

**Department of Economic and Social Affairs  
Statistics Division**

**NATIONAL ACCOUNTS  
STATISTICS: MAIN AGGREGATES  
AND DETAILED TABLES, 2006**

**PART I**

**UNITED NATIONS  
NEW YORK, 2007**

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which States Members of the United Nations draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and, through technical assistance, helps build national capacities.

#### NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas.

# INTRODUCTION

1. This is the forty-eighth issue of *National Accounts Statistics: Main Aggregates and Detailed Tables 1/* showing detailed national accounts estimates for 185 countries and areas for the reporting years 1995 to 2006. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical services. It is issued in accordance with the recommendation of the Statistical Commission at its first session 2/ that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

## THE NEW NATIONAL ACCOUNTS QUESTIONNAIRE 1993 SNA

2. This publication, for the eighth time, is based on the new United Nations National Accounts Questionnaire 1993 SNA (NAQ), which was introduced in October 1999.

3. The *System of National Accounts 1993* (1993 SNA) 3/ was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts* (1968 SNA) 4/, the Council in its resolution 1993/5 of 12 July 1993 recommends that member states use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that member states consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the UN Regional Commissions, has designed a United Nations National Accounts Questionnaire (NAQ) based on the 1993 SNA with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the UN Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UN Statistical Commission has agreed that the scope and pace of the

implementation of the 1993 SNA must be decided by each country according to its analytic and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

## SCOPE OF THE NEW QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditures in current and constant prices and on the relations among product, income, savings and net lending aggregates.

6. Part II (Tables 2.1 to 2.3) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities, Rev. 3 (ISIC Rev. 3) 5/ either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O) or as single tabulation categories (A to P) (one-digit level of ISIC). Only in the case of categories A and I information at the two-digit level is requested for divisions 01, 02, 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according to the Classifications of Expenditure According to Purpose 6/. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10 divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure of households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC) 7/. For the individual consumption expenditure of non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure of general

government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.7) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e. the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Table 5.1) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 as indicated in Part II above.

10. Countries are requested to update the data tables and complete them to the extent possible. They are the following:

#### Part I: Main aggregates

- Table 1.1 Gross domestic product by expenditures at current prices
- Table 1.2 Gross domestic product by expenditures at constant prices
- Table 1.3 Relations among product, income, savings and net lending aggregates at current prices

#### Part II: Domestic production by industries

- Table 2.1 Value added by industries at current prices
- Table 2.2 Value added by industries at constant prices
- Table 2.3 Output, gross value added and fixed assets by industries at current prices

#### Part III: Classifications of expenditure according to purpose

- Table 3.1 General government final consumption expenditure by function at current prices
- Table 3.2 Individual consumption expenditures at current prices

#### Part IV: Integrated economic accounts

- Table 4.1 Total economy (S.1)
- Table 4.2 Rest of the world (S.2)

- Table 4.3 Non-financial corporations (S.11)
- Table 4.4 Financial corporations (S.12)
- Table 4.5 General government (S.13)
- Table 4.6 Households (S.14)
- Table 4.7 Non-profit institutions serving households (S.15)

#### Part V: Cross classification of gross value added by industries and institutional sectors

#### Table 5.1 Cross classification of gross value added by industries and institutional sectors

11. It should be noted that the new NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it is mainly geared to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly the one-digit level of ISIC instead of the two-digit level of ISIC.

## COMPILATION OF DATA

12. To compile the large volume of national accounts data, the Statistics Division annually sends a pre-filled SNA questionnaire to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical services and from national source publications.

13. In order to lighten the reporting burden of countries to different international and regional organizations, the United Nations, the Statistical Office of the European Union (EUROSTAT) and the Organisation for Economic Co-operation and Development (OECD) have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent currently possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), all OECD countries submit data either to EUROSTAT or OECD but need not conduct duplicate submissions. Member states of OECD which are not members of the European Community have to complete a sub-set of the ESA 1995 questionnaire. In addition, data for the transition economies are received through the United Nations Economic Commission for Europe

(UNECE). As a result, the UN questionnaire based on the 1993 SNA is sent to less than 160 countries out of the 207 included in the UNSD National Accounts database.

14. The new UN National Accounts Questionnaire (NAQ) based on the 1993 SNA was implemented in October 1999 for the first time. Some countries have just started to familiarize themselves with the new NAQ. Therefore many of them are implementing and reporting data for some tables only. Several countries have also deliberately decided on a phased implementation of the 1993 SNA. In particular, member countries of the EU and OECD have agreed on a phased implementation of the ESA 1995/1993 SNA questionnaire tables whereby a five-year period (from 1999 to 2003) has been allotted to gradually transmit all tables.

15. In order to create a new database based on the new questionnaire, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database. Together with the data, also the footnotes were imported to the new database. These references were adjusted to comply with the new questionnaire.

#### CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

16. The form and concepts of the statistical tables in the present publication generally conform to the recommendations in the 1993 SNA. A summary of the conceptual framework and definitions of transactions is provided in chapter I of the present publication.

17. It has to be pointed out that the data collected by the new NAQ are in the format of the 1993 SNA but the concepts applied by countries to compile their data may still adhere to the 1968 SNA or even the 1953 SNA. A series of questions focusing on the most important conceptual changes from the 1968 SNA to the 1993 SNA was added to the annual NAQ sent to countries in October 2002 in order to evaluate the status of the conceptual adherence to the 1993 SNA.

18. The Series Note at the top of each table indicates the SNA system used by the given country to compile the displayed data of the given series. Series numbers below 100 are used for 1968 SNA data, series numbers 100 and higher are used for 1993 SNA estimates. Whenever 1968 SNA data are not replaced for all years by a series of 1993 SNA data, the new 1993 SNA data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is attached to the relevant tables.

19. In the tables with constant prices data (Table 1.2 and Table 2.2), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is data with annually changing base years. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use annually changing base years but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e. the total is not equivalent to the sum of its components. Also, constant price data, which are scaled up or down to a certain reference year in order to allow international comparison, are not additive.

20. In the present publication, the data for each country or area are presented in separate chapters, as far as possible, under uniform table headings and classifications of the SNA. Differences in definition and coverage of specific items are indicated in footnotes to the relevant tables.

21. Country data are presented in alphabetical order. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series Note at the top of each table indicates the type of fiscal year used for any given series.

#### COMPARABILITY OF THE NATIONAL ESTIMATES

22. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted that the country notes not only refer to the latest data covered in this publication but to the country in general.

#### REVISIONS

23. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

## NOMENCLATURE

24. The information for the countries and areas shown in this publication reflect what is available to the Statistics Division of the United Nations as of August 2007.

25. Designations, which have changed in recent years, are as follows:

Hong Kong - Pursuant to a Joint Declaration signed on 19 December 1994, the United Kingdom restored Hong Kong to the People's Republic of China with effect from 1 July 1997; the People's Republic of China resumed the exercise of sovereignty over the territory with effect from that date.

Zaire - All data for the former Zaire are shown under the country name of Democratic Republic of the Congo.

Czech Republic, Slovakia - Data for Czech Republic and Slovakia are shown separately under the appropriate country name. For period prior to 1 January 1993, data for the former Czechoslovakia are shown under the country name Czechoslovakia (Former)

Yugoslavia (Former) - All data for Yugoslavia prior to 1 January 1992 refer to the Socialist Federal Republic of Yugoslavia, which was composed of six republics. After that date, when available, data for the republics, Bosnia and Herzegovina, Croatia, Slovenia, The Former Yugoslav Republic of Macedonia, and Serbia and Montenegro are shown separately.

USSR (Former) - In 1991, the Union of Soviet Socialist Republics formally dissolved into fifteen independent republics (Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Republic of Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine and Uzbekistan). When available, data are shown for the individual republics. All data for the former USSR are shown under the country name USSR (Former)

Germany - On October 1990, the Federal Republic of Germany and the German Democratic Republic united to form one sovereign State under the designation Germany.

Yemen - In May 1990, Yemen and Democratic Yemen united to form a single State. Since that date they have been represented as one country with the name "Yemen".

Ethiopia, Eritrea – In 1993 Eritrea separated from Ethiopia to form a new state. Ethiopia refers to Ethiopia excluding Eritrea while Ethiopia (Former) refers to Ethiopia including Eritrea.

Serbia and Montenegro – The state union of Serbia and Montenegro dissolved in June 2006. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. When available, data are shown for the individual republics.

## SYMBOLS AND DATA DISPLAY

26. The following symbols have been employed:

Data not available..... [..]  
Magnitude nil or less than five percent of the unit employed..... [0.0]  
Decimal figures are always preceded by a point [.]

27. Each series is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series Note at the top of each table informs about SNA system applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

28. Decimals in tables do not necessarily add to totals shown because of rounding.

## GENERAL DISCLAIMER

29. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

30. Where the designation "country or area" appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation "country" appears in the headings of tables, it covers countries, territories, cities or areas

---

1/ United Nations publication. The first 25 editions of this publication were issued under the title Yearbook of National Accounts Statistics under the following sales number: 1957, 58.XVII.3; 1958, 59.XVII.3; 1959, 60.XVII.3; 1960, 61.XVII.4; 1961, 62.XVII.2; 1962, 63.XVII.2; 1963, 64.XVII.4; 1964, 65.XVII.2; 1965, 66.XVII.2; 1966, 67.XVII.14; 1967, E.69.XV11.6; 1968, vol.I, E.70.XV11.2, vol.II, E.70.XVII.3; 1969, vol.I, E.71.XVII.2. vol.II, E.71.XVII.3; 1970, (2 volumes), E.72.XVII.3; 1971, (3

volumes), E.73.XVII.3; 1972, (3 volumes), E.74.XVII.3; 1973, (3 volumes), E.75.XVII.2; 1974, (3 volumes), E.75.XVII.5; 1975, (3 volumes), E.76.XVII.2 .1976, (2 volumes), E.77.XVII.2; 1977, (2 volumes), E.78.XVII.2; 1978, (2 volumes), E.79.XVII.8; 1979, (2 volumes), E.80.XVII.11; 1980, (2 volumes), E.82.XVII.6; 1981, (2 volumes), E.83.XVII.3;

Beginning with the twenty-sixth edition, this publication replaced Volume 1. Individual Country Data of the Yearbook and it was issued under the following sales number:

1982, E.85.XVII.3; 1983, E.86.XVII.3; 1984, E.86, XVII.26; 1985, E.87.XVII.10; 1986, E.89.XVII.7 (Parts I and II); 1987, E.90.XVII.2 (Parts I and II); 1988, E.90.XVII.18 (Parts I and II); 1989, E.91 XVII.16 (Parts I and II); 1990, E.93.XIII.3 (Parts I and II); 1991, E.94.XVII.5 (Parts I and II); 1992, E.95.XVII.4 (Parts I and II); 1993, E.96.XVII.5 (Parts I and II); 1994, E.97.XVII.6 (Parts I and II); 1999, E.99.XVII.7 (Parts I and II); 2000, E.00.XVII.11 (Parts I and II); 2001, E.01.XVII.14; 2002, E.02.XVII.6.

# I. SYSTEM OF NATIONAL ACCOUNTS (SNA)

1. The System of National Accounts 1993 (1993 SNA) 1/ was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993 2/. Similar to the recommendation made in 1968 for its predecessor, A System of National Accounts (1968 SNA) 3/, the Council in its resolution 1993/5 of 12 July 1993 recommends that members states use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that member states consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool.

## A. THE SNA AS A SYSTEM

2. The System of National Accounts (SNA) consists of a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA includes an external account that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels

of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyse the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic Product (GDP), that are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

## B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to chapter II of the SNA for a comprehensive overview of the System.

## *1. The sequence of accounts*

### *Current accounts*

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

### *Production account*

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

### *Distribution and use of income accounts*

8. These consist of a set of articulated accounts showing how incomes are:

Generated by production

Distributed to institutional units with claims on the value added created by production

Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes

Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward into the capital account, the first in the System's sequence of accumulation accounts.

## *Accumulation accounts*

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).

The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.

A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

### *Balance sheets*

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets

and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

## 2. *Activities and transactions*

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

### C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly the main sectors of the economy for which it is possible to compile the full sequence of accounts summarized in the previous section. Two main kinds of

institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by Governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analysed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V at the end of the SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

## D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

### *1. Supply and use tables*

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

### *2. Price and volume measures*

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modelling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as

targets for the formulation of economic policy-making. They are an essential part of the System, especially given the emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

## E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

### *1. The production boundary*

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

### *Household production*

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

- (a) The production of agricultural goods by household enterprises for own final consumption;
- (b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc;

(c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the production of personal and domestic services by members of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production

boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

#### *Other production boundary problems*

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

#### *2. The consumption boundary*

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the estimated values of the agricultural products consumed by households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the

cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

### *3. The asset boundary*

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

### *4. National boundaries*

29. The accounts of the System are compiled for resident institutional units grouped into institutional sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of

a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

## F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high-inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic

circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

### *1. Specific uses*

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

#### *Monitoring the behaviour of the economy*

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

#### *Macroeconomic analysis*

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different

economic variables by applying econometric methods to time series of data at both current and constant prices compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

#### *Economic policy-making and decision-taking*

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data. The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees. Such agencies typically require very detailed national accounts data.

### *International comparisons*

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the

SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

### *2. Flexibility of implementation and use*

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy

needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

### *3. The SNA as a coordinating framework for statistics*

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

## G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind the revision of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the SNA, the harmonization process has been particularly effective in respect of balance of payments statistics, government finance statistics and money and banking statistics, for which the IMF has responsibility. Revisions of each of these three systems are being undertaken by the IMF in order not only to

update these systems but also to make them consistent with the SNA to the fullest extent possible. Revised manuals on these systems are being published at about the same time as, or in the years immediately following, the 1993 SNA.

48. Various other revised international guidelines are being issued at about the same time as the revised SNA. These include the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the SNA. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

## H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

### *1. Final consumption, intermediate consumption and gross fixed capital formation*

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption, whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

#### *Training, research and development*

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

#### *Education*

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practising - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

#### *Repairs, maintenance and gross fixed capital formation*

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or

prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

## *2. Interpretation of the distinction between consumption and gross fixed capital formation*

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain

expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

## I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

### *Acquisitions*

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

### *Actual final consumption of general government*

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.

### *Actual final consumption of households*

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

### *Actual final consumption of NPISHs*

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

### *Additivity*

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

### *Base period*

The period that provides the weights for an index is described as the base period.

### *Basic price*

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

### *C.i.f. price*

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

### *Capital transfers*

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred.

### *Chain indices*

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

### *Changes in inventories (including work-in-progress)*

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

### *Compensation of employees*

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

### *Constant prices*

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in “constant price terms”).

### *Consumption good or service*

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

### *Consumption of fixed capital*

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

### *Current transfers*

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.

### *Deductible VAT*

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

### *Disposals*

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

### *Export subsidies*

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

### *Export taxes*

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

### *Exports of goods*

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

### *Exports of services*

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

### *F.o.b. price*

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

### *Factor cost*

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

### *Final consumption*

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

### *Final consumption expenditure of government*

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

### *Final consumption expenditure of households*

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by

resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

### *Final consumption expenditure of NPISHs*

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

### *Financial intermediation services indirectly measured (FISIM)*

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

### *Fixed assets*

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

### *Goods*

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

### *Gross*

The term “gross” is a common means of referring to values before deducting consumption of fixed capital (generally used as in “gross capital stock” or “gross domestic product”).

### *Gross capital formation*

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

### *Gross domestic product - expenditure based*

Expenditure-based gross domestic product is total final expenditures at purchasers’ prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

### *Gross domestic product - income based*

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

### *Gross domestic product - output based*

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

### *Gross domestic product at market prices*

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

### *Gross fixed capital formation*

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.

### *Gross national disposable income*

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

### *Gross national income (GNI)*

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

### *Gross saving*

Gross saving is gross disposable income less final consumption expenditure.

### *Gross value added*

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

### *Gross value added at basic prices*

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

### *Gross value added at producers' prices*

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

### *Import duties*

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

### *Import subsidies*

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

### *Imports of goods*

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

### *Imports of services*

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

### *Indirect taxes*

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term “indirect taxes” is not used in 1993 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

### *Intermediate consumption*

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

### *Inventories*

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

### *Invoiced VAT*

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

### *Market prices*

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

### *Mixed income*

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

### *Net*

The term “net” is a common means of referring to values after deducting consumption of fixed capital (generally used as in “net capital stock” or “net domestic product”); it should be noted, however, that the term “net” can be

used in different contexts in the national accounts, such as “net income from abroad” which is the difference between two income flows.

### *Net income from abroad*

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

### *Net lending*

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as “net borrowing”.

### *Net national disposable income*

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

### *Net national income*

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

### *Net saving*

Net saving is net disposable income less final consumption expenditure.

### *Net value added*

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

### *Non-deductible VAT*

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

### *Non-financial assets*

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

### *Non-produced assets*

Non-produced assets are non-financial assets that come into existence other than through processes of production.

### *Non-profit institutions serving households (NPISHs)*

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

### *Non-resident*

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

### *Operating surplus*

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called “mixed income”).

### *Other subsidies on production*

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (eg, subsidies on payroll or workforce or subsidies to reduce pollution).

### *Other subsidies on products*

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1)

subsidies on products used domestically, (2) losses of government trading organisations, and (3) subsidies to public corporations and quasi-corporations.

### *Output*

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

### *Producer's price*

The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

### *Property income*

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

### *Purchaser's price*

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

### *Resident*

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

### *Services*

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realised by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

### *Stocks*

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as “inventories” in the System).

### *Subsidies*

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

### *Taxes and duties on imports*

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

### *Taxes on production and imports*

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

### *Taxes on products*

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a

result of their use for own consumption or own capital formation.

### *Transfer*

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

### *Valuables*

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

### *Value added - gross*

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

### *Value added - net*

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

### *Value added tax (VAT)*

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

## II. COUNTRY TABLES

---

# Afghanistan

## Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Office, Kabul.

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

## Albania

### Source

INSTAT is the most important agency for the collection of Albanian macro economic statistics. INSTAT undertakes most of the data collection and compilation, with the main exceptions being that balance of payments (Bop) and banking sector data are responsibility of the Bank of Albania (BOA), government statistics are collected by the Ministry of Finances (MOF) and agricultural statistics are collected by the Ministry of Agriculture and Food (MAF).

The estimation of the new ESA95-compliant national accounts is responsibility of the INSTAT's Sector of National Accounts. Following the internal organisation of INSTAT, the National Accounts Sector is part of a new and larger entity, the Department of Statistics Production (which, in addition to the National Accounts sector includes also other sectors). Most of the basic statistics used in compiling the national accounts are produced by this Department and by other INSTAT Departments.

The current task of the National Accounts Sector consists in preparing annual national accounts at current and constant prices, estimated both from the resources side (import, output, intermediate consumption and value added) and from the use side (export, final consumption, gross fixed capital formation, change in stocks

### General

Till 1990 (under old regime) all calculations of macro-economic indicators were based on the Albanian version of the System of Material Production. Statistics of National Incomes were confidential and were reported only to high members of government and of the party. Based on these results only some estimations of GDP in connection with U.N. were produced, which is in relation with the transformation from Albanian SMP indicators to SNA indicators. These estimations were published in the "Albanian Statistical Yearly book 1991".

Such calculation was no longer adopted at the end of 1991. When the whole system collapsed it was no longer possible to continue the registration of basic data, as a result, the data of SMP were not useful. Since 1991 no official data for GDP were provided: some estimation have been produced mainly by the IMF and Macroeconomic Unit in the Council of Ministers. Such estimates were based on previous calculations of the former Directorate of Statistic, today INSTAT.

The work on implementing the system of national accounts in INSTAT was undertaken in two stages. The main objective of the first stage in the implementation of SNA'93/ ESA'95 is the compilation of annual GDP data by production and expenditures approaches at current and constant prices. The objective of the second stage is the implementation of the full system of SNA'93/ESA'95. However, no definite timetable has been established so far for the second stage.

The compliance with ESA 1995 and SNA 1993 compilation of GDP data by production and expenditure at current and constant price has been improved thanks to two projects financed by the European Union and the International Monetary Fund, both started at the beginning of 2004 and accomplished at the beginning of 2006 . Both programmes (EU and IMF) aimed at providing a general improvement in the accuracy of annual GDP estimation.

### Methodology:

#### Overview of GDP Compilation

The basic approach can be summarized as follows:

- a) The production-side estimates are mainly based on grossing up the enterprise figures from the surveys using numbers of enterprises. Estimation of labour input by combining sources from the labour demand side (businesses) and demographic sources play an essential role in producing the estimate of the non observed

economy.

b) Domestic demand is estimated by combining data on the supply of products with data on expenditure obtained from the household consumption surveys, special surveys and businesses' balance sheets.

c) The aggregates for general government, financial institutions and some public corporations are estimated from budgets or balance sheets and from other administrative sources (cash not accrual).

d) The main approach used to estimate output for agriculture is "price x quantity".

e) A chain index system is used for valuations at constant prices.

## **Expenditure Approach**

Source data are very limited for household consumption. Some information are derived from Household Budget Survey (HBS), based on COICOP classification. However, the HBS is not conducted regularly and does not cover the whole of Albania.

Given the lack of basic information, the final consumption of household are mainly estimated using the commodity flow approach. The starting point of the procedure used in the grossing up of the economic data relative to final household consumption is to assume the GDP (or Output) measure by production approach.

Final consumption of general government and non-profit institutions serving households (NPISHs)  
Final consumption of general government and NPISHs is valued as the sum of the costs incurred to produce those individual and collective services; it is equal to the difference between the output of general government and NPISHs and the value of the residual sales.

The data sources for estimating final consumption of general government and NPISHs are the consolidated budget, GFS data, a special questionnaire worked out for NPISHs in 1998.

Following this period a survey on NPISHs has not been carried out. In general the last data are modified using a constant growth annual changes in the time.

### **Gross fixed capital formation**

Gross fixed capital formation is valued at purchaser price. Different data sources are used to estimate gross fixed capital formation: statistics available at Ministries (Ministry of Agriculture and Food, Ministry of Public Work), balance sheets, foreign trade statistics, Census of Agriculture.

An estimate of GFCF in construction has been obtained deducting from the Output the component which is not defined as investment.

The gross fixed capital formation in machinery and electrical equipment is equal with the value of domestic production plus imports minus exports.

At present, independent estimates on change in inventories are not available, but they are added in the resources and uses estimates of the item change in inventories and statistical discrepancies.

The indicators used for deflating the Gross Fixed Capital Formation are listed below:

- Livestock Volume Index
- Orchards and vineyards Volume Index
- Forestry Volume Index
- Construction Construction Cost Index
- Geology Volume Index and PPI
- Machinery and Equipment UVI and PPI for and domestic production

The estimation methodology for change in inventories at constant price is highly dependent on the kind of information on inventories available. Due to the absence of a complete data set an indirect way to estimate change in inventories has been adopted; meaning that change in inventories, for a group of products, are calculated using the commodity flow method as the difference between total supply and total use.

#### Changes in inventories

At present, independent estimates on change in inventories are not available, but they are added in the resources and uses estimates of the item change in inventories and statistical discrepancies, which are published.

#### Exports and imports of goods and services

In accordance with the SNA'93 methodology the exports and imports of goods and services are valued at FOB and converted from foreign currencies using monthly exchange rates. Main data source for estimating net export is the balance of payments from the Bank of Albania.

On the basis of the existing data, a methodology to compute import and export of goods, broken down by branch of activity has been developed. The sources of data used are the custom declaration for the imports export of goods and the balance of payments for services. The indicators used for deflating import and export in goods and services are Unit Value Index for goods and CPI for services.

### **Income Approach**

Not Applicable

### **Production Approach**

The adopted classification of economic activity is the NACE Rev. 1, which is the official European classification and is coherent with the ESA95.

The main data sources for agriculture are the different surveys conducted by the Ministry of Agriculture and Food (MAF) and the Census of Agriculture conducted in 1999 by INSTAT and MAF. In 2005 a general revision of the MAF survey has been conducted. In particular, the questionnaire has been reviewed in order to enlarge the information examined and to finalize it to the national accounts purposes. Tables on labour input, balance sheets and farm expenditures were added. These new pieces of information are important for compiling the Economic Account of Agriculture.

The elaboration of production was made directly: the quantity of production multiplied by the average price (there is no different prices for different uses).

The own-account production of agricultural goods for own final consumption is included in the production account.

For the estimation of the intermediate consumption we refer the new questionnaire allowed the quantification of the costs and include the expenses made over the year for seeds, chemical and natural fertilizers, electricity, water, paid services, fuel and other materials.

The results obtained have allowed the construction of the resources and uses account for the agricultural sector. This is an important innovation for the Albanian statistical system, which improves the coherence between the supply and demand side estimates.

#### The non-agriculture market activities

The estimate of the output in non-agriculture market non financial activities is mainly based on the following main data sources:

1. Statistical Business register;
2. Annual structural statistics survey;
3. Balance sheets (loss and profit account);

4. VAT declaration (more in general fiscal register).
5. Other data from technical ministries, etc.

For each source, the internal coherence of individual data is checked by ascertaining that accounts are balanced, that data in different tables are consistent and that the main data are economically sound. External coherence of both sources is also checked for each year based on the identity of current accounts available in both sources.

The processing of data includes two main phases. In the first stage, the various files coming from surveys and balance sheets are revamped. The purpose is to get a common format; it is also an opportunity for checking the internal coherence of balance data and survey data. For large and medium enterprises internal discrepancies are reduced on a case-by-case basis. For smaller enterprises any internal discrepancies are eliminated by automatic adjustments. As a result it is possible to calculate the production, intermediate consumption and value added on the level of individual enterprises.

After all these controls and adjustments, the micro-database file is created.

From a general point of view data are collected from enterprises, therefore an estimation base on Local Kind of Economic Activities is not performed. From a theoretical point of view this is an import drawback, but, in practice, it does not cause a relevant bias in the estimates because, in Albania, enterprises with more than one activity are very limited.

For the financial institutions, value added is derived from accounting records for banking, and other financial institutions from statistics of the supervisory board for insurance.

Rent: These activities cover the actual rent and imputed rent as well. The first estimates of imputed rent (rent considered as being paid by the owners of dwellings) are based on the data of stock of dwellings and estimates of the rent paid per square meter.

Actual rent covers the rent for publicly-owned dwellings and the rent paid to private owners who rent dwellings (also some information coming from the CPI compilation was used).

The value added of government services is estimated by adding the cost items obtained from accounting records provided by the Macro Economic Department in Ministry of Finances.

In accordance with the SNA'93 rules output is evaluated at basic prices, that means without taxes on products and import but with subsidies on products and import. Based on the information coming from the consolidated budget and Government Financial Statistics (GFS) a breakdown of subsidies by activities was done, therefore the output was estimated at basic prices.

Taking into account the legislation in place for the examined period and the SNA'93 methodology –using GFS data and those coming from the consolidated budget - taxes on products and imports were identified. The most relevant of those taxes are: Value Added Tax; Excises; Customs duties. It is important to stress that, at present, source data do not provide sufficient detail on production taxes to allow a proper evaluation of transaction.

No adjustments are made to convert taxes and subsidies from cash to an accrual basis.

Intermediate costs are valued at purchaser prices and INSTAT, in line with ESA95, has an on going project to make appropriate adjustment to exclude deductible tax.

In order to estimate the Non Observed Economy the Italian method (Labour Input Method) has been adapted to the Albanian situation, which has replaced the previous expert method. The Labour Input method consist on the comparison of the data coming from labour force survey conducted to the households and the data from enterprises survey. The procedure synthesized in this method allows to define a National Account target population in terms of employed persons. Therefore it is possible to estimate the corresponding value added (as

well as output and intermediate cost), for non-observed economy.

### CONSTANT PRICE ESTIMATION

For constant price, taking into account the availability of price / volume indices different methods for deflation are used, both the single extrapolation of value added with the volume index of output and double deflation.

The single extrapolation of value added with the volume index of output was mainly applied to the branches of services and the double deflation for the manufacturing industries, using the Producer Price Index. For construction and transport the deflation is done using volume indices available.

In general, for each product in agriculture, for each year the data on output and intermediate consumption in quantity and in prices are available. The estimates of the Output and the Intermediate Consumption at prices of the previous year are obtained by multiplying the quantity at time t with prices of time t-1.

The volume of the value added within construction activity is obtained by deflating the value of the output of the production and intermediate consumption by the total of construction cost index (CCI). Using the CCI as a deflator for both output and intermediate consumption is an invalid method for measurement of volume of the construction.

Concerning internal trade activity the turnover was deflated with CPI for goods and then the volume index for turnover was used to extrapolate output.

Other market services are mainly deflated using appropriate components of CPI. General government and NPISHs activities were deflated using the wage index as price index for gross value added and CPI to deflate intermediate consumption.

## Algeria

### Source

Reply to the United Nations national accounts questionnaire from the Office National des Statistiques (ONS), Alger. Official estimates are published in "Comptes Economiques" by the Direction des Statistiques et de la Comptabilite Nationale, Secretariat d'Etat au Plan, and in the "Annuaire Statistique de L'Algerie" by ONS.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Andorra

### Source

The preparation of national accounts statistics in Andorra is undertaken by the "Servei d'Estudis" at Andorra's Ministry of Finance. The data displayed have been submitted directly to the United Nations Statistics Division through the UN national accounts questionnaire.

### General

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated only by production approach.

### Production Approach

Gross value added of the economy is valued at basic prices and defined as the total productive activity of the resident units of production as measurable in monetary transactions. Since information enabling a direct computation of value added is not available for the majority of economic sectors, the "Servei d'Estudis" has made an estimation of this macroeconomic aggregate by means of an indirect method, which has been applied to all the economic sectors with exception of the banking sector. The indirect method multiplies the compensation of employees declared for each economic activity with the Andorran Social Security Fund "Caixa of Seguretat Social (CASS)" with a technical coefficient "VAB" (Gross Value Added/ Compensation of Employees at basic current prices) for each activity. This coefficient is calculated on the primary sector by the "Institut des Comptes Nationaux" (INR-ICN) from Belgium and the other sectors are calculated by the National Institute of Statistics of Spain (INE) from Canarias when estimating the regional accounts of Spain.

The value added for the financial sector is estimated on the basis of balance sheets and profit-and-loss statements of the banking organizations that operate in Andorra. The GDP value is computed by adding indirect taxes collected by the central administration to the Value Added. Computation of integrated institutional sector accounts has not been implemented since currently only rudimentary information is available, i.e. on the government sector and the household sector but not on the other sectors. GNI cannot be computed since data on transactions of the domestic sectors with the Rest of the World is not available.

# Anguilla

## Source

Reply to the United Nations national accounts questionnaire from the Development Planning Unit, Ministry of Finance and Economic Development, Anguilla. The official estimates were published in "Anguilla - National Accounts Statistics, 1984-1987" by the Ministry, May 1988.

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

<sup>b</sup> Data for this year(s) have not been revised and are therefore not consistent with equivalent data in other table(s).

<sup>c</sup> Data for this year(s) have not been revised and are therefore not consistent with equivalent data in other table(s). Data contains discrepancies between components and total due to rounding of some data.

## Argentina

### Source

The preparation of national accounts statistics in Argentina is undertaken by Dirección Nacional de Cuentas Nacionales (DNCN) INDEC. The official estimates are published by the DNCN in "Economic Activity Press Release" and by the Ministerio de Economía in "Economic Report". In 1999, the publication "Sistema de Cuentas Nacionales, Año Base 1993" was presented and contains detailed description of the sources and methods used for the national accounts estimation, in accordance with the United Nations System of National Accounts 1993 (1993 SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

#### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, gross investment in construction and machinery and exports and imports of goods and services. The commodity-flow approach is used to estimate the current value of private final consumption expenditure and the gross investment in machinery and equipment by sector of origin, using indices of prices and quantities for sectors producing domestic and imported goods. Coefficients for the allocation of economic use are determined on the basis of the nature of the goods involved. Government final consumption expenditure is estimated in accordance with budgetary information from national, provincial and municipal government. Investment in construction is estimated with a physical volume index prepared as a weighted average of labor (data from the social security system) and material inputs into the construction industry.

The estimation of domestically produced capital goods is done on the basis of the industrial censuses. For the years between censuses, the data are updated through a combination of indexes of physical output and price indexes. Data on exports and imports of goods and services are obtained from the balance of payments accounts. Constant values of government consumption expenditure are obtained through deflating purchases of goods and services by the average of the wholesale and the consumer prices. Private consumption expenditure at constant prices is obtained with a commodity flow method. Construction cost is used by multiplying the price index with the constant values for construction to obtain current values. Domestic machinery and equipment products are deflated by the price index of producer prices or extrapolated by volume of production. Imported machinery and equipment are deflated by capital goods import price index. Price deflation is used for exports and imports of goods and services.

#### Income Approach

The estimates of compensation of employees are based on employment data and remuneration data (sources: social security system and Permanent Household Survey). Operating surplus is, in general, obtained as a residual.

## Production Approach

The production approach is used to estimate value added of most industries. The basic statistics on agricultural production are obtained from the Secretaría de Agricultura y Ganadería, Pesca y Alimentación (SAGPyA), producers' associations and other relevant institutions. Livestock quantity estimates output are based on information provided by SAGPyA and other relevant institutions on the basis of surveys, administrative records and estimates on production and stocks for different species. Prices of outputs and inputs are collected within the framework of the INDEC prices indices system. For fishing and related services the data used is based on the deep-sea catches on quantities by species and by type of vessel, provided by the SAGPyA. Monthly data on prices by species are available from the INDEC system of wholesale price indices.

The data needed to calculate the value added of mines and quarries is provided by the SubSecretaría de Energía (quantities produced and prices of oil and gas) and the Secretaría de Minería (other minerals). The main data sources used in estimating industrial production are the monthly and annual surveys for the manufacturing industry and the industrialists' chambers and administrative data sources for some industries. Data on production at current prices as well as volume indices at the level of five digits of the industrial classification are obtained from the surveys. The other data sources vary according to the activity, although they are mainly data on quantities produced. The value added of supply of electricity, gas and water are provided by the enterprises, covering 100% of the industry in electricity and gas and the relevant enterprise in water. Prices are obtained from wholesale price index system of the INDEC.

Data on the physical volume index is prepared as a weighted average of labor (social security system) and material inputs into the construction industry are used to estimate the value of construction. Information on prices from the INDEC system of construction cost indices. Gross output of the trade sector is estimated through applying gross percentage mark-up rates to the value of goods recorded as entering the various marketing channels. The main sources are economic census of 1984, production from monthly industrial surveys and foreign trade statistics. Other data sources include the stocks of vehicles used to estimate vehicle repairs. The value of hotels at constant prices are based on trend movements of this industry estimated from press information, tourism flow data and the travel category in the balance of payments (Dirección Nacional de Cuentas Internacionales).

The value of restaurants at constant prices is derived from a demand corresponding to hotels and restaurants in the consumer price index. Different kinds of indicators are used for the estimates of land transport services depending of the type of service. Thus, indicators used include: the number of passengers and tons transported by railways, commodity flow data for road transport of goods, number of passengers transported by buses, demand functions for expenditure on taxis, etc. Relevant price indices for the corresponding items of transportation are available from the wholesale and consumer prices indexes compiled by the INDEC. Quarterly estimates for air transport are based on information (transported passengers and cargo) from Aerolíneas Argentinas (the largest airline) and consumer price indices compiled by the INDEC. Quarterly information from all airlines is used for the revised quarterly estimates.

The indicator used for the water transport industry is the income from freight by resident producers. Related services are estimated on the basis of a variety of indicators such as hotels and air transport (travel agencies), the commodity flow method (warehousing), export and import cargoes (port activities), number of crossing vehicles (tolls), etc. Prices indices from the wholesale and consumer price indices as well as tariffs for specific services are available. For communications the data used is based on financial information of the enterprises belonging to this sector and are available quarterly as a basis for the current price estimates. Volume indicators are calculated for telephone services based on the data reported by the telephone companies on the number of telephone lines in service, invoiced impulses, and minutes of international calls (incoming and outgoing). Relevant price indices from the system of wholesale price indices of the INDEC and specific tariff price indices for some of the communication services are available to deflate current price data.

The value added of financial intermediation is based on financial and quantity data of the banking system. Quantity data, and in some cases, also financial data, are available for others producers of financial services. Monthly data

on insurance premiums and quarterly financial statements are available for insurance companies. Value added in the real estate, renting and business activities, is estimated from the stock of dwellings and different indicators for each of the business services: number of deeds in Buenos Aires (real estate) or yield of the judicial tax (judicial activities). The value added of public administration and defense is based on compensation of employees on accrual basis from the execution of the national budget and are available from the integrated system of financial information (SIDIF). Data on the execution of the budget by the provincial and municipal governments are supplied by the Dirección Nacional de Coordinación Fiscal con las Provincias (Ministerio de Economía). Volume indices of employment (based on number of persons) for each of the government levels are available for the estimates at constant prices.

The value of public education is the same as for public administration plus full coverage financial and physical data from extra budgetary educational institutions. Estimates for the private educational are compiled on the basis of labor (social security system). The value of public health is the same as for public administration. Volume indices are compiled based on quantities of services provided based on administrative records. Quantity indicators related to outpatient consultations, emergency rooms and hospitalization are obtained from a sample of medical centers in Buenos Aires and major cities are the basis for the estimates for the private health industry. Price indices of drugs, wages and medical services are available from INDEC and SIJP. For other activities involving community, social and personal services, services are estimated on the basis of demand functions. The value of the domestic services is estimated on the basis of labor (Encuesta Permanente de Hogares of INDEC).

## Armenia

### Source

Reply to the United Nations national accounts questionnaire from the State Department of Statistics. The latest data for Armenia was received through the United Nations Economic Commission for Europe (UN/ECE).

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Armenia has changed in 1994 from the Russian rouble to Armenian dram. One dram equals 200 Russian rubles (see World Bank, "Statistical Handbook for the States of the FSU, 1996").

## Aruba

### Source

Reply to the United Nations national accounts questionnaire from the Central Bureau of Statistics, Aruba. Official estimates are published by the Central Bureau of Statistics in the "National Accounts of Aruba, provisional estimates for 1994" and the "Statistical Yearbook".

### General

The estimates shown in the following tables have been prepared in accordance with the System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Australia

### Source

Reply to the United Nations national accounts questionnaire from the Australian Bureau of Statistics (ABS), Canberra. The official estimates are published in the ABS Australian System of National Accounts, (cat. no. 5204.0). The data for Australia was received through the Organization for Economic Co-operation and Development (OECD), Paris.

### General

The estimates shown in the following tables have been prepared by the ABS in accordance with the international standards contained in the System of National Accounts, 1993 (SNA93) and can be accessed via the ABS web site <http://www.abs.gov.au>. Detailed information on the compilation of the Australian national accounts is contained in the ABS publication Australian System of National Accounts: Concepts, Sources and Methods (cat. no. 5216.0). Quarterly estimates of the Australian national accounts are published on the first Wednesday of the third month following the reference quarter in Australian National Accounts: National Income, Expenditure and Product (cat. no. 5206.0). Annual estimates are released on the first Wednesday in November following the reference year in Australian System of National Accounts (cat. no. 5204.0). In addition, input-output tables are released in Australian National Accounts: Input-Output Tables (cat. no. 5209.0) and Australian National Accounts: Input-Output Tables (Commodity Details) (cat. no. 5215.0). Footnotes are provided when the scope and coverage of the estimates differ for conceptual or statistical reasons from the standards of the SNA93. Estimates relate to the fiscal year beginning 1 July, unless otherwise shown. The reference year for chain volume measures is currently 2004-05.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product (GDP) is estimated in Australia using three approaches: the income approach (I), the expenditure approach (E) and the production approach (P). A description of each approach is provided below.

While each of the I, E and P measures should, conceptually, provide the same estimate of GDP, if the three measures are compiled independently using different data sources, then different estimates result. From 1994-95, up to the year preceding the latest complete financial year, balanced supply (production) and use (demand) tables by commodity are compiled. The annual GDP (I, E and P) estimates are then benchmarked to these balanced supply-use estimates, ensuring the annual estimates using the I, E and P approaches are identical for the years for which supply and use tables are available.

Prior to 1994-95, and for the latest financial year and for quarterly estimates for all years, the estimates using each approach are based on independent sources, and there are differences between the income, expenditure and production estimates. Nevertheless, for these periods, a single estimate of GDP has been compiled. In chain volume terms, GDP is derived by averaging the chain volume estimates obtained from each of the three independent approaches. The current price estimate is obtained by reflatting the average chain volume estimate by the implicit price deflator derived from the expenditure-based estimates.

As a result of these methods, there is no statistical discrepancy for annual estimates from 1994-95 up to the year prior to the latest complete financial year. For years prior to 1994-95, and the latest financial year and for quarterly estimates for all years, statistical discrepancies exist between estimates based on the I, E and P approaches and the single estimate of GDP, in both current prices and volume terms.

#### Expenditure Approach

Government final consumption expenditure and public gross fixed capital formation are estimated from the accounting records of the government sector. Private final consumption expenditure on goods is mainly derived from information collected in retail censuses (held approximately every six years) as well as data on production,

imports and exports, and motor vehicle registrations. The results of a monthly survey of retail sales are used to interpolate between census benchmarks and to extrapolate for the period since the last retail census. Benchmarks for dwellings rent are derived from population census data collected every five years. The consumer price index is used in conjunction with a perpetual inventory model of the stock of dwellings to interpolate between census year estimates and extrapolate from the most recent census. Estimates of expenditure on other services are based mainly on revenue or earnings data. Increase in inventories is based on book value levels of inventories reported in ABS economic censuses and surveys, taxation statistics and ABS Quarterly Business Indicator Surveys (QBIS) (less the inventory valuation adjustment). Estimates of private gross fixed capital expenditure are obtained from a quarterly collection of building and engineering construction statistics and from a quarterly survey of new capital expenditure by private businesses on plant and equipment. Exports and imports of goods are estimated from customs data while exports and imports of services are derived from transportation survey data and from data obtained as a by-product of the administration of foreign exchange transactions. Chain volume measures are derived quarterly with annual estimates obtained by summing the quarterly series. Government consumption expenditures are deflated by composite wage rate and material price indexes. Substantial use is made of consumer price indexes in the deflation of private final consumption expenditure. Estimates of gross fixed capital expenditure are deflated using (output) building price indexes for building; composite wage and material price indexes for engineering construction; producer price indexes and import price indexes for equipment; and quantity revaluation for real estate transfer expenses. For exports and imports, considerable use is made of the quantity revaluation technique with the remainder deflated using price indexes. Increase in inventories volume estimates are derived using detailed price indexes to revalue book value levels.

### **Income Approach**

The components of indirect taxes (net) are estimated from government accounting records. Estimates of gross operating surplus are mainly based on annual ABS Economic Activity Survey (EAS) data supplemented by taxation statistics. The annual estimates are then moved on a quarterly basis using an indicator series [Company gross operating profits] from the ABS Quarterly QBIS. Gross mixed income (GMI), which denotes the income from unincorporated enterprises, is derived separately for the farm and non-farm sectors. Annual GMI for the non-farm sector is derived from taxation statistics supplemented with information from ABS and other sources and moved quarterly using a range of data relating to turnover (e.g. retail sales and building activity). GMI of farm unincorporated enterprises is derived using a range of ABS and non-ABS sources. Estimates of the consumption of fixed capital are derived at current replacement cost using the perpetual inventory method. Compensation of employees data for the private sector are based on ABS Economic Activity Survey data, moved quarterly using QBIS. Compensation of employees data for the public sector are currently based on a survey of employment and earnings.

### **Production Approach**

GDP using the production approach is derived as the sum of gross value added for each industry, at basic prices, plus taxes less subsidies on products. The current price estimates of gross value added by industry are only produced annually. For years prior to 1994-95 the estimates were derived for the most part using the income approach only. For years from 1994-95 they have been derived in a supply-use framework and are in balance with the expenditure estimates on an annual basis for all years prior to the latest complete financial year. The annual benchmark estimates are based on ABS EAS data supplemented by taxation statistics.

Quarterly chain volume measures of gross value added by industry are derived by interpolating and extrapolating annual benchmarks using quarterly indicator series. Both the annual benchmarks and the quarterly indicators are calculated as chain volume measures. From 1994-95, the annual benchmarks are obtained from supply and use (S-U) tables compiled in the prices of the previous year.

Quarterly chain volume indicators of gross value added in the Australian national accounts are derived using three different methods:

- the output indicator method (the most common method);

- double deflation (used for Agriculture estimates); and
- the input indicator method

The method selected to obtain chain volume measures for a particular industry depends on the data available in respect of that industry.

In the Australian National Accounts, the QBIS data are used extensively for those industries for which the output indicator method is used. A range of other data is also used such as output volume data for certain industries, other ABS survey data (e.g. Retail Turnover Survey, Building Activity Survey, etc.), public finance data and other indicator data. More information can be provided on request.

<sup>a</sup> Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

<sup>b</sup> Mixed income, net. Excludes consumption of fixed capital.

<sup>c</sup> Net lending in the financial account has not been reconciled with Net lending in the capital account.

## Austria

### Source

The preparation of annual national accounts statistics in Austria is undertaken by the Directorate of Macroeconomic Statistics at STATISTICS AUSTRIA, the Austrian National Statistical Office located in Vienna. The official estimates are published annually on the internet ([www.statistik.at](http://www.statistik.at)), as well as in the Statistical Yearbook. At present, a consistent time series is published back to 1976. All data are available in the yearly publication "Volkswirtschaftliche Gesamtrechnungen – Hauptergebnisse" as well as online ([www.statistik.at](http://www.statistik.at)). In January 2007, a revised version of the comprehensive methodological inventory on GDP compilation was submitted to EUROSTAT. The inventory describes in detail all methods applied in compiling the SNA accounts and exhibits numerical results. This detailed back-ground information as well as other metadata such as quality reports and a quarterly NA inventory is also online available. The data provided to UNSD were received through the Organisation for Economic Co-operation and Development (OECD), Paris.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Input-output tables have been published for the years 1961, 1964, 1976, 1995, and 2000. Supply-use tables are published every year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. On 1 January 1999 the conversion rate of the national currencies to the new currency Euro was irrevocably fixed and the Euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in Euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'Euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'Euro'. In the case of Austria the currency name for the data before 1999 is "1999 ATS Euro". For international comparisons, like for example when converting national data into US dollar the data before the Euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 13.7603 Austrian schilling. - The name of the currency of the newly submitted data is "1999 ATS Euro" for the data before 1999 and "Euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Austria, like for example all old data following the 1968 SNA is still in "Austrian schilling", although this is not specifically indicated in the tables.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and expenditure approaches. The income approach is treated residually. Input-Output tables are compiled every five years, according to the respective European legislation. Supply-use tables are compiled each year and the results are taken as benchmark values for GDP compilation in current prices. The integration process in volume terms is currently under way. Since 2004 GDP and other transactions in real terms are compiled at prices of the previous year and the changes are presented as volume indices.

#### Expenditure Approach

The estimates of government final consumption expenditure are derived from production accounts compiled on the basis of the accounting records of the various authorities. The values of private expenditure on goods are mostly obtained by means of the commodity flow method, either by multiplying the quantity data by average consumer prices or by adding distributive margins and turnover tax and indirect taxes to the value of goods produced

domestically or imported. The sources of data include statistics on agricultural produce, industrial output data by commodities, data on energy and foreign trade by commodities, motor vehicle registration statistics, closed accounts for public transportation enterprises, communication, insurance and others. In addition, household budget surveys, carried out every five years, provide benchmark information. For price data the consumer price index is largely referred to. Own-account consumption is valued at producers' prices, for use of owner-occupied dwellings the corresponding market rents are imputed. For private expenditure on services, the estimates are mostly based on the respective production accounts as well as value added tax statistics. The data on increase in stocks are based on regular stock surveys covering almost all branches; those that are not covered are estimated. For gross fixed capital formation in machinery and electrical equipment, the value of domestic production plus imports minus exports is adjusted to include transport costs, trade margins, customs duties, etc. The estimates of transport equipment are based on registration statistics and are obtained by multiplying the quantity by the current prices. For construction, the gross value is derived from data on characteristic gross output, with additions for material supplied, non-characteristic construction (including own-account construction, e.g. residential buildings). The estimates of exports and imports of goods and services are based on foreign trade statistics and the balance of payments. Constant price estimates of government final consumption expenditure are based on deflation for intermediate consumption and non-commodity sales. Compensation of employees is in certain activities also deflated, for others quantum indicators are used. For private consumption expenditure, direct revaluation at base-year prices is used where information is available on quantities of commodities consumed. Otherwise, the current estimates are deflated by appropriate price indexes. This same method is used for increase in stocks, exports and imports of goods and services and for gross fixed capital formation.

### **Income Approach**

Estimates of compensation of employees are based on contributions paid by employers to government funds and wage statistics, as well as structural business statistics. Direct information is available on compensation of government employees. Operating surplus/mixed income is basically derived as a residual item. Further information is gained from income tax statistics for unincorporated enterprises, independent professions and property. Corporate balance sheets and tax statistics are used for undistributed profits of corporations: for agriculture and forestry income is derived from the production account. In the case of the public sector, data are obtained from the accounting records of public bodies. Depreciation estimates of stocks are obtained either by using the perpetual inventory concept or, in some instances, are extrapolated by net output at constant prices and inflated by national accounts' price index for fixed capital formation. Indirect taxes and subsidies are obtained directly from the records of the various governments.

### **Production Approach**

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added of nearly all industries. The income approach is used to estimate value added of public administration and defence. The value added of agriculture is obtained by deducting the cost of all non-factor inputs from the gross value of production, which include an imputation for produce consumed on the farms. The calculations are based on production statistics for quantities, and on agricultural price surveys. Mining and quarrying, manufacturing, electricity, gas and water, construction, trade, transport, financial intermediation as well as business services are surveyed by annual structural business statistics. Benchmark estimates have been prepared for 1995, when the last full census was carried out and for 2000, for which the latest Input-output table was compiled. When necessary extrapolation is based on output statistics, sample survey and turnover statistics.

Estimates of restaurants and hotels are based on SBS information and additionally other suitable indicators (private accommodation) are used. For railways and air transportation and communication, additional information is derived from the accounts of concerned enterprises.

For the financial institutions, value added is derived from accounting records for banking and other financial institutions from statistics of the supervisory board for insurance. Data on real estate are obtained from decennial housing censuses and micro-census data on housing and rents. In the case of owner-occupied dwellings, rents paid for comparable dwellings are applied. The value added of government services is calculated by adding the cost items obtained from accounting records.

The estimates of other services are based on annual turnover statistics, value added tax statistics and various net to gross ratios obtained from the 1995 census of non-agricultural establishments. The value of domestic and health services is calculated by means of VAT, social security and wage statistics. For the constant price estimates, double deflation is used. A variety of price indices is used, such as: producer price index for agriculture, manufacturing and for selected business services, whole sale price index, consumer price index, PI for investment goods, collective wage index, construction price index. Volume indicators are created for some health services. In manufacturing, a combination of double deflation and fixed net ratios is applied. The turnover of wholesale and retail trade is deflated by appropriate price indexes. For the producers of government services, partly quantum indicators, partly suitable price (wage) indexes are used.

**Table 1.1 Gross domestic product by expenditures at current prices**

<sup>a</sup> Statistical discrepancy with equivalent item in Table 1.3.

<sup>b</sup> Statistical discrepancy with equivalent item in Table 1.1 Gross domestic product by expenditures at current prices. As different methods are used for accounting gross capital formation by activity and gross capital formation for the whole economy, results differ.

<sup>c</sup> Statistical discrepancy with equivalent item in Table 1.1 Gross domestic product by expenditures at current prices.

<sup>d</sup> Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

## Azerbaijan

### Source

Reply to the United Nations national accounts questionnaire from the State Committee of Republic of Azerbaijan on Statistics. The latest data for Azerbaijan was received through the United Nations Economic Commission for Europe (UN/ECE).

The preparation of national accounts statistics in Azerbaijan undertaken by the National Accounts Statistics Department at State Statistical Committee of Azerbaijan Republic, located in Baku. Data on national accounts statistics are published annually in "National Accounts of the Azerbaijan Republic" (Azeri and English), Statistical Yearbook - "Statistical Indicators of the Azerbaijan Republic" (Azeri and English), "Azerbaijan in figures" (Azeri and English), on the internet ([www.azstat.org](http://www.azstat.org)); quarterly in "Statistical review" (Azeri), monthly in "Socio-Economic Development" (Azeri) and Press-releases (Azeri).

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). The recording period for annual accounts is the calendar year. The previous year and 2001 serves as the base year for data series at constant prices.

### Methodology:

#### Overview of GDP Compilation

GDP data are currently published using the national Classification of Types of Economic Activities based on NACE. GDP cover all resident units, including producers engaged in unrecorded activities. The contribution of the informal sector to GDP is estimated on the basis of budget and special surveys, and added to annual GDP by production activities. Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled.

Following the 1993 SNA all non-financial transactions are covered (exclude military goods). The entire territory of the Azerbaijan Republic (exclude occupied territories) is covered. Special sample surveys are conducted to estimate unrecorded production not included in the regular national accounts compilation. For this purpose, the data from household budget surveys, retail trade turnover and transport, balance methods, the State Tax Committee and Customs Committee and other supervisory agencies are used.

Production output is valued at basic prices. Intermediate and final consumption are recorded at market prices. Gross fixed capital formation is recorded at market prices. Non-market production is valued on the basis of outlays. Imports and exports of goods and services are valued on an FOB basis. The monetary unit is Manat. Input-output tables were compiled for 2001 in 2004.

#### Expenditure Approach

Basic data sources for estimation of GDP through expenditure approach are: household Budget Surveys and surveys of retail trade; reports on incomes and expenditures of nonprofit institutions serving households; annual budget report provided by MOF; reports on the balance sheets of enterprises and data on imports of capital (investment) goods, and on investment expenditures of government; reports on customs payments, and import and export of goods and services provided by the customs authorities; balance of payments data provided by the NBA.

Consumption expenditure of households is estimated from household surveys and goods turnover in retail trade.

Final consumption of nonprofit institutions serving households consists of expenditures on services provided to households free of charge.

Final consumption of government is estimated from current expenditure reported in the annual state budget. Fixed capital formation is estimated from the expenditure of enterprises and organizations on capital investments, geological prospecting operations, etc. Changes in inventories include changes in inventories of raw materials and supplies, goods for resale, finished products, and unfinished production. Net exports (less imports of goods and services) are derived from customs data that are adjusted by the NBA for "shuttle" trade.

Estimation of data in prices of the previous year: The data in current prices are deflated by the appropriate components of the available price indices. Final consumption of households is deflated by the CPI. Government final consumption is extrapolated using employment data. Imports and exports of goods and services are deflated using unit value indices for imports and exports (that are not published). Gross fixed capital formation is deflated using mainly the price index for capital investment.

## **Production Approach**

Basic data sources for estimation of GDP through expenditure approach are: monthly, quarterly and annual reports on production and expenses submitted to the SSC by enterprises (In general, monthly reports cover large enterprises, while the annual surveys include small enterprises as well); quarterly household surveys; monthly and annual employment and wage surveys; annual banking statistics provided by the National Bank of the Azerbaijan Republic (NBA); the budget report of the Ministry of Finance (MOF); reports on customs payments and taxes of the MOF. Additionally, the following activity-specific sources are used:

**Agriculture:** Production data in physical terms and data on prices of agricultural products. For most farms the first set of data is submitted by reporting farms, and the second set of data is obtained from price surveys of farms. In the case of privately operated farms, the data on farm productivity and yield per acre are collected in surveys of these farms, and the prices data are collected separately from surveys. Agricultural output is estimated as the product of output of crops and animal husbandry and corresponding prices. Output includes the change in the value of unfinished production in crop farming and animal husbandry.

**Industry:** Monthly, quarterly and annual report forms on production and expenses submitted by enterprises on a monthly and annual basis. Estimates of production and production expenses of units engaged in individual entrepreneurial activity are compiled from household surveys. Industrial output is compiled from the data on total production as reported by enterprises, excluding intra-factory turnover, i.e. the value of finished and semi-finished goods used within the enterprise.

**Construction:** Monthly, quarterly and annual reports of construction companies on completed construction and capital investments, and annual income and expenditure statements. Large enterprises report on a monthly basis; small enterprises on a quarterly basis; and all enterprises are covered on an annual basis. Gross output of construction is determined from the purchasers' side, and includes the value of construction and installation work, operational drilling, and other capital work. Individual construction activity is estimated using records of city and local governments relating to new and additional construction.

**Transportation:** Monthly, quarterly and annual reports of transport companies on freight and passenger turnover, and reports on income and costs. Gross output of transportation includes output of enterprises in rail transport, highway transport, waterway transport, aviation, small (individual) transporters.

**Communications:** Reports on the (monetary value of) services provided and costs submitted by postal service enterprises and electrical communications services, and reports on the (monetary value of) services provided submitted by small enterprises.

**Trade and public food service:** Reports on turnover submitted by enterprises engaged in retail trade and public food services, and data of other economic units engaged in this activity. Special quarterly surveys of city markets

(4) and trade fairs. Output of retail and wholesale trade is determined as the difference between the value of sales and the purchase value of goods.

Finance, credit, insurance: Quarterly and annual statistical reports of the banking sector, the annual report of the National Bank, and annual reports of insurance companies.

General government: Monthly reports on revenue and expenditure of the government (MOF) and consolidated annual report on the budget.

Health care, education, social sphere, and other services: Annual surveys of enterprises engaged in providing these services, and data on current expenditure from the monthly and annual budget reports of MOF.

Output of non-market services is determined from the cost side, mainly from expenditures reported in the annual budget, and includes consumption of fixed capital. Output of market services of self-supporting enterprises and state-supported enterprises, including services provided by private individuals, is determined from sales volume. Estimation of data in prices of the previous year: In the case of commodity sectors, volume indices are used to derive the estimates at constant prices of the previous year. For services, extrapolation is done using employment indices.

## Bahamas

### Source

Latest data is compiled on the basis of "The National Accounts Report 2005", published by the Department of Statistics of the Ministry of Finance of Bahamas. Previous data was based on replies to the United Nations national accounts questionnaire from the Department of Statistics, Nassau.

### General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

### Overview of GDP Compilation

The national accounts estimates are primarily based on the production approach.

### Expenditure Approach

Government Final Consumption Expenditure was derived from an analysis of the Treasury. Private Final Consumption Expenditure of Residents has many constituent elements. A major part of the total was derived from the establishment survey and consists of revenue in retail trade - adjusted for sales made for purposes of Gross Fixed Capital Formation and sales made to other businesses. The revenues of hotels, restaurants and service establishments and revenues derived from medical and dental practices as well as revenues derived from personal expenditure on the services of accountants, lawyers and architects and the expenditure of charitable organizations as well as associations of individuals such as labor unions were all included. Gross paid and imputed residential rents for household accommodation was derived mainly from the census of population and labor force surveys. Paid and imputed service charges for personal banking and insurance services were also included. An estimate for expenditure in the informal economy was made.

The Change in Stocks were obtained from records of public corporations and the establishment survey in retail and wholesale trade. Since, at the moment, no knowledge of inventory accounting practices exists nor are there any price indexes measuring the change in the value of inventories, these estimates must be considered rough approximations to the true change in the value of inventories. Presently no data exist in areas other than outlined above. The values of Residential Building Construction and of Other Construction were based on the establishment surveys in the construction industry. Purchases of Machinery and Equipment were derived from detailed import data adjusted for custom duties and mark-ups. The value of Exports and Imports of Goods and Services are anchored to the balance of trade and balance of payment data estimated by the Department of Statistics and the Central Bank of the Bahamas respectively. The Tourism data is based on Ministry of Tourism figures.

### Production Approach

GDP is estimated based on the aggregate estimate of gross revenue and intermediate consumption for each economic activity as defined by ISIC. Unless otherwise stated these data were derived from questionnaires asking for such detail as gross revenue, salaries and wages, expenses incurred in carrying out the business etc. These questionnaires were sent out to all commercial establishments. An establishment is defined as a unit of business that can give information on its gross revenue and specified items of cost. Most industries are covered by the Department of Statistics (DOS) "Business Establishment Survey".

For the largest entities in the various industries the survey is a census, while for the smaller entities a scientifically constructed sample survey is used. Data in the Agriculture and Fishing industries were constructed from information obtained from the Departments of Fisheries and Agriculture. The Financial Industry data is obtained mainly from the Registrar of Insurance and from the Central Bank of the Bahamas. For Public Administration, Public Education, and Public Health the major portion of the information came from the treasury accounts of the government of the Bahamas. The industrial total thus derived yielded Gross Value Added at producer prices, from which FISIM was subtracted, while the statistical discrepancy was added to obtain GDP at market prices. The Taxes less subsidies on products mainly represent the Import taxes, which could not be distributed by industry to compute Gross Value Added at basis prices. The Indirect taxes and subsidies on product that could be identified by industry were applied at the industry level, for example casino taxes were applied to the casino industry itself.

<sup>a</sup> Output data obtained from the national source include Taxes less subsidies on products and therefore differ from this value.

# Bangladesh

## Source

Reply to the United Nations national accounts questionnaire from the Bureau of Statistics, Dhaka.

## General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

## Barbados

### Source

Reply to the United Nations national accounts questionnaire from the Barbados Statistical Service, Bridgetown, St. Michael. Official estimates are provided by the Statistical Service and published in the "Annual Statistical Digest" of the Central Bank of Barbados.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Belarus

### Source

Reply to the United Nations national accounts questionnaire from the State Committee of the Republic of Belarus on Statistics and Analysis. The latest data for Belarus was received through the United Nations Economic Commission for Europe (UN/ECE).

Annual statements are prepared by the Ministry of Statistics and Analysis in accordance with the system of national accounts of Belarus. Official statements (evaluations) are published on a quarterly basis on the website of the Ministry [www.belstat.gov.by](http://www.belstat.gov.by), and also in printed form, in the Russian and English languages: Quarterly Statistical Bulletin; Quarterly statements of gross domestic product; Statistical Yearbook of Belarus; The yearbook of National Accounts of the Republic of Belarus; The Republic of Belarus in Figures.

The method of calculation for national accounts is described in detail in the publications "Methodological Regulations on Statistics", issue one (1999) and issue two (2003), and in brief in the publications on the national accounts.

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The currency of Belarus changed in the reporting year 1993 from Russian rouble to Belarussian rouble (1 Belarussian rouble equals 10 Russian roubles). Series 300 is expressed in re-denominated format, with 1 re-denominated Belarussian rouble equaling 1000 Belarussian roubles.

Price indexes are rebased: for 1995 using the measure of prices as of 20 August 1994 (reduced by a factor of 10), for 2000 using the measure of prices as of 1 January 2000 (reduced by a factor of 1,000), and for the other years using the measure of prices for the years in question.

### Methodology:

#### Overview of GDP Compilation

The basic method of measuring GDP is the production approach. Measurement is also made using the expenditure approach and the income approach. Input-output tables are compiled annually.

#### Expenditure Approach

Household expenditure on consumer goods and services comprises: expenditure on the purchase of consumer goods and services; and expenditure on the consumption of goods and services for final consumption by households. Household expenditures are expressed in terms of purchase prices and are determined on the basis of data from selective household surveys. The data from household surveys are adjusted to allow for various systemic errors (for example a reduction in the consumption of alcoholic beverages or cigarettes, errors related to the insufficiently representative nature of the selective pool of households, and so forth).

The consumption of goods and services produced for final consumption by households includes: the cost of the produce from farms, private subsidiary plots belonging to members of the public and the notional value of services relating to the occupancy of private residential accommodation. The value of goods produced for final consumption by households is determined on the basis of selective household surveys.

Expenditure on final consumption by State agencies comprises expenditure on consumer goods and services for both individual and collective consumption. Such expenditure is financed from budgetary resources. Individual

goods and services provided by State agencies include services in the field of education, culture and art, cinematography, the mass information media, health and physical culture, social policy, some household services, and other services. Expenditure by State agencies providing collective services include expenditure on general-purpose State bodies, law enforcement and ensuring security, scientific research, pension benefits, etc. Expenditure on final consumption by State agencies providing collective services reflects the cost of the non-market services of such agencies which is taken as equal to their current expenditure, including consumption of fixed capital.

The data in the consolidated budget performance report of the Republic of Belarus, in the annual report of the Public Social Security Fund and in the State statistical reports are the source of information on expenditure on final consumption of individual and collective goods and services by State agencies. The gross accumulation of fixed capital is discounted at the time of transfer of the right of ownership thereof to the institutional unit that intends to use it in production.

Uncompleted construction works carried out on a business basis are included in the gross fixed capital accumulation of the builder in proportion to the completion of the work. Equipment with a long production cycle (ships, transfer lines, etc.) are included in fixed capital accumulation at the time of delivery to the client. Increase in the value of cattle in the main herd is determined on the basis of data concerning the number of cattle at the start and end of the year and the prices for each type of such cattle. Data in the State statistical report are the source of information for calculation of gross fixed capital accumulation.

Change in reserves of floating assets is defined as the difference between the goods entering and being withdrawn from storage. At the same time, the assets must be valued at the market prices in force at the time of entry or withdrawal. Reserves of purchased physical working assets are valued at the price paid by the purchaser. Reserves of physical floating assets produced in-house are valued at basic prices. In order to exclude the influence of price changes (holding gain) during the period in reserve, the value of physical floating assets is recalculated at the beginning and end of the accounting period at the mid-prices for the accounting period by using a tariff adjustment. To allow for variations in reserves and prices over the course of the year, the calculation is made at quarterly intervals, the size of the change in reserves for the year being the sum of the quarterly data. Measurements of the export and import of goods and services are based on the foreign trade statistics and the balance of payments of the Republic of Belarus.

The volume of GDP by the expenditure approach at constant prices is determined by aggregating the components of GDP, with current prices converted to constant prices. In converting to constant prices, household expenditure on purchase of goods and payment for services (consumer costs) is divided into groups of goods and services in accordance with consumption trends on the basis of the international Classification of Individual Consumption According to Purpose (COICOP) and deflated by the corresponding consumer price indexes. The final consumption expenditure of State agencies and non-profit institutions serving households, classified by types of services at constant prices, is calculated by the method of extrapolation of data from the production account at current prices for the preceding year according to the index of the physical volume of output of the corresponding sector (type of services).

Gross fixed capital formation at constant prices is calculated by aggregating the component elements converted to constant prices by data deflation at current prices to the corresponding price indexes. In calculating the conversion of reserves of tangible current assets to constant prices, data at current prices are allocated in accordance with the sectoral structure based on the data of the input-output tables for the previous year and are deflated to the price indexes of the corresponding sectors.

Calculation of the export (import) of goods at constant prices is done by the extrapolation of data on the export (import) of goods at current prices for the preceding year in accordance with the index of the physical volume of the export (import) of goods. Calculation of the export (import) of services at constant prices is done by the extrapolation of data on the export (import) of services at current prices for the preceding year in accordance with the index of the physical volume calculated on the basis of the index of the export (import) value of the services

and the index of the export (import) prices of goods in United States dollars.

### **Income Approach**

Labour costs comprise two basic components: wages and contributions by employers to State social insurance. Wages comprise remuneration for work performed and time worked; incentive payments (allowances and additional payments for occupational skills, grade, length of service, etc.); compensatory payments (additional payments for hazardous working conditions, remuneration for work performed on days off, on holidays, etc.); and payment for time not worked.

Employers' State social insurance contributions may be calculated on an actual or nominal basis. Actual social insurance contributions comprise payments made by employers to the Social Security Fund of the Republic of Belarus and to the State Employment Assistance Fund. Nominal social insurance contributions comprise social assistance paid by employers directly to their employees, former employees or their dependents that are entitled thereto by virtue of their resources.

Information for the calculation of labour costs is derived from the data in the State statistical reports and from other administrative sources. Information on taxes and subsidies on production and imports comes from the data in the consolidated budget performance report of the Republic of Belarus. Gross profit and gross mixed income are calculated as a balancing item.

### **Production Approach**

GDP data using the production approach by sector are reported at market prices. The production approach is used for the calculation of Value Added in all sectors as the difference between output and intermediate consumption.

The output of the "Industry" sector includes: the value of goods produced by industrial organizations, by their subsidiary industrial production systems, and by small enterprises, and the value of industrial goods produced in household enterprises.

The output of the "Agriculture" sector comprises the output of agricultural entities, farms, private subsidiary enterprises belonging to citizens and organizations providing services to agriculture.

The output of the "Construction" sector includes: the value of building and installation work; design and survey work; major repair work on buildings and installations; the value of individual residential accommodation and other structures built by in-house resources.

The output of the "Transport" sector includes: earnings from the carriage of goods and passengers; earnings from subsidiary transport activity (loading and unloading operations, operation of warehouse premises, etc.); the value of work on the repair and maintenance of highways. The calculation is made by type of transport.

The "Trade and public catering" sector includes both domestic (wholesale and retail) and foreign trade, and public catering. The output of the retail and wholesale trade is measured by the size of the commercial markup (gross revenue), which is the difference between the sale price and purchase price of goods. The output of public catering is equivalent to the trade turnover of public catering (in other words, in addition to gross revenue it includes the value of the produce used in food preparation).

The "Housing" sector includes services in connection with the operation of the housing stock, including hostels, other than those for visitors. The output of market services for housing is determined by the amount paid as operating expenditure. The output of non-market housing services is evaluated by the amount of current costs for the servicing of the housing stock. Information for calculation of the output and intermediate consumption of the above-mentioned sectors comes from the data in the State statistical reports and from domestic housing surveys.

The output of the "Health", "Education", "Culture" and "Management" sectors include the value of market services

and the value of services financed from budgetary resources. Information for the calculation of the output and intermediate consumption of market services comes from data in the State statistical reports for non-market services, and data in the consolidated budget performance report.

In order to estimate the Valued Added of the sectors at constant prices, the double deflation method is used. Output by sector at constant prices is converted by extrapolation into the corresponding indexes of physical volume (industry, agriculture, trade, transport), or by deflation into the corresponding price indexes (construction, market services). The index of the number of persons employed in sectors of the economy is used in evaluating non-market services at constant prices by the extrapolation method.

The components of Intermediate consumption are converted to constant prices by means of deflation into the corresponding price indexes.

## Belgium

### Source

The national accounts are produced under the responsibility of The Institute of National Accounts (INA) which was created by the Law of 21 December 1994 on the reform of the Belgian statistical apparatus. The INA is charged with compiling the following statistics and forecasts:

- real and financial national accounts;
- quarterly national accounts;
- regional accounts;
- detailed quarterly accounts of general government;
- input-output tables;
- international trade statistics;
- economic forecasts for the federal budget.

The INA does not have any staff of its own, but coordinates the tasks of three associated institutions:

- the National Statistical Institute (NSI), which is responsible for collecting the basic data (apart from data on international trade);
- the Federal Planning Office (FPO), which compiles the input-output tables and budget forecasts;
- the National Bank of Belgium (NBB), which compiles annual real and financial national accounts, quarterly accounts, regional accounts, international trade statistics (including the collection of basic data) and, in cooperation with the FPO, the detailed accounts of general government.

The official estimates are published on the internet ([www.nbb.be](http://www.nbb.be)) and through several publications referred on that same website.

### General

The Belgian national accounts are in accordance with the concepts and methodology prescribed in the SNA 1993 and the ESA 1995. A complete methodological inventory on GNI compilation, including a numerical example for 2003, is available on the website of the National Bank.

The timetable for publishing the non-financial annual national accounts is as follows:

Industry tables and Sector accounts will be published in October for the years t-1, t-2, t-3 and Supply and use table (SUT) will be published on December of each year for the year t-3

Input-output tables are compiled every five years (from 2000 onwards).

The main reason for current revisions is that more exhaustive or more reliable source data become available than when the previous estimate was made. The revisions therefore relate mainly to the most recent year.

Not all the revision items identified for the accounts are actually carried out, but only those which do not cause a break in the series. Exceptions are revisions which are necessitated by adjustments which have to be made immediately pursuant to European Directives (e.g. Directives on excessive government deficits or on contributions to the European Union's own resources).

Current revisions to the national accounts, other than revisions resulting from European Directives, are made with effect from the date on which the last deadline for the reporting tables expired. The reporting tables and their deadlines are laid down in the ESA 95 transmission programme. The last deadline is for the supply and use table: t + 36 months. This means that, as of that date, no further current revisions are carried out and that GDP and GNI are definitive (until the next occasional revision, cf. *infra*). Current revisions of the annual accounts and quarterly accounts are synchronized. Quarters in a year for which annual aggregates have already been published are only revised as part of a revision of the annual aggregates (October).

For the period for which no further current revisions can be made, new data or improved methods can of course become available after the definitive accounts have been compiled. The revisions to which this can give rise are only performed on an occasional basis, however. Occasional revisions can also be prompted by the application of new concepts (e.g. ESA 95 concepts) or amended classifications. Occasional revisions are not performed at any pre-determined frequency, nor is there any particular period to which revisions have to relate. As a general rule, occasional revisions go as far back in time as possible, so as to preserve the consistency of the series.

In Belgium, recent occasional revisions were carried out in connection with the introduction of ESA 95 (in 1998) and in 2005. In future, revisions will be carried out in line with the common revisions policy to be agreed on between the Member States and Eurostat.

In October 2006 the volume measurement has been switched from fixed prices (2000) to chain volume measurement, from 1995 onwards.

## **Methodology:**

### **Overview of GDP Compilation**

Gross domestic product is estimated mainly through the production and the expenditure approach, and the production approach is the dominant one.

### **Expenditure Approach**

The consumer expenditure of households is obtained mainly from the annual Household Budget Survey (HBS), administrative data and specific surveys. Administrative data are used mainly for estimating the consumption of alcoholic beverages and tobacco products, purchases of cars and spending on health care.

The HBS provides the data based on the concept of final national consumption (final consumption by Belgian households). Because the supply and use table is integrated on territorial lines, the figures have to be converted from the national concept to the domestic concept of final consumption (final household consumption on Belgian territory). To this end, balance of payments data are used. Tourist expenditure abroad by households which are resident in Belgium is not included in the HBS, whereas final consumer expenditure by non-residents in Belgium (obtained from the balance of payments) is added to final consumption (by resident households) in Belgium.

The consumer expenditure of general government is based on administrative sources. This item is subdivided into individual final consumption (P31S13), i.e. expenditure in respect of which the consumer is identifiable, and collective consumption (P32S13).

Individual consumer expenditure (P31S13) includes general government expenditure on goods and services produced by market producers with a view to providing them (without processing) to households in the form of social transfers in kind (D6311+D63121+D63131). In Belgium, the latter are especially important, since all hospitals, rest homes, and reception centers for the disabled, whether privately or publicly owned, are market producers.

The main sources are accounting data from budget turn-outs. They can differ, depending on the sub sector in question: payment orders in the case of the Federal Government (S1311) and the Communities and Regions (S1312), spending commitments for local government (S1313) and economic charges borne by social security funds (S1314).

Final consumer expenditure by NPISHs is equal to the sum of their non-market output (P13) and their expenditure on goods and services produced by market producers with a view to making them available to households in the form of social transfers in kind (D63131).

Three main sources are used to estimate fixed capital formation are the annual enterprise accounts, VAT returns

and the structural business surveys. Additional sources are used only for certain 'special' estimates, e.g. investments in dwellings, software and agriculture. The detailed general government accounts are used to estimate investments in the general government sector.

Specific estimates are made for dwellings, software, literary, software and artistic originals, and for farmers.

The balance of payments and international trade statistics form the basis for the calculations of imports and exports of goods and services.

Volume measurement is carried out in prices of the previous year, using available price information on a level as detailed as possible.

### **Income Approach**

No independent estimate of GDP is made from the income perspective. The estimate of value added in basic prices and its income components, compensation of employees (D1), net other taxes/subsidies on production (D29-D39), gross operating surplus/mixed income (B2g/B3g), is done simultaneously, with B2g+B3g being determined as a balancing item.

Compensation of employees (D1) is estimated by a combined use of accounting information (annual accounts, specific accounting documents for the financial sector, general government accounts) and information on paid social contributions. The totals for D29 and D39 are available from the general government account and the rest of the world account. These totals are distributed over sectors and industries, taking account of the type of taxes and subsidies.

### **Production Approach**

The output-side estimate of GDP is based largely on the business register, which is compiled by the National Statistical Institute. This database includes all economic agents which are active in Belgium. The basic information for the register is provided by a number of government departments (Value added tax (VAT)-Administration, National Social Security Office (NSSO), National Register) which manage partial files of units for their own purposes (enterprises which are liable for VAT, enterprises/employers and legal persons). The NSI compiles the business register by combining the identifiers in the source files.

On the basis of this register, the NBB compiles an annual 'directory' which includes all enterprises (corporations, self-employed persons, non-profit associations) and the identification numbers and characteristics which are relevant to the national accounts.

By combining the following characteristics, it is possible to calculate ESA 95 variables in detail, and select the most appropriate basic source:

- NACE code (determines the industry to which the unit is classified);
- category (determines which basic source is used to estimate a unit's activities);
- institutional sector code (determines the institutional sector to which the unit is classified) .

The units for the general government sector (S13) are obtained from an exhaustive list, which is updated annually. As the estimate of value added in the general government sector is based on specific source material, aggregates for these units are calculated differently to those for market producers.

Sector codes are assigned to the units in the directory largely via an automated procedure. By combining the NACE code and the significance of certain digits in the identification number, it is possible to determine the sector code of units which are not part of general government.

The aggregates (e.g. turnover, acquisitions, wages and salaries) for these units are calculated using a standardized method. The variables in the various source files are always aggregated on the basis of the characteristics (NACE code, sector code) in the directory. This ensures that results which are calculated from

different sources are mutually comparable. Basic aggregates at national level are always calculated at industry level and per institutional sector. This ensures a completely integrated calculation at industry and sector levels.

All relevant administrative and survey data for non-financial corporations (S11) and unincorporated enterprises (S14) are stored at enterprise level in an 'enterprise database'. In the case of corporations in the processing industry, for example, we have at our disposal the annual accounts, total wage bill as derived from the NSSO-return, turnover, current purchases of goods and services and investments as recorded in VAT returns, industrial output as recorded in Prodcum (Community survey of industrial output) and the structural business survey data.

The calculation method employed in ESA 95 makes full use of administrative data. The most important administrative sources are the annual accounts compiled by non-financial corporations, VAT returns by enterprises which are liable for VAT and NSSO returns submitted by employers.

In Belgium, almost all limited-liability corporations (public limited companies, cooperatives, etc.) are required to make their accounts public by filing them with the NBB's Central Balance Sheet Office in a standardized form which is laid down by law. The annual accounts file is therefore the preferred source for estimating ESA 95 aggregates in the output and primary generation of income accounts of non-financial corporations.

All enterprises with a turnover of more than 0,5 million EUR must comply with the 'Minimum Standardized Accounts System'. This accounting plan (introduced by Royal Decree in 1983) implements the Law on the financial records and annual accounts of enterprises, which dates from 1975. The Law on financial records lays down the content of the various headings in the balance sheet and profit-and-loss account (revenues and costs). In this way, enterprises' accounting plans can be translated into the transactions defined for ESA 95.

The activities of most non-financial corporations (the supply of goods and services) are subject to VAT. Only a small number of activities are exempt from VAT (e.g. legal and medical services and rents on immovable property). The VAT returns can be used to derive turnover (proxy for P1), current acquisitions of goods and services (proxy for P2) and acquisitions of investment goods (proxy for P51). In most industries, the information on turnover and current purchases is used to estimate the value added of units in sector S14 which are liable for VAT, and to estimate the activities of corporations for which (usable) annual accounts are not available.

All employers established in Belgium are required to submit a quarterly return to the NSSO. The returns are used to calculate the social contributions payable. The information contained in the returns makes it possible to calculate the compensation of employees. Total wage bill is used, in some service industries, to estimate the value added of corporations with no annual accounts and non-profit associations in sector S11.

Financial institutions (S12) and general government (S13) use specific types of financial accounts which have to be translated into national accounts aggregates.

The value added of non-market non-profit associations (S15) is estimated by means of a combination of administrative data (NSSO total wage bill) and survey data. In recent years, a special survey of non-profit associations has been carried out for national accounts purposes.

National accounts aggregates are compiled in two stages. First there is the transition from micro-economic aggregates to administrative aggregates at a rather detailed level. After several quality checks the administrative aggregates are converted into national accounts aggregates. All adjustments and reclassifications have a counterpart, which may be recorded in the operating account or elsewhere. In this way, the overall consistency of the sector account is maintained.

The information necessary for making these adjustments is available either from the annual accounts or from the structure survey, or in the form of exogenous data in accounts S13 (taxes/subsidies on products and other taxes/subsidies on production) and S12 (insurance premiums received and insurance claims paid).

For all industries volume is compiled using the double deflation method. Chain volume measurement has been applied since 2006.

## Belize

### Source

Reply to the United Nations national accounts questionnaire from the Central Planning Unit, Ministry of Finance and Economic Planning, Belize. Official estimates are published in "National Accounts Statistics". Information on sources and methods of estimation are published in "National Accounts Statistics - Sources and Methods" and in "Economic Accounts of the Public Sector".

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all the tables were updated. Some contain data following the 1968 SNA which usually show small differences compared to the new data compiled in accordance with the 1993 SNA. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Benin

### Source

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique et de l'Analyse Economique, Direction Generale, Cotonou. Official estimates are published in "Comptes de la Nation 1974-1975 et les Estimations des Aggregats de Comptes Nationaux a Prix Courants et a Prix Constants de 1970 a 1977".

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Bermuda

### Source

Reply to the United Nations national accounts questionnaire from the Statistics Department of Bermuda, Hamilton.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The data from 1996 on have been completely revised and therefore, a new series was introduced. Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Bhutan

### Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Office, Bhutan. The official estimates are published in "Revised Series on Gross Domestic Product of Bhutan" and "National Accounts Statistics".

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

### Methodology:

#### Expenditure Approach

Private consumption expenditure was estimated based on the 2000 HIES and 2003 BLSS as benchmarks. The two sets of data were adjusted for under coverage in the sample population. Private Consumption Expenditure was classified using COICOP. The value of FISIM estimated as consumed by households and output of life insurance were added to total PCE in line with the recommendations of the 1993 SNA. The estimates for Gross Domestic Capital Formation consist of Machinery & equipments, construction and change in stock. For machinery and equipment, the sources of data are mainly from trade documents and in absence of trade documents historical trends were made use of. Change in stocks of livestock was revised based on livestock population of 2000 Agriculture Census and the off census years were estimated based on the growth rate of the previous data. Data for export and imports of goods were based on merchandise trade compiled by the Ministry of Finance while the data on services were taken from the BOP of the RMA.

#### Production Approach

The GDP figures for Agriculture were revised using the results of the 2000 Census of Agriculture production as benchmark. The 2000 base year prices were computed by multiplying quantity of harvest by the 2000 farm gate prices for crops whose prices are available. For crops where prices were not available, farm gate prices were estimated using the retail prices collected for the compilation of consumer price index. Subsequent prices of the commodities were estimated based on the change in retail price for the CPI compilation or the trend of prices of commodities with farm-gate prices. The benchmark population data of livestock and poultry were taken from the 2000 Census of Agriculture. These benchmark values were extrapolated using the trend of the statistics generated from the reports of the dzongkhags. The parameters of estimation were not changed as they are believed to still hold. Animal feed are excluded in the estimates as most of the livestock fodder are maintained by livestock grower. Moreover, there is no strong basis of the estimates of animal feed from the forest.

Value added ratios of the different types of mining were revised from a constant value added ratios to annually updated ratios based on profit and loss statements of mining companies for various types of mining. In general, the value added ratios were lower than the fixed value added ratios used in the original estimates.

Manufacturing was divided into large, small and unregistered. Estimates of large manufacturing, which accounts for more than 70 % of total manufacturing are done based on the profit and loss statement of the enterprise. Estimates at 2000 prices are based by deflating the gross value added by the rebased price deflator.

Gas was removed from the economic activity as this refers to LPG which is more of packaging of LPG. The activity is classified as an activity of retail trade. The estimate of electricity is based on actual data on electricity generation and distribution. The estimation methods were retained.

Construction value added is divided into private construction composed of private urban, thatched houses repair of

thatched houses, development of orchard, other farm construction, construction of private and government corporations and general government construction.

To estimate figures for Wholesale, Retail Trade and Repair of Vehicle and other household equipment, data based on turnover statistics from Inland Revenue Office were used. Estimates of Repair of Vehicle and household equipment were included using the data from the 2000 HIES as benchmark. The total household expenditure on repair was divided by the number of light vehicle and multiplied by the total number of vehicle. The benchmark is extrapolated using the registered number of vehicle and price index of non food. Data for Hotels and restaurants are shown separately according to ISIC rev 3 and for better use of data for an emerging economic activity.

The estimates of financial services are based on audited financial reports of the financial institutions in Bhutan. This covers the monetary authority, commercial banks, insurance and other financial institutions. The computation is based on the recommendations of the 1993 SNA for commercial banks and insurance services. Financial intermediation services and insurance were distributed to producers and household as final consumer of banking and insurance services. This is in accordance with the recommendations of the 1993 SNA.

Data for Real estate and business services included actual rental and imputed rental of owner occupied dwelling. Benchmark estimates of actual rental and imputed rental of owned dwelling were based on 2000 HIES and 2003 BLSS. Business Services output and value added is based on the turnover statistics provided by the Ministry of Finance as by-product of revenue function.

Transportation and communication consists of transportation by Road, Air and Tele-communications. The estimates are based on number passenger buses, trucks, taxis, etc; and for air transportation it is based on their annual profit and loss account statements. The prices or price indices with base year 1980 were rebased to 2000 and used to deflate the current price estimates to derive the gross value added at 2000 prices.

The recommendation of the 1993 SNA to separate the different economic activities of general government was adopted in the revision. Public administration referred only to general government activities on policy and regulatory activities. Educational and Health Services were separated and grouped with private services. Data for Public administration were estimated as non market output where gross value added is computed as the sum of compensation, consumption of fixed capital.

Health and education services include government and private sector services. Government services are estimated directly from government expenditure while private education and health services are estimated using the household expenditure on health and education services from the 2000 HIES and 2003 BLSS. As government health and education services are free, household expenditure for health and education services taken as private services.

Other services are estimated based on benchmark values taken from 2000 HIES and 2003 BLSS. The estimates are then interpolated between the two surveys and extrapolated using population and consumer price index.

## Bolivia

### Source

The preparation of national accounts statistics in Bolivia is undertaken by the Instituto Nacional de Estadística, La Paz. From 1970 to 1982, they were prepared by the Central Bank of Bolivia. The official estimates and methodological notes are published in a series of publications entitled "Boletín de Cuentas Nacionales". The most detailed description of the sources and methods used for the national accounts estimation is found in "Cuentas Nacionales, 1958-1966, Planeamiento". The Input-output table for 1958 has been published in "La Matriz de Transacciones Intersectoriales de Bienes Nacionales e Importados". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. On 1 January 1987, the Bolivian peso was re-denominated from pesos to bolivianos. One boliviano is equivalent to one million pesos.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the United Nations System of National Accounts 1968 (1968 SNA) so far as the data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure which is obtained as a residual. The estimates of the government final consumption expenditure are based on the annual government accounts furnished by the respective government agencies. Increase in stocks estimates are based on information obtained from the enterprises. For public capital information, estimates are obtained from financial statements of the public institutions. The estimates are classified by type of goods and subdivisions of the public sector. For the estimates of private capital formation, the Instituto Nacional de Estadística requests detailed information from the enterprises. The estimates of imported machinery and equipment are based on c.i.f. import values classified by use or economic destination. Trade margins and transport expenses are then added. The estimation of domestically produced capital goods is done on the basis of annual industrial statistics. Data on exports of goods and services are obtained from the balance of payments accounts. The value of non-monetary gold export is added to the f.o.b. figures while imports are estimated by the Banco Central. For the constant price estimates, government expenditure on wages and salaries are revalued at base-year prices while purchases of goods and services are deflated by implicit price or cost-of-living indexes. The estimates of private consumption expenditure is obtained as a residual. For the remaining items, price deflation is used.

### Income Approach

The cost structure of the gross domestic product has not been estimated since 1969.

### Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most industries, but due to lack of information on intermediate consumption, value added coefficients established from the input-output table of 1958 have been utilized. The income approach is used to estimate value added of public administration and defence and some private industries. For agriculture, information relating to production volume is used, estimated on the basis of information on areas sown and production yields prepared by the Ministerio de Asuntos Campesinos y

Agropecuarios and by special institutions. The gross value of production is estimated by using data on physical volumes and producer prices. Estimates of livestock production is based on existing livestock, information on meat cutting for domestic consumption and export data. The mining sector consists of the Corporacion Minera de Bolivia (COMIBOL), and of medium and small mines. The basic statistics are obtained from the accounts of COMIBOL, from Ministerio de Minera, from financial statements of medium-sized mines and from export statistics for small mines.

The estimates for the manufacturing sector are based on information obtained from the annual industrial statistics published by the Instituto Nacional de Estadística supplemented by statistics from private and public institutions and other studies. Information on electricity is obtained from the Direccion Nacional de Electricidad which controls all the public and private enterprises. The sources used for the construction estimates are the accounts of public institutions permits issued by municipalities and financial statements submitted by the construction enterprises. The value of production of private construction, which is based on permits issued and classified by surface area, is adjusted by a percentage for planned unfulfilled work. Information on trade margins and trade volumes is furnished by various concerned institutions. The gross trade margins are estimated from the price differences between the wholesale and producers prices as well as the consumer and wholesale prices for all the agricultural products and a sample of manufactured and imported goods entering the distribution channels.

Restaurants and hotels estimates are based on a sample survey of the principal establishments in La Paz, blown-up to cover the whole country by using the number of establishments as indicators. The estimates of railway transport are based on the accounts of the public railway enterprise. The gross value of production for urban passenger transport is estimated on the basis of the number of buses in operation, mileage, passenger volumes and average tariffs. Air transport estimates are based on the accounting statements of the national airline as well as taxes charged on foreign airlines. The accounting statements of the financial institutions are used for the financial sector. For ownership of dwellings, census information on population and housing is used supplemented by statistics on real estate.

For public administration and defense, the main source is the annual financial statement requested by the Banco Central de Bolivia. Estimates for private services are obtained from concerned entities and institutions. For constant price estimates, value added for agriculture, mining and quarrying, manufacturing and transport sectors is extrapolated by quantity index for output. Value added of construction is estimated by multiplying the annual authorized construction volume by the base year prices. For the remaining industries, value added is deflated by appropriate price indexes.

## Bosnia and Herzegovina

### Source

The data on Bosnia and Herzegovina was received through the United Nations Economic Commission for Europe (UN/ECE).

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

## Botswana

### Source

The national accounts Statistics in Botswana are prepared by the National Accounts Statistics Unit (NASU), which is a unit within the Economic Statistics Division of the Central Statistics Office (CSO) of the Ministry of Finance and Development Planning, Gaborone. Official estimates together with methodological notes are published in a series of reports entitled "National Accounts of Botswana". The following statistical sources are used to compile the National Accounts Statistics of Botswana: Census of Production and Distribution (CPD) - annually, Census of Construction and Manufacturing (CMC) - annually, Survey of Recent Trends (SRT) - quarterly, Agriculture Statistics - annually, Government Accounts (Central and local), External Trade Statistics - quarterly, Balance of Payments Statistics - annually, Household Income and Expenditure, Survey (HIES)-1993/94 (every 10 years), Price Statistics - quarterly, Employment Statistics - twice a year, Transport Statistics - quarterly, Mine Statistics - quarterly, Population Projections (every 10 years). The following tables have been prepared from the successive replies to the United Nations national accounts questionnaire.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The previous estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). The most detailed description of the sources and methods used for the national accounts estimation is found in the twenty-first edition of the report published in March 2000 for the fiscal year 1994/95. Data starting 1989 is reported with fiscal year beginning on 1st of July of the previous year to the 30th June of the current year. Previously, data was reported with fiscal year beginning on 1st July of the current year to the 30th June of the preceding year. This data was adjusted to conform with the new fiscal year. The new data is indicated by the start of new series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

### Methodology:

#### Overview of GDP Compilation

The GDP by kind of economic activity is prepared at market prices. The production approach is used to estimate value of almost all industries. The income approach is used for some sub-groups of private services and for producers of government services.

#### Expenditure Approach

Estimate of final expenditure on GDP may be obtained in two ways. First output of goods and services can be traced through the economy from the original producer to final uses, this is known as commodity flow approach. Alternatively, the receipt and expenditure of the various economic transactions of the system can be looked at directly in order to identify the expenditures that are final and this is referred to as direct estimation of final expenditure. In Botswana national accounts, direct estimation is used for most of the expenditure components. All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure which is obtained as a residual. The estimates of the government final consumption expenditure are based on annual statements of the accounts of central and local governments. Changes in stocks is estimated on the basis of Census of Production & Distribution (CPD) for all the sectors of the economy. Gross fixed capital formation of the government sector is estimated from the government accounts and of the private sector from the CPD. Included in the capital formation estimates are the cost of land clearings and imputed values of new huts. The estimates of imports and exports of goods and services are based on balance-of-payments data. Exports and imports of goods have to be adjusted for duty content, in accordance with the Southern African Customs Union agreement.

### **Income Approach**

Estimates of compensation of employees are obtained from the Census of Production and Distribution (CPD). Data on payment of wages and salaries are distinguished whether paid to residents or to non-residents and are also classified by type. The main source for estimating consumption of fixed capital formation in the private sector is the CPD. For government assets, straight - line depreciation is applied, the constant percentage varying for different types of assets. Indirect taxes are extracted from the Accountant General's annual statements of accounts, the CPD and the Trade Statistics Unit.

### **Production Approach**

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of almost all industries. The income approach is used for some sub-groups of private services and for producers of government services. For the traditional farming of the agricultural sector, the main source used for crops is the annual agricultural sample survey and for cattle, the sources used include Household Income and Expenditures Surveys (HIESs) and annual reports of Botswana Meat Commission. The method has been to obtain quantities of production from the above mentioned sources and apply unit values. Data from the 1985/86 and 1993/94 HIESes also provided information on milk production for own use and the value of meat consumed. From the two surveys, detailed input-output activity analysis of the traditional farming sector has been conducted. For the freehold farmers, the main source has been the CPD and to some extent the annual agricultural survey. For the non-respondents, a grossing-up is made by reference to other farms of the same type.

The estimates for the mining sector are obtained from the Census of Manufacturing and Construction (CMC) which covers all the primary industries. For the manufacturing sector which is dominated by about three sub-industries, the source is the CMC and quarterly survey of Industrial Production. The two above mentioned sources cover all the primary industries, whilst the rest of the sectors are covered by the CPD. This came into effect in 1989. Both the CMC and the CPD gives information for estimating the cost of intermediate consumption. All the government industries go to their respective sectors. For construction, the private contractors and brigades are covered by the CMC. Estimates of construction outlays for sites and services are supplied by city and town councils whilst rural huts construction estimates are imputed on the basis of the HIES data. Estimates of construction carried out by the government departments are derived from the analysis of government accounts.

The main source of information for the trade sector is the CPD. The data obtained from this source is grossed-up to allow for under-coverage. Gross margins are estimated as the difference between sales and purchases of goods for resale. Taxes levied on imported goods are treated as indirect taxes collected by the trade sector. As far as the transport sector is concerned, the source of data is the CPD. The major contributor is post and telecommunication (30 to 40 percent of value added). Gross output of financial institutions is made up of the actual sales of services and an imputed service charge. Estimates for producers of government services are based on the Annual Statements of Accounts of the central and local governments. For the constant price estimates, the CPD data are deflated by a cost-of-living index.

## Brazil

### Source

Reply to the United Nations national accounts questionnaire from the Instituto Brasileiro de Geografia e Estatística, Departamento de Contas Nacionais (DECNA), Rio de Janeiro. The official estimates are published by DECNA in a series of entitled "Conjuntura Economica" and Sistema de Contas Nacionais Brasil". Data are in units of real before 1991 and real from 1991 onwards.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## British Virgin Islands

### Source

Reply to the United Nations national accounts questionnaire from the Development Planning Unit, Ministry of Finance, Economy and Development Planning, Tortola. The official estimates are published in "National Accounts Statistics", by the Development Planning Unit. Employment data is published in Employment and Earnings Statistics Report.

### General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

#### Expenditure Approach

GDP by expenditure is the sum of final consumption at purchasers' prices, gross capital formation (acquisition less disposals of fixed assets and valuables at purchasers' prices plus the net change in inventories) and net exports of goods and services (exports of goods and services at purchasers' prices less imports of goods and services at purchasers' prices).

#### Income Approach

GDP by income paid to the factors of production, which equals labour, capital and taxes on production and imports.

#### Production Approach

Value added is calculated separately for each activity at basic prices. The sum of the values added by activity (at basic prices) and taxes on products is equal to GDP at producers' prices for the entire economy. GDP is thus the sum of the values added produced by resident productive units in a given time period, adjusted for the relevant taxes. Value added is defined as the difference between output at basic prices and intermediate consumption, plus taxes on products. In the British Virgin Islands, the only taxes on products are import duties and hotel accommodation taxes. In addition, there are no value added taxes which implies that GDP at producers' prices equals GDP at market prices.

## Brunei Darussalam

### Source

The preparation of annual and quarterly national accounts statistics in Brunei Darussalam is undertaken by the Department of Statistics (DOS), Department of Economic Planning and Development (JPKE), Prime Minister's Office, Brunei Darussalam.

The official annual estimates are published in the Annual National Accounts (ANA) and the Brunei Darussalam Statistical Yearbook (BDSYB) publications; while the quarterly estimates are released through the Quarterly Gross Domestic Product reports on the internet ([www.depd.gov.bn](http://www.depd.gov.bn)) and published in the Brunei Darussalam Quarterly Statistical Indicators (BDQSI) publication.

### General

The latest estimates shown in the following tables are based on the new national accounts series for Brunei Darussalam. On 14 August 2006, JPKE announced the new rebased and revised national accounts series for Brunei Darussalam, particularly the estimates of the Gross Domestic Product (GDP). The new GDP series, with 2000 as the base year, is consistent with the latest international guidelines as outlined in the 1993 System of National Accounts (1993 SNA). The previous 1974-based GDP series followed the 1968 SNA.

During the overall revision of the national accounts statistics for Brunei Darussalam, the following improvements were undertaken :

- a) Establishing new benchmark levels of GDP by production approach;
- b) Compilation of GDP by expenditure approach;
- c) Changing to a new base year (2000 = 100);
- d) Compilation of quarterly GDP by production and expenditure;
- e) Developing new methodology for the national accounts compilation; and
- f) Incorporating changes as recommended in System of National Accounts 1993 (1993 SNA).

The new series was released in the Annual National Accounts, 2000 – 2004 (2000=100) publication. The publication provides Technical Notes which includes definitions of national accounting terms, brief explanations of the different approaches used to compile GDP, as well as an outline of data sources and methodology used in the estimation. To facilitate users' needs for a longer time series, the estimated GDP back series covering the years 1985 – 1999, both by production and expenditure is also included in the publication.

### Methodology:

#### Overview of GDP Compilation

GDP is estimated mainly by the production approach. GDP by expenditure approach is also compiled. A statistical discrepancy is added to the GDP by expenditure to record the difference in the GDP values obtained from the production and expenditure approaches. GDP by income approach is currently not compiled

#### Expenditure Approach

The commodity flow approach is used for the estimation of personal consumption expenditure (PCE) and gross fixed capital formation (GFCF).

Total supply consists of local production and imports of goods and services, adjusted for trade and transport mark-up and tax mark-up. For local output, results from the 2002 EC and estimates of output based on the results of the QSB were used. While imports of goods are from the external trade statistics (ETS) that of services were derived from the balance of payments (BOP). ETS is used for the supply of imported commodities since it contains more detailed information than the BOP.

For the construction sector, the value of construction which was reported in EC and extrapolated using the indicators based on QSB was evaluated using the building materials approach. This is a variant of the commodity flow approach wherein the quantity and value of construction materials was used as indicator of the trends in the construction sector.

Estimation of government final expenditures as well as the gross value added originating from the government services sector is done by identifying from the available detailed government expenditures, those that fall under value added and intermediate consumption of government sector. For example, the contribution of government services to GDP is defined as expenditures on personal services including government employees' additional benefits such as free housing. Intermediate inputs are those referring to selected recurrent expenditures such as fuels, supplies and materials and other purchased services; while the rest of the recurrent expenditures are classified as current transfers and capital formation. GVA of the government is deflated using CPI all items.

Imports and exports of goods are direct estimates from ETS; while that of exports and imports of services are from the estimates of the same items in the BOP.

Imports of goods at constant prices were computed by dividing the current price estimates with the corresponding import price indices. Import price indices were constructed using unit values (value of imports divided by quantity of imports) from ETS.

### **Income Approach**

GDP by income approach is currently not compiled.

### **Production Approach**

The benchmark gross value added (GVA) of private businesses were derived mostly from the results of the 2002 Economic Census (EC). For the following years, the main bulk of information used in the production accounts was obtained from the results of the Quarterly Survey of Businesses (QSB). QSB is a short survey of medium and large enterprises in the country and thus effectively represents almost 60 per cent of the total value added in the economy. Data on basic indicators such as revenue, employment and compensation were asked in the survey for each quarter of the reference period.

For sectors which are included in the 2002 EC, gross output (GO) is calculated as the value of sales or revenue adjusted with changes in the inventories of finished goods (own produced). GVA is estimated by deducting from output the value of inputs or intermediate consumption (IC) used in the production process.

For the estimation of output for sectors with data on quantity of production such as for agriculture, mining and liquefied natural gas (LNG) manufacturing; output is defined as quantity of production multiplied with producers' prices. GVA is estimated by multiplying output with a gross value added ratio (GVAR). GVAR is computed using data from 2002 EC.

For sectors with data on volume of production, the constant price estimates are estimated by valuing current period production at base year prices.

A composite index consisting of average compensation index and all items consumer price index (CPI) weighted by value added shares was used to deflate the GVA of some sectors. Some deflators were constructed from the components of CPI, while others were developed as specific-purpose price indices such as export price indices.

## Bulgaria

### Source

Reply to the United Nations national accounts questionnaire from the National Statistical Institute, Sofia. Official estimates and descriptions are published annually by the same Institute in "Stiticheski Godishnik" (Statistical Yearbook).

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. In the reporting year 1999, the official currency has changed to denominated lev (1 denominated lev equals 1000 lev).

## Burkina Faso

### Source

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique et de la Demographie, Ouagadougou. Official estimates are published by the Institut in "Comptes Nationaux du Burkina Faso".

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). Previous estimates were compiled following the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Source

Reply to the United Nations national accounts questionnaire from the National Institute of Statistics, Ministry of Planning. The official estimates are prepared by the National Institute of Statistics (NIS), Ministry of Planning, with technical assistance from the Asian Development Bank (ADB).

## General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

## Cameroon

### Source

The national accounts of Cameroon are prepared each year by the Subdirectorates of National Accounts and Statistical Digests of the National Statistics Institute (INS) based in Yaoundé, Cameroon. Results have been issued in several official publications since 1994, which was when work started on the modernization and revision of the national accounts and the transition was made from the 1968 version to the 1993 version of the System of National Accounts (SNA).

The first publications, entitled "National accounts of Cameroon using 1993 SNA", were issued in April 1999, April 2000 and May 2002 and included the series of accounts from 1989/90 to 2000/01. Subsequently, two technical evaluation missions of the International Monetary Fund (IMF), which took place from 29 September to 9 October 2003 and from 6 to 17 December 2004, audited the methodology used to prepare the accounts and the quality of the data. Following these missions, the IMF experts concluded that the methodology used was in conformity with 1993 SNA and that the results obtained could be published and used.

Accordingly, the most recent publication, entitled "National accounts of Cameroon for 1993-2003 using 1993 SNA", was issued in August 2005. A CD-ROM was produced for distribution and may be consulted. The results are also available on the INS website [www.statistics-cameroon.org](http://www.statistics-cameroon.org).

### General

Prior to 1994, national accounts estimates were prepared using 1968 SNA. Thus the input-output tables were published for the period from 1965/66 to 1988/89. The national accounts are now prepared using the new System of National Accounts adopted by the United Nations in 1993 (1993 SNA). The preparation comprises six main stages: (i) classification and inventory of sources. This is a one-time operation, performed when the base year is selected, which is in theory changed every 10 years; (ii) collection and processing of data sources; (iii) reconciliation (cross-checking of various data sources for each operation involving goods and services and allocation); (iv) analytical work including compilation of supply-use balances, branch accounts and accounts of institutional sectors (who-to-whom matrix); (v) preparation of digests; and (vi) post-digest work (preparation of the next exercise).

Methodology guidelines describing these different stages have been published and a summary is given in the latest national accounts published in August 2005. This series differs from previous ones because of the transition from the budget year (July/June) to the calendar year (January/December), in compliance with the rules of the Central African Economic and Monetary Community (CEMAC), the accounting plan of the Organization for the Harmonization of Business Law in Africa (OHADA) and the IMF requirements specified in the General Data Dissemination System (GDDS).

In addition, there are new classifications of activities and products in compliance with revision 3 of the International Standard Industrial Classification of All Economic Activities (ISIC) and the new Central Product Classification (CPC): activities are classified at two levels (44 branches and 102 sub-branches); the classification of products is linked to that of activities and includes 3 levels and 287 products at the greatest level of detail.

The summary tables generally published are:

- Supply and use tables, formerly known as input-output tables in 1968 SNA, valued at current prices and at constant prices for 1993 and 2000;
- Integrated economic tables, formerly called comprehensive economic tables in 1968 SNA.

Since 1994, national accounts have been prepared by microcomputing using the ERE/TES system. This software was developed with the support of the French cooperation agency and the European Union. The ERE/TES module

has three main functions:

- A database comprising: (i) storage space for two years of data, facilitating comparisons; and (ii) working tables for compilation of the supply-use balance, branch accounts and the who-to-whom matrix;
- A management system for coordinating an exercise of preparing national accounts, by assigning tasks among team members and networking;
- Methodological guidelines for compilation of accounts using a plan of the various stages of work, help screens for each stage and assistance in monitoring work done.

It also has subsidiary functions, for instance for the publication of summary tables and of any other information available in the database.

## **Methodology:**

### **Overview of GDP Compilation**

In Cameroon, GDP is calculated using the following three approaches: production, expenditure and income. The first two approaches use data from the supply and use tables, while the third uses data from the integrated economic tables. The process involves parallel estimations of goods and services transactions and distribution operations. The estimates of these different operations are then cross-checked in the working tables (supply-use balances, branch accounts and who-to-whom matrix). Supply-use balances are compiled for each of the 287 products classified as products of Cameroon and branch accounts for each of the 102 branches into which activities in Cameroon are classified. The who-to-whom matrix is prepared for the various operations covered by the integrated economic tables. For each distribution operation, the goal is to match institutional sectors that provide goods and services and those that receive.

### **Expenditure Approach**

The final consumption expenditures of public administrations and non-profit institutions serving households (NPISH) are derived from estimates of their non-merchandise production, which is in turn calculated from data from various government and private sources. Final consumption expenditures are also classified into separate individual and collective non-merchandise categories.

Final consumption household expenditures are of two types: merchandise and non-merchandise. The data sources used to date are: (i) the 1984 budget consumer survey; (ii) the 1993 and 1994 1-2-3 survey of employment, the informal sector and consumption; (iii) the 1996 Cameroonian household survey (ECAM I); and (iv) the 2001 Cameroonian household survey (ECAM II). The volume index by product is estimated while the price index by product is derived from the national price index. These indices are then used to calculate final consumption levels at constant and current prices for a given year.

The gross fixed private capital formation is derived largely from the statistical and tax declarations of companies. The variables noted concern, inter alia, the value of land, non-residential buildings, residential buildings, other types of construction, plantations, transportation equipment, farming equipment, and plant and equipment under construction. The accounts also cover the different stocks of products (raw materials, products in manufacture, finished products and products for resale).

Gross fixed capital formation is obtained from documents on the credit situation that describe central government expenditures, government accounts, financial statements or operating accounts of decentralized public administrations, communal budgets and communal administrative accounts for local collectivities and international assistance the data on which is provided by the Caisse Autonome d'Amortissement (CAA) and the United Nations Development Programme (UNDP).

Figures for imports and exports of goods and services are obtained from customs and balance of payments statistics. A conversion table is prepared to convert the foreign trade data submitted under the Harmonized Commodity Description and Coding System (HS) to the corresponding national accounts product classification. Price indices are calculated from trends in unit values and the volume index from the ratio between the value and price indices. The balance of payments is prepared by the Ministry of the Economy and Finance and a conversion table is prepared to establish equivalences between its product classifications and those used in the national accounts.

### **Income Approach**

Data on workers' wages and taxes net of subsidies on the production of non-financial and financial companies are obtained from the statistical and tax declarations of companies. With regard to the central government, the same data is obtained from monthly wage figures, the table of financial operations of the State, and from the accounts of local collectivities and public establishments. Data for the household sector is obtained from the statistical and tax declarations of individual entrepreneurs and/or from analysis of the informal sector survey results. The combined gross surplus from operations and income is obtained from the balance between the value added from the production account of each institutional sector and the above elements. It should be noted, lastly, that sector accounts are prepared at current prices only.

### **Production Approach**

Data on the merchandise and non-merchandise production and on intermediate consumption in the different economic sectors are obtained from various sources. Data on production are at base prices while data on intermediate consumption are at acquisition prices.

Data on the production of subsistence and industrial export crops are obtained from the statistics of the Ministry of Agriculture and Rural Development. The value is calculated using data from the survey on the price formation of subsistence crops carried out by the National Statistics Institute and the export unit prices or world prices.

Data on livestock and fisheries are obtained from the Ministry of Fisheries and Animal Industries. In the absence of data on changes in the size of herds, the model used is based on the final consumption of meat and the rate of transformation from cattle on the hoof to meat.

Data on the production and intermediate consumption of agroforestry and forestry development and from the extractive and manufacturing industries, among others, are obtained from the statistical and tax declarations of enterprises in these sectors. It should be noted that the statistical and tax declaration is prepared each year by enterprises in the formal sector reporting on their financial and accounting situation.

Data on the production of banks and microfinance, insurance and insurance brokerage institutions are also obtained from the statistical and tax declarations and from the insurance market report prepared annually by the Ministry of the Economy and Finance.

The value of the non-merchandise production of public administrations is calculated from the wage bill, intermediate consumption and other taxes less any subsidies on production and fixed capital consumption. Data is also obtained from the various public administration records referred to above.

Data on the various types of taxes, including value-added tax, customs charges and export taxes, is obtained from government accounts, which cover income from government administrations, public financial statistics, tax statements and Cameroonian financial legislation.

Given the size of the informal economy of Cameroon, two matrices of production and intermediate consumption by sector of activity are also prepared in order to reflect the value created by this sector of the economy. The data sources used to date are the 1993 and 1994 1-2-3 surveys and the 2005 informal sector employment survey (EESI).

In the absence of source data, employment data and estimates of the consistency of technical coefficients and labour productivity (level of production divided by jobs) are sometimes used. Where possible, volume indices are calculated from changes in quantity and the price index is often calculated from the consumer price index.

## Canada

### Source

The preparation of national accounts statistics in Canada is undertaken by Statistics Canada, Ottawa. Official estimates are published by Statistics Canada quarterly in "National Income and Expenditure Accounts", Catalogue 13-001. Statistics Canada also publishes annual input-output tables at current prices in "The Input-Output Structure of the Canadian Economy", Catalogue 15-201. Monthly estimates of Gross Domestic Product by industry in chained dollars are published in "Gross Domestic Product by Industry" Catalogue 15-001-XIE (English) and 15-001-XIF (French). Quarterly statistics on flows of funds are published in "Financial Flow Accounts" Catalogue 13-014 and quarterly estimates of balance sheets in "National Balance Sheet Accounts" Catalogue 13-214. The monthly, quarterly and annual GDP in chained (1997) dollars is published in "Gross Domestic Product by Industry" Catalogue 15-001-XIE. These data can also be found online at [www.statcan.ca](http://www.statcan.ca).

Detailed sources and methods are published in "Gross Domestic Product by Industry: Sources and Methods" Catalogue 15-547-XIE (English) and Catalogue 15-547-XIF (French) and in "Gross Domestic Product by Industry: Sources and Methods with Industry Details" Catalogue 15-548-XWE (English) and Catalogue 15-548-XWF (French). In addition, detailed sources and methods are published in "A Guide to the Financial Flow and National Balance Sheet Accounts" Catalogue 13-585e (English) and 13-585f (French). A detailed description of the sources and methods used for the Income and Expenditure Accounts estimation is found in "Guide to the Income and Expenditure Accounts" Catalogue 13-603E (English) and 13-603f (French). A detailed description of the sources and methods used for obtaining the Input-Output Accounts in constant prices can be found in "A Guide to Deflating the Input-Output Accounts: Sources and methods" Catalogue 15F0077GIE. Reply to the national accounts questionnaire was received through the Organisation for Economic Co-operation and Development (OECD), Paris, France.

### General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the 1993 SNA, a footnote provides explanation. A discussion of these differences is found in Lal, K. "Remaining Differences Between the 1997 Canadian System of National Accounts and the 1993 International System of National Accounts, Statistics Canada, 1998" as well as Lal, K. "Measurement of Output, Value Added, GDP in Canada and the United States: Similarities and Differences, Statistics Canada, 2003." From 1961, chain constant dollars are referenced to the year 2002 and are not additive.

### Methodology:

#### Overview of GDP Compilation

In the Canadian System of National Accounts, activity is geared towards compiling data according to three different programs:

- 1) The annual Input-Output Accounts, where data are compiled using a value-added approach by sector and by industry. Data are presented in three main tables for Canada and its provinces and territories: the output, input and final demand tables. Provincial/territorial tables are linked through an interprovincial flows table that shows each jurisdiction's exports to, and imports from, other provinces and territories as well as abroad; National tables are produced on an annual basis, beginning with the 1961 reference year. Provincial tables are produced annually (starting with the 1997 reference year) and released with the national tables in November of each year with a 34 month lag from the reference year.
- 2) The quarterly Income and Expenditure Accounts, for which data by sector are reconciled with the Input-Output Accounts in benchmark years and projected using various surveys and administrative data for more current time

periods. A statistical discrepancy, balances the two approaches. The Accounts portray income arising from production, final expenditure on that production and redistribution of income through intersectoral transfers. Capital finance accounts show saving and non-financial investment of each sector, thus yielding their respective lending capacity or borrowing requirements. Initial estimates for a given quarter are released 60 days after the end of a reference quarter. These are subject to revision when estimates for subsequent quarters of the same calendar year are released and once a year in the following four years. Annual Provincial Income and Expenditure Accounts are released in two stages: in April of each year, when estimates for the preceding year are published, and in November of each year when four years' of data are revised and released.

3) The monthly GDP Estimates, which are chained volume estimates with a 1997 reference year. From the reference year forward, the monthly estimates are benchmarked to annually chained Fisher volume indexes of GDP obtained from the constant-price input-output tables, to the most recent year in which the latter are available. More current data are derived by chaining a fixed-weight Laspeyres volume index to the prior period. The fixed weights are the industry output and input prices from the most recent year available.

Canadian basic prices do not correspond exactly to international basic prices. The concept of modified basic prices is used, instead. The modified basic price of a product is equal to the price receivable from the purchaser minus any transport margins and trade margins at the time of delivery of the product to the purchaser and any taxes on products. It excludes any subsidy receivable by the producer. In Canada, the modified basic price is the subsidized price on products, while in the 1993 SNA it is the actual price plus subsidies.

## **Expenditure Approach**

Benchmark estimates of consumer expenditure have been based on the decennial Censuses of Merchandising and Services and on the retail commodity survey of 1974 and 1989 as well as the annual Family Expenditure Survey. More recently, mostly from 1997 onward, the benchmark estimates rely on the annual and monthly Retail Trade Survey and the quarterly Retail Commodity Survey as well as the annual Survey of Household Spending. These estimates are first adjusted to include commodities purchased through non-retail trade outlets and then broken down into trade groupings. For the non-census years, the benchmark estimates of each trade group are interpolated or projected by using the movement of sales of equivalent kind-of-business groupings. For non-retail trade groups, surveys of wholesale trade and service industries are used. Estimates of consumer expenditure on services such as transport, health care and education are based on annual surveys or published reports.

Government final consumption expenditure is based on public accounts and financial records and statements of government bodies. At the federal and provincial levels, the figures are derived by eliminating from total government budgetary expenditure all outlays that are not made directly to purchase new goods and services. At the local level, the estimates are built up directly on a gross basis from the data sources, subtracting revenues from sales of goods and services.

Comprehensive figures on the quantities of physical stocks held on farms and grains in commercial channels are available from the Agriculture Division of Statistics Canada. Inventories held by government agencies are obtained from government records. Estimates of inventory book values of non-farm business are based on annual censuses or sample surveys.

The estimates of gross fixed capital investment are based on the results of annual surveys which are published in "Private and Public Investment in Canada: Outlook" reports. Data are available separately for non-residential construction and machinery and equipment. Residential construction estimates are derived from housing starts as counted by Canada Mortgage and Housing Corporation, building permit values and monthly work-put-in-place coefficients.

The estimates of exports and imports of goods and services are based on information available in the balance of payments. For merchandise, the import and export figures are obtained from customs entries while for services, the estimates draw upon a number of sources such as surveys of business firms and Statistics Canada's international travel surveys.

Constant dollar values of government consumption expenditure are obtained through extrapolating base-year wages and salaries by total hours worked data and through deflating other current expenditure by base-weighted price indexes. Price deflation is also used for private final consumption expenditure, non farm stocks, non residential construction and machinery and equipment, and exports and imports of goods and services. The constant price series for farm inventories is derived by valuing the physical quantities of stocks in prices from the base period chosen. For residential construction, the estimates are derived by deflating current dollar component estimates with price indexes. Exports and imports of merchandise are each revalued by specially constructed current-weighted indexes.

### **Income Approach**

The general method used in the preparation of the labour income estimates consists of calculating the payments made on labour account by the various industrial groups and summing the results. The estimates are based on monthly and annual samples of full-coverage surveys conducted by Statistics Canada, decennial or quinquennial censuses and published statements of governments. A principal benchmark source of information is the tabulation of total wages and salaries submitted by employers with respect to employees' earnings, which is undertaken by the Canada Revenue Agency in connection with the administration of the Income Tax Act.

Estimates of corporation profits are obtained from the Survey of Quarterly Financial Statistics for Enterprises (for which annual data are based on tax data from the Canada Revenue Agency). Estimates of interest and miscellaneous investment income are based on information obtained from various sources such as the Canada Revenue Agency, the Bank of Canada, accounts and financial statements of governments and others. For unincorporated business, estimates are obtained either through direct inquiry, subtracting expenses from gross income or through applying the ratio of net to gross income based on survey or income tax data. The estimates of depreciation are calculated on an original cost valuation basis with a close link to the figures of book depreciation reported in the accounting records of business firms. For the government sector, capital consumption allowances are imputed while for the agricultural and housing sectors, replacement cost estimates of capital consumption are prepared from estimates of fixed reproducible capital at market values. The estimates of indirect taxes are based on accounting records of the various levels of government. Subsidies consist of federal and provincial production subsidies.

### **Production Approach**

In the Canadian Input-Output Accounts, gross domestic product is prepared by sector at basic prices and is classified by industry on the basis of establishment data. Estimates are compiled using the value-added approach. The input-output tables (in current and constant prices) are produced on an annual basis.

Outputs, intermediate inputs and inventory data of the Agriculture industries are estimated from farm cash receipts and farm operating expenses available from Statistics Canada's agriculture economic statistics program. GDP is estimated using the production approach. The output of Services Incidental to Agriculture is estimated using demand side data.

Estimates for Mining and Oil and Gas extraction are based on census data (mines) and annual sample surveys. Outputs and intermediate inputs are estimated using the survey data and GDP is obtained residually. The individual components of GDP are estimated from the survey data and reconciliation with estimates derived from the income-approach.

Output estimates for the Fishing and Trapping industries are based on annual survey statistics and administrative data while the intermediate inputs are estimated based on benchmark data available occasionally. Total GDP is estimated using the value added approach while the individual components of GDP are estimated using income statistics.

Estimates for Logging and Forestry, Manufacturing, Wholesale, Retail and Business and Personal service industries including Real Estate Lessors and Brokers are based on annual sample surveys that provide financial

and production statistics for these industries. Outputs and intermediate inputs are estimated using the survey data and GDP is obtained residually. The individual components of GDP are estimated from the survey data and reconciliation with estimates derived from the income-approach.

The Construction industries in the Canadian Input-Output Accounts are comprised of contract and own-account construction activity. The outputs are derived from an annual sample survey of capital expenditures. Value added for construction is estimated using the income-approach while intermediate inputs are estimated using benchmark cost estimates from different types of construction projects. The estimates include adjustments for own account wages and materials for construction activity.

The estimates of outputs and intermediate inputs for Utilities industries are based on annual surveys of production and administrative data. GDP is estimated residually using the value added approach.

For financial institutions, outputs, intermediate inputs, and value added are derived from the accounting records of banks and other financial institutions from statistics of the Office of the Superintendent of Financial Institutions.

In the Canadian Input-Output Accounts, market as well as non-market producers are shown in the supply and use table. Non-market outputs are derived as the sum of costs which are obtained from administrative sources.

For the estimates of GDP at constant prices, a double deflation approach is used for the business sector industries. The double deflation approach consists of taking the difference between gross output at constant prices and the sum of intermediate inputs and net taxes on products at constant prices. For producers of government services and producers of private non-profit services to households, various indicators, such as hours worked, are used to extrapolate or deflate directly value added.

Sources of deflators include a number of measured prices such as Industrial Product Price Indexes for the output of manufactured goods, accounting, engineering consulting and traveller accommodation for some business services. Machinery and Equipment Price Indexes are used to deflate the machinery and equipment commodity. Import deflators, which are largely based on trade data, are used to deflate import commodities. Consumer commodities bought by households are deflated using the Consumer Price Index. Other deflators are constructed using various approaches, as unit value indexes for primary commodities based on quantity and value data. Information on ton-kilometers and values are used for truck and rail transportation deflators.

The Fisher index, which is the geometric average of Laspeyres and Paasche indexes, is used as the official measure of volume changes of GDP. The Input-Output estimates of GDP by industry in constant prices serve as annual benchmarks for the monthly GDP by industry.

## Cape Verde

### Source

Reply to the United Nations national accounts questionnaire from the Ministerio da Coordenacao Economica, Direccao Geral de Estatistica. The official estimates are published in "Boletim Anual de Estatistica" and "Boletim de Contas Nacionais".

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Chile

### Source

The preparation of national accounts statistics in Chile is undertaken by the Central Bank of Chile (Banco Central de Chile). The official estimates are published in "Cuentas Nacionales de Chile" (<http://www.bcentral.cl/publicaciones/indexextema.htm>). The following presentation of sources and methods is mainly based on a detailed description received by the United Nations from the Central Bank of Chile. Also, an updated methodological summary can be found in the Dissemination Standards Bulletin Board IMF (see <http://dsbb.imf.org/Applications/web/basepagesmreport/?strcode=CHL&strcat=NAG00>).

The new series of national accounts is compiled in constant 2003 prices. The methodological background of the reference 2003 year is: "National Accounts of Chile 2003 Benchmark and Compilation" (see [www.bcentral.cl/eng/publications/statistics/economic-activity/aeg15.htm](http://www.bcentral.cl/eng/publications/statistics/economic-activity/aeg15.htm)).

### General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach, except external trade flows based on expenditure approach.

#### Expenditure Approach

Exports and imports of goods and services are based on expenditure approach. Data is obtained from the balance of payments statements prepared by the Central Bank of Chile. Final consumption expenditure of the general government is obtained mainly from the Office of the General Controller (Contraloría General de la República) reports. For lack of direct data the rest of the components of the GDP expenditure are estimated from a two-step procedure: first, a detailed estimation of hypothesis of use by domestic and imported products separately. The hypothesis covers intermediate, final consumption and fixed capital formation. An estimation of changes in inventories is made for finished manufactured goods and work-in-progress. The second step is developed in the supply and use balancing process, where the hypothesis are confronted with the partial data of intermediate use by product and fixed capital formation and changes in inventories by activities. Such procedure is performed both at current and constant prices, ensuring a total consistency between volume and prices components. Depending on each product, at the end of the balancing decisions process meaningless discrepancies could be imputed as changes in inventories, intermediate or private consumption.

#### Income Approach

Wages and salaries are in most cases estimated from the financial statements corporations, economic surveys and special tax record on compensation of employees (Servicio de Impuestos Internos). Employers' contributions to social security schemes as well as wages and salaries in kind are included in the estimates. Operating surplus is obtained as a residual. Fixed capital consumption data are obtained from accounting statements, economic surveys of corporations and special data from income tax records. That data is conciliated with estimations of fixed assets by type of capital and useful life time. For indirect taxes, published fiscal statements by type of tax are used.

## Production Approach

In general, constant and current price data on output, intermediate consumption, and value-added, are obtained from extrapolations using quantum and price indicators. Output data and intermediate consumption are calculated only on an annual basis. For quarterly data it is implicitly assumed a constant relation between output and value-added. This assumption could change from one year to another, by confronting the data on output and intermediate consumption on an annual basis. Supply and use tables are quarterly estimated.

Agriculture, livestock and forestry: Annual surveys on sowing programs and on harvesting, conducted by the National Institute of Statistics (INE), INE's statistics of manufacturing production on activities linked with agriculture, and detailed data on exports of agricultural products provided by the Customs Service, are used in agricultural production evaluation.

Statistics on livestock and manufacturing of meat, produced by the INE, are used to estimate livestock production. Statistics on woods manufacturing production, elaborated by the INE, are used to estimate forestry production.

For quarterly data, the quantum indicators are obtained mainly by using a commodity approach, (i.e. indirect indicators on the evolution of intermediate consumption are used as a proxy). For annual data, and for the revised quarterly figures, direct production indicators are used.

Fishing: Monthly data related to quantity of catch, from National Service of Fishing (SERNAPESCA) of the Ministry of Economics. For quarterly data, the quantum indicators are obtained mainly by using a commodity approach, for annual data, and for the revised quarterly figures, direct production indicators are used.

Mining: Monthly surveys on production and sales, from larger mining corporations, collected by the National Accounts Department, and statistics of production of different mining products from the Ministry of Mining. Direct quantum indicators are used both for annual and quarterly data. The data at current prices are obtained by applying appropriate price index at the 2-digit level of ISIC 3.

Manufacturing industry: Monthly detailed data of the quantum Indices of output and sales on Manufacturing Industry; source: INE. For validation and crosschecks, some consultations are made directly to the enterprises. Direct quantum indicators are used both for annual and quarterly data. The data at current prices are obtained by applying appropriate price index at the 2-digit level of ISIC 3

Electricity, gas and water supply: Statistics on electrical energy generation and consumption, from the National Committee of Energy; and monthly reports about production and sales, from the largest corporations, collected by the National Accounts Department. Direct quantum indicators are used both for annual and quarterly data. The data at current prices are obtained by applying appropriate price index at the 2-digit level of ISIC 3

Construction: Administrative records, collected at a local government level, of the authorized and started constructions; source: INE. Data about expenditure in engineering or infrastructure work; source: Corporation of Capital Goods and Ministry of Public Construction. For housing and building a model is used. That model is based on administrative records of permissions, construction's employment, and sales of construction intermediate inputs. For the rest of activities of construction, indicators of quantum are obtained by deflating, through the uses of appropriate price indices, the values on expenditure, given by the Corporation of Capital Goods, the Ministry of Public Construction, and surveys to the largest investment enterprises

Wholesale and retail trade: INE's index on consumption goods sales; detailed data of value-added tax provided by Ministry of Finance ; INE's sales indices of manufacturing industry; and production estimates, of the National Accounts Department, on agricultural and fishing production. Trade Index of the Trade Association (Cámara de Comercio) is used for crosscheck purposes. Direct indicators, provided by INE and value-added tax from the Ministry of Finance are used for annual and quarterly data. In addition, other important indirect indicators such as data on physical sales of industry and indicators from the National Trade Association are used to conciliate the

final estimation figures.

Hotels and restaurants: Statistics provided by the Ministry of Finance on the added value taxes paid by these types of enterprises. Indicators of quantum are obtained by deflating, through the use of appropriate price indices, indicators of values obtained from statistics of taxes.

Transport and communications: Quantum data on passengers, kilometers traveled, and cargo transported on rail, air and sea transport services, given by the main enterprises of the sector. For land transport, production of user's activities according to the estimates of the National Accounts Department. For Communications, monthly reports on quantum of sales from the largest corporations. Direct quantum indicators are used both for annual and quarterly data. The data at current prices are obtained by applying appropriate price index at the 2-digit level of ISIC 3

Financial intermediation: Indicators of quantum are obtained by deflating, through the use of appropriate price indices, indicators of values obtained from assets and liabilities of the industry provided by the Superintendency of Banks and Financial Institutions (Superintendencia de Bancos e Instituciones Financieras) of the Ministry of Finances.

Housing: Housing stocks calculated by the National Accounts Department, according to the corresponding data of production within the construction sector. Volume index of housing is used to extrapolate the output.

Public administration and defense: Quarterly data on the number of employees, given by the Ministry of Finance. Direct quantum indicators are used to calculate annual and quarterly data on value-added at constant prices. Budget records are used to get annual and quarterly data on output and intermediate consumption at current prices. Intermediate consumption at constant prices is estimated by deflating the current prices' data with the appropriate price indices. Adjustments are not made for productivity changes.

Education: Annual data on the number of students of the country, provided by the Ministry of Education. The data at current prices are obtained by applying appropriate price index at the 2-digit level of ISIC 3

Health: Data on budget execution and data on number of health cares, provided by the Ministry of Health.

Other services: Statistics of taxes, provided by the Ministry of Finance, and indicators of production of related sectors, from the National Accounts Department. Indicators of quantum are obtained by deflating, through the use of appropriate price indices, indicators of values obtained from statistics of taxes.

# China

## Source

Reply to the United Nations national accounts questionnaire from the National Bureau of Statistics, International Statistical Information Center, Beijing. Official estimates are published monthly by the Bureau in the "China Monthly Economic Indicators" bulletin.

## General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). However, the MPS data usually was adjusted to fit the 1968 SNA concepts and definitions. The data displayed refer to Mainland China only. Data for Hong Kong Special Administrative Region and Macao Special Administrative Region are stored separately in the UN national accounts database and published as individual territories.

## China, Hong Kong SAR

### Source

Reply to the United Nations national accounts questionnaire from the Census and Statistics Department, Hong Kong. Earlier replies were received from the Overseas Development Administration, Foreign and Commonwealth Office, London. The official estimates together with methodological notes have been published in a series of annual publications titled "Gross Domestic Product".

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). HKSAR adopts an incremental approach in implementing those new guidelines in the SNA 1993. Some of the new guidelines had been implemented in preparing the estimates under the "10" series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, this is indicated by a footnote in the relevant tables.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated through the expenditure approach and production approach.

### Expenditure Approach

The commodity-flow approach is used for compiling private final consumption expenditure and gross capital formation in machinery and equipment, supplemented by data collected from annual economic surveys. Goods for private consumption are mainly from imports, for which detailed trade statistics are available. Trade statistics of retained imports are complemented by data from the household expenditure surveys, census/surveys of manufacturing establishments, sample surveys on sales of business establishments, administrative data and other sources. Estimated of food produced domestically for local consumption are compiled from data provided by the Agriculture, Fisheries and Conservation Department and other government departments. Imported and domestically produced commodities are reported in importers' and producers' values, respectively, and the retail value is arrived at by adding transport expenses and distributors' margins.

Government consumption expenditure data up to 1972 were obtained from the annual reports of the Director of Accounting Services which provided data on the actual expenditure of individual departments by financial year ending 31 March. Since 1973, quarterly figures have been available from the Treasury and adjustment to a calendar year basis is no longer required. The estimates relate to current expenditure on goods and services by government departments not engaged in market activities. Estimates of changes in inventories of distributors and manufacturers have been compiled based on results of the censuses/surveys of manufacturing establishments and distributive trades. Information on quantities of hydrocarbon oils kept in stock by oil companies are obtained from the Electrical and Mechanical Services Department.

For gross fixed capital formation, investment in machinery and equipment is based mainly on the value of retained imports of capital goods, with a percentage added to allow for transport, assembly charges and installation expenses and distributors' margins. Estimates of domestically manufactured machinery and equipment locally purchased are calculated from results of the censuses/surveys of manufacturing establishments. Private sector investment in building and construction prior to 1979 is based on the monthly statistical returns of the Building Ordinance Office. From 1979, it is based on the results of Annual Survey of Building, Construction and Real Estate Sectors while investment in the government sector is obtained from an analysis of the accounts of government departments. Estimates of business investment in computer software are derived from data collected through annual economic surveys whereas corresponding estimates for the public sector are compiled from records of government accounts as well as returns of quasi-government institutions and public corporations. Exports and

imports of merchandise are obtained from detailed external trade statistics.

Estimates of residents' expenditure abroad (an imported service) are based on administrative data and household surveys. Expenditure of visitors in Hong Kong (an exported service) is based on data provided by the Hong Kong Tourism Board. Expenditure of employees of extra-territorial bodies and their dependents in Hong Kong is estimated based on the number of such persons staying in Hong Kong and their average expenditure. Extra-territorial bodies include foreign consulates and trade commissions (the UK troops were also included before July 1997). Data on expenditure abroad of overseas offices and miscellaneous expenditure abroad of the government are obtained from the government accounts. The Annual Survey of Banks, Deposit-taking Companies, Restricted Licence Banks and Representative Offices of Foreign Banks has been conducted since the reference year 1980 to collect data on imports and exports of banking services. Estimates of the other services categories are mainly based on data collected from the Annual Survey of Imports and Exports of Services, supplemented by administrative data.

The Annual Survey of Imports and Exports of Services was launched starting from the reference year 1978. For earlier years, the estimates were compiled with reference to imports and exports of goods and data from the Annual Survey of Imports and Exports of Services for reference year 1978. For the constant price estimates, price deflation is used for most of the expenditure items. The current values are deflated by various price indexes such as specially constructed salary rate index, consumer price indexes, tourist price index, cost index of building and construction, overall index of unit values of exports and imports, etc. For changes in inventories, unit value index of imports as well as the consumer price index of appropriate commodity groups are used.

### **Income Approach**

The main components of the table: compensation of employees and operating surplus are compiled using the same source of data for compiling GDP by the production approach. Data, available since 1980, are based on information collected from economic censuses/surveys conducted for the various major economic sectors.

### **Production Approach**

The production approach is used to estimate the value of production of individual economic activities. The value of production is measured by value added. Annual data series at current prices which are available since 1980 are compiled mainly based on information collected from economic censuses/surveys conducted for the various major economic sectors and administrative records. For the data series at constant prices, annual figures which are available since 2000 are the sum of the quarterly figures of the reference year. Quarterly constant price value added for various economic sectors in Hong Kong is generally compiled using four methods: (a) single extrapolation of base year value added by deflated gross output measures e.g. business receipts deflated by PPI; (b) single extrapolation of base year value added by volume/quantity measures such as volume of trade and physical units of outputs; (c) single extrapolation of base year value added by input indicators such as number of hours worked; (d) double indicators methods. Data sources for compiling quarterly constant price value added for various economic sectors mainly include quarterly and monthly surveys on industrial/business establishments and on households, government accounts, and administrative data from government departments and other organizations.

<sup>a</sup> In making reference to constant price GDP and its components for the years before 2000, it should be noted that since each component for each year is re-referenced to 2000 independently of other components and aggregates at different levels, the sum of these re-referenced components are not equal to the re-referenced aggregates and to the GDP. Although the lack of additive consistency appears to be an inconvenience, it is inevitable if the correct weighting is to be maintained, a practice adopted by statistical authorities worldwide.

<sup>a</sup> Refers to financing (banking, stock & share brokers/dealers, and fund management), insurance, real estate, and business services only.

<sup>b</sup> Data up to 1995 are based on a set of composite employment estimates which are derived by reconciling employment statistics obtained from the Quarterly Survey of Employment and Vacancies and the General Household Survey. Moreover, data refer to the average of the four quarterly estimates of the year. The industrial classification is based on the Hong Kong Standard Industrial Classification which is based on ISIC Rev. 2 with local adaptation. From the year 1996 onwards, data are based on the results of the "2001 Population Census" in which the "resident population" approach is used as the benchmark population data. The compilation methodology of composite employment estimates has been reviewed in June 2005. approach is used as the benchmark population data. The compilation methodology of composite employment estimates has been reviewed in June 2005. Employment figures from 1996 onwards have been revised accordingly. They are thus not strictly comparable with those of earlier years.

<sup>d</sup> Refers to Community, social, and personal services provided by non-profit making institutions and commercial establishments.

<sup>e</sup> Refers to Ownership of premises.

## China, Macao Special Administrative Region

### Source

Reply to the United Nations national accounts questionnaire from the Statistics and Census Service, Macao SAR.

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

## Colombia

### Source

Reply to the United Nations national accounts questionnaire from the Departamento Administrativo Nacional de Estadística (DANE), Bogotá. Official estimates and some methodological notes are published in "Cuentas Nacionales de Colombia" (Revision 3).

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) so far as the data would permit. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, exports and imports of goods and services, part of increase in stocks and gross fixed capital formation in construction. For other gross fixed capital formation, the commodity-flow approach is used. Private final consumption expenditure and part of increase in stocks are obtained as a residual. The estimates of government final consumption expenditures are based on official sources such as Informe Financiero de la Contraloría General de la República. The estimates of private consumption expenditure are obtained as a residual except for the benchmark year 1970 which were based on results from the family budget survey conducted that year. The estimates for changes in stocks are based on information obtained from various sources such as manufacturing surveys, commercial census, and the Federación Nacional de Cafeteros.

For gross fixed capital formation, the c.i.f. values of imported capital goods in the foreign trade statistics are adjusted to include customs duties, other taxes and transport and insurance costs. Adjustments are also made for trade margins and installation costs on goods passing through trade channels. For domestic production, estimates are based on manufacturing surveys. Estimates of capital formation in construction are obtained as by-product in the calculation of the construction sector's contribution to Gross domestic product whereas investments in the government sector is obtained from the government accounts. The estimates of exports and imports of goods are derived from foreign trade statistics while that of services are derived from the balance of payments. For the constant price estimates, current values of government expenditure and gross fixed capital formation estimates are deflated by appropriate price indexes. Estimates of private consumption expenditure at constant prices are obtained as a residual. No specific information is available for the remaining expenditure items.

### Income Approach

The estimates of compensation of employees are obtained in the process of estimating value added by industrial origin. The estimates are obtained from the statistical surveys held in 1970 and from accounting data. In the case of agriculture, hunting, forestry and fishing, the estimates are based on projections from census data on employment and statistics of average wages and salaries. Depreciation of assets owned by general government are not included in the estimates. Operating surplus is obtained as a residual and no information is available for the estimates of consumption of fixed capital and of net indirect taxes.

## Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of almost all industries. The income approach is used to estimate the value added of producers of government services and some private services, while the expenditure approach is used for ownership of dwellings. Gross output of the trade sector is estimated by the commodity-flow approach. For agriculture, the gross value of production is obtained by multiplying the output of each commodity by the price paid to producers. The production and price data are derived from agricultural sample surveys and from various concerned institutions. The Federacion Nacional de Cafeteros supplies information on data for coffee. For livestock, the estimates are based on statistics of government controlled slaughterings and net exports with rough estimates made for uncontrolled slaughterings.

Data for the petroleum industry are obtained directly from the oil companies. Information on the output and value of minerals is available from censuses of mines and concerned institutions. For manufacturing, results of surveys carried out by the Departamento Administrativo Nacional de Estadística are used. The estimates are projected by applying volume and price indexes to both output and input. The basic data for electricity, gas and water are obtained from concerned enterprises and surveys. Coefficients calculated from these surveys are used to estimate value added of plants not covered. For urban construction, estimates are derived from building permits issued while rural construction estimates are based on an estimation of economic life of existing constructions and on demographic data. Estimates of public construction are obtained from the government records.

For the trade sector, value added is based on estimates of the flow of goods through trade channels. The gross margins are based on data provided by the Banco de la Republica or recalculated from the Commercial Census 1967. The mark-ups are kept constant over the period of analysis. For transport, estimates are based on information provided by the Banco de la Republica. Data to measure the contribution of the communication sector are obtained by direct inquiries. Estimates for the financial institutions are obtained directly from the enterprises concerned through the Superintendencia Bancaria. The contribution of the government sector is measured by the wages and salaries paid to employees. Value added of other private services is estimated by the Banco de la Republica using the results of the census of services in 1970. Constant input-output ratios have been assumed.

For the constant price estimates, value added of the majority of industries is extrapolated by quantity index for output. For ownership of dwellings and producers of government services, value added is deflated by an index of rents and an index of wages and salaries, respectively.

## Cook Islands

### Source

Reply to the United Nations national accounts questionnaire from the Statistical Office, Ministry of Finance and Economic Management, Rarotonga, Cook Islands. The first comprehensive estimates of gross domestic product for the period 1982-1986 was published in "National Accounts of the Cook Islands, 1982-1986" in September 1990. This was the result of the joint efforts of the Statistics Office of Cook Islands with the Asian Development Bank.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

## Costa Rica

### Source

Reply to the United Nations national accounts questionnaire from the Banco Central de Costa Rica, Departamento de Estudios Economicos, Seccion Cuentas Nacionales, San Jose. Official estimates are published in "Cifras de Cuentas Nacionales de Costa Rica". The main sources for the compilation of the national accounts include: the General Customs Directorate and the Foreign Trade Promotion Office, providing foreign trade data, the State-owned companies and other public agencies, providing their financial statements and budget performance reports, as well as records of construction permits, amounts of goods and services produced, salaries paid, price indices, etc. In addition, some of the information used to prepare the national accounts comes from surveys of productive establishments and households. Among these, mention may be made of the monthly surveys of manufacturing firms and of trade, multi-purpose household surveys and income and expenditure surveys (the last two being conducted by the National Statistics and Census Institute).

### General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Since 1957, the national accounts of Costa Rica have been prepared by the Central Bank of Costa Rica and this task is currently performed by the Bank's Social Accounting Department. Information at current prices has been available since 1957. Data at constant prices are available as of 1966 for a series covering the period 1966-1998, for which the base year is 1966. In 2000, an improved new series of national accounts was made available to the public, with 1991 as the base year, covering the period 1991-2006. This publication contains the "Introduction to concepts, sources and methods used in the national accounts of Costa Rica", and these are in turn based on the methodological and accounting guidelines in the 1993 System of National Accounts (1993 SNA). The official estimates are posted online ([www.bccr.fi.cr](http://www.bccr.fi.cr)) quarterly and annually, in the sections "Indicadores Económicos" and "Publicaciones", and in the Bank's annual report.

The estimation concepts, definitions and methods are those recommended in the 1993 SNA. To the extent permitted by the statistical base available in Costa Rica, an attempt has been made to follow the recommendations in that System in order to ensure international comparability of the data compiled by Costa Rica. The annual national accounts of Costa Rica are presented in two clearly differentiated blocks: valuation at current prices and valuation at constant prices. The national accounts figures at current prices are given in 72 tables, while those valued at constant prices consist of 61 tables. In addition, quarterly national accounts data are available from 1991. Product classification follows the United Nations Central Product Classification (CPC), adapted to reflect the features of the Costa Rican economy. On the basis of the primary information compiled, 170 products (goods and services) were identified, representing the maximum disaggregation level in the supply and use table. However, for publication purposes, only 148 items were used, in order to report at the statistically most reliable data level.

In the supply and use table, the breakdown by products refers only to the production of goods by resident industries, whereas imports, with the exception of imports of some agricultural goods, have not been listed according to the CPC, because of the limited data available on the use of imported supply at a detailed level. The 1993 SNA recommends that the International Standard Industrial Classification of All Economic Activities (ISIC), revision 3, should be used as a frame of reference for the classification of establishments and industries and the preparation of production accounts by establishments and groups of establishments. However, in view of the basic statistics available at the time of implementing the 1993 SNA, ISIC revision 2 was used to prepare the supply and use table.

For compilation purposes, 127 industries were selected, for which production accounts were prepared. However, for publication purposes, only 31 of them were used, which with certain variations correspond to the two-digit classification, i.e. division level.

## Cote d'Ivoire

### Source

Reply to the United Nations national accounts questionnaire and communication from the Direction des Études de Développement, Ministère du Plan, Abidjan. The official estimates are published annually in "Comptes de la Nation".

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Croatia

### Source

Reply to the United Nations national accounts questionnaire from the Central Bureau of Statistics. The latest data for Croatia was received through the United Nations Economic Commission for Europe (UN/ECE).

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). The official estimates and detailed description on the concepts, sources and methods of estimation used in the compilation of national accounts estimates are published in "National Accounts of the Republic of Croatia and the "Statistical Yearbook of the Republic of Croatia"

# Cuba

## Source

Official estimates are published by the Oficina Nacional de Estadísticas, Habana in "Anuario Estadístico de Cuba".

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). Previous estimates followed the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Cyprus

### Source

The preparation of national accounts statistics in Cyprus is undertaken by the Statistical Service, Ministry of Finance, Nicosia. The official estimates are published annually in the "National accounts" and the "Statistical Abstract", issued by the same Service. The following tables have been prepared from successive replies to the United Nations National Accounts Questionnaire.

### General

Information on concepts, sources and methods of estimation used can be found in the "History and Analysis of the Methodology of National Accounts in Cyprus", published in 1977 and covers the period 1960-1975 and the "New National Accounts of Cyprus 1976-1983", published in 1985 and covers the years 1976 and after. The latest estimates (data 1995 onwards) have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA which is compatible to ESA 95). Previously the estimates were prepared generally in accordance with the classifications and definitions of the United Nations System of National Accounts 1968 (1968 SNA). For the years 1950-1975, the 1958 SNA was used, for the period 1976–1994 the 1968 SNA was used, while since 1995 onwards the SNA 1993 was applied. To compare national accounts estimates based on the 1993 SNA and those based on the 1968 SNA, the following differences should be taken into consideration: (1) under the 1993 SNA, the valuation of the output of insurance services has changed e.g. inclusion of revenues from investment of technical reserves, (2) introduction of the concept of financial leasing, (3) mineral exploration and computer software expenses are, under 1993 SNA, recorded as capital formation, (4) capital consumption is also recorded for infrastructural work of government. Starting 2006, FISIM is distributed to uses in the data submitted for the years 1995-2006.

### Methodology:

### Overview of GDP Compilation

Geographical coverage of the national accounts of Cyprus is limited to government controlled areas. Prior to 1976, gross domestic product was estimated through a combination of the income and the production methods. Since 1976, GDP is solely estimated through the production method. The data for the years 1995-2003 have been compiled using a balanced system of accounts based on both production and expenditure approach.

### Expenditure Approach

The expenditure method is used to estimate all the components of the expenditure account (i.e. government and private final consumption expenditure, capital formation, stocks and imports and exports of goods and services). Sources of data are the treasury report for government financial accounts, the publications of the Statistical Service on Household Budget Survey and annual data on Imports and Exports. The Central Bank of Cyprus provide detailed data on balance of payments and its components. For constant price estimates the total cost of living allowance index is used to deflate wages and salaries in government final consumption expenditure and partial price indices from the consumer price index are used to deflate the private final consumption expenditure. For the other expenditure items, various price deflators are used. From 2006 onwards, chain linking (the new methodology for constant prices according to the EU regulations), has been applied for the period 1995-2006.

### Income Approach

Separate estimates for compensation of employees and operating surplus were not available prior to 1976. Since 1976, separate estimates for compensation of employees and operating surplus are compiled from annual production surveys and other secondary sources. These estimates are published in the "National Accounts". The estimate of consumption of fixed capital was until 1995 based on a fixed percentage (10.5%) of the gross national product. Recently, this is calculated based on the existing capital stock, using the Perpetual Inventory Method (PIM). Net indirect taxes are available in the Financial Report, issued by the Treasury Department.

## Production Approach

Agricultural estimates were based mainly on ad-hoc inquiries of the Ministry of Agriculture and Natural Resources for years prior to 1969. From 1969 to 1974, estimates were derived from area sample surveys conducted twice a year. From 1975, the area sample was replaced by an annual survey of crop and livestock holders. Data on fishing and forestry are supplied by the fisheries and forestry departments respectively. Estimates for mining and quarrying, manufacturing and electricity, gas and water are derived from the annual industrial production surveys and the censuses of industrial production held every five years since 1956.

Construction sector consists of public and private construction. Public construction estimates are compiled from the annual financial report of the Treasury Department and the annual reports of semi-government organizations and local government authorities. For private construction the data are derived from the annual construction surveys conducted since 1978 and based on the building permits. While since 1987, an additional economic survey is conducted through building contractors. Prior to 1981, wholesale and retail trade estimates were based on gross trade margins, calculated through the commodity flow method. Since the 1981 Census of Wholesale and Retail, estimates are derived from an annual survey.

For transport, prior to 1980, estimates were based on extrapolation of value added by using indices of the number of buses in use and bus fares, rented cars and fares as well as the number of taxis and their revenues. For lorry transport, estimates were based on the transport margins derived from the commodity flow method. Estimates for port services and civil aviation were compiled from the annual financial report of the Treasury Department and for Cyprus Airways data were obtained regularly from their annual report. For storage, data were compiled from ad-hoc inquiries collected through the agricultural surveys and later by conducting special surveys. For communication, estimates were obtained for postal services from the financial report and for the Cyprus Telecommunication Authority data were compiled from its annual report. Since 1980 estimates are based on annual economic surveys on all activities of the transport sector.

Data on financial institutions are collected by the Central Bank of Cyprus. Data on insurance activities are extracted from the records of the Office of the Supervisor of Insurance Companies and ad-hoc surveys conducted by the Statistical Service. Data on real estate are based on land and buildings transfer fees and ad-hoc surveys. Data on business services are derived from annual economic surveys. The main source of information for public administration and defence and public services is the annual financial report of the Treasury Department and annual returns submitted by the local authorities. Estimates for the private services are derived from the annual services survey.

For the constant price estimates, the double deflation method is used for all items of agricultural outputs and inputs to arrive at value added estimates. Special price deflators for each category and or product items are constructed for both the output and inputs. Prior to 1976, value added was deflated by using a combination of indices for the remaining industries. Quantity indices for mining and quarrying, manufacturing and construction, price indices for wholesale and retail trade, base year average prices for electricity, gas and water, employment and wage rate indices for all the other services sectors. Since 1976, double deflation method of output and inputs is used. For producers of government services, the cost of living allowance index is used to deflate their value added which comprises mainly of compensation of employees. From 2006 onwards, chain linking (the new methodology for constant prices according to the EU regulations), has been applied for the period 1995-2006.

## Czech Republic

### Source

The preparation of annual national accounts statistics in the Czech Republic is undertaken by the department of Annual National Accounts at the Czech Statistical Office (CZSO) located in Prague. The official estimates are published annually on the internet ([www.czso.cz](http://www.czso.cz)), as well as in the annual Statistical Yearbook of the Czech Republic. The concepts, definitions, sources of basic statistics and methods of estimation for most parts of national accounts were described in Gross National Income Inventory 2002 (in 2006) and the description is going to be allocated also on CZSO's web site. This inventory was submitted by CZSO to EUROSTAT. It describes in detail all methods applied in compiling the SNA accounts and exhibits numerical results. The data provided to UNSD was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA) in its European variant ESA 1995. Printed publications on national accounts statistics have been replaced by publishing the data on the Internet, path: [www.czso.cz](http://www.czso.cz) - Economy - GDP, National Accounts - Annual national accounts. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in ESA, a footnote is indicated to the relevant tables. The submitted data are reported in national currency (Czech koruna, CZK), in million.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled. Input-Output tables in the form of Supply and Use Tables are also compiled annually.

#### Expenditure Approach

The estimates of government final consumption expenditure are derived from production accounts compiled on the basis of the accounting records of the various authorities. The values of private expenditure on goods and services are mostly obtained by means of Household Budget Survey and its grossing up to the whole population with increased weight attributed to the highest income group of households. The result is confronted with commodity flow method during the compilation of Supply and Use Tables, including also recalculating data at current prices into prices of the previous year and then into prices of the chosen benchmark year.

The comparison and balancing data is based on adding distributive and transport margins and taxes on products less subsidies on products to the value of goods and services produced domestically or imported at basic prices.

The sources of data include mainly statistical annual surveys on enterprises linked to their bookkeeping (structural statistics), of which up-grossed results are confronted with administrative sources mainly from Ministry of Finance on taxes and subsidies, Social Security institutions on social contributions and benefits, Czech National Bank on Balance of Payments for compilation of external accounts, revenues, costs, financial assets and liabilities of banks and others. For price data the consumer price index is largely referred to.

Own-account consumption is valued at producers' prices, for use of owner-occupied dwellings the user cost prices including 2.5% of the net value of dwelling and of associated land as the net operating surplus less allocated FISIM included in intermediate consumption are imputed.

The data on changes in inventories are based on regular annual surveys. Data on the difference between the closing and incipient stocks are deperated by subtracting holding gains and by addition of holding losses.

For gross fixed capital formation in machinery and equipment, dwellings, other buildings and structures and other tangible and intangible new and used fixed assets, data on acquisition, sales and transfers are collected and balanced also in the framework of supply-use tables, including recalculating into constant prices.

The estimates of exports and imports of goods and services are based on foreign trade statistics and the balance of payments.

Constant price estimates of government final consumption expenditure are based on deflation for intermediate consumption and other components of costs and on the other hand for non-market sales of products produced by general government. For example, compensation of employees is deflated by index of their annual wage adjusted by estimated annual growth of labour productivity.

For private consumption expenditure, revaluation by CPI at previous-year prices is used in most cases. For other components of product resources and uses, current estimates are deflated by appropriate (basic, export, import) price indexes and their combination. This same method is used for change in inventories and valuables and for gross fixed capital formation.

### **Income Approach**

Estimates of compensation of employees are based on wage statistics and contributions paid by employers to government funds. Direct information is available on compensation of government employees. Operating surplus is basically derived as a residual item. Further breakdown is based on income tax statistics for unincorporated enterprises, independent professions and property. In the case of the public sector, data are obtained from the accounting records of public bodies. Depreciation estimates of stocks are mostly obtained by using the perpetual inventory concept or, in some instances, are derived from quantities, replacement costs and service life times of fixed assets. Indirect taxes and subsidies are obtained directly from the records of the various governments. Accrual values are obtained by shift in time of cash data on tax payments.

### **Production Approach**

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added of nearly all industries. The income approach is used to estimate value added in non-market production. Large scale enterprises of all industries are surveyed by annual overall censuses while small-scale enterprises are surveyed annually by samples. When necessary, extrapolation is based on output statistics, sample surveys and turnover statistics. For the financial institutions, value added is derived from accounting records for banking and other financial institutions from statistics of the supervisory board for insurance. The value added of government services is estimated by adding the cost items obtained from bookkeeping records and from imputing consumption of fixed capital. For the constant price estimates, double deflation is used. For the producers of government services, partly quantum indicators, partly suitable price (wage) indexes are used.

## Denmark

### Source

The preparation of national accounts statistics in Denmark is undertaken by the Statistics Denmark, Copenhagen. The official estimates are published in "Nationalregnskabsstatistik", Danmarks Statistik. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

### General

The estimates in the following tables have been prepared in accordance with the concept and definitions recommended in System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

An in-depth description of the compilation of the Danish National Accounts at current prices can be found in "Danish National Accounts, Sources and Methods 2003" at [www.dst.dk/nationalregnskabsmetode](http://www.dst.dk/nationalregnskabsmetode). A detailed description of the compilation at constant prices can be found at [www.dst.dk/Vejviser/Portal/Nationalregnskab/fastpris.aspx](http://www.dst.dk/Vejviser/Portal/Nationalregnskab/fastpris.aspx).

Final national accounts data are calculated three years after the reference year (year t+3). Several versions of preliminary accounts are calculated before that. The first version is available as the sum of quarters two months after the end of the reference year, and the last preliminary version is published at the end of year t+2.

The constant price series are Laspeyres chain-linked values with 2000 as the reference year.

### Methodology:

#### Overview of GDP Compilation

The Danish national accounts consist of both annual and quarterly accounts. The official balance of payments estimate is consistent with the national accounts rest-of-the-world account. As from the 1997 publication, the Danish national accounts have been compiled in accordance with the guidelines in the European version of SNA93, the European System of Accounts (ESA 95). Consistent time series are available back to 1966.

The Danish national accounts are built around an integrated set of supply and use tables and institutional sector accounts. Initial unbalanced GDP estimates are to a large extent calculated independently from the output and expenditure sides and balanced in a detailed product balance system covering around 2 350 products, some 1 960 of which are goods and 410 services. The result is a balanced set of supply and use tables and integrated production and generation of income accounts for industries and institutional sectors. The sector-industry tables are thus an integral part of the final annual national accounts. With the balanced supply and use tables as a starting point, symmetrical, industry x industry input-output tables are constructed annually on the basis of the "industry technology assumption".

Since 2001, annual financial accounts are also produced and net-lending from the financial transaction account and the non-financial accounts are reconciled in a balancing process. In addition capital stock estimates (produced assets) are compiled using gross fixed capital formation series at industry level, which secures consistency between investment and capital stock series. This system also produces consumption of fixed capital series. Finally, labour productivity is produced for annual figures.

The only case where ESA 95 is not followed is on the recording of payments on the harmonised VAT basis which accrue to the EU in connection with the third own resource. According to ESA 95 paragraph 4.14, this resource should be recorded as taxes on products paid by residents to the EU (D.211). When implementing the ESA 95,

Denmark found this rule unrealistic from an economic point of view. Instead, these payments are recorded as a current transfer from Denmark to the EU. Total VAT revenue is recorded as income for the resident general government sector.

Constant price estimates are derived by deflation of each of the 2,350 product balances in the SUT. For each product separate deflators are used for domestic output, imports, exports and domestic uses.

The national accounts for Denmark cover only the southern part of the kingdom and therefore exclude the Faeroe Islands and Greenland.

## **Expenditure Approach**

The most important sources for the estimate of the components of expenditure-based GDP are the following:

Household final consumption expenditure:

Retail trade statistics, DOI (level of retailable consumption)

The FU [household budget survey] (structure of retailable consumption, services)

VAT statistics

Surveys of housing rentals

Housing surveys (housing stock, stratified)

Energy statistics (electricity, gas, district heating)

Statistics on financial institutions (financial services)

Statistics on public finances (user payments to public institutions)

Tax statistics (quantities of goods on which excise duties are levied)

Supply side estimates

Motor vehicle statistics (households' acquisitions of new cars)

Balance of payments statistics (tourist revenue and expenditure)

Final consumption expenditure in NPISHs:

ERE [establishment-related employment statistics] estimates of total wages and salaries

Gross fixed capital formation:

Agricultural statistics

Public finance statistics

Accounts statistics for industries predominated by public corporations

Register of buildings and dwellings (BBR)

Index of construction costs

Product statistics for the IT industries

ICT expenditure

External trade statistics

Industrial accounts statistics

Specific industry statistics

Media statistics

Register of motor vehicles

Register of vessels

Register of aircrafts

Acquisitions less disposals of valuables:

Industrial commodity statistics

External trade statistics

Household budget survey (FU)

Changes in inventories:

Industrial accounts statistics

## SLS-E statistics

Accounting statistics for industries where public corporations predominate

Specific industry statistics, including agricultural statistics

Energy statistics

Agricultural statistics

Imports and exports of goods and services:

External trade statistics (Intrastat and Extrastat)

Balance of payments statistics

Settlements statistics from the Nationalbank

VAT statistics

Accounts statistics for sea water transport.

By far the largest share of expenditure-based GDP is calculated using a direct estimate. The most important exceptions are household consumption of hotel and restaurant services, dwelling services, consumption in NPISH, which are all calculated indirectly from the supply side.

For some consumption groups of household final consumption expenditure, more than one source is available. In these cases, an assessment of which source is the most reliable for estimating the variable (consumption group) has been made. The assessment mainly relates to whether the consumer survey (FU) should be replaced by another source.

The main rule in the Danish national accounts has been that wherever possible the FU has been replaced by other information to determine levels, but it is widely used to determine the structure of expenditure – for the breakdown of food consumption into individual foodstuffs, for example. For retailable consumption, i.e. that share of private final consumption which passes through retail trade, the FU figures are replaced by retail sales figures which must be considered a much better statistical source for determining levels of private consumption. The FU figures are used to divide the aggregate groups from retail sales statistics into the detailed consumption groups. For energy products and acquisitions of motor vehicles, there is special information available based on physical data.

Capital formation can in principle be estimated in two ways, either directly using information on the expenditure (uses) side (purchaser's side) or indirectly on the basis of supplies of products to the domestic market, using estimated shares of supplies to the final demand components to calculate final uses from the resources side. During the recent years widening of the scope of the industrial accounts statistics have led to estimates of GFCF in machinery, equipment and major building repairs that have gradually changed from supply side estimates to estimates that are mainly based on information from the uses side. The estimates for construction of new buildings are based either on accounting statistics with very detailed coverage of actual observations or a calculation based on the exhaustive register of buildings (the BBR) and prices per square meter for the different types of buildings. However, even after the introduction of a direct expenditure based estimate of capital formation in machinery and equipment, it is likely that it will be adjusted to some degree to take account of supply side estimate

Since the Danish national accounts are adjusted in a detailed product balance system, there is a systematic confrontation in connection with the balancing. One of the strongest cross-checks for the compilation of national accounts consists in comparing information from purchasers on their acquisitions less disposals of the individual products or groups of products with information on the sellers' side on supplies to the domestic market.

Transition from private accounting and administrative concepts to NA concepts:

In household and business accounts, purchases of goods and services are recorded in terms of purchasers' prices including non-refundable VAT. Refundable VAT is not included in the acquisition prices, on which information is available, which is consistent with the ESA 95 net VAT system.

Various acquisitions which the national accounts treat as gross fixed capital formation are included in business

accounts as current operating expenditure in the form of intermediate consumption or wages and salaries which are not capitalised. Examples would be consumables as well as purchased and own-produced software. The corrections on the expenditure side are a mirror image of the corrections to the output value (e.g. own-produced software) and intermediate consumption (consumables and purchased software) in the output-based estimate as described in chapter 1.3 and chapter 3.

For each type of inventory, changes in inventories in the business accounts are calculated as the value of closing stocks minus the value of opening stocks, estimated according to the enterprises' own accounting principles, which means that opening and closing stocks are calculated at different price levels. In the national accounts, changes in inventories should be estimated at the average prices for the year. Ideally, changes in inventories should be monitored throughout the year and all changes split into revaluations (holding gains) and national accounts changes in inventories. Normally, a reasonable approximation of the correct change can be produced by converting the value of both opening and closing stocks to the average prices for the year using the ratio of the year's average price to the price on the date of the inventory estimate. In the Danish national accounts, opening and closing stocks are converted to average prices for the year for all combinations of product number/target total module code/DK-NACE industry/sector following the breakdown of inventory totals by product. The national accounts change in inventories is calculated as closing stocks minus opening stocks for each of these combinations.

For import and export of services, the statistical challenge arising from the use of settlements statistics for the estimate of aggregate exports/imports of services lies in ensuring that the definition of what constitutes an export or an import of services remains consistent with the external trade statistics and national accounts estimates of exports of goods f.o.b. and imports of goods c.i.f. Therefore, a correction is made to exports and imports of services as estimated in the settlements statistics to bring the latter into line with the estimate of exports of goods f.o.b. and imports of goods c.i.f.

Constant price estimates are derived by deflation of each of the 2,350 product balances in the SUT. For each product separate deflators are used for domestic output, imports, exports and domestic uses. In particular consistency with the consumer price index is ensured at a detailed level.

## **Income Approach**

The main sources used for compiling GDP from the income side are:

- The annual working time accounts (WTA) (compensation of employees)
- The system for compiling fixed capital in the national accounts (consumption of fixed capital)
- Administrative data used for compiling general government (other taxes on production and imports and other subsidies on production)
- Gross operating surplus and mixed income are compiled as residuals.

The WTA is compiled in Statistics Denmark's division for labour market statistics. The WTA is used almost directly in the national accounts and only with a few adjustments made in the national accounts. The background for the WTA is a considerable expansion in the number of statistics covering the labour market and the fact that the figures from different statistics are not immediately comparable. The WTA is a statistical system integrating already existing labour market statistics.

## **Production Approach**

General Government:

For central government, the main statistical source is central government accounts. For local government, the main source is local government accounts for all 275 municipalities and 14 counties. For the "self-owning" institutions, under both central and local government, annual accounts, assumed to cover the whole population, are collected. For the social security funds, the statistical source is their annual accounts, which are collected for all units concerned.

The units included in the statistical system for public finance as producer units in S.13 and those units which are classified in the business register as government non-market units are exactly the same. The grouping of government units by purpose, COFOG, is only added in the public finance statistical system and not in the business register.

The accounting plan in central government accounts is not the same as that used for local government accounts. All municipalities and counties are obliged to use the local government plan. When compiling national accounts, the accounts for central government, local government, "self-owning" institutions and social security funds are coded with national accounts classifications based on ESA95. Then they are stored in one compilation system, the DIOR database [Databasen for integrerede offentlige regnskaber, i.e. database for integrated public accounts]. All individual entries at the most detailed level of the primary accounting systems are given an ESA95 code. All entries are classified by type of transaction, by purpose and by industry.

#### Financial institutions:

The sectoral delimitation of the subsectors complies strictly with the ESA 95 rules. Subsectors S.121 The central bank and S.122 Other monetary financial institutions have complete accounts.

In subsectors S.123 Other financial intermediaries and S.124 Financial auxiliaries, certain units are not covered by the financial accounts statistics collected by the supervisory authority, Finanstilsynet, or by Statistics Denmark. For S.123, those accounts which are available for the sector are grossed up to cover all units in that sector on the basis of employment. Enterprises in S.124 are covered by company accounts also grossed up on the basis of employment to cover the total population.

Insurance corporations and pension funds are covered in full by Finanstilsynet's accounting estimates.

#### Non-financial corporations:

For publicly controlled non-financial corporations the source for the national accounts estimate is "statistics for public enterprises". As general government statistics are compiled in line with national accounts principles, the extended statistics for public enterprises are processed according to national accounts definitions and presented according to the accounting plan for non-financial corporations in the ESA 95. One of the reasons is the desire to be able to produce a national accounts estimate of the "public sector", which is a combination of general government (S.13) and public corporations (S.11001). The public sector is all producer units in the economy under public control.

Non-financial corporations other than the government controlled and the household sector (sole proprietorships and households as owner-occupiers) together account for by far the largest share of market output in the economy. As a general rule, value added is calculated from the two sets of accounts statistics, namely:

- a) the industrial accounts statistics, which is by far the most important, covering for 2003 all non-financial producer units other than general government and industries where public corporations traditionally predominate and
- b) "SLS-E accounts statistics", which cover the remainder of the economy, mainly certain personal service industries. This is accounts statistics based on standardised accounts (SLS-E=Statens Ligningssystem for Erhvervsdrivende), the government tax assessment system for businesses), which all firms, with certain exceptions, have to send in to the tax authorities together with their tax returns.

The SLS-E statistics is used for the grossing up of the industrial accounts statistics as well as for compiling the industries mentioned under b) which are not covered by industrial accounts statistics.

#### Agriculture, horticulture and the raising of fur animals:

The statistical source for agriculture, horticulture and the raising of fur animals is Danmarks Statistik's agricultural statistics which, as already stated, are a national accounts estimate. The statistics comply with the guidelines in

Eurostat's agricultural statistics manual. The calculations of intermediate consumption are based on 1) quantities of products used multiplied by the average selling price, 2) accounting information collected by the economic advisers for agriculture and 3) annual accounting statistics for agriculture and horticulture compiled by Statens Jordbrugs- og Fiskeriøkonomiske Institut.

#### Dwellings:

The output value of dwellings is estimated every fourth year as a benchmark calculation of the price times volume type, based on the total stratified housing stock and comprehensive rental figures covering almost two-thirds of all dwellings in Denmark which are let. Both sources must be considered to be of high quality.

In years between the benchmark calculations, the latest benchmark is projected using price and volume indicators. The price indicator is rental information from the sample survey of rentals which is carried out every six months to provide information on changes in rentals in the consumer price index. The volume indicator is information from building statistics based on Bygnings- og Boligregistret (BBR) [the Register of buildings and dwellings] which gives the number of square metres constructed combined with an estimate of the number of dwellings demolished.

The benchmark calculation is particularly detailed and uses the stratification method which the GNP Committee approved as the preferred method. The stratification of the housing stock is much more detailed than the minimum requirements set out in the Commission Decision (95/309/EC, Euratom). Whilst this Decision requires a minimum of 30 strata, the Danish calculation of levels for 1999 uses roughly a thousand strata.

#### Non-profit institutions serving households:

By far the largest expenditure component in the case of private non-market output is the wage or salary bill. In Denmark, the ERE (Erhvervsbeskæftigelsesstatistik, translated into English in Danmarks Statistik publications as "Establishment-related employment statistics") statistics calculate the total wage or salary bill in all producer units in the economy, including in private non-profit institutions serving households. This is the main source for the calculation.

For want of accounting statistics in this field, the other components in the estimate of output from the costs side, i.e. intermediate consumption, consumption of fixed capital and other taxes and subsidies on production, are calculated on the basis of the accounts for the largest trade union (HK).

#### Private households with employed persons:

Statistics Denmark has carried out two benchmark surveys linked to the labour force surveys for 1992 and 2004, in which the households were asked a series of questions on their untaxed activities. Interviewees were asked about the number of hours worked and their income. On the basis of these figures, benchmark values were fixed for output by grossing up to the total population.

From 1992 and onward values were projected in the current years using changes in the net price index (consumer price index excluding taxes on products and subsidies) for cleaning. And off course, the new benchmark value in 2004 gave an opportunity to make a minor revision of the figures in the years between the two benchmarks.

#### Transition from private accounting and administrative concepts to ESA95 concepts:

After processing the accounting statistics underlying the national accounts calculations of value added a number of corrections to the first version are carried out. These corrections include:

#### On the supply side:

- 1) Production in the hidden economy.
- 2) Fringe benefits produced from own production.
- 3) Revenue from licenses and royalties.
- 4) Software produced on own-account.
- 5) Entertainment, literary and artistic originals

6) Price correction of changes in inventories of finished goods, work in progress and goods for resale.

On the uses side:

- 7) Fringe benefits purchased
- 8) Financial intermediation services paid for directly.
- 9) FISIM
- 10) Correction for net insurance premiums
- 11) Public fees
- 12) Expenditure on licences and royalties
- 13) Software produced on own-account
- 14) Purchased software
- 15) Price correction of changes in inventories of raw materials.
- 16) Small tools etc.

## Dominican Republic

### Source

Reply to the United Nations national accounts from the Banco Central de la Republica Dominicana, Santo Domingo. The official estimates are published by the Banco Central in the series "Cuentas Nacionales, Producto Nacional Bruto", which also includes a detailed description of the sources and methods used for the national accounts estimation. Beginning 1984, estimates for imports and exports of goods and services were converted from dollars to pesos by using the annual average exchange rates fixed by the Central Bank.

### General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. Gross fixed capital formation is mainly estimated by the commodity-flow method, whereas private final consumption expenditure is taken as a residual, which also includes changes in stocks which could not be computed directly. Government consumption expenditure data for the central government is obtained from the Ministry of Finance and the National Budget Office. For gross fixed capital formation, import statistics are utilized for capital goods such as machinery, equipment and transport and communication equipment, since no such products are produced locally. To the import values are added customs duties, surcharges, mark-ups, etc. The data on exports and imports of goods and services are taken from the publication on balance of payments, prepared by the Central Bank. For the calculation of constant prices, price deflation is used for government consumption expenditure. Compensation of employees is deflated by means of the cost of living index, whereas for government purchases and sales general price indexes are used. Constant value of private consumption expenditure is obtained as a residual. The value of construction is deflated by a construction costs index. In the case of rural dwellings base-year prices are multiplied by number of dwellings built. The import price index is used as a deflator for exports and imports of goods and services.

### Income Approach

The data on indirect taxes and subsidies are based on the annual reports of the Ministry of Finance and on information from the Treasury and the National Budget Office.

### Production Approach

The production approach is the basic method of estimation used for most sectors. The income approach is used for trade, transport and communication, finance, general government and other services. In agriculture, gross output is estimated by multiplying the quantities harvested by the average price paid to the producers. Quantity data are available from the agricultural censuses of 1950, 1960 and 1970 and from estimates by the Banco Agrícola, the Ministry of Agriculture and others. Own-account consumption is included in the production series. Data on the volume of livestock production is provided by the Ministry of Agriculture, which also estimates the quantity of unreported slaughter and herd changes in livestock.

The basic information for calculating gross output of the mining and quarrying sector is obtained directly from the reports on production and sales of enterprises. For manufacturing, the main source of information is the series of annual bulletins of industrial statistics. The value of construction for 1960, which is taken as a benchmark, is extrapolated by means of a value index. This index is a combination of a price index of construction costs and an index of main materials used. Value added is obtained by applying to gross output a coefficient representing the ratio of gross factor income. Data for the trade sector are available from the first national trade census carried out in 1955, and from total wholesale and retail sales figures published periodically by the National Statistical Office. Wages and salaries are calculated by combining average remunerations series with sectoral employment series. The Dominican merchant marine and the Dominican airline provide the data needed to estimate incomes, inputs and value added for shipping and air transport. For land transport the information obtained include data from transport enterprises and surveys among owners of trucks and taxis.

For financial institutions the estimates are based on complete accounting information which is available for all banks and finance companies and most insurance companies. Value added of ownership of dwellings is taken as the difference between gross rents paid or imputed based on census data and the inputs for maintenance, upkeep and management and property taxes. For public administration and defence, data are obtained from government authorities, publications and from independent institutions. For other private services, data on the number of persons employed and mean income are used. The benchmark data are extrapolated according to a specially constructed income index.

For the computation of constant prices, the value added for agriculture is estimated by a revaluation at base-year prices of the harvested quantities. In the case of livestock products, estimates of annual changes in average meat yield per animal are utilized. For mining and quarrying, value added is estimated by revaluating the different minerals at their respective 1962 prices. Value added of manufacturing is extrapolated by a quantity index of output. Current values of public and private construction are deflated by means of an index of construction costs. Wholesale and retail sales of locally produced and imported goods are deflated using the respective price indexes. For transport, storage and communication, value added is extrapolated by quantity index of output. For financial institutions, value added is extrapolated by quantity indicators of personnel employed. For ownership of dwellings the indicator used is the number of urban and rural dwellings. Value added for public administration, defence and other services is extrapolated by an indicator of the number of personnel employed.

## Ecuador

### Source

Reply to the United Nations national accounts questionnaire from the Subgerencia de Cuentas Nacionales, Banco Central del Ecuador, Quito. The official estimates are published annually in "Memoria del Gerente General del Banco Central del Ecuador".

### General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). These data are denominated in sucres. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Egypt

### Source

The preparation of national accounts statistics in Egypt is undertaken by the Ministry of Planning, Cairo. Official estimates are published in the annual "Statistical Yearbook" published by the same agency. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. Some tables have been updated from 1987 onwards using the "Economic Bulletin", Vol. 52 No. 1, 1999 of the National Bank of Egypt. The data from 1996 onwards have been prepared from successive replies to the United Nations national accounts questionnaire.

### General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. The estimates of government final consumption expenditure are based on government budgets and accounts. For private consumption expenditures, the estimates are based on family budgets and household expenditure surveys. The Department of Statistics prepares data on inventories of cotton, covering both commercial stocks and stocks of spinning industry. Other sources of information for changes in stocks include data collected regularly by the Ministry of Supply. For gross fixed capital formation, the government sector is estimated directly together with government consumption expenditure. The private sector estimate is obtained by deducting the government estimate from total capital formation. Capital formation in machinery and equipment is estimated through the commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of merchandise are generally based on foreign trade statistics. The estimates of GDP by expenditure type in constant prices are prepared by the CAPMAS on the basis of official index numbers of prices and quantities.

### Income Approach

The estimates of wages and salaries are based on government accounts and on various sectoral surveys. No specific information is available for operating surplus, which is computed as a gross estimate, i.e., including consumption of fixed capital. Indirect taxes and subsidies are separately available for all economic units in the compulsory standard accounts for public enterprises and in the economic surveys for the private sector.

### Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is used to estimate value added of community, social and personal services. The Ministry of Agriculture collects, through annual sample surveys, data on crop area, yield and crop-cutting. Livestock data are obtained through special censuses every two years and prices received by farmers are collected annually. The estimated acreage of each of the main crops is multiplied by average productivity of the basic area of measurement. The gross output is evaluated at farm-gate prices and estimates of intermediate consumption are based on data collected from the co-operative societies and from censuses. For the industrial activity sector, annual statistics on industrial production, capital formation,

employment, wages and salaries are available for industrial establishments with ten workers or more which form the organized sector of the economy. For the non-organized sector, estimates are made by using data from industrial censuses and by studying the cost-structure of each industry, productivity and degree of mechanization.

The output of construction is estimated indirectly from the input side by means of employment data and data on intermediate consumption. The value of gross output and components of value added are obtained by using the relationship between available data on intermediate consumption and primary inputs in organized enterprises and applying this relationship on the estimated intermediate consumption of this industry. For trade, annual basic statistics are available for establishments with five or more workers, while those with less than five workers are covered by sample surveys conducted every three years. Estimates for restaurants are made by using data on establishments, wages and salaries, working hours and data from sample surveys. Estimates for hotels are obtained through annual questionnaires. Data on input, output and other elements of large-scale transport are available through annual accounts. For unorganized transport, estimates are based on information on the number of establishments and workers, on wages and salaries and on other sources. Indicators such as input ratios are used to estimate value added.

Gross output and input of public financial institutions and insurance companies are based on data collected annually. The estimates of real estate, business services, and imputed rents of owner-occupied dwellings are based on family budget surveys. The government accounts provide information to estimate government services. Annual data are available for non-profit institutions serving households. For the service activities of unincorporated enterprises, gross output and inputs are estimated by using available censuses of establishments, wages and salaries statistics. The constant prices of GDP by kind of economic activity are estimated by CAPMAS on the basis of official index numbers of prices and quantities such as wholesale prices, consumer prices and quantities of imported and exported merchandise.

<sup>a</sup> Discrepancy between Total Economy and the sum of domestic sectors.

<sup>b</sup> Includes Financial intermediation services indirectly measured (FISIM) of Total economy

<sup>c</sup> Discrepancy with equivalent item in Table 1.3: Relations among Product, Income, Savings and Net Lending Aggregates.

<sup>d</sup> Does not add up to corresponding components in the domestic and the rest of the world sector accounts.

<sup>e</sup> Adjustment for a part of FISIM.

<sup>f</sup> Discrepancy with equivalent item in Table 1.3: Relations among Product, Income, Savings and Net Lending Aggregates. Discrepancy between Total economy and the Rest-of-the-World Account.

Table 4.2 Rest of the world (S.2)

## El Salvador

### Source

The preparation of national accounts statistics in El Salvador is undertaken by the Departamento de Cuentas Macroeconomicas, Gerencia de Estudios y Estadísticas Económicas del Banco Central de Reserva de El Salvador. The official estimates are published quarterly in "Revista Trimestral" and monthly on the internet ([www.bcr.gob.sv](http://www.bcr.gob.sv)). A detailed description of the sources and methods used for the national accounts estimation is contained in "Un Nuevo Sistema de Cuentas Nacionales" published by the Banco Central de Reserva de El Salvador in 1995. Employment data are compiled by the Dirección General de Estadísticas y Censos.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides clarification. The estimations of new base 1990 are made by means of the use of tools such as the tables of supply and demand that allow to calculate the supply and demand for eighty products, which are grouped in forty five economic activity branches.

On 1 January 2001 the Monetary Integration Law was accepted in El Salvador, and it grants the American dollar unrestricted legal effect with unlimited releasing power setting the exchange rate for the Salvadoran colon against US Dollar at 8.75. The newly submitted data for the years before 2001 were reported and published in national currency (Salvadoran colon) but were converted to American dollar using the exchange rates (used to national account intentions) data to allow for easy comparison of national time series data.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and expenditure approaches. Income approach was compiled at current prices, only for the period from 1990 (base period) to 1993; statistical limitations have not allowed to continue with this approach. Supply and Use tables are compiled annually.

#### Expenditure Approach

The estimates by the expenditure approach are obtained from the supply of eighty products setting the production destiny as the households final consumption, investment and exports; and for the government, the production has an only destiny: the public consumption. The estimates of government consumption expenditure are obtained directly from government sources. The estimates of increase in stocks are based on information on stored agricultural products, and the stocks of the manufacturing and trade. Private capital formation is estimated on the basis of data on domestically produced and imported capital goods and on statistics of construction and repair work. The imports data are adjusted to include import duties, trade margins and installation costs. For public expenditure on capital formation, data are obtained from official sources. Data on exports and imports of goods and services are obtained from the balance of payments. Export data on coffee are obtained from the Consejo Salvadoreño del Café. Gross domestic product by expenditure at constant prices is estimated.

#### Income Approach

Income approach was compiled at current prices, only for the period from 1990 (base period) to 1993; statistical limitations have not allowed to continue with this approach. Compensation of employees, combined with operating surplus, is obtained as a residual. The estimates of net indirect taxes are derived from the government accounts. No specific information is available on how consumption of fixed capital is estimated. The Income Approach at constant prices is not estimated.

## Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most industries. The public administration and defence is estimated by the sum of the costs, and trade sector is estimated by the sum of commerce margins. The agricultural data, which are provided by Ministerio de Agricultura y Ganadería, are obtained through various periodic surveys. Data on the coffee harvest are supplied by the Consejo Salvadoreño del Café while coffee prices are taken from the balance of payments. Information on the production of cotton is provided by the Cooperativa Algodonera Salvadoreña Ltda. The gross value of production is calculated by applying producers' prices to the quantity of each commodity produced. For the livestock sector, information is obtained from the Ministerio de Agricultura y Ganadería. Value added of forestry and logging is estimated by means of indirect methods using data provided by The Dirección General de Ordenamiento Forestal, Cuencas y Riegos del Ministerio de Agricultura y Ganadería.

For the mining and quarrying sector, the estimates are based on data provided by the Dirección General de Estadísticas y Censos from companies of mining and quarrying. The gross value of production in manufacturing is based on the results of annual surveys to the manufacturing industry, made by the Dirección General de Estadísticas y Censos to the small, medium and great industry companies. The estimates for electricity are based on information provided by companies related like: generating, distributing and transmitting companies of electricity. For private construction, the information is obtained from statistics related to the cement apparent consumption; information on construction permissions provided by the Oficina de Planificación del Área Metropolitana de El Salvador (OPAMS), etc. The estimates for public construction are obtained from concerned institutions such as the Dirección General de Inversión y Crédito Público del Ministerio de Hacienda. For both public and private constructions, intermediate consumption is determined by using a fixed percentage of gross value of production.

Gross output of the trade sector is determined on the basis of the values of domestic and imported goods marketed. The gross value of production of domestic goods and the c.i.f. values of imported goods are adjusted for changes in stocks and trade margin are added. An estimate of inputs, is made from a survey based on percentages such as cement consumption, metallic products, etc., which is deducted from the total gross value of production to arrive at value added. Estimates of restaurants and hotels are interpolated and extrapolated on the basis of census of 1992 and applying indicating of volume and prices obtained from the survey made to restaurants and hotels carried out by the Dirección General de Estadísticas y Censos. The enterprises concerned with road transport are classified in load transport and passengers transport. A sample from each category is taken in order to obtain average figures for estimating receipts per ton, which are multiplied by quantity transported figures to arrive at gross value of production and value added. For air transport and communication, information is obtained directly from concerned companies.

The estimates of the financial sector are based on financial statements furnished by the banks and insurance companies, Private Pension Fund Administrator and Financial Auxiliaries. Imputation is made for service charges by deducting interest from investment income. The estimate of ownership of dwellings are based on the number of urban and rural dwellings obtained from the population censuses and rents data from "Encuestas de Hogares y Propósitos Múltiples", and using the cost of living index as an inflator. The estimates of government services are based on information published by the Ministerio de Hacienda. For other services such as education, hospitals, religion, the estimates are obtained from concerned institutions. For domestic services the estimations, are made taking into account the employment indicator generated by this activity and the annual information provided by "La Encuesta de Servicios" carried out by the Dirección General de Estadísticas y Censos. For the constant price estimates, value added for the agricultural, electricity, trade, transport and financial sectors is estimated by using volume or quantity indexes. Double deflation is used for the electrical energy, water, communications, insurances and government services.

## Estonia

### Source

Reply to the United Nations national accounts questionnaire from the State Statistical Office of Estonia, Tallinn. The official estimates are published in the "National Accounts in Estonia". Previous data was received through the United Nations Economic Commission for Europe (UN/ECE).

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Previously the estimates have been prepared in accordance with the United Nations document entitled "Comparison of the System of National Accounts and the System of Balances of the National Economy, Part 1: Conceptual Relationships" (F.20) for the years 1980-1990. For the years beginning 1991, the estimates are in accordance with the 1993 System of National Accounts. On June 20, 1992 Estonia shifted from the Soviet rouble to the Estonian kroon at a rate of 10 roubles equal to 1 kroon. All estimates shown in the following tables accordingly were converted to Estonian kroon.

## Ethiopia

### Source

The preparation of national accounts statistics in Ethiopia is undertaken by the Ministry of Finance & Economic Development Office, Addis Ababa. The official estimates with methodological notes are published annually in the "Statistical Abstract". Data from 1987 onwards has been obtained from "Statistical Abstract" 1997 edition published by Central Statistical Authority of Ethiopia and "Quarterly Bulletin" Vol. 14, No. 4, Fourth Quarter, 1998/99; Vol. 12, No. 1, First Quarter, 1996/97 and Vol. 12, No. 4, Fourth Quarter, 1996/97 published by National Bank of Ethiopia. The data for Ethiopia excludes Eritrea.

### General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations Systems of National Accounts 1993 (1993 SNA). The Ethiopian fiscal year which is from June to July has been used for all estimates except the "External Transactions" table. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach, is also used for estimating gross fixed capital formation. Private consumption expenditure is estimated separately by household consumption & expenditure survey. Government final consumption expenditure, consisting of compensation of employees and net purchases of goods and services, is obtained from the annual budgetary revenue and expenditure report, from the Ministry of Finance and from municipalities. These sources are also used for estimating the public sector's capital formation in building and construction. The estimates of private construction in urban areas are based on the construction expenditure from the investment authority. Construction in the rural areas is estimated by applying the growth rate of rural housing by 1994 housing & population census. For capital formation in machinery and equipment, import statistics are used. To the import values are added import duties, transport costs, trade margins and installation costs. The data on exports and imports of goods and services are obtained from the external trade statistics. Gross domestic product by expenditure type at constant prices is not estimated.

### Income Approach

The cost-structure of the gross domestic product is not estimated.

### Production Approach

The table of gross domestic product by kind of economic activity is prepared in basic price values. The production approach is used to estimate value added of most industries. The income approach is also used in measuring the output of the modern sectors of the economy such as the industrial activity and the services sectors. The estimates of the value added from the agriculture sectors are done by annual agricultural surveys. Benchmark estimates of livestock production were based on the number of livestock by type. The 1961-1963 benchmark estimates of livestock production were based on the number of livestock by type, on gross output and on value added. For subsequent years, gross output and value added are derived by applying growth factors linked to the population growth rate. For forestry, the sources include the Forestry Department, the survey of wood-working industries, and the annual surveys of manufacturing industries. Value added is derived by deducting 10 percent

from gross value of production of industrial wood and firewood.

The annual budgetary reports provide data for the mining sector. The value of production is estimated by multiplying the quantity produced of each mineral product by its average price. The source of data for large-scale manufacturing is the annual survey of manufacturing industries. Value added is obtained by deducting the cost of inputs of raw materials, fuel and energy from the gross value of production.

Data for electricity are obtained from annual returns to questionnaires submitted to concerned enterprises. Data on the number of building permits issued, the 1968 household expenditure survey and population estimates are used to estimate the value of construction in the private sector. The total value of Addis Ababa building permits is adjusted for timing and under-reporting. Work done in other towns is estimated by applying the ratio of per capita consumption expenditure in Addis Ababa to the per capita consumption expenditure in other towns. For the public sector, data are obtained from the budgetary revenue and expenditure reports as well as from questionnaires sent to municipalities and public agencies.

The gross trade margin of imported goods is estimated at 15 per cent of the value of imports based on the 1963 trade inquiry. Similar assumptions are made for locally produced goods. Value added in the transport sector is based on the annual reports of concerned enterprises for the railway, water and air transports. For road transport, data on passenger or ton kilometres, registration statistics, and passenger fares and freight rates are used. For the financial institutions, the profit and loss statement and the annual reports of concerned institutions are used.

Benchmark estimates for 1999/2000 are available for ownership of dwellings. The gross rental income of the urban areas is obtained by multiplying the total number of housing units by assumed actual and imputed average annual rental rates, while for the rural areas the total number of houses is multiplied by the assumed average value per house. Value added of public administration and defence is equal to total wages and salaries paid to government employees, including payment in kind. The sources of data include annual reports and questionnaires sent to different agencies. For other government services such as education and health, value added is based on government reports. Value added per student enrolled in non-governmental schools is estimated as two-thirds of the value added per student in government schools. The value of domestic services is obtained by multiplying the number of employees by assumed average pay rates.

For the constant price estimates, the current net output of plant products in the agricultural sector is revalued at base-year producer prices. For livestock, water supply and construction, value added at current factor costs is assumed to be equal to the value added at constant factor costs. Price indexes are used to deflate the current value added of mining and quarrying, small-scale manufacturing, trade, finance and most of the services sectors. For large-scale manufacturing, electricity, transport and domestic services, value added is extrapolated by volume indexes.
