

**Department of Economic and Social Affairs
Statistics Division**

**NATIONAL ACCOUNTS
STATISTICS: MAIN AGGREGATES
AND DETAILED TABLES, 2004**

PART II

**UNITED NATIONS
NEW YORK, 2005**

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which States Members of the United Nations draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and, through technical assistance, helps build national capacities.

NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas.

INTRODUCTION

1. This is the forty-fifth issue of *National Accounts Statistics: Main Aggregates and Detailed Tables 1/* showing detailed national accounts estimates for 176 countries and areas for the reporting years 1993 to 2004. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical services. It is issued in accordance with the recommendation of the Statistical Commission at its first session 2/ that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

THE NEW NATIONAL ACCOUNTS QUESTIONNAIRE 1993 SNA

2. This publication, for the sixth time, is based on the new United Nations National Accounts Questionnaire 1993 SNA (NAQ), which was introduced in October 1999.

3. The *System of National Accounts 1993* (1993 SNA) 3/ was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts* (1968 SNA) 4/, the Council in its resolution 1993/5 of 12 July 1993 recommends that member states use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that member states consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the UN Regional Commissions, has designed a United Nations National Accounts Questionnaire (NAQ) based on the 1993 SNA with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the UN Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UN Statistical Commission has agreed that the scope and pace of the

implementation of the 1993 SNA must be decided by each country according to its analytic and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

SCOPE OF THE NEW QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditures in current and constant prices and on the relations among product, income, savings and net lending aggregates.

6. Part II (Tables 2.1 to 2.3) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities, Rev. 3 (ISIC Rev. 3) 5/ either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O) or as single tabulation categories (A to P) (one-digit level of ISIC). Only in the case of categories A and I information at the two-digit level is requested for divisions 01, 02, 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according to the Classifications of Expenditure According to Purpose 6/. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10 divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure of households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC) 7/. For the individual consumption expenditure of non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure of general

government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.7) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e. the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Table 5.1) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 as indicated in Part II above.

10. Countries are requested to update the data tables and complete them to the extent possible. They are the following:

Part I: Main aggregates

- Table 1.1 Gross domestic product by expenditures at current prices
- Table 1.2 Gross domestic product by expenditures at constant prices
- Table 1.3 Relations among product, income, savings and net lending aggregates at current prices

Part II: Domestic production by industries

- Table 2.1 Value added by industries at current prices
- Table 2.2 Value added by industries at constant prices
- Table 2.3 Output, gross value added and fixed assets by industries at current prices

Part III: Classifications of expenditure according to purpose

- Table 3.1 General government final consumption expenditure by function at current prices
- Table 3.2 Individual consumption expenditures at current prices

Part IV: Integrated economic accounts

- Table 4.1 Total economy (S.1)
- Table 4.2 Rest of the world (S.2)

- Table 4.3 Non-financial corporations (S.11)
- Table 4.4 Financial corporations (S.12)
- Table 4.5 General government (S.13)
- Table 4.6 Households (S.14)
- Table 4.7 Non-profit institutions serving households (S.15)

Part V: Cross classification of gross value added by industries and institutional sectors

Table 5.1 Cross classification of gross value added by industries and institutional sectors

11. It should be noted that the new NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it is mainly geared to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly the one-digit level of ISIC instead of the two-digit level of ISIC.

COMPILATION OF DATA

12. To compile the large volume of national accounts data, the Statistics Division annually sends a pre-filled SNA questionnaire to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical services and from national source publications.

13. In order to lighten the reporting burden of countries to different international and regional organizations, the United Nations, the Statistical Office of the European Union (EUROSTAT) and the Organisation for Economic Co-operation and Development (OECD) have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent currently possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), all OECD countries submit data either to EUROSTAT or OECD but need not conduct duplicate submissions. Member states of OECD which are not members of the European Community have to complete a sub-set of the ESA 1995 questionnaire. In addition, data for the transition economies are received through the United Nations Economic Commission for Europe

(UNECE). As a result, the UN questionnaire based on the 1993 SNA is sent to less than 160 countries out of the 207 included in the UNSD National Accounts database.

14. The new UN National Accounts Questionnaire (NAQ) based on the 1993 SNA was implemented in October 1999 for the first time. Some countries have just started to familiarize themselves with the new NAQ. Therefore many of them are implementing and reporting data for some tables only. Several countries have also deliberately decided on a phased implementation of the 1993 SNA. In particular, member countries of the EU and OECD have agreed on a phased implementation of the ESA 1995/1993 SNA questionnaire tables whereby a five-year period (from 1999 to 2003) has been allotted to gradually transmit all tables.

15. In order to create a new database based on the new questionnaire, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database. Together with the data, also the footnotes were imported to the new database. These references were adjusted to comply with the new questionnaire.

CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

16. The form and concepts of the statistical tables in the present publication generally conform to the recommendations in the 1993 SNA. A summary of the conceptual framework and definitions of transactions is provided in chapter I of the present publication.

17. It has to be pointed out that the data collected by the new NAQ are in the format of the 1993 SNA but the concepts applied by countries to compile their data may still adhere to the 1968 SNA or even the 1953 SNA. A series of questions focusing on the most important conceptual changes from the 1968 SNA to the 1993 SNA was added to the annual NAQ sent to countries in October 2002 in order to evaluate the status of the conceptual adherence to the 1993 SNA.

18. The Series Note at the top of each table indicates the SNA system used by the given country to compile the displayed data of the given series. Series numbers below 100 are used for 1968 SNA data, series numbers 100 and higher are used for 1993 SNA estimates. Whenever 1968 SNA data are not replaced for all years by a series of 1993 SNA data, the new 1993 SNA data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is attached to the relevant tables.

19. In the tables with constant prices data (Table 1.2 and Table 2.2), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is data with annually changing base years. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use annually changing base years but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e. the total is not equivalent to the sum of its components. Also, constant price data, which are scaled up or down to a certain reference year in order to allow international comparison, are not additive.

20. In the present publication, the data for each country or area are presented in separate chapters, as far as possible, under uniform table headings and classifications of the SNA. Differences in definition and coverage of specific items are indicated in footnotes to the relevant tables.

21. Country data are presented in alphabetical order. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series Note at the top of each table indicates the type of fiscal year used for any given series.

COMPARABILITY OF THE NATIONAL ESTIMATES

22. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted that the country notes not only refer to the latest data covered in this publication but to the country in general.

REVISIONS

23. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

NOMENCLATURE

24. The information for the countries and areas shown in this publication reflect what is available to the Statistics Division of the United Nations as of August 2005.

25. Designations, which have changed in recent years, are as follows:

Hong Kong - Pursuant to a Joint Declaration signed on 19 December 1994, the United Kingdom restored Hong Kong to the People's Republic of China with effect from 1 July 1997; the People's Republic of China resumed the exercise of sovereignty over the territory with effect from that date.

Zaire - All data for the former Zaire are shown under the country name of Democratic Republic of the Congo.

Czech Republic, Slovakia - Data for Czech Republic and Slovakia are shown separately under the appropriate country name. For period prior to 1 January 1993, data for the former Czechoslovakia are shown under the country name Czechoslovakia (Former)

Yugoslavia (Former) - All data for Yugoslavia prior to 1 January 1992 refer to the Socialist Federal Republic of Yugoslavia, which was composed of six republics. After that date, when available, data for the republics, Bosnia and Herzegovina, Croatia, Slovenia, The Former Yugoslav Republic of Macedonia, and Serbia and Montenegro are shown separately.

USSR (Former) - In 1991, the Union of Soviet Socialist Republics formally dissolved into fifteen independent republics (Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Republic of Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine and Uzbekistan). When available, data are shown for the individual republics. All data for the former USSR are shown under the country name USSR (Former)

Germany - On October 1990, the Federal Republic of Germany and the German Democratic Republic united to form one sovereign State under the designation Germany.

Yemen - In May 1990, Yemen and Democratic Yemen united to form a single State. Since that date they have been represented as one country with the name "Yemen".

Ethiopia, Eritrea – In 1993 Eritrea separated from Ethiopia to form a new state. Ethiopia refers to Ethiopia excluding Eritrea while Ethiopia (Former) refers to Ethiopia including Eritrea.

SYMBOLS AND DATA DISPLAY

26. The following symbols have been employed:

Data not available..... [..]
Magnitude nil or less than five percent of the unit employed..... [0.0]
Decimal figures are always preceded by a point [.]

27. Each series is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series Note at the top of each table informs about SNA system applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

28. Decimals in tables do not necessarily add to totals shown because of rounding.

GENERAL DISCLAIMER

29. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

30. Where the designation "country or area" appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation "country" appears in the headings of tables, it covers countries, territories, cities or areas

1/ United Nations publication. The first 25 editions of this publication were issued under the title Yearbook of National Accounts Statistics under the following sales number: 1957, 58.XVII.3; 1958, 59.XVII.3; 1959, 60.XVII.3; 1960, 61.XVII.4; 1961, 62.XVII.2; 1962, 63.XVII.2; 1963, 64.XVII.4; 1964, 65.XVII.2; 1965, 66.XVII.2; 1966, 67.XVII.14; 1967, E.69.XV11.6; 1968, vol.I, E.70.XV11.2, vol.II, E.70.XVII.3; 1969, vol.I, E.71.XVII.2. vol.II, E.71.XVII.3; 1970, (2 volumes), E.72.XVII.3; 1971, (3 volumes), E.73.XVII.3; 1972, (3 volumes), E.74.XVII.3; 1973, (3 volumes), E.75.XVII.2; 1974, (3 volumes),

E.75.XVII.5; 1975, (3 volumes), E.76.XVII.2 .1976, (2 volumes), E.77.XVII.2; 1977, (2 volumes), E.78.XVII.2; 1978, (2 volumes), E.79.XVII.8; 1979, (2 volumes), E.80.XVII.11; 1980, (2 volumes), E.82.XVII.6; 1981, (2 volumes), E.83.XVII.3;

Beginning with the twenty-sixth edition, this publication replaced Volume 1. Individual Country Data of the Yearbook and it was issued under the following sales number:

1982, E.85.XVII.3; 1983, E.86.XVII.3; 1984, E.86.XVII.26; 1985, E.87.XVII.10; 1986, E.89.XVII.7 (Parts I and II); 1987, E.90.XVII.2 (Parts I and II); 1988, E.90.XVII.18 (Parts I and II); 1989, E.91.XVII.16 (Parts I and II); 1990, E.93.XVII.3 (Parts I and II); 1991, E.94.XVII.5 (Parts I and II); 1992, E.95.XVII.4 (Parts I and II); 1993, E.96.XVII.5 (Parts I and II); 1994, E.97.XVII.6 (Parts I and II); 1999, E.99.XVII.7 (Parts I and II); 2000, E.00.XVII.11 (Parts I and II); 2001, E.01.XVII.14; 2002, E.02.XVII.6.

I. SYSTEM OF NATIONAL ACCOUNTS (SNA)

1. The System of National Accounts 1993 (1993 SNA) 1/ was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993 2/. Similar to the recommendation made in 1968 for its predecessor, A System of National Accounts (1968 SNA) 3/, the Council in its resolution 1993/5 of 12 July 1993 recommends that members states use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that member states consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool.

A. THE SNA AS A SYSTEM

2. The System of National Accounts (SNA) consists of a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents, that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA includes an external account that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels

of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyse the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic Product (GDP), that are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to chapter II of the SNA for a comprehensive overview of the System.

1. The sequence of accounts

Current accounts

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

Production account

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

Distribution and use of income accounts

8. These consist of a set of articulated accounts showing how incomes are:

Generated by production

Distributed to institutional units with claims on the value added created by production

Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes

Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward into the capital account, the first in the System's sequence of accumulation accounts.

Accumulation accounts

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).

The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.

A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

Balance sheets

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets

and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

2. *Activities and transactions*

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly what are the main sectors of the economy for which it is possible to compile the full sequence of accounts summarized in the previous section. Two main

kinds of institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by Governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analysed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V at the end of the SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

1. Supply and use tables

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

2. Price and volume measures

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modeling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as

targets for the formulation of economic policy-making. They are an essential part of the System, especially given the emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

1. The production boundary

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

Household production

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

- (a) The production of agricultural goods by household enterprises for own final consumption;
- (b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc.;

(c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the production of personal and domestic services by members of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production

boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

Other production boundary problems

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

2. The consumption boundary

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the estimated values of the agricultural products consumed by households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the

cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

3. The asset boundary

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

4. National boundaries

29. The accounts of the System are compiled for resident institutional units grouped into institutional sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of

a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high-inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic

circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

1. Specific uses

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

Monitoring the behaviour of the economy

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

Macroeconomic analysis

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different

economic variables by applying econometric methods to time series of data at both current and constant prices compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

Economic policy-making and decision-taking

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data. The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees. Such agencies typically require very detailed national accounts data.

International comparisons

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the

SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

2. Flexibility of implementation and use

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy

needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

3. The SNA as a coordinating framework for statistics

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind the revision of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the SNA, the harmonization process has been particularly effective in respect of balance of payments statistics, government finance statistics and money and banking statistics, for which the IMF has responsibility. Revisions of each of these three systems are being undertaken by the IMF in order not only to

update these systems but also to make them consistent with the SNA to the fullest extent possible. Revised manuals on these systems are being published at about the same time as, or in the years immediately following, the 1993 SNA.

48. Various other revised international guidelines are being issued at about the same time as the revised SNA. These include, the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the SNA. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

1. Final consumption, intermediate consumption and gross fixed capital formation

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption, whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

Training, research and development

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

Education

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practising - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

Repairs, maintenance and gross fixed capital formation

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or

prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

2. Interpretation of the distinction between consumption and gross fixed capital formation

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain

expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

Acquisitions

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

Actual final consumption of general government

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.

Actual final consumption of households

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

Actual final consumption of NPISHs

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

Additivity

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

Base period

The period that provides the weights for an index is described as the base period.

Basic price

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

C.i.f. price

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

Capital transfers

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred.

Chain indices

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

Changes in inventories (including work-in-progress)

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

Compensation of employees

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

Constant prices

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in “constant price terms”).

Consumption good or service

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

Consumption of fixed capital

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

Current transfers

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.

Deductible VAT

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

Disposals

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

Export subsidies

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

Export taxes

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

Exports of goods

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

Exports of services

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

F.o.b. price

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

Factor cost

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

Final consumption

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

Final consumption expenditure of government

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

Final consumption expenditure of households

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by

resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

Final consumption expenditure of NPISHs

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

Financial intermediation services indirectly measured (FISIM)

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

Fixed assets

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

Goods

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

Gross

The term “gross” is a common means of referring to values before deducting consumption of fixed capital (generally used as in “gross capital stock” or “gross domestic product”).

Gross capital formation

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

Gross domestic product - expenditure based

Expenditure-based gross domestic product is total final expenditures at purchasers’ prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

Gross domestic product - income based

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

Gross domestic product - output based

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross domestic product at market prices

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross fixed capital formation

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.

Gross national disposable income

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Gross national income (GNI)

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

Gross saving

Gross saving is gross disposable income less final consumption expenditure.

Gross value added

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Gross value added at basic prices

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

Gross value added at producers' prices

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

Import duties

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

Import subsidies

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

Imports of goods

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

Imports of services

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

Indirect taxes

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term “indirect taxes” is not used in 1993 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

Intermediate consumption

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

Inventories

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

Invoiced VAT

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

Market prices

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

Mixed income

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

Net

The term “net” is a common means of referring to values after deducting consumption of fixed capital (generally used as in “net capital stock” or “net domestic product”); it should be noted, however, that the term “net” can be

used in different contexts in the national accounts, such as “net income from abroad” which is the difference between two income flows.

Net income from abroad

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

Net lending

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as “net borrowing”.

Net national disposable income

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Net national income

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

Net saving

Net saving is net disposable income less final consumption expenditure.

Net value added

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Non-deductible VAT

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

Non-financial assets

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

Non-produced assets

Non-produced assets are non-financial assets that come into existence other than through processes of production.

Non-profit institutions serving households (NPISHs)

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

Non-resident

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

Operating surplus

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called “mixed income”).

Other subsidies on production

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (eg, subsidies on payroll or workforce or subsidies to reduce pollution).

Other subsidies on products

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1)

subsidies on products used domestically, (2) losses of government trading organisations, and (3) subsidies to public corporations and quasi-corporations.

Output

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

Producer's price

The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

Property income

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

Purchaser's price

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Resident

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

Services

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realised by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

Stocks

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as “inventories” in the System).

Subsidies

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

Taxes and duties on imports

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

Taxes on production and imports

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

Taxes on products

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a

result of their use for own consumption or own capital formation.

Transfer

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

Valuables

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

Value added - gross

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Value added - net

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Value added tax (VAT)

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

II. COUNTRY TABLES

Kazakhstan

Source

Reply to the United Nations national accounts questionnaire from the State Committee of the Republic of Kazakhstan on Statistics and Analysis. The latest data for Kazakhstan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Kazakhstan has changed in 1993 from the Russian rouble to Kazakh tenge. One tenge equals 500 Russian rubles (see World Bank "Statistical Handbook for the States of the FSU, 1996").

^d Excludes financial intermediation services indirectly measured (FISIM).

Kenya

Source

The preparation of national accounts statistics in Kenya is undertaken by the Central Bureau of Statistics, Nairobi. The official estimates are published annually in the "Statistical Abstract". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). A full revision of previous estimates for the years 1972-1975 were published in 1976, implementing improved methods and sources of estimation. Input-output tables for 1967 and 1971 were published in 1972 and 1976 respectively in "Input-Output Tables for Kenya". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Estimates are published in Kenya pound (K£), which is used as unit of account and equals 20 Kenyan shilling.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. A combination of the commodity-flow and expenditure approaches is used to estimate gross capital formation. The estimates of government final consumption expenditure are derived from the accounts of the central and local government, the East African Community, the relevant statutory boards and the National Security Fund. All accounts are prepared on a cash basis. Private consumption expenditure is obtained as a residual. Changes in stocks are recorded for agriculture, industrial activity, building and construction and wholesale and retail trade sectors. The sources of information are the large-farm censuses, the integrated rural survey, annual surveys or reports from concerned sectors and the survey of Distribution. The estimate of capital formation in building and construction is derived from "completions" reported by municipalities and from expenditure on other construction undertaken by government and industry. Included in gross fixed capital formation is the value of development of permanent crops. Expenditure estimates on machinery and equipment are derived by using the commodity-flow method. For import items, import duties are added to the c.i.f. values. For domestic production, the annual surveys of manufacturing are the source of information. The figures derived are converted to purchasers' values by adding transport and distribution margins. Exports and imports of goods and services are based on foreign trade reports and balance of payments estimates. For the constant price estimates, government expenditure on wages and salaries are extrapolated by an index of employment, while purchases of goods and services are deflated by various price indexes. Private consumption expenditure is obtained as a residual. For the remaining expenditure items, price deflation is used.

Income Approach

Wages and salaries paid in most industries are obtained from the annual surveys of employees and self-employed persons. Other sources include the integrated rural survey for small farms, logger licenses and wage rate for forestry, reports and special surveys for transport, government accounts for the government sector and annual questionnaires for the private non-profit services. Information on indirect taxes and subsidies is obtained from concerned enterprises and from government records. Operating surplus, including consumption of fixed capital, is obtained as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The expenditure approach is used for construction and capital formation in residential and non-residential buildings while the income approach is used for insurance and real estate. For the agricultural sector, the main sources of information are the annual large-farm censuses, annual integrated rural surveys and purchases by boards, co-operatives and large factories. The Ministry of Agriculture provides supplementary information. The censuses and surveys provide information on quantity and value of sales and quantity consumed at the farms. The prices for agricultural products sold to boards and co-operatives are those paid by the boards while prices used for other products are those obtained from integrated rural survey, reflecting prices in the local markets. Estimates for forestry and fishing are obtained from concerned departments. Information on gross output and intermediate consumption of mining and quarrying and electricity is obtained from the companies concerned. A census of manufacturing industry was held in 1972 covering all establishments. Annual surveys are undertaken for all firms employing 50 or more persons and a sample is taken for firms employing between 20 and 49 persons. For firms with less than 20 employees, estimates are derived by inflating the value of gross output and intermediate consumption obtained in the 1972 census. The benchmark estimate for construction contractors is based on the 1972 census of industry and the rural enterprise survey. Information from large contractors are available annually while those with less than 4 employees are covered by the labour force survey. Their estimates are obtained by applying an increasing factor to the census figures. The estimates of own-account construction are obtained from the large-farm censuses. Certain percentages are added for maintenance and labour costs. The East African Power and Lighting Co., Ministry of Works, Forests Department and other local authorities provide information on their own-account construction activities. In the non-monetary sector, the value of output is the number of huts built multiplied by its current cost and 15 per cent added for maintenance. For trade, the Survey of Distribution 1967 provided benchmark information on the value of output and intermediate consumption. Value added by each sub-division is then extrapolated by using various indicators. The rural enterprise survey in 1972 provided benchmark estimates for the rural areas. The sources of information for railway, shipping and air transports are the annual reports of the concerned companies and special questionnaires. For buses, data are obtained from the Kenya Bus Services Co. only and their ratios are applied to other bus firms. For the financial sector, the Central Bank of Kenya provides the information needed. Value added of real estate is calculated as net trade receipts of companies and individuals and 50 per cent of the rentals of companies. For ownership of dwellings, a stratified multi-stage sample is taken annually. The estimates of producers of government services are obtained from the accounts of the government, East-African Community and National Security Fund. For private services, bench-mark estimates are derived from a survey conducted in 1972. Domestic services are calculated from the estimated number of servants and their wage rates. For the constant price estimates, double deflation is used for agriculture, with current year's quantities revalued at base year prices. Double deflation is also used for mining and quarrying, manufacturing and construction. For electricity, gas and water, trade, transport and community services, value added is extrapolated by various quantity indicators and indexes. Current values of financial institutions, insurance and real estate are deflated by price indexes.

Korea, Republic of

Source

Reply to the United Nations national accounts questionnaire from the National Accounts Office of the Bank of Korea, Seoul. The official estimates are published in "National Accounts", Bank of Korea. The data for the Republic of Korea was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The estimates shown in the tables below have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The official estimates and methodological notes on sources and methods are published annually by the Bank in "National Accounts". Input-output tables have been compiled and published by the Bank. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following presentation is based mainly on information contained in "National Accounts in Developing Countries in Asia" issued by the Development Centre of the Organization for Economic Co-operation and Development (OECD), Paris. Original constant prices are based on the year 1995.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the expenditure approach except part of private final consumption expenditure and the purchases of producers' durable equipment which are estimated through the commodity-flow approach. The estimates of government consumption expenditure are derived from government fiscal data. Expenditure on all consumer goods, except food grain, is estimated by the commodity-flow method using industry's production data, export and import data, changes in stocks and input-output tables. Adjustment are made for net expenditure abroad by residents. For food grain, consumption per household or per head is multiplied by the total number of household or population. Changes in stocks of grain, livestock and imported raw materials are estimated by deducting total domestic demand from total domestic supply, valued at average prices. For mining and manufacturing products, estimates are based on the ratio of change in stocks to total production, this ratio is applied to the value of output by subgroups. Investment in the government sector is derived from government accounts. For the private sector, estimates of investment in construction are derived from output data adding incidental costs and excluding repair cost and construction for defence. Estimates for durable equipment are based on production data, import and exports and changes in stocks. Estimates for exports and imports of goods and services are based on balance of payments statements. For the constant price estimates, price deflation is used for government consumption expenditure, net expenditure abroad by resident and exports and imports of goods and services. Private expenditure on food grain is extrapolated by the index of consumption while other expenditure are based on constant value of production, imports and exports and increase in stocks. This latter source and method is also used for estimating producers' durable equipment. For increase in stocks of mineral and manufactured goods, the constant output value is multiplied by the rate of inventory change while for agricultural products and imported raw materials, the method is the same as the one used to estimate these items at current market prices.

Income Approach

The cost-structure estimates of gross domestic product are compiled by aggregating the value added at factor cost of each industry, making adjustments for net indirect taxes which are obtained from taxation statistics.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most industries. The income approach is used for electricity, gas and water, part of transport and communication and part of other services. The value of output of agriculture is obtained by multiplying the quantities produced by the corresponding prices, the data of which are supplied by the Ministry of Agriculture & Forestry. The financial data contained in the "Yearbook of Agriculture and Forestry Statistics" are used to obtain the value added of agricultural services. The value added of forestry is obtained by multiplying the value of production by the value added ratio calculated from the input-output tables. For fisheries, the value added is obtained by multiplying the value of production by the value added ratio calculated from the input-output tables.. Value added of the mining and manufacturing sectors is estimated by applying the value added ratio to current value of output. Value added ratio of subsectors are calculated from the input-output table and the financial statement analysis of enterprises. For mining, output is estimated by multiplying quantities produced by unit prices collected from producers' price, export unit value and representative producers' prices while quantity data are obtained from statistics on mining products. For manufacturing, output is obtained by inflating the constant-price of output by a weighted price index while quantity data are obtained from industrial production index statistics. Value added of electricity, gas and water is derived from the financial data of concerned enterprises. Value added of the construction sector is obtained by multiplying the construction value of each sector by a corresponding value added ratio. The construction unit cost and value added ratio are specially calculated by using the base year composition of input to total construction value. The construction value is estimated by multiplying total floor area by construction unit cost for the private sector and for the public sector, derived from fiscal data. Value added of the trade sector is estimated by multiplying total mark-up by the value added ratio calculated from the input-output table. For restaurants and hotels, value added in the base year is extrapolated by volume indicators and revalued at current prices. Value added of railway and air transportation and communication is derived directly from the respective financial data while for other transportation and storage, the gross earnings in the base year are extrapolated by a quantity index and then revalued by appropriate price indexes. The value added of financing and insurance and real-estate is obtained from financial data and taxation data, respectively. For business services, value added is estimated by extrapolating the base year estimate. The government executed budget is used to estimate the contribution of public administration and defence to GDP. For the private services, estimates are calculated by multiplying the constant price estimate by appropriate price index, using such sources as Statistical Yearbook of Education and Yearbook of Public Health and Social Statistics. For the constant price estimates, double deflation is used for agriculture and fishing. Current estimates of agriculture services, government construction, financial institutions and insurance and government services are deflated by appropriate price indexes. For the remaining sectors of the economic activity, value added in the base year is extrapolated by quantity indicators.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Includes social contributions.

Kuwait

Source

Reply to the United Nations national accounts questionnaire from the Central Office of Statistics, Ministry of Planning, Kuwait City. Official estimates are published by the same Office in "National Accounts Statistics", "Annual Statistical Abstract" and "Economic Statistical Indicator for Private Sector in Kuwait's Economy during the period 1987-1992".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Committee of the Republic of Kyrgyzstan. The latest data was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions.

Lao People's Democratic Republic

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Center of Lao PDR. The National Statistical Center is a department of the Committee for Planning and Cooperation, which is responsible for the collection and dissemination of statistics and operates as the coordinating agency for statistical activities in Lao PDR.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

The latest estimates displayed have been prepared in accordance with the annual gross domestic product by economic activity at current and constant (1990) prices. Concepts and definitions follow the System of National Accounts with some adjustments to the context of the Lao PDR's economy and data availability. Gross domestic product is estimated mainly through the production approach.

Production Approach

The compilation system for calculating GDP by activity at current and constant prices can be described as follows: A benchmark estimate of gross value added for 1990 was prepared mostly on the basis of quantity of production or quantity indicators; prices for these products based on some studies in major cities and estimated value added to output ratios. The quantities of production in each year are multiplied by the 1990 price to derive output at 1990 prices. Value added to output ratios estimated for 1990 are used to derive value added at constant prices. Value added estimates at constant prices in each year are inflated (in most cases) using the overall CPI to derive value added at current prices.

Latvia

Source

Reply to the United Nations national accounts questionnaire from the State Committee for Statistics of the Republic of Latvia, Riga.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions.

Lesotho

Source

The preparation of national accounts statistics in Lesotho is undertaken by the Bureau of Statistics, Maseru. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The official estimates together with methodological notes on sources and methods are published in a series of reports entitled "National Accounts". Beginning 1980, the estimates have been revised utilizing new sources of information. The most important of which is the 1986/87 Household Budget Survey. The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure, consisting of wages and salaries and purchases of goods and services, is obtained from government accounts. The government expenditure is classified by the type of service provided by the central authorities. The estimates of private final consumption expenditure are based on the rural household survey undertaken in 1967-1969 and on the urban household survey carried out in six district towns from May 1972 to May 1973. Recently, this item has been estimated as a residual. For the new series, household consumption is also obtained as a residual. Increase in stocks is estimated mainly from questionnaires and surveys carried out for the agricultural sector. Gross fixed capital formation consists of the value of purchases and own-account construction of fixed assets by government, private and public enterprises, individuals and non-profit institutions. Various sources such as questionnaires and imports of building materials are used to collect the information. The gross capital formation in plant machinery and vehicles of the new series is assumed to be 1.2 times the imports of capital goods. Estimates of exports and imports of merchandise are obtained from foreign trade statistics with adjustments made for differences in coverage and valuation. Exports are recorded f.o.b. at the border of Lesotho and imports are also recorded f.o.b. at the point of dispatch. For the estimates of GDP at constant prices, household consumption is obtained as a residual. The estimates of gross capital formation and the imports and exports of goods and services are calculated by using the relevant import price indexes.

Income Approach

Wages and salaries are derived from the government accounts and other returns. Estimates of operating surplus are derived as residuals from the production accounts of all sectors. Depreciation is obtained from returned questionnaires and no estimate is available for the government or subsistence sectors. Indirect taxes consist mainly of revenue received by Lesotho as a member of the customs agreement with Botswana, South Africa and Swaziland. Subsidy figures consist of government contributions to defray part of the operating expenses of government and other enterprises.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of the different industries except for producers of government services in which case the income approach is used. The agricultural division of the Bureau of Statistics carries out regular annual surveys. The 1970 census of agriculture and the 1973 agricultural survey are used to derive estimates of cereal production, assuming a wastage of six per cent during the various stages of harvest. The 1967-69 rural household survey is used for fruit and vegetable production estimates. For livestock, balance sheets prepared by the agricultural division of the Bureau of Statistics provide changes in stock estimates, to which the average values for different types of livestock are applied. For the new series, the annual crop survey and annual livestock survey supply information on quantities produced. The price information for the crop is available from the Ministry of Agriculture while the price movement for livestock is deducted from retail price index. For meat production, average carcass weights are applied to the number of livestock slaughtered which are obtained from the Ministry of Health and annual production surveys. The value of diamonds sold to licensed dealers by diggers is regarded as the value of diamonds exported from Lesotho. The receipts from diamonds are regarded as a contribution by the mining sector to GDP. Data on quantities and values of diamonds are obtained monthly from the Department of Mines and Geology. For manufacturing, data are derived from questionnaires prepared specially for manufacturing enterprises while data for handicrafts are based on the 1967-1969 rural household consumption and expenditure survey. For years 1980-1985, the estimates of manufacturing have been reconciled with the Yearbook of Industrial Statistics 1987. The estimates of the years after 1985 are based on industrial survey and survey of industrial production. Data for electricity and water are obtained from the balance sheets of the electricity corporation and accounts of the concerned ministry. Special questionnaires filled in by building contractors are used for the construction sector. Estimates of own-account contribution are included. For the new series, value added of construction is a fixed proportion of the input of building material which is based on import statistics. For the trade sector, questionnaires are used for large enterprises while the results of a survey conducted in 1970-1971 are used for small enterprises. Estimates of the public transport and communication sector are based on government accounts supplemented by inquiries while estimates of private transport are obtained from the concerned enterprises. For the financial sector, special inquiries directed at the banks and the headquarters of insurance companies are used. For ownership of dwellings, government accounts provide information for the public sector while questionnaires returned by businesses and institutions are used for the private sector. The 1972-73 urban household survey is used to estimate imputed rent. Information relating to general government services is obtained from the government accounts. Data on other services are obtained through questionnaires and special inquiries. The estimates of GDP by kind of economic activity at constant prices are calculated by using relevant price indexes for most of the industries.

Reply to the United Nations national accounts questionnaire from the Department of Statistics.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA).

Methodology:

Overview of GDP Compilation

National Accounts in Lithuania have been compiled since 1992 on the basis of the 1993 System of National Accounts (SNA 1993), as well as the European System of National and Regional Accounts (ESA 1995), which is broadly consistent as regards definitions, accounting rules and classifications. One of the main indicators in the System of National Accounts – Gross domestic product (GDP)– was estimated from 1990 (annual) and quarterly is available since 1995. Gross national income (GNI), disposable national income, saving and net borrowing are calculated applying the Balance of Payments data, which reflect transactions with the rest of the world. The calculation started from 1993 with the introduction of Balance of Payments in Lithuania. Aiming at presentation of indicators, which characterise regional development, calculation of Regional GDP started in 1998. Statistics Lithuania has carried out a revision of 1995-2001 data of the National accounts in 2003. The purpose of the revision was implementation of more accurate calculation methods using new and upgraded current information resources. All recently available novelties have been hold and used to simultaneously revise time series of indicators. As a result, it becomes easier to interpret economic change trends. Data of revised national accounts are better harmonized with methodological regulations and classifications of the 1995 System of European National and Regional Accounts. GDP and its components recalculated at constant prices of 2000 instead of 1995 for the period of 1995-2001 as well. Data reflect a more real outlook on the recent economic structure and its changes. A new system of deflators and extrapolators had to be prepared for the data recalculation. It was improved and expanded very much in comparison with the previously used. Year 1997 was chosen as a link year with a previous time series calculated at the base year of 1995.

Luxembourg

Source

Reply to the United Nations national accounts questionnaire from the Service Central de la Statistique et des Etudes Economiques, Ministere de L'Economie Nationale, Luxembourg. The official estimates and descriptions are published by the Service in "Cahiers Economiques", Serie B, Comptes Nationaux. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. The estimates prepared according to the 1968 SNA are provided in the former national currency Luxembourg franc. The newly submitted constant price data which are compiled according to the 1993 SNA are not additive. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Luxembourg the currency name for the data before 1999 is "1999 LUF euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 40.3399 Luxembourg franc. - The name of the currency of the newly submitted data is "1999 LUF euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Luxembourg, like for example all old data following the 1968 SNA is still in "Luxembourg franc", although this is not specifically indicated in the tables.

Malawi

Source

The preparation of national accounts statistics in Malawi is undertaken by the National Statistical Office, Zomba. The official estimates are published in a series of reports entitled "National Accounts Report". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

A detailed description of the sources and methods used for national accounts estimates is found in "National Accounts Handbook, Sources and Methods" published in 1985. The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, investment in building and construction and exports and imports of goods and services. The commodity-flow approach is used to estimate the gross capital formation of transport equipment, plant and machinery whereas private final consumption expenditure is estimated as a residual. Government expenditure is estimated by netting out rent from the total of Malawi government revenue, expenditure on revenue and development account expenditure and final consumption as shown in "Public Sector Financial Statistics". Changes in recorded stocks of the monetary sector are obtained from the annual economic surveys and annual reports of the Agricultural Development and Marketing Corporation. Unrecorded stocks, i.e., imported goods, are estimated on the basis of information received from businessmen and the Ministry of Trade and Industry. Estimates of non-monetary stocks are estimated from annual economic surveys, reports of the Veterinary Department and from the Agricultural Development and Marketing Corporation. Estimates of investments in building and construction are obtained directly from large enterprises and government. For fixed operating and auxiliary equipment, installation costs are estimated at 25 per cent of the price of deliveries. Other equipment is valued at estimated delivered prices. Fifteen per cent of the private cars and bicycles are assumed to be imported by government and private industry and are treated as capital formation. Export and imports of goods and services are based on the balance of payments report. For the constant price estimates, price deflation is used to estimate all items of GDP by expenditure type.

Income Approach

Estimates of compensation of employees, operating surplus and consumption of fixed capital are based on data obtained from the annual survey of economic activities. Data on indirect taxes and subsidies are taken from the financial statistics of the public sector.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of most industries. The value added of large and medium-scale establishments, was generally taken from the Annual Economic Survey 1973-1979 and from the Medium Business Annual Review. Estimates of agricultural output are based mainly on the annual reports of the Agricultural Development and Marketing Corporation and on agricultural surveys undertaken by the National Statistical Office. Net income of farmers from sales of crops to the corporation is derived by deducting from total farm receipts the expenditure on cotton spraying and 50 per cent of the expenditure on fertilizers, seeds and tools. Income from

sales of crops to other dealers is calculated as 50 per cent of the free-on-rail export value of the crops, whereas income from sales in local village and urban markets is calculated from estimates of the annual consumption of main food crops by the African population. For livestock production, estimates are based on live-weight purchases by butchers and the Cold Storage Commission which are published in the annual reports of the Veterinary Department. Increase in herds is estimated from the annual livestock censuses and the national sample survey of agriculture. For forestry, the National Statistical Office makes estimates of the retail value of firewood sales less the cost of axes and hatchets. An assumption on the quantities of firewood consumed per household is made for non-marketed firewood. The Fisheries Department provides estimates for the fishing sector. Own-consumption of fish is estimated as 10 per cent of the landed value of the total fish catch. The estimates of large mining enterprises are based on the annual economic survey. For large manufacturing enterprises employing 20 persons or more, the annual economic survey is used to estimate gross output and intermediate consumption. The estimates of enterprises such as grain-milling, tailoring, fish-curing, handicrafts, etc. are based on agricultural sample surveys, information from the Ministry of Trade and Industry, data supplied by the Buildings Department, etc. The sources for the estimates of electricity, gas and water are the annual economic surveys and the public sector financial statistics. For government construction, the annual reports of the Ministry of Works and Supplies and the estimates prepared by the National Statistical Office are used as sources. For private construction, the quarterly building inquiries and the annual economic surveys are used for the larger enterprises while data from agricultural surveys are used for other construction including own-account construction. It is assumed that the ratio of value added to total receipts for the large construction enterprises also applies to small operators. The annual economic survey is the source used to estimate activity of larger trade enterprises while the annual reviews of small businesses are used for other enterprises. The wage component of gross output is derived from data on average employment per store and minimum wage rates. For the transport sector, the annual economic survey is also used for the larger enterprises while the annual reports of the Road Traffic Commissioner are used for the small transport operators. It is assumed that average value added per vehicle for the larger operators applies equally to the small enterprises. Value added of the financial institutions is estimated on the basis of the quarterly employment inquiries, documents of banks, information from the Ministry of Finance and the accountant-general's annual reports. Rental value are obtained from various sources such as the public sector financial statistics, the accountant-general's annual reports and reports of the commissioner for taxes and income survey, respectively. Value added of public administration and defence is obtained from the detailed analysis of government accounts. For private services, estimates are based on quarterly employment and earnings inquiries, agricultural surveys, annual inquiries of domestic servants, annual economic surveys and information supplied by the Ministry of Trade and Industry. Gross domestic product by kind of economic activity is not estimated at constant prices.

Malaysia

Source

Reply to the United Nations national accounts questionnaire from the Department of Statistics, Kuala Lumpur. The official estimates are published in a series of reports entitled "Annual National Product and Expenditure Accounts".

General

The estimates shown in the following tables are prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. The publication of estimates of national accounts have been on a Malaysia basis since 1963, and are expressed only in current prices. Since 1970, the estimates are available in both current and constant prices. The initial constant price series published were valued in 1970 prices, for the period 1971 to 1983. Subsequently, the valuation of the constant series were updated to 1978 prices and are available from 1978 up to 1997. The series were again updated to 1987 prices and available data are from 1987 to the present. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through two national accounting transactions, production and expenditure approaches.

Expenditure Approach

The expenditure approach in combination with the commodity-flow approach are used to estimate the expenditure aggregates. Government final consumption expenditure is based on public accounts and financial records and statements of the government bodies. Benchmark estimates of private final consumption expenditure are derived from detailed commodity balancing for the final accounts years. Between final accounts years, estimates of private consumption expenditure have been made by allocating the available supply of consumer goods and services from import and local production to the various consumption component items. Gross fixed capital formation includes not only construction, machinery and equipment but also investment in plantation and smallholders' perennial crops. Exports and imports of goods and services are estimated from customs returns and balance of payments returns. In the process of compiling the constant price series, extensive use is made of the Producer Price Index and the Consumer Price Index as deflators. For the producers of government services, an average price index for material inputs as well as a weighted index for salary revisions have been utilized.

Income Approach

Estimates for compensation of employees are derived from statistical surveys and from government accounts. Indirect taxes are obtained from government accounts. Operating surplus including depreciation is obtained as a residual. The cost structure of the gross domestic product is only estimated for final accounts years.

Production Approach

The production approach is used to estimate the value added by kind of economic activity. A detailed commodity-flow approach has been adopted for the reference years 1971, 1973, 1978, 1983, and 1987 to derive value added by sector. For those years in between, national accounts estimates are compiled based extensively on volume indicators of production. The indicators are used to extrapolate base year value added by sector/subsectors. Current monthly/annual statistics for agricultural crops, manufacturing, mining and other service sectors form the basis for computation of the appropriate volume indices. For producers of government services, the value added is derived from preliminary estimates of the expenditure obtained from the Accountant General's Office.

Reply to the United Nations national accounts questionnaire from the Ministry of Planning and National Development, Maldives. Official estimates are published in the "Statistical Yearbook".

General

The latest data shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Malta

Source

The preparation of national accounts statistics in Malta is undertaken by the Central Office of Statistics, Valetta. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The latest data have been taken from the "Quarterly Review Dec. 2002" published by the Central Bank of Malta.

General

The official estimates and methodological notes are published annually in "National Accounts of the Maltese Islands". The estimates are generally in accordance with the definitions and classifications recommended in the United Nations System of National Accounts 1968 (1968 SNA). Input-output tables are published in the above-mentioned publication. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classification recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used for gross fixed capital formation and private final consumption expenditure. Increase in stocks is obtained as a residual. The estimates of government consumption expenditure is based on returns from all government departments. Excluded are current expenditure on national insurance benefits, subsidies and grants to persons and expenditure on fixed capital assets and on addition to stocks. Private consumption expenditure represents expenditure on consumer goods and services by persons and non-profit making bodies at market prices. Gross fixed capital formation constitutes expenditure on fixed assets for the replacement of and addition to existing assets. The estimates are based on an analysis of government expenditure, import data and censuses of production. The estimates of exports and imports of goods and services are based on data available from trade returns, banking statistics and estimates of expenditure on services, supplemented by ad-hoc inquiries. For the constant price estimates, government final consumption expenditure, gross fixed capital formation and exports and imports of goods and services are deflated by appropriate indexes. For private consumption expenditure, extensive use is made of the various sub-indexes that make-up the retail price index.

Income Approach

Compensation of employees includes employers' contributions to national insurance. For the private sector, employees' incomes are taken from annual reports of labours inspectors except in the manufacturing, quarrying and construction sectors, for which data are taken from the censuses of production. Government wages and salaries are estimated on the basis of department returns, while the services submit actual figures of their wage and salary bill. Profits are estimated from income tax data for professionals, annual censuses of production for manufacturing and ad hoc inquiries for other activities. For trade, gross profits are arrived at by assessing wholesale and retail profits on the basis of calculated turnovers. Income from property is estimated on the basis of actual rents received by the government plus rents earned by the private sector which is based on data obtained in the census of population, housing and employment in 1967 and interest earned from local sources. Indirect taxes cover items such as customs and excise duties, business licenses, stamp duties, motor vehicle licenses, etc. While subsidies include grants to farmers, price-stabilization payment, loss incurred on water and milk supplies, etc.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The income approach is used to estimate the value added of most industries except agriculture and fishing, for which the production approach is used. For most sectors of GDP by economic activity, separate estimates are available for wages and salaries, income from self-employment and other trading income. The contribution of each industry also includes provision for depreciation. The sources of these estimates are described in the cost-structure of GDP above. Gross domestic product by kind of economic activity is not estimated at constant prices.

Reply to the United Nations national accounts questionnaire from the Office of Planning and Statistics, Majuro in collaboration with the Asian Development Bank. The most recent data was obtained from the internet website (<http://www.spc.int/prism/country/mh/stats/Economic/NationalAcct/RMIGDP.htm>), as reported by the Economic Policy, Planning and Statistics Office (EPPSO), Majuro, Marshall Islands.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Mauritius

Source

The preparation of national accounts statistics in Mauritius is undertaken by the Central statistics Office, Port Louis. The official estimates are published periodically in "National Accounts of Mauritius". The estimates are also published in Economic and Social Indicators. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The following presentation on sources and methods is mainly based on information received from the central Statistics Office. The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used to estimate gross fixed capital formation. The commodity-flow approach is used for private final consumption expenditure supplemented by the expenditure approach for expenditure on services. Government consumption expenditure is estimated on the basis of the annual financial reports of the government and the municipal and town councils. The sources of data for private expenditure on goods include the 2000 census of population, the 1996/97 household budget survey, the annual trade reports of the Customs Department, the annual financial reports of the government and special surveys of wholesale and retail margins, costs and profits. Figures of imported goods are extracted and reclassified from the foreign trade statistics and added to the figures for local production, both valued at market prices. Expenditure on services and private expenditure abroad are estimated on the basis of data from financial reports of the government, the censuses, records of income tax office and annual reports of the Ministry of Education. Information of investment on new buildings is obtained from records of building permits issued, records of the municipal and town councils and from returns of industrial and building companies. Investment on plantations is estimated from the returns of agricultural concerns and reports of the Chamber of Agriculture and the Tobacco Board. For machinery and equipment, figures on imports are derived from the annual trade reports and returns from industrial firms. Charges for transport, trade margins and installation costs are added to the c.i.f. values. Domestic production figures are obtained from the annual returns of manufacturing firms. Estimates of exports and imports of goods and services are based on sources such as the annual trade reports of the Customs Department, monthly returns from banks, records of Post Office and balance of payments. Current price estimates of the different components of GDP from the expenditure side are deflated by appropriate indices to obtain growth rates. It should be noted that increase in inventories may include any discrepancy between the production and expenditure approach.

Income Approach

Information on compensation of employees for large establishments of all sectors, except the sugar industry is available from questionnaires sent out in connexion with the census of production and income tax returns. For the sugar sector, detailed figures of payments in cash and in kind are supplied by all sugar estates with factories while figures from employment records, statutory wage rates and the quantity of canes produced are used for the

remaining sugar industry. Wages and salaries for the public sector are obtained from a bi-annual survey of all government departments and ministries. Operating surplus is estimated through the use of questionnaires and income-tax statistics for the private sector and production accounts for the government sector. No attempt has been made to estimate the consumption of fixed capital because of the lack of data on capital stock. Consequently all aggregates are given on a gross basis. Data on Taxes on production and imports are obtained from government and municipal council records.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is used for some private services and for public administration and defence. For the agricultural sector, estimates are made on an item-by-item basis using annual statistical returns, annual surveys and reports supplemented by direct inquiries among producers and distributors. Sources used for sugar production are reports of the Chamber of Agriculture and financial statements of the Mauritius Sugar Syndicate. The estimates for mining and quarrying refer only to salt production and sand quarries and are provided directly by the concerned enterprises. The estimates for manufacturing are obtained through similar methods as those used for the agricultural sector. For sugar and related products, data are obtained from returns furnished by the factories and distilleries, reports and statistics of the Chamber of Agriculture and financial statements of the Mauritius Sugar Syndicate. The estimates of electricity and water are based on information provided by the concerned enterprises and the financial reports of the government. Information on private construction is obtained from records of building permits issued and from the municipal and town councils. Information furnished by the building contractors and financial reports of the government are used for public construction. For trade, information is obtained from the Income Tax Office and from imports and local production statistics. Special questionnaires on receipts and expenditure are sent to large hotel and restaurant enterprises as well as to large transport enterprises. Information on public transport is available from the accountant-general's records. For the financial sector, the most important sources are the central bank, income-tax returns of commercial banks and annual reports of the registrar of insurance companies. Special questionnaires are also sent to insurance companies. The estimates for ownership of dwellings are based on the 2000 Housing Census and records of building permits issued. For public administration and defence, detailed information is available from treasury records. For the private services, information is obtained from the population census and special questionnaires sent to large enterprises. Growth rates are derived by deflating current values by appropriate price indexes.

Mexico

Source

The preparation of national accounts statistics in Mexico is undertaken by the General Director of National Accounting, Sociodemographic Studies and Prices of the National Institute of Statistics, Geography and Information (Instituto Nacional de Estadística, Geografía e Informática), Mexico. Official estimates are published by National Institute annually in "System of National Accounts of Mexico". Reply to the United Nations national accounts questionnaire was received through the Organisation for Economic Co-operation and Development (OECD), Paris, France.

General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The estimates of gross fixed capital formation is largely based on the commodity-flow approach, such as private final consumption expenditure. The estimates of government consumption expenditure are based on government accounts. For gross fixed capital formation the values from the input-output table (1980) are extrapolated by value indexes for each of the principal components. The indexes are constructed by using special quantity and price indexes. Exports and imports of goods are estimated from the tables of external transactions, which is based on the balance of payments. For the calculation of constant prices, general government expenditure in goods and services is deflated by a specially constructed price index and the value added is extrapolated by occupation index. The private consumption expenditure in constant prices is extrapolated with a quantity index. Gross domestic investment is also extrapolated by quantity index by kind of asset. Imports of goods and services are deflated by specially constructed price indexes and exports are extrapolated with quantity index.

Income Approach

The estimates of compensation of employees for general government, petroleum and electricity production, financial institutions and partly for the transport and communications sectors, are based on direct current information on wages, salaries, etc. In the case of manufacturing, mining and private services the estimates are based on surveys that include wages and salaries. For construction, trade and agriculture, employment are extrapolated by production indexes and indexes of average wages. The estimates of consumption of fixed capital, are based on an approximation to the perpetual inventory methods. Each year depreciation of the capital stock, valued at replacement cost, is estimated, based on assumptions regarding the economic life replacement cost, based on assumptions regarding the economic life of the fixed assets. Government accounts are used in the estimation of indirect taxes and subsidies. Operating surplus is estimated as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of all industries with direct relation to the input-output table (1980). The income approach or the expenditure approach are used for some sectors. The

estimation of gross output, intermediate consumption and value added is based on the input-output table (1980), from which extrapolations are made by means of value indexes. These value indexes are, in general, the products of price indexes and volume indexes. The volume index for agricultural production is based on statistics of gross output of more than 196 commodities. The index for livestock production is based on statistics of animals slaughtered for domestic consumption and export, live animals exported and inventory changes. The intermediate consumption of crop and livestock production is extrapolated by value indexes for the principal components and commodities used (1980). For petroleum and other mining, the volume indexes are based on data from the concerned authorities and a survey. The intermediate consumption is extrapolated by value indexes for the principal components and commodities used, based on various surveys (1980). The volume index for manufacturing, which covers 250 activities, is based on data from the special survey and through direct inquiries to industry associations and manufacturers. Input is extrapolated by value indicators. The index for construction is compiled on the basis of the apparent consumption of a some construction material. Fixed input-output coefficients are used (1980). The volume index for trade is based on estimates of trade margins on locally produced and imported goods. Gross margins are based on data from the commercial censuses and special surveys. Input is extrapolated by a weighed value index. The volume index for transport and communications is based on data from the concerned authorities and companies. Value added of financial institutions and insurance is estimated through the income approach. The real estate output is extrapolated by value index for housing construction and industrial rents. Fixed input-output coefficients are used at constant prices. Current prices are obtained through the use of a specially constructed price index of principal commodities and a quantity index. The population censuses and household budget surveys are used to impute the rents of owner-occupied dwellings. The public administration and defense is extrapolated by an index of occupation of the government employees. The input of the base year is extrapolated by quantity indexes in all sectors except for the electricity, construction, restaurants and hotels, financing and services sectors, in which cases either deflation by price indexes is done or constant input-output coefficients are assumed. In the community, social and personal services sector, various approaches are used to estimate output in constant prices, such as double deflation, extrapolation of value added and deflation by price indexes.

Morocco

Source

The preparation of national accounts statistics is undertaken by the "Division du Plan et des Etudes Economiques". Official estimates are published by the Division in "Comptes de la Nation". Some data have been taken from "Annual Report 1999" published by Bank Al-Maghrib of Morocco. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates have been adjusted by the "Division du Plan et des Etudes Economiques" in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. The domestic territory is defined to include all de facto residents, such as foreign diplomats and troops. In terms of geographic coverage of the national accounts it is important to note that the data include the territory of Western Sahara.

^a Petroleum refining is included in Electricity, gas and water supply.

^b Excludes gas.

^c These data and its components were revised using the internet source "Direction de la Comptabilité Nationale" (www.statistic-hcp.ma) and therefore differ slightly (0.0% to 0.4%) from the GDP by expenditures.

Mozambique

Source

Reply to the United Nations national accounts questionnaire from Instituto Nacional de Estatística, Departamento de Contas Nacionais e Indicadores Globais, of Mozambique. Previous estimates were published by the Direcção Nacional de Estatística in "Infermacao Estadística" and "Mozambique in Figures 1998".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

^b Discrepancy between Total Economy and the sum of domestic sectors.

Myanmar

Source

Reply to the United Nations national accounts questionnaire from the Planning Department, Ministry of Planning and Finance, Rangoon. The official estimates and descriptions are published annually in "National Income of Myanmar" and "Review of the Financial Economic and Social Conditions", by the same Department.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Namibia

Source

Reply to the United Nations national accounts questionnaire from the National Planning Commission of the Central Statistical Office, Windhoek. The Namibian national accounts are compiled by the CSO. The official estimates are published in the CSO's publication "National Accounts".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. According to the publication "National Accounts 1983-1998" of the Central Bureau of Statistics of Namibia the most recent data from the reporting year 1989 on is based on the 1993 System of National Accounts.

Reply to the United Nations national accounts questionnaire from the National Income Division, Central Bureau of Statistics, Kathmandu.

General

The estimates shown in the tables below have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit. The official estimates are published annually in the "National Accounts of Nepal" by the Central Bureau of Statistics which contains detailed description of the sources and methods used for the national accounts estimation. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Netherlands

Source

The preparation of national accounts statistics in the Netherlands is undertaken by the Central Bureau of Statistics, Voorburg. The official estimates together with methodological notes are published annually in "Nationale Rekeningen" (National Accounts). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The first annual publication on input-output tables, covering the years 1948-1957, was issued in 1960. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Chain indices are used to measure volume growth and the resulting chained constant prices data, 1995 base, are not additive. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Netherlands the currency name for the data before 1999 is "1999 NLG euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 2.20371 Netherlands guilder. - The name of the currency of the newly submitted data is "1999 NLG euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Netherlands, like for example all old data following the 1968 SNA is still in "Netherlands guilder", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. The national accounts data are compiled to cover only the official geographical area of The Netherlands, i.e. they exclude Aruba and the Netherlands Antilles.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, gross fixed capital formation and exports and imports of goods and services. A combination of the commodity-flow approach and the expenditure approach is used for the estimation of private final consumption expenditure, private gross fixed capital formation and increase in stocks. The main sources for estimating general government consumption expenditure are the final accounts of the various agencies. The data sources for exports and imports of goods and services are foreign trade statistics for merchandise and balance of payments data and survey data for services. Constant prices are obtained through deflation with price indexes for all expenditure components, except government consumption expenditure referring to wages and salaries, which is extrapolated by employment data.

Income Approach

The main sources for the compilation of compensation of employees are data from the social security institutions and data from annual production statistics in the case of employees in enterprises and accounts data in the case

of general government employees. Operating surplus is obtained as a residual within the framework of "Statistics" of the annual input-output tables. Estimates of the consumption of fixed capital are made by the Central Bureau of Statistics, based on the perpetual inventory method. Information on indirect taxes and subsidies is provided by government agencies.

Production Approach

The table on Gross domestic product by kind of economic activity is prepared at market prices net of value added tax for which breakdown by kind of economic activity is not available. The production approach is used to estimate value added of most industries. This is done within the framework of detailed input-output tables using the commodity-flow approach. The income approach is used to estimate value added of producers of government services, business services and most community, social and personal services. For the agricultural sector, the main sources of information are the annual surveys of crop production and unpublished reports of statutory trade offices. Data on the structure of production costs are provided by annual farm management surveys. Statistics on sales of horticulture produce in special markets are also available. Net increase of livestock is evaluated on the basis of frequent samples, and on average annual prices per category. Regarding crude petroleum and natural gas production the information base consists of data supplied by all individual enterprises. The information base for manufacturing consists mainly of an annual survey of all enterprises with more than 10 employees. Recent benchmark information is given by a census of establishments conducted for 1978. The census covers all establishments and collects information on kind of economic activity and employment. For the private construction sector, annual production surveys are available. For general government, data are available on the capital expenditure. The production of buildings is covered by quarterly progress reports from the municipalities. The production value is estimated on the basis of the production of work completed. Benchmark data for wholesale and retail trade are available for certain years. For some parts of the trade sector annual production surveys are available. Surveys are planned to be held for other parts. Annual surveys are carried out for the transport sector. Information on railways and communications is derived directly from the few existing enterprises. Inter-urban public transportation by bus is covered by statements by government agencies. For the estimation of value added of credit institutions, the required data are collected on the basis of an annual survey. Data of insurance companies are obtained both from an annual survey and from the companies' accounts. The value of dwellings corresponds to total rents, including the imputed rents of owner-occupied houses. Cost accounts for houses are published by housing corporations. For producers of government services the main sources are the accounts of the agencies. Considerable gaps exist regarding some subsectors of private services. In these cases data are collected from various sources such as income tax data and social security information. For the constant price estimates, double deflation is used for agriculture and fishing. Current output quantities are valued at base year prices where quantities are available, otherwise deflated by representative price indexes. Some input categories are valued at base year prices while others are deflated by price index. Value added of mining and quarrying, manufacturing, electricity, gas, water, transport and communication is calculated by double deflation. For trade, output at constant prices is extrapolated by quantity indicators for output, input categories are deflated by price indexes. Value added at constant prices of financing, insurance and business services is generally extrapolated by means of volume indexes of material output and factor input. For producers of government services, net value added at constant prices is extrapolated by means of a value added index based on quantity data of factor services. For private services value added is extrapolated by indexes of employment.

^a Discrepancy between components and total. Discrepancy between the total economy and the domestic sector accounts.

^b Discrepancy between the total economy and the domestic sector accounts.

^c Not equal to the sum of corresponding components in the domestic sector accounts as one or more of the components have not been revised.

^d Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^e Mixed income, net. Excludes consumption of fixed capital.

^f Discrepancy between Total Economy and domestic sectors since value for Financial Corporations has been adjusted for FISIM.

^g Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

^h Excludes Adjustment to reconcile Net Lending of the Financial account and the Capital account.

Financial derivatives
Other accounts receivable

^a Account does not balance.

^b Discrepancy between components and total.

^c Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^d Mixed income, net. Excludes consumption of fixed capital.

^e Statistical discrepancy between data for this year(s) and the sum of the corresponding items of Sectors S.14 and S.15 as one or both of the items have not been revised.

Netherlands Antilles

Source

Reply to the United Nations national accounts questionnaire from the Centraal Bureau Voor de Statistiek, Netherlands Antilles. Official estimates and detailed information on concepts, definitions, sources and methods of estimation utilized are published by the Bureau in "National Accounts Netherlands Antilles 1996-2003". The estimates beginning 1979 exclude Aruba.

General

The latest official estimates have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). Previous series were compiled according to 1968 SNA. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. It should be noted that estimates for Aruba and Windward Islands are not included in the data displayed in this chapter.

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique et des Etudes Economiques (INSEE), Paris.

General

The estimates shown in the tables below have been adjusted by the Institut National de la Statistique et des Etudes Economiques (INSEE) Paris in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

New Zealand

Source

The annual national accounts statistics in New Zealand are prepared by the National Accounts division of Statistics New Zealand, the New Zealand National Statistical Office located in Auckland, Christchurch and Wellington. The official estimates are published annually on the internet (www.stats.govt.nz), as well as in the Statistical Yearbook. The data provided to UNSD were received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (SNA93). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (SNA68). National accounts estimates of New Zealand systematically exclude Niue and Tokelau. Data are disseminated in New Zealand dollars. Industry statistics are classified according to the Australia New Zealand Standard Industry Classification (ANZSIC).

Methodology:

Overview of GDP Compilation

In the New Zealand System of National Accounts, the items making up gross domestic product and expenditure on gross domestic product are estimated independently, using diverse data sources. Annual supply-use analyses (for the years 1987 to n-2) result in balanced gross domestic product and expenditure accounts. These are published as final estimates. The results for the latest 2 years are published as provisional estimates at the total economy level. The income and expenditure measures of gross domestic product are used in the calculation of provisional estimates.

Expenditure Approach

The expenditure-based measure of GDP is obtained by summing the components of final demand: the estimates of government final consumption expenditure are derived from production accounts, compiled mostly from data obtained through the Central Government Financial System (CFIS) and the Local Authority Survey. The values of household consumption expenditure on goods and services are mostly obtained from quarterly Retail Trade Surveys and the Household Economic Survey. Expenditure overseas by New Zealand resident households and expenditure in New Zealand by foreign tourists are obtained from Balance of Payments statistics. Gross fixed capital formation by industry estimates are derived by reconciling supply-side economy-wide totals by asset type and demand-side industry estimates. The Annual Enterprise Survey is the key data source used to compile industry statistics, supplemented by data from annual reports, central and local government surveys and the Agriculture Production Survey. For residential and non-residential building investment, the all-sector totals are derived using work put in place from the quarterly Building Activity Survey. For transport equipment, some of the components are valued as the number of new vehicle registrations multiplied by an average price, with the remainder calculated as the value of imports plus domestic production. The plant, machinery and equipment all-sector total is calculated as the value of imports plus domestic production. The estimates for change in inventories are based mostly on quarterly wholesale and retail trade stock surveys. Other sources used include the Agriculture Production Survey, statistics from the Ministry of Agriculture and Forestry, and the Annual Enterprise Survey. The estimates of exports and imports of goods and services are based on overseas trade data and balance of payments statistics.

Income Approach

The income-based measure of GDP represents the income earned from production in New Zealand, whether that is carried out by New Zealanders or foreign firms operating in New Zealand: Estimates of compensation of employees are obtained from labor market statistics, tax data, AES results, annual report analysis, central and local government surveys. Gross operating surplus is derived as a residual item. Taxes on production and imports,

and subsidies are obtained from the Crown Financial Information System. Estimates of consumption of fixed capital at replacement cost are obtained from the capital stock perpetual inventory method.

Production Approach

The production-based measure of GDP is calculated as the total market value of goods and services produced in New Zealand after deducting the cost of goods and services utilised in the process of production, but before deducting allowances for the consumption of fixed capital: Most industry production accounts are compiled from income and expenditure data sourced from the Annual Enterprise Survey. This may be supplemented by data from other sources such as annual reports, the Quarterly Manufacturing Survey, the Quarterly Employment Survey, the Labor Cost Index and the Producers Price Index. Exceptions include a) Agriculture value added is obtained by deducting the cost of inputs from the gross value of production. Output is calculated as the sum of sales and stock change by product. Volumes data comes from a number of sources (such as the Agriculture Production survey, livestock slaughter statistics, and annual reports), while prices data are collected from organisations including the Ministry of Agriculture and Forestry, and Meat and Wool New Zealand Ltd. b) Government Administration and defence value added is compiled from data obtained through the Central Government Financial System (CFIS) and the Local Authority Survey. c) Industry value added for water supply; owner builders; superannuation operation; residential and commercial property operators and developers; owner-occupied dwellings; private households employing staff ; and religious organisations are calculated from sources other than the Annual Enterprise Survey.

Nicaragua

Source

Reply to the United Nations national accounts questionnaire from the Banco Central de Nicaragua, Managua. The official estimates are published by the Banco Central in "Informe Anual".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. The main sources of data are surveys and financial reports from agricultural and industrial enterprises. Other sources are financial reports of central government and public enterprises, banks and other financial institutions and utilities enterprises. Real output of industries is calculated using volume indexes in almost all activities, except construction and financial intermediation activities, which are deflated. On 15 February 1988 the new córdoba, equal to 1,000 old córdobas, was introduced. A new currency unit called córdoba oro (gold córdoba) was introduced as a unit of account on 1 May 1990. On 30 April 1991 the gold córdoba completely replaced the old córdoba as the sole legal tender.

Reply to the United Nations national accounts questionnaire from the Service de la Statistique et de la Mécographie, Niamey.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Table 1.1 Gross domestic product by expenditures at current prices

Nigeria

Source

The preparation of national accounts statistics in Nigeria is undertaken by the Federal Office of Statistics, Abuja. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The official estimates together with methodological notes on sources and methods are published in "Gross Domestic Product of Nigeria". Another publication "National Accounts of Nigeria" with estimates dating back to 1958/59, was published in 1978. The estimates are generally in accordance with the definitions and classifications recommended in the United Nations System of National Accounts 1968 (1968 SNA) so far as existing data would permit. Input-output tables have been published for the year 1959/60 in "An Input-Output Analysis of the Nigerian Economy". Estimates of the series 10 and 20 relate to fiscal year beginning 1 April. All other series relate to fiscal year equal to Western calendar year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, exports and imports of goods and services and buildings and other construction of gross fixed capital formation. This approach, in combination with the commodity-flow approach is used to estimate investment in machinery and equipment. Private final consumption expenditure, which includes increase in stocks, is estimated as a residual. Government consumption expenditure is estimated from the annual economic analysis of the accounts of the public authorities. Useful information on private consumption expenditure will become available when the urban consumer survey and the rural consumption inquiry for 1974/75 are completed. The estimates of gross fixed capital formation for machinery, transport and other equipment are based on foreign trade statistics supplemented by information on import duties. A mark-up for trade, transport and installation charges of 33.3 per cent and 10 per cent is added to the import values of machinery and transport equipment respectively. The values of small concrete buildings are based on the value of cement used and of mud-walled houses on the estimated population in need of such houses. For the oil sector, the estimates of gross capital formation are compiled from the returns obtained from the oil companies. Sources for other sectors include the accounts of the Nigerian Coal Corporation, the reports of the Nigerian Steel Development Authority, the Nigerian Railway Corporation and the Nigerian Shipping Line Ltd., and the accounts of the government. The main sources of information for exports and imports of goods and services are the balance of payments accounts.

Income Approach

Compensation of employees, operating surplus, and consumption of fixed capital are obtained as a residual by deducting net indirect taxes from the gross domestic product. For indirect taxes and subsidies, the annual government accounts are used.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of most industries. The income approach is used for producers of government services. Production estimates for 13 harvested agricultural crops are obtained from the national

agriculture sample census in 1974/75 and the annual rural economic surveys. Estimates of output for green vegetables, tomatoes, oranges, bananas, sugar cane, coconut, pawpaw and pineapple are based on the average expenditure per household contained in the reports on inquiries into the income and expenditure patterns of lower and middle income households supplemented by export data. The values are reduced by 50 per cent for trade and transport charges. Foreign trade statistics provide the information for all other crops, except cocoa and tobacco which is estimated from information supplied by the Nigerian Produce Marketing Company, and from manufacturing companies. For livestock and its products, estimates are based on such data as foreign trade statistics, number of animals slaughtered, number of cattle that are milked, Lagos retail prices, etc. Non-monetary activities are covered in the estimates. The output of timber is estimated from the data on logs exported or used locally. Data on the production of fish are obtained from the Federal Fisheries Department. The annual reports of the Petroleum Division in the Federal Ministry of Mines and Power furnish information on production and f.o.b. values of crude oil and the quantity of gas sold. The same Ministry also furnishes data on production of metalliferous ores. This output is valued at f.o.b. prices. Information on the values of manufacturing output and intermediate consumption are obtained from the annual surveys of large establishments. Adjustment is made of value added by 20 per cent to cover small establishments. The estimates of electricity are based on annual reports of the concerned companies. The sources of information on water supply are the actual expenditure of the government bodies and annual accounts of water boards of corporations. Data for estimating value added in construction are obtained from accounts of public authorities and corporations government enterprises and the survey of large establishments engaged in mining, manufacturing and distributive activities. For smaller construction activities, sources such as the value of cement used, questionnaire and actual of approved expenditure of public authorities are used. Trade is assumed to be 12.5 per cent of GDP in the base year 1958/59. For other years, value added is extrapolated by indexes. The benchmark value added of road transport is based on the number of commercial vehicles. Other years' estimates are made by projecting the 1958/59 figure by the estimated number of tractors and commercial vehicles and using the CPI of transport services for five urban centres. The value added of railways, harbours, water and air transports are estimated from annual reports of concerned enterprises. The sources of information for estimating the value added of government services are the accountant-general's reports and budget of the public authorities. For education, estimates are based on information obtained from the Federal Ministry of Education and the National Universities Commission for private institutions and on the number of teachers and an assumed average salary per teacher for other institutions. For private health institutions, the expenditure on personal emoluments is regarded as value added and assumed to grow at the same rate as for government institutions. The value added of other services, which includes the financial sector, is assumed to grow at an average annual rate of 13.8 per cent. For the constant price estimates, price deflation is used for the manufacturing, construction, part of transport and services sectors. For agriculture, the production of crops is either revalued at 1962/63 prices or deflated by retail prices. Value added of mining, electricity, trade and transport relating to passenger-miles and ton-miles is extrapolated by appropriate indicators.

Norway

Source

The preparation of national accounts statistics in Norway is undertaken by Statistics Norway, Oslo. The official estimates are published annually in "Nasjonalregnskapsstatistikk/National Accounts", and are also available on Statistics Norway's web site www.ssb.no. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates have been prepared in accordance with the concepts and definitions recommended in the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Statistics Norway has published revised national accounts estimates in 2002. Chain indices are used to measure volume growth and the resulting chained constant prices data, 1995 base, are not additive.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate all components of gross domestic product by expenditure type, within the framework of detailed input-output tables using the commodity-flow method. Change in inventories, however, is primarily calculated as the difference between supply and other uses for each commodity. Government final consumption expenditure is mainly based on government accounts. Household final consumption expenditure is estimated from household consumer surveys, retail trade statistics and the commodity-flow method following output estimates in particular. Gross fixed capital formation has two main dimensions in term of breakdowns, one by type of assets, and one by kind of activity. The estimation of gross fixed capital formation is an interplay between various approaches. Exports and imports of goods and services are mainly based on foreign exchange statistics from the Bank of Norway and external trade statistics from Statistics Norway. For the constant price estimates, double deflation and the commodity-flow approach are used within the framework of detailed annual input-output tables for all expenditure components. Current values are deflated by appropriate price indices.

Income Approach

Compensation of employees is estimated mainly from industry data and government accounts, and sometimes from an indicator-based approach using wages and employment data. The estimation of compensation of employees is closely linked to the estimation of employment. Operating surplus is arrived at as a residual. Consumption of fixed capital is estimated by using the perpetual inventory method. Time series of gross investment at constant prices provide the basis for calculating consumption of fixed capital. Taxes and subsidies on production are estimated from government accounts.

Production Approach

The production approach is used to estimate value added of almost all industries. This is done within the framework of detailed input-output tables using the commodity-flow method. The income approach is used for producers of government services and parts of other private services. The expenditure approach is used in the case of the trade sector. Agricultural production is estimated from data prepared by the Budgeting Committee for

Agriculture. For mining and quarrying estimates are extracted from the annual industrial statistics, which include crude oil and natural gas production in the North Sea. For manufacturing use is made of the annual industrial statistics, which supply detailed information on gross output and intermediate consumption by industrial activity and by commodity. The annual statistics of construction give information on the value of production, cost of materials and gross fixed capital formation. The estimates for wholesale and retail trade are based on annual turnover and annual accounting statistics, with benchmark data based on sample surveys on trade margins. The estimates for railway, tramway, subway and suburban railway transport as well as air transport are based on detailed accounting data. For other land transport the statistical sources are the annual scheduled road transport statistics, data from censuses of establishments, etc. Summary accounts for financial institutions exist in the annual credit market statistics. For insurance the annual insurance statistics and extracts of accounts are used. The production of rental services is distributed among production of paid rent (market output) and imputed rent by owner-occupiers (production for own use). New estimates of imputed rent have been carried out based on survey data on actual rents. Business services are estimated from annual production statistics. For government services data are obtained from the municipal accounts and central government accounts including social insurance administration. Private services are estimated from various annual production and accounting statistics. For the estimation of constant prices, double deflation and the commodity-flow approach are used within the framework of detailed annual input-output tables. Output and intermediate consumption is deflated by appropriate price indices. Different kinds of price indices are used, such as producer's price indices, consumer price indices, price indices for exports and imports, etc. About 3800 price indices are used in the estimation of volume figures.

Occupied Palestinian Territory

Source

The national accounts data were obtained from the Palestinian Central Bureau of Statistics (PCBS). PCBS was established in 1993 under the name of the Palestinian Bureau of Statistics.

General

Palestinian National Accounts were first created in 1994. The publication of such accounts continued on annual basis until a revised time series covering 1994-2000 in constant and current prices was achieved. The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The official estimates and methodological notes on sources and methods are published in the world-wide-web at <http://www.pcbs.org/statistics/econ.aspx>.

Methodology:

Overview of GDP Compilation

The first estimates for National Accounts were compiled in 1994; their cornerstone was the Establishments Census 1994, which constituted the sampling frame of the all economic surveys that took place for the first time in 1994. These surveys, including Industry, Domestic Trade, Services (both market producers and non-profit institutions), and Building and Construction Contractors were the source data for the compilation of the National Accounts. Moreover, National Accounts were also substantially based on administrative records. Estimates of 1995 and 1996 were prepared simultaneously after conducting field surveys using two separate questionnaires for both years. The 1996 questionnaire was detailed whereas the 1995 questionnaire was abridged. The updating of the economic surveys of this period were based on the administrative records and a number of field visits. Technical advances especially with respect to coverage and comprehensiveness marked this stage. Supply and Use Tables were compiled for the National Accounts of 1997 and 1998. It was based on the Population, Housing, and Establishment Census 1997, which enabled a better level of coverage and comprehensiveness both in respect of the sampling method for economic surveys (establishments record) and the estimates of households' expenditure in accordance with the findings of the Population Census. Using Supply and Use Tables as a methodology to prepare and construct the National Accounts led to important adjustments to some data sources such as foreign trade and agricultural statistics. Additionally, better estimates of the informal sector were achieved at this stage.

Reply to the United Nations national accounts questionnaire from the Information and Documentation Centre of the Ministry of Development, Muscat. Official estimates are published in the "Statistical Yearbook", Fourth Issue, 1397 A.H., 1977 A.D.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Pakistan

Source

Reply to the United Nations national accounts questionnaire from the Federal Bureau of Statistics, Statistics Division of the Ministry of Finance and Economic Affairs, Islamabad. National accounts estimates are also published in the "Monthly Bulletin of Statistics" and "Statistical Pocket Book of Pakistan", "Pakistan Statistical Yearbook", "Economic Survey", and "Annual Report of the State Bank of Pakistan", and also released on FBS website, www.statpak.gov.pk.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The official estimates and methodological notes on sources and methods are published in a series of reports entitled "National Accounts of Pakistan". Estimates relate to fiscal year beginning 1 July. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Rebasings of the National Accounts estimates from 1980-81 to 1999-2000 gained prime importance as Pakistan delayed the re-basing of the national accounts for two decades. As such, many structural changes which took place since 1980-81 until 1999-2000 on the production and consumption structure of the economy were not captured in the country's national accounts. A number of economic areas remained either uncovered or under-reported and accordingly under-estimated the size of the national income. Taking cognizance of facts narrative above, the Annual Plan Coordination Committee (APCC) in its meeting in 1997 recommended to re-base the national accounts of Pakistan to make the GDP and investment figures more realistic. The journey of the re-basing exercises that began in 1997 culminated in July 2003. During the period, various technical committees were set up, a number of studies were undertaken and reviewed by experts inside and outside the country. Accordingly, the size of the overall GDP in 1999-2000 increased by 19.5 percent, agriculture by 18.5 percent, industries by 18.0 percent, and services by 20.8 percent over the old base. Per capita income in US dollar term was estimated at \$526 for the year 1999-2000 compared to \$441 according to the old base. Similarly, fixed investment showed an improvement of 34.3 percent in 1999-2000 mainly due to improved coverage.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used to estimate gross capital formation. Government consumption expenditure is estimated by analysing the budgets of the government bodies with an element of estimation made for the local government bodies for which all the budgets are difficult to obtain. The basic information used in estimating increase in stocks is received from the Planning Commission. The estimates of gross fixed capital formation are classified by economic sectors. Benchmark estimates of agriculture are derived from 1980 Agriculture Census adjusted for 1980-81 and non-monetized investment are based on survey results conducted by FBS. Investment in the mining and quarrying sector is estimated on the basis of data obtained from annual censuses of mining industries and from concerned source agencies. For large-scale manufacturing, investment estimates are based on annual sample surveys while the small industries surveys in 1976-77, 1983-84, 1987-88, and now 1996-97 provided data for investment in small industries. Investment in machinery and equipment of the agricultural sectors is estimated by the commodity-flow method. For the service sector, estimates are prepared from trade and domestic production data, annual budgets and annual questionnaires. Estimates of private residential construction are based on the rural construction survey, census reports, population growth and number of persons per household. Capital expenditure for the government bodies are based on the classification of their budgets. The estimates of exports of goods and services are

obtained from the trade statistics of the FBS and the balance of payments statistics. For constant price estimates, all items of GDP by expenditure type are deflated by appropriate price indexes while gross fixed capital formation is deflated by sectoral deflators.

Income Approach

Domestic factor incomes consisting of compensation of employees and operating surplus, is obtained as a residual, i.e., after subtracting depreciation and net indirect taxes from gross domestic product. For depreciation, a flat rate is applied for the different sectors, 5 per cent for agriculture, mining and quarrying, small-scale manufacturing, public administration and defence and other private services, 10 per cent for large-scale manufacturing, 2.5 per cent for construction, 2 per cent for trade and 20 per cent for ownership of dwellings in the rural areas and 25 per cent in the urban areas. Data of indirect taxes and subsidies are derived from budgets of the government bodies, together with those collected by the Central Board of Revenue.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added in agriculture, mining and quarrying, manufacturing and electricity. The income approach is used for most of the remaining sectors. Production data of major agricultural crops are obtained from the Ministry of Agriculture. Corresponding harvest prices are obtained from the Provincial Directorates of Land Records. Minor crops harvest prices are taken at 80 per cent of the wholesale prices. Data on livestock products are obtained from the Department of Agricultural Marketing and Grading. The current price estimates are derived indirectly by applying the wholesale price index to the constant price estimates. Production and price data of forestry/fishing are obtained from concerned departments. The Natural Resources Division and the Provincial Mineral Development Department provide production and price data for the mining sector. Gross value of output is obtained by multiplying the output of each mineral by pit-head or well-head prices in the benchmark year while annual output and index of wholesale prices are used for the current estimates. Value added at constant factor cost thus obtained are adjusted by wholesale price index for manufacturing to arrive at current estimates. For small-scale manufacturing, benchmark 1980-81 was computed on the basis of survey reports on SHMI for 1976-77 and 1983-84 and employment data from 1981 Population Census and Labour Force Surveys 1982-83 and 1984-85. The estimates for electricity and gas are based on data furnished by concerned companies while the estimates of water are included in public administration and defence sector. For construction estimates are based on gross fixed capital formation data in construction activity collected on annual basis by FBS, and its value added coefficients obtained from concerned construction agencies/companies. The value added of the trade sector is measured by net trade margins earned by traders on various types of products entering into wholesale and retail trade. Trade margins are derived from distributive Trade Survey 1983-84. For the transport sector, estimates are based on data supplied by concerned enterprises and FBS surveys on mechanized and non-mechanized road transport. For the financial sector, value added is based on data provided by the State Bank of Pakistan and various financial institutions. Estimates of ownership of dwellings are based on Housing Census 1980, HED Survey 1973 and Construction Survey 1986. For government services, the budgets of the government bodies are used. For private services, the number of persons engaged in the different occupations is obtained from the 1981 Population Census and extrapolated by the intercensal growth rate in the working force of this sector. Price deflation is used for forestry and fishing, electricity and gas, transport, financial and community services. For mining, the annual output of each mineral is multiplied by the base year pit-head and well-head prices. Value added of the trade sector is obtained from the distribution of agricultural produce, manufactured and imported goods. Value added of manufacturing, construction and ownership of dwellings is extrapolated by quantum indexes.

Panama

Source

The preparation of national accounts statistics in Panama is undertaken by the Direcccion de Estadistica y Censos Panama. Official estimates are published annually, from 1960 in "Estadistica Panamena, Serie C, Ingreso Nacional" and from 1976 in the bulletin "Situacion Economica". The latter publication also contains the most detailed description of the sources and methods used for the national accounts estimation. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previous estimates were prepared in accordance with the concepts and definitions of the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure as well as imports and exports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure and, to a large extent, gross capital formation. Data on government consumption expenditure are obtained from official documents and directly from the concerned agencies. Estimates of private consumption expenditure are based on data on locally produced and imported consumer goods. The gross value of construction is obtained by adding the cost of inputs of building materials to the estimated value added of the industry. Factor and non-factor services rendered by residents of Panama to the Former Canal Zone and to the Colon Free Zone are treated uniformly as non-factor services to the rest of the world. These services are, therefore, included in exports of goods and services. Constant prices are estimated by a combined use of extrapolation and price indexes. For government consumption expenditure, compensation of employees is extrapolated by the number of persons employed, whereas purchases of goods and services are deflated by a combination of price indexes. For private consumption expenditure, base-year estimates are extrapolated by means of indexes which refer to consumption at both current and constant prices. The final estimates are adjusted for the discrepancy between total demand and total supply. Current values of gross fixed capital formation are deflated by a price index for inputs in the case of buildings and other construction. The current value of transport equipment and machinery and equipment are extrapolated by a volume index obtained by deflating current values by an index based on the unit export value of machinery in supplier countries. Various price indexes are used for price deflation of exports and imports of goods and services.

Income Approach

Estimates of compensation of employees are based on data on average wages, and the percentage distribution of employees obtained from household surveys. To this information is added yearly estimates of salaries earned in the public and private sectors, employers' contribution to social security schemes and an estimate of the incomes of self-employed workers. Operating surplus is compiled from various items, such as property income, saving and direct taxes. The estimates on consumption of fixed capital, which exclude depreciation of government fixed capital, are based on accounting data of the private enterprises, obtained through direct surveys, and financial information of all autonomous and semi-autonomous entities included in the public sector. Estimates of indirect taxes are based on data from public finance, and on revenue figures from central government, municipalities and the Panamanian Institute of Tourism.

Production Approach

For the agriculture, forestry and fishing sector, value added is obtained by deducting inputs from gross value of production. Sources used to estimate agricultural production include the census of agriculture, agricultural surveys and, in the case of export products, external trade statistics. Price data are obtained from the current statistics on prices received by the agricultural producers. Value added in forestry is derived from a benchmark estimate of sawn wood produced, the number of persons occupied and the ratio of output to employment, which is obtained from periodical industrial inquiries. In the case of fishing, estimates are based on fish landings in the Gulf of Panama, as published in "Estadística Panameña" and on the number of persons engaged in fishing, which is obtained from the latest population census. Value added of manufacturing is estimated by extrapolating the benchmark estimate by an indicator based on the gross value of production by type of industrial activity. A similar approach is used for the electricity, gas and water sector, as well as the construction and the trade sectors. For the trade sector the indicator used is based on the current prices of products which are marketed through wholesale and retail trade. For transport, value added is estimated on the basis of the payments to factor of production. Value added for ownership of dwellings is obtained by aggregating estimates for different geographical areas of the country. For business services value added is estimated by utilizing an indicator of patent registrations in force for operating business at the end of each year. Financial reports relating to factor payments from central government, other government authorities and municipalities, form the data basis for estimates of public administration. A similar approach is applied for other public services, whereas for other private services value added is first estimated at constant prices and then inflated by price indices to arrive at value added at current prices. For the estimation of constant prices in the agricultural sector, the current quantities are valued at base year prices. Base year estimates for the manufacturing sector, are extrapolated by various indexes such as indexes of input quantities and quantum indexes of output. For construction, value added is extrapolated by a quantity index of inputs. For electricity, trade and transport value added is extrapolated by quantity indicators of output. For restaurants and hotels the indicators are based on tourist expenditure in Panama and on food and beverage quantities. For banks, value added is extrapolated using the balance of loans and deposits at the end of each year. For ownership of dwellings in urban areas, the construction of new dwellings is used as indicator, and for the rural areas the base year estimate is extrapolated by an index of rural population growth. The value added of government services is extrapolated by an index of number of government employees. For other private services as well value added is extrapolated using various quantity indicators.

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Office (formerly Bureau of Statistics), Port Moresby. The official estimates are published in "Gross Domestic Product and Expenditure".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). A detailed description of the sources and methods used for the national accounts estimation is found in "National Accounts Statistics". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. However, the commodity-flow approach is used for checking purposes in the case of a few items included under private consumption expenditure. The estimates of government consumption expenditure are based on budget papers, annual reports of the commissioner for local government, financial statements of provincial government and Australian budget papers. The market component of household consumption expenditure is estimated mainly from the results of the retail sales and selected services survey. Estimates for items not covered by this survey are obtained from sources such as budget papers, the population census, various surveys of urban markets and village industry and taxation data. For some selected items, the estimates are checked and supplemented by data from international trade statistics using the commodity-flow approach. The non-market component of household consumption consists of food and firewood for own consumption and services of owner-occupied dwellings. Estimates of food produced for own consumption are calculated by using data from the Rural Industrial Bulletin and the estimated consumption per head of population. The annual quantity of firewood used per family is multiplied by average price and the number of families gathering firewood for own use. Construction and maintenance of housing is estimated by multiplying population data by the time spent and the minimum wage rate. Estimates of increase in stocks are based mainly on the Taxation Statistics Bulletin. For gross fixed capital formation by private industries, the principal source of information is the capital expenditure survey and for the public industries, the annual reports of the public enterprises. Exports and imports of goods and services are estimated mainly from the international trade statistics. For the constant price estimates of parts of government expenditure, private expenditure, gross fixed capital formation, increase in stocks and exports of merchandise, the current quantities are revalued at base-year prices. Regarding the market component of private consumption expenditure, building and construction, government expenditure on goods and services and imports of merchandise, the current values are deflated by appropriate price indexes.

Income Approach

Estimates of compensation of employees are based on taxation statistics, statistics of religious organizations and the Labour Information Bulletin. Adjustments are made for wages and salaries not covered by the above sources. Imputed wages referring to work provided to government and mission authorities are shown separately. Estimates of operating surplus for the market component are based mainly on taxation returns with some adjustments made to cover imputed bank service charge and to include producers not required to submit returns. For owner-occupied dwellings, operating surplus is calculated from information contained in the Building Statistics Bulletin. Consumption of fixed capital is estimated based on taxation data supplemented by annual reports for producers

not covered. The Papua New Guinea Budget papers and the annual reports of the Commissioner for Local Government provide all the information needed to estimate indirect taxes and subsidies.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The income approach is used to estimate value added of most industries. Value added is defined as the sum of compensation of employees, operating surplus, consumption of fixed capital and net indirect taxes. The principal source is the income tax statistics, supplemented by annual reports of public and private enterprises. The reporting unit in these statistics is the enterprise (legal entity) rather than the establishment. For the major activities such as mining and quarrying, electricity, gas and water, and communication, in which cases almost the whole production is concentrated in a few enterprise units, the establishment type data are used. In cases where surveys data are used, adjustments and supplementary data are taken into account to cover activities not included. For the non-marketed production and contributions of free and partially paid labour, estimates are available separately as subdivisions of the relevant items as the amounts involved are quite substantial. As mentioned above, estimates of GDP by kind of economic activity are arrived at by subdividing the cost-structure components of total GDP into the various kinds of activity. Compensation of employees is classified in accordance with the industry information on individuals' tax returns. If an individual has more than one source of income, he is allocated to the industry category corresponding to his major source of income and all of his income is classed to that category. Data on operating surplus of private enterprises are classified on the basis of information given in the company tax statistics and in the statistics of individuals' income other than wages and salaries, while the industry categories of the operating surplus of public enterprises are determined by the nature of their productive activities. For industry allocation of consumption of fixed capital, the taxation data supplemented by other information in respect of producers not covered by the taxation statistics provide the basis. In the case of indirect taxes and subsidies, the industry allocation is made on the basis of the nature of indirect taxes and subsidies. GDP by kind of economic activity at constant prices is not estimated.

Paraguay

Source

The preparation of national accounts statistics in Paraguay is undertaken by the Departamento de Estudios Economicos of the Banco Central del Paraguay, Asuncion. The official estimates are published by the Department in "Cuentas Nacionales".

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used for the estimation of gross fixed capital formation. Private final consumption expenditure is arrived at as a residual. The information needed to estimate government consumption expenditure is obtained from the Ministerio de Hacienda, which controls the budget of the public sector institutions. Increase in stock is estimated for livestock only. It is assumed to be the annual increase of the cattle production minus the number of cattle slaughtered. Gross fixed capital formation is estimated on the basis of import statistics for machinery, equipment, transport and communication. Estimates of the domestic production of these items as well as the gross value of production in the construction sector are also included. Exports and imports of goods and services are estimated on the basis of information furnished by the Division de Balanza de Pagos of the Banco Central. For the constant price estimates, the only information available is that the wholesale price index is used as a deflator.

Income Approach

Compensation of employees is estimated by combining the information on the number of persons employed, by economic sectors and the average wages paid in each productive sector. Depreciation is estimated on the basis of the average lifetime of each type of capital good established in the respective depreciation tables. Information on indirect taxes and subsidies are supplied by the Ministerio de Hacienda. Operating surplus is obtained as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most industries. The income approach is used to estimate the value added of public administration and defence, part of transport and communication, and part of other private services. The gross output of the trade sector is based on the commodity-flow approach, applying a fixed percentage for value added. The value of agricultural production is obtained by multiplying quantities by prices. Information on prices and on most quantities are obtained from Ministerio de Agricultura y Ganaderia. Remaining quantities are estimated through the use of indirect indicators such as the rate of population growth. The value of livestock production is estimated by type of livestock. Slaughtering is estimated on the basis of information provided by the Direccion de Impuestos and the meat-processing industries while stocks of cattle are based on the 1956 agricultural census. Inputs for the agricultural section is assumed to be a certain percentage of the gross value of production. The production of mining and quarrying is estimated on the basis of

the industrial production coefficients of lime and cement. Information on the manufacturing sector is obtained from the surveys of the Banco Central, and the 1955 and 1963 industrial censuses. The value added of each industrial group is determined on the basis of coefficients from the 1963 industrial census applied to the gross production values. The value added of electricity and water is mainly based on information from the concerned enterprises. For construction, the source used is the production index for construction materials. This index is compared with permits granted by the municipalities expressed in quantitative measures, multiplied by the base year value and inflated by the implicit price index of construction materials. Value added of the trade sector is assumed to be 30 per cent of the values of locally manufactured goods, imported goods and agricultural products net of farm consumption. For motor transport, the number of vehicles by category is multiplied by the number of days worked and the gross income earned in the base year. The resulting amounts are then multiplied by value added coefficients for each category of vehicle. Non-mechanical transport is calculated on the basis of the index of agricultural production transported in rural areas by carts. For ownership of dwellings, the estimates are prepared on the basis of the number of dwellings by type of construction materials used. Value added is estimated by multiplying the paid and imputed rents by the number of dwellings. The value added of public administration and defence is estimated as the total compensation paid to government employees based on information furnished by the Presupuesto General de la Nacion. The value of public education is determined directly from the Presupuesto General de Gastos de la Nacion while that of private education is estimated at constant prices by multiplying the number of students enrolled by the annual education costs plus registration fees minus 20 per cent for intermediate consumption. For health, information is obtained directly from the public health services and social security services and from the Ministerio de Salud Publica y Bienestar Social for the private sector. Estimates for domestic services are obtained by multiplying actual annual wages by employment figures which are assumed to increase at a rate of 3.3 per cent in the urban area and 2.6 per cent in the rural area. For other services, benchmark estimates, based on the 1963 economic census, are projected by a specially constructed growth rate. For the constant price estimates, double deflation is used for the agricultural sector. The current quantities of mining and manufacturing are revalued at baseyear prices. Value added of construction, transport and financial sectors is extrapolated by using quantity indicators. For electricity, gas and water, trade and services sectors, value added is deflated by using appropriate price indexes.

Peru

Source

Reply to the United Nations national accounts questionnaire from the Directorate of National Accounts of the Instituto Nacional de Estadística e Informática (INEI) in Lima. The official estimates are published annually in the publication "Oferta y Demanda Global", as well as on the website www.inei.gob.pe, and in the statistical yearbook "Compendio Estadístico Annual".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. On February 1, 1985, the inti, equal to 1,000 soles, was introduced. On July 1, 1991, the new sol, equal to one million intis, replaced the inti currency.

Reply to the United Nations national accounts questionnaire from the National Statistical Coordination Board, Manila.

General

The estimates shown in the following tables are extracted from the National Accounts of the Philippines (NAP), which is compiled under the Philippine System of National Accounts (PSNA) in accordance with the United Nations System of National Accounts (SNA) 1968. PSNA estimates have been compiled by the National Statistical Coordination Board (NSCB) since 1957. PSNA official estimates are published on a quarterly/annual basis in print and on the NSCB website, www.nscb.gov.ph. Annual and quarterly linked series are also being maintained and regularly updated. The annual series starts from 1946 while the quarterly series starts with 1981. The linked series was launched in 1990 reflecting the shift of the base year from 1972 to 1985. The current PSNA is being compiled using three approaches: production, expenditure and income approaches. The Gross Domestic Product (GDP), however, is mainly based on the production approach. Estimates based on the production and expenditure approaches are available on a quarterly basis while income approach estimates are reported annually. Regional [subnational] estimates are available for both the production and expenditure accounts. The gross value-added (GVA) estimates by kind of economic activity reflected in the tables are valued at market prices, i.e., producers' values instead of recommended basic prices, due to limitations in the existing data system. The PSNA still follows the 1977 Philippine Standard Industrial Code (PSIC) and adopts the 1968 SNA institutional sectors as follows: Private and Public Corporations; General Government; Household; and Unincorporated Enterprises, which includes non-profit institutions serving households. The revised 3-year [2001-2003] annual and quarterly series released on June 17, 2004 and May 27, 2004, respectively, already incorporate updates and revisions in the basic data as provided by the PSNA data sources, and have yet to be linked with the 1946-1999 series. The updating of the linked series is part of the overall revision of the PSNA. Detailed discussion of the revisions, frameworks, sources and methods are found in the publication entitled "Analysis of the revised Philippine System of National Accounts and Manual on the Frameworks, Sources and Methods (1995). When scope and coverage differ, for conceptual or statistical reasons, from the definitions and classifications recommended in the SNA, a footnote is indicated in the relevant tables.

Methodology:

Expenditure Approach

Expenditure on the GDP [expenditure approach] is the sum of the final uses of goods and services in the economy. Final uses refer to the values at purchasers' prices of goods and services used for the final consumption of households and private non-profit institutions, general government both national and local government units, as well as those used for gross fixed capital formation by both public and private enterprises and for exports (net of imports) to the rest of the world. Personal Consumption Expenditure (PCE) is basically compiled using the commodity flow approach supported with other indicators from administrative-based data systems. Government Consumption Expenditure (GCE) estimates are based on the Commission on Audit and Department of Budget and Management. Capital Formation (CF) consists of construction, durable equipment, breeding stocks and orchard development, and changes in stocks, which are based on administrative data from the concerned government agencies. The main source of data for exports and imports of goods is the Foreign Trade Statistics (FTS) compiled by the National Statistics Office (NSO), while data for exports/imports of services come from the Balance of Payment (BOP) compiled by the Bangko Sentral ng Pilipinas (Central Bank of the Philippines). The constant price estimates of PCE, GCE, CF, export and import of services are generally derived by deflating the current price estimates by the appropriate indices. Merchandise exports and imports use the quantity revaluation method wherein the volume of goods that is reported in gross kilos is multiplied by the appropriate base year prices. The statistical discrepancy, which accounts for the difference between the production and expenditure approaches, is reported in the expenditure side of the NAP.

Income Approach

Annual surveys of establishments (ASE) [now Annual Survey of Philippine Business and Industries (ASPBI)] of the PNSO, reports of financial institutions and public utilities, and studies on production costs provide data for the estimation of compensation of employees, operating surplus and depreciation. The estimates of indirect taxes and subsidies are based on the reports of the Commission on Audit (COA), Bureau of Internal Revenue (BIR) and Bureau of Customs (BOC).

Production Approach

Under this approach, the economy is grouped by economic activity/industry. The GDP is the sum of the GVAs of the different industries. There are three major industries: (1) Agriculture, Fishery and Forestry (AFF), (2) Industry, and (3) Services. Estimates for AFF are based on data from agricultural surveys conducted and administrative-based data collected by Bureau of Agricultural Statistics (BAS), Sugar Regulatory Authority (SRA), National Irrigation Administration (NIA), and other related agencies. In general, the value of production of AFF is estimated by multiplying the volume of output by the average prices received by farmers. Gross Value Added Ratios (GVAR), which are based on the results of the Census on Agriculture and relevant studies, are applied to the derived value of output to come up with the GVA estimates. Industry is comprised of Mining and Quarrying (M&Q), Manufacturing, Construction and Utilities [Electricity, Gas and Water (EGW)] sectors. Estimates for Industry are primarily based on administrative reports of concerned agencies and ASE/ASPBI of the PNSO. M&Q estimates are derived from the reports of the Mines and Geo-Sciences Bureau. EGW uses data/information from electric and water companies and cooperatives, such as the National Power Corporation, Transco Corporation, Manila Electric Company, Maynilad and Manila Water Services, among others. Under Construction, the gross output of private construction is estimated based on building construction statistics and data from building permits processed by the PNSO while that for public construction is derived from the reports of the DBM and COA. Benchmark estimates for Manufacturing are based on the Census of Establishments (CE) [now Census of Philippine Business and Industries (CPBI)] while the quarterly estimates are derived using the results of the Monthly Integrated Survey of Selected Industries conducted by the PNSO. Services consist of: Transportation, Communication and Storage, Trade, Finance, Ownership of Dwellings and Real Estate, and Private and Government Services. Most of these industries use the results of the CE/CPBI of the PNSO for the benchmark estimates of GVA. These GVAs are extrapolated using the results of the Quarterly Survey of Establishments (QSE) [now Quarterly Survey of Philippine Business and Industries (QSPBI)] of the PNSO to derive the present estimates of GVA. Other indicators that come from financial reports of the major/key industry players are also collected to validate the estimates. For government services, data are obtained from the reports of the COA and DBM. To derive the constant price estimates of AFF and M&Q, the base year unit values are applied to the volume of production. For the other sectors, namely, manufacturing, EGW, construction, TCS, trade, finance, ODRE, private and government services sectors, the value-added is deflated by appropriate price indexes.

Poland

Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Office of Poland, Warsaw. The data for Poland was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. National accounts estimates with methodological notes are published in "Produkt krajowy brutto 1991" (Gross Domestic Product in 1991) and "Ocena sytuacji gospodarczej i szacunek produktu krajowego brutto w 1993 roku" (Evaluation of the economic performance and estimate of the GDP in 1993), issued by the CSO of Poland in 1993. Chain indices are used to measure growth and the resulting chained constant prices data, 1995-based, are not additive.

Portugal

Source

The preparation of national accounts statistics in Portugal is undertaken by the Instituto Nacional de Estatística (INE), Lisbon. The official estimates are published annually in the "Contas Nacionais", INE. A detailed description of the sources and methods used for the national accounts estimation is found in "As Contas Nacionais Portuguesas 1958-1971", published by the Institute in 1972. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Input-output table for 1959 has been published in "Algumas Aplicacoes de Analise Input-Output a Matriz Portuguesa de 1959". From 1986, the revised methodology includes the Azores and Madeira. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The data before 1999 is still in national currency but it was converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Portugal the currency name for the data before 1999 is "1999 PTE euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 200.482 Portuguese escudo. - The name of the currency of the newly submitted data is "1999 PTE euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Portugal, like for example all old data following the 1968 SNA is still in "Portuguese escudo", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the expenditure approach. The commodity-flow approach is also used for part of private final consumption expenditure. The estimates of government consumption expenditure are obtained from the government accounts. For private consumption expenditure, only estimates for food, beverages, tobacco, gross rent, fuel and power are made. For other components an estimate is derived as a residual between GDP and other final uses. The estimates of food, beverages and tobacco are based on retail prices and quantities consumed. Quantities consumed of other consumer products are available either through direct information or from production and foreign trade statistics, taking into account changes in producers' and wholesalers' stocks. Expenditures on house rent are estimated on the basis of information published in Estatísticas das Contribuções e Impostos, adding 12 per cent for repairs. The calculation of increase in stocks is based on information on stock values supplied by corporations. Fixed capital formation in the private sector is estimated on the basis of annual surveys of corporation, the results of which are used to calculate increasing coefficients to be applied to total fixed capital formation. The annual construction surveys are used for the estimations of expenditure on new dwellings. For the public sector, investment is

estimated from the revenue and expenditure data of the central government and other state organizations. Data for estimating exports and imports of goods and services are obtained from the balance of payments. For the constant price estimates, current values of government consumption expenditure, gross capital formation and exports and imports of goods and services are deflated by appropriate price indexes. For private consumption expenditure, the current quantities of the items estimated are revalued at base year prices.

Income Approach

Wages and salaries for private sector are calculated per capita and applied to the number of employees which are obtained from the employment surveys submitted by the enterprises. Remuneration data for the government sector are obtained from government accounts. The data on employers' contributions to social security schemes are taken from "seguro social". Mathematical formulae are used to calculate consumption of fixed capital. Indirect taxes and subsidies are obtained directly from the government accounts.

Production Approach

Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. Since 1977, the Portuguese National Institute of Statistics has followed the European System of Integrated Economic Accounts (ESA) in the national accounts estimates. The data reported according to ISIC major divisions have been approximated from the Portuguese Branch and Product Nomenclature. The production approach is used to estimate value added of goods-production sectors whereas the income approach is used for the service sectors. The principal sources used to estimate agricultural production are *Estatísticas Agrícolas* and the monthly *Estado das Culturas e Previsão das Colheitas* which contain data on quantities and prices. Data on intermediate consumption are supplied by the entities that supply the products. For products of forestry and logging not covered by statistics on agriculture, estimates are based on per capita data on consumption. For fishery, quantity and price data are obtained from fishery statistics while intermediate consumption is calculated as a percentage of the gross value of production. For the industrial activity sectors estimates are obtained directly from *Estatísticas Industriais* and the *Anuário Estatístico*. Adjustments are made for activities in the manufacturing sector not covered in these two sources by using the industrial census of 1957. Value added of electricity, gas and water is obtained directly from annual surveys of corporations, non-corporations and local government services. The construction estimates are based on annual surveys of enterprises. For dwellings taxation statistics are used and the figures relating to floor area of new buildings are multiplied by the average cost of construction by region. For the trade sector, the annual surveys of corporations are used for the corporations while data on the economically active population and the value added per capita for the retail trade is used for the individual enterprises. Taxation statistics and information provided by corporation are used for restaurants and hotels. The value added of the transport sector is obtained from the concerned companies and from annual surveys. The estimates for the financial institutions are based on direct information whereas data published in "*Estatísticas das Contribuições e Impostas*" are used for ownership of dwellings. For government services, value added is obtained through government accounts. For private services, estimates are obtained through the use of data from "*Estatísticas de Educação*" for education, inquiries held in various cities for domestic servants, number of tickets sold for recreational services and taxation statistics for other personal services. For the constant price estimates, double deflation is used for the agricultural sector. Value added for construction, trade, restaurants, services incidental to transport, financial institutions, and community services is deflated by appropriate price indexes. For industrial activity sectors, hotels, transport and ownership of dwellings, value added is extrapolated by quantity indexes.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

Puerto Rico

Source

Reply to the United Nations national accounts questionnaire from the Planning Board, San Juan. Official estimates are published periodically by the Board in "Ingreso y Producto-Puerto Rico Income and Product". The following presentation of sources and methods is mainly based on information received from the Planning Board.

General

The estimates provided in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure of goods and private investment in machinery and equipment which are estimated through the commodity-flow approach. Estimates of government consumption expenditure are based on special tabulations prepared by the accounting division of the Department of the Treasury. For personal consumption expenditure on goods, import data in f.o.b. values are obtained from the trade statistics whereas transport costs by commodity are computed by the Division of Economic Accounts. Estimates of locally produced goods are prepared by using the Puerto Rican censuses of manufactures as benchmarks and extrapolating these data for other years. Estimates of local sales of agricultural products are furnished by the Division of Agricultural Statistics. Adjustments for changes in trade inventories and mark-ups are made on the basis of data obtained from income tax returns and from the firms concerned. For some goods, the estimated quantity consumed is multiplied by the average price believed to have been paid by the consumer. Estimates of services are based on the gross receipts of the firms or organizations providing the services. Estimates of changes in stocks for the manufacturing sector are obtained through the use of census data which are extrapolated for the non-census years. For sugar and tobacco, quantity data from official sources are multiplied by the average export prices. For trade, inventories are calculated as percentages of sales from a sample of income tax returns. These percentages are then applied to the estimated total sales. Farm inventories of livestock are computed from data supplied by the Department of Agriculture. Estimates of gross fixed domestic investment in construction are obtained directly through surveys among the contractors. For those not covered by the surveys, data from building permits are used. Private investment in machinery and equipment is estimated on the basis of import statistics. For the government sector, capital expenditure estimates are based on direct surveys within the agencies and on special tabulations prepared by the accounting division of the Department of the Treasury. Sales to the rest of the world, i.e., to the federal government and other non-residents of Puerto Rico, include wages and salaries paid to federal employees and all purchases of goods and services by the federal government. These data are obtained from the records of the agencies themselves. Data on imports are obtained from the trade statistics issued by the United States Department of Commerce. For the constant price estimates, private final consumption expenditure is obtained by multiplying quantities by base year prices where quantity data are available. Otherwise, the current estimates are deflated by appropriate price indexes. For all other components of GDP by expenditure type, price deflation is used.

Income Approach

Basic data on wages and salaries are derived from records of the Bureau of Unemployment Insurance, from censuses of business and manufacturers and from income tax returns and other financial reports of private

businesses and public corporations. The method used for estimating operating surplus in manufacturing, construction and some services consists in calculating, from a sample of income tax returns, ratios of profits and other property income to wages and salaries. These ratios are then applied to total wages and salaries. For some industries, the method is based on ratios of profits to gross receipts as reported on the income tax returns. Rental income of persons is estimated by deducting from the total rent paid the rent received by businesses, government and the rest of the world. Depreciation is estimated by applying to the total wages and salaries the ratio of depreciation charges to wages and salaries or to gross receipts, in the case of trade, derived from income tax returns. Data on indirect taxes and subsidies are obtained in detail from government reports.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The income approach by distributive shares is used to estimate the value added of each industrial sector. The net income by distributive shares is available by industrial sector. Business transfer payments, depreciation and subsidies are distributed using direct information. Indirect business taxes are obtained from government reports and are broken down by industrial sector, using economic indicators such as data on local production and imports. For the constant price estimates, price deflation is used for the different economic activities of GDP.

Reply to the United Nations national accounts questionnaire from the Central Statistical Organization, Doha.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The previous estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA) as far as the existing data would permit.

Republic of Moldova

Source

Reply to the United Nations national accounts questionnaire from the Department of State for Statistics of the Republic of Moldova. The latest data was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions. Please note that the official currency of the Republic of Moldova has changed in 1993 from the Russian rouble to Moldovan leu. 1000 Russian rouble is equal to one Moldovan leu (see World Bank "Statistical Handbook for the States of the FSU, 1996").

Romania

Source

Reply to the United Nations national accounts questionnaire from the National Institute of Statistics, Bucharest.

General

The estimates starting 1989 up to 1997 in the tables below have been prepared in accordance with the concepts and definitions of the System of National Accounts 1968 (1968 SNA) and those starting with 1998 in accordance with the System of National Accounts 1993 (1993 SNA). Previously, the estimates have been prepared as follows: For the period 1980-1988, the GDP in current prices has been computed on the basis of the aggregates compiled according to the concept and the methodology of the System of Material Product Balances (MPS). These aggregates were corrected and adjusted from the point of view of their content and coverage in order to align them to the European System of Accounts (ESA); as regards the GDP in constant prices, the same method was used for the period 1980-1989. The official estimates and descriptions are published annually by the National Commission for Statistics of Romania, Bucharest in "Anuarul Statistic al României" (Romanian Statistical Yearbook). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Russian Federation

Source

Reply to the United Nations national accounts questionnaire from the State Committee of the Russian Federation on Statistics and Analysis. The latest data was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions. From the reporting year 1998, the Russian rubel is displayed in re-denominated Russian rubel (1 re-denominated Russian rubel equals 1000 Russian rubel).

Rwanda

Source

Reply to the United Nations national accounts questionnaire from the Ministry of Finance and Economic Planning, Kigali. Some official estimates and information on concepts, definitions and methods of estimation are published in "Comptes Economiques du Rwanda, 1969 et 1970". Data from 1990 onwards of the latest series were obtained through the National Bank of Rwanda. These figures are published by the Ministry of Finance and Economic Planning, Direction de la Statistique, and in "Indicateurs de Développement du Rwanda", No. 4, Juillet 2001.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Saint Kitts and Nevis

Source

Reply to the United Nations national accounts questionnaire from the Ministry of Finance, St. Kitts-Nevis. Latest revisions were as published by the Statistics Division, Planning Unit, Ministry of Finance, Technology and Sustainable Development of St. Kitts and Nevis in the "Statistical Review, 2004".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Saint Lucia

Source

The estimates were published in "Economic Survey and Projections", by the British Development Division in the Caribbean. Reply to the United Nations national accounts questionnaire by the British Development Division.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Saint Vincent and the Grenadines

Source

The preparation of national accounts statistics in St. Vincent and the Grenadines is undertaken by the Statistical Office, Ministry of Finance, Planning and Development, Kingstown. The official estimates and a description of the sources and methods used for the national accounts estimation are published in "National Accounts of St. Vincent and the Grenadines". Reply to the United Nations national accounts questionnaire by the Statistical Office.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

San Marino

Source

The following tables have been prepared from reply to the UN National Accounts Questionnaire in 2003 by the Statistical Office of San Marino.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) as far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Saudi Arabia

Source

The preparation of national accounts statistics in Saudi Arabia is undertaken by the Central Department of Statistics, Ministry of Finance and National Economy, Riyadh. The official estimates are published in the National Income Series entitled "National Accounts of Saudi Arabia". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. Some data have been obtained from the Annual Report, 2002 ed. published by Saudi Arabian Monetary Agency and the Statistical Yearbook, 1996-2001 ed. published by the Ministry of Planning. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The most detailed description of the sources and methods used for the national accounts estimation is found in "National Accounts of Saudi Arabia 1386-87 through 1391-92, A.H." published in 1973. The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). The national accounts estimates shown relate to Hejra fiscal years. A Hejra fiscal year covers the period from the beginning of the seventh month of one Hejra calendar year through the end of the sixth month of the following year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure and gross fixed capital formation of private transport establishments which are estimated by using the commodity-flow approach. Government consumption expenditure is calculated as the sum of compensation of employees and net current purchases of goods and services. Data are obtained from the appropriations in the government budget rather than from actual expenditure data. The estimates are, however, adjusted for under-spending. Estimates of private consumption expenditure are based on imports in c.i.f. values and gross output of domestically produced goods and services. Import duties are based on the customs tariffs whereas transport and distribution margins are based on assumed margin rates. In order to estimate the gross fixed capital formation of transport establishments, a detailed classification of import statistics is used to estimate the capital formation in transport equipment. For general government, public enterprises and private industries the estimates are based on surveys of industrial production, which include information on fixed assets. Gross capital formation of the oil sector is based on data provided by the oil companies through their annual returns. Exports of crude petroleum and petroleum products constitute over 99 per cent of total exports of merchandise. The data are obtained from annual returns of the oil companies. Non-petroleum exports and imports of merchandise are obtained from foreign trade statistics and balance of payment estimates. Gross domestic product by expenditure type at constant prices is not estimated.

Income Approach

Compensation of employees for the crude petroleum and petroleum refining industries is obtained from the annual returns provided by the oil companies. For most of the other industries, the estimates are determined on the basis of an estimated ratio of wages to gross output. Estimates of indirect taxes are made from revenue figures of the central and local governments while subsidies are calculated from information supplied by the Ministry of Finance. Gross operating surplus, including depreciation, is estimated as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of the majority of industries. The income approach is used for mining other than extraction of crude petroleum and natural gas, mechanized road transport, ownership of dwellings, domestic services and producers of government services. For the agricultural sector, benchmark estimates for 1967-68 on gross output and intermediate consumption were prepared based on the results of agricultural surveys conducted in the period 1960-1965. Other years' estimates are calculated by multiplying the 1967-68 figures by index numbers of physical output and producers' prices. The extraction of crude petroleum and natural gas are undertaken by Aramco, Getty, and Arabian Oil Company. The annual returns from these companies and from the Saudi Arabian Oil refineries provide details on sales, costs and capital expenditures which enable the calculation of gross output, intermediate consumption and compensation of employees for mining, manufacturing of petroleum products and construction. Internal prices of the oil companies are used for the calculation of sales figures and not the "posted" prices which are used for calculating the payment of income tax. For other manufacturing, electricity, non-residential building construction, trade, water transport, financial services other than commercial banks, real estate, business services and private services, the estimates on gross output, intermediate consumption and compensation of employees for 1970 are available from the sample survey of establishments in 1971. Other years' estimates are calculated by multiplying the benchmark year figures by quantity indexes, price indexes or assumed growth rates. Estimates on construction for the government sector are based on details of government appropriations. For the private sector, the value of construction of dwellings is derived by multiplying the estimated number of dwellings constructed by the estimated cost of construction per dwelling. For mechanized road transport, the estimated number of vehicles is multiplied by an estimated value added per vehicle while for the airlines, railways and the Tapline annual returns from the companies concerned provide data on gross output, intermediate consumption and compensation of employees. Commercial banks' figures for 1970 are obtained from a survey of the operations of commercial banks. An estimated index of growth of banking services is applied for other years. Estimates of government services are derived from a classification of government appropriations shown in the budget volumes. For the constant price estimates, the value added of the agricultural sector, manufacturing, electricity, trade, transport and other services is extrapolated by quantity indexes. Value added of crude petroleum and petroleum refining is extrapolated by quantity indexes compiled from figures on barrels produced. Different kinds of price indexes such as index of wage rates and cost of living index are used to deflate the value added of construction and the financial sectors.

Reply to the United Nations national accounts questionnaire from the Direction de la Statistique, Dakar.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) as far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Serbia and Montenegro

Source

Reply to the United Nations national accounts questionnaire from the Federal Statistical Office. The latest data for Serbia and Montenegro (formerly Yugoslavia) was received through the United Nations Economic Commission for Europe (UN/ECE). Effective January 1999, data does not include Kosovo and Metohia. It should also be noted that the change in name from Yugoslavia to Serbia and Montenegro was made official only on 4 February 2003.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Series 20 has been introduced in 2003, it excludes Kosovo and Metohia.

Source

Reply to the United Nations national accounts questionnaire from the Ministry of Administration and Manpower, Victoria. The official estimates were published annually in the "National Accounts Bulletin," which was replaced by "National Income and Expenditure" in 1991. Further sources are the "Statistical Abstract" and "Seychelles in Figures".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Source

Reply to the United Nations national accounts questionnaire from the Department of Statistics, Ministry of Trade and Industry, Singapore.

General

The latest data shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of national Accounts 1968 (1968 SNA), based on the response to a conceptual questionnaire and/or other available information. Previously, the estimates and a comprehensive description of the sources and methods used for the national accounts estimation is found in "Singapore National Accounts" published by the Singapore Department of Statistics in March 1988. Significant changes in treatment and classification are recorded in "Singapore System of National Accounts" published by the Singapore Department of Statistics in May 1996. The publication also documents the rebasing of the constant price GDP estimates to 1990 prices from the previous 1985 prices. In the latest rebasing exercise, GDP at basic price has been compiled. Information on the adoption of basic price and toher recent methodological/classification changes are provided in the information paper "Rebasing of the Singapore System of National Accounts to Reference Year 1995". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated using the production, expenditure and income approaches.

Expenditure Approach

The commodity-flow approach is adopted to estimate private consumption expenditure (PCE) on goods and services. PCE estimates of goods are mainly compiled from external trade statistics and Census of Industrial Production. To estimate household final expenditure on goods, the supply of goods from retained local production and retained imports are examined to identify and determine the proportion meant for household consumption. The value of these consumer goods is then marked up by trade and transport margins and taxes on products to derive consumption expenditure on goods at current market prices. Consumption expenditure on services is derived mainly from survey of services conducted by the Department of Statistics. Constant price estimates on PCE are mainly obtained by deflating the corresponding nominal estimates by relevant sub-components of Consumer Price Index (CPI). For government consumption expenditure (GCE), the basic data sources include financial statements of the Accountant-General, detailed income and expenditure statements of non-profit making statutory boards and data collected from educational institutions. GCE at constant market prices are largely obtained by deflation using appropriate price indicators, eg, implicit government price index and composite index of selected CPI items. Gross fixed capital formation (GFCF) includes construction and works, transport equipment and machinery and equipment. Capital expenditure on construction and works comprises new buildings for residential, non-residential and other construction works. The estimates are mainly based on the certified payments of construction works. The gross margins of real estate developers and other transfer costs are added to derive the current price estimates on construction and works. Capital expenditure on transport equipment as well as machinery and equipment i.e., ships and boats, aircraft and road vehicles, is largely compiled from the results of the Census of Industrial Production and external trade statistics. The supply of goods from retained local production & retained imports are examined to identify and determine the proportion meant for capital formation. The value of these capital goods is then marked up by trade and transport margins and taxes on products to derive the current estimates for transport equipment as well as machinery and equipment. As estimates for the public sector are obtained from the Quarterly Survey of Capital Expenditure on Machinery and Equipment, estimates for the private sector are derived residually. The estimates on construction and works at constant prices are derived by deflation using appropriate deflators eg, Construction Price Index and Property Price Index.

Constant price estimates on transport equipment as well as machinery and equipment are mainly derived by deflation using relevant sub-indices of Import Price Index and Singapore Manufactured Products Price Index. The main data sources for changes in inventories are Census of Industrial Production and surveys on wholesale and retail sectors. Constant price estimates on changes in inventories at the sectoral categories are mainly obtained by deflation using relevant deflators eg, Import Price Index and Singapore Manufactured Products Price Index. For exports and imports of goods and services, the main data source is the balance of payments statistics. Exports and imports of goods and services are deflated at the disaggregated levels by appropriate sub-components of several deflators eg, Export Price Index, Import Price Index and Unit Business Cost.

Income Approach

The estimates of the cost/income structure of the gross domestic product are compiled at current market prices. Compensation of employees includes wages and salaries, employers' contribution to Central Provident Fund (CPF) and pension funds, and benefits in kind. In line with the SNA, compensation of employees exclude incomes received by self-employed or own account workers (which are classified as operating surplus). It excludes any taxes (such as foreign worker's levy) payable by the employer. In addition, wages and salaries are recorded before the deduction of employee's contribution to CPF. Estimates of compensation of employees are compiled based on administrative data on average monthly earnings by industry obtained from the CPF Board and employment statistics obtained from the Ministry of Manpower. These estimates are reviewed when the results from the annual surveys such as the Census of Industrial Production, Survey of Commerce, Survey of Services, Survey of Public Sector Accounts and Survey of Financial Institutions become available. Estimates of gross operating surplus are mainly based on annual surveys that provide data on corporate profits for most industries. Annual estimates for the current year are computed based on the data on operating receipts and expenses collected from the Survey of Monthly Industrial Production for the manufacturing sector and the quarterly business expectation surveys for commerce and services industries as well as quarterly surveys on financial institutions and insurance activities. Taxes on production and on imports such as import and excise duties, foreign workers' levy, business registration fees, stamp duties and property tax, are obtained from government administrative records.

Production Approach

The table on gross domestic product by kind of economic activity is prepared at basic prices. The classification of GDP by industry follows the Singapore Standard Industrial Classification 2000, adapted from the United Nations' International Standard Industrial Classification (rev 3). For current price value added of manufacturing establishments employing ten or more workers, basic data are obtained from the annual census of industrial production. For smaller establishments, estimates are made from employment data and per capita value added. The index of industrial production which reflects the level of output of the manufacturing reflects the level of output of the manufacturing sector with reference to a base year is used to estimate the value added at constant prices. Construction value added at current prices is estimated as a ratio of the total cost of work done, based on progress certified payments data collected by the Building and Construction Authority of Singapore. Estimates for minor renovation, maintenance and repair works are included. Value added at constant prices is obtained by deflation. The data used for the estimates of utilities value added at current prices are obtained from detailed accounts provided by all the utilities companies. Volume indicators such as kilowatt-hours of electricity and gas and cubic metres of water consumed are used to derive the constant price estimates. Other goods industries include agriculture and fishing whose value added are derived from the survey data obtained from the Agri-Food and Veterinary Authority of Singapore. The wholesale and retail trade is divided into entrepot trade and domestic trade activities. Singapore's external trade data from the IE Singapore constitute the main data source. For the domestic trade activities, estimates for retained imports are compiled from the external trade statistics while estimates for local production are based on agricultural output and the sales of the manufacturing sector to wholesalers and retailers. Data gathered in the surveys of wholesale and retail trade are also used. Constant price value added is obtained mainly by the deflation method using appropriate price indices. Current price estimates of the value added of the hotels and restaurants sector are derived from the surveys of services. For hotels, value added at constant prices is estimated from volume indicators such as hotels room days occupied collected by the Singapore Tourism Board. In the case of restaurants, constant price estimates are obtained by deflating the current values by suitable sub-group indices of the consumer price index. For the transport and communications sector, value added at current prices is mainly derived from the surveys of services. Indicators

used in the value added estimates at constant prices for the transport and communications sector include bus fare receipts, number of registered taxi, tonnage of air and seas cargo handled, number of passenger boats licensed, volume of postal articles handled, number of international telephone call minutes, mobile phone traffic in minutes and internet dial-up traffic. Value added for the financial services sector is mainly derived from the detailed data obtained from the quarterly and annual surveys conducted by the Monetary Authority of Singapore and the Singapore Department of Statistics. For business services, the estimates are mainly derived from the surveys of services. Government output is valued at the cost of producing its services and value added is analysed from government financial statements, income and expenditure accounts of statutory boards and data provided by educational institutions and the Ministry of Education. The value added of community social and personal services in the public and private sectors are separately estimated. For public sector, estimates are calculated from government financial statements. For private sector, estimates are based on the survey of services. The value added of domestic services consists of wages and income in kind and is estimated on the basis of the numbers employed and average earnings. The estimates of owner-occupied dwellings are imputed based on the annual value of properties as assessed for property tax.

^a Includes Quarrying.

^b Refers to all other services.

^c As constant price series are chain-linked at the base year, the gross value amounts are not additive prior to the base year. Thus, prior to 1995, the aggregates at 1995 prices are not equal to the sum of their components.

Slovakia

Source

Reply to the United Nations national accounts questionnaire from the Statistical Office of the Slovak Republic, Bratislava. The data for Slovakia was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Original constant prices are based on the year 1995. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA).

^b Discrepancy between industry components and total economy.

^c Derived from available data.

^d Includes Gross mixed income and FISIM.

^e Discrepancy between components and total as one or more components have not been revised.

^f Includes Net mixed income.

^a Includes Financial intermediation services indirectly measured (FISIM).

^b Discrepancy with equivalent item in Table 2.1: Value added by industries at current prices.

^c Discrepancy between components and total.

^d Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^e Mixed income, net. Excludes consumption of fixed capital.

^f Discrepancy between total economy and components as displayed in sub-item tables.

^g Net lending in the financial account has not been reconciled with Net lending in the capital account.

^a Discrepancy between components and total.

^b Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^c Mixed income, net. Excludes consumption of fixed capital.

^d Account does not balance.

Slovenia

Source

Reply to the United Nations national accounts questionnaire from the Statistical Office of the Republic of Slovenia, Ljubljana. The latest data for Slovenia was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The constant price data prior 1995 is not additive.

Solomon Islands

Source

Data was obtained from the internet website (<http://www.spc.int/prism/country/sb/stats/Economic/economic.htm>) as reported by the Solomon Islands National Statistics Office (SINSO), Department of Finance.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

South Africa

Source

The preparation of national accounts statistics in South Africa is undertaken by the South African Reserve Bank, Pretoria. The South African Reserve Bank and Statistics South Africa share responsibility for the compilation of national accounts. Statistics South Africa is responsible for compiling the production side of the national accounts, while the Bank is responsible for compiling the expenditure side of the national accounts, as well as income, expenditure and saving accounts for the institutional sectors and the balance of payments. The official estimates are published in the Bank's Quarterly Bulletin. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

A detailed description of the sources and methods used for the national accounts estimation is contained in a supplement to the Bulletin published in June 1999 entitled "South Africa's National Accounts, 1946 to 1998". The estimates are generally in accordance with the classifications and definitions recommended in the 1993 System of National Accounts (SNA 1993). Supply and Use Tables and value added by industry according to the SNA 1993 have been published by Statistics South Africa in Stats SA Report No 04-04-01 (1993) and Statistical release P0441 respectively. The current base year is 2000.

Methodology:

Overview of GDP Compilation

The production approach is applied for the benchmark years and annual estimates. For the quarterly estimates a combination of the production approach and the income method is used. The estimates for the gross domestic product by kind of economic activity at constant prices, using the extrapolation method of base-year estimates (by appropriated volume indices) have been supplemented, since 1993, by deflating output and intermediate input for the relevant sectors.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the expenditure approach. Final consumption expenditure by general government is estimated through the use of published annual accounts and monthly issues from the exchequer account for the national government, quarterly returns submitted directly to the Reserve Bank for the provincial governments, and annual and quarterly data collected by Statistics South Africa for the local authorities. Estimates of final consumption expenditure by households are based on a variety of sources such as quarterly data on the agricultural products marketed for food, monthly excise figures for beverages and tobacco, monthly retail sales data for inter alia clothing, medicine, entertainment and other consumer goods, number of motor vehicles and cycles sold for transport equipment, number of dwelling units and average rent and income of concerned enterprises. The estimates of change in inventories are based on census results and quarterly surveys. Information on capital formation in the public sector is obtained from published accounts updated by quarterly returns submitted to the Reserve Bank by concerned authorities. For the private sector, data on capital formation by the different industries are obtained from various sources: censuses and quarterly surveys for agriculture, manufacturing and mining, the value of buildings completed in urban areas for the sectors of commerce, and financial institutions. All relevant information for exports and imports of goods and services is based on balance-of-payments data. Official statistics and sample surveys of financial and non-financial companies are also used for exports and imports of services. For the constant price estimates, price deflation is used for final consumption expenditure on intermediate goods and services by general government, components of final consumption expenditure by households, change inventories, except agricultural stocks, gross fixed capital formation and exports and imports of goods and services. The net value of gold exports at constant prices is obtained by extrapolating the value of the base year on the basis of the number of kilograms of gold produced. The base year values of government compensation of employees and components of final consumption expenditure by households e.g transport equipment are extrapolated by appropriate volume indices.

For agricultural stocks, values at constant prices are obtained by multiplying the change in the number of livestock by the average flock value.

Income Approach

Estimates of compensation of employees of all industries of the economy are based on census results and monthly and quarterly data of wages, salaries and benefits paid to employees. Operating surplus is obtained from various sources for the different industries of the economy - data obtained from the National Department of Agriculture for the agricultural sector, census results and quarterly surveys of financial statistics for mining, manufacturing, construction and trade, information from concerned enterprises for electricity, gas and water, financial data for the financial institutions, annual and monthly statistics for trade and communication and data on the number of residential units and indices of house and flat rents for real estate. Consumption of fixed capital is calculated according to the straight-line method and valued at replacement cost. Taxes on production and imports are estimated on the basis of an analysis of government accounts by the Reserve Bank.

Production Approach

The table of value added by kind of economic activity is prepared at basic price values. For the period before 1993 the income approach is used to estimate the annual and quarterly value added of industries, except agriculture for which the production approach is used. From 1993 the annual value added estimates are compiled according to the production method, whereby complete production accounts are compiled for the various industries. For quarterly estimates a combination of the production approach and the income method is used. The estimates of agricultural production are obtained by valuing physical output at net producers' prices. Data pertaining to agricultural and livestock production are obtained from the census of agriculture and forestry. For forestry and fishing, estimates are obtained from the Department of Water and Forestry Affairs and from the Marine Development Branch of the Department of Environmental Affairs, respectively. Estimates of the production of gold, coal, diamond and other mines are obtained from periodic censuses. For non-census years, estimates are based on various sources such as reports of the Chamber of Mines and quarterly sample surveys of financial statistics of mining. Estimates of manufacturing are based on periodic censuses. For other years, estimates are based on monthly data on production and sales and quarterly surveys of financial and labour statistics conducted by Stats SA, supplemented by sample surveys on financial statistics conducted by the Reserve Bank. For electricity gas and water, estimates are based on annual financial statements for corporations and surveys conducted for local authorities and private enterprises. The estimates of construction are based on periodic censuses of construction. For non-census years, sample surveys of wages and salaries and analysis of financial statements of important companies and estimates of capital formation for building and construction works are used. The basic information for trade is obtained from the censuses of wholesale trade, commercial agents and allied services; retail trade; and motor trade and repair services, catering and accommodation services and licensed restaurants, conducted by Stats SA. For enterprises of general government, annual and quarterly surveys of local authorities, conducted by Stats SA, are used. For other years, estimates are based on monthly surveys of turnover statistics of wholesale, retail and motor trade and quarterly labour statistics and trading statistics for hotels, conducted by Stats SA, supplemented by financial statistics and sample surveys conducted by Stats SA and the Reserve Bank, respectively. Estimates for the transport storage and communication sector are obtained from published financial reports of Transnet, Telkom, SA Post Office; annual and quarterly surveys of local authorities conducted by Stats SA. Private transport benchmark estimates are obtained from censuses of transport and allied services, conducted by Stats SA. Estimates for in-between years of private transport are extrapolated according to the monthly surveys of road and rail transport of passengers and goods. Supplemented by individual studies such as for the taxi industry, the cellular networks and the internet service providers. Estimates for financial intermediation and insurance are based on annual and quarterly surveys conducted by the Reserve Bank among the various institutions in the private sector and information reported by public authorities and public corporations. Estimates are based on the results from censuses of business services and periodic population censuses supplemented by individual studies such as for car rentals and the security industry. For general government services, information is obtained from the GFS analyses and for other years from the main budget and annual reports of the provincial and local authorities and extra-budgetary accounts. For other services and other producers estimates are based on periodic censuses of social services conducted by Stat SA and censuses of relevant social services (such as welfare organisations), supplemented by population censuses and annual reports of relevant non-profit

institutions. Estimates of the GDP by kind of economic activity at constant prices are made on a quarterly basis. The value added of most industries is extrapolated by appropriate volume indices which is supplemented by deflating output and intermediate consumption for the relevant sectors.

Spain

Source

The preparation of national accounts statistics in Spain is undertaken by the Instituto Nacional de Estadística (INE), Madrid. The official estimates are published annually in "Contabilidad Nacional", INE. In this publication traditional accounts and tables of institutional sectors and industry are included, as well as the annual input-output table related to the year in which calculations are definite. The following tables have been prepared from successive replies to the United Nations national accounts questionnaires. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. The publication: "Contabilidad Nacional de España. Base 1985. Cuentas Nacionales y Tabla Input-Output" includes detailed description of utilized sources and methodology for calculation of the national accounts. Likewise, annual consecutive publications include improvements made to the procedures and sources of data of the Spanish System of National Accounts. Furthermore, a linkage of all national accounts series in Spain has been elaborated. In doing so, many complicated methodological problems have been solved such as the standardization of value for some transactions before and after including VAT in the Spanish tax system. Methodology and calculations of this linkage are published in: "Contabilidad Nacional de España. Serie Enlazada 1964-1991. Base 1986". When the scope and coverage of the estimates differ from conceptual or statistical reasons, from definitions and classifications recommended by the SNA, a footnote is indicated to the relevant tables. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Spain the currency name for the data before 1999 is "1999 ESP euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 166.386 peseta. - The name of the currency of the newly submitted data is "1999 ESP euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Spain, like for example all old data following the 1968 SNA is still in "peseta", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used for calculation of collective consumption expenditure of government, changes in stocks and imports and exports of goods and services. This approach combined with equilibrium of resources/employment is used to estimate private consumption and gross fixed capital formation. Calculations of collective consumption of government are based on data from budgetary data from central government, territorial and social security administrations. Calculation of private consumption is made with data from income and expenditure survey, using the commodity flow method. In calculating value of stocks several sources are used,

among them: data from Fondo de Regulacion y Ordenacion de Producciones y Productos Agrarios; Servicio Nacional de Productos Agrarios for agricultural sector and annual industrial survey, which has large coverage of energy and industrial units (exhaustive for establishments with more than 20 employees and by sampling for establishment with less than 20 employees). Data on supply (production from industrial survey data and external trade from customs data) and demand (data from the Ministry of Agriculture for agricultural production units, Construction Survey of the Ministerio de Obras Publicas y Medio Ambiente for construction units and data from government) are used for fixed capital formation calculations. Balance of payments is the source of information for calculation of imports and exports of goods and services. Balance of Payments calculation is based on external trade statistics, data on external monetary flows and other complementary information, from insurance company surveys and government. Regarding constant price calculations, all GDP aggregates made with expenditure approach, are deflated with appropriate price indexes.

Income Approach

Calculations on compensation of employees are made with data from statistical sources of each sector or industry, as well as research on employment costs. As in the case of wages and salaries, information is used from: agricultural survey on wages and salaries of the "Ministerio de Agricultura"; survey on salaries on industry and services (quarterly short-term statistics) and labor costs survey (quarterly) and from statistics on collective agreements of the Labor Ministry and Social Security. Calculation of social security contributions is made with data from government accounts which are elaborated by "Intervencion General de la Administracion del Estado". The same source is used for taxes and subsidies on production and imports. In the case of institutional sectors, the operating surplus is calculated with data from specific sources: households, credit institutions, insurance companies and government. In the case of enterprises and non-financial quasi-enterprises, operating surplus is calculated by the difference with respect to the total national economy which in turn has been calculated by industry with the functional analysis approach.

Production Approach

Initially, Gross domestic product by industry is calculated at market prices in accordance with the criteria on definition and valuation of transactions adopted by the Spanish National Accounting, in accordance with the European System of Integrated Economic Accounts on actual production valued at producers' prices, intermediate consumption at purchasers' prices. Calculations for agricultural sector are made with data from the Ministry of Agriculture (agriculture accounts, statistics on production) and by INE (sectors of agricultural inputs) which are integrated and adapted to the SNA. For mining and energy activities, economic data is used from EI, as well as other set of information from the Ministry of Industry and Energy in conjunction with INE. The industrial survey is the basic data source for calculations of manufacturing industry. Data from the survey of structure and construction are used for construction activities, as well as building and dwelling statistics. Internal trade survey is used for trade calculations. The survey is carried out quarterly and it has a large coverage. Up to now, 1984, 1988 and 1992 surveys have been carried out. Specific studies on trade are also carried out by the Direccion General de Comercio Interior. In the case of hotels and restaurants, there are many sources on the short-term evolution of these activities (rooms, rate of occupancy, etc.) as well as two exhaustive structural researches carried out by INE: hotel's survey (1987) and Encuesta de Restauracion (1989). Calculations on transport are based on data from RENFE (public enterprise) and other public and private railroad enterprises; airline enterprises; survey on transport of travellers and transport of goods that is used for road transport, and data from maritime enterprises are used for maritime transportation. Calculations of value added for communications are made directly from state monopolies data. Data for financial and insurance activities are from the directly implicated institutions. Institutional sector credit accounts are elaborated by the Banco de Espana. Calculation for imputed rents is based on income and expenditure survey results; rents are imputed at total cost base, hence net rent is considered as property income. Production of government services is obtained from Ministerio de Economia y Hacienda data. Data on public and private health sector is from government accounts, complemented with income and expenditure survey and health establishments survey. Accounting of other services is based on accounting data, specific surveys and on the number of employed persons reported by population censuses and labour surveys, comparing such data within the framework of the input-output table elaboration. Value added of domestic services and other services rendered to households is obtained from the income and expenditure survey. Calculation at constant prices is

made by using double deflation in the case of agriculture, energy industry, construction and certain services. Other services are deflated or extrapolated in accordance to the availability of appropriate price or quantity index.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

Sri Lanka

Source

Reply to the United Nations national accounts questionnaire from the Sri Lankan Department of Census and Statistics, Colombo. The official estimates are published by the Department in "National Accounts in Sri Lanka".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following presentation on sources and methods is based mainly on a report by the U.N. Regional Adviser of National Accounts entitled "Assessment of sources, methods and reliability of estimates of gross domestic product by kind of economic activity in Sri Lanka (1975)" and on a detailed and comprehensive information received from the Department of Census and Statistics in 1978.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, gross fixed capital formation in the public sector and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used to estimate private final consumption expenditure. The commodity-flow approach is used for gross fixed capital formation in the private sector. Changes in stocks are estimated as a residual. General government expenditure consists of actual expenditure made by central government and current expenditure by the local government on goods and services which are obtained from the Treasury Votes Ledgers and the Ministry of Local Government, respectively. Private consumption expenditure is estimated by using the commodity-flow method on the basis of imports as well as domestic goods available for consumption. Bench-mark estimates for selected consumer items are available in value terms through the use of household survey data. These estimates are extrapolated by using the increase in population and price levels. For gross fixed capital formation in the public sector, direct estimates are prepared on the basis of information available in the budgetary accounts. For building and other construction, the supply of locally produced building materials are first compiled, adding 45 per cent to the production values for trade and transport margins while data on imported materials are obtained from customs returns adding import duties and 45 per cent for trade and transport margins. It has been found that building materials constitute 45 per cent of the construction cost with wages and profits at 55 per cent. For machinery and equipment, import statistics are analyzed in detail. Estimates for exports and imports of goods and services are based on foreign trade statistics and balance of payments data. For the constant price estimates, all items of Gross domestic product by expenditure type are deflated by appropriate price indices or extrapolated by using quantum indices.

Income Approach

Data on wages and salaries in the government sector are obtained from Treasury records. In order to estimate compensation of employees in the private sector, the percentages of wage component for the key sectors, obtained from the socio-economic survey data for 1980/1981, are applied to the respective activity. Based on special inquiries made, depreciation is assumed to be 33.3 per cent of the value of fixed assets up to 1978 and 20 per cent for the years 1979, 1980 and 1981. Indirect taxes are obtained from government revenue records and subsidies from treasury records.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in producers values. The production approach is used to estimate value added of most industries. For livestock and forestry, the expenditure approach is used and for some of the service sectors like banking and transport, the income approach is used. Estimates of value added for tea and rubber have been revised by using the production approach. The estimation of coconut production is based on domestic and industrial consumption and exports. The annual cost of production returns are used for estimating inputs. The volume of paddy production is estimated on the basis of acreage statistics obtained from a multistage sample survey of crop-cutting. Own-account consumption is estimated as 10 per cent of production. Benchmark estimates for fruits and vegetables are based on the 1973 consumer finance survey. These are extrapolated for current years by increase in population and price levels. For livestock products, the per capita consumption obtained from the 1973 consumer finance survey is multiplied by each year's mid-year population. Production data for the mining and quarrying sector are obtained from the Department of Geological Survey. The value of input is assumed to be 15 per cent of the value of gross output. For large-scale manufacturing, quantities and values of gross output and values of inputs are submitted in annual returns furnished by the registered industrial establishments. Benchmark estimates for small-scale industries are obtained from the 1971 survey on the unorganized sector conducted by the Industrial Development Board. Extrapolation is done by using the growth in the labour force and the wage index. Data on electricity, gas and water are obtained from the Ceylon Electricity Board and the Ministry of Industries. The value added of construction activity in the private sector is based on locally produced and imported building materials obtained from the annual returns of manufacturing establishments and the customs returns, respectively. For the government sector, value of materials used in building and other construction accounts for 45 per cent of the gross value. This estimate is deducted from the value of the total supply of materials to obtain the value of material used in the private sector. Value added for the distributive trade is measured by net trade margins earned by traders on various types of products. Gross trade margin estimates are made separately for exports, local market production, government and private imports, etc. From these estimates 15 per cent is deducted for input. Benchmark estimates for hotels and restaurants have been obtained from the 1969/70 socio-economic survey. These estimates are extrapolated by population growth and a specially constructed index for meals consumed outside homes. For transport in the government sector, the expenditure on personal employment is taken as value added. The gross value of goods, transport and trade is obtained by applying specified distribution margins to the c.i.f. value in the case of imports and to the producer value in the case of locally produced goods. Wherever retail and producer prices are available the difference between them is taken as the distribution margin. For the financial sector, value added is based on data obtained from the Central Bank and concerned institutions. Benchmark data for gross rental values have been obtained from the 1980/81 socio-economic survey. These estimates are applied to the housing stock, with an allowance made for rental increases. The value added of government services is obtained from the treasury accounts. For the private sector, value added is based on expenditure data obtained from the 1980/81 consumer finance survey, extrapolated by the growth in the labour force adjusted for changes in wages. For the constant price estimates, price deflation is used for most of the industries. For some agricultural products, electricity, gas and water, transport and government services, value added is extrapolated by a quantity index.

Sudan

Source

The preparation of national accounts statistics in Sudan is undertaken by the Department of Statistics, Khartoum. The official estimates, sources and methods are published in a series of publications entitled "National Accounts and Supporting Tables". Input-output tables were published in 1964 in "National Income of Sudan in 1961/62 (with preliminary estimates for 1962/63)". Reply to the United Nations national accounts questionnaire from the Department of Statistics.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). From 1969 to 1994, estimates are for fiscal years beginning 1 July. Estimates from 1996 onwards are for fiscal years beginning 1 January. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except the estimates of gross fixed capital formation which are based partly on the commodity-flow method and partly on the expenditure approach. The sources of data for government final consumption expenditure are the actual figures available at Ministry of Treasury, Ministry of Local Government, different government units and public entities. For the central government, current and capital expenditure budgets are available, while for the local government figures on receipts and expenditures are available only for the six northern provinces, for the three southern provinces, budget figures have to be used. The estimates of private fixed consumption expenditure are based on the Household Budget Sample Survey 1967/68 which provided for the six northern provinces, data on average income and expenditure of households in the urban, semi-urban and rural areas. The number of households in these areas is based on the result of the 1973 Population Census. For the three southern provinces, which were not included in the Household Budget Sample Survey 1967/68, certain assumptions have been made to estimate their average expenditure per household. The expenditure by object per household has been calculated for 1967/68 to 1970/71 by multiplying an estimated rate of consumption increase by the number of urban, semi-urban and rural households in the North and the South. Increase in stocks is estimated partly on the basis of replies to questionnaires sent to public enterprises, producing industries and wholesale and retail trade companies. Capital formation estimates for central government and public entities are extracted from government capital expenditure accounts and for local government from the accounts of local councils. Total private expenditure on construction is obtained as a residual after deducting public expenditure on construction from total output of the construction sector. The expenditure on machinery and equipment is obtained from the statistics of imports classified by end-use. The data on external transactions are provided by the Bank of Sudan. The estimates of direct purchases by non-residents are based on a survey of the non-residents in Sudan. GDP by expenditure type at constant prices is not estimated.

Income Approach

In estimating the cost-structure components of gross domestic product, compensation of employees is taken as the wage bill reported by manufacturing establishments and companies in the various economic activities. For the agriculture and primary sectors, compensation of employees is imputed from the employment side. Operating surplus is in most cases taken as the residual of gross output over total costs. Depreciation estimates of public

corporations and private manufacturing enterprises are based on actual information available. Indirect taxes consist mainly of import and excise duties and are obtained from government budgets and accounts.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. Value added of most industries is estimated through the production approach. The income approach is used for government services and for electricity, gas and water. The commodity-flow method is used for the construction and trade sectors, while the expenditure approach is used for private services. For the agricultural sector, information on crop production is based on rough estimates furnished by the Ministry of Agriculture. To obtain the value of most crops, production figures are multiplied by auction or wholesale prices reduced by 10 per cent for transport and distribution margins. The estimates of value added of cotton, wheat, durra and ground-nuts are based on the records of Sudan Gezira Board which provides data on production, value and cost of production. The value of animal production is obtained through multiplying the assumed production per species by average producer price per head, supplied by the Department of Animal Resources. In the calculation of input and value added of livestock, dairy and poultry products, certain per centages have been adopted. There is a considerable difficulty in estimating the non-marketed production and own consumption in agriculture, as such information is only available from supply and disposition surveys which unfortunately have not been recently conducted. For forestry, hunting and fishing, data are supplied by the respective departments. The intermediate consumption of hunting and fishing is assumed to be a certain per centage of gross output. The gross output and value added of manufacturing are based on the Industrial Survey 1970/71 and on computed indexes of the value of production. The value added of industrial corporations are obtained from the balance sheets and profit and loss accounts of the corporations. Gross output of construction is estimated indirectly by calculating the total supplies of cement and the imported building materials. Intermediate consumption constitute 60 per cent of gross output. The market value of imported building materials is calculated by adding estimated margins to the c.i.f. value. For the domestic production of cement, an assumed average price per ton is applied. The construction of traditional buildings is estimated based on the 1973 Population Census and certain assumptions. For the trade sector, the trade margin of imported goods is calculated on the basis of c.i.f. value plus five per cent covering assumed duties and transport margin. For local production, it is assumed that 20 per cent of agricultural production represents own consumption. For the remaining marketable agricultural and industrial production, the trade margin is assumed to be 21.2 per cent. A rough estimate of the intermediate consumption is obtained by applying certain per centages and ratios. For transport, detailed data on receipts and expenditure are obtained from the accounts of the large public enterprises and by means of questionnaires and special surveys for other enterprises. Information on banks and insurance companies are obtained from the enterprises concerned. Gross output of banks is equated to the sum of actual service charges received plus imputed service charges. Data on intermediate consumption and factor income of banks and insurance companies are obtained from their balance sheet and profit and loss statements. The estimates of producers of government services are obtained from the ordinary budget or the extra-budgetary funds. For health services, entertainment and personal care, information is obtained from the institutions concerned and from the Household Sample Survey 1967/68 and the Population Census 1973. Gross domestic product by kind of economic activity at constant prices is not estimated.

Reply to the United Nations national accounts questionnaire from the Algemeen Bureau Voor de Statistiek, Paramaribo. The official estimates are published by the Bureau in "Nationale Rekeningen van Suriname".

General

The estimates shown in the following table have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Reply to the United Nations national accounts questionnaire from the Central Statistical Office, Mbabane. Official estimates are published annually by the Central Statistical Office in "National Accounts Report".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Sweden

Source

The preparation of national accounts statistics in Sweden is undertaken by Statistics Sweden. The annual estimates of certain standard tables are published in a series of Statistical Reports entitled "Nationalräkenskaper - National Accounts". Supplementary and supporting tables are published separately in a set of appendixes. Each series of the Statistical Reports contains some methodological notes. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. The former Swedish National Accounts System corresponds closely to the United Nations System of National Accounts 1968 (1968 SNA). Separate input-output tables have been published for the years 1964, 1968, 1969, 1975, 1980 and 1985 in "Input-Output tabeller for Sverige". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Chain indices are used to measure volume growth and the resulting chained constant prices data are not additive.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure is calculated from the cost side. The calculations for the central government are based on the semi-annual groupings made by the National Accounting and Audit Bureau and on reports of the Central Government Revenue. For local government the calculations are based on finance statistics compiled by Statistics Sweden. Private consumption expenditure consists of approximately 90 items, for which a number of estimation methods are used. The Swedish Board of Agriculture is the source for the estimate of food consumption, and for most of the remaining goods, the estimates are based on a combination of the Family Expenditure Survey and turnover statistics of retail trade. Gross capital formation estimates are derived from investment inquiries from the different sectors of economic activity and from government accounts data. Exports and imports of goods and services are mainly estimated from foreign trade statistics and balance of payment statistics of the Swedish Central Bank. For the constant price estimates, price deflation is used for most of the expenditure items, the current values being deflated by various price indexes such as weighted consumer price indexes, adjusted export and import price indexes, price indexes for different capital goods, etc. Components of government consumption expenditure are deflated by relevant price indexes, except wages and salaries which are extrapolated by employment indexes.

Income Approach

Estimates of the cost components of the gross domestic product are for compensation of employees based on statistics on income verifications from employers with addition for employers' contribution to social security schemes etc. Consumption of fixed capital is calculated from capital stock values. Data on indirect taxes and subsidies are based on government finance statistics. Operating surplus is a residual item.

Production Approach

The table on gross domestic product by kind of economic activity is calculated in basic values. Value added is derived from the input-output tables. The input-output tables are calculated annually in current and constant prices starting from 1980. Statistics from the Board of Agriculture is the main source of information for the estimation of the agriculture sector. Estimates of output and intermediate consumption of mining, manufacturing and electricity, gas and water are based on annual censuses. Special calculations are made to include establishments not included in the census. Output of construction is calculated mainly from the demand side. Production of the trade sector (trade margins) is calculated within the input-output tables. For the rest of the service sectors production statistics for services and finance statistics of enterprises are mostly used. The source for central government services is statistics from the National Accounting and Audit Bureau, estimates on local government are based on finance statistics. The general approach for the constant price estimates for most industries is double deflation. Different kinds of price indexes have been used, such as producer's price indexes, consumer price indexes, implicit price indexes, etc. For producers of government services base year values on compensation of employees are extrapolated by employment statistics (hours worked), which is also the kind of statistics used for estimating value added of financing and insurance. In addition those values are adjusted for two per cent increase in productivity per year.

^a Discrepancy between components and total.

^b Includes FISIM but FISIM is not included in Intermediate consumption of the other domestic sectors.

^c Discrepancy with equivalent item in Table 2.3 Output, gross value added and fixed assets by industries.

^d Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^e Not equal to the sum of corresponding components in the domestic sector accounts as one or more of the components have not been revised.

^f Mixed income, net. Excludes consumption of fixed capital.

^g Statistical discrepancy between data for this year(s) and the sum of the corresponding items of domestic and rest of the world sectors is equal to the amount of FISIM.

^h Account does not balance by an amount equal to FISIM.

ⁱ Account does not balance. Not equal to the sum of corresponding components in the domestic sector accounts as one or more of the components have not been revised.

^a Discrepancy between components and net value.

^b Statistical discrepancy between data for this year(s) and the sum of the corresponding items of sectors S.11 and S.12 is equal to the amount of FISIM.

^c Account does not balance.

^d Discrepancy between components and total.

^e Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

^c Discrepancy between components and total.

^d Account does not balance.

Switzerland

Source

Reply to the National Accounts Questionnaire from the Fédéral de la Statistique(OFS), Neuchâtel. The official estimates are published in "Le système de comptabilité", OFS, 1948-1976. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the 1993 System of National Accounts (1993 SNA). Previous estimates were prepared in accordance with the 1968 System of National Accounts (1968 SNA). Not all of the tables have yet been updated with data according to the 1993 SNA, and therefore still contain only data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. Chain indices are used to measure volume growth and the resulting chained constant prices data are not additive.

Syrian Arab Republic

Source

The preparation of national accounts statistics in Syrian Arab Republic is undertaken by the Directorate of National Accounts, Central Bureau of Statistics, Damascus. The official estimates are published annually in the "Statistical Abstract", issued by the Central Bureau of Statistics. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The following presentation of sources and methods is based on a report entitled: "National Accounts of the Syrian Arab Republic and Syria's First Effort at Implementing Stages of the New United Nations System of National Accounts 1968 (1968 SNA)". The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, exports and imports of goods and services, and part of changes in stocks. This approach, in combination with the commodity-flow approach, is used to estimate gross fixed capital formation. Private final consumption expenditure is obtained as a residual. The basic data for government final consumption expenditure estimates are available from the budgets of the state, the municipalities and religious endowment administrations. Stock fluctuations are not estimated. For gross fixed capital formation, detailed classification of import statistics are utilized for machinery and equipment. Added to the c.i.f. values are import duties, other indirect taxes and estimated trade margins. For construction in the private sector, estimates are obtained by multiplying the area of floor space indicated in the annual census by the average price per square metre and by adding thereto the value of repairs carried out. The estimates of exports and imports of goods and services are based on foreign trade statistics and balance-of-payments data. For the constant price estimates, price deflation is used for government final consumption expenditure and gross fixed capital formation. Price deflation and extrapolation by volume index are used for exports and imports of merchandise. Private consumption expenditure is obtained as a residual and no estimates for increase in stocks are made.

Income Approach

The cost-structure table of the gross domestic product is not being estimated.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most industries. The income approach is used for some private services and for producers of government services. The commodity-flow approach is used to estimate the gross output of the trade sector. The data on field and animal agricultural production are collected by the Ministry of Agriculture. Gross output and intermediate input are compiled per individual commodity group, estimated from figures gathered separately on quantities and prices. The agricultural prices were obtained through a census for the year 1971. For other years, only wholesale prices are known while producers' prices are derived on the basis of varying assumptions. Own-account consumption of agricultural production is mainly based on the sample survey conducted in 1970 and the 1968 family budget survey. Data for extractive industries, such as crude

oil and phosphates, owned by the state are obtained from reports that include the size and value of production and intermediate consumption. Extractive industries in the private sector are based on industrial surveys. Data concerning industrial public enterprises are available from the Union of Industries. For the private sector, the Central Bureau of Statistics has undertaken a general economic survey for 1971, which covers all establishments employing more than nine persons and includes a sample of the smaller establishments. The frame for the survey was based on the 1970 population census. Other data sources has been used to cover establishments created after 1970. In the manufacture of food, the value of flour is multiplied by the ratio between the value of bread and the value of flour derived from the economic survey. Similar ratios between gross output and intermediate consumption and compensation of employees are used for the estimation of intermediate consumption and compensation of employees. The sources of data on the electricity and water industries are the accounts of the concerned enterprises. For construction, estimates of production values and intermediate consumption in the private sector are made by determining the value of construction projects completed during the year and adding to it the value of the completed portions of unfinished buildings and construction projects. The progress reports issued by the State Planning Commission are the prime source of data for construction in the public sector. For trade, gross margins are estimated as per centage mark-ups on commodity-flow values. The value of intermediate consumption is estimated as 8 per cent of the production value. Information on railway and air transport and communication activities is supplied entirely by public enterprises. Gross output of road transport are based on the registration of licenses issued, and on gross revenue and cost data by type of unit, based on ad-hoc transport sample surveys. Estimates of pipeline and sea transport are obtained from concerned enterprises. For banks, the production value is calculated by adding to actual expenditure imputed service charges. Estimates of insurance and real estate activities are derived from the concerned companies. The production value of the housing sector is estimated as rents paid to others for house leases plus the estimated rental value of owner-occupied houses. For community services, the basic data are available from the accounting records of public enterprises and the budgets of public authorities. The results of the 1971 general economic survey are used for some private services while proxy output indicators derived from the results of the 1970 population census and administrative records are used for other services. For the constant price estimates, double deflation is used for agriculture. Value added of all other economic activity sectors of GDP, except trade, is extrapolated by a quantity index. To obtain wholesale and retail trade margin at constant prices, the same per centages as those used for current prices are applied to the production values of the agricultural, mining and quarrying and manufacturing sectors.

Tajikistan

Source

Reply to the United Nations national accounts questionnaire from the State Committee for Statistics of the Republic of Tajikistan. The latest data for Tajikistan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Tajikistan has changed in 1995 from the Russian ruble to Tajik ruble (one Tajik ruble equals 100 Russian rubles), and in 2000 from Tajik ruble to Samoni (one Samoni equals 1,000 Tajik rubles).

Thailand

Source

Reply to the United Nations national accounts questionnaire from the Office of the National Economic Development Board, Bangkok. The official estimates are published annually by the same office in "National Income of Thailand".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit. When the scope and coverage of the estimates differ from conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. The commodity-flow approach, supplemented by the expenditure approach, is used for the estimation of private final consumption expenditure and gross fixed capital formation. Estimates of government consumption expenditure are compiled from government accounts. Expenditure financed by foreign aids is added. For the main items of private consumption expenditure, the commodity-flow method is used. The per capita consumption of other items such as flour and chicken is based on family expenditure inquiries extrapolated by population and price changes. Stock changes in the private sector are estimated on the basis of commodity balance accounts. The estimate of private building activity is based on building permits issued for the urban areas and on municipal building construction costs. Additions are made for the input profit of builders based on sample surveys, for permanent fixtures and fittings and for construction for own use. For the public sector questionnaires are sent to various government departments and enterprises. Estimates of other capital formation are based on foreign trade statistics. To the import values are added import duties, mark-ups and installation costs. Exports and imports of goods and services are derived directly from the balance of payments. For the constant prices estimates, current values of most of the expenditure items are deflated by appropriate price indexes. For private consumption expenditure, direct revaluation at base year prices is used when information is available on quantities of commodities consumed.

Income Approach

Estimates of compensation of employees are derived from the cost of production estimated through surveys for the agricultural sector, from data on the average wage per worker multiplied by the construction sector, and for the public and financial sectors, the estimates are obtained from their records. Depreciation is estimated as 6.67 per cent and 10 per cent of gross domestic product for building construction and equipment, respectively. Indirect taxes net of subsidies are estimated by the Comptroller-General's Department. Operating surplus is obtained as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate value added of most industries. However, the expenditure approach is used to estimate part of the agricultural sector, the income approach for public administration and defence and part of the private services and the commodity-flow approach for gross output of the trade sector. For the agricultural sector, annual production figures of paddy and 19 other principal crops are reported by the

Department of Agriculture while vegetables and fruit production is based on consumption estimates. The production figure of each crop is multiplied by the average ex-farm prices. Annual livestock production estimates are based on inventory changes and the number of animals that are exported or slaughtered while cost estimates are based on information from the Department of Livestock Development. Own-account consumption of rice and fish, vegetables and fruits is based on the quantity consumed multiplied by local prices and on the 1962 household expenditure survey, respectively. The value of forestry production is estimated by multiplying the average price per unit by the total quantity produced. For mining and quarrying, the total production quantity of each mineral is multiplied by its average price to obtain the production value. Data on the gross value of production, intermediate consumption and value added in manufacturing by both private and public enterprises and registered partnership are obtained from reports submitted to the Comptroller-General's Department, the Ministry of Industry, the Department of Revenue and the Budget Bureau. For other manufacturing, value added is estimated by applying approximate value added ratios to the gross value of production derived from financial statements and tax returns. The estimates of electricity, gas and water are computed directly from the financial statements of the various agencies. Construction expenditure in the public sector is reported directly to the National Statistical Office. Adjustments are made for non-reported construction. For the private sector, it is based on reported data such as building permits of municipalities or on average price of new houses. Intermediate cost for each type of construction is derived from questionnaires sent to contractors and information received from architects and engineers. The income originating in the trade sector is estimated by the commodity-flow method which traces the flows of consumer and producer goods of both domestic and foreign origin through the distribution channel. Gross margins are derived from the differences between retail prices and producers' prices. For the public transport and communications sectors, information is obtained directly from the financial statements of the agencies concerned. In the private sector, information is obtained from various sources such as the operating accounts of enterprises, registration and licence data and information on the earnings of companies that supply data. Value added of travel agencies is calculated from a tourist expenditure survey. For the financial sector, estimates are based on profit and loss statements for banking and insurance and on income tax returns for real-estate brokers and warehouse operators. Value added of ownership of dwelling represents the estimated rental value after expenses. Net rent is estimated by multiplying the estimated average net rent per dwelling by the estimated number of dwellings. For business services, value added of legal services for the base year is estimated from the number of lawyers practicing while average income is based on the labour survey and extrapolated by the growth rate of total criminal and civil cases. Other services such as auditing and engineering are estimated from auditing fees paid and the value of dwellings construction in the municipal area, respectively. Value added of public administration and defence are supplied by the Comptroller-General's Department. For other private services, including restaurants and hotels, data from the Department of Revenue licensing statistics and other data collected by the National Statistical Office are used. Both public and private education estimates are based on wages and salaries data of teachers. For the constant price estimates, price deflation is used to estimate the value added for most industries. For agriculture, when quantity figures of agricultural products are available, the base year of mining and quarrying are extrapolated by quantity indicators. For public administration and defence, the number of employees by civil classification is used as an indicator of value added in real terms.

The former Yugoslav Republic of Macedonia

Source

Reply to the United Nations national accounts questionnaire from the Statistical Office of Macedonia. Official estimates are published in "Macedonia Basic Economic Data". The latest data for Macedonia was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Not all of the constant price data is additive. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Timor-Leste

Source

Reply to the United Nations national accounts questionnaire from the UN Transitional Administration in East Timor (UNTAET) on behalf of the East Timor Central Fiscal Authority, with the assistance of the Boston Institute for Developing Economies, Massachusetts.

General

The estimates in the tables below have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. Prior to independence in September 2002, the gross domestic product of East Timor was estimated by the Indonesian Central Statistics Agency (Badan Pusat Statistik, BPS). The only account estimated by BPS annually was the production account, as shown in tables 2.1 and 2.2, which present the 1993-1998 series in current and constant 1993 rupiah respectively. In attempting to build a system of national accounts for an emerging country such as East Timor with its limited human and financial resources, the tables below should be interpreted as "order-of-magnitude" estimates, subject to much greater error than those of other more developed countries. As the first set of accounts for the nation, it was important to produce aggregates with a tolerable level of accuracy, since these will form the basis for policy in the coming year. When the coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Reply to the United Nations national accounts questionnaire from the Central Statistical Office, Port-of-Spain. The official estimates are published by the Central Statistical Office in the "National Income of Trinidad and Tobago" and in the "Annual Statistical Digest".

General

The latest estimates of Trinidad and Tobago have been adjusted by the Central Statistical Office in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Tunisia

Source

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique, Ministère du Développement Economique, Tunis. The official estimates are published annually by the Institut in "La Tunisie en Chiffres" and "Annuaire Statistique de la Tunisie".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Turkey

Source

Reply to the United Nations national accounts questionnaire from the State Institute of Statistics, Ankara. Methods of estimation, explanatory notes and primary sources are described annually in "National Income of Turkey". The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The official estimates have been prepared by the State Institute of Statistics in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Turkmenistan

Source

Reply to the United Nations national accounts questionnaire from the Statistics Department, Nuku'alofa. The latest data for Turkmenistan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). The official currency of Turkmenistan changed in 1992 from the Russian ruble to Turkmen manat. Data for 90-91, originally compiled in Russian rubles, have been converted to manats applying a conversion rate of 500:1.

Uganda

Source

The preparation of national accounts statistics in Uganda is undertaken by the Uganda Bureau of Statistics, Entebbe. The official estimates are published by the Bureau in "Statistical Abstract" and "Statistical Bulletin".

General

The estimates shown in the following tables have been prepared in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). On May 15, 1987, the new shilling, equal to 100 old shillings, was introduced. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. The Government compiles national accounts using two period types, fiscal year ending 30th June and Western calendar year. The data stored in the UN national accounts database are based on Western calendar year. Since the constant price data are compiled on the basis of the fiscal (as opposed to calendar) reference year, current price data and constant price data are not identical in the base year.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used to estimate gross capital formation. Private final consumption expenditure is obtained as a residual. Government final consumption expenditure is obtained from accounts of the government bodies. The estimates are recorded on a cash basis and are classified by purpose. Estimates of changes in stocks are prepared for coffee and livestock only, for which average prices are used. The value of capital expenditure on plant, machinery and transport equipment is estimated on the basis of import values, adding import duties, mark-ups for trade, transport and other miscellaneous charges. The estimates of construction are prepared on the basis of the estimated value of building materials as well as on wages and salaries paid. Own-account rural residential construction is estimated on the assumption that it keeps pace with the population growth. Estimates of government gross fixed capital formation are derived from the government fiscal and operating accounts. For exports and imports of goods and services, the annual trade reports issued by the East African Customs Department and the balance of payments statistics are used.

Income Approach

For the government sector, wages and salaries are derived from the government accounts, for large-scale manufacturing they are obtained from the surveys of industrial production, for trade they are based on the 1966 census of distribution, with a constant ratio to total value added for other years and for services, they are taken from accounts of the services establishments or from the enumeration of employees. The estimates of consumption of fixed capital are built-up by branch from various sources such as the annual surveys of industrial production and the accounts of enterprises in mining, electricity and water supply. Estimates of indirect taxes and subsidies are obtained from government accounts. Operating surplus is in most cases derived as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of the goods-commodity-producing sectors. The income approach is used for the service-producing sectors except the trade sector, for which the commodity-flow approach is used. For the five major commercial agricultural crops: coffee, cotton, tea, tobacco and sugarcane, statistics of

production and value are available annually from sources such as the Coffee Marketing Board, the annual surveys of industrial production and the Produce Marketing Board. For other crops, benchmark estimates are based on the results of the census of agriculture in 1964/65. Production figures for other years are obtained by using population growth as an indicator. Estimates of subsistence production are based on ad-hoc statistical inquiries conducted during the 1960s. Crop prices are collected monthly by the Ministry of Agriculture from selected markets. For intermediate consumption, input ratios are used. Livestock slaughtered for own consumption is evaluated at annual average auction prices while the marketed meat is evaluated at annual average retail prices adjusted for trade and transport margins. For forestry, the gross value of output of the public forests is taken to be equal to the gross revenue earned by the government from this activity. The main sources for estimating the mining industry are the annual surveys of industrial production. For manufacturing, the Statistics Division conducts annual surveys of industrial production covering all establishments employing 10 or more workers. The 1965 survey also covered small establishments employing 5 to 9 workers. The price data applicable for the large-scale sector are also used for the small-scale sector. The input ratios are mainly based on the 1965 survey results and assumed to remain constant. Estimates of electricity and water are obtained from the annual reports and accounts of the agencies involved. For construction, a bench-mark survey of building and construction activities was carried out in 1964 covering both small and large construction units and own-account construction in the organized sector. For trade, annual gross sales are determined by applying mark-ups based on the 1966 census of distribution and assuming stocks to remain constant. The value of gross sales is then related to inputs, wages and operating surplus on the basis of global norms derived from the 1966 census results. These norms are assumed to remain constant over the years. For restaurants and hotels, benchmark information has been collected for 1967 from the profit and loss accounts of 50 hotels and restaurants. The information collected are projected by means of either sales tax data or data on wages and salaries. The estimates of railways, air transport and communications are obtained from the relevant corporations which are managed by the East African Community. For financial institutions, benchmark information in terms of profit and loss accounts and balance-sheets of individual banks and other financial institutions has been analysed and estimates have been compiled for 1969. For other years, these relationships have been applied to the number of employees in these institutions. Benchmark information on insurance companies is available for 1967 and extrapolated by using management expenses. For real estate and ownership of dwellings, the estimates of rental values in urban areas are based on the records of the Land and Survey Department and the annual reports of the town councils. Benchmark estimates for business services were collected in 1967 and are projected using as indicator the number of persons engaged in these services. For producers of government services, sources of data are the annual reports of government agencies and accounts of non-profit institutions. For other services, 1967 benchmark estimates are extrapolated by the results of the annual enumeration of employees. For the constant price estimates, double deflation is used for agriculture, mining and quarrying, electricity, gas and water and trade sectors. For manufacturing and transport, value added is extrapolated by a quantity index for output. Price deflation is used for construction, restaurants and hotels and for financial and services sectors.

Ukraine

Source

Reply to the United Nations national accounts questionnaire from the Ministry of Statistics of the Ukraine. Official estimates are published in "Statistical Bulletin in National Accounts". The latest data for Ukraine was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). In the reporting year 1996, the official currency has changed from karbovantsy to hryvnia (1 hryvnia equals 100,000 karbovantsy).

United Kingdom

Source

The preparation of national accounts statistics in United Kingdom is undertaken by the Office for National Statistics(ONS), London. The official estimates are published in "United Kingdom National Accounts", ONS. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. A comprehensive description of the sources and methods used in the preparation of the estimates is given in "National Accounts Statistics, Sources and Methods", H.M.S.O., London, 1968. A new source of reference is "The National Accounts - A Short Guide", H.M.S.O. London, 1981. Input-output tables for selected years are produced and published by the Central Statistical Office. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is calculated as average estimate of the three component measures of income, expenditure and output. Geographical coverage of the statistics comprises the United Kingdom of Great Britain and Northern Ireland only. i.e. territories such as Bermuda, British Virgin Islands, Cayman Islands, Anguilla, Turks and Caicos, Falkland Islands, Gibraltar, Pitcairn, St. Helena, Channel Islands, Ile of Man are excluded.

Expenditure Approach

The expenditure approach is used to estimate all types of expenditure. Government final consumption expenditure is based on accounting data and departmental returns. Estimates for the central government are derived from the various exchequer and departmental accounts. Both the central government and the local government data are extensively rearranged to fit the concepts used in the national accounts. The estimates of private final consumption expenditure are built up commodity by commodity from a variety of independent sources. The sources available are statistics of supplies, sample surveys of consumers' expenditure, and statistics of sales by retail shops and other outlets. The major sources for estimating gross fixed capital formation in private industries are the annual censuses of production and annual inquiries into the distributive and service trades. Base year estimates of dwellings are, however, based on the number of houses under construction and average prices. Changes are estimated from building output data obtained from contractors. The estimates of capital formation for the public sector are based on accounts. The statistics of exports and imports of goods and services are taken from the balance of payments accounts. Government final consumption expenditures referring to wages and salaries are estimated at constant prices partly by deflating by indexes of changes in rates of pay, but mostly by the use of volume indicators based on numbers employed. Goods and services are mainly deflated by composite base-weighted price indexes. No single-approach is used for all components of private final consumption expenditure. Most food, beverages and tobacco are revalued item by item at average base-year prices. Deflators constructed from components of the General Index of Retail Prices are used for other items. Price deflation is used for gross fixed capital formation. For buildings and other construction out-turn price indexes of successful tenders are used. For exports and imports of goods and services base-year figures on a balance of payments basis are extrapolated by means of volume changes for many goods. For other goods and services, however, mainly price deflation is used.

Income Approach

Information about wages and salaries paid in cash is obtained from the PAYE (Pay-As-You-Earn) system. The estimates of employers' contributions to national insurance and health are taken from the central government accounts. Estimates of operating surplus are provided through tax assessment data for profit incomes. Since they, however, are not available for the latest periods, the quarterly sample inquiry on company trading profits undertaken by the Inland Revenue is also used. Statistics of the trading surplus of public corporations, central government and local authority trading enterprises are taken from their accounts. The method used for estimating capital consumption is mainly the perpetual inventory method. Estimates of total taxes on expenditure and subsidies are available from government accounts.

Production Approach

The income approach is used to estimate value added of most of the various economic activities. The production approach is applied in connexion with the estimates of agricultural income. The production figures of agriculture are based on estimates prepared by the departments concerned. Agricultural earnings, including payments in kind, are estimated by these departments from regular sample surveys. The estimate of income from farming is built up from very detailed estimates of output and expenditure. Information about crop areas and livestock numbers is collected from farmers by means of questionnaires, and estimates on the quantity harvested are based on the production acreage and the yield per acre. The estimates of mining and quarrying, manufacturing, electricity, gas and water and construction are built up from tax assessment data and production censuses. The censuses of production which are conducted annually, provide information on sales, employment, wages and salaries, purchases, expenditure, etc. For electricity, gas and water annual accounts data are also used, while for construction government accounts are among the sources. The estimates for the distributive trade are calculated from tax assessment data, number in employment and changes in average earnings. In the transport, storage and communication group, income data for the nationalized industries and public corporations are obtained from their annual reports, whereas for the remainder tax assessment data, annual censuses of employment and earnings inquiries are used. Tax assessment data and PAYE (Pay-As-You-Earn) statistics are mainly used as sources for financial institutions. Rents are based on the estimated rent income from various groups of property. Business services are mainly estimated from Inland Revenue data. The figures of central government wages and salaries are obtained from departments, while for local authorities they are derived from official publications. Tax assessment data are utilized to estimate the wage and salary bill for most services. Estimates at constant prices for the agricultural sector are obtained through double deflation. Output is valued at base year prices, while input is valued at pre-subsidy base year prices. Value added of all other sectors is obtained through extrapolation by indexes of production, volume or output.

^a Discrepancy with equivalent item in Table 2.3 Output, gross value added and fixed assets by industries.

^b Includes FISIM but FISIM is not included in Intermediate consumption of the other domestic sectors.

^c Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^d Mixed income, net. Excludes consumption of fixed capital.

^e Does not add up to corresponding components in the domestic and the rest of the world sector accounts as one or more of the components have not been revised.

^f Discrepancy between Total Economy and domestic sectors as one or more data for domestic sectors have not been revised.

^g Statistical discrepancy with equivalent item in Table 1.1 Gross domestic product by expenditures at current prices.

^h Discrepancy with equivalent item in Table 1.3: Relations among Product, Income, Savings and Net Lending Aggregates. Discrepancy between Total Economy and domestic sectors as one or more data for domestic sectors have not been revised.

ⁱ Discrepancy with equivalent item in Table 1.3: Relations among Product, Income, Savings and Net Lending Aggregates.

United Republic of Tanzania

Source

The preparation of National Accounts Statistics in the United Republic of Tanzania is undertaken by the Bureau of Statistics, President's Office, Planning Commission, Dar-es-Salaam. Official estimates are published in a series of reports entitled "National Accounts of Tanzania". Reply to the United Nations national accounts questionnaire by the Bureau of Statistics.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates presented relate to Tanzania (mainland) only, i.e., the former territory of Tanganyika and excluding Zanzibar. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

I. Introduction: The publication entitled "National Accounts of Tanzania Mainland 1988-1999" gives consolidated estimates of Gross Domestic Product (GDP) and other allied aggregates of Tanzania Mainland. It is the third in the series of the publication with GDP at 1992 prices. Estimates of GDP with 1992 as the base year are also available in the Economic Survey 1999, published by the Planning Commission. The national accounts methodology was essentially based on the 1991/92 Household Budget Survey (HBS), the 1991 Informal Sector Survey, the Agriculture Surveys. Also data from the 1996 economic survey of three industries -Construction, Trade, and Transport - was incorporated in the national accounts.

II. Concepts and Definitions: The concepts and definitions followed to a large extent conform to the latest United Nations Recommendations on the subject contained in the United Nations publication a System of National Accounts (SNA 1993). A few points of divergence, however, do exist and these have already been outlined in the sources and methods. Short definitions of the main aggregates are given here for the convenience of readers and users.

Gross Domestic Product: GDP is the sum of the values added of all resident producers in the economy. GDP factor cost is measured exclusive of taxes on products and GDP at market prices includes all taxes on products including import taxes.

National Income at market prices: Is the sum of compensation of resident employees, the excess of the property and entrepreneurial income receivable by resident economic agents over the property and entrepreneurial income payable by them and indirect taxes net of subsidies. It differs from the domestic product at market prices by inclusion of net factor income (i.e. net incomes other than transfer incomes received through participation in productive activity) received from abroad.

Gross Domestic Product at factor cost differs from GDP at market prices by the exclusion of the excess of indirect taxes over subsidies. It is the value of all goods and services produced by the resident producers of Tanzania, counted without duplication and is the same as the aggregate of wages, salaries, interest, rent dividends and profits attributable to resident producers of Tanzania before making provision for consumption of fixed capital.

Gross fixed capital formation: This consists of the sum of all producers' acquisitions, less disposals, of new or existing fixed assets. Disposals do not include consumption of fixed capital, hence the term "gross".

Household Final Consumption: This consists of the expenditure of resident households on goods and services. It includes goods produced for own consumption and imputed expenditures made by Government and Non-profit Institutions serving Households (NPISHs) on behalf of households.

Government Final Consumption: This consists of expenditures incurred by both Central and Local Governments on goods and services other than those distinguishes between individual consumption of goods and services and collective consumption of services. Individual services are those provided to particular households that could be bought and sold on the market. Examples are health and education services, which as mentioned above, are treated as Household rather than Government. Collective services are those that are provided simultaneously to all members of the community, such as public administration and defence. These are the "public goods" of economic theory.

Net taxes on products: These are taxes on goods and services that become payable as a result of production, sale or transfer of these goods and services. Subsidies are treated as negative taxes.

III. Geographical Coverage: The estimates presented in the report relate to Tanzania Mainland only.

IV. Estimates of GDP by Region: Estimates of Gross Domestic Product by region for years 1988-2002 at current prices have been presented in this publication. With

the exception of Agriculture, Mining and Manufacturing, estimates of the rest of sectors are based on the basis of number of registered business establishments in the region.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income and production approaches.

Expenditure Approach

Government final consumption expenditure and exports and imports of goods and services are estimated through the expenditure approach, while private final consumption expenditure and gross capital formation are compiled by using a combination of the commodity-flow and expenditure approaches. For government expenditure, actual central government revenue and expenditure, classified by purpose, are available from government documents. Revenue and expenditure details of local authorities are obtained from the Prime Minister's Office and from the local authorities themselves. For private consumption expenditure, estimates of domestic production of all commodities are compiled and allowances made for various intermediate uses and government and business purposes. The estimates are then marked up for distribution costs and adjusted for imports and exports. Data from the 1991/92 Household Budget Survey are used with regard to most expenditures on services. The estimate of change in stocks covers parastatal enterprises, livestock and national grain reserve, export crops, livestock and those factories which were included in the survey of manufacturing industries. Estimates of gross fixed capital formation for the public sector are derived from detailed analysis of the accounts of the agencies concerned and from detailed statistics on imports of capital equipment. Own-account rural residential construction has been estimated on the basis of building costs data, rental values and data on population growth. Exports and imports of goods and services are obtained from the balance of payment statements of the Bank of Tanzania. Gross domestic product by expenditure at constant prices is not regularly estimated.

Income Approach

In estimating the cost structure components of gross domestic product, estimates of compensation of employees are obtained from each industry group separately. In addition, information obtained from employment and earnings survey is used for the non-primary and mining industries groups. For agriculture, animal husbandry, forestry and fishing, the wage component of value added is fixed at 4.3 per cent of its value added based on the results of various farm surveys. Operating surplus estimates for each industrial sector is obtained from the companies concerned. Estimates of depreciation for fixed assets of the parastatal enterprises are provided by the establishments themselves and for other sectors, estimates are based on percentages obtained from previous surveys. Data on indirect taxes and subsidies are obtained by analyzing government recurrent revenue and expenditure.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at factor costs. The value added of agriculture, mining and manufacturing is estimated through the production approach while for the remaining industries, the income approach is used. For agriculture, the data on production, prices and cost of production of each export crop, available with the respective commodity boards, are utilized to derive estimates of their value added. For the non-export crops, similar data available from the Ministry of Agriculture and Livestock Development, Marketing Development Bureau, Bureau of Statistics and data collected through Economic and Household Budget Surveys and the 1992 Input-Output Table have been used.

United States

Source

The Bureau of Economic Analysis (BEA), an agency of the Department of Commerce, is responsible for the preparation of national economic accounts of the United States. The official estimates are published in the "Survey of Current Business". Reply to the United Nations national accounts questionnaire was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). For the new 1993 SNA data, original chain constant prices are based on the year 1996 and have been scaled down to the price levels of 1995 in order to allow international comparisons. The resulting chain constant prices are not additive. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), although the official estimates were not totally consistent with the classifications and definitions used in the 1968 SNA. See "The United Nations System of National Accounts: An Introduction" which was published in the June 1990 Survey. A summary explanation of the accounting framework appears in BEA's 1985 publication, Methodology Paper No.1, "An Introduction to National Economic Accounting". Subsequent modifications are described in the September and October 1991 Surveys. Information on sources and methods used to estimate the national accounts appears in BEA's 1987 publication, Methodology Paper No. 4, "GNP: An Overview of Source Data and Estimating Methods". The July 1992, August 1993, and July 1994 Surveys update this publication. Information on United States' capital finance accounts and balance sheets is found in "Guide to Flow of Funds, 1993", a publication of the Boards of Governors of the Federal Reserve System. The most recent benchmark input-output accounts were published in 1994 in "The Benchmark Input-Output Accounts of the United States". The following tables have been prepared to complete the national accounts questionnaire provided by the United Nations. The United States converts its official estimates as closely as possible to SNA definitions. When differences in scope and coverage from definitions and classifications recommended in the SNA remain, footnotes are attached to the appropriate tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated using both the income and expenditure approaches. The economic area covered by the US national accounts consists of the 50 states and the District of Columbia. Outlying territories, such as the Commonwealth of Puerto Rico, Guam, American Samoa, Northern Mariana Islands, US Virgin Islands are excluded.

Expenditure Approach

The estimates of general government final consumption expenditures are based largely on budgetary and administrative information. Estimates of federal government expenditures are based on the federal budget, published by the Office of Management and Budget, on financial reports published by the Department of Treasury, and on reports of other federal government agencies. Estimates of State and local government expenditures are based largely on Census Bureau quinquennial and annual surveys of these governments. Benchmark estimates of private final consumption expenditures are taken from the detailed input-output tables prepared every five years to coincide with comprehensive Census Bureau economic censuses. In addition, major statistical sources include the Census Bureau decennial census of housing and survey of residential finance for housing services; Department of Energy and private trade sources for household utilities; various federal regulatory agencies for imputed financial service charges; and private trade sources for various insurance expenses. Estimates for non-benchmark years are extrapolations and interpolations of the benchmark data, using Census Bureau surveys of retail trade sales, service receipts, rental payments, and other public and private data sources. Benchmark estimates of gross fixed capital formation are summations of residential buildings (estimates are based on Census Bureau construction surveys and sources), non-residential buildings and other construction (estimates are from the census of

construction industries and other Census Bureau surveys, other government agencies statistics, and private trade data), and producers' durable goods (estimates are mainly from the Census Bureau census of manufactures shipments data, Census Bureau on U.S. international trade in goods, and private trade sources). Estimates for non-benchmark years are extrapolations and interpolations of the benchmark data using Census Bureau annual and monthly survey data, Census Bureau and BEA data on U.S. international trade in goods and services, and various trade sources. Estimates of exports and imports of goods, taken from U.S. balance of payment accounts, are based on customs documents tabulated by the Census Bureau. Service transactions, taken from U.S. balance of payments accounts, are based on BEA surveys and other government sources. Constant-dollar government final consumption expenditures are calculated in three parts. Employee compensation is obtained by extrapolating base-year compensation with full-time equivalent employment measures, with detail by level of pay or experience. Purchases of many defense goods are derived by developing base-year prices for specific items and applying those prices to actual deliveries of goods. Purchases of most other goods and services are obtained by deflation. The price indexes used include components of the Consumer Price Index (CPI) and the Producer Price Index (PPI), selected construction price indexes, and other indexes. Constant-dollar private final consumption expenditures are deflated mainly by components of the CPI. To deflate several service components, BEA composite indexes of input prices are used. Constant-dollar gross fixed capital formation are deflated by various price indexes. For residential buildings, hedonic price indexes from the Census Bureau and from BEA are the major sources. For non-residential buildings and other construction, cost indexes from government agencies and trade sources are used. For most of producers' durable goods, components of the PPI are used; for computers and peripheral equipment, a BEA hedonic price index is used. For purchases of imports, components of the Bureau of Labor Statistics (BLS) import price index are used. Constant-dollar exports and imports of goods and services are deflated mainly by components of the BLS export and import price indexes. Other indexes used include the PPI, CPI, BEA computer price indexes, indexes from other government agencies, and other sources.

Income Approach

Indirect taxes for the federal government include excise taxes and customs duties; estimates are based on administrative records. Indirect taxes for state and local government include sales taxes and property taxes; estimate are derived from Census Bureau sources. Subsidies paid by the federal government are mainly payments to farmers and housing subsidies. Subsidies are estimated using the same sources that are used for government final consumption. Consumption of fixed capital is derived from perpetual inventory calculations used in BEA's capital stock estimates. The annual estimates of compensation of employees are taken mainly from administrative records of government agencies. The operating surplus is estimated in four separate parts: Income of unincorporated enterprises (farm and nonfarm proprietors' income), corporate profits, net interest, and rental income of persons. Tabulations of tax returns are the primary source for nonfarm proprietors' income, corporate profits and net interest. Farm income is based on data from by the Department of Agriculture. Rental income of persons - which covers only rental income of persons not primarily engaged in the real estate business - is based primarily on the decennial census and a biennial survey of housing; royalty payments are also included and are based on tax information. Imputed rental receipts of owner-occupants of nonfarm dwellings are estimated using the rental-equivalency method. Rental receipts for both tenant and owner-occupied housing are adjusted to exclude expenses.

Production Approach

Except for establishments of government enterprises which are shown as a single industry, the industrial distributions are based on the U.S. standard industrial classification (SIC) system. Some differences between the SIC and the ISIC are the following: establishments that manufacture and sell commodities including food and apparel, at retail are classified in retail trade in the SIC and in manufacturing in the ISIC; establishments that publish and reproduce video recordings and computer media, retread and repair machinery and equipment are classified in services in the SIC and in manufacturing in the ISIC; and establishments that repair motor vehicles are classified in services in the SIC and in retail trade in the ISIC.

^a At producer's prices.

^b GDP instead of Gross value added at basic prices.

^c The individual industries do not add to the total because the statistical discrepancy between GDP by expenditure approach and the GDP by production approach is included in the total, but not allocated among the individual industries. Also Output and the components of Value Added do not include said statistical discrepancy.

^d Includes Taxes less Subsidies on products.

^e Includes Mixed Income, Gross. Discrepancy with equivalent item in Table 4.1. For private industries, operating surplus is presented without the capital consumption adjustment, which is not available by industry.

^f Discrepancy with equivalent item in Tables 1.3 and 4.1. For private industries, consumption of fixed capital is presented without the capital consumption adjustment, which is not available by industry. Consumption of fixed capital for general government and government enterprises includes the adjustment.

^g Includes Net mixed income. Includes statistical discrepancy which has not been distributed among individual industries.

^h Discrepancy between Total Economy and domestic sectors since data for domestic sectors have not been revised.

^b Refers to Net Mixed Income.

Uruguay

Source

The preparation of national accounts statistics in Uruguay is undertaken by the Banco Central del Uruguay, Montevideo. The official estimates and some methodological notes are published annually by the Banco Central in "Producto e Ingreso Nacionales". The following presentation of sources and methods is mainly based on a report entitled "Metodologia del Calculo de las cuentas de actividades, a precios corrientes".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. On March 1, 1993, the Uruguayan peso, equal to 1,000 new Uruguayan pesos, was introduced.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure and gross investment in machinery and equipments which are estimated by the commodity-flow approach. The estimates of government final consumption expenditure are based on the budgetary programmes of the different institutional subsectors. The items are analyzed in accordance with the government disbursements which are classified into ten different items. The commodity-flow approach is used to estimate private final consumption expenditure by separating the current products according to their origin and source. These estimates are periodically checked by surveys of homes and of family budgets. The estimates of increase in stocks refer to stock variations for meat and wool only. The estimates of imported machinery and equipment are based on c.i.f. import values classified by industry of origin, principal groups of goods and sectors of destination. Customs duties, indirect taxes, trade margins, etc. are then added. Domestically produced capital goods are estimated in the same manner. The estimates of exports and imports of goods and services are based on the foreign trade statistics which are adjusted for unregistered transactions. The balance of payments data are also used. For the constant price estimates, price deflation is used for government purchases of goods and services, public construction and exports and imports of services. For government compensation of employees, increase in stocks, private construction, investment in machinery and equipment and exports and imports of goods, the base year estimates are extrapolated by quantity index. Private consumption expenditure is obtained as a residual.

Income Approach

The estimates of wages and salaries in the agricultural sector are estimated by using employment data and average wages obtained from censuses and extrapolated and interpolated by using indices of physical volumes. For private construction, the ratio of wages and salaries to the value of building is determined for the different types of construction work. For the trade sector, wages and salaries are measured from employment data obtained from the 1963 population census and extrapolated by volume index of commercialized merchandise. For the public sectors, compensation of employees is obtained directly from the government enterprises. In general, consumption of fixed capital is valued at original cost. Information of indirect taxes and subsidies is available directly for registered tax classifications by economic branch. Profits of government monopoly enterprises are treated as indirect taxes while deficits are treated as subsidies. Operating surplus is obtained as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of most industries. However, the income approach is used for producers of government services, part of the construction sector and part of the services sector. The Ministerio de Ganadería y Agricultura conducts censuses and surveys every four years, covering agricultural establishments of over one hectare. The censuses include various type of information such as ownership, locations, land tenure conditions, production, stocks, etc. The Ministerio also conducts annual sample surveys on principal crops, wool production, etc. The gross value of livestock production is based on the number of livestock, adjusted for imports and exports and changes in stocks. Data on mining production and prices are provided by the Instituto Geológico del Uruguay and the Camara de la Construccion, respectively. The estimates of intermediate consumption are based on the 1968 national economic census. For manufacturing, quarterly and annual surveys are conducted. They provide data on labour force, salaries and wages, raw materials, manufactured products, costs, etc. The value of electricity and water production is obtained directly from the concerned enterprises which are government monopolies. The data of gas production are furnished by the concerned companies. Basic information used to estimate the gross value of production in the building sector is obtained from the administrative records of the public sector. For private building, the municipal records provide data on approved licences, quantity, size and type of construction. This information is adjusted on the basis of surveys on time extension of buildings and areas. The accounting records of the central government and public enterprises supply the information used to estimate the gross production value of public buildings. The estimates of the trade sector are based on the gross value of commercialized production while intermediate consumption is obtained from an analysis of the accounts of certain enterprises. The Banco Central del Uruguay conducts surveys of trade channels and trade margins. For restaurants and hotels, the estimates are based on studies carried out in 1962 extrapolated by price and volume indexes. The production values of railways, air transport and ports are estimated from the data supplied by the respective government enterprises. For other transport, data are obtained directly from concerned enterprises and from licence permits issued. Benchmark estimates of cargo transport were prepared for 1961. These estimates are projected by the use of an index of receipts. Information on water transport, storage and communication is obtained directly from a special maritime commission, from the Mercado de Frutos, and from the accounts of government enterprises, respectively. The estimates of banking services are obtained from administrative records. For real estate, the value of production is determined as the amount of gross rents paid or imputed for housing services. Owner-occupied dwellings are imputed in accordance with the average rents for rented houses. The estimates of business services are based on the number of persons employed and average wages. For producers of government services, the estimates are based on budgetary programmes of the institutional subsectors. For domestic service, data from the 1963 population census are extrapolated on the basis of information from employment agencies. For other private services, bench-mark studies referring to 1961 are extrapolated by the most suitable indicators. For the constant price estimates, value added of most industries is extrapolated by a quantity index. Double deflation is used for all components of the agricultural sector and price deflation is used for public construction.

Uzbekistan

Source

Reply to the United Nations national accounts questionnaire from the State Committee of the Republic of Uzbekistan on Forecasting and Statistics. The latest data for Uzbekistan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Uzbekistan has changed in 1994 from the Russian ruble to Uzbek sum. One sum equals 1,000 Russian rubles (see World Bank "Statistical Handbook for the States of the FSU, 1996").

Vanuatu

Source

Reply to the United Nations national accounts questionnaire from the National Planning and Statistical Office, Vila. The estimates are published in "National Income Accounts of Vanuatu". The most recent data was obtained from the internet website (<http://www.vanuatustatistics.gov.vu/About%20VNSO/Data/Economic/nataccs.htm>), as reported by the Vanuatu Statistics Office, Port Vila.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

^c Refers to personal services.

^d At producer's prices.

Venezuela

Source

The preparation of national accounts statistics in Venezuela is undertaken by the Banco Central de Venezuela. The official estimates are published annually by the Banco Central in "Memorias o Informes Economicas". A detailed description of the sources and methods used for the national accounts estimation is found in "Metodologia de las Cuentas Nacionales de Venezuela" and in "Practicas en materia de cuentas" also published by the Banco Central.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used for private consumption expenditure and gross fixed capital formation. Increase in stocks is obtained as a residual. The estimates of government final consumption expenditures are based on information obtained from government budgets and financial statements of the government entities. For private consumption expenditure on imported goods, estimates are based on the value of imports f.o.b. Values of locally produced goods are based on the production account of agriculture, manufacturing and the services. Trade margins based on surveys are used to estimate purchasers' values. The information used to estimate gross fixed capital formation include data on construction, manufacturing production, sales of vehicles and livestock and imported capital goods. The data on petroleum and iron-ore exports are obtained from the Ministerio de Energia y Minas while exports of other merchandise are obtained from the Oficina Central de Estadisticas e Informatica. The Corporacion de turismo, the embassies as well as companies engaged in transports, communication and insurance also provide export data. Import data are mainly provided by the Oficina Central de Estadisticas e Informatica. For the constant price estimates, only information for gross fixed capital formation is available. The item is deflated by price indexes constructed separately for construction, machinery and equipment and transport equipment. For other aggregates of this item, the estimates are obtained directly at constant prices.

Income Approach

In estimating the cost structure components of gross domestic product, estimates of compensation of employees, operating surplus and depreciation are obtained for each industry group separately. For agriculture, forestry and fishing, they are estimated as a percentage of the gross value of production based on factor and coefficients from a 1968 study. For the mining sector, information from the Ministerio de Energia e Minas are used for petroleum activity and iron-ore mining. For manufacturing, estimates are based on cost structure data by the Ministerio de Hacienda supplemented by information from public enterprises and petroleum refineries. A survey conducted by the Banco in 1968-70 provides coefficients for the trade sector. Financial statements are used for public enterprises railway transport, communication, financial institutions and insurance. Input coefficients obtained from surveys are used for road transport and private services. Data on indirect taxes and subsidies are obtained from government sources.

Production Approach

The table of gross domestic product by kind of economic activity at market prices, i.e., producers' values. The production approach is used to estimate the value added of most industries. The income approach is used to estimate producers of government services, domestic services and part of other private services. The information on gross output in the agricultural sector is furnished annually by the Ministerio de Agricultura y Cria on the basis of field survey conducted during the summer (January-April) and the winter (May-December). These surveys give information on cultivated areas and physical production of the principal crops. The value of production is first calculated in constant prices by multiplying the physical production of each item by the respective producers' prices in 1968 and then converting it to current values by using the producers' price index estimated by the Banco. Value added is obtained by applying the cost structure estimated for 1968. For crude petroleum and refinery products, a production account covering all enterprises in the petroleum sector is constructed on the basis of information provided by the Ministerio de Energia y Minas. Crude petroleum is separated from refinery production on the basis of annual survey data. During the period 1968-1975, exports were calculated at official fiscal prices for export as declared by foreign concessionaires while from 1976 onwards, the prices reported by the nationalized enterprises have been used. Value added for the manufacturing industries is estimated by applying to the gross value of production by kind of economic activity the cost structure information on companies. Benchmark estimates on gross value of manufacturing production have been prepared based on the third industrial survey conducted in 1971. These estimates are extrapolated by the annual changes in the index of industrial production through annual surveys. The Instituto Nacional de Obras Sanitarias provides information on production and cost structure of water supply. For public construction, information is obtained from censuses conducted by the Banco. For private construction requiring permits, estimates are based on construction coefficients per capita which are available for 14 urban centers through a survey. The estimates for the federal district are calculated independently through a survey and through using information on construction permits. Non-permit construction estimates are agriculture. Benchmark estimates for each of the activities in the trade sector have been prepared for 1968-1970 by using the results of a national survey conducted by the Banco. Since 1970, overall estimates are made by extrapolating the total value of production by an index of market sales. Adjustments are made to account for the public enterprises by using their respective financial statements. Value added in the private transport sector is estimated by applying the sample coefficient, obtained through surveys, to the receipts for each type of services. For the public sector, information is obtained directly from concerned enterprises. The value added of the financial institutions is obtained as the difference between the value of production and intermediate consumption. For ownership of dwellings, the value of production is estimated from the total number of occupied dwellings and the annual average rent, adjusted by the rent item in the cost-of-living index. For real estate and business services, the production value is estimated by projecting the annual changes of incomes obtained from surveys. The value added of government services constitutes the remuneration of employees of the various government agencies and the consumption of fixed capital of the administrative organizations. For private services, coefficients of value added obtained from surveys are used. For the constant price estimates, value added of agriculture and mining is extrapolated by quantum indexes. For other industries, current values are deflated by various price indexes.

Viet Nam

Source

Reply to the United Nations national accounts questionnaire from the Secretariat and International Cooperation, General Statistics Office of Vietnam. The official estimates are published in "System of National Accounts of Viet Nam". The most recent data was obtained from the internet website (www.gso.gov.vn), as reported by the General Statistics Office in Hanoi, Vietnam.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA).

Yemen

Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Organization, Sana'a.

General

The latest data shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. In May 1990, Yemen and Democratic Yemen united to form a single State. Since that date have been represented as one country with the name "Yemen".

Zambia

Source

The preparation of national accounts statistics in Zambia is undertaken by the Central Statistical Office (CSO), Lusaka. The official estimates are published in November-December issue of the Monthly Digest of Statistics. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

A description of the sources and methods used for the National Accounts estimation is found in "National Accounts and Input-Output Tables, 1971" and "National Accounts, 1972" published in August 1975 and June 1978, respectively. The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except for the total estimate of private consumption expenditure which is obtained as a residual. However, a detailed breakdown is obtained through the use of the expenditure approach. Data used to estimate government expenditure are contained in Financial Statistics of the Government Sector supplemented by detailed tabulations prepared by the CSO. The Urban Household Budget Survey in Low-cost Housing Areas, 1966-1968 and the household budget surveys 1974/75 for the urban and rural areas provide a detailed breakdown for the private consumption expenditure. Data on changes in stocks are collected through the annual national income inquiries and the balance sheets supplied by the enterprises. These two sources as well as government accounts are also used to estimate gross fixed capital formation. For transport equipment and machinery, furniture etc., the estimates are based closely on end-use groupings of imports and domestic products. Transactions with the rest of the world are estimated from the balance of payments statistics. Data on exports and imports are obtained from the annual statements of external trade prepared by the CSO. The CSO also undertakes a special inquiry on international transactions of all major private and public sector enterprises. For the constant price estimates, the current values of the expenditure items are deflated by various price indexes such as weighted index of wages and prices, consumer price index, implicit price index, etc.

Income Approach

The estimates of compensation of employees are based on information obtained through the annual income inquiries, the annual censuses of production and construction and other sources. Grossing-up factors to account for non-responding units are worked out on the basis of employment data collected through the quarterly employment surveys. Compensation of employees includes an estimated figure for domestic servant based on the 1969 population census data projected by an assumed 5 per cent annual growth rate. Consumption of fixed capital figures are obtained from the balance sheets of enterprises. Depreciation is imputed for some government enterprises and government administration and for owner-occupied buildings in urban and rural areas. Indirect taxes estimates are derived from the annual national income inquiries, the annual censuses of industrial production and construction data. Operating surplus is obtained as a residual.

Production Approach

The production approach is used to estimate the value added of nearly all industries. The income approach is used for the value added of producers of government services. The accounts of the agricultural sector have been divided into a commercial sector and a subsistence sector. The commercial sector includes all surplus production of the rural areas, the output of agricultural extension services, own-account capital formation and retentions by commercial farmers. The estimates for the subsistence sector are restricted to own consumption by traditional producers. The Quarterly Agricultural Statistical Bulletin gives information on intakes of agricultural products, official producer prices and input prices. Intake data are used for estimating surplus productions of commercial and non-commercial farmers. The output of agricultural extension services relates to tenant schemes of the Tobacco Board of Zambia and the extension services of the government. The estimates of own-account capital formation of livestock are based on the annual surveys of agricultural and pastoral production and on annual censuses of livestock. The estimates of retentions by commercial farmers are also based on the annual surveys of agricultural and pastoral production. The 1971/72 survey included, for the first time, information on intermediate inputs of commercial farmers. This information is used for non-commercial farmers as well. The average input-output ratio for 1972 has been applied to agricultural output for earlier years. For later years, a constant real input-output ratio is assumed. Estimates of the subsistence sector's own-consumed production are derived from total production estimates by subtracting surplus production, covered by the commercial sector estimates. This is done for crops on the basis of the first sample census of non-commercial farms held during the crop year 1970/71. The annual censuses of industrial production provide the data for the estimates of mining and quarrying, manufacturing and electricity and water. For mining, the financial statements of the mining companies are also used. For manufacturing, extensive data on output and input of goods and services are available from the censuses. Provisions for non-responding establishments are made on the basis of employment data. The annual censuses of construction by contractors provide data for the construction sector. For own-account construction by households, the Ministry of Local Government and Housing provides information on the number, type and cost of houses. The principal source for the services sectors (trade, transport, communication, financial and community services), is the annual national income inquiry. Questionnaires are sent out annually to all large and medium-sized establishments and on a sample basis for small establishments using a short form. Information by kind of economic activity, is requested on employment, earnings, operating and non-operating incomes and expenditure, appropriation of surplus, capital investment and input and output of materials. For owner-occupied dwellings, rents are estimated on the basis of cost of houses and their life and on data from the household budget surveys. For producers of government services, estimates are based on financial statistics of the government sector. For constant price estimates, double deflation is used for the agricultural and mining sectors. For the remaining sectors, the current values are deflated by various price indexes.

Zimbabwe

Source

The preparation of national accounts statistics in Zimbabwe is undertaken by the Central Statistical Office, Harare. The official estimates and methodological notes are published by the Central Statistical Office annually in "National Accounts of Zimbabwe" and quarterly in the "Quarterly Digest of Statistics".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the use of the expenditure approach combined with the commodity-flow approach except private consumption expenditure which is derived as a residual. In general, the commodity-flow approach determines to which consuming sector or group the commodities would be allocated. For government expenditure, detailed accounts are available from each department of the central government while the local authorities and certain controlled organizations and funds provide copies of their annual financial statement. Total private consumption expenditure is to a large extent derived as a residual. However, supplementary information is obtained from returns of major suppliers of consumer products and from family budget surveys. The estimates are checked by turnover statistics of retailers. Data on changes in stocks are available from the annual censuses of production, agriculture and livestock and from the 1975 census of road transport and for the trade sector, from turnover indexes. Expenditure on capital goods are available in the annual censuses of agriculture and production, the annual analysis of public sector accounts and the annual surveys of financial institutions. The data from these sources are classified by industry, sector and type of asset. The value of new buildings construction is estimated from monthly surveys of private contractors and public sector producers. The estimates include own-account construction of dwellings and service charges of capital nature. Tabulations of exports and imports classified by industry of origin and commodity are used to determine the proportion of each group's output sold abroad and the value of imports at the border. Valuation adjustments are made to bring all trade to a uniform f.o.b. or free-on-rail valuation at the border of the exporting country. For the constant price estimates of all expenditure items deflation is done with the use of appropriate price indexes.

Income Approach

Wages and salaries paid in the industrial activity sectors are obtained from the annual censuses of industrial production. The estimates are adjusted from fiscal to calendar year and projected using ratios derived from the quarterly employment inquiries. This latter source also provides wage data for the financial, trade and service sectors. Wages and salaries paid in the agricultural sector are taken from the results of quarterly censuses of farmers. Estimates of indirect taxes and subsidies are obtained from government accounts. Gross operating surplus, including depreciation, is estimated as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. For the service sector, the income approach is used

while for the trade sector, the estimates are made by projecting the results of the latest census of distribution. Information on the gross output of agriculture is available either from regular annual censuses or from records of sales to official marketing authorities. Value of own-account consumption for some items is estimated on the basis of forecasts of total production less recorded sales and for other items, on the basis of assumed average consumption rates. The gross output of forestry and logging is estimated to include the cost of plantation development, sales and increase in stocks of cut timber, etc. For agricultural services, estimates are based on a survey held in 1974 of the main establishments. For the industrial activity sector and construction, complete output and input accounts are available from the annual censuses of production. The results are converted from fiscal to calendar-year basis and extrapolated by indicators such as turnover, mineral output, construction work done and prices. The gross output of establishments classified to manufacturing which also engage in distribution activity includes the sales margin only on goods purchased for resale without further processing. Estimates of output and input of the trade sector are made by extrapolating the results of the 1969 census of distribution, using turnover indicators. For transport, the production account is based on the results of the 1975 census of road transport supplemented by the accounts of concerned companies. Estimates of financial institutions are based on the results of annual surveys taken together with statutory statistical returns rendered by registered institutions. The 1969 census of population provided information on the number of dwellings by type of dwelling, as well as the average gross rents paid for rented dwellings and these are updated using the consumer price rent index. The ratio between rented and owner-occupied dwellings are assumed to have remained constant since 1969. Cost of inputs into dwellings are estimated on a unit basis from annual surveys. Value added of private domestic services is estimated as wages in cash and in kind paid. Value added of education, health and other services are based on income tax statistics and wage data collected through the quarterly employment inquiries. Gross domestic product by kind of economic activity is estimated at constant prices mainly by the use of volume indices at commodity group levels for goods producing industries, trade (volume of goods handled), transport (volume of traffic by types) and services like education (combined index of students and teachers). In the case of the rest of the services, the total employment in each year is used as the indicator for constant price estimates.
