and other charges collected from leading manufacturing firms. The estimates of exports and imports of goods and services are based on balance of payment statistics supplemented by information supplied by government agencies. For the constant 1993-1994 price estimates, private expenditure on goods is extrapolated by quantity indexes. Changes in stocks of livestock, mining and food grains are valued at 1993-1994 prices. For government expenditure, private expenditure on services, increase in stock for other sectors and gross fixed capital formation the current values are deflated by relevant price indexes.

Income Approach

Estimates of compensation of employees are based on budget documents, annual reports of enterprises, income and expenditure accounts of institutions and companies and sample surveys. Estimates of operating surplus are based on most of the sources used for compensation of employees. Consumption of fixed capital is estimated for each industry separately on the basis of estimated value of capital stock and the expected age of various types of assets at the aggregate level by following the perpetual inventory method. The sources include the All-India rural

debt and investment surveys, livestock censuses, budget documents and annual accounts. Estimates of indirect taxes and subsidies are based on accounts and annual reports of government bodies.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at factor cost. The production approach is used to estimate value added for all commodity producing sectors and moving the benchmark estimates for unregistered manufacturing. Value added of construction is based on a combination of the commodity-flow and expenditure approaches. A combination of production and income approaches are used for all other sectors. The production estimates of principal agricultural crops are based on administrative records which give crop acreage statistics and the results of the random sample crop-cutting surveys conducted by the respective state government agencies which give the yield estimates. The wholesale prices in the primary markets are used to evaluate the total production of each commodity. The annual estimates of livestock products are based on the livestock population by type and the corresponding average yield rate of estimates through the annual integrated sample survey conducted by the state government agencies. Intermediate consumption is estimated by using a variety of sources such as the cost of cultivation studies conducted by the central government, the National Sample Survey Organization (NSSO), the All-India rural debt and investment survey, marketing reports and other administration based statistics. Estimates of the gross output of minerals are based on data available from the Indian Bureau of Mines and the state governments. For large-scale manufacturing, estimates are prepared for 20 industry groups based on the Annual Surveys of Industries (ASI). Benchmark estimates for the household and non-household unregistered manufacturing and other unorganised portions of trade, transport etc. are prepared using data on value added per worker derived from the follow-up surveys of economic census of CSO and NSSO and estimated working force. For other years' estimates are extrapolated by means of indicators of physical output or input and prices. Estimates of pucca construction are compiled by the commodity flow approach using data on steel and cement production, foreign trade statistics, customs and excise revenue, etc. The estimates of kutchha construction (from locally available materials) are based on expenditure data from NSSO, debt and investment surveys and other sources. For public sector trade, transport, administration, banks etc., estimates are based on the analysis of budget documents and annual accounts. The estimates of gross rents for urban and rural dwellings are based on the number of dwellings and estimated gross rental value per dwelling obtained from the NSSO surveys on consumer expenditure. For the constant price estimates, double deflation is used for the agriculture and mining sectors. Current values of large-scale manufacturing and construction are deflated by price indexes. For unregistered manufacturing, electricity, gas and water, trade, transport, ownership of dwellings and other services, value added is extrapolated by quantity indexes. Current price estimates of public administration are deflated with the consumer price index of industrial workers to obtain the constant price estimates.

Indonesia

Source

Reply to the United Nations national accounts questionnaire from BPS Statistics, Jakarta. Official estimates are published annually in the "National Accounts Statistics".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual and statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Until 1998 Timor L'este was integral part of the economic area of Indonesia and is therefore included in the estimates. From 1999 onwards the region is systematically excluded from the national accounts.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, exports and imports of goods and services. Private final consumption expenditure is derived as residual. The commodity-flow approach is used for gross fixed capital formation. The main sources of data for the estimation of central government consumption expenditure are the budgetary accounts of the Department of Finance, while local governments provide data directly to the Central Bureau of Statistics (CBS). Benchmark data for capital formation are based on statistics of imports and domestic production of construction materials and machinery and equipment. For other years, import of machineries and equipments are obtained from import statistics, while domestic production is compiled by using production and implicit price indexes to extrapolate the benchmark estimates. The input-output ratios for buildings and structures have been established for 1971 on the basis of special surveys on construction projects in that year. Other years' estimates are extrapolated by quantity and price indexes of domestic production and imports of construction materials. Estimates of exports and imports of goods and services are obtained from foreign trade and balance of payment statistics. For the constant price estimates, current values of government expenditure items are deflated by the consumer price index and by the wholesale price index. For gross fixed capital formation referring to buildings and structures, the benchmark values are extrapolated by quantity indicators of domestic production and volume indicators of imports of construction materials. Values of exports and imports are deflated by the corresponding unit value price indexes.

Income Approach

Consumption of fixed capital for manufacturing, electricity, gas and water, is estimated from information available at the CBS. For other sectors the estimates are based on the results of special surveys. The main source of data for net indirect taxes are the budgetary accounts of the central and local governments. Compensation of employees together with operating surplus is obtained as a residual.

Production Approach

The table on gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most of the industries. The income approach is used for government and domestic services while gross output of trade and construction is estimated on the basis of the commodity-flow approach. For agriculture, main food crops production is compiled on the basis of information relating to area harvested and average yield for each crop obtained from the CBS. The prices used are based on farm-gate prices obtained from annual surveys. The consumption of vegetables by households is

based on per capita consumption estimates derived from the Household Survey 1969/79 and 1976, extrapolated by population and price changes and adding one per cent to cover consumption outside households. For main food crops, commercial and estate crops, the value of intermediate inputs is based on cost-structure surveys. Estimates of livestock, forestry, and fishing are obtained from the departments concerned. For livestock, intermediate inputs are calculated as fixed percentages of gross output. The most important mining commodity is crude petroleum for which production data are available for all enterprises concerned. Estimates of prices and input costs are compiled on the basis of returns furnished by the largest firm. For the base-year 1971, data on output and input structure of manufacturing have been compiled for each industry group from statistics maintained by the CBS and from surveys and other studies undertaken. For other years industrial production indexes are compiled on the basis of output of selected manufactured products. For gross output of construction, the information on imports of construction materials is obtained from commodity imports statistics whereas estimates of domestically produced materials are based on the annual industrial surveys. The average ratios of intermediate inputs to gross output are based on data gathered from surveys. Gross output of the trade sector is calculated by multiplying estimates of the producers' values of the marketed surplus of agricultural products, domestically produced manufactured goods, selected mining and quarrying products and the cost of imported goods by the percentage distribution mark-ups gathered from special surveys undertaken in 1971. Estimates for other years are extrapolated by a quantity index of marketed surplus traded and an implicit price index. For railway transport, the annual reports of the State Railway Company constitute the main source of data for estimating gross output, intermediate input and value added. For road transport, gross output and input values are estimated by multiplying the average earning of each type of vehicle by the corresponding number of vehicles. For other transports, estimates are based on cost-structure surveys and data from concerned authorities and companies. The information of gross output and value added of the banking sector is based on the data compiled annually by the Bank of Indonesia supplemented by special inquiries for other financial intermediaries. Basic data relating to real estate and business services are limited and rough procedures are adopted by using information gathered from the special surveys. For government services, estimates are obtained from current budget expenditure and information furnished by local bodies. Estimates of other services are calculated for the year 1971 as the benchmark year, and estimates of other years are extrapolated by using employment and price indicators. For the constant price estimates, revaluation is used for the agricultural sector, while value added of public administration and defence, is deflated by a moving average of the consumer price index. In all other sectors value added is extrapolated by various quantity indicators and indexes.

Iran, Islamic Republic of

Source

The preparation of national accounts statistics in Iran is undertaken by the National Accounts Department, Bank Markazi Jomhouri Islami Iran, Tehran. The official estimates are published in the annual bulletin "Bank Markazi Jomhouri Islami Iran, Economic Report and Balance Sheet". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Detailed data as well as description of sources and methods used for national accounts estimation are published in the latest volume of the National Accounts of Iran, 1974-1987. Input-output tables have been compiled for the years 1965, 1969, 1973 and 1984. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate all components of gross domestic product by expenditure type except gross fixed capital formation in machinery which is calculated mainly by commodity-flow approach. Estimates for government final consumption expenditure are based on records from all sectors of general government. Private final consumption expenditure is estimated using data from family budget surveys. The estimates of gross fixed capital formation in private construction are derived from annual surveys on construction. The data on investment in construction by the public sector is obtained from the accounts of different government units. The capital formation in machinery and equipment is estimated through commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of goods and services are obtained from the balance of payments accounts and foreign trade statistics. For the constant price estimates all items of gross domestic product by expenditure type are deflated by appropriate price indices.

Income Approach

The estimates of compensation of employees are obtained in the process of estimating value added by industrial origin. Consumption of fixed capital is estimated according to useful lifetime of different type of capital goods. Operating surplus is obtained as a residual. Estimates of indirect taxes and subsidies are based on government accounts.

Production Approach

Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared at factor values. The production approach is used to estimate the value added of most industries. The income approach is used for producers of government services, communication and part of other services. The agricultural estimates are based on annual surveys of agriculture, carried out by Ministry of Agriculture. The estimates are checked using the results of the annual family budget surveys. Data on the production of red meat are based on information supplied by slaughter houses in urban areas and on the results of expenditure surveys in rural areas. The data are then converted to current price estimates by using wholesale price index. Statistics concerning forestry and fishing are obtained from concerned agencies. Mining estimates are based on annual

sample surveys and the 1991 Census of Mining. The value added of oil sector is derived from the reports of the Ministry of Oil. The manufacturing estimates for large establishments which employ 10 workers or more are based on the results of the annual surveys of manufacturing. For small establishments, estimates are derived using the sample surveys of 1986 and information from other sources. The estimates of electricity, gas and water are based on information obtained from the government accounts. Estimates for private construction in the urban areas are obtained from the results of Bank Markazi's annual surveys with adjustments made to cover contractors' profits which are not included in the surveys. As for the rural areas, the results of 1973 Survey of Rural Construction by the Statistical Center of Iran are extrapolated using information concerning construction in small towns. For trade sector the gross margin is calculated using the results or survey of wholesale and retail trade in the urban areas. Estimates for transport sector are generally based on the sample surveys by Bank Markazi Jomhuri Islami Iran and financial statements of the government organizations involved. The value added of financial institutions and insurance is obtained directly from the financial statements of concerned institutions. The estimates for dwellings are based on data obtained from family budget surveys and imputations are made for owner-occupied dwellings. For producers of government services estimates are derived from government accounts. Estimates for social and personal services are based on information from various sources mainly the family budget surveys. For constant price estimates, the current values are deflated by an appropriate price index for each kind of economic activity.

Iraq

Source

The preparation of national accounts statistics in Iraq is undertaken by the Central Statistical Organization, Baghdad. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The following presentation of sources and methods is mainly based on information contained in a handbook entitled "Technical Note on the Estimation of National Income of the Republic of Iraq, 1962-1965". The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). Input-output tables have been published in "Input-Output and Social Accounts of Iraq 1960-1963". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used for gross fixed capital formation. The commodity-flow approach is used for private consumption expenditure. The estimates of government final consumption expenditure, consisting of wages, salaries and allowances and intermediate consumption of goods and services are obtained from the final accounts of the concerned bodies. The estimates of private final consumption expenditure is obtained as a residual for some years, while family budget surveys are used for other years. The data used for the estimation of increase in stocks are obtained from the final accounts of the establishments of the trade, transport and communication sectors. The industrial surveys provide data for the manufacturing industries. The gross fixed capital formation is classified according to economic activities and kinds of assets. Data are obtained from various sources such as the ordinary budget, actual expenditure on the development planning budget, reports and surveys. Foreign trade statistics provide data on imports of capital goods in c.i.f. values. Exports and imports of goods and services are estimated from foreign trade statistics and balance of payments data. Gross domestic product by expenditure type at constant prices is not estimated.

Income Approach

The estimates of compensation of employees in the socialist sector are obtained from the final accounts of the government and companies. For the private sector, the data are obtained from service surveys and internal trade surveys. Operating surplus is obtained as a residual. The depreciation estimates are prepared according to kinds of fixed assets and are based on the estimates of fixed capital formation, taking into consideration the prices of fixed assets and the average age of each kind of asset. The data on indirect taxes and subsidies are obtained from the actual accounts of the government or from the final accounts of the establishments of the socialist sector.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of most industries. The income approach is used for transport and storage, private services and producers of government services. The commodity-flow approach is used to estimate gross output of the trade sector. Data on areas cultivated, average yield, quantity and value of each crop

are obtained from the Central Statistical Organization (CSO) while prices are based on a production survey. The production of various types of vegetables is estimated from data of the Ministry of Agriculture, and the valuation is made by using farm prices collected by the CSO. The results of the 1971 Agricultural Census are used for estimating the value of fruit production. Intermediate consumption of these agricultural crops are estimated individually. The estimation of livestock products is based on sample surveys. The quantity of meat is estimated by multiplying the number of animals slaughtered in the abbatoirs by the average weight of the animals. The number of animals slaughtered outside the abbatoirs is estimated on the basis of data on exports of skins and guts. The estimate of the output of crude oil, natural gas and sulphur is based on the final accounts of the producing companies, from which data on the quantity and value of production and other factors of the value added are obtained. The data on manufacturing are obtained from the annual and quarterly industrial surveys which collect data on the number of establishments and employees, wages and salaries, quantity and value of inputs, increase in stocks and capital formation. The data for electricity, gas and water are obtained from the balance sheets and final accounts of the concerned establishments and from the Industrial Department of the CSO. The value added in the construction sector is based on the reports of the CSO and data on fixed capital formation which are based on the national development planning budget. The data used to estimate value added in the trade sector are taken from government final accounts, the internal trade survey and the hotel survey. For restaurants and hotels, a survey of services and hotels comprising the number of employees and establishments, wages and salaries, revenue, purchases, etc. is used. The final accounts of public establishments and the reports issued by the CSO are the basis for estimating transport and communication. The gross value of output is obtained by adding intermediate consumption to value added. Data on banking, insurance and other financing establishments have been obtained directly from concerned establishments. The services survey is used for the value added of real estate services. For ownership of dwellings, rents are imputed based on the rent survey conducted by the Ministry of Finance and the family budget surveys. For government services, estimates are based on final government accounts and balance-sheets and final accounts of semi-governmental institutions. The services survey and the family budget surveys are used for estimating private services, GDP by kind of economic activity at constant prices is estimated taking 1964, 1969 and 1974 as base year.

Ireland

Source

The preparation of national accounts statistics in Ireland is undertaken by the Central Statistical Office (CSO), Dublin. The official estimates are published annually in "National Income and Expenditure". The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates prepared according to the 1968 SNA are provided in the former national currency Irish pound. The following presentation of sources and methods is mainly based on a report entitled "Basic statistics needed for the ESA accounts and tables: present situation and prospects for improvements" prepared by the Statistical Office of the European Communities in 1976 and on information received from Ireland's Central Statistics Office. Official input-output tables have been published in respect of the years 1964, 1969 and 1975. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Ireland the currency name for the data before 1999 is "1999 IEP euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = .787564 Irish pound. - The name of the currency of the newly submitted data is "1999 IEP euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Ireland, like for example all old data following the 1968 SNA is still in "Irish pound", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure and gross fixed capital formation except in the case of building and construction and government capital formation. Government final consumption expenditure is estimated from the accounts of the various government bodies such as the ministries, the local authorities and health boards, extrabudgetary funds and the Industrial Development Authority. Data on private consumption expenditure are also estimated from Household Budget Inquiries. "Largescale Household Budget Inquiries" were carried out in 1951-52, 1965-66, 1973 and 1980. The 1951-52 and 1965-66 surveys were restricted to urban areas. "Smallscale Annual Household Budget Surveys" were undertaken in 1974-1979 and 1981. These were restricted to urban areas for 1974-1979 but covered urban and rural areas in 1981. Estimates of transactions in goods and services are obtained from the censuses of industrial production and the statistics of imports and exports of merchandise. The goods are valued at national average retail prices where volume data are available. Otherwise, they are aggregated at appropriate producers' or import prices and adjusted for distribution costs. In building up the stock figures, industrial stocks

from stocks inquiries and censuses of industrial production, and stockpiles of strategic commodities from the Department of Agriculture. Investment in building and construction is estimated through the use of data from the production surveys. Estimates of locally produced goods are obtained from production census data minus exports plus distribution margins. Estimates of imported goods are obtained from detailed import returns. The estimates of imports and exports of goods and services are obtained from balance-of-payments, special studies and surveys. For the constant price estimates, direct revaluation at base-year prices is used for items of private final consumption expenditure where quantity data are available. For all other components of GDP by expenditure type, price deflation is used.

Income Approach

Estimates of compensation of employees are based on wage rates and number of farm worker for the agricultural sector, censuses of industrial production for the industrial sectors, surveys conducted at intervals and updated by indexes of earnings for the trade sector, annual surveys conducted among the relevant companies for the transport, credit and insurance sectors and salary rates and number of employees for the other market services. Operating surplus is calculated from returns made to the revenue authorities and from government accounts. Depreciation is based on the perpetual inventory method for the agricultural sector. For private enterprises, it is taken as the income tax wear-and-tear and other allowances. Indirect taxes and subsidies are estimated from the government accounts.

Production Approach

Before the implementation of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. The income approach is used to estimate the value added of all industries except agriculture, for which the production approach is used. Annual estimates of agricultural output are calculated on a commodity basis for crops, livestock and livestock products. The data on quantities and values are obtained from various sources such as Department of Agriculture and Central Statistics Office. The total quantities purchased and amounts paid by the purchasers for important agricultural items such as wheat and barley are available from various inquiries and adjusted for marketing margins and transport costs. For live exports, f.o.b. export value less an allowance for marketing margins, is taken as the output value. For the remaining items market prices are used as the basis for evaluation. Input data are obtained through the Department of Agriculture for fertilizers. Data for seeds are compiled indirectly from acreages and seedling rates. Own-account consumption of food and fuel is evaluated at agricultural prices. For mining, quarrying and manufacturing enterprises employing more than three persons, the estimates are based on annual censuses. Quarterly surveys of turnover and employment are conducted for manufacturing. For small-scale manufacturing, the number of persons engaged, which is derived as the difference between population census data and data from the production census, interpolated for intercensal years and projected forward, are multiplied by average income per person. The estimates of electricity, gas and water and of construction are based on annual inquiries. For trade, censuses of distribution provide benchmark data for turnover, purchase of products, wages and salaries and intermediate inputs. For intervening years, monthly turnover figures from a sample of 2,500 establishments are used together with annual estimates of the number of employees and trends in earnings. For restaurants and hotels, annual surveys and revenue data are used. Transport is mainly provided by public enterprises and data are obtained from published accounts. Data obtained from annual reports, direct surveys on wages and salaries and revenue statistics are used for the estimates of the financial sector. For real estate and business services, data from population census, imputed average income and revenue accounts are used. The imputed rent of owner-occupied dwellings is taken as the average rent paid for similar dwellings in similar locations. Estimates of other private services are based on the results of inquiries into wages and salaries and on trends in operating surplus taken from revenue data. Data on government services are obtained from the government accounts. For the constant price estimates, double deflation is used for agriculture. Value added of all other economic activity sectors of GDP is extrapolated by a quantity index.

Israel

Source

The preparation of national accounts statistics in Israel is undertaken by the Central Bureau of Statistics, Jerusalem. The official estimates are published annually by the CBS in the "Statistical Abstract of Israel" and in the "Current Briefings in Statistics". The CBS publishes also quarterly estimates of the GDP through the expenditure approach in the "Monthly Bulletin of Statistics". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates since 1995 shown in the data tables have been prepared in compliance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the 1968 SNA. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The estimates of the Gross Domestic Product and its components at constant prices are calculated each year, at the prices of the previous year, and presented in the tables as chained estimates at 2000 prices, to allow comparisons between non-consecutive years. Because of chaining, estimates for each category of the GDP do not add up to the total GDP.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated both through the expenditure and production approaches, when the expenditure approach is considered more reliable.

Expenditure Approach

General government consumption expenditure is estimated on the basis of the Accountant-General's budget execution reports as well as the budget provisions, and by using of complementary data received from the other central government units. Expenditure of the local authorities and non-profit institutions mainly financed and controlled by the government is estimated on the basis of their financial statements and budget proposals. Private expenditure estimates on food, beverages and tobacco are based on data concerning quantities produced and marketed and on consumer prices, while estimates of expenditure on housing and business services, consumption of industrial products and other food products are based on the household expenditure surveys conducted annually since 1997. Estimates of changes in inventories in agriculture, fuel and government strategic stocks are prepared by multiplying quantity changes in inventory stocks by their average prices. Regular quarterly and annual surveys are used to estimate inventory changes for industry and wholesale trade. The data obtained are adjusted to approximate the value of the physical change in stocks. The estimates of changes in inventories include the value of unsold production (mainly software and R&D) of the start-up companies, estimated on the basis of data on investments of the Venture Capital Funds in these companies. Gross fixed capital formation in construction is calculated basing on quantitative data on the area under construction and average per unit costs; for the general government and public non-financial enterprises, financial data on construction carried out are used. The estimates of imported machinery and equipment are based on the foreign trade statistics using the customs tariff description to identify the relevant items, while estimates of locally produced goods are based on a monthly report of sales by product obtained from a sample of the producers. The estimates of exports and imports of goods and services are based on foreign trade statistics and balance of payments data. For the constant price estimates, government wages and salaries are extrapolated using changes in the labor inputs. Government purchases of goods and services are deflated by relevant components of the consumer or wholesale price index. Price deflation is also used for most of the items of private expenditure, exports and imports of goods and services and for a part of the gross fixed capital formation. For private food consumption and inventory changes in agriculture, fuel supplies, and government strategic stocks, estimates are computed by multiplying current quantities by prices in the base year.

Income Approach

The estimates of wages and salaries are based either on surveys of the industrial and construction branches and financial reports of government and private non-profit institutions or on employers' reports to the National Insurance Institute. The estimate of consumption of fixed capital was calculated at replacement cost. Estimates of taxes on production and imports are based on the financial reports of the government and the local authorities. Operating surplus is obtained as a residual.

Production Approach

The table of gross domestic product by industry is prepared at basic prices. All taxes less subsidies on products are estimated at total economy level only and not by industry. The production approach is used to estimate value added of most industries. The income approach is mainly used to estimate value added of services produced by the general government units and private non-profit institutions. For the agricultural sector, data on output and input are based on the agricultural statistics series prepared in the CBS. For mining and manufacturing (excluding diamond industry) the estimates are based on industrial surveys carried out annually. For years not covered by industrial surveys estimates are interpolated and extrapolated using current production indices. For the diamond industry the estimates, at current and constant prices, is obtained using data on imports and exports of diamonds of the various types. Estimates of the output are calculated for each type of diamond separately. Estimates for Electricity and water are based on input-output tables for 1995, as well as on data on revenue from V.A.T. for other years. Changes of product, at constant prices, were obtained by using indicators of the output: water output measured at cubic meters and electricity supplied at k.w.h. The estimates for construction are obtained by using the financial and quantitative data on the main components of the industry's output: investments in buildings and in other construction works (roads, pipe lines, railway tracks, cable laying and other building works) and construction for defense purposes. It was assumed that there was a constant ratio between input and output, at constant prices, in the main types of construction. Estimates for Commerce, restaurants and hotels are based on input-output table for 1995 and on data on revenue from V.A.T. or on hotel surveys for other years. Product at constant prices was obtained by deflating the product at current prices by appropriate price indices. Estimates for Transport, storage and communications are mostly obtained by analyzing financial reports. In the case of buses, taxis and lorries, the product is obtained by a calculation based on the amount of travel. Changes of product, at constant prices, were obtained by using measures of the output: kilometers traveled by taxis and lorries, loads hauled by ships, number of passengers in Israeli airlines. Estimates for the financing and insurance industries are based on consolidated reports prepared by the supervisor of banks and the supervisor of insurance. Estimates for renting (including imputed rents in own-occupied dwellings) are based on benchmark estimate for residential rent, extrapolated by the change in the value of inventories of dwellings. For other services, estimates are derived from a sample of income tax files, VAT revenue data and manpower data.

^a Includes Manufacturing.
^b Includes Mining and quarrying.
^c Relates to subsidy component in government loans to the business sector (on domestic production and exports) which could not be classified by industry. It was not possible to estimate this item for the years preceding 1975.
^d Net domestic product at factor cost.

Italy

Source

The preparation of national accounts statistics in Italy is undertaken by the Istituto Central di Statistica (ISTAT), Rome. The official estimates are published in the "Contabilità Nazionale". The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates prepared according to the 1968 SNA are provided in the former national currency Italian lira. The following presentation on sources and method is based mainly on information prepared by the Statistical Office of the European Communities in 1976 in a report entitled "Basic statistics needed for the ESA accounts and tables: present situation and prospects for improvements". Input-output tables have been published in "Supplemento Straordinario al Bollettino Mensile di Statistica". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Italy the currency name for the data before 1999 is "1999 ITL euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 1936.27 Italian lira. - The name of the currency of the newly submitted data is "1999 ITL euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Italy, like for example all old data following the 1968 SNA is still in "Italian lira", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used to estimate private final consumption expenditure and gross fixed capital formation. For central government, the estimates are based on data obtained from the Bilancio dello Stato. Complete accounts for the other bodies of the general government are available after 39 months and for social security funds, after 27 months. Household consumption expenditure is primarily based on the quarterly surveys of family budgets supplemented by estimates based on commodity-flows. The surveys cover 36,000 households by rotation with 9000 new families each quarter. Surveys carried out by the Banco d'Italia provide consumption data for non-resident households on the domestic market and for residents abroad. The main statistical source used for estimating changes in stocks is the value added surveys conducted for all enterprises in the industrial construction, trade and transport sectors that employ more than 20 persons. The stocks relate to industrial products only. Data for estimating gross fixed capital formation are obtained through a questionnaire attached to the value-added survey. Government capital expenditure are obtained from government accounts. For construction and building, the Istituto Central di

Statistico conducts specific surveys such as surveys on residential buildings and on public works. The estimates of exports and imports of goods and services are based mainly on the balance-of-payments and foreign trade statistics. For the constant price estimates, most of the items of GDP by expenditure type are deflated by appropriate price indexes. Government building depreciation is estimated as a certain percentage of the stock value at constant prices. Private consumption of own-produced food and stock increases of agricultural products are revalued at base-year prices. Gross rent is extrapolated by the number of dwelling units.

Income Approach

Compensation of employees is estimated through use of the value-added survey and a survey carried out by the Ministry of Labour and Social Security for the industrial sector, minimum contractual wages and survey of the compensation of permanent employees for the agricultural sector, surveys and inquiries carried out by other institutes for the service sector and other indirect evaluation for sectors not covered by surveys. Information on operating surplus is obtained from the value-added surveys and from actual interest received and paid by the various sectors. Depreciation is valued on the basis of time series of gross fixed capital formation at constant prices by product and by branch of economic activity. Constant prices of 1970 are estimated by using the perpetual inventory method, assuming that the devaluation of the product is constant during its economic life. Estimates of indirect taxes and subsidies are obtained from government sources. Taxes linked to production and imports are broken down by branch according to the type of tax. Data on subsidies are classified by branch on the basis of the recipients indicated in the government budgets.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most of the industries. This is supplemented by the income approach for industries to which the value added surveys are applied. The income approach alone is used for the producers of government services. Statistics on agricultural production prices, etc. are derived from current agricultural surveys. A new survey was carried out in 1975, covering 6,000 farms with complete accounts which produce about 10 per cent of the total output. Crop surveys of major products are conducted annually. Information on gross marketable livestock production is available separately for major items. For forestry, a quarterly survey supplies data on production and prices. Monthly surveys of products unloaded in Italian ports are used for estimating value added of fishing. For the industrial activity sector, the estimates are based on value added surveys and the product surveys. In addition to these surveys, the rapid surveys of large enterprises are also used for manufacturing. The annual value added survey, which covers all enterprises employing more than 20 persons and is available after 15 months, includes transactions in goods and services, distributive transactions and employment data. The survey does not allow product-by-product analysis. The product survey which covers all enterprises employing more than 50 persons and is available after 24 months, is used for compiling input-output tables and is linked with the European Community surveys on industrial activity. The annual rapid survey, covering all enterprises employing more than 250 persons is available within three months. This survey provides information similar to that obtained in the value added surveys. The surveys used for the manufacturing sector are also used for construction. In addition construction estimates are based on the results of surveys on the number of residential buildings, surveys of public works and sample surveys of work in progress on building sites. For the trade sector, the main source is the value added survey. However, to cover enterprises employing less than 20 persons, an indirect method, which consists in constructing an index of traded consumer goods, capital goods and goods for export, is used for estimating gross output of the trade sector. The value added surveys are also used for the transport sector. Additional information is supplied directly by the relevant firms and public agencies. For the financial institutions, annual surveys are carried out which covers 97 per cent of the activity. Special calculations are made for institutions not covered. Estimates of government services are based on surveys conducted by the social security funds and on data compiled by the Ragioneria generale dello Stato and the Istituto Centrale de Statistic. For other services, the Istituto Central di Statistica carries out a single direct survey of public hospitals. Other market services are valued indirectly, mostly on the basis of the results of family budgets surveys. For the constant price estimates, price deflation is used for community, social and personal services. Double deflation is used for all the other sectors. Output is either deflated by appropriate indexes or is extrapolated by quantum indexes while input is deflated by price indexes.

^a Discrepancy with equivalent item in Table 2.3 Output, gross value added and fixed assets by industries.

^b Not equal to the sum of corresponding components in the domestic sector accounts as one or more of the components have not been revised.

^c Discrepancy with equivalent item in Table 2.3 Output, gross value added and fixed assets by industries. Includes FISIM but FISIM is not included in Intermediate consumption of the other domestic sectors.

^d Data have not been revised. Discrepancy with equivalent item in Main Aggregate Tables. This holds also for the other items in the same table for the given years.

^e Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^f Mixed income, net. Excludes consumption of fixed capital.

^g Data for this year(s) have not been revised and are therefore not consistent with equivalent data in other table(s).

^h Does not add up to corresponding components in the domestic and the rest of the world sector accounts.

ⁱ Excludes Adjustment to reconcile Net Lending of the Financial account and the Capital account.

^j Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

Reply to the United Nations national accounts questionnaire from the Statistical Institute of Jamaica, Kingston. Official estimates and information on concepts, sources and methods of estimation utilized are published annually by the Department in "National Income and Product".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

^a Discrepancy between agricultural subindustries and total.
^b Does not include repair of motor vehicles, motorcycles, personal and household goods.
^c Includes public education, health and social work.
^d Discrepancy between components and total.
^e Includes private education, health, social work, and repairs to personal and household goods.
^f Derived from available industry breakdown.
^g At the latter part of 1991 a system of Value Added Tax (GCT) was introduced; this replaced the majority of taxes on commodities. GCT, unlike the former taxes, does not form part of the valuation at producers' prices.
^h Statistical discrepancy with equivalent item in Table 1.1 Gross domestic product by expenditures at current prices.

^a Discrepancy between agricultural subindustries and total.

^b Does not include repair of motor vehicles, motorcycles, personal and household goods.

^c Includes public education, health and social work.

^d Discrepancy between components and total.

^e Includes private education, health, social work, and repairs to personal and household goods.

^f At producer's prices.

^g At producer's prices. Derived from available industry breakdown.

Japan

Source

Reply to the United Nations national accounts questionnaire from the Economic Research Institute of the Economic Planning Agency, Tokyo. The official estimates are published in "Annual Report on National Accounts". The data for Japan was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following presentation of sources and methods is mainly based on information from "A System of National Accounts in Japan" published by the Economic Planning Agency. Input-output tables have been published by the Management and Coordination Agency (former Administrative Management Agency).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

Using the commodity flow method, output, intermediate consumption by industry, household final consumption expenditure, gross capital formation, exports and imports are estimated for each of approximately 2,200 commodities. Shipments estimates are derived directly or indirectly from the statistics such as Crop Survey, Census of Manufactures, Current Production Statistics Survey, Establishment Census and Census of Commerce. The distribution channels and the constant coefficients such as the distribution ratios, the transportation fee rates and the trade margin rates are decided for each of the commodities based on the information of the Input-output Table. Services produced and consumed by the producers of government services and private non-profit services to households are estimated separately based on the settlement of accounts of governments, Survey of Private Non-profit Institutions and so on. Gross domestic expenditure is obtained by adding up final consumption expenditure, gross capital formation, increase in stocks and current external transactions. Exports and Imports are estimated by the estimation method for external transactions, which rearranges the Balance of Payments in consideration of its consistency with the Balance of Payments. For final consumption expenditure of households, calendar-year figure is estimated by the commodity flow method. Each commodity is classified into one of the elements of a 43-objects x 5-uses matrix. Each element of the matrix corresponds to one of the 4 types of expenditure. Quarterly figures are estimated by distributing the calendar-year figure through expenditure approach which uses Survey of Farm Household Economy, Family Income and Expenditure Survey and National Survey of Family Income and Expenditure. For gross capital formation, quarterly and sectorial figures are estimated by breaking down the calendar-year figure estimated by the commodity flow method, on the basis of the quarterly and sectorial figures estimated through expenditure approach which uses settlements of accounts of government, Financial Statements of Corporations by Industry and so on for gross fixed capital formation. For increase in stocks, special accounts for food administration, Financial Statements of Corporations by Industry are used. Gross domestic product at constant prices is estimated mainly using price indexes called basic unit deflators which correspond to the approximately 400 commodities aggregated from the approximately 2,200 commodities used for the commodity flow method. Series at constant prices are obtained by dividing the nominal values of the 400 commodities by the basic unit deflators for each demand item. In other words, constant value is estimated using Paasche-type deflator weighted by 400 commodities. Government services and private non-profit services to

households are estimated using deflators by activities which correspond respectively to six activities of government services and three activities of private non-profit services to households.

Income Approach

Wages and salaries are estimated separately for the three groups of agriculture, forestry and fisheries, government services, and other industries. Concerning the other industries, quarterly cash allowances to employees by industries are calculated by multiplying the per head wage by the number of employees. In this case, the number of employees is based on the "Population Census" conducted every five years and is interpolated in the mid-year of a five-year period by trends observed from the "Labor Force Survey", while the cash allowances per head is mainly based on the "Monthly Labor Survey". Cash allowances to officers are estimated by multiplying the number of officers by the difference between the per head allowances of both officers and regular employees, which are obtained from the "Financial Statements of Corporations by Industry", and the per head allowances of regular employees. Employers' contributions to social security schemes are estimated on the basis of the operational reports of these schemes. Employers' contributions to others and payments in kind are estimated on the basis of settlements of accounts of the central government and local governments data on taxation, business and housing survey data on payments for housing. The operating surplus is estimated through production approach (value-added method), and is distributed to each institutional sector according to the ratios of operating profits to the total by kind of income-earning subject (after inventory valuation adjustment). The ratios are estimated on the basis of statistical data such as "Financial Statements of Corporations by Industry". Consumption of fixed capital consists of loss from wear and tear (depreciation) and estimated damage from fire, typhoons, floods and other accidents. Depreciation is estimated on the basis of "Financial Statements of Corporations by Industry", "Financial Statistics of Local Public Enterprises" and so on. Accidental damage is estimated making use of settlements of accounts of insurance companies and so on. Indirect taxes and subsidies are estimated on the basis of settlements of accounts of central and local governments.

Production Approach

The gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The output of each of the 82 industry groups is estimated from the "V" table (a make matrix for commodity by activity), of which the control total is given as the output of the 2200 commodities estimated by the commodity flow method. The intermediate input of each industry group is estimated from the "U" table (a use matrix for commodity by activity), in the base year which is compiled from "Input-output Table" and the "V" table, and from the "U" table in the mid-year which is separately compiled from the information of the cost structure estimated for about 4 or 15 items every year. The value added and its component items by industry are estimated by subtracting the intermediate input from the output. The output, intermediate input, value added and its component items by the producers of government services and by the producers of private non-profit services to households are separately estimated using the settlement of accounts of government, survey of private non-profit institutions and so on. Gross domestic product by industry at constant prices is estimated by the double deflation technique. The output by industry is estimated from the "V" table at constant prices which is obtained by dividing the output of each commodity by its output deflator. The intermediate input by industry is estimated from the "U" table at constant prices which is obtained by dividing the intermediate input of each commodity by its input deflator.

^a Includes Financial intermediation services indirectly measured (FISIM).

^b GDP and all balancing items in the full sequence of the Total Economy Account exclude the Statistical Discrepancy that links the GDP by production and the GDP by expenditure approach as displayed in Table 2.1.

^c Excludes taxes less subsidies on products.

^d Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^e Mixed income, net. Excludes consumption of fixed capital.

^f Discrepancy with equivalent item in Table 1.1. GDP by Expenditures.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

Jordan

Source

The preparation of national accounts statistics in the Hashemite Kingdom of Jordan is undertaken by the Department of Statistics, Amman. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The most recent data have been provided by the Department of Statistics. The annual national account statistics are published in the annual Yearbook and on the DOS website www.dos.gov.jo.

General

The annual official estimates together with methodological notes are published in a series of publications entitled "National Accounts". A comprehensive description of the concepts and definitions underlying the various tables is contained in "The National Accounts 1976-2002", published in 2004 by the Department of Statistics. The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). The latest Input-output tables were published in 1991 and there was no follow up until now. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated separately except private consumption expenditure which is estimated residually. The estimates of government final consumption expenditure are obtained from the records of the Ministry of Finance, National Planning Council and municipalities. Estimates of gross fixed capital formation of the private sector are obtained from the data of the surveys conducted annually. Construction activities are covered through three surveys; the surveys provide data on the buildings and other constructions. The data on the capital formation of the government sector is available from records of the Ministry of Finance. Estimates of increase in stocks are based on the stocks data obtained from the annual surveys. Gross domestic product by expenditure at constant prices is not estimated.

Income Approach

The sources and methods applied in estimating the cost-structure by components of gross domestic product are based on the breakdown of income estimates obtained from the annual surveys that cover most of the economic sectors. Separate estimates are made for incomes generated by the agricultural workers, income of skilled labourers, and for income from property and capital assets. Gross operating surplus (i.e. including consumption of fixed capital) is derived.

Production Approach

The estimates of gross domestic product by kind of economic activity are compiled at basic prices. The production approach is used to estimate the value added of all industries. Annual agricultural sample surveys are undertaken on a country-wide basis providing production estimates for crops. The quantities obtained from these surveys are valued at farm prices collected from the farmers through a monthly survey. Livestock estimates are obtained through sample surveys covering the organized farms and unorganized sector. The estimates of industrial production were based on the industrial surveys and censuses until 1998. In 1999 a general establishment census was conducted which provide frames for all economic surveys. The value added of private building constructions constructed by the unregistered contractors are derived from the cost estimates obtained from the complementary

quarterly surveys, while value generated from constructing public and private constructions conducted by registered contractors is obtained from the contractors surveys conducted annually. Annual sample surveys of wholesale and retail trade are conducted annually. For passenger and freight transport, the source of information is mainly the records of the authority or the corporation concerned. The transport activities are covered through two surveys; the first survey covers the organized sector which includes all establishments performing the activities of road, sea, air transport, in addition to post and telecommunications. Annual surveys are conducted annually to collect data on financial and insurance activities. For other services, data are provided from annual surveys covering all services activities. Gross domestic product by kind of economic activity at constant prices is estimated with a base year 1994; the data available for the period 1976-2003.
