

**Department of Economic and Social Affairs
Statistics Division**

**NATIONAL ACCOUNTS
STATISTICS: MAIN AGGREGATES
AND DETAILED TABLES, 2008**

PART II

**UNITED NATIONS
NEW YORK, 2009**

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which Members States of the United Nations draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and helps build national capacities through technical assistance.

NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas.

INTRODUCTION

1. This is the fiftieth issue of *National Accounts Statistics: Main Aggregates and Detailed Tables*^{1,2} showing detailed national accounts estimates for 193 countries and areas for the reporting years 1997 to 2008. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical offices. It is issued in accordance with the recommendation of the Statistical Commission at its first session³ that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

THE NATIONAL ACCOUNTS QUESTIONNAIRE

2. This publication is the tenth issue based on the United Nations National Accounts Questionnaire (NAQ) introduced in October 1999, which in turn is based on *the System of National Accounts 1993 (1993 SNA)*⁴.

3. The 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts (1968 SNA)*⁵, the Council in its resolution 1993/5 of 12 July 1993 recommends that Member States use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that Member States consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool. In 2003 the United Nations Statistical Commission (UNSC) called for an update of the 1993 SNA. The first 17 Chapters of the 2008 SNA, comprising the accounting rules, the accounts and tables, and their integration was approved by the UNSC in 2008; Chapters 18 to 29, comprising the interpretations and extensions of the accounts and tables of the System, was approved by the UNSC in 2009. The updated SNA, called *The System of National Accounts 2008*⁶, or in short the 2008 SNA, was finalised in September 2009. It is expected that countries would start compiling national accounts data according to the 2008 SNA by 2010.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the United Nations Regional Commissions, has designed the United Nations National

Accounts Questionnaire (NAQ) based with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the United Nations Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UNSC has agreed that the scope and pace of the implementation of the 1993 SNA must be decided by each country according to its analytical and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

SCOPE OF THE QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditure in current and constant prices and on the relations among product, income, saving and net lending aggregates.

6. Part II (Tables 2.1 to 2.3) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities, Rev. 3 (ISIC Rev. 3)⁷ either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O) or as single tabulation categories (A to P) (one-digit level of ISIC). Only in the case of categories A and I information at the two-digit level is requested for divisions 01, 02, 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according to the Classifications of Expenditure According to Purpose⁸. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10

divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure by households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC)⁹. For the individual consumption expenditure by non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure by general government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.9) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e. the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Table 5.1) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 as indicated in Part II above.

10. Countries are requested to update the data tables and complete them as comprehensively as possible. The tables are listed below :

Part I: Main aggregates

Table 1.1 Gross domestic product by expenditures at current prices

Table 1.2 Gross domestic product by expenditures at constant prices

Table 1.3 Relations among product, income, saving and net lending aggregates at current prices

Part II: Domestic production by industries

Table 2.1 Value added by industries at current prices

Table 2.2 Value added by industries at constant prices

Table 2.3 Output, gross value added and fixed assets by industries at current prices

Part III: Classifications of expenditure according to purpose

Table 3.1 General government final consumption expenditure by function at current prices

Table 3.2 Individual consumption expenditures at current prices

Part IV: Integrated economic accounts

Table 4.1 Total economy (S.1)

Table 4.2 Rest of the world (S.2)

Table 4.3 Non-financial corporations (S.11)

Table 4.4 Financial corporations (S.12)

Table 4.5 General government (S.13)

Table 4.6 Households (S.14)

Table 4.7 Non-profit institutions serving households (S.15)

Table 4.8 Combined Sectors: Non-Financial and Financial Corporations (S.11 + S.12)

Table 4.9 Combined Sectors: Households and NPISH (S.14 + S.15)

Part V: Cross classification of gross value added by industries and institutional sectors

Table 5.1 Cross classification of gross value added by industries and institutional sectors

11. It should be noted that the NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it is mainly serves to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly the one-digit level of ISIC instead of the two-digit level of ISIC.

COLLECTION OF DATA

12. To collect the large volume of national accounts data, the Statistics Division annually sends a pre-filled NAQ to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical offices and from national source publications. Countries are also requested to provide a brief overview of the sources and methods to compile their national accounts.

13. In order to lighten the reporting burden of countries to different international and regional organizations the UNSD receives data from the Statistical Office of the European Commission (EUROSTAT), the Organisation for Economic Co-operation and Development (OECD), the United Nations Economic Commission for Europe (ECE) and the Caribbean Community (CARICOM) on behalf of their constituents. The UNSD, EUROSTAT and the OECD have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), all OECD countries submit data either to EUROSTAT or OECD but need not provide duplicate submissions. Member States of OECD which are not members of the European Community complete a sub-set of the ESA 1995 questionnaire. The ECE provides data for transition economies. CARICOM uses the NAQ to collect data from its Member States and provided it to UNSD. As a result, the United Nations questionnaire based on the 1993 SNA is sent to less than 160 countries, areas, and territories out of the 235 (of which only 193 have provided sufficient data to be published) included in the UNSD National Accounts database.

14. In order to create a comprehensive database based on the 1993 SNA, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database.

CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

15. The form and concepts of the statistical tables in the present publication generally conform to the recommendations by the 1993 SNA. A summary of the conceptual framework and definitions of transactions is provided in chapter I of the present publication.

16. Although the NAQ collects data in the 1993 SNA format, countries may still use the 1968 SNA (or in some rare cases the 1953 SNA) guidelines to compile their national accounts. The UNSD evaluates the status of the conceptual adherence to the 1993 SNA from time to time.

17. The Series note at the top of each table indicates which SNA version is used by the given country to compile their national accounts. Series numbers below 100 relates to data according to the 1968 SNA data and series numbers 100 and above relates to data according to the 1993 SNA. Whenever 1968 SNA data are not replaced backwards for all years by a series of 1993 SNA data, the 1993 SNA data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or

statistical reasons from the definitions and classifications recommended by the 1993 SNA, a footnote is attached to the relevant tables.

18. In the tables with constant price data (Table 1.2 and Table 2.2), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is chain linked volume series. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use chain linked volume series but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e. the total is not equivalent to the sum of its components. Also, constant price data, which are scaled up or down to a certain reference year in order to allow international comparison, are not additive.

19. In the present publication, the data for each country or area are presented in separate chapters, in alphabetical order, under uniform table headings and classifications of the 1993 SNA. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series note at the top of each table indicates the type of fiscal year used for any given series.

COMPARABILITY OF THE NATIONAL ESTIMATES

21. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted that the country notes not only refer to the latest data covered in this publication but to the country in general.

REVISIONS

22. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

NOMENCLATURE

23. The information for the countries and areas shown in this publication reflect what is available to the UNSD as of August 2009. Updated national accounts data are usually provided by countries to the UNSD between January and July. Data for the year 2008 is currently available for 66 countries and areas.

24. Designations, which have changed in years represented in this yearbook (1997 to 2008), are as follows:

Hong Kong - Pursuant to a Joint Declaration signed on 19 December 1994, the United Kingdom restored Hong Kong to the People's Republic of China with effect from 1 July 1997; the People's Republic of China resumed the exercise of sovereignty over the territory with effect from that date. However, China is published in this yearbook in three sections: China; China, Hong Kong; and China, Macao. The data for China excludes the special administrative regions of Hong Kong and Macao.

Zaire - All data for the former Zaire are shown under the country name of Democratic Republic of the Congo.

Serbia and Montenegro – The state union of Serbia and Montenegro dissolved in June 2006. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. Available data are shown for the individual republics.

Tanzania – The data for Tanzania is published in two parts in this yearbook: mainland Tanzania and Zanzibar. Note that the data listed under Tanzania does not include Zanzibar.

SYMBOLS AND DATA DISPLAY

25. The following symbols have been employed:

Data not available..... [...]
 Magnitude nil or less than five percent of the unit employed..... [0.0]
 Decimal figures are always preceded by a point [.]

26. Each series version is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series version is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series note at the top of each table informs about the SNA version applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

27. Decimals in tables do not necessarily add to totals shown because of rounding.

GENERAL DISCLAIMER

28. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

29. Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation “country” appears in the headings of tables, it covers countries, territories, cities or areas

I. SYSTEM OF NATIONAL ACCOUNTS

1. The origins of the System of National Accounts (SNA) trace back to the 1947 Report of the Sub-Committee on National Income Statistics of the League of Nations Committee of Statistical Experts under the leadership of Richard Stone¹. At its first session in 1947, the United Nations Statistical Commission emphasized the need for international statistical standards for the compilation and updating of comparable statistics in support of a large array of policy needs. Specifically, the Commission recommended that the United Nations Statistical Office, in consultation with the interested specialized agencies, should work on guidelines for national accounts statistics (national income and expenditure), taking into consideration best practises and international comparability². In view of the emphasis on international statistical standards, the first national accounts standard was produced and published in 1953. The SNA was subsequently revised and updated in 1960, 1964, 1968 and 1993. In 2003 the United UNSC called for an update of the 1993 SNA. The System of National Accounts 2008³, (in short the 2008 SNA) was finalised in September 2009. This chapter describes the concepts and definitions of the SNA as recommended by the 1993 SNA.

A. THE SNA AS A SYSTEM

2. The System of National Accounts (SNA) consists of a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA includes an external account

that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyse the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic product (GDP), that are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to

describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to chapter II of the 1993 SNA for a comprehensive overview of the System.

1. The sequence of accounts

Current accounts

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

Production account

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

Distribution and use of income accounts

8. These consist of a set of articulated accounts showing how incomes are:

Generated by production

Distributed to institutional units with claims on the value added created by production

Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes

Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from

production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward into the capital account, the first in the System's sequence of accumulation accounts.

Accumulation accounts

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).

The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.

A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

Balance sheets

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever

any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

2. *Activities and transactions*

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly the main sectors of the economy for which it is possible to compile the full sequence of accounts summarized in the previous section. Two main kinds of institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analysed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V of the 1993 SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the

economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the 1993 SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

1. Supply and use tables

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

2. Price and volume measures

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modelling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as targets for the formulation of economic policy-making. They are an essential part of the System, especially given the emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

1. The production boundary

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

Household production

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

(a) The production of agricultural goods by household enterprises for own final consumption;

(b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc;

(c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the production of personal and domestic services by members

of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

Other production boundary problems

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

2. The consumption boundary

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the estimated values of the agricultural products consumed by

households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

3. The asset boundary

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

4. National boundaries

29. The accounts of the System are compiled for resident institutional units grouped into institutional

sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high-inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total

economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

1. Specific uses

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

Monitoring the behaviour of the economy

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

Macroeconomic analysis

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different economic variables by applying econometric methods to time series of data at both current and constant prices compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

Economic policy-making and decision-taking

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data. The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees.

Such agencies typically require very detailed national accounts data.

International comparisons

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by

most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

2. Flexibility of implementation and use

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the 1993 SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the 1993 SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the 1993 SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

3. The SNA as a coordinating framework for statistics

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind revisions of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the 1993 SNA, the harmonization process has been particularly effective in respect of balance of

payments statistics, government finance statistics and money and banking statistics, for which the IMF has responsibility. Revisions of each of these three systems are being undertaken by the IMF in order not only to update these systems but also to make them consistent with the 1993 SNA to the fullest extent possible. Revised manuals on these systems are being published at about the same time as, or in the years immediately following, the 1993 SNA.

48. Various other revised international guidelines are being issued at about the same time as the 1993 SNA. These include the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the 1993 SNA. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the 1993 SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

1. Final consumption, intermediate consumption and gross fixed capital formation

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption, whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

Training, research and development

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

Education

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practising - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

Repairs, maintenance and gross fixed capital formation

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or

prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

2. Interpretation of the distinction between consumption and gross fixed capital formation

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain

expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

Acquisitions

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

Actual final consumption of general government

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.

Actual final consumption of households

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

Actual final consumption of NPISHs

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

Additivity

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

Base period

The period that provides the weights for an index is described as the base period.

Basic price

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

C.i.f. price

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

Capital transfers

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred.

Chain indices

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

Changes in inventories (including work-in-progress)

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

Compensation of employees

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

Constant prices

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in “constant price terms”).

Consumption good or service

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

Consumption of fixed capital

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

Current transfers

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.

Deductible VAT

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

Disposals

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

Export subsidies

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

Export taxes

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

Exports of goods

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

Exports of services

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

F.o.b. price

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

Factor cost

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

Final consumption

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

Final consumption expenditure of government

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

Final consumption expenditure of households

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by

resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

Final consumption expenditure of NPISHs

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

Financial intermediation services indirectly measured (FISIM)

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

Fixed assets

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

Goods

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

Gross

The term “gross” is a common means of referring to values before deducting consumption of fixed capital (generally used as in “gross capital stock” or “gross domestic product”).

Gross capital formation

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

Gross domestic product - expenditure based

Expenditure-based gross domestic product is total final expenditures at purchasers’ prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

Gross domestic product - income based

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

Gross domestic product - output based

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross domestic product at market prices

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross fixed capital formation

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.

Gross national disposable income

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Gross national income (GNI)

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

Gross saving

Gross saving is gross disposable income less final consumption expenditure.

Gross value added

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Gross value added at basic prices

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

Gross value added at producers' prices

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

Import duties

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

Import subsidies

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

Imports of goods

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

Imports of services

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

Indirect taxes

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term “indirect taxes” is not used in 1993 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

Intermediate consumption

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

Inventories

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

Invoiced VAT

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

Market prices

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

Mixed income

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

Net

The term “net” is a common means of referring to values after deducting consumption of fixed capital (generally used as in “net capital stock” or “net domestic product”); it should be noted, however, that the term “net” can be

used in different contexts in the national accounts, such as “net income from abroad” which is the difference between two income flows.

Net income from abroad

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

Net lending

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as “net borrowing”.

Net national disposable income

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Net national income

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

Net saving

Net saving is net disposable income less final consumption expenditure.

Net value added

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Non-deductible VAT

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

Non-financial assets

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

Non-produced assets

Non-produced assets are non-financial assets that come into existence other than through processes of production.

Non-profit institutions serving households (NPISHs)

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

Non-resident

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

Operating surplus

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called “mixed income”).

Other subsidies on production

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (eg, subsidies on payroll or workforce or subsidies to reduce pollution).

Other subsidies on products

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1)

subsidies on products used domestically, (2) losses of government trading organisations, and (3) subsidies to public corporations and quasi-corporations.

Output

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

Producer's price

The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

Property income

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

Purchaser's price

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Resident

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

Services

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realised by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

Stocks

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as “inventories” in the System).

Subsidies

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

Taxes and duties on imports

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

Taxes on production and imports

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

Taxes on products

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a

result of their use for own consumption or own capital formation.

Transfer

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

Valuables

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

Value added - gross

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Value added - net

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Value added tax (VAT)

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

II. COUNTRY TABLES

Cyprus

Source

The preparation of national accounts statistics in Cyprus is undertaken by the Statistical Service, Ministry of Finance, Nicosia. The official estimates are published annually in the "National accounts" and the "Statistical Abstract", issued by the same Service. The following tables have been prepared from successive replies to the United Nations National Accounts Questionnaire.

General

Information on concepts, sources and methods of estimation used can be found in the "History and Analysis of the Methodology of National Accounts in Cyprus", published in 1977 and covers the period 1960-1975 and the "New National Accounts of Cyprus 1976-1983", published in 1985 and covers the years 1976 and after. The latest estimates (data 1995 onwards) have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA which is compatible to ESA 95). Previously the estimates were prepared generally in accordance with the classifications and definitions of the United Nations System of National Accounts 1968 (1968 SNA). For the years 1950-1975, the 1958 SNA was used, for the period 1976-1994 the 1968 SNA was used, while since 1995 onwards the SNA 1993 was applied. To compare national accounts estimates based on the 1993 SNA and those based on the 1968 SNA, the following differences should be taken into consideration: (1) under the 1993 SNA, the valuation of the output of insurance services has changed e.g. inclusion of revenues from investment of technical reserves, (2) introduction of the concept of financial leasing, (3) mineral exploration and computer software expenses are, under 1993 SNA, recorded as capital formation, (4) capital consumption is also recorded for infrastructural work of government. Starting 2006, FISIM is distributed to uses in the data submitted for the years 1995-2006.

Methodology:

Overview of GDP Compilation

Geographical coverage of the national accounts of Cyprus is limited to government controlled areas. Prior to 1976, gross domestic product was estimated through a combination of the income and the production methods. Since 1976, GDP is solely estimated through the production method. The data for the years 1995-2003 have been compiled using a balanced system of accounts based on both production and expenditure approach.

Expenditure Approach

The expenditure method is used to estimate all the components of the expenditure account (i.e. government and private final consumption expenditure, capital formation, stocks and imports and exports of goods and services). Sources of data are the treasury report for government financial accounts, the publications of the Statistical Service on Household Budget Survey and annual data on Imports and Exports. The Central Bank of Cyprus provides detailed data on balance of payments and its components. For constant price estimates the total cost of living allowance index is used to deflate wages and salaries in government final consumption expenditure and partial price indices from the consumer price index are used to deflate the private final consumption expenditure. For the other expenditure items, various price deflators are used. From 2006 onwards, chain linking (the new methodology for constant prices according to the EU regulations), has been applied for the period 1995-2006.

Income Approach

Separate estimates for compensation of employees and operating surplus were not available prior to 1976. Since 1976, separate estimates for compensation of employees and operating surplus are compiled from annual production surveys and other secondary sources. These estimates are published in the "National Accounts". The estimate of consumption of fixed capital was until 1995 based on a fixed percentage (10.5%) of the gross national product. Recently, this is calculated based on the existing capital stock, using the Perpetual Inventory Method (PIM). Net indirect taxes are available in the Financial Report, issued by the Treasury Department.

Production Approach

Agricultural estimates were based mainly on ad-hoc inquiries of the Ministry of Agriculture and Natural Resources for years prior to 1969. From 1969 to 1974, estimates were derived from area sample surveys conducted twice a year. From 1975, the area sample was replaced by an annual survey of crop and livestock holders. Data on fishing and forestry are supplied by the fisheries and forestry departments respectively. Estimates for mining and quarrying, manufacturing and electricity, gas and water are derived from the annual industrial production surveys and the censuses of industrial production held every five years since 1956.

Construction sector consists of public and private construction. Public construction estimates are compiled from the annual financial report of the Treasury Department and the annual reports of semi-government organizations and local government authorities. For private construction the data are derived from the annual construction surveys conducted since 1978 and based on the building permits. While since 1987, an additional economic survey is conducted through building contractors. Prior to 1981, wholesale and retail trade estimates were based on gross trade margins, calculated through the commodity flow method. Since the 1981 Census of Wholesale and Retail, estimates are derived from an annual survey.

For transport, prior to 1980, estimates were based on extrapolation of value added by using indices of the number of buses in use and bus fares, rented cars and fares as well as the number of taxis and their revenues. For lorry transport, estimates were based on the transport margins derived from the commodity flow method. Estimates for port services and civil aviation were compiled from the annual financial report of the Treasury Department and for Cyprus Airways data were obtained regularly from their annual report. For storage, data were compiled from ad-hoc inquiries collected through the agricultural surveys and later by conducting special surveys. For communication, estimates were obtained for postal services from the financial report and for the Cyprus Telecommunication Authority data were compiled from its annual report. Since 1980 estimates are based on annual economic surveys on all activities of the transport sector.

Data on financial institutions are collected by the Central Bank of Cyprus. Data on insurance activities are extracted from the records of the Office of the Supervisor of Insurance Companies and ad-hoc surveys conducted by the Statistical Service. Data on real estate are based on land and buildings transfer fees and ad-hoc surveys. Data on business services are derived from annual economic surveys. The main source of information for public administration and defence and public services is the annual financial report of the Treasury Department and annual returns submitted by the local authorities. Estimates for the private services are derived from the annual services survey.

For the constant price estimates, the double deflation method is used for all items of agricultural outputs and inputs to arrive at value added estimates. Special price deflators for each category and or product items are constructed for both the output and inputs. Prior to 1976, value added was deflated by using a combination of indices for the remaining industries. Quantity indices for mining and quarrying, manufacturing and construction, price indices for wholesale and retail trade, base year average prices for electricity, gas and water, employment and wage rate indices for all the other services sectors. Since 1976, double deflation method of output and inputs is used. For producers of government services, the cost of living allowance index is used to deflate their value added which comprises mainly of compensation of employees. From 2006 onwards, chain linking (the new methodology for constant prices according to the EU regulations), has been applied for the period 1995-2006.

Czech Republic

Source

The preparation of annual national accounts statistics in the Czech Republic is undertaken by the department of Annual National Accounts at the Czech Statistical Office (CZSO) located in Prague. The official estimates are published annually on the internet (www.czso.cz), as well as in the annual Statistical Yearbook of the Czech Republic. The concepts, definitions, sources of basic statistics and methods of estimation for most parts of national accounts were described in Gross National Income Inventory 2002 (in 2006) and the description is going to be allocated also on CZSO's web site. This inventory was submitted by CZSO to EUROSTAT. It describes in detail all methods applied in compiling the SNA accounts and exhibits numerical results. The data provided to UNSD was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA) in its European variant ESA 1995. Printed publications on national accounts statistics have been replaced by publishing the data on the Internet, path: www.czso.cz - Economy - GDP, National Accounts -Annual national accounts. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in ESA, a footnote is indicated to the relevant tables. The submitted data are reported in national currency (Czech koruna, CZK), in million.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled. Input-Output tables in the form of Supply and Use Tables are also compiled annually.

Expenditure Approach

The estimates of government final consumption expenditure are derived from production accounts compiled on the basis of the accounting records of the various authorities. The values of private expenditure on goods and services are mostly obtained by means of Household Budget Survey and its grossing up to the whole population with increased weight attributed to the highest income group of households. The result is confronted with commodity flow method during the compilation of Supply and Use Tables, including also recalculating data at current prices into prices of the previous year and then into prices of the chosen benchmark year.

The comparison and balancing data is based on adding distributive and transport margins and taxes on products less subsidies on products to the value of goods and services produced domestically or imported at basic prices.

The sources of data include mainly statistical annual surveys on enterprises linked to their bookkeeping (structural statistics), of which up-grossed results are confronted with administrative sources mainly from Ministry of Finance on taxes and subsidies, Social Security institutions on social contributions and benefits, Czech National Bank on Balance of Payments for compilation of external accounts, revenues, costs, financial assets and liabilities of banks and others. For price data the consumer price index is largely referred to.

Own-account consumption is valued at producers' prices, for use of owner-occupied dwellings the user cost prices including 2.5% of the net value of dwelling and of associated land as the net operating surplus less allocated FISIM included in intermediate consumption are imputed.

The data on changes in inventories are based on regular annual surveys. Data on the difference between the closing and incipient stocks are deperated by subtracting holding gains and by addition of holding losses.

For gross fixed capital formation in machinery and equipment, dwellings, other buildings and structures and other tangible and intangible new and used fixed assets, data on acquisition, sales and transfers are collected and balanced also in the framework of supply-use tables, including recalculating into constant prices.

The estimates of exports and imports of goods and services are based on foreign trade statistics and the balance of payments.

Constant price estimates of government final consumption expenditure are based on deflation for intermediate consumption and other components of costs and on the other hand for non-market sales of products produced by general government. For example, compensation of employees is deflated by index of their annual wage adjusted by estimated annual growth of labour productivity.

For private consumption expenditure, revaluation by CPI at previous-year prices is used in most cases. For other components of product resources and uses, current estimates are deflated by appropriate (basic, export, import) price indexes and their combination. This same method is used for change in inventories and valuables and for gross fixed capital formation.

Income Approach

Estimates of compensation of employees are based on wage statistics and contributions paid by employers to government funds. Direct information is available on compensation of government employees. Operating surplus is basically derived as a residual item. Further breakdown is based on income tax statistics for unincorporated enterprises, independent professions and property. In the case of the public sector, data are obtained from the accounting records of public bodies. Depreciation estimates of stocks are mostly obtained by using the perpetual inventory concept or, in some instances, are derived from quantities, replacement costs and service life times of fixed assets. Indirect taxes and subsidies are obtained directly from the records of the various governments. Accrual values are obtained by shift in time of cash data on tax payments.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added of nearly all industries. The income approach is used to estimate value added in non-market production. Large scale enterprises of all industries are surveyed by annual overall censuses while small-scale enterprises are surveyed annually by samples. When necessary, extrapolation is based on output statistics, sample surveys and turnover statistics. For the financial institutions, value added is derived from accounting records for banking and other financial institutions from statistics of the supervisory board for insurance. The value added of government services is estimated by adding the cost items obtained from bookkeeping records and from imputing consumption of fixed capital. For the constant price estimates, double deflation is used. For the producers of government services, partly quantum indicators, partly suitable price (wage) indexes are used.

Denmark

Source

The preparation of national accounts statistics in Denmark is undertaken by the Statistics Denmark, Copenhagen. The official estimates are published in "Nationalregnskabsstatistik", Danmarks Statistik. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The estimates in the following tables have been prepared in accordance with the concept and definitions recommended in System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

An in-depth description of the compilation of the Danish National Accounts at current prices can be found in "Danish National Accounts, Sources and Methods 2003" at www.dst.dk/nationalregnskabsmetode. A detailed description of the compilation at constant prices can be found at www.dst.dk/Vejviser/Portal/Nationalregnskab/fastpris.aspx.

Final national accounts data are calculated three years after the reference year (year t+3). Several versions of preliminary accounts are calculated before that. The first version is available as the sum of quarters two months after the end of the reference year, and the last preliminary version is published at the end of year t+2.

The constant price series are Laspeyres chain-linked values with 2000 as the reference year.

Methodology:

Overview of GDP Compilation

The Danish national accounts consist of both annual and quarterly accounts. The official balance of payments estimate is consistent with the national accounts rest-of-the-world account. As from the 1997 publication, the Danish national accounts have been compiled in accordance with the guidelines in the European version of SNA93, the European System of Accounts (ESA 95). Consistent time series are available back to 1966.

The Danish national accounts are built around an integrated set of supply and use tables and institutional sector accounts. Initial unbalanced GDP estimates are to a large extent calculated independently from the output and expenditure sides and balanced in a detailed product balance system covering around 2 350 products. The result is a balanced set of supply and use tables and integrated production and generation of income accounts for industries and institutional sectors. The sector-industry tables are thus an integral part of the final annual national accounts. With the balanced supply and use tables as a starting point, symmetrical, industry x industry input-output tables are constructed annually on the basis of the "industry technology assumption".

Since 2001, annual financial accounts are also produced and net-lending from the financial transaction account and the non-financial accounts are reconciled in a balancing process. In addition capital stock estimates (produced assets) are compiled using gross fixed capital formation series at industry level, which secures consistency between investment and capital stock series. This system also produces consumption of fixed capital series. Finally, labour productivity is produced for annual figures.

The only case where ESA 95 is not followed is on the recording of payments on the harmonised VAT basis which accrue to the EU in connection with the third own resource. According to ESA 95 paragraph 4.14, this resource should be recorded as taxes on products paid by residents to the EU (D.211). When implementing the ESA 95, Denmark found this rule unrealistic from an economic point of view. Instead, these payments are recorded as a

current transfer from Denmark to the EU. Total VAT revenue is recorded as income for the resident general government sector.

Constant price estimates are derived by deflation of each of the 2,350 product balances in the SUT. For each product separate deflators are used for domestic output, imports, exports and domestic uses.

The national accounts for Denmark cover only the southern part of the kingdom and therefore exclude the Faeroe Islands and Greenland.

Expenditure Approach

The most important sources for the estimate of the components of expenditure-based GDP are the following:

Household final consumption expenditure:

Retail trade statistics, DOI (level of retailable consumption)

The FU [household budget survey] (structure of retailable consumption, services)

VAT statistics

Surveys of housing rentals

Housing surveys (housing stock, stratified)

Energy statistics (electricity, gas, district heating)

Statistics on financial institutions (financial services)

Statistics on public finances (user payments to public institutions)

Tax statistics (quantities of goods on which excise duties are levied)

Supply side estimates

Motor vehicle statistics (households' acquisitions of new cars)

Balance of payments statistics (tourist revenue and expenditure)

Final consumption expenditure in NPISHs:

ERE [establishment-related employment statistics] estimates of total wages and salaries

Gross fixed capital formation:

Agricultural statistics

Public finance statistics

Accounts statistics for industries predominated by public corporations

Register of buildings and dwellings (BBR)

Index of construction costs

Product statistics for the IT industries

ICT expenditure

External trade statistics

Industrial accounts statistics

Specific industry statistics

Media statistics

Register of motor vehicles

Register of vessels

Register of aircrafts

Acquisitions less disposals of valuables:

Industrial commodity statistics

External trade statistics

Household budget survey (FU)

Changes in inventories:

Industrial accounts statistics

SLS-E statistics

Accounting statistics for industries where public corporations predominate
 Specific industry statistics, including agricultural statistics
 Energy statistics
 Agricultural statistics

Imports and exports of goods and services:
 External trade statistics (Intrastat and Extrastat)
 Balance of payments statistics
 Settlements statistics from the Nationalbank
 VAT statistics
 Accounts statistics for sea water transport.

By far the largest share of expenditure-based GDP is calculated using a direct estimate. The most important exceptions are household consumption of hotel and restaurant services, dwelling services, consumption in NPISH, which are all calculated indirectly from the supply side.

For some consumption groups of household final consumption expenditure, more than one source is available. In these cases, an assessment of which source is the most reliable for estimating the variable (consumption group) has been made. The assessment mainly relates to whether the consumer survey (FU) should be replaced by another source.

The main rule in the Danish national accounts has been that wherever possible the FU has been replaced by other information to determine levels, but it is widely used to determine the structure of expenditure – for the breakdown of food consumption into individual foodstuffs, for example. For retailable consumption, i.e. that share of private final consumption which passes through retail trade, the FU figures are replaced by retail sales figures which must be considered a much better statistical source for determining levels of private consumption. The FU figures are used to divide the aggregate groups from retail sales statistics into the detailed consumption groups. For energy products and acquisitions of motor vehicles, there is special information available based on physical data.

Capital formation can in principle be estimated in two ways, either directly using information on the expenditure (uses) side (purchaser's side) or indirectly on the basis of supplies of products to the domestic market, using estimated shares of supplies to the final demand components to calculate final uses from the resources side. During the recent years widening of the scope of the industrial accounts statistics have led to estimates of GFCF in machinery, equipment and major building repairs that have gradually changed from supply side estimates to estimates that are mainly based on information from the uses side. The estimates for construction of new buildings are based either on accounting statistics with very detailed coverage of actual observations or a calculation based on the exhaustive register of buildings (the BBR) and prices pr square meter for the different types of buildings. However, even after the introduction of a direct expenditure based estimate of capital formation in machinery and equipment, it is likely that it will be adjusted to some degree to take account of supply side estimate

Since the Danish national accounts are adjusted in a detailed product balance system, there is a systematic confrontation in connection with the balancing. One of the strongest cross-checks for the compilation of national accounts consists in comparing information from purchasers on their acquisitions less disposals of the individual products or groups of products with information on the sellers' side on supplies to the domestic market.

Transition from private accounting and administrative concepts to NA concepts:
 In household and business accounts, purchases of goods and services are recorded in terms of purchasers' prices including non-refundable VAT. Refundable VAT is not included in the acquisition prices, on which information is available, which is consistent with the ESA 95 net VAT system.

Various acquisitions which the national accounts treat as gross fixed capital formation are included in business accounts as current operating expenditure in the form of intermediate consumption or wages and salaries which

are not capitalised. Examples would be consumables as well as purchased and own-produced software. The corrections on the expenditure side are a mirror image of the corrections to the output value (e.g. own-produced software) and intermediate consumption (consumables and purchased software) in the output-based estimate as described in chapter 1.3 and chapter 3.

For each type of inventory, changes in inventories in the business accounts are calculated as the value of closing stocks minus the value of opening stocks, estimated according to the enterprises' own accounting principles, which means that opening and closing stocks are calculated at different price levels. In the national accounts, changes in inventories should be estimated at the average prices for the year. Ideally, changes in inventories should be monitored throughout the year and all changes split into revaluations (holding gains) and national accounts changes in inventories. Normally, a reasonable approximation of the correct change can be produced by converting the value of both opening and closing stocks to the average prices for the year using the ratio of the year's average price to the price on the date of the inventory estimate. In the Danish national accounts, opening and closing stocks are converted to average prices for the year for all combinations of product number/target total module code/DK-NACE industry/sector following the breakdown of inventory totals by product. The national accounts change in inventories is calculated as closing stocks minus opening stocks for each of these combinations.

For import and export of services, the statistical challenge arising from the use of settlements statistics for the estimate of aggregate exports/imports of services lies in ensuring that the definition of what constitutes an export or an import of services remains consistent with the external trade statistics and national accounts estimates of exports of goods f.o.b. and imports of goods c.i.f. Therefore, a correction is made to exports and imports of services as estimated in the settlements statistics to bring the latter into line with the estimate of exports of goods f.o.b. and imports of goods c.i.f.

Constant price estimates are derived by deflation of each of the 2,350 product balances in the SUT. For each product separate deflators are used for domestic output, imports, exports and domestic uses. In particular consistency with the consumer price index is ensured at a detailed level.

Income Approach

The main sources used for compiling GDP from the income side are:

- The annual working time accounts (WTA) (compensation of employees)
- The system for compiling fixed capital in the national accounts (consumption of fixed capital)
- Administrative data used for compiling general government (other taxes on production and imports and other subsidies on production)
- Gross operating surplus and mixed income are compiled as residuals.

The WTA is compiled in Statistics Denmark's division for labour market statistics. The WTA is used almost directly in the national accounts and only with a few adjustments made in the national accounts. The background for the WTA is a considerable expansion in the number of statistics covering the labour market and the fact that the figures from different statistics are not immediately comparable. The WTA is a statistical system integrating already existing labour market statistics.

Production Approach

General Government:

For central government, the main statistical source is central government accounts. For local government, the main source is local government accounts for all 275 municipalities and 14 counties. For the "self-owning" institutions, under both central and local government, annual accounts, assumed to cover the whole population, are collected. For the social security funds, the statistical source is their annual accounts, which are collected for all units concerned.

The units included in the statistical system for public finance as producer units in S.13 and those units which are classified in the business register as government non-market units are exactly the same. The grouping of government units by purpose, COFOG, is only added in the public finance statistical system and not in the business register.

The accounting plan in central government accounts is not the same as that used for local government accounts. All municipalities and counties are obliged to use the local government plan. When compiling national accounts, the accounts for central government, local government, "self-owning" institutions and social security funds are coded with national accounts classifications based on ESA95. Then they are stored in one compilation system, the DIOR database [Databasen for integrerede offentlige regnskaber, i.e. database for integrated public accounts]. All individual entries at the most detailed level of the primary accounting systems are given an ESA95 code. All entries are classified by type of transaction, by purpose and by industry.

Financial institutions:

The sectoral delimitation of the subsectors complies strictly with the ESA 95 rules. Subsectors S.121 The central bank and S.122 Other monetary financial institutions have complete accounts.

In subsectors S.123 Other financial intermediaries and S.124 Financial auxiliaries, certain units are not covered by the financial accounts statistics collected by the supervisory authority, Finanstilsynet, or by Statistics Denmark. For S.123, those accounts which are available for the sector are grossed up to cover all units in that sector on the basis of employment. Enterprises in S.124 are covered by company accounts also grossed up on the basis of employment to cover the total population.

Insurance corporations and pension funds are covered in full by Finanstilsynet's accounting estimates.

Non-financial corporations:

For publicly controlled non-financial corporations the source for the national accounts estimate is "statistics for public enterprises". As general government statistics are compiled in line with national accounts principles, the extended statistics for public enterprises are processed according to national accounts definitions and presented according to the accounting plan for non-financial corporations in the ESA 95. One of the reasons is the desire to be able to produce a national accounts estimate of the "public sector", which is a combination of general government (S.13) and public corporations (S.11001). The public sector is all producer units in the economy under public control.

Non-financial corporations other than the government controlled and the household sector (sole proprietorships and households as owner-occupiers) together account for by far the largest share of market output in the economy. As a general rule, value added is calculated from the two sets of accounts statistics, namely:

- a) the industrial accounts statistics, which is by far the most important, covering for 2003 all non-financial producer units other than general government and industries where public corporations traditionally predominate and
- b) "SLS-E accounts statistics", which cover the remainder of the economy, mainly certain personal service industries. This is accounts statistics based on standardised accounts (SLS-E=Statens Ligningssystem for Erhvervsdrivende), the government tax assessment system for businesses), which all firms, with certain exceptions, have to send in to the tax authorities together with their tax returns.

The SLS-E statistics is used for the grossing up of the industrial accounts statistics as well as for compiling the industries mentioned under b) which are not covered by industrial accounts statistics.

Agriculture, horticulture and the raising of fur animals:

The statistical source for agriculture, horticulture and the raising of fur animals is Danmarks Statistik's agricultural statistics which, as already stated, are a national accounts estimate. The statistics comply with the guidelines in Eurostat's agricultural statistics manual. The calculations of intermediate consumption are based on 1) quantities

of products used multiplied by the average selling price, 2) accounting information collected by the economic advisers for agriculture and 3) annual accounting statistics for agriculture and horticulture compiled by Statens Jordbrugs- og Fiskeriøkonomiske Institut.

Dwellings:

The output value of dwellings is estimated every fourth year as a benchmark calculation of the price times volume type, based on the total stratified housing stock and comprehensive rental figures covering almost two-thirds of all dwellings in Denmark which are let. Both sources must be considered to be of high quality.

In years between the benchmark calculations, the latest benchmark is projected using price and volume indicators. The price indicator is rental information from the sample survey of rentals which is carried out every six months to provide information on changes in rentals in the consumer price index. The volume indicator is information from building statistics based on Bygnings- og Boligregistret (BBR) [the Register of buildings and dwellings] which gives the number of square metres constructed combined with an estimate of the number of dwellings demolished.

The benchmark calculation is particularly detailed and uses the stratification method which the GNP Committee approved as the preferred method. The stratification of the housing stock is much more detailed than the minimum requirements set out in the Commission Decision (95/309/EC, Euratom). Whilst this Decision requires a minimum of 30 strata, the Danish calculation of levels for 1999 uses roughly a thousand strata.

Non-profit institutions serving households:

By far the largest expenditure component in the case of private non-market output is the wage or salary bill. In Denmark, the ERE (Erhvervsbeskæftigelsesstatistik, translated into English in Danmarks Statistik publications as "Establishment-related employment statistics") statistics calculate the total wage or salary bill in all producer units in the economy, including in private non-profit institutions serving households. This is the main source for the calculation.

For want of accounting statistics in this field, the other components in the estimate of output from the costs side, i.e. intermediate consumption, consumption of fixed capital and other taxes and subsidies on production, are calculated on the basis of the accounts for the largest trade union (HK).

Private households with employed persons:

Statistics Denmark has carried out two benchmark surveys linked to the labour force surveys for 1992 and 2004, in which the households were asked a series of questions on their untaxed activities. Interviewees were asked about the number of hours worked and their income. On the basis of these figures, benchmark values were fixed for output by grossing up to the total population.

From 1992 and onward values were projected in the current years using changes in the net price index (consumer price index excluding taxes on products and subsidies) for cleaning. And off course, the new benchmark value in 2004 gave an opportunity to make a minor revision of the figures in the years between the two benchmarks.

Transition from private accounting and administrative concepts to ESA95 concepts:

After processing the accounting statistics underlying the national accounts calculations of value added a number of corrections to the first version are carried out. These corrections include:

On the supply side:

- 1) Production in the hidden economy.
- 2) Fringe benefits produced from own production.
- 3) Revenue from licenses and royalties.
- 4) Software produced on own-account.
- 5) Entertainment, literary and artistic originals
- 6) Price correction of changes in inventories of finished goods, work in progress and goods for resale.

On the uses side:

- 7) Fringe benefits purchased
- 8) Financial intermediation services paid for directly.
- 9) FISIM
- 10) Correction for net insurance premiums
- 11) Public fees
- 12) Expenditure on licences and royalties
- 13) Software produced on own-account
- 14) Purchased software
- 15) Price correction of changes in inventories of raw materials.
- 16) Small tools etc.

Reply to the United Nations national accounts questionnaire from Direction Nationale de la Statistique, Djibouti. The official estimates are published by the Direction Nationale de la Statistique in "Annuaire Statistique de Djibouti" and "Comptes Nationaux de Djibouti, 1990-1998".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Reply to the United Nations national accounts questionnaire from the Ministry of Finance, Trade and Industry, Roseau.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Dominican Republic

Source

Reply to the United Nations National Accounts Questionnaire from the Banco Central de la Republica Dominicana, Santo Domingo. The official estimates are published by the Banco Central in the series "Cuentas Nacionales, Producto Nacional Bruto", which also includes a detailed description of the sources and methods used for the national accounts estimation. Beginning 1984, estimates for imports and exports of goods and services were converted from dollars to pesos by using the annual average exchange rates fixed by the Central Bank.

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. Gross fixed capital formation is mainly estimated by the commodity-flow method, whereas private final consumption expenditure is taken as a residual, which also includes changes in stocks which could not be computed directly. Government consumption expenditure data for the central government is obtained from the Ministry of Finance and the National Budget Office. For gross fixed capital formation, import statistics are utilized for capital goods such as machinery, equipment and transport and communication equipment, since no such products are produced locally. To the import values are added customs duties, surcharges, mark-ups, etc. The data on exports and imports of goods and services are taken from the publication on balance of payments, prepared by the Central Bank. For the calculation of constant prices, price deflation is used for government consumption expenditure. Compensation of employees is deflated by means of the cost of living index, whereas for government purchases and sales general price indexes are used. Constant value of private consumption expenditure is obtained as a residual. The value of construction is deflated by a construction costs index. In the case of rural dwellings base-year prices are multiplied by number of dwellings built. The import price index is used as a deflator for exports and imports of goods and services.

Income Approach

The data on indirect taxes and subsidies are based on the annual reports of the Ministry of Finance and on information from the Treasury and the National Budget Office.

Production Approach

The production approach is the basic method of estimation used for most sectors. The income approach is used for trade, transport and communication, finance, general government and other services. In agriculture, gross output is estimated by multiplying the quantities harvested by the average price paid to the producers. Quantity data are available from the agricultural censuses of 1950, 1960 and 1970 and from estimates by the Banco Agrícola, the Ministry of Agriculture and others. Own-account consumption is included in the production series. Data on the volume of livestock production is provided by the Ministry of Agriculture, which also estimates the quantity of unreported slaughter and herd changes in livestock.

The basic information for calculating gross output of the mining and quarrying sector is obtained directly from the reports on production and sales of enterprises. For manufacturing, the main source of information is the series of annual bulletins of industrial statistics. The value of construction for 1960, which is taken as a benchmark, is extrapolated by means of a value index. This index is a combination of a price index of construction costs and an index of main materials used. Value added is obtained by applying to gross output a coefficient representing the ratio of gross factor income. Data for the trade sector are available from the first national trade census carried out in 1955, and from total wholesale and retail sales figures published periodically by the National Statistical Office. Wages and salaries are calculated by combining average remunerations series with sectoral employment series. The Dominican merchant marine and the Dominican airline provide the data needed to estimate incomes, inputs and value added for shipping and air transport. For land transport the information obtained includes data from transport enterprises and surveys among owners of trucks and taxis.

For financial institutions the estimates are based on complete accounting information which is available for all banks and finance companies and most insurance companies. Value added of ownership of dwellings is taken as the difference between gross rents paid or imputed based on census data and the inputs for maintenance, upkeep and management and property taxes. For public administration and defence, data are obtained from government authorities, publications and from independent institutions. For other private services, data on the number of persons employed and mean income are used. The benchmark data are extrapolated according to a specially constructed income index.

For the computation of constant prices, the value added for agriculture is estimated by a revaluation at base-year prices of the harvested quantities. In the case of livestock products, estimates of annual changes in average meat yield per animal are utilized. For mining and quarrying, value added is estimated by revaluating the different minerals at their respective 1962 prices. Value added of manufacturing is extrapolated by a quantity index of output. Current values of public and private construction are deflated by means of an index of construction costs. Wholesale and retail sales of locally produced and imported goods are deflated using the respective price indexes. For transport, storage and communication, value added is extrapolated by quantity index of output. For financial institutions, value added is extrapolated by quantity indicators of personnel employed. For ownership of dwellings the indicator used is the number of urban and rural dwellings. Value added for public administration, defence and other services is extrapolated by an indicator of the number of personnel employed.

Ecuador

Source

Reply to the United Nations national accounts questionnaire from the Subproceso de Cuentas Nacionales, Banco Central del Ecuador, Quito. The official estimates are published annually in "Cuentas Nacionales" Bulletin and "Memoria Anual del Banco Central del Ecuador".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) and in sucres (the national money).

Effective March 13, 2000, a full dollarization scheme was established (ley para la Transformacion Economica del Ecuador). The currency of Ecuador is the Ecuadorian Sucre, but the dollarization legislation allows the free circulation of the dollar and provides for a limited issue of domestic coins with small value to re-main in circulation to facilitate small transactions and requires that they be fully backed at all times by dollars. The dollarization legislation provides for the central bank to exchange on demand sucres at a rate of S/. 25,000 per U\$. 1.00.

These data are denominated in millions of dollars (base year = 1993 and base price = 2000). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Egypt

Source

The preparation of national accounts statistics in Egypt is undertaken by the Ministry of Planning, Cairo. Official estimates are published in the annual "Statistical Yearbook" published by the same agency. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. Some tables have been updated from 1987 onwards using the "Economic Bulletin", Vol. 52 No. 1, 1999 of the National Bank of Egypt. The data from 1996 onwards have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. The estimates of government final consumption expenditure are based on government budgets and accounts. For private consumption expenditures, the estimates are based on family budgets and household expenditure surveys. The Department of Statistics prepares data on inventories of cotton, covering both commercial stocks and stocks of spinning industry. Other sources of information for changes in stocks include data collected regularly by the Ministry of Supply. For gross fixed capital formation, the government sector is estimated directly together with government consumption expenditure. The private sector estimate is obtained by deducting the government estimate from total capital formation. Capital formation in machinery and equipment is estimated through the commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of merchandise are generally based on foreign trade statistics. The estimates of GDP by expenditure type in constant prices are prepared by the CAPMAS on the basis of official index numbers of prices and quantities.

Income Approach

The estimates of wages and salaries are based on government accounts and on various sectoral surveys. No specific information is available for operating surplus, which is computed as a gross estimate, i.e., including consumption of fixed capital. Indirect taxes and subsidies are separately available for all economic units in the compulsory standard accounts for public enterprises and in the economic surveys for the private sector.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is used to estimate value added of community, social and personal services. The Ministry of Agriculture collects, through annual sample surveys, data on crop area, yield and crop-cutting. Livestock data are obtained through special censuses every two years and prices received by farmers are collected annually. The estimated acreage of each of the main crops is multiplied by average productivity of the basic area of measurement. The gross output is evaluated at farm-gate prices and estimates of intermediate consumption are based on data collected from the co-operative societies and from censuses. For the industrial activity sector, annual statistics on industrial production, capital formation,

employment, wages and salaries are available for industrial establishments with ten workers or more which form the organized sector of the economy. For the non-organized sector, estimates are made by using data from industrial censuses and by studying the cost-structure of each industry, productivity and degree of mechanization.

The output of construction is estimated indirectly from the input side by means of employment data and data on intermediate consumption. The value of gross output and components of value added are obtained by using the relationship between available data on intermediate consumption and primary inputs in organized enterprises and applying this relationship on the estimated intermediate consumption of this industry. For trade, annual basic statistics are available for establishments with five or more workers, while those with less than five workers are covered by sample surveys conducted every three years. Estimates for restaurants are made by using data on establishments, wages and salaries, working hours and data from sample surveys. Estimates for hotels are obtained through annual questionnaires. Data on input, output and other elements of large-scale transport are available through annual accounts. For unorganized transport, estimates are based on information on the number of establishments and workers, on wages and salaries and on other sources. Indicators such as input ratios are used to estimate value added.

Gross output and input of public financial institutions and insurance companies are based on data collected annually. The estimates of real estate, business services, and imputed rents of owner-occupied dwellings are based on family budget surveys. The government accounts provide information to estimate government services. Annual data are available for non-profit institutions serving households. For the service activities of unincorporated enterprises, gross output and inputs are estimated by using available censuses of establishments, wages and salaries statistics. The constant prices of GDP by kind of economic activity are estimated by CAPMAS on the basis of official index numbers of prices and quantities such as wholesale prices, consumer prices and quantities of imported and exported merchandise.

El Salvador

Source

The preparation of national accounts statistics in El Salvador is undertaken by the Departamento de Cuentas Macroeconomicas, Gerencia de Estudios y Estadísticas Económicas del Banco Central de Reserva de El Salvador. The official estimates are published quarterly in "Revista Trimestral" and monthly on the internet (www.bcr.gob.sv). A detailed description of the sources and methods used for the national accounts estimation is contained in "Un Nuevo Sistema de Cuentas Nacionales" published by the Banco Central de Reserva de El Salvador in 1995. Employment data are compiled by the Dirección General de Estadísticas y Censos.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides clarification. The estimations of new base 1990 are made by means of the use of tools such as the tables of supply and demand that allow to calculate the supply and demand for eighty products, which are grouped in forty five economic activity branches.

On 1 January 2001 the Monetary Integration Law was accepted in El Salvador, and it grants the American dollar unrestricted legal effect with unlimited releasing power setting the exchange rate for the Salvadoran colon against US Dollar at 8.75. The newly submitted data for the years before 2001 were reported and published in national currency (Salvadoran colon) but were converted to American dollar using the exchange rates (used to national account intentions) data to allow for easy comparison of national time series data.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and expenditure approaches. Income approach was compiled at current prices, only for the period from 1990 (base period) to 1993; statistical limitations have not allowed to continue with this approach. Supply and Use tables are compiled annually.

Expenditure Approach

The estimates by the expenditure approach are obtained from the supply of eighty products setting the production destiny as the households final consumption, investment and exports; and for the government, the production has an only destiny: the public consumption. The estimates of government consumption expenditure are obtained directly from government sources. The estimates of increase in stocks are based on information on stored agricultural products, and the stocks of the manufacturing and trade. Private capital formation is estimated on the basis of data on domestically produced and imported capital goods and on statistics of construction and repair work. The imports data are adjusted to include import duties, trade margins and installation costs. For public expenditure on capital formation, data are obtained from official sources. Data on exports and imports of goods and services are obtained from the balance of payments. Export data on coffee are obtained from the Consejo Salvadoreño del Café. Gross domestic product by expenditure at constant prices is estimated.

Income Approach

Income approach was compiled at current prices, only for the period from 1990 (base period) to 1993; statistical limitations have not allowed to continue with this approach. Compensation of employees, combined with operating surplus, is obtained as a residual. The estimates of net indirect taxes are derived from the government accounts. No specific information is available on how consumption of fixed capital is estimated. The Income Approach at constant prices is not estimated.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most industries. The public administration and defence is estimated by the sum of the costs, and trade sector is estimated by the sum of commerce margins. The agricultural data, which are provided by Ministerio de Agricultura y Ganadería, are obtained through various periodic surveys. Data on the coffee harvest are supplied by the Consejo Salvadoreño del Café while coffee prices are taken from the balance of payments. Information on the production of cotton is provided by the Cooperativa Algodonera Salvadoreña Ltda. The gross value of production is calculated by applying producers' prices to the quantity of each commodity produced. For the livestock sector, information is obtained from the Ministerio de Agricultura y Ganadería. Value added of forestry and logging is estimated by means of indirect methods using data provided by The Dirección General de Ordenamiento Forestal, Cuencas y Riegos del Ministerio de Agricultura y Ganadería.

For the mining and quarrying sector, the estimates are based on data provided by the Dirección General de Estadísticas y Censos from companies of mining and quarrying. The gross value of production in manufacturing is based on the results of annual surveys to the manufacturing industry, made by the Dirección General de Estadísticas y Censos to the small, medium and great industry companies. The estimates for electricity are based on information provided by companies related like: generating, distributing and transmitting companies of electricity. For private construction, the information is obtained from statistics related to the cement apparent consumption; information on construction permissions provided by the Oficina de Planificación del Área Metropolitana de El Salvador (OPAMS), etc. The estimates for public construction are obtained from concerned institutions such as the Dirección General de Inversión y Crédito Público del Ministerio de Hacienda. For both public and private constructions, intermediate consumption is determined by using a fixed percentage of gross value of production.

Gross output of the trade sector is determined on the basis of the values of domestic and imported goods marketed. The gross value of production of domestic goods and the c.i.f. values of imported goods are adjusted for changes in stocks and trade margin are added. An estimate of inputs, is made from a survey based on percentages such as cement consumption, metallic products, etc., which is deducted from the total gross value of production to arrive at value added. Estimates of restaurants and hotels are interpolated and extrapolated on the basis of census of 1992 and applying indicating of volume and prices obtained from the survey made to restaurants and hotels carried out by the Dirección General de Estadísticas y Censos. The enterprises concerned with road transport are classified in load transport and passengers transport. A sample from each category is taken in order to obtain average figures for estimating receipts per ton, which are multiplied by quantity transported figures to arrive at gross value of production and value added. For air transport and communication, information is obtained directly from concerned companies.

The estimates of the financial sector are based on financial statements furnished by the banks and insurance companies, Private Pension Fund Administrator and Financial Auxiliaries. Imputation is made for service charges by deducting interest from investment income. The estimate of ownership of dwellings are based on the number of urban and rural dwellings obtained from the population censuses and rents data from "Encuestas de Hogares y Propósitos Múltiples", and using the cost of living index as an inflator. The estimates of government services are based on information published by the Ministerio de Hacienda. For other services such as education, hospitals, religion, the estimates are obtained from concerned institutions. For domestic services the estimations, are made taking into account the employment indicator generated by this activity and the annual information provided by "La Encuesta de Servicios" carried out by the Dirección General de Estadísticas y Censos. For the constant price estimates, value added for the agricultural, electricity, trade, transport and financial sectors is estimated by using volume or quantity indexes. Double deflation is used for the electrical energy, water, communications, insurances and government services.

Estonia

Source

The main providers of official statistics are Statistics Estonia and the Bank of Estonia. Statistics Estonia is responsible for most parts of the official statistics. The Bank of Estonia compiles the balance of payment and the monetary and financial accounts.

Official national accounts data are published in the Statistics Estonia yearbook, National Accounts of Estonia Yearbook, and Monthly Bulletins. Additionally, data are available online at www.stat.ee. The National Accounts 2005 Yearbook is the most recent publication which contains information on national accounts methodology used in Estonia.

Preliminary quarterly GDP is released 70 days after the reference period. The first annual GDP estimate, based on quarterly data, is published 70 days after the end of year with the publication of the fourth quarter for the previous year (from 2007 onwards). The second release of GDP estimates are made 6 months after the end of year. Semi-final GDP estimates are published 18 months after the reference period and are adjusted based on yearly reports of enterprises and public institutions. Final GDP data are derived from the supply and use tables and are published 42 months after the reference period.

The fiscal year is the calendar year.

Data in constant prices are reported in volume measures with a fixed base year of 2000.

General

The production approach is the main method for compiling GDP in Estonia. In GDP compilation, the production approach is considered to be the most reliable method, because of more detailed information is available for this approach, and there are more possibilities to verify the estimates against alternative data sources.

See more detail description of the National Accounts methodology in National Accounts 2005 Yearbook, www.stat.ee

Methodology:

Expenditure Approach

GDP at market prices by the expenditure approach is derived as the sum of the components of household final consumption expenditure, final consumption expenditure of government and NPISH, gross fixed capital formation, changes in inventories, net exports of goods and services. The expenditure approach is an independent approach as the various expenditure components are completely estimated. The expenditure measure of GDP relies very much on statistical surveys data, which are derived mainly from Household Budget Survey, Structural Business Survey and from statistical surveys, conducted by the Bank of Estonia.

In the expenditure approach the biggest part of final consumption expenditure is private consumption expenditure; and its sources are the Household Budget Survey; information about the retail sales of goods and services from SBS; administrative sources; and information from big suppliers (water consumption, telecommunication services, etc). Data on the expenditure of non-residents in Estonia and residents abroad are obtained from the balance of payments, which uses the results from the foreign visitors border survey for non-residents and the tourism survey for residents carried out by the SE.

HFCE estimates are prepared in accordance with "Tabular approach" that is used for compilation of HFCE in Estonia. The "Tabular Approach", developed by Eurostat, presents a set of analytical tables where estimates are obtained in a systematic way and all steps from raw data until the final figures are clearly identified. For HFCE

estimates, a bottom-up approach is used. HFCE estimates are broken down by 116 commodity groups at 4-digit level of COICOP. The valuation of HFCE estimates at purchasers' prices is in line with ESA95.

Government final consumption expenditure is estimated on the basis of total output value, from which own-account GFCF and income from sales of goods and services are excluded and social transfers in kind are added. The same data sources are used for calculation of final consumption expenditure by government as those used in the calculation for production approach.

In the general government sector, most state fee categories are recorded as government income from sales of services, except car registration taxes (taxes on products) and state fees from issue of government activity licenses and activity permits (other taxes on production). Social transfers in kind of market goods and services cover general government expenditure on products supplied to households via market producers. They are mainly financed from the state budget, local budgets and health insurance budget. In the central government sector (S.1311) the main categories of social transfers are expenditure on adult education and health services. In the local government sector (S.1313) the main categories of social transfers are expenditure on steam and hot water services. In social security funds (S.1314) the main categories of social transfers are expenditure on health services and medicines.

Gross fixed capital formation includes acquisitions of new and existing tangible assets during the accounting year, including major repair and land improvement, less disposals of tangible assets. Fixed assets acquired under financial leasing contracts (in the total value of capital goods) as well as own-account construction and major repair of fixed assets are included in GFCF. Acquisitions less disposals of intangible assets, including own-account produced software, are also taken into account. Acquisitions of tangible assets are valued at purchaser's prices including installation charges and other costs of ownership transfer.

Gross fixed capital formation is estimated: by institutional sector (non-financial corporations, financial corporations, general government, households and non-profit institutions serving households); by type of fixed assets; by activity; and by product.

The main sources for estimating GFCF in general government sector are the statements of fixed assets both for central and local government. The main data sources used for GFCF estimates of financial corporations are the annual statements of the Bank of Estonia, the commercial banks, leasing and insurance companies.

Changes in inventories are estimated by economic activity, by products and by type of inventory, for non-financial corporations and for general governments sectors. Basic data source for inventories of the non-financial corporations sector are the following statistical surveys: Structural Business Statistics survey module I (Assets, liabilities, equity) covering enterprises in activities NACE C – NACE K, NACE M – NACE O; and "Annual data of agriculture, hunting, forestry and fishing enterprises" survey module (Assets, liabilities, equity) covering activities NACE A – NACE B.

Data on inventories of the general government sector are obtained from the reports on the state budget execution. State inventories only include strategic goods like fuel, cereals, food products and medicines.

Changes in stocks are valued at weighted average prices for the reference period. Holding gains/losses are eliminated from stocks.

Exports of goods are recorded at f.o.b., which is equivalent to purchasers' prices. Imports of goods in supply tables are valued at c.i.f., which corresponds to basic prices.

The estimates for exports and imports of goods are primarily based on administrative data sources derived from the customs declarations of the Tax and Customs Board. Statistical surveys used for goods are not subject to customs clearance; these sources include: data on exports of electrical energy, imports of natural gas, sale of fish in foreign waters are available from monthly survey conducted by the Statistics Estonia; data for goods purchased

abroad by transportation vehicles (e.g. fuel, lubricants, etc.) is obtained from the transportation company surveys of the Bank of Estonia; and data for repairs of capital goods come from the Bank of Estonia.

Data for exports and imports of services are based on the balance of payments compiled by the Bank of Estonia (BOE). BOE has developed a mixed system regarding data collection. Data come from the enterprise survey system (8 different quarterly survey forms), ITRS (international transaction reporting system) and from various administrative sources. Estimates for all exports and imports of services, except travel, are very much based on information from the surveys of enterprises collected directly from data providers by the Bank of Estonia. Estimates for travel are based on the regular border survey of different groups of visitors, tourism statistics surveys of the Statistics Estonia.

For constant price calculations it is assumed that changes in output and value added are linear, which in essence implies to the single deflation (i.e. converting to constant prices). This means that if a change in output is estimated on the basis of a price index (comparing to the preceding year according to the chain-linking method), the same change is taken into account also in case of value added. With double deflation different price indices are applied to output and intermediate consumption. In that case the dynamics of aggregate output growth in constant prices differs from that of value added since intermediate consumption price indices change differently.

Single deflation is applied because sufficient details regarding products included into intermediate consumption are not available. But these are available regarding output. Currently, the following principal indices are used upon deflation: consumer price indices per groups of goods and services; producer price indices per economic activities; construction price indices; and export and import price indices.

Calculation of value added for the government sector is cost-based. Upon deflation of the GDP components of that sector the physical volume index (i.e. the change in the number of employees) is applied. Volume indices are also used in calculations of constant prices in several other economic activities (e.g. transport, mining industry, electric energy, gas and water supply).

Income Approach

The GDP by income approach is not an independent approach, since operating surplus and mixed income are derived residually when balancing the supply and use tables. The income approach uses, to a large extent, the same sources as the production approach. This means that the two approaches coincide with respect to use of the surveys and administrative sources involved.

The GDP by income approach distinguishes the following components: compensation of employees, other taxes on production and imports, other subsidies on production, operating surplus, mixed income and consumption of fixed capital.

Compensation of employees is broken down into wages and salaries in cash, wages and salaries in kind, employers' social contributions, both actual and imputed. Compensation of employees is estimated by institutional sector and by activity.

Statistics Estonia makes estimates on hidden labour and envelope salaries. Estimates for hidden labour are based on the labour input method. Labour Force Survey data are used for comparison of employment data from the SBS and other surveys and for making adjustments for the non-observed economy. Envelope salaries are defined as wages paid, but not reported officially in the business accounts and tax statements. Data sources used for estimation of underreporting of wages and profits are the results of opinion surveys of households by Estonian Institute of Economic Research indicating the scope of the payments of envelope salaries.

Other taxes on production include taxes on land and pollution resulting from production activities, charges for specific exploitation of water resources, fishing-right fees, business and professional licenses, taxes on the use of motor vehicle and advertising. In national accounts, other taxes on production are calculated using information from the Tax and Customs Board, the Ministry of the Environment and the Ministry of Finance.

Other subsidies on production are mainly consisting of support to agricultural activities like organic farming, common economic activity, liming agricultural lands, agro-environmental management, and agricultural insurance support. Information for subsidies on agricultural activities is obtained from the annual reports on executed national aid schemes from Estonian Agricultural Registers and Information Board (ARIB), the government institution subordinated to the Ministry of Agriculture.

Production Approach

The Production approach is the main method for compiling GDP in Estonia. Estimates of GDP at basic prices are made by economic activities broken down by institutional sectors and by type of producers. GDP at market prices is derived from GDP at basic prices by adding taxes on products, and subtracting subsidies on products. The final estimates of GDP by production approach are derived from the balanced supply and use tables.

For the production of economic statistics, the Business Register for Statistical Purposes is used. It includes all economic units active in Estonia, which are needed for the compiling of national accounts. These include: enterprises, branches of foreign companies and sole proprietors whose annual turnover exceeds 250000 EEK (ca 16000 EUR) from the Commercial Register sole proprietors whose annual turnover is less than 250000 EEK can be registered on their own request or if stipulated in any other law); Sole proprietors who are registered in the Register of Taxable Persons by the Tax and Customs Board (sole proprietors are included in the statistical business register, but are not used in constructing survey frames); non-profit institutions and foundations from the Non-profit Institutions and Foundations Register; and central and local government institutions and their subordinate establishment units from the State Register of State and Local Government Agencies.

The statistical units, included in the Business Register for Statistical Purposes, are institutional units (enterprise; non-profit institutions; foundations; and state and local government institutions) and a local kind of activity unit. For all units included in the statistical business register, the common data are identification code and contact information. All statistical units are classified by branch of activity, by legal form, by form of ownership and by geographical location. During the year, the Business Register for Statistical Purposes is updated on a basis of legal registers, a special annual survey, statistical surveys, different administrative data sources and other sources.

Output is valued at basic prices in the case of market production and production for own final use by households. Other non-market output is valued at the total production costs.

Intermediate consumption and value added are valued at purchasers' prices, excluding deductible VAT.

Overview of the Compilation of the Integrated Economic Accounts

Methodology of ESA95 is followed and the same sources of information are used as in compilation of GDP.

There is no direct source of information for assets and liabilities for S14 and S15 in financial account therefore the sectors are treated as a residual.

No adjustment between non-financial and financial accounts is made and two different values are reported for net lending/net borrowing.

There is no country-specific treatment with regard to institutional sectors

There is no direct source of information for assets and liabilities for S14 and S15 in financial account therefore the sectors are treated as a residual.

Ethiopia

Source

The preparation of national accounts statistics in Ethiopia is undertaken by the Ministry of Finance & Economic Development Office, Addis Ababa. The official estimates with methodological notes are published annually in the "Statistical Abstract". Data from 1987 onwards has been obtained from "Statistical Abstract" 1997 edition published by Central Statistical Authority of Ethiopia and "Quarterly Bulletin" Vol. 14, No. 4, Fourth Quarter, 1998/99; Vol. 12, No. 1, First Quarter, 1996/97 and Vol. 12, No. 4, Fourth Quarter, 1996/97 published by National Bank of Ethiopia. The data for Ethiopia excludes Eritrea.

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations Systems of National Accounts 1993 (1993 SNA). The Ethiopian fiscal year which is from June to July has been used for all estimates except the "External Transactions" table. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach, is also used for estimating gross fixed capital formation. Private consumption expenditure is estimated separately by household consumption & expenditure survey. Government final consumption expenditure, consisting of compensation of employees and net purchases of goods and services, is obtained from the annual budgetary revenue and expenditure report, from the Ministry of Finance and from municipalities. These sources are also used for estimating the public sector's capital formation in building and construction. The estimates of private construction in urban areas are based on the construction expenditure from the investment authority. Construction in the rural areas is estimated by applying the growth rate of rural housing by 1994 housing & population census. For capital formation in machinery and equipment, import statistics are used. To the import values are added import duties, transport costs, trade margins and installation costs. The data on exports and imports of goods and services are obtained from the external trade statistics. Gross domestic product by expenditure type at constant prices is not estimated.

Income Approach

The cost-structure of the gross domestic product is not estimated.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in basic price values. The production approach is used to estimate value added of most industries. The income approach is also used in measuring the output of the modern sectors of the economy such as the industrial activity and the services sectors. The estimates of the value added from the agriculture sectors are done by annual agricultural surveys. Benchmark estimates of livestock production were based on the number of livestock by type. The 1961-1963 benchmark estimates of livestock production were based on the number of livestock by type, on gross output and on value added. For subsequent years, gross output and value added are derived by applying growth factors linked to the population growth rate. For forestry, the sources include the Forestry Department, the survey of wood-working industries, and the annual surveys of manufacturing industries. Value added is derived by deducting 10 percent

from gross value of production of industrial wood and firewood.

The annual budgetary reports provide data for the mining sector. The value of production is estimated by multiplying the quantity produced of each mineral product by its average price. The source of data for large-scale manufacturing is the annual survey of manufacturing industries. Value added is obtained by deducting the cost of inputs of raw materials, fuel and energy from the gross value of production.

Data for electricity are obtained from annual returns to questionnaires submitted to concerned enterprises. Data on the number of building permits issued, the 1968 household expenditure survey and population estimates are used to estimate the value of construction in the private sector. The total value of Addis Ababa building permits is adjusted for timing and under-reporting. Work done in other towns is estimated by applying the ratio of per capita consumption expenditure in Addis Ababa to the per capita consumption expenditure in other towns. For the public sector, data are obtained from the budgetary revenue and expenditure reports as well as from questionnaires sent to municipalities and public agencies.

The gross trade margin of imported goods is estimated at 15 per cent of the value of imports based on the 1963 trade inquiry. Similar assumptions are made for locally produced goods. Value added in the transport sector is based on the annual reports of concerned enterprises for the railway, water and air transports. For road transport, data on passenger or ton kilometres, registration statistics, and passenger fares and freight rates are used. For the financial institutions, the profit and loss statement and the annual reports of concerned institutions are used.

Benchmark estimates for 1999/2000 are available for ownership of dwellings. The gross rental income of the urban areas is obtained by multiplying the total number of housing units by assumed actual and imputed average annual rental rates, while for the rural areas the total number of houses is multiplied by the assumed average value per house. Value added of public administration and defence is equal to total wages and salaries paid to government employees, including payment in kind. The sources of data include annual reports and questionnaires sent to different agencies. For other government services such as education and health, value added is based on government reports. Value added per student enrolled in non-governmental schools is estimated as two-thirds of the value added per student in government schools. The value of domestic services is obtained by multiplying the number of employees by assumed average pay rates.

For the constant price estimates, the current net output of plant products in the agricultural sector is revalued at base-year producer prices. For livestock, water supply and construction, value added at current factor costs is assumed to be equal to the value added at constant factor costs. Price indexes are used to deflate the current value added of mining and quarrying, small-scale manufacturing, trade, finance and most of the services sectors. For large-scale manufacturing, electricity, transport and domestic services, value added is extrapolated by volume indexes.

Fiji

Source

The preparation of annual national accounts statistics in Fiji is undertaken by the Economic Statistics Division of the Fiji Islands Bureau of Statistics (FIBOS), the National Statistics Office which comes under the Ministry of National Planning and Finance and located in the capital city of Suva. The official estimates are published annually on our website: www.statsfiji.gov.fj as well as in the quarterly publication the "Key Statistics". The report titled 'National Accounts of Fiji- 1995 Sources & Methods' contains the sources and methods for the compilation of the Current Price Gross Domestic Product.

General

The latest estimates shown in the following tables have been prepared in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and Income approach are also compiled

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure which is mostly based on the commodity-flow approach. The estimates of government final consumption expenditure are based on the annual report "An Economic and Functional Classification of Government Accounts". For private consumption expenditure estimates, all imported items valued at landed cost from foreign trade statistics and producers' values from industrial censuses are grossed up by margins. Estimates of gross capital formation for the private sector are based on surveys and indicator of import of investment goods, while for the government sector the estimates are derived from government account. Value of imports and exports of goods and services are obtained from the balance of payments.

Income Approach

The components of the Income approach to GDP compilation are Compensation of Employees (COE), the Operating Surplus (OS), Consumption of Fixed Capital (CFC) and Net Taxes on Production and Imports. Data are sourced from Government Account for the Central government whereas data for the Private sector and Public Enterprises are sourced from enterprise surveys and taxation data. Estimates of Taxes on production and imports are based on government accounts.

Production Approach

The table of gross domestic product by kind of economic activity is prepared using the Production approach. The value of production is the value of gross output less the value of materials and services used up in production is the value of intermediate input or intermediate consumption equates to the Gross value added of producers.

The compilation of GDP involve the collection of data of goods and services in the base year prices of the main sectors of the economy as categorised in the Fiji Standard Industrial Classification (FSIC) in the following groups: 1) Agriculture, Forestry and Fishing, 2) Mining & Quarrying, 3) Manufacturing, 4) Electricity & Water, 5) Construction, 6) Wholesale, Retail, Trade, Restaurant & Hotels, 7) Transport & Communication, 8) Finance,

Insurance, Real Estate and Business Services, 9) Community, Social and Personal Services

Data are sourced from surveys of all economic sectors. As for government sector data are sourced from government accounts. For the Agriculture, forestry and fishing sector a special study was undertaken and results are published in the report titled "A Study of the Agriculture, Forestry and Fishing sector of Fiji for the compilation of the 1989 GDP rebase". A similar study was undertaken for the 1995 re base. In the case of GDP at constant price, a year considered to be a normal year is chosen as the base year and the output of each economic sector is worked out as a per centage of the total which reflects the importance (weight) of the sector relative to the total economy. In cases where the production figures can be quantified , the current quantity . is deflated by the by the base quantity to reflect on the movement in output between the base year and the current year. The change would be used to inflate the base year value added to arrive at the constant price output for the current year.

Finland

Source

The compilation of annual national accounts statistics in Finland is undertaken by the unit Economic Statistics at STATISTICS FINLAND, the Finnish National Statistical Office located in Helsinki.

The official annual estimates are published three times a year, main aggregates on the internet (http://tilastokeskus.fi/til/vtp/tie_en.html). Once a year the publication National Accounts, Tables is released. Data are available in Statistics Finland's FINSERIES (ASTIKA) database. Published data are also available on the web site http://pxweb2.stat.fi/database/StatFin/kan/vtp/vtp_en.asp.

The concepts, definitions, sources of basic statistics and methods of estimation are described in Methodological description of Finland's gross domestic income (http://tilastokeskus.fi/til/vtp/vtp_2007-02-08_men_008_en.html), which was submitted to Eurostat in January 2007. The inventory describes methods at current prices only. There is also another inventory concerning constant price calculations which will be available on Eurostat's web site.

The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

General

The national accounts estimates have been prepared in accordance with the concepts and definitions of European System of Accounts 1995 (ESA 95) which mainly follows System of National Accounts 1993 (1993 SNA).

ESA 95 was introduced in 1999 and the series start from 1975 onwards. Previously the estimates were based on the United Nations System of National Accounts 1968 (1968 SNA). Supply and use tables are integrated in annual accounts and input-output tables are published once a year for the statistical year $t-2$.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Finland the currency name for the data before 1999 is "1999 FIM euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 5.94573 Finnish markka. The name of the currency of the newly submitted data is "1999 FIM euro" for the data before 1999 and "euro" for the data from 1999 on.

The following is the timetable for revisions and finalising estimates:

- The first preliminary data for year t will be published at the end of February or at the beginning of March in year $t+1$. This first version is less comprehensive than the national accounts proper. While the contents of the first version will correspond to the quarterly national accounts, it will also contain the first complete version of sector accounts for all sectors. The data for the last quarter of the previous year will be published at the same time.
- A second version will be produced in the first half of July in year $t+1$. At that time, the national accounts for year t will be compiled in their entirety for the first time for all real (non-financial) accounts.
- The third version will be ready in January of year $t+2$, the fourth, final version in December of year $t+2$ as a result of product-specific balancing of supply and use tables.

An example of the production times for versions of the national accounts in 2005 according to the current practice is as follows: Version 1 in February 2006; Version 2 in July 2006; Version 3 in January 2007 and Version 4 in December 2007.

Methodology:

Overview of GDP Compilation

Gross domestic product is mainly estimated through the production approach. Expenditure approach is also independently calculated. Income approach can not be considered as independent as other two approaches, but the sum of income components are determined according to the other two approaches. Supply and use tables and input-output tables are compiled annually for definitive estimates for t-2 of annual accounts.

In constant price calculations the chain-linking method (and constant price estimates at the prices of the previous year) have been taken into use. Also the double deflation method is used and supply and use tables at constant prices are calculated. Mostly output data is deflated by producer price indices, also PPIs for services are available for many market services. Volume of government individual services (education, health, social services, social insurance) is calculated using volume indicators.

Expenditure Approach

In the national accounts, GDP is determined on the basis of the production approach. The expenditure approach is also taken into account independently. The difference in GDP, as calculated by the production and expenditure methods of approach, is recorded as a statistical discrepancy in the preliminary national accounts. In the final figures, supply and demand are balanced on a product by product basis and no statistical discrepancy occurs.

The use of products is valued at purchasers' prices. Final consumption expenditure therefore includes value added tax and other product taxes, but not subsidies. The products acquired by instalment payments or an equivalent credit system are recorded by their date of purchase.

Benchmark estimates for household final consumption expenditure are based on household budget survey which is in Finland conducted every three to five years. Annual calculations are based on sales statistics and other sources and the commodity flow method. Calculations are made on the level of 182 headings of COICOP.

For use of owner-occupied dwellings the corresponding market rents are imputed. For price data the consumer price index is largely referred to.

The estimates of government final consumption expenditure are derived from production accounts compiled on the basis of the central government accounting data, local government financial statistics, statistics on employment pension funds and data on Social Insurance Institution.

Civil engineering work is based on structural business statistics, central government accounting data and local government financial statistics and other data sources by industries.

Gross fixed capital formation includes value added tax insofar as it is not tax deductible. Investments are recorded according to the date of the transfer of assets. There are three exceptions to this rule in the national accounts. First, financial leasing is recorded as an investment by the industry using it, even if there is no change of ownership. Secondly, own account investments are recorded when they are produced. Thirdly, construction investments are recorded as they are built and not after completion of the building, when ownership generally changes hands. Estimates for gross fixed capital formation in machinery and equipment and transport equipment are based on several statistical sources, most important are structural business statistics and the local government financial statistics.

Estimates for investments on residential and other buildings comprise new construction, refurbishments and

commissions and fees. Investments are estimated at purchaser's prices and they include value-added tax, insofar it is not deductible. Own-account construction is included. Starting point for estimates is output of construction industry, but estimates for demand side are calculated as well by industries. Benchmarks and extrapolation based on special reports are also used to calculate gross fixed capital formation of building refurbishment contained in estimates of investments in the building construction.

Change in inventories is valued at the average price for the year, i.e. the value of opening and closing stock is averaged for the year and then the difference between them is calculated. The data on changes in inventories are based on structural business statistics and information of public inventories and agriculture.

Goods imported and exported are valued at their f.o.b. value, i.e. their value when they leave the port of the exporting country. Exports of services are valued at basic prices and imports of services at purchasers' prices. The estimates of exports and imports of goods and services are based on foreign trade statistics, survey on international trade and other sources for services. In general estimates are same for balance of payments.

Ultimately, the coordination and balancing of the production and expenditure approaches will be ensured by the supply and use table method, which provides assurances regarding a systematically exhaustive approach, also with respect to the estimation of GDP expenditure components.

Income Approach

In Finland's national accounts, GDP is not independently calculated using the income approach because sources for gross operating surplus are not reliable enough as an independent estimate. Gross operating surplus is calculated as a residual in market production, when other income components have been deducted from gross value added.

The income components of GDP are calculated using the same industry and producer type classification (in generation of income accounts) as was used for gross value added in the production approach. However, wages and salaries and employers' social contributions are calculated in two ways. Firstly, wages and salaries are calculated as the total for the overall economy mainly from aggregate data sources and secondly, by industry. Sometimes earnings calculated by industry do not tally with the sum calculated for the overall economy. Balancing is made so that the discrepancy is adjusted in relation to the wages and salaries of the market producers calculated by industries. A correction in the opposite direction is made to the operating surplus. Employers' social contributions are adjusted with the same method separately.

The key data source of wages and salaries for the overall economy is the taxation levy statistics by the National Board of Taxes. Main data sources by industry are structural business statistics, the Business Register, the local government financial statistics, consolidated accounting data and the Financial Statement and Report of Central Government, banking statistics and insurance corporation statistics. Some industries use an indirect estimating method, such as price by volume type estimates in which the average hourly pay is multiplied by the number of hours worked.

Employers' social contributions for the overall economy are calculated using direct sources from institutions which collect contributions (e.g. Social Insurance Institution, employment pension funds).

Employers' social contributions by industry and payment type are generally calculated by the so called percentage payment method. The difference between data by industries and data for the overall economy is then adjusted to industries.

Operating surplus is basically derived as a residual item by industries and if necessary, adjusted according to correction of wages and salaries and employers' social security contributions.

Consumption of fixed capital is obtained by using the perpetual inventory method.

Other taxes on production and other subsidies on production are obtained from the government data.

Production Approach

When preparing Finland's national accounts, the production approach is primary in calculating GDP. Allowance is also made for the expenditure ap-proach when balancing the accounts.

Gross value added at basic prices is equal to the total of gross value added by industry. Definitive estimates are calculated and balanced in the supply and use tables on a product by product basis. When taxes on products are added to and subsidies on products are deducted from gross value added at basic prices, gross value added at market prices or GDP is obtained.

In the production approach to preparing Finland's national accounts, the statistical units are the product, the establishment and the institutional unit. The establishment is equivalent to the local kind of activity unit (KAU), as defined in ESA 95. The institutional sector, however, remains the core reference and is also the basic framework used for inspections proper to each industry. Calculations are made on the level of 15 sectors, 183 industries (100 industries in the preliminary calculations), 3 producer types and 952 product groups.

The main data source for assessing the output and/or intermediate consumption of many industries is the structural business statistics of the industry concerned. The Business Register, the business income tax register (EVR) and direct survey data are combined in structural business statistics. These statistics are based on concepts of enterprises' profit and loss accounts and the EU regulation on structural statistics.

Many information sources proper to each industry are also used. The main data sources in non market production are consolidated accounting data and the Financial Statement and Report of Central Government, and local government financial statistics.

The compilation of Finland's national accounts relies mainly on source statistics drawn up each year. Benchmarks and extrapolation are used to calculate output in just a few industries.

^a Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

France

Source

The preparation of national accounts statistics in France is undertaken by the Institut National de la Statistique et des Etudes Economiques (INSEE), Paris, with the co-operation of some other administrative bodies. The official estimates are published in "Comptes de la Nation", INSEE which is issued annually on June in the "INSEE-Resultats" series. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The estimates are generally in accordance with the classifications and definitions recommended in the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. The estimates are elaborated according to French classifications and the estimates prepared according to the 1968 SNA are provided in the former national currency guidelines of the "Systeme Elargi de Comptabilite Nationale", which is the French version of the "European System of Integrated Economic Accounts" (ESA). The estimates prepared according to the 1968 SNA are provided in the former national currency French franc. The latest data input-output tables valued at market prices are an integral part of the French national accounts and are published every year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Chain indices are used to measure volume growth and the resulting chained constant prices data, 1995 base, are not additive.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of France the currency name for the data before 1999 is "1999 FRF euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 6.55957 French franc. - The name of the currency of the newly submitted data is "1999 FRF euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for France, like old data following the 1968 SNA is still in "French franc", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

The economic territory for which the French national accounts are compiled includes the so-called "overseas departments" (French Guyana, Guadeloupe, Martinique, and Réunion), and excludes other kinds of overseas territories (e.g. New Caledonia). Some units located in the other overseas territories may be included in the French economic territory to the extent that they constitute military bases or scientific stations. E.g. the military base located in French Polynesia is included in the French economic territory while French Polynesia as such does not. The same holds for scientific stations situated on the Antarctic continent.

Gross domestic product (GDP) is estimated through three different approaches: the production, the expenditure and the income approach, which are used to derive GDP by kind of economic activity, by expenditure and by cost

structure, respectively. The input-output table allows a partial synthesis between the production and the expenditure approaches. The final synthesis is based on the production accounts by industry. It actually concerns a part of the national economy only: some accounts (government and private non-profit administrations, financial institutions, insurance companies, large public corporations) which are integratedly built for the industries and for the corresponding sectors are taken to be final and are not questioned at this stage. Reconciling estimates relating to industries and to sectors is performed by distributing value added discrepancies among them or adjusting the global value added estimate: in this case, the distribution of total supply between intermediate consumption and final uses is revised and/or production accounts are corrected for institutional sectors which are considered to be questionable.

Expenditure Approach

For each commodity of the input-output table classification, a commodity-flow balance is built, generally by aggregating and completing balances elaborated at a more detailed level of the classification. Sources allowing the household private consumption to be estimated are infra-annual inquiries on production combined with foreign trade data at a very detailed level of the classification, households surveys and specific information relating to such expenses as health or dwelling. Estimates relating to goods are compared with information about the retail trade turnover. Gross fixed capital formation estimates proceed from the commodity flow balances compared with information originating in the investors business accounts at a rather aggregated level. Changes in producers stocks come from the breakdown, by product, of stocks held at the beginning and at the end of the year by enterprises and from an estimate of the holding gains accruing on goods held in stock. Users and trade stocks are estimated by composing intermediate and households consumptions estimates in the commodity flows. Foreign trade comes from the customs statistics and the balance of payments services exchanges, completed by some ad-hoc sources.

Income Approach

Three basic sources are used to estimate the cost-components of the different institutional sectors. First, individual accounting data which are not adjusted: government administrations, large public corporations, financial institutions and insurance companies. Second, data on firms (non-financial corporations excluding large public corporations and private unincorporated non-agricultural enterprises) originating from fiscal information which are adjusted to take into account absences, tax cheating and evading and made consistent with corresponding data obtain from the first source. Third, statistics not originating in the centralization of individual accounting data: unincorporated agricultural enterprises, some productions of households (rental services of dwellings, self consumption of agricultural products, domestic services), private non-profit institutions.

Production Approach

The estimates of the production of non-financial and non-agricultural firms by industry, except large public national firm start from the sales as reported in the firms' fiscal returns. The part of the production which is not properly reported in the sales - inter-establishment deliveries, production for own capital formation, subcontracting and processing of customers owned materials - is added up in order to obtain non-stocked production estimates. Accounting data of financial institutions, insurance companies and large public corporations which are processed separately make it possible to estimate the output of the corresponding industries. Agriculture production indirectly estimated from products sources while trade output is estimated from trade margins by product and type of use. The estimates of the production of government industries come from data supplied by concerned units. Non-market services output is obtained as the sum of the costs. With the exception of some rows or columns, or more generally of some cells, of the intermediate consumptions table, the intermediate consumptions are calculated, for current year in an indirect way, that is, the principle consists in projecting the preceding year table assuming that the technical coefficients remain unchanged at constant prices. The adding up of the estimates in row, i.e., the projected total intermediate consumption for each product, is compared with the intermediate demand as estimated from the commodity-flow balances (see gross domestic product by expenditure).

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique et des Etudes Economiques (INSEE), Paris. Official estimates and descriptions are published by the same Institut in "Comptes Economiques de la Polynesie Francaise".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates were adjusted by the Institut National de la Statistique et des Etudes Economiques (INSEE), Paris, in accordance with the United Nations System of National Accounts. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Gambia

Source

Reply to the United Nations national accounts questionnaire from the Central Statistics Department, Ministry of Economic Planning and Industrial Development, Banjul. The official estimates are published in "Sources and Methods of Estimates of National Income at Current Prices in The Gambia", February 1985, "Estimates of National Income at Constant Prices in The Gambia", July 1985 and "National Accounts of The Gambia, 1989/90 to 1993/94 " June 1995.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Table 1.1 Gross domestic product by expenditures at current prices

Series 100: 1993 SNA, Dalasi, Western calendar year												Data in tens of thousands

^a Excludes financial intermediation services indirectly measured (FISIM).

Georgia

Source

The latest data was received through the United Nations Economic Commission for Europe (UN/ECE). Macroeconomic Statistics Division at Department of Statistics under Ministry of Economic Development of Georgia is the responsible authority for official compiling of National Accounts Statistics in Georgia. The data sources for National Accounts are Quarterly and annual information of Enterprises Statistics, data of Household's sample survey, data of Price Statistics, Monthly data of National Bank, Monthly data of Ministry of Finance. The official estimations of National Accounts are published on the internet (<http://www.statistics.ge/>), National Accounts of Georgia (annually), Statistical Yearbook of Georgia (annually), and Quarterly Bulletin of Statistics (quarterly).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note the changes in the official currency of Georgia. The reported data for the years 1990-1992 is in Russian ruble, 1993-1994 in coupon, and from 1995 onwards in lari.

National Accounts are currently published using the Georgian national classification of types of economic activities (GNC 001-2004). It was created on the base of European classification standard of types of economic activities NACE rev 1.1. Compilation of accounts began from 1990. National accounts cover the entire territory of Georgia and all types of economic activities. Accounts are compiled using results of regular statistical surveys.

Accounts cover non-observed economy. It is estimated using special sample surveys. Periodicity is Quarterly and annual. Timeliness is 85-th day after accounting period. The following accounts and balance sheets are compiled: the Production account, the generation of income account, the allocation of primary income account, the secondary distribution of income account, the use of income account, the capital account, the goods and services account, supply and use tables. The following indicators are estimated: Gross Domestic Product (GDP), Net Domestic Product, Gross National Income, Net National Income, Gross Disposable Income, Consumption of fixed Capital, Net Saving, Net Lending(+)/Net Borrowing(-)

Methodology:

Overview of GDP Compilation

There are three approaches (Expenditure approach, Income approach and Production approach) used for compilation of GDP. The main approach is the production approach. Main macroeconomic indicators are calculated by methods of production and final consumption in current prices (in Georgian Lari - GEL). The indicators estimated by production method are calculated in constant prices (to 2003 – by single deflation, after 2003 – by double deflation). Transactions are generally recorded on an accruals basis. Output is valued at basis prices. Intermediate consumption is recorded at purchaser's prices. Non-market production is valued on the basis of outlays. Imports and Exports of goods and services are valued on an FOB basis.

Data is revised on the basis of outcomes of annual structural statistical studies; and when new highly trustworthy data is received from new information source or a survey. In this case general correction of timelines by using benchmarking is used. In the following tables 1996 was taken as the base year. Since 2008 the new base year of 2003 is used. Nowadays GDP data are compiled and disseminated at current prices and at constant 2003 prices on a quarterly basis and on an annual basis. An estimate of non-observed economic activities is added to the GDP. The production approach is used to estimate value added of nearly all types of economic activities. The

Income method is used to estimate value added of public administration and defence. GDP is calculated as sum of all value added for all types of economic activities at market prices.

Germany

Source

National accounts statistics in Germany are compiled and provided by the Federal Statistical Office (Statistisches Bundesamt) in Wiesbaden. The official estimates are published regularly on the internet (www.destatis.de), in the publication "Volkswirtschaftliche Gesamtrechnungen, Fachserie 18, Reihe 1.4" (and other series), as well as in the annual Statistical Yearbook. Data are also sent to international organizations. The data provided to UNSD was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Large-scale revisions of national accounts introduce new concepts and are performed about every five years. They ensure full international comparability of the data published and are mandatory, that is, they are required by European legal acts. The two major changes of the last revision in 2005 were a modified presentation of the "real" results, that is, results adjusted for price changes (changeover from fixed price base to previous year's price base) and a modified treatment of banking activities (allocation of FISIM = financial intermediation services indirectly measured). Those conceptual changes have been implemented not only for the results for Germany from 1991 onwards, but also for the former territory of the Federal Republic for the years 1970 to 1991.

The publication Fachserie 18, Reihe S.22 "Inlandsprodukt nach ESGV 1995 – Methoden und Grundlagen" contains comprehensive documentation on the methods used to compile German annual national accounts.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Germany the currency name for the data before 1999 is "1999 DEM euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 1.95583 Deutsche Mark.

The name of the currency of the newly submitted data is "1999 DEM euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data.

Methodology:

Overview of GDP Compilation

Gross domestic product (GDP) is calculated applying both the production and the expenditure approach.

The production approach means that GDP is obtained by calculating the value added of all producers as the difference between the value of goods and services produced (output) and intermediate consumption, adding the taxes on products (such as tobacco, mineral oil and value added tax), and subtracting the subsidies on products.

Gross domestic product is also calculated through the demand side by applying the expenditure approach: The expenditure for the final use of goods and services, i.e., final consumption expenditure of households and government final consumption expenditure, capital formation, and the balance of exports and imports (= export surplus = exports minus imports) are compiled and added up to GDP.

Calculating GDP by means of the distribution approach is not possible in Germany because basic data on property and entrepreneurial income are partly lacking. In national accounts, the property and entrepreneurial income is obtained as a residual value.

Input-output computations represent the production and the use of goods and services in a breakdown of commodities as well as the income generated as part of the production process. The supply and use tables permit to change over from results of domestic product calculations to the results of input-output computations and vice versa.

Expenditure Approach

Three main methods can be used to compute the gross domestic product (GDP) via the expenditure approach. Firstly, the buyers or users of goods can be asked about their expenditure. Secondly, the producers of goods and services can be asked about their deliveries to consumers, investors and the rest of the world. Thirdly, an estimation of the use structures for goods and services (commodity flow method) can be applied.

Currently, consumption expenditure of private households is calculated mainly by using the so-called supplier method, whereby information about suppliers' sales to private households (in particular the sales of retail and wholesale trade) are used to determine consumption expenditure. These results are complemented by special product-related calculations, e.g., for tobacco goods, motor vehicles, and fuels. Statistical sources are, among others, annual business surveys in industry, trade, and most transport sectors, the turnover tax statistics, and multi-year censuses resp. register-based data.

The consumption expenditure of general government is calculated by deducting the sales revenue of non-market output and the self-produced fixed capital formation from the current expenditure for the non-market output of this sector (intermediate consumption, compensation of employees, capital consumption, and other net taxes on products), adding the social benefits in kind. The statistical sources are the results for the federal budget, the results of the finance statistics, broken down in detail according to types of income and expenditure, and the results from social insurance bodies.

For the computation of fixed capital formation, the commodity-flow method is mainly used. Important sources for estimating fixed capital formation are the annual survey of companies employing 20 or more workers, the annual census in the construction industry, the cost structure statistics, the turnover tax statistics, the monthly foreign trade statistics, the quarterly production statistics, and the monthly sales survey in the capital goods producing sector are important sources for estimating fixed capital formation.

Changes in inventories are generally calculated by converting survey data on the initial and closing inventories (book values) using a model in accordance with the concepts of ESA95. Important statistical information is provided by the cost structure statistics in the various industries and price indices from the price statistics.

The value of exports and imports is obtained from the foreign trade statistics and from the balance of payments statistics of the Central Bank.

Income Approach

Compensation of employees includes gross wages and salaries as well as actual and imputed social contributions of employers. Main data sources are employers' monthly, quarterly, and annual reports and special surveys among employers that are conducted every few years, such as the survey on labour costs. Data from social security statistics is also used. Indirect taxes and subsidies are taken directly from the general government accounts. Operating surplus is then obtained as a residual.

Production Approach

The table of GDP by kind of economic activity shows the GDP at market prices and the GVA at basic prices. The production approach for output is used to estimate value added of most industries. The income approach is used to estimate value added of domestic services, private non-profit institutions, and producers of government services.

Value added of agriculture is obtained by deducting the cost of all intermediate consumption from the gross value of production, which includes products consumed on farms. The calculations are based on production statistics for quantities and on agricultural price surveys for prices.

The main sources for estimating output and intermediate consumption (ratios) for mining and quarrying, manufacturing, electricity, gas and water, and construction are the yearly structural business statistics (SBS) of production industries (cost-structure statistics) and annual data taken from several other sources for crosschecking (VAT statistics, business register).

For trade as well as hotels and restaurants the output is calculated by turnover data from SBS, VAT statistics, and business register, while input is estimated from SBS and for some smaller parts from annual trade reports. For the transport sector, SBS are used to estimate parts of output and intermediate consumption for most sub-sectors. Turnover tax statistics are used to prepare the current output estimates, too.

Banking statistics, collected by the Central Bank, and insurance statistics, collected by the Federal Supervisory Board, provide the basis for estimating output of financial institutions including insurance. Input is estimated on the basis of bank company reports and insurance company reports. Additionally, FISIM as an important part of output is calculated by using a model based on quantities and interest rates.

Rents are estimated separately by using a model based on different strata like old, medium, and new buildings. The rents are based on data from censuses of buildings and dwellings which include owner-occupied dwellings. The data are extrapolated by quantity and price indices.

The data used to estimate value added of government services are mainly based on revenue and expenditure statistics of general government. For private non-profit institutions, output is estimated as the sum of costs for wages and salaries, estimated capital consumption, and other net taxes on production. Double deflation is used for the calculation of price-adjusted results for gross value added. Output of most industries is deflated by weighted producer price indices. For almost all industries, the inputs are deflated by specially constructed input price indices.

Ghana

Source

The preparation of national accounts statistics in Ghana is undertaken by the Central Bureau of Statistics, Accra. The official estimates are published by the bureau in the "Economic Survey". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data from 1992 to 1996 has been taken from "Quarterly Digest of Statistics", Dec. 1997, of the Statistical Service of Ghana.

General

A detailed description of the sources and methods used for the national accounts estimation is contained in the publications "Sources and Methods of Estimation of National Income at Current Prices in Ghana" and "National Income of Ghana at Constant Prices". The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). Work relating to input-output analysis is being done at present. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

Gross fixed capital formation is estimated by using the commodity-flow approach. A combination of commodity-flow and expenditure approach is used for increase in stock. Private consumption expenditure is treated as a residual. Gross fixed capital formation is classified according to type of capital goods and not according to kind of economic activity. The estimates of increase in stocks are mainly based on special inquiries into the stocks held by selected kinds of producers and distributors. Adjustment is made to arrive at estimates on the equivalent of physical changes in the stocks, valued at average market prices during the period of account. Government consumption expenditure is estimated on a cash basis from government records. These records are reclassified according to government purposes. It is feasible to distinguish between acquisition for military purposes and for civilian purposes which exclude durable goods. Sales of goods and services by government to the public are subtracted from total expenditure. Exports and imports of goods and services are mainly estimated from foreign trade statistics of merchandise trade supplemented by information from the Central Bank. For the constant price estimates, no specific information is available for government consumption expenditure, but wages and salaries paid by government are extrapolated by index numbers of employment. For gross capital formation, current values are deflated by appropriate price indexes. In the case of commodity trade, current values are deflated by Paasche indexes of prices specially prepared for this purpose. Private consumption expenditure is obtained as a residual.

Income Approach

In estimating the cost structure components of gross domestic product, the perpetual inventory method is used for estimating consumption of fixed capital. Indirect taxes net of subsidies are obtained by analysing the taxes on production and expenditure in the revenue account of the government. The domestic factor income is obtained as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices i.e., producers values. The value added of the majority of industries is estimated through the production approach. A combination of the commodity-flow approach and the expenditure approach is used for the construction sector. For the

agricultural sector, statistics of the Ghana Cocoa Marketing Board is the main source of information for the estimation of cocoa, which is the most important crop in Ghana. For other principal crops, information is collected through annual sample surveys. The production of crop is estimated as the product of area sown and yield per acre. The intermediate consumption is estimated on the basis of a small-scale survey in 1969 and projected on the basis of movements in acreage and prices of the crops. Data on gross output of forestry and logging are obtained from the Forestry Department while for intermediate consumption, a small-scale sample survey has been carried out in a bench-mark year and a constant input ratio applied for subsequent years.

Annual establishment surveys are undertaken on a census basis for mining, large-scale manufacturing and electricity and water supply. In the case of manufacturing, the surveys provide detailed information on inputs and outputs for commodity-flow purposes. A sample survey was carried out in 1963 for small-scale and medium-scale manufacturing. The data collected formed the basis for the estimates in the subsequent years by using per worker input and output in the benchmark year and projected employment data, extrapolated from population census. For the construction sector, data on works undertaken by the government are obtained by analysing the government accounts. Information on domestic production, imports and exports of construction materials, trade and transport margins and cost-composition of the total expenditure are available to prepare estimates of gross output.

The gross margins of wholesale and retail trade estimates are based partly on spotchecks in a benchmark year and partly on sample survey, while gross receipts and intermediate consumption estimates are based on income tax records and annual surveys. For the services sectors, information is generally obtained from the institutions concerned. The rental value of residential dwellings are imputed on the basis of cost components, estimated from the record of the Ministry of Local Government. For the constant price estimates, the general approach used for agriculture, industrial activity, electricity, gas and water and construction sectors is double deflation. The value added of the trade, transport and financial services is extrapolated by quantity indexes. Different kinds of price indexes are used to deflate the value added of restaurants and hotels as well as the education and recreational services.

Greece

Source

The preparation of national accounts statistics in Greece is undertaken by the National Statistical Service of Greece, Athens. Official estimates are published in a series of reports entitled "National Accounts of Greece". The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. The estimates prepared according to the 1968 SNA are provided in the former national currency drachma. Input-output tables have been published for the years 1958 and 1970 in "National Accounts of Greece 1970-1976". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Chain indices are used to measure volume growth.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. Greece joined the EMU on 1 January 2001 as 12th country and the above applies for Greece from 2001 on. In the case of Greece the currency name for the data before 2001 is "2001 GRD euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 340.750 drachma. - The name of the currency of the newly submitted data is "2001 GRD euro" for the data before 2001 and "euro" for the data from 2001 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Greece, like for example all old data following the 1968 SNA is still in "drachma", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach, is also used to estimate gross capital formation. Private final consumption expenditure is estimated on the basis of the direct expenditure approach. The estimates of government final consumption expenditure are obtained from the accounts of the different government units. For private consumption expenditure, sources include the household budget surveys, tax statistics and other statistical sources. In estimating increase in stocks, delayed information from the manufacturing and mining surveys is used to supplement the commodity-flow method. Estimates of investments in private buildings are based on building permits that have been issued, while for the public sector construction, estimates are derived from government budgetary accounts and replies from public enterprises and public funds. Information from the annual manufacturing and mining surveys as well as investments by large industrial units, public enterprises and public funds are used for machinery and equipment. Own-account construction is covered

by information on loans granted for such construction works. For exports and imports of goods and services, foreign trade statistics based on the special trade principle are used. For the constant price estimates, price indices are used to deflate the wages and salaries of government employees. For the private expenditure, the annual quantities of food, fuel, light and water charges are multiplied by average base-year prices. Expenditure on other private goods and services are deflated by appropriate price indexes. Value added of residential and non-residential buildings is extrapolated by specially constructed indicators. For other components of gross capital formation, price deflation is used. The base-year values of exports and imports of merchandise are extrapolated by volume indexes while other goods and services are deflated by mean value index of exports and imports.

Income Approach

Estimates of compensation of employees for various services such as finance, insurance and transport are estimated by using data derived from questionnaires sent to them by the National Accounts Service. For manufacturing and mining, data are derived from the annual industrial surveys. The employers' contributions are estimated by using data derived from statements of the social insurance funds. Capital consumption is estimated as a percentage of the corresponding capital stock figure for each industry and type of assets. The current-price estimates of capital stock and depreciation are calculated on a replacement cost basis. The estimates of indirect taxes and subsidies are obtained from government accounts. Operating surplus is calculated as a residual.

Production Approach

Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is used for lignite mining, electricity, gas and water and parts of the service sectors such as transportation, communication, health and education, and miscellaneous services. For agricultural and animal breeding, the estimate of production is based on annual surveys conducted by the National Statistical Office of Greece.

Intermediate consumption estimates are based on data taken from various sources such as Ministry of Agriculture and the Public Power Corporation.

Agricultural product prices refer to prices obtained by farmers. The estimates of mining and quarrying and manufacturing are based on the annual survey of industrial establishments. The information from the survey is available within 2-3 years, meanwhile, value added is extrapolated by the index of industrial production and the wholesale price index. Value added of electricity, gas and water is estimated on the basis of annual questionnaires sent to the concerned enterprises. For construction, gross value is obtained from investment data of buildings and other construction to which values of military construction and repairs are added. The estimates of gross trade margins for agricultural products are based on traded quantities valued at the difference between consumers' and producers' prices. For industrial and imported products, percentages of gross trade margins are applied to the traded values at current prices. Intermediate consumption estimates are based on a survey conducted in 1970 for the compilation of the input-output table. Value added of transport and communication and finance and insurance services is based on data compiled through questionnaires sent to the concerned enterprises. For ownership of dwellings, the estimation of real or imputed rent is carried out at constant prices, based on the number of dwelling rooms existing and the average annual rent expenditure in a benchmark year. These data are obtained from dwelling censuses and household budget surveys. Estimates concerning government services are obtained from general government accounts. For private health and educational services, only wages and salaries data are available. Value added of hotel is based on surveys conducted every three years by the National Accounts Service, while that of restaurants is based on data obtained from household budget surveys. For other services, employment data as well as data on average remuneration per person employed or data derived from taxation returns are used. For the constant price estimates, double deflation is used for agriculture and electricity. For water, construction, transport and hotels, value added is extrapolated by quantity indicators. For the remaining sectors of the industries, price deflation is used.

^a Statistical discrepancy between data for this year(s) and the sum of the corresponding items of Sectors S.14 and S.15 as one or both of the items have not been revised.

^b Includes Mixed Income, Gross.

Greenland

Source

The preparation of the annual National Accounts statistics in Greenland is undertaken by Statistics Greenland, located in Nuuk. Data are published once a year, typically by the end of November, and are made available on the internet (www.statgreen.gl/STATBANK) with the names of the variables appearing in Greenlandic, Danish and English. The data for the previous year (t-1) are always preliminary and are subject to revisions when more final sources are available. Data for all other years (t-2 and back) are considered to be finalized. Data are followed by a short press-release and a publication containing more details, both available in Greenlandic and Danish. Longer time series are shown together with comments in Statistical Yearbook (text in Greenlandic and Danish).

General

The present national accounts statistics for Greenland are based on 1968 SNA. The calculations are primarily based on the income approach. The main source is data on taxes and income from the tax authorities. Statistics for the General Government sector are quite detailed and it is possible to establish all accounts, i.e. the production accounts to the capital account, for this sector. The general government is quite important in Greenland and total expenditure for this sector accounts for approximately 70 per cent of GDP. Data are reported in current prices. Gross National Income is also calculated in constant prices (1979=100), using the general consumer price index as deflator. This method of deflation is very rude and the estimated number of growth rates in real terms has to be analysed with care. Many important data of the national accounts system are missing. No data on value added by industries are available. Also data on private consumption and private investments are missing. It is also not possible to establish a balance of payment statistics, since no data in trade of services, compensation of employees and property income to and from abroad are available. No input-output tables are calculated. For some historical years more detailed accounts have been established, often as part of one-time projects or as part of PhD-projects. For the year 1992 a full set of accounts and input-output tables were established in cooperation with Statistics Denmark. In 2006 Statistics Greenland received extra budget funding from the Home rule of Greenland, to establish a new production based national account. Two specialists were assigned full-time to this project that effectively started in the spring of 2006. In 2007 the first results from the project will be published, covering national accounts, input-output tables, and balance of payments statistics.

Grenada

Source

Official estimates are published by the Central Statistical Office, Ministry of Finance, in "National Income Estimates of Grenada", St. George's.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Guatemala

Source

The Bank of Guatemala, through the Department of Economic Statistics and the National Accounts Section, is responsible for the compilation of official national accounts statistics. Each year the Bank of Guatemala issues a summary of the national accounts statistical tables; these tables can be found online at http://www.banguat.gob.gt/cuentasnac/TOMO_II.pdf.

General

Prior to 2006, the calculation of the main variables in the national accounts were based on the methodology contained in the 1953 version of the national accounts handbook, revision 2; these variables were based on the production structure of 1958. While that methodology was useful for illustrating economic trends, its capacity to reflect the current state of the economy was limited in some respects.

To ensure that the calculations reflect the country's current production structure, since 1997 the Bank of Guatemala has been making efforts to compile the national accounts in accordance with the internationally recommended 1993 System of National Accounts (1993 SNA), with 2001 as the base year.

The selection of 2001 as the base year for the national accounts was based on the following considerations: in the years from 1995 to 1998 substantial changes took place in economic and political relations as a result of the end of the armed conflict in 1996; in 1996 there was a slowdown in economic activity; in 1997 and 1998 the country suffered knock-on effects from the financial crises in the Asian countries, and in 1998 its economic infrastructure was badly damaged by adverse weather events; relative prices followed a normal and steady pattern for the six years immediately preceding 2001; the first economic survey referred to information for 2001; in 2001 the Free Negotiation of Foreign Exchange Act was adopted; the information collected in the eleventh national population census and the sixth national housing census, taken in 2002; the national household income and expenditure survey, taken in 1998-1999; the consumer price index (CPI), base year 2000; the national survey on living conditions, taken in 2000; and the fourth national agricultural census, taken in 2002-2003, is considered to be close to the information for 2001; and the National Business Directory was issued in 2000.

The updated national accounts, with 2001 as the base year, for the 2001-2005 time series were officially released in April 2007 (along with updated methodology notes). This material is available online at the following address: http://www.banguat.gob.gt/cuentasnac/TOMO_I.pdf.

In Guatemala the financial period is the same as the fiscal year, which runs from 1 January to 31 December of each year.

In order to present a gross domestic product (GDP) series at constant 2001 prices (fixed base period), the components (value added by economic activity and expenditure) and GDP were individually linked using the volume indices derived from the moving base period, so as to preserve the volume movements observed from one year to the next. However, as predicted in theory, the constant price values for the components do not add up to the constant price values of the aggregates after the series have been linked. For this reason, the relevant tables include a note indicating that discrepancies between the aggregate and the sum of the components are due to the fact that chain indices are not additively consistent.

Methodology:

Overview of GDP Compilation

GDP is calculated using the production, expenditure and income approach. Each method of calculation yields different analytical tools.

In the production approach, GDP is equal to the sum of the gross values added (in current values and in constant values) of all economic activities, calculated as the difference between output and intermediate consumption, plus taxes net of subsidies on products not included in the value of output, minus financial intermediation services indirectly measured (FISIM).

In the expenditure approach, GDP is equal to final consumption expenditure plus gross fixed capital formation plus changes in inventories plus exports, minus imports. This calculation yields final demand for goods and services, the structure of which, compared between the base years 1958 and 2001, shows significant differences in the share of exports and imports in the economy. These are due primarily to the introduction of export processing (maquila) activities and free-trade zones in the external trade sector.

In the income approach, GDP is equal to compensation of employees plus taxes, less subsidies, on production and imports, plus operating surplus and mixed income. Although this approach is the least commonly applied, it is very useful for observing the distribution of income; however, it is calculated only in current values. It should be noted that this method of measuring GDP did not exist when 1958 was used as the base year. Both value added and FISIM are valued at basic prices.

Expenditure Approach

Final consumption expenditure by households consists of the various consumption goods and services acquired by households on the market, such as food, clothing and durable goods, among others. It also includes imputed expenditure, such as rent. Actual final consumption includes, in addition to final consumption expenditure, the goods and services provided to households by general government units or non-profit institutions serving households (NPISHs).

Final consumption expenditure by households was estimated on the basis of data from the national household income and expenditure survey and the national survey on living conditions, which were processed using the product nomenclature of Guatemala. In the particular case of the national household income and expenditure survey (1998-1999), a period adjustment was applied so that the information would correspond to the calendar year 1998. Since these two surveys do not pertain to the base year (2001), it was necessary to project the data using price and volume indices in order to obtain final consumption data projected to 2001 for the two surveys. A single vector was then developed in order to obtain the most suitable measurement of household final consumption expenditure.

General government final consumption expenditure on individual and collective consumption consists of other non-market output for own final use (P.131), calculated in the production account. In the compilation of the general government accounts, individual final consumption expenditure was considered to include expenditure directed to a limited group of people, as in the case of education, health, sports and recreation. Collective final consumption expenditure was considered to include all services provided by government to the community as a whole, such as public administration and defence. Individual final consumption expenditure also includes purchases of goods and services by general government that are distributed to households without any processing, such as drugs provided free of charge. The value of individual final consumption expenditure, recorded in the use of disposable income account, is transferred to households in the form of social transfers in kind. This transaction is recorded in the redistribution of income in kind account.

Gross fixed capital formation, which includes acquisitions of durable goods and intangible investments, is calculated on the basis of movements of fixed assets and accounting flows, deducting the revaluation effect.

Exports and Imports of goods and services are measured on the basis of balance of payments information and external trade statistics. In this connection, external trade statistics are released on the basis of electronic contract data transmitted by the Superintendency of Tax Administration. These statistics can be used to classify overall external trade into customs territory trade, trade covered by Decree No. 29-89 of the Congress of the Republic (Export and Maquila Activity Promotion and Development Act) and trade covered by Decree No. 65-89 of the Congress of the Republic (National Free-Trade Zones Act).

Income Approach

Compensation of employees was calculated on the basis of average wages and salaries, which were researched directly in the field for each economic activity or determined through economic surveys.

Taxes and subsidies on production are measured on the basis of the general government data contained in the relevant financial statements and are distributed within each economic activity.

The operating surplus of economic activities, which is recorded in the generation of income account, is equal to the output of those activities minus the sum of the costs incurred; i.e., it is calculated as a balancing item.

Mixed income represents a combination of two kinds of income: the surplus from production, and remuneration for work done by the entrepreneur together with family members providing unremunerated labour.

The information used for the calculation of the components of value added was taken from economic surveys, validated by the surveys on household income and expenditure and on living conditions, since the latter two surveys identified income variables in accordance with 1993 SNA concepts: labour and non-labour income, in cash and in kind, by occupational category and branch of activity.

Production Approach

The basic information used to prepare the production account of the various economic activities consists of companies' financial statements, compiled through the economic surveys carried out by the National Economic Statistics Improvement Programme (PRONAME) and obtained directly from public corporations, general government and financial institutions, which provided analytical records supplemented by statistical annexes, along with explanatory notes in some cases.

Overview of the Compilation of the Integrated Economic Accounts

The non-financial corporations sector is subdivided into public non-financial corporations (S.11001), large private non-financial corporations (S.11002) and other private non-financial corporations (S.11004). The basic information used to prepare these accounts consists of companies' financial statements, compiled through the economic surveys carried out by PRONAME and obtained directly from public corporations, which provided analytical records supplemented by statistical annexes, along with explanatory notes in some cases. Information was taken from income statements to calculate output up to the secondary distribution of income. The output of goods-producing non-financial corporations was calculated by the sales method, in which output consists of the sum of all sales during the period, other uses of output (transfers, remuneration in kind and donations) and changes in inventories of finished goods and work in progress. The output of non-financial corporations engaged in trade was calculated through the measurement of trade margins; i.e., the value of sales minus the cost of sales. For the set of units engaged in providing services, output is equal to sales income. With respect to accumulation accounts, opening balances, changes in balances and closing balances, information was obtained from the balance sheets, which show a company's financial and non-financial assets and liabilities at a particular point in time. Thus, accounts compiled on the basis of these balance sheets measure flows or movements in the course of the year.

This financial corporations sector is divided into five subsectors: central bank (S.121), other depository corporations (S.122), other financial intermediaries, except insurance corporations and pension funds (S.123), financial auxiliaries (S.124) and insurance corporations and pension funds (S.125). The main sources of information for compiling the accounts of financial corporations are the financial statements of the institutional units that make up this sector, which are provided by the Superintendency of Banks for the institutions under its supervision; information on other institutions is obtained from the institutions themselves.

The calculation of intermediate consumption takes into account expenditure on goods and services used in production processes, such as commissions, rental of buildings, electric power, communication expenses, etc.

Value added is the difference between the gross value of output and intermediate consumption. Its components are determined from the information provided by institutions.

The balancing item obtained is the gross operating surplus.

The output of the Central Bank, unlike that of other financial institutions, is calculated on the basis of explicit costs incurred; that is, as the sum of intermediate consumption, compensation of employees, other taxes on production and consumption of fixed capital. Since the Bank's consumption of fixed capital has not been estimated, depreciation was used as a proxy for this item. Property income receivable and payable, consisting of interest and dividends, can be calculated directly from the accounting and financial information obtained for this sector. Owing to the effect produced by the dual recording of FISIM as output and as property income, it is necessary to make an adjustment to the allocation of primary income account in which the value of FISIM is recorded as a negative value in order to offset this effect and obtain a primary income balance net of this duality. This adjustment is made because FISIM have not yet been allocated by institutional sector and economic activity. The correction entails the creation of a nominal sector whose production and generation of income account shows zero output, intermediate consumption equal to the value of FISIM and a negative value added and operating surplus equal in size but opposite in sign from intermediate consumption.

Gross fixed capital formation, which includes acquisitions of durable goods and intangible investments, is calculated on the basis of movements of fixed assets and accounting flows, deducting the revaluation effect.

Gross saving in this sector is obtained as a residual. This procedure is used to reconcile the non-financial and financial transactions in the financial statements and to ensure the consistency of net lending.

Changes in inventories include stocks of silver, gold and/or other precious metals, as well as merchandise inventories. They are measured taking movements in accounting flows into consideration.

After the financial account is compiled on the basis of the financial assets and liabilities identified in the balance sheet, net lending (+)/net borrowing (-) in the financial account is compared to net lending/net borrowing in the capital account. In principle, the two values should be equal; in practice, they are not because certain details are missing from the basic data.

In the case of insurance corporations, the production account reflects, first, the amount of gross premiums and claims recorded on the income statement, for both direct insurers and corporations that import or export reinsurance services. Gross premiums ceded for reinsurance with non-resident reinsurers are disaggregated into costs of imported services (intermediate consumption) and net premiums. In principle they should correspond to claims payments received from abroad, but in practice these claims are generally greater, and the surplus is treated as a capital transfer from the rest of the world. Gross premiums received as exports of reinsurance services, though the amounts involved are insignificant, are also disaggregated into costs of exported services (gross output) and net premiums, which are the claims paid to entities abroad. In addition, the gross premiums recorded by direct insurers are subdivided into service costs (gross output) and net premiums. This makes it possible to disaggregate the value of claims paid by direct insurers into claims and capital transfers paid by insurance corporations to other sectors.

In sum, gross output includes the cost of direct services and the cost of exported services, which constitute the principal output of insurance corporations, to which is added income from secondary activities such as commissions and rentals, among others.

For all the institutional units that make up this sector, the full sequence of accounts is compiled, from production accounts to balance sheets.

This general government sector is divided into four subsectors: central government (S.1311), decentralized public institutions (S.1312), local government (S.1313) and compulsory social security funds (S.1314).

The information used to compile the non-financial and financial accounts was taken from the financial statements and budget performance data for the central government, decentralized public institutions, the Guatemalan Social Security Institute (IGSS), budget performance data for local governments and the financial statements of the Military Pension Institute (IPM) and the Municipal Employees' Social Benefits Plan (PPEM).

Budget performance data are used to calculate current transactions because the details they contain make it possible to distinguish the various transactions recorded in the different accounts. Moreover, as this information is available at the level of the entities and bodies identified as budgetary units, it can be used to effect the necessary classifications in accordance with the economic activity and function performed by these units when they take part in certain transactions. It should be noted that the expenditures cited in the budget performance data have already been adjusted as necessary, in accordance with the items of expenditure concerned, in order to convert them to an accrual basis.

In principle, for general government, decentralized public institutions, IGSS, IPM and PPEM, the full sequence of accounts is compiled, from production accounts to balance sheets, whereas for local government accounts are compiled only up to the financial account. The accounting items contained in the financial statements and budget performance data were codified, taking the corresponding nomenclature into account, for conversion to SNA transactions. The particular features of the accounts of this sector are highlighted below.

Government institutional units can have market output, output for own final use and other non-market output. Total output is calculated using explicit costs incurred; i.e., by calculating the sum of intermediate consumption, compensation of employees, other taxes on production and consumption of fixed capital. As consumption of fixed capital was not estimated, data on depreciation, where available, were used as a proxy for this item. Other non-market output for own use (P.131) is obtained by deducting from total output calculated on a cost basis the value of sales of goods and services at economically significant prices (P.11) and sales of goods and services at prices that are not economically significant (P.132).

The operating surplus of the economic market activities of general government institutions, which is recorded in the generation of income account, is equal to the output of such activities minus the sum of the costs incurred; that is, it is calculated as a balancing item, as in the case of any market activity.

Taxes on production and imports were measured using data on the tax revenues and own income received by certain institutional units such as the Guatemalan Tourism Institute, the National Technology and Training Institute and the Superintendency of Tax Administration. The criteria for the recording of current taxes on income, wealth, etc., are similar to those applied to taxes on production and imports.

All transfers which government undertakes to make to public corporations, private schools and universities and other private corporations are recorded under "subsidies", which are reflected in the budget performance data and financial statements, as the case may be.

The item "property income payable" encompasses, primarily, interest paid on the internal and external public debt and on issued securities, which are reconciled, in the process of preparing the interest matrix, with interest received by banks and the rest of the world. "Property income receivable" includes dividends and withdrawals of income from quasi-corporations by public non-financial and financial corporations, as well as interest on deposits and securities acquired from third parties. "Rent" includes private-sector payments to government for the use of State-owned resources, such as petroleum royalties.

The item "Social security contributions receivable" includes the income of IGSS, IPM and PPEM from the contributions they receive from employees and employers in exchange for the provision of social security benefits to participants.

The calculation of social security benefits includes data on pension and retirement benefits, temporary disability

benefits, lump-sum benefits for permanent disability, special rehabilitation benefits and disability, old-age and survivor's benefits, among others.

Benefit payments to employees that do not come from special funds (which at the same time are considered imputed social contributions) refer to social assistance benefits paid in the form of pensions directly by the government as an employer to its former employees, disabled former employees, etc. It makes these payments without creating a segregated reserve or other special fund for the purpose.

For the measurement of other current transfers payable, the data reported by each institutional unit are recorded, first separating current transfers within general government (D.73) from transfers paid to other sectors; the latter are reconciled with the values which those sectors report having received in the process of preparing the matrices of current transfers. For other current transfers receivable, the internal and external transfers recorded as government revenue are measured.

General government final consumption expenditure on individual and collective consumption consists of other non-market output for own final use (P.131), calculated in the production account. In the compilation of the general government accounts, individual final consumption expenditure was considered to include expenditure directed to a limited group of people, as in the case of education, health, sports and recreation. Collective final consumption expenditure was considered to include all services provided by government to the community as a whole, such as public administration and defence.

Individual final consumption expenditure also includes purchases of goods and services by general government that are distributed to households without any processing, such as drugs provided free of charge. The value of individual final consumption expenditure, recorded in the use of disposable income account, is transferred to households in the form of social transfers in kind. This transaction is recorded in the redistribution of income in kind account.

For the calculation of gross fixed capital formation in construction and equipment, data from the balance sheet were used after they had been reconciled with budget performance data, in cases where data from both sources were available.

Capital transfers receivable are calculated on the basis of government revenues and the values shown in the budget performance data for transfers paid. In both cases, internal transfers (between subsectors of the general government) were distinguished from transfers receivable from and payable to other sectors. Like current transfers, capital transfers are reconciled with the values reported as having been received and paid by those sectors in the process of preparing the capital transfer matrices. It should be noted that the data on capital transfers receivable and payable were taken from budget performance data, as they could not be identified from the wealth data shown on the balance sheet.

The financial accounts were compiled on the basis of balance sheet data, identifying transactions involving financial assets and liabilities and incorporating the adjustments obtained in the process of preparing the financial transactions matrices. These adjustments refer primarily to interest receivable and commercial credits not recorded in basic government data.

The households sector consists of all resident households. These include institutional households made up of persons staying in hospitals, retirement homes, convents, prisons, etc. for long periods of time. An unincorporated enterprise owned by a household is treated as an integral part of the latter and not as a separate institutional unit, except when the enterprise qualifies as a quasi-corporation.

The general definition of household enterprises is based on their legal organization as unincorporated enterprises, one of whose major features is the lack of a clear distinction between the assets and liabilities of the enterprise and those of its owner as a member of the household.

With the implementation of the 1993 SNA in Guatemala, households' accounts are now compiled. This compilation has broad coverage, given that there is household participation in 91 market activities and 3 activities for own final use.

Households as an institutional sector fulfil three functions: as producers, income recipients and consumers.

In their role as producers, households carry out their activities through the enterprises they own. These enterprises are production units whose owners may be either employers or own-account workers, depending on whether or not they employ other people. Such enterprises are classified as either natural persons or de facto corporations. Enterprises of the first type are directed by the owner as an individual, while those of the second type belong to various households. Both types are unincorporated enterprises that belong to the households sector.

The household production recorded in the national accounts includes the output of all goods and services that are intended primarily for sale; the output of goods for households' own consumption or own fixed capital formation and the own-account production of services of owner-occupied dwellings and domestic and personal services produced by paid domestic staff.

The calculation of households' accounts includes the measurement of formal and informal enterprises, although to date they have not been presented separately. Given the specific features of the households sector, some productive activities are captured by economic surveys while others are not, since they are carried out on an itinerant basis or within the owner's dwelling. This segment of the household enterprises sector is termed "invisible" because these units are not included in the National Business Directory.

With respect to the household production captured by economic surveys, output is calculated on the basis of the form for small businesses included in economic surveys, which was used to research household enterprises with fixed premises engaged in manufacturing, trade, services and transport. For other activities such as mining, construction, agriculture, financial auxiliaries and domestic services, complementary sources of information were used.

The "invisible" segment of the households sector was measured as follows: the number of employed persons by economic activity for the total number of households was calculated on the basis of the national household income and expenditure survey; the number of employed persons was projected to 2001 and the results were compared to the economic surveys; the difference between the number of employed persons indicated in the national household income and expenditure survey and the number indicated in economic surveys was considered to represent the "invisible" segment; the average per capita productivity was calculated on the basis of economic surveys, by activity included in the Nomenclature of Economic Activities of Guatemala; and the output of invisible enterprises was obtained by multiplying average productivity (obtained from economic surveys) by the number of employed persons in the invisible segment.

Intermediate consumption consists of the inputs used in production processes that are consumed within the accounting period. They were measured using the same sources as those used to calculate output.

Given their function as producers, households are also income recipients. Depending on their labour status, employed persons may receive income in two forms: remuneration if they are employees, or mixed income if they are own-account workers, employers or owners of unincorporated enterprises. They are also recipients of property income.

Mixed income represents a combination of two kinds of income: the surplus from production, and remuneration for work done by the entrepreneur together with family members providing unremunerated labour.

The information used for the calculation of the components of value added was taken from economic surveys, validated by the surveys on household income and expenditure and on living conditions, since the latter two surveys identified income variables in accordance with 1993 SNA concepts: labour and non-labour income, in

cash and in kind, by occupational category and branch of activity.

When households receive income, they can use it to meet their needs; this is where the households sector's function as a consumer becomes evident.

The households account was processed at the institutional level from the production account to the capital account, and at the same time the accounts of economic activities in which households participate were compiled. This ensured consistency between institutional sectors and economic activities.

Two main types of NPISHs may be distinguished in the national accounts framework. The first type consists of NPISHs which are created by associations of persons to provide goods or, more often, services primarily for the benefit of the members themselves. The services are usually provided free, being financed by regular membership subscriptions or dues. They include NPISHs such as professional or learned societies, political parties, trade unions, consumers' associations, churches or religious societies, and social, cultural, recreational or sports clubs. The second type of NPISH consists of charities, relief or aid agencies that are created for philanthropic purposes and not to serve the interests of the members of the association controlling the NPISH. Such NPISHs provide goods or services on a non-market basis to households in need, including households affected by natural disasters or war. The resources of such NPISHs are provided mainly by donations in cash or in kind from the general public, corporations or governments. They may also be provided by transfers from non-residents, including similar kinds of NPISHs resident in other countries.

The information used to compile the non-financial and financial accounts of NPISHs was taken from the detailed financial statements of these institutions, consisting of the income statement and the balance sheet, which were captured in the economic surveys carried out. In principle, the full sequence of accounts is compiled for the units that make up this sector, from production accounts to balance sheets; the accounting items contained in the financial statements were codified, taking the corresponding nomenclature into account, for conversion to SNA transactions. The particular features of the accounts of this sector are highlighted below.

Output is measured by the costs incurred; that is, as the sum of intermediate consumption, compensation of employees, other taxes on production and consumption of fixed capital. Since consumption of fixed capital was not estimated, depreciation was used as a proxy for this item. Other non-market output for own use (P.131) is obtained by deducting from total output calculated on a cost basis the value of sales of goods and services at economically significant prices (P.11) and sales of goods and services at prices that are not economically significant (P.132).

The operating surplus of the economic market activities of these institutions, which is recorded in the generation of income account, is equal to the output of such activities minus the sum of the costs incurred.

Property income receivable consists primarily of the interest accrued on deposits and, to a lesser extent, some investments in securities.

Most of the sector's resources come from current transfers to these institutions from various resident sectors and the rest of the world. These data were obtained from the institutions' financial statements and from the process of preparing the current transfers matrices, in which, for each counterpart sector, this sector was assigned the amounts paid by other sectors and the rest of the world.

The individual final consumption expenditure of these institutions consists of other non-market output for own final use (P.131), calculated in the production account, plus purchases of goods and services by NPISHs that are distributed to households without any processing. The value of individual final consumption expenditure, recorded in the use of disposable income account, is transferred to households in the form of social transfers in kind (individual transfers of non-market goods and services). This transaction is recorded in the redistribution of income in kind account.

Reply to the United Nations national accounts questionnaire from the National Statistics Office of Ministry of Economics and Finance, Conakry.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Footnotes indicate when the scope and coverage of the data differ from the definitions and classifications recommended in the SNA 1993.

Reply to the United Nations national accounts questionnaire from the Statistical Bureau, Georgetown. Official estimates have been published by the Statistical Bureau in "Annual Statistical Abstract".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Honduras

Source

The preparation of national accounts statistics in Honduras is undertaken by the Departamento de Estudios Economicos, Banco Central de Honduras, Tegucigalpa, D.C. The official estimates are published in "Cuentas Nacionales".

General

The estimates shown in the following tables have prepared in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used for private final consumption expenditure and for gross capital formation. Government final consumption expenditure is estimated on the basis of government accounts. Changes in stocks are estimated on the basis of information obtained from various sectors such as the banana industry, the mines, the petroleum sector and the trade enterprises. Private investment consists of gross value of production in the construction sector, plus imports and domestic production of capital goods which are adjusted to purchasers' values. Public investment is estimated from public sector data on settlements by type of construction and classes of machinery and equipment. The estimates of exports and imports of goods and services are based on the balance of payment data. Private consumption expenditure is estimated as a residual. For the constant price estimates, private final consumption expenditure is estimated as a residual while all other items of GDP by expenditure type are deflated by various price indexes.

Income Approach

Estimates of labour income are derived from sources such as censuses and surveys, supplemented by information on wages and salaries paid by various government agencies and other public bodies. Estimates of profits of enterprises and professional incomes are obtained from the Direccion General del Impuesto sobre la Renta. Estimates of interest and dividend payments received by household and private non-profit institutions are derived as a residual. Indirect taxes and subsidies are estimated on the basis of government sources. For consumption of fixed capital, no specific information is available.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is, however, used to estimate value added of producers of government services, part of the transport sectors and other private services. For the agricultural crop production, information is obtained directly from the most important export enterprises while for other products, estimates are obtained from consumption per capita data adjusted for exports and imports. Surveys are conducted to obtain information on basic production of grains. Agricultural censuses were held in 1953, 1965 and 1974. The Instituto Hondureno del Cafe provides complete information for coffee production. The banana companies in the northern zone are visited annually while for the rest of the country, consumption per capita data are taken into account together with prices collected from native producers.

Livestock production information is gathered from the most important producers with adjustments made for clandestine or uncontrolled transaction. Inputs are estimated as 30 percent of the gross value of production. The production in the forestry sector is calculated as a function of household and industrial consumption of firewood, and extrapolated by an index. The estimates of fishing are calculated on the basis of information on survey economics, the foreign trade statistics and per capita consumption data.

For metal mining, the statistical information is obtained directly while estimates for non-metallic mineral are based on inputs used in the construction sector using certain coefficients derived from analysis of construction costs. The estimates of manufacturing are based on economic surveys (Departamento de Estudios Economicos del Bano Central de Honduras). Information on electricity, gas and water is obtained directly from concerned enterprises. The data available cover gross values of production, aggregated values, physical production, installed capacity and personal occupation. Information on public construction is taken directly from the municipalities. Based on the information obtained from them, a sample is taken from which the growth of private construction can be measured. The population and housing censuses are also taken into account for dwellings.

For the trade sector, the estimates are based on the gross value of agricultural and industrial production by item. The value of imports and exports are estimated from foreign trade statistics and information received from the Direccion de Tributacion Directa. In estimating road transport, information on registered vehicles for rental is used. Data on income and expenditure by type of vehicle, depreciation and profits are obtained. Information for financial institutions is obtained from the Superintendencia de Bancos, which provides financial statements for all banks in the system and insurance companies. The estimates of ownership of dwellings are based on census information for 1949, 1961 and 1974 covering the number of dwellings and the average rents paid and imputed.

For producers of government services, information is obtained directly from the Contaduria General de la Nacion and Ministerio de Finanzas (Finance Ministry). For private services, use is made of employment data, classified by type of service rendered and data on average wages and salaries from other information sources. For domestic services, data on employment and wages are basis for estimating the value added with 75 per cent added to the cash figures for board and lodging as wages and salaries in kind. For the constant price estimates, value added of the agricultural sector is either extrapolated by quantity indexes for output or deflated by price indexes. For the industrial activity sector, trade, transport and storage, financial institutions and insurance and private services, value added is extrapolated by quantity index. For the remaining sectors, current values are deflated by various price indexes.

^b Excludes Financial intermediation services indirectly measured (FISIM).

Hungary

Source

The compilation of annual national accounts in Hungary is prepared by a common work of the Directorate of National Accounts and the Directorate of Sector Accounts of the Hungarian Central Statistical Office, Budapest. The official estimates are published annually on the internet in "Downloadable publications" (www.ksh.hu) and in the handbook „National Accounts Hungary - Magyarország nemzeti számlái", KSH. The data for Hungary were received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) - more precisely ESA95 - which was used from 1990 onward. Before 1990 estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated; data until 1990 were estimated using 1968 SNA. The concepts, definitions and sources of used basic statistics and estimation methods are described in the OECD-HCSO common publication ("National Accounts in Hungary – Revised Sources, Methods and Estimates") published in 1997. Methodological changes, introduced since this above mentioned publications, are described in the volumes of annual national accounts publications (see National Accounts Hungary - Magyarország nemzeti számlái). Constant price calculations are based on the years 1991, 1995, 1998 and 2000. In 2006 the chain linked measurement was introduced. Data in the tables are in national currency, Hungarian Forint. Annual national accounts calculation is made at t+9 months, as preliminary, and at t+16.5 months, as final version. Routine revision is possible twice a year.

Methodology:

Overview of GDP Compilation

As a general rule the statistical units are institutional units. Only the government production is shown by establishments. Substantial changes were introduced in the compilation of national accounts from 1991. The most important ones are as follows: (a) the output of financial intermediaries was measured on cost level before the revision, presently the service charges are accounted as the output of this sector; (b) owner-occupied dwellings are valued on cost basis; (c) estimation for consumption of fixed capital in the government sector are obtained as a product of PIM (prior to 1991 they were based on historical costs). Where the scope and coverage of the estimates differ from the definitions and classifications recommended in 1993 SNA for conceptual or statistical reasons, it is indicated in footnotes of the relevant tables. FISIM allocation is introduced also in 2006. Moreover, data in the integrated sectors generally display discrepancies between the domestic sectors and the total economy due to data consolidation procedures used by the Statistical Office. It should be noted that the equality between the sum of domestic sectors and total economy does not hold valid when data are consolidated because consolidation involves the elimination of certain various debtor/creditor relationships which occur between two transactions belonging to the same institutional sector or sub-sector. The national classification of industries is the same like in NACE. Gross domestic product is estimated from three approaches: production, expenditure and cost structure (income side). The main approach used for the estimation of GDP is the production approach.

Expenditure Approach

The expenditure approach is used to estimate all expenditure type components of GDP. Final consumption expenditure by general government is based on records from all subsectors of general government. For volume measure of health and education the direct volume indicator method is used. Final consumption expenditure by households is estimated mainly using household budget survey and retail trade statistics. For services other data surveys are also used. Own-account consumption is valued at market prices, output of the owner occupied dwellings are estimated by user cost method. For deflation of household consumption consumer price index is used. The investment surveys are the main sources for estimation of gross fixed capital formation. Data from STS are the main source for estimation of changes in inventories. Exports and imports of goods and services are based

partly on INTRASTAT data collection (within EU), partly on customs declarations, while exports and imports of services are obtained from other special surveys, for example tourism. For the calculation of constant prices, price deflation is used for different groups.

Income Approach

Compensation of employees is estimated from tax declarations of corporations, income tax declarations, SBS, labour surveys, financial data for general government and social security statistics. Taxes and subsidies on products are taken directly from the general government accounts. Operating surplus is to be found in the national accounts as a residual of production. Compensation of employees and other taxes on production are deducted from gross value added and other subsidies on production received are added. Mixed income is a residual item in household sector. Consumption of fixed capital is obtained by using PIM for fixed capital. There is no constant price calculation for income elements.

Production Approach

The table of value added by kind of activity is prepared at basic prices. The main sources of the estimation at current prices are: SBS, financial tax reports of corporations, state budget, income tax statistics, agricultural statistics, reports of financial intermediaries and surveys on non-profit institutions. Double deflation method is used for the calculations at constant prices, except owner-occupied dwellings and government services.

Iceland

Source

The preparation of national accounts statistics in Iceland is undertaken by the National Account Department at Statistic Iceland, Reykjavik.

The official estimates are published twice a year in "Gross Domestic Product", (Statistic Iceland, Statistical series) and on the internet (www.statice.is) as well as in the annual Statistical Yearbook. A detailed description of the sources and methods is found in "Gross National Income Inventory", submitted to Eurostat in March 2004 (www.statice.is/lisalib/getfile.aspx?itemid=1173). This inventory describes in detail all method applied in compiling the National Accounts at current prices in Iceland.

The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA).

Constant prices estimates are based on annual chain linking with 2000 as reference year.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach. The production approach is used in estimating GDP by kind of economic activity as well as cost-structure of GDP as described below.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure is mainly based on government accounts. Estimates of private consumption expenditure are based on various sources. A vital source is the import of consumer goods plus import duties and trade and transport margin. The Agricultural Production Board is the source for the estimate of consumption of domestically produced agricultural products. A considerable part of the consumption of services is derived from the Industrial Statistics and the continuous Household Expenditure Survey which is used as a weight in consumer price index.

Gross capital formation is mostly based on investment statistics from the Enterprise Accounts Register, direct inquiries to the main constructors, information about residential construction from the Land Registry of Iceland and government accounts. Exports and imports of goods and services are estimated from foreign trade statistics and balance of payment statistics. Price deflation is used for most of the expenditure items in arriving at constant prices. Various price indices are used.

Income Approach

(See "Gross domestic product by kind of economic activity" below.)

Production Approach

The production approach is used to estimate both cost-structure of domestic product and gross domestic product by kind of activity. The main source is the Enterprise Accounts Register. From 1997 onwards it has been compulsory for incorporated enterprises and unincorporated enterprises (from 2001) to return standardized annual accounts to the tax authorities. In addition to the Enterprise Accounts Register information from the VAT Register

and the Pay-as-you-earn Register are used for control and grossing up. In cases where the accounting rules are not in accordance with the National Accounts standard appropriate adjustments are made to the accounts. For the constant price estimates the general approach for almost all industries is the deflation of the gross output or extrapolation of base year value of output. Double-deflation is not used in any industry.

India

Source

Reply to the United Nations national accounts questionnaire from the National Accounts Division of the Central Statistical Organization (CSO), Ministry of Statistics and Programme Implementation, New Delhi. Official estimates are published annually in the "National Accounts Statistics".

General

The estimates shown in the following tables have been prepared in accordance with the System of National Accounts 1993 (1993 SNA). The estimates relate to fiscal year beginning 1 April. The sources of data and methodology followed are given in the publication "National Accounts Statistics - Sources and Methods", 2007, which is also available at www.mospi.gov.in. When the scope and coverage of the estimates differ for conceptual and statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach for the commodity producing sectors and a combination of production and income approaches for the services sectors.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure whereas the estimate of gross fixed capital formation is based on both the commodity-flow approach and the expenditure approach. Estimates of government consumption expenditure are mainly obtained from budget documents and annual reports of the government bodies.

Estimates of private expenditure of goods are obtained from commodity production data adjusted for change in stocks and foreign trade, and reduced by intermediate consumption, government final consumption and by the quantities used for capital formation. Private expenditure of services is estimated as the value of the total output for each kind of service reduced by the estimated expenditures on government services and business services. Estimates of increase in stocks for the public sector and organized (i.e. larger or modern) private industries are based on government budget documents and annual accounts, and reports of industries, respectively. Estimates of change in stocks of unorganized private industries are based on sample survey data, data on bank advances and margins and on livestock censuses. For gross fixed capital formation, estimates of construction are compiled using data from a number of sources such as dispatches of cement and steel for domestic consumption, sample surveys and government budget documents and the All-India debt and investment surveys. For machinery and equipment, estimates are based on the annual survey of industries, foreign trade statistics, customs and excise revenue statements, data on trade, transport and other charges collected from leading manufacturing firms. The estimates of exports and imports of goods and services are based on balance of payment statistics. For the constant price estimates changes in stocks of livestock, mining and food grains are valued at 1999-2000 prices. For government expenditure, private expenditure on services, increase in stock for other sectors, gross fixed capital formation and exports & imports, the current values are deflated by relevant price indices and unit value indices.

Income Approach

Estimates of compensation of employees are based on budget documents, annual reports of enterprises, income and expenditure accounts of institutions and companies and sample surveys. Estimates of operating surplus are based on most of the sources used for compensation of employees. Consumption of fixed capital is estimated for each industry separately on the basis of estimated value of capital stock and the expected age of various types of

assets at the aggregate level by following the perpetual inventory method. The sources include the All-India debt and investment surveys, livestock censuses, budget documents and annual accounts. Estimates of indirect taxes and subsidies are based on accounts and annual reports of government bodies.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added for all commodity producing sectors and moving the benchmark estimates for unregistered manufacturing. Value added of construction is based on a combination of commodity-flow and expenditure approaches. A combination of production and income approaches are used for all other sectors. The production estimates of principal agricultural crops are based on administrative records which give crop acreage statistics and the results of the random sample crop-cutting surveys conducted by the respective state government agencies which give the yield estimates. The wholesale prices in the primary markets are used to evaluate the total production of each commodity. The annual estimates of livestock products are based on the livestock population by type and the corresponding average yield rate of estimate through the annual integrated sample survey conducted by the state government agencies. Intermediate consumption is estimated by using a variety of sources such as the cost of cultivation studies conducted by the central government, the National Sample Survey Organization (NSSO), the All-India debt and investment survey, marketing reports and other administration based statistics.

Estimates of the gross output of minerals are based on data available from the Indian Bureau of Mines and the state governments. For large-scale manufacturing, estimates are prepared for 20 industry groups based on the Annual Surveys of Industries (ASI). Benchmark estimates for the household and non-household unregistered manufacturing and other unorganised portions of trade, transport etc. are prepared using data on value added per worker derived from the follow-up surveys of economic census of CSO and NSSO and estimated working force. For other years, estimates are extrapolated by means of indicators of physical output or input and prices. Estimates of pucca construction are compiled by the commodity flow approach using data on steel and cement production, foreign trade statistics, customs and excise revenue, etc. The estimates of kutcha construction (from locally available materials) are based on expenditure data from NSSO, debt and investment surveys and other sources. For public sector trade, transport, administration, banks etc., estimates are based on the analysis of budget documents and annual accounts.

The estimates of gross rents for urban and rural dwellings are based on the number of dwellings and estimated gross rental value per dwelling obtained from the NSSO surveys on consumer expenditure. For the constant price estimates, double deflation is used for the agriculture and mining sectors. Current values of large-scale manufacturing and construction are deflated by price indexes. For unregistered manufacturing, electricity, gas and water, trade, transport, ownership of dwellings and other services, value added is extrapolated by quantity indexes. Current price estimates of public administration are deflated with the consumer price index of industrial workers to obtain the constant price estimates.

Indonesia

Source

Reply to the United Nations national accounts questionnaire from BPS-Statistics Indonesia, Jakarta. Official estimates are published annually in the "National Accounts Statistics".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual and statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Until 1998 Timor L'este was integral part of the economic area of Indonesia and is therefore included in the estimates. From 1999 onwards the region is systematically excluded from the national accounts.

Expenditure Approach

The expenditure approach is used to estimate private final consumption, government final consumption, exports and imports of goods and services. Private final consumption expenditure is estimated using Socio-Economic Survey (Susenas) data. The commodity-flow approach is used for gross fixed capital formation. The main sources of data for the estimation of central government consumption expenditure are the budgetary accounts of the Department of Finance, while local governments provide data directly to the BPS-Statistics Indonesia. Benchmark data for capital formation are based on statistics of imports and domestic production of construction materials and machinery and equipment. For other years, import of machineries and equipments are obtained from import statistics, while domestic production is compiled by using production and implicit price indexes to extrapolate the benchmark estimates. The input-output ratios for buildings and structures have been established for 2000 on the basis of special surveys on construction projects in that year. Other years' estimates are extrapolated by quantity and price indexes of domestic production and imports of construction materials. Estimates of exports and imports of goods and services are obtained from foreign trade and balance of payment statistics. For the constant price estimates, current values of private expenditure items are deflated by the consumer price index, government expenditure items are deflated by the consumer price index and by the wholesale price index. For gross fixed capital formation referring to buildings and structures, the benchmark values are extrapolated by quantity indicators of domestic production and volume indicators of imports of construction materials. Values of exports and imports are deflated by the corresponding unit value price indexes.

Income Approach

Consumption of fixed capital for manufacturing, electricity, gas and water, is estimated from information available at the CBS. For other sectors the estimates are based on the results of special surveys. The main sources of data for net indirect taxes are the budgetary accounts of the central and local governments. Compensation of employees together with operating surplus is obtained as a residual.

Production Approach

The table on gross domestic product by kind of economic activity is prepared at market prices, i.e. producers' values. The production approach is used to estimate value added of most of the industries. The income approach is used for government and domestic services while gross output of trade and construction is estimated on the basis of the commodity-flow approach.

For agriculture, food crops production is compiled on the basis of information relating to area harvested and average yield for each crop obtained from the BPS-Statistics Indonesia. The prices used are based on farm-gate prices obtained from annual surveys. Production of commercial and estate crops, livestock, forestry, and fishery are obtained from the departments concerned. For main food crops, commercial and estate crops, livestock, forestry, and fishery the value of intermediate inputs is based on cost-structure surveys. The most important mining commodity is crude petroleum for which production data are available for all enterprises concerned. Estimates of prices and input costs are compiled on the basis of returns furnished by the largest firm. For the base-year 2000, data on output and input structure of manufacturing have been compiled for each industry group from statistics maintained by the BPS-Statistics Indonesia and from surveys and other studies undertaken. For other years industrial production indexes are compiled on the basis of output of selected manufactured products.

For gross output of construction, the information on imports of construction materials is obtained from commodity imports statistics whereas estimates of domestically produced materials are based on the annual industrial surveys. The average ratios of intermediate inputs to gross output are based on data gathered from surveys. Gross output of the trade sector is calculated by multiplying estimates of the producers' values of the marketed surplus of agricultural products, domestically produced manufactured goods, selected mining and quarrying products and the cost of imported goods by the percentage distribution mark-ups gathered from special surveys. Estimates for other years are extrapolated by a quantity index of marketed surplus traded and an implicit price index. For railway transport, the annual reports of the State Railway Company constitute the main source of data for estimating gross output, intermediate input and value added. For road transport, gross output and input values are estimated by multiplying the average earning of each type of vehicle by the corresponding number of vehicles. For other transports, estimates are based on cost-structure surveys and data from concerned authorities and companies.

The information of gross output and value added of the banking sector is based on the data compiled annually by the Bank of Indonesia supplemented by special inquiries for other financial intermediaries. Basic data relating to real estate and business services are limited and rough procedures are adopted by using information gathered from the special surveys. For government services, estimates are obtained from current budget expenditure and information furnished by local bodies. Estimates of other services are calculated for the year 2000 as the benchmark year, and estimates of other years are extrapolated by using employment and price indicators. For the constant price estimates, revaluation is used for the agricultural sector, while value added of public administration and defence, is deflated by a moving average of the consumer price index. In all other sectors value added is extrapolated by various quantity indicators and indexes.

Iran, Islamic Republic of

Source

The National Accounts Department, Bank Markazi Jomhouri Islami Iran, Tehran provided notes on Methodology and data reflected in the tables under series 100. These estimates are published in the annual bulletin "Bank Markazi Jomhouri Islami Iran, Economic Report and Balance Sheet". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Detailed data as well as description of sources and methods used for national accounts estimation are published in the latest volume of the National Accounts of Iran, 1974-1987. Input-output tables have been compiled for the years 1965, 1969, 1973 and 1984. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate all components of gross domestic product by expenditure type except gross fixed capital formation in machinery which is calculated mainly by commodity-flow approach. Estimates for government final consumption expenditure are based on records from all sectors of general government. Private final consumption expenditure is estimated using data from family budget surveys. The estimates of gross fixed capital formation in private construction are derived from annual surveys on construction. The data on investment in construction by the public sector is obtained from the accounts of different government units. The capital formation in machinery and equipment is estimated through commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of goods and services are obtained from the balance of payments accounts and foreign trade statistics. For the constant price estimates all items of gross domestic product by expenditure type are deflated by appropriate price indices.

Income Approach

The estimates of compensation of employees are obtained in the process of estimating value added by industrial origin. Consumption of fixed capital is estimated according to useful lifetime of different type of capital goods. Operating surplus is obtained as a residual. Estimates of indirect taxes and subsidies are based on government accounts.

Production Approach

Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared at factor values. The production approach is used to estimate the value added of most industries. The income approach is used for producers of government services, communication and part of other services. The agricultural estimates are based on annual surveys of agriculture, carried out by Ministry of Agriculture. The estimates are checked using the results of the annual family budget surveys. Data on the production of red meat are based on information supplied by slaughter houses in urban areas and on the results of expenditure surveys in rural areas. The data are then converted to current price estimates by using wholesale price index. Statistics concerning forestry and fishing are obtained from concerned agencies.

Mining estimates are based on annual sample surveys and the 1991 Census of Mining. The value added of oil sector is derived from the reports of the Ministry of Oil. The manufacturing estimates for large establishments which employ 10 workers or more are based on the results of the annual surveys of manufacturing. For small establishments, estimates are derived using the sample surveys of 1986 and information from other sources. The estimates of electricity, gas and water are based on information obtained from the government accounts. Estimates for private construction in the urban areas are obtained from the results of Bank Markazi's annual surveys with adjustments made to cover contractors' profits which are not included in the surveys. As for the rural areas, the results of 1973 Survey of Rural Construction by the Statistical Center of Iran are extrapolated using information concerning construction in small towns.

For trade sector the gross margin is calculated using the results or survey of wholesale and retail trade in the urban areas. Estimates for transport sector are generally based on the sample surveys by Bank Markazi Jomhuri Islami Iran and financial statements of the government organizations involved. The value added of financial institutions and insurance is obtained directly from the financial statements of concerned institutions. The estimates for dwellings are based on data obtained from family budget surveys and imputations are made for owner-occupied dwellings. For producers of government services estimates are derived from government accounts. Estimates for social and personal services are based on information from various sources mainly the family budget surveys. For constant price estimates, the current values are deflated by an appropriate price index for each kind of economic activity.

Iraq

Source

The Iraq National Accounts are compiled and disseminated by the National Accounts Department of the Central Office of Statistics and Information Technology (COSIT) at the Ministry of Planning. COSIT located in Baghdad. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The National Accounts estimates are published on the internet (www.iraqcosit.org), as well as in the Annual Statistical Abstract.

General

The latest estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Latest Input – Output tables have been published in 1988. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The National Accounts Department has revised the time series of national accounts for the period 1997-2004. The following illustrates the recent changes and improvements made in the methodology: Estimates for animal products, are based on the new agriculture census 2001. In addition, old coefficients used in the estimation of animal production have been updated based on discussion with officials from the Ministry of Agriculture. The results of a study conducted by the FAO on the Kurdistan region have been used to measure the cultivated areas and volume of production by crop.

For Other Mining and Quarrying, the results of an establishment survey of the private sector that was conducted on 2003 have been used. For data on Electricity and Water, private production of electricity was included. The imported building materials used by public enterprises have been estimated based on market exchange rate. The results of a survey on road passengers transport conducted on 2003 have been used to update estimates of the related sector. The results of the population census conducted 1997 have been used to estimate the number of units [for rents own]. For the following years 5% of the value of the new houses is estimated as [owned houses].

Public Health & Education has been excluded from the public administration and defence. The imported good of the government have been evaluated based on market exchange rate. The methodology has been changed, and the first quarter results of the household income and expenditure survey conducted in 2002 are used, replacing the old estimates that were based on the 1993 personal services survey. New deflators have been used, in particular, volume deflators such as index numbers of manufacturing production, index number of government employees to deflate the current output and intermediate consumption of the government activity. The deflators have been updated. GFCF is estimated according to current market prices rather than a price based on official exchange rate.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled.

Expenditure Approach

Government consumption is estimated from the government accounts. Private household consumption is estimated from the data of the Household socio economic survey. Gross Fixed Capital Formation: all data are obtained from government accounts, public financial accounts, manufacturing surveys, and construction output. Estimates are made for the rest of the activities. Exports and Imports of goods and services data are obtained from Central Bank. Changes in stocks are estimated as residual.

Income Approach

The estimates of compensation of employees in the public sector are obtained from the final accounts of the government and companies. For the private sector, the data are obtained from both service surveys and internal trade surveys. Operating surplus is obtained as a residual. The data on indirect taxes and subsidies are obtained from the actual accounts of the government or from the final accounts of the establishments of the public sector.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at factor cost. Data on cultivated area, production by crop, and prices are provided by the Agricultural Statistics Department of COSIT in cooperation with the Ministry of Agriculture. Intermediate consumption is estimated based on information obtained from administrative data. The output for Fishing is estimated based on quantity sold on the wholesale fish markets of the governorates of Iraq. The Department of National Accounts estimates the quantity sold outside wholesale fish markets and the production for own use. The quantity sold outside wholesale fish markets is estimated at 20 % of the quantity sold inside such markets. Production for own use is estimated based on information obtained from the 1993 Household Income & Expenditure Survey.

Oil production is estimated based on volume and price data provided by the Ministry of Oil. The intermediate consumption is also provided by the Ministry of Oil. For sulphur and phosphate the estimation is based on the profit and loss accounts of the concerned public enterprises. Annual establishment's survey is the source of data to estimate the production account. Large scale establishments (30 employees or more) and medium size (10-29 employees) are covered on complete enumeration while small establishments (< 10 employees) are sampled. The value added is deflated by manufacturing volume production index.

Data source for Electricity and Water are the financial statements and profit and loss accounts of all public companies producing electricity and water. For Transportation, Communication and Storage, the public establishment production accounts are estimated by using annual financial statements. Private transport is estimated based on administrative data obtained from traffic police as well as studies on revenue and cost of vehicle. As for communication, there are 5 companies operating in Iraq. However, these companies do not provide data to COSIT and therefore, are excluded from the estimates. Private establishments working in storage activity are not included in the estimates.

The source of data for public sector's construction, are the financial statements of public establishments. Private construction activity is estimated using the number of building permits issued by the administrative authorities. COSIT conducts an annual survey on a sample of construction sites to measure the actual value of production. In addition, the department adopting fixed ratio to estimate the profit margin for the private sector. The methodology does not include illegal construction activities (building without permits).

The data source for public sector is the financial statements of publicly owned establishments. Private sector activities are estimated from the annual survey and business services, hotels, reports received from consumer cooperatives. For trade activity the National Accounts Department uses the commodity flow method. The weaknesses of the estimates are that a general trade margin is applied by activity (example agriculture, manufacturing, imports) rather than margin by commodity. In addition, all imports of government and private companies that are not channelled to wholesale retail trade are included on the estimates. The source of data for banks and insurance companies is the financial statements of profit and loss accounts. The 2002 Household socioeconomic survey is used to estimate the production accounts of this activity. The government budget is the source of data for Public Administration and Defence.

Ireland

Source

The preparation of national accounts statistics in Ireland is undertaken by the Central Statistical Office (CSO), Dublin. The official estimates are published annually in "National Income and Expenditure" and quarterly in "Quarterly National Accounts". These publications can be accessed on the website www.cso.ie and contain details of estimation methods used. In 2002 a complete methodological inventory on GDP compilation was submitted by the CSO to EUROSTAT and was followed more recently by a second GNI inventory at end 2006. The inventory describes in detail all methods used in compiling the national accounts statistics. Additionally, in April 2007 Financial and Non-Financial Institutional Sector Accounts were published for the first time for the years 2002 – 2005 see www.cso.ie for details. The data were received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates prepared according to the 1968 SNA are provided in the former national currency Irish pound. The following presentation of sources and methods is mainly based on a report entitled "Basic statistics needed for the ESA accounts and tables: present situation and prospects for improvements" prepared by the Statistical Office of the European Communities in 1976 and on information received from Ireland's Central Statistics Office. Official input-output tables have been published in respect of the years 1964, 1969, 1975, 1998 and 2000. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Ireland the currency name for the data before 1999 is "1999 IEP euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = .787564 Irish pound. - The name of the currency of the newly submitted data is "1999 IEP euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Ireland, like for example all old data following the 1968 SNA is still in "Irish pound", although this is not specifically indicated in the tables. The CSO's practice in the past has been to incorporate revisions and updates to the national accounts on an on-going basis whenever a new series of results are being published.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income & expenditure approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The main sources used in the compilation of Household final consumption include trade and production data in the commodity flow approach, fiscal data from the Revenue

Commissioners, Household Budget Surveys and the Census of Population for the rent estimation. Other sources include administrative data and direct inquiries to some of the main public service providers. Government final consumption expenditure is estimated from the accounts of the various government bodies such as the ministries, the local authorities and health boards, extra-budgetary funds and the Industrial Development Authority. The main sources used in the compilation of Gross Fixed Capital Formation are administrative and fiscal data, surveys, direct information and trade and production data in the commodity flow method. Administrative data, direct inquiries (including the Quarterly Stocks Inquiry) and surveys are the main sources used in estimating changes in inventories. The estimates of imports and exports of goods and services are obtained from balance-of-payments, special studies and surveys. For the constant price estimates, direct revaluation at base-year prices is used for items of private final consumption expenditure where quantity data are available. For all other components of GDP by expenditure type, price deflation is used.

Income Approach

Compensation of employees is estimated by assigning an income to each person classified as an employee in the labour market statistics derived from the Quarterly National Household Survey (QNHS). The QNHS results are annualised to provide control totals for the numbers of employees in each branch. To convert from the residence basis used in the QNHS to the domestic concept used in the national accounts, an adjustment is made for persons employed by embassies and international organisations. The earnings information used in the calculations is largely derived from statistical surveys and administrative records. The statistical surveys include the Census of Industrial Production and the Annual Services Inquiries. For public sector employees, including most teachers and health service workers, the remuneration estimates are taken from public accounts and from information provided by Government Departments. Operating surplus is calculated from returns made to the revenue authorities and from government accounts. Depreciation is based on the perpetual inventory method for the agricultural sector. For private enterprises, it is taken as the income tax wear-and-tear and other allowances. Indirect taxes and subsidies are estimated from the government accounts.

Production Approach

Before the implementation of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. The income approach is used to estimate the value added of all industries except agriculture, for which the production approach is used. Annual estimates of agricultural output are calculated on a commodity basis for crops, livestock and livestock products. The data on quantities and values are obtained from various sources such as Department of Agriculture and Central Statistics Office. The total quantities purchased and amounts paid by the purchasers for important agricultural items such as wheat and barley are available from various inquiries and adjusted for marketing margins and transport costs. For live exports, f.o.b. export value less an allowance for marketing margins, is taken as the output value. For the remaining items market prices are used as the basis for evaluation. Input data are obtained through the Department of Agriculture for fertilizers. Data for seeds are compiled indirectly from acreages and seedling rates. Own-account consumption of food and fuel is evaluated at agricultural prices. For mining, quarrying and manufacturing enterprises employing more than three persons, the estimates are based on annual censuses. Quarterly surveys of turnover and employment are conducted for manufacturing and services. For small-scale manufacturing, the number of persons engaged, which is derived as the difference between population census data and data from the production census, interpolated for intercensal years and projected forward, are multiplied by average income per person. The estimates of electricity, gas and water and of construction are based on annual inquiries. For trade, censuses of distribution provide benchmark data for turnover, purchase of products, wages and salaries and intermediate inputs. For intervening years, monthly turnover figures from a sample of 2,500 establishments are used together with annual estimates of the number of employees and trends in earnings. For restaurants and hotels, annual surveys and revenue data are used. Transport is mainly provided by public enterprises and data are obtained from published accounts. Data obtained from annual reports, direct surveys on wages and salaries and revenue statistics are used for the estimates of the financial sector. For real estate and business services, data from population census, imputed average income and revenue accounts are used. The imputed rent of owner-occupied dwellings is taken as the average rent paid for similar dwellings in similar locations. Estimates of other private services are based on the results of inquiries into wages and salaries and on trends in operating surplus taken from revenue data. Data on government services are obtained from the government accounts. For the constant price estimates, double

deflation is used for agriculture. Value added of all other economic activity sectors of GDP is extrapolated by a quantity index.

Israel

Source

The preparation of national accounts statistics in Israel is undertaken by the Central Bureau of Statistics, Jerusalem. The official estimates are published annually by the CBS in the "Statistical Abstract of Israel" and in the "Current Briefings in Statistics". The CBS publishes also quarterly estimates of the GDP through the expenditure approach in the "Monthly Bulletin of Statistics". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates since 1995 shown in the data tables have been prepared in compliance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the 1968 SNA. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, the differences are explained in footnotes to the relevant tables.

The estimates of the Gross Domestic Product and its components at constant prices are calculated each year, at the prices of the previous year, and presented in the tables as chained estimates at 2005 prices, to allow comparisons between non-consecutive years. Because of chaining, estimates for each category of the GDP do not add up to the total GDP.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated both through the expenditure and production approaches. The expenditure approach is considered more reliable, and thus a statistical discrepancy will balance the GDP estimated from the production approach. Annual series on domestic product by the income approach are also presented, although the aggregate is not obtained independently, since net operating surplus is derived by deducting from the GDP, at basic prices, compensation of employed persons, consumption of fixed capital and other taxes on production (net).

Expenditure Approach

General government consumption expenditure: The estimates for central government are based on the analysis of the Accountant General's reports, the budget provisions, and complementary data received from the Ministries of Finance and Defense, which provide monthly, quarterly, and annual reports. The quarterly data for the local authorities, national institutions, and non-profit institutions are based on data from alternative sources, mainly the NII's monthly wage data and the Treasury's monthly data on transfers to these institutions. Annual financial and budget accounts of local authorities and related institutions are used to prepare final estimates. Data on number of employees and hours worked are obtained from the ministries' and the NII's wage files and from the quarterly labor force surveys of the CBS. For the constant price estimates, wages and salaries are extrapolated using changes in the labor inputs. Purchases of goods and services are deflated by relevant components of the consumer or wholesale price index.

Private consumption expenditure: The main data sources for the components of household final consumption expenditure are: (i) Flow of goods and services: calculated on the basis of monthly data on quantities and consumer prices. The sources for monthly data on quantities are (a) for meat, fish, eggs, and fruits and vegetables; supply to the local market by the Agricultural Produce Marketing Board (about 90 % of total supply) and production for own use from agricultural surveys; (b) reports of Israel Electric Corporation (IEC) and fuel companies for electricity and fuel; (c) monthly surveys of the Central Bureau of Statistics (CBS) on the supply of durable goods to the domestic market and person-nights in hotels; and (d) reports of the Ministry of Health on the number of hospitalization days in commercial hospitals. Prices for electricity are obtained from the ISC. Prices for all the other items listed above are taken from the relevant prices collected for the consumer price indices.

(ii) Household expenditure survey (HES): Household expenditure survey (HES): This source is used for consumption of housing services, business and personal services, part of the food products for which data on quantity marketed are not obtained, and industrial products other than food products or fuel. Since 1997 the HES is conducted annually, in years before that each 5 years until 1992/93. The survey frame is the municipal tax (Arnona) file. Before 1997 the sample represented only urban households, and estimates for non-urban households were added based on the composition of these households. Since 1997 the sample also covers non-urban households.

The extrapolation and interpolation are based on indicators, such as domestic sales in the relevant industrial branches (3-digit) obtained from monthly industry surveys (see the summary methodology for production index) conducted by the CBS (around 20% of household consumption); VAT revenues from communication and recreational services; quarterly data on revenues from financial data collected by the CBS covering domestic transport, hotel, postal, private hospital, and broadcasting services; administrative data on floor area of completed dwellings updating the stock of dwellings; monthly data on number of departures and entries of Israeli residents from the Ministry of the Interior; and the import of consumer goods (around 13% of household consumption). The latter is measured on the basis of the classification of imported goods between consumer, capital, and intermediate goods mainly based on the results of the "Import Destination Survey" conducted in 1988, although the destinations for some important goods such as PC's, vehicles have been checked in recent years. Relevant components of producer and import price indices are used to derive volume extrapolators, and relevant consumer price indices are used to convert the volume measures into estimates at current prices.

(iii) Direct purchases by foreign residents in the domestic market and by Israelis abroad: Estimates are obtained from the "Travel" item in the Balance of Payments, after deduction of an estimate for business expenditures. Final consumption expenditure of NPISHs: Data are obtained from an annual survey of NPISHs which covers all NPISHs employing two or more employees. The survey sample includes about 2000 institutions - all large institutions and a representative sample of smaller institutions by purpose. Data on wages reported to the National Insurance Institute (NII) are used to derive preliminary estimates based on the annual survey.

Estimates of changes in inventories in agriculture, fuel and government strategic stocks are prepared by multiplying quantity changes in inventory stocks by their average prices. Regular quarterly and annual surveys are used to estimate inventory changes for industry and wholesale trade. The data obtained are adjusted to approximate the value of the physical change in stocks. The estimates of changes in inventories include the value of unsold production (mainly software and R&D) of the start-up companies, estimated on the basis of data on investments of the Venture Capital Funds in these companies.

Gross fixed capital formation in construction is calculated basing on quantitative data on the area under construction and average per unit costs; for the general government and public non-financial enterprises, financial data on construction carried out are used. The estimates of imported machinery and equipment are based on the foreign trade statistics using the customs tariff description to identify the relevant items, while estimates of locally produced goods are based on a monthly report of sales by product obtained from a sample of the producers. The estimates of exports and imports of goods and services are based on foreign trade statistics and balance of payments data.

Income Approach

Estimates of compensation of employees were obtained by summing up compensation of employees in each industry based on industry surveys such as the Manufacturing Survey. For industries where surveys were not conducted, estimates were based on administrative reports, such as: employers' reports to the NII or reports from the Accountant General. The estimate of consumption of fixed capital was calculated using the perpetual inventory method.

Production Approach

The table of gross domestic product by industry is prepared at basic prices. All taxes less subsidies on products are estimated at total economy level only and not by industry.

Agriculture, hunting, and forestry, Fishing - Output from Annual Census of Agriculture carried out by the Ministry of Agriculture and the CBS- Intermediate consumption is estimated (based on imports, domestic supply of fertilizer, etc.) - Wage data from the National Insurance Institute (NII). Preliminary estimates based on Monthly statistics on production of agricultural goods.

For mining and manufacturing (excluding diamond industry) the estimates are based on industrial surveys carried out annually. For years not covered by industrial surveys estimates are interpolated and extrapolated using current production indices. For the diamond industry the estimates, at current and constant prices, are obtained using data on imports and exports of diamonds of the various types. Estimates of the output are calculated for each type of diamond separately.

Estimates for Electricity, gas, and water supply are based on annual financial statements from the electricity company, gas companies, and on revenue data from VAT. Changes of value added, at constant prices, were obtained assuming fixed input-output ratios from the latest input-output table, and using indicators of the output: water output measured at cubic meters and electricity supplied at KWhours.

The estimates for construction are obtained by using the financial and quantitative data on the main components of the industry's output: investments in buildings and in other construction works (roads, pipe lines, railway tracks, cable laying and other building works) and construction for defense purposes. It was assumed that there was a constant ratio between input and output, at constant prices, in the main types of construction.

Estimates for Commerce, restaurants and hotels are based on annual Trade and Services surveys and Hotel surveys. For years not covered by annual surveys estimates are interpolated and extrapolated using current VAT indices, and indicators on tourism, such as Guest-nights in hotels.

Estimates for Transport, Storage and Communications are based on annual Trade and Services surveys. For years not covered by annual surveys estimates are interpolated and extrapolated using financial reports for some industries, VAT indices on revenue, or indicators such as data on kilometers traveled by taxis and trucks, loads hauled by ships, number of passengers in domestic airlines.

Estimates for the financing and insurance industries are based on consolidated reports prepared by the supervisor of banks and the supervisor of insurance.

Estimates for renting (including imputed rents in own-occupied dwellings) are based on benchmark estimate for residential rent, extrapolated by the change in the value of inventories of dwellings.

For other services, estimates are derived from a sample of income tax files, VAT revenue data and manpower data.

Italy

Source

The preparation of national accounts statistics in Italy is undertaken by the Istituto Nazionale di Statistica (Istat), Rome. The official estimates are published annually on the website (www.istat.it) and also published in the "Contabilità Nazionale" Yearbook. In 2003, a complete methodological inventory on GDP compilation for the benchmark year 1992 was submitted by Istat to EUROSTAT. This inventory describes in detail all methods applied in compiling the SNA accounts and exhibits numerical results. The update of the inventory, describing sources and methods for the last benchmark year (2000) estimates will be soon available. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Input-output tables have been published for the years 1959, 1965, 1972, 1975, 1982, 1985, 1988, 1992, and 2000. From 2005 are also available supply and use tables which refer to the time series 1995-2004. The estimates prepared according to the 1968 SNA are provided in the former national currency Italian lira. The following presentation on sources and method is based mainly on information contained in the "2003 Inventory on GDP compilation" submitted by the Istituto Nazionale di Statistica to Eurostat and on the updates of this document which will be published by International Institutions. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Italy the currency name for the data before 1999 is "1999 ITL euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 1936.27 Italian lira. - The name of the currency of the newly submitted data is "1999 ITL euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Italy, like for example all old data following the 1968 SNA is still in "Italian lira", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

The European System of National and Regional Accounts underlines the fact that the annual national accounts aggregates should be derived from an input-output framework. A complete coherence between national accounts and the input-output framework by means of Supply and Use Tables (SUT) should be guaranteed in reference to the year of estimate considered to be definitive. The Italian approach at the basis of the integrated estimate of the national accounts aggregates and of the supply and use tables is based on the analysis, correction and, finally, balancing of the discrepancies among the supply and use aggregates, independently estimated, and includes the construction of a constraint system that allows the simultaneous balancing of all the accounts and tables, which compose the supply and use tables framework at purchaser's prices and at basic prices. With the 2005 benchmark revision previous year prices calculations and chains' indices have been introduced for the constant prices evaluations.

Expenditure Approach

The expenditure approach relates to the estimates of final consumption, increase in stocks and exports and imports of goods and services. The private consumption estimates are obtained from a complex integration of different sources (the commodity flows method, households' budget survey, sales indicators in commercial businesses, multi-purpose survey, other quantity and price indicators by specific items). Households' budget quarterly survey covers 28,000 households by rotation with 7000 new families each quarter. Surveys carried out by the Banca d'Italia provide consumption data for non-resident households on the domestic market and for residents abroad. A similar approach, a complex integration of different sources (the commodity flows method, the expenditure method, quantity and price indicators by specific items), is used to estimate gross fixed capital formation. For General government the estimations are based on Government units data coming from the Rendiconto generale dello Stato, Other central government units budget reporting, Local government units budget reporting and/or profit and loss accounts and Social Security Funds budget reporting. For some local government units there exist specific Istat's surveys used for the calculation of the aggregates. The main statistical source used for estimating changes in stocks is the value added surveys conducted for all enterprises in the industrial construction, trade and transport sectors that employ more than 20 persons. The stocks relate to industrial products only. For construction and building, the Istituto Nazionale di Statistica conducts specific surveys such as surveys on residential buildings and on public works. The estimates of exports and imports of goods and services are based mainly on the balance-of-payments and foreign trade statistics. For the constant price estimates, most of the items of GDP by expenditure type are deflated by appropriate price indexes except for non market services (General Government and Non profit Institutions serving Households) for which output (quantity indicators) and input based methods are used. Government building depreciation is estimated as a certain percentage of the stock value at constant prices. Private consumption of own-produced food and stock increases of agricultural products are revalued at base-year prices. Gross rent is extrapolated by the number of dwelling units.

Income Approach

Income approach is applied for all the sectors of national economy but it can be considered suitable for the integrated approach to GDP estimates only for specific segments of the economy, namely the estimates of value added produced by non market industries and domestic services. Compensation of employees is estimated through use of the value-added survey and a survey carried out by the Ministry of Labour and Social Security for the industrial sector, minimum contractual wages and survey of the compensation of permanent employees for the agricultural sector, surveys and inquiries carried out by other institutes for the service sector and other indirect evaluation for sectors not covered by surveys. Information on operating surplus is obtained from the value-added surveys and from actual interest received and paid by the various sectors. Depreciation is valued on the basis of time series of gross fixed capital formation at constant prices by product and by branch of economic activity. Constant prices of 1970 are estimated by using the perpetual inventory method, assuming that the devaluation of the product is constant during its economic life. Estimates of indirect taxes and subsidies are obtained from government sources. Taxes linked to production and imports are broken down by branch according to the type of tax. Data on subsidies are classified by branch on the basis of the recipients indicated in the government budgets.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most of the industries. This is supplemented by the income approach for industries to which the value added surveys are applied. Statistics on agricultural production prices, etc. are derived from current agricultural surveys. Several surveys are presently carried out referring to Regional Agricultural Departments information and databases. Crop surveys of major products are conducted annually. Information on gross marketable livestock production is available separately for major items. For forestry, a quarterly survey supplies data on production and prices. Monthly surveys of products unloaded in Italian ports are used for estimating value added of fishing. For the industrial activity sector, the estimates are based on value added surveys and the product surveys. Two main annual business surveys conducted by Istat are the Survey of Economic and Financial Accounts (SCI) for enterprises with 100 or more persons employed and the Survey of Small and Medium Enterprises (PMI) for those with up to 100 persons

employed. These two structural business statistics (SBS) surveys are the main base of information for the economic activities in manufacturing and private services. The SCI is an exhaustive survey covering, since 1998, close to 10,000 enterprises. It collects data concerning profit and loss accounts, balance sheets, and employment. The results are available 18 months after the reference year. The PMI is a stratified simple random sample survey stratified by four-digit ATECO, region, and size class. The sample is about 108,000 enterprises or 2.8 percent of the target population. Grossing up is done on the basis of number of workers and number of enterprises. The main variables collected are the same as for the SCI. In addition, the industrial sector survey PRODCOM should be mentioned. The PRODCOM survey is conducted as a result of a EU regulation dating from 1993 and is directed at units belonging to the extractive and manufacturing industries. Included are all local units of enterprises of 20 workers and over, and a sample of the enterprises with three to 19 workers. The two-page questionnaire collects information by type of product on output and energy consumption in volume terms and, where appropriate, in values. Provisional data are available after six months, final data are available 18 months after the reference year. The surveys used for the manufacturing sector are also used for construction for the trade sector, the transport sector. Additional information is supplied directly by the relevant firms and public agencies. For the financial institutions, annual surveys are carried out which covers 97 per cent of the activity. Special calculations are made for institutions not covered. Estimates of the production of government services are based on data compiled by the Ragioneria generale dello Stato (for the input indicators related to civil servants) and data coming from surveys of the Istituto Nazionale di Statistica and other surveys, produced by other institutions belonging to the National Statistical System such as the Ministry of Health and the Ministry of Education and University, for the output methods (quantity indicators). Other market services are valued integrating SCI and PMI surveys with different sources like the results of family budgets surveys or the expenditure approach. For the constant price estimates, price deflation is used for community, social and personal services. Double deflation is used for all the other sectors. Output is either deflated by appropriate indexes or is extrapolated by quantum indexes while input is deflated by price indexes.

Source

Reply to the United Nations national accounts questionnaire from the Statistical Institute of Jamaica, Kingston. Official estimates and information on concepts, sources and methods of estimation utilized are published annually by the Department in "National Income and Product".

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

^a Does not include repair of motor vehicles, motorcycles, personal and household goods.

^b Includes public education, health and social work.

^c Includes private education, health, social work, and repairs to personal and household goods.

^d Excludes public education, health and social work.

^e At producer's prices.

^f Includes Financial intermediation services indirectly measured (FISIM) of Total economy

^g At the latter part of 1991 a system of Value Added Tax (GCT) was introduced; this replaced the majority of taxes on commodities. GCT, unlike the former taxes, does not form part of the valuation at producers' prices.

^g Excludes Value Added Tax.

Japan

Source

The preparation of national accounts in Japan is undertaken by the Economic and Social Research Institute of the Cabinet Office (former Economic Planning Agency), Tokyo. Official estimates are published in "Annual Report on National Accounts." The data for Japan was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Whenever the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following presentation of sources and methods is mainly based on information from "A System of National Accounts in Japan" published by the Economic and Social Research Institute. Input-output tables have been published by the Ministry of Internal Affairs and Communications (former Management and Coordination Agency).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach.

Expenditure Approach

Using the commodity flow method, output, intermediate consumption by industry, household final consumption expenditure, gross capital formation, exports and imports are estimated for each of approximately 2,200 commodities. Shipment estimates are derived directly or indirectly from statistics such as Crop Survey, Census of Manufactures, Current Production Statistics Survey, Establishment Census, and Census of Commerce. Distribution channels and constant coefficients such as the distribution ratios, transportation fee rates, and trade margin rates are decided for each of the commodities based on the information of the Input-output Table. Services produced and consumed by the producers of government services and private non-profit services to households are estimated separately based on the settlement of accounts of governments, on the Survey of Private Non-profit Institutions and other sources. Gross domestic expenditure is obtained by adding up final consumption expenditure, gross fixed capital formation, increase in stocks, and current external transactions. Exports and imports are estimated by the estimation method for external transactions, which rearranges the Balance of Payments Statistics in consideration of its consistency with the SNA. For final consumption expenditure of households, calendar-year figures are estimated by the commodity flow method.

Each commodity is classified into one of the elements of a 43-objects x 5-uses matrix. Each element of the matrix corresponds to one of the four types of expenditure. Quarterly figures are estimated by distributing the calendar-year figure through the combined figures of both supply side and demand side. Supply-side figures are estimated by a modified commodity flow method. (The number of commodities are aggregated into 90). Demand-side figures are estimated by source data such as the Family Income and Expenditure Survey, the Survey of Household Economy, and the National Survey of Family Income and Expenditure. For gross capital formation, quarterly figures are estimated in the same way as final consumption expenditure of households. The calendar-year figure is distributed into quarterly figures through the combined figures of both supply side and demand side. Sectoral figures are estimated by breaking down the calendar-year figures estimated by the commodity flow method, on the basis of sectoral figures estimated through the expenditure approach, which uses settlements of accounts of government, Financial Statements Statistics of Corporations by Industry and so on for gross fixed capital formation. For increase in stocks, Financial Statements Statistics of Corporations by Industry are mainly used.

Gross domestic product at constant prices is estimated by the chain-linked method (reference year: 2000). The minimum unit of price indexes is called a basic unit deflator, which corresponds to the approximately 400 commodities aggregated from the approximately 2,200 commodities used for the commodity flow method. Series at constant prices are obtained by dividing the nominal values of the 400 commodities by the basic unit deflators for each demand item. In other words, constant value is estimated using a chain-weighted Paasche-type deflator weighted by 400 commodities. Government services and private non-profit services to households at constant price are estimated using deflators by activities that correspond respectively to six activities of government services and two activities of private non-profit services to households.

Income Approach

Wages and salaries are estimated separately for the three groups of agriculture, forestry and fisheries, government services, and other industries. Concerning the other industries, quarterly cash allowances to employees by industries are calculated by multiplying the per-head wage by the number of employees. In this case, the number of employees is based on the "Population Census" conducted every five years and is interpolated midway through the five-year period by trends observed from the "Labor Force Survey," while the cash allowances per head are mainly based on the "Monthly Labor Survey." Cash allowances to officers are estimated by multiplying the number of officers by the difference between the per-head allowances of both officers and regular employees, which are obtained from the "Financial Statements of Corporations by Industry", and the per-head allowances of regular employees. Employers' contributions to social security schemes are estimated on the basis of the operational reports of these schemes. Employers' contributions to others and payments in kind are estimated on the basis of settlements of accounts of the central government and local governments data on taxation, business and housing survey data on payments for housing. The operating surplus is estimated through a production approach (value-added method) as a residual item, and is distributed to each institutional sector according to the ratios of operating profits to the total by type of income-earning subject (after inventory valuation adjustment). The ratios are estimated on the basis of statistical data such as "Financial Statements of Corporations by Industry." Consumption of fixed capital consists of loss from wear and tear (depreciation) and estimated damage from fire, typhoons, floods, and other accidents. Depreciation is estimated on the basis of "Financial Statements of Corporations by Industry", "Financial Statistics of Local Public Enterprises" and other sources. Accidental damage is estimated by making use of settlements of accounts of insurance companies and other entities. Indirect taxes and subsidies are estimated on the basis of settlements of accounts of central and local governments. Except for consumption of fixed capital, we do not calculate constant price data of the above-mentioned.

Production Approach

The gross domestic product by type of economic activity is prepared at market prices, i.e. producers' values. The output of each of the 83 industry groups is estimated from the "V" table (a make matrix for commodity by activity), of which total control is given as the output of the 2,126 commodities estimated by the commodity flow method. The intermediate input of each industry group is estimated from the "U" table (a use matrix for commodity by activity), in the base year which is compiled from "Input-output Table" and the "V" table, and from the "U" table in the mid-year, which is separately compiled from the information of the cost structure estimated for about □ to 15 items every year. The value added and its component items by industry are estimated by subtracting the intermediate input from the output. The output, intermediate input, value added and its component items by the producers of government services and by the producers of private non-profit services to households are separately estimated by using the settlement of accounts of government, survey of private non-profit institutions, and other sources. Gross domestic product by industry at constant prices is estimated by the double deflation technique. Output by industry is estimated from the "V" table at constant prices, which is obtained by dividing the output of each commodity by its output deflator. The intermediate input by industry is estimated from the "U" table at constant prices, which is obtained by dividing the intermediate input of each commodity by its input deflator.

^a Includes Financial intermediation services indirectly measured (FISIM).

^b Discrepancy between total economy and sum of domestic sectors since data by domestic sectors exclude the statistical discrepancy that links GDP by expenditure and GDP by production approach as displayed in Table 2.1.

^c Excludes the statistical discrepancy between expenditure-based and production-based GDP amounts.

The preparation of national accounts statistics in the Hashemite Kingdom of Jordan is undertaken by the Department of Statistics, Amman. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The most recent data have been provided by the Department of Statistics. The annual national account statistics are published in the annual Yearbook and on the DOS website www.dos.gov.jo.

General

The annual official estimates together with methodological notes are published in a series of publications entitled "National Accounts". A comprehensive description of the concepts and definitions underlying the various tables is contained in "The National Accounts 1976-2002", published in 2004 by the Department of Statistics. The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA). The latest Input-output tables were published in 1991 and there was no follow up until now. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated separately except private consumption expenditure which is estimated residually. The estimates of government final consumption expenditure are obtained from the records of the Ministry of Finance, National Planning Council and municipalities. Estimates of gross fixed capital formation of the private sector are obtained from the data of the surveys conducted annually. Construction activities are covered through three surveys; the surveys provide data on the buildings and other constructions. The data on the capital formation of the government sector is available from records of the Ministry of Finance. Estimates of increase in stocks are based on the stocks data obtained from the annual surveys. Gross domestic product by expenditure at constant prices is not estimated.

Income Approach

The sources and methods applied in estimating the cost-structure by components of gross domestic product are based on the breakdown of income estimates obtained from the annual surveys that cover most of the economic sectors. Separate estimates are made for incomes generated by the agricultural workers, income of skilled labourers, and for income from property and capital assets. Gross operating surplus (i.e. including consumption of fixed capital) is derived.

Production Approach

The estimates of gross domestic product by kind of economic activity are compiled at basic prices. The production approach is used to estimate the value added of all industries. Annual agricultural sample surveys are undertaken on a country-wide basis providing production estimates for crops. The quantities obtained from these surveys are valued at farm prices collected from the farmers through a monthly survey. Livestock estimates are obtained through sample surveys covering the organized farms and unorganized sector. The estimates of industrial production were based on the industrial surveys and censuses until 1998. In 1999 a general establishment census was conducted which provide frames for all economic surveys. The value added of private building constructions constructed by the unregistered contractors are derived from the cost estimates obtained from the complementary quarterly surveys, while value generated from constructing public and private constructions conducted by

registered contractors is obtained from the contractors surveys conducted annually. Annual sample surveys of wholesale and retail trade are conducted annually. For passenger and freight transport, the source of information is mainly the records of the authority or the corporation concerned. The transport activities are covered through two surveys; the first survey covers the organized sector which includes all establishments performing the activities of road, sea, air transport, in addition to post and telecommunications. Annual surveys are conducted annually to collect data on financial and insurance activities. For other services, data are provided from annual surveys covering all services activities. Gross domestic product by kind of economic activity at constant prices is estimated with a base year 1994; the data available for the period 1976-2003.

Kazakhstan

Source

Reply to the United Nations national accounts questionnaire from the State Committee of the Republic of Kazakhstan on Statistics and Analysis. The latest data for Kazakhstan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Kazakhstan has changed in 1993 from the Russian ruble to Kazakh tenge. One tenge equals 500 Russian rubles (see World Bank "Statistical Handbook for the States of the FSU, 1996"). Data in series 150 and 200 for 1990-1992 (1990-1993 for data at constant prices) were compiled in Russian rubles and converted to tenge. Starting 1993 (1994 for data at constant prices), data were compiled in tenge.

^b Data refers to financial intermediation only, excludes real estate, renting and business activities.

^c Excludes financial intermediation services indirectly measured (FISIM).

Kenya

Source

The national accounts are compiled and disseminated by the national accounts section of the Kenya National Bureau of Statistics. The definitions and concepts are based on United Nations System of National Accounts of 1993. Data are presented in millions of Kenya shillings. The Department adopted the SNA 1993 in 2005 and provided revision of National accounts statistics based on the new system (SNA 1993) back to 1996. The official estimates are published annually in the "Economic survey" and "Statistical Abstract". The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates are generally in accordance with the concepts, classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Accounts 1968 (1968 SNA). A full revision of previous estimates for the years 1996-2004 were published in 2005, implementing enhanced methods and new data sources for National Accounts estimates. A full revision of previous estimates for the years 1972-1975 were published in 1976, implementing improved methods and sources of estimation. Input-output tables for 1967 and 1971 were published in 1972 and 1976 respectively in "Input-Output Tables for Kenya". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. A combination of the commodity-flow and expenditure approaches is used to estimate gross capital formation. The estimates of government final consumption expenditure are derived from the accounts of the central and local government, the East African Community, the relevant statutory boards and the National Security Fund. All accounts are prepared on a cash basis. Private final consumption expenditure is made up of final consumption expenditure by households and by non-profit institutions serving households. This is derived in the commodity flows. Currently, changes in inventories are estimated only in a few commodity flows: For a few minerals, as a balancing item between output and exports; for crude petroleum and refined petroleum products, based on quantitative data on supply and use.

Gross fixed capital formation is derived in the commodity flows, which allow disaggregation by type of asset: Buildings and structures, transport equipment, other machinery and equipment, cultivated assets, and intangible assets. Estimates are also made of GFCF by general government.

Imports of goods and services comprise sales and grants of goods and services by non-residents to residents. Imports of goods are valued c.i.f in the source data as well as in the commodity flows. Total imports of goods are valued f.o.b. by deducting an adjustment for c.i.f./f.o.b. This is all considered to be imported freight and insurance services. The major source for imports of goods is customs data delivered by the Customs Department and processed by the CBS using the Eurotrace software. Separate commodity flows are compiled for each BEC-category. Re-exports are also available by BEC and are recorded as exports in the commodity flows.

Consumption of fixed capital is then estimated assuming a linear depreciation in the capital stock; for example, for an asset with a life span of 10 years, the capital consumption for a year is 10% of the value of the capital stock.

For Building and structures: 40 years. For Transport and machinery: 10 years. For Other machinery and equipment: 10 years. For cultivated assets: 10 years.

Exports and imports of goods and services are based on foreign trade reports and balance of payments estimates. For the constant price estimates, government expenditure on wages and salaries are extrapolated by an index of employment, while purchases of goods and services are deflated by various price indexes.

Income Approach

Wages and salaries paid in most industries are obtained from the annual surveys of employees and self-employed persons. Other sources include the integrated rural survey for small farms, logger licenses and wage rate for forestry, reports and special surveys for transport, government accounts for the government sector and annual questionnaires for the private non-profit services. Information on indirect taxes and subsidies is obtained from concerned enterprises and from government records. Operating surplus, including consumption of fixed capital, is obtained as a residual.

Production Approach

The Kenya National Bureau of Statistics (KNBS) maintains a central register of establishments (the business register). The Register serves as the frame on which surveys of the formal sector are based. Due to the dynamism of the economy, the rate of entry and exit of firms is high and this makes the tracking of the firms difficult. There is also a problem of non-response. In addition, the following new data sources, which were previously not used for the national accounts estimates, have been included: The 1997 Welfare Monitoring Survey (WMS 1997); The 1998 Labour Force Survey (LFS 1998); The 1999 National Micro and Small Enterprise Survey (MSE 1999); and The 1999 Population Census. A recent survey of manufacturing, carried out by Kenya Institute of Public Policy Research and Analysis (KIPPRA) has also been used.

The estimates for central government are based on accounting records, provisional budget and revised budget estimates published or unpublished. These records undergo a considerable amount of analysis before being used for national accounts compilation. Since the Government data are recorded in fiscal years, adjustments are made by taking the average of two fiscal years to represent the calendar year. The estimates for local government are based on accounts from local authorities gathered by the CBS. Constant prices are derived by extrapolation with employment numbers.

Agriculture: Estimates are product based instead of being based on data from agricultural holdings (establishments), and output data are derived from commodity flows. Growing of cereals and other edible crops is principally done by small-scale holdings, i.e. household enterprises. Therefore, benchmarks for production for own consumptions have been derived from household surveys (WMS 1997) and additional sources for marketed produce are used for maize, wheat, barley and rice. At present there are no estimates of hunting. Tea and coffee production are estimated from data on deliveries to respective marketing boards. Livestock production is measured from returns compiled by department of Livestock Production. Marketed milk data is obtained from the Dairy Board of Kenya and Kenya Co-operative Creameries (KCC). Marketed maize and wheat data is obtained from National Cereals and Produce Board and millers while an estimate of total production is obtained from the Ministry of Agriculture. Estimates of the small-scale farmers are based on the past bench mark data, which have been brought forward with indicators for large-scale farming. Intermediate consumption is based on data collected from agricultural suppliers. Constant prices are estimated by double deflation using price and volume data from the sources mentioned above.

Forestry: The Forestry Department supplies data on its wages and numbers employed, which are the basis for the estimates for forestry operated by government. The estimates for private logging are based on royalties and other payments from the private sector. Estimates at constant prices are derived from quantitative data on trees felled and areas planted. The non-monetary sector is estimated through extrapolation of an old benchmark (time use survey 1972) by the changes in rural population and by applying an average rural wage.

Fishing: Marketed output both at current and constant prices, are based on data from the Fisheries Department on

fish landed by quantities and values. Constant prices are derived using catches of the four major categories as volume indicators. Intermediate consumption is assumed to be 35% of output based on the 1998 Labour Force Survey. Unreported output (includes production for own-consumption) is assumed to be 10 per cent of market output.

Compensation of employees; A benchmark for 1998 has been calculated by multiplying average earning with an approximate number of employees based on the 1998 Labour Force Survey. Compensation of employees is assumed to have a fixed ratio to output.

Mining and quarrying: The estimates are based on data on production obtained from the Mines and Geology Department. These data include values and quantities of ores and minerals and are used for estimates of output and value added at current and constant prices.

Manufacturing: A benchmark estimate of output for 2001 (the base year) based on various sources and judgmental estimates is used. The ratio of intermediate consumption over output is estimated on the basis of KIPPRA survey data and other sources for some sub-sectors. Constant prices are calculated by extrapolation using volume index for manufacturing. Thus, single deflation is used assuming a fixed ratio of intermediate consumption over output. The Monthly Survey of Industrial Production (MSIP) collects data on quantities and value of output for major products. Current prices are then derived from constant values by reflating with various price indices, normally the same for output and intermediate consumption. However, for some sub-sectors the current estimates have been used as provided by the source data. Compensation of employees is calculated on the basis of the annual Labour Enumeration Survey (LES). Finally, 10% are added to take into account the social contributions. A commodity flow is compiled for each sub-sector. Exports are from the foreign trade statistics

Electricity and water: The annual reports of KPLC and KenGen contain both financial and quantitative data for all operators. These data are for financial years ending 30 June. Calendar years are calculated as the average of two adjacent financial years. Output at constant prices is calculated by extrapolation with the quantities sold broken down by the different categories of users. Compensation of employees (COE) for KPLC and KenGen is derived from the relevant items in the income statements. For IPP (Independent Power Producer), EPP (Emergency Power Producer) and REP (Rural Electrification Programme) COE is assumed to be the same ratio over output as for KenGen. Water: Central government includes services provided for rural water schemes, while local government is responsible for distribution of water to households, industries and other consumers. Sum of cost approach is used to compute the output at constant and current prices. Intermediate consumption is deflated by CPI, non-food excl. VAT. Compensation of employees is deflated with a salary index derived from earnings and employment in local government according to the LES. Water collection: all household without piped water are assumed to collect water. Output is computed as product of number of households, average time spent per day (WMS 1997), and earning per day (based on gazetted monthly basic minimum wage for Agriculture, unskilled labour under 18 years) for 360 days per year. Constant prices are calculated by multiplication with the minimum wage for the base year.

Construction: The estimates both at current and constant prices are based on the commodity flow approach. Imports sorted by Broad Economic Categories (BEC) include a category for industrial supplies, among which goods mainly used for input in construction have been identified. This is recorded as intermediate consumption by market producers with deduction of intermediate consumption by central government. Supply from domestic producers originates mainly in quarrying and certain sub-sectors of manufacturing. Additions have been made for inputs not typical for construction (for example fuel). A fixed ratio of value added to intermediate consumption at constant prices is used to derive output, value added and intermediate consumptions. Compensation of employees is based on the annual Labour Enumeration Survey. Current prices are then derived by reflating with the total building cost index. Own account construction: A benchmark for 2003 has been estimated separately for the two house types by multiplying the costs with number of households and dividing with the average life span. The cost for replacement of the roof for type 1) has been added. An addition of 10% has been made for the building of ancillary structures such as kitchens and latrines. Annual estimates at constant prices are derived by projecting with the annual growth of households. Current prices are derived by reflating: valued added with an

index based on the gazetted minimum wage for rural workers and intermediate consumption with the average of the building cost index for timber and hardware. Sum of cost approach is used for the government account.

Wholesale and Retail trade; repairs: Output is calculated as the sum of trade margins in the commodity flows both at current and constant prices. An addition of 10% is made for a likely underestimation of margins on goods sold for intermediate consumption and for services that are not included in the trade margins. Intermediate consumption is estimated at 54% of output (derived from 1999 SME survey). Repairs: Output. A benchmark for 2001 estimated by multiplying the number of cars with assumed average cost for repair and maintenance is extrapolated with the number of vehicles for the estimates of constant prices. Current prices are derived by reflation with CPI, transport. Intermediate consumption is estimated at 55% of output. Compensation of employees (including repair activities) is estimated by extrapolating with employment numbers then reflation with the gazetted minimum wage.

Hotels and restaurants: Hotels Output. The estimates are based on average room rates and volume indicators. Intermediate consumption is 65% of output both at current and constant prices. Compensation of employees is 45% of valued added. Constant prices are derived by deflation with the average of CPI, all items and the exchange rate for US Dollars. Restaurants output: A benchmark at constant prices is projected forwards with the volume index for hotels. Current prices are then derived by reflation with an index calculated as the average of CPI, food and CPI, alcoholic beverages. Intermediate consumption is assumed at 75% of output; 70% of this is assumed to be food. Compensation of employees is estimated at 80% of valued added. Informal sector: A benchmark for the year 1998 is based on the 1998 LFS. The annual increase at constant prices is assumed at 4% and CPI, all items is the deflator. Compensation of employees is estimated at 10% of valued added.

Transport and Communication: Estimates are done separately for railway, road passenger and freight, pipeline, water and air transport. In addition, estimations for harbours, airports, auxiliary transport activities and communication are provided. Railway transport: All the necessary data are available from the income statement provided by Railway Corporation. Various volume indicators are used to derive constant estimates. Intermediate consumption at constant prices is assumed to move with output. Road passenger: Estimates are based on 2001 benchmark output for 2001 (matatu industry). The annual increase at constant prices is assumed to be equal to the population growth while current prices are derived by reflation with CPI, transport. Intermediate consumption is assumed at 58% of output both at current and constant prices. A benchmark estimate of output for 2001 is based on annual survey of transport (taxis, buses, tour operators). Freight transport: A benchmark estimate of output for 2001 is estimated on the basis of an indirect indicator, the sales of diesel. Ratios of intermediate consumption and compensation of employees over output are according to annual survey of freight transport. A volume index is calculated as a straight average of the quantities of diesel sold and trade margins at constant prices. For transport via pipeline all necessary data is available from the Kenya pipeline company. Water transport: Estimates are based on annual survey of transport. For the estimates at constant prices a volume index is used, calculated as the average of employment and net registered tonnage. All necessary data are available from Kenya Ports Authority on the activities at the harbours. Constant price estimates are calculated using a volume index which is computed as a weighted average of number of ships (25%), tonnes of exports (15%), and tonnes of imports (60%). Intermediate consumption at constant prices is assumed to follow output.

Communication: Information contained in the respective companies' annual reports and surveys are used to generate the required variables. Relevant CPI indices are used to deflate.

Financial Intermediation: Current price data on financial intermediaries are timely and detailed. Questionnaires are sent out to financial institutions and the response is complete. Annual reports of all the companies are used as a complimentary data source. Estimates of insurance companies, agents and brokers are based on wages and salaries obtained from the employment survey. Constant prices for both financial intermediaries and insurance are derived by deflating with CPI non-food excluding VAT. Output of insurance services at constant prices is calculated by volume extrapolation (employment index adjusted by 1% for productivity)

Real Estate, Renting and Business services: The estimates are based on the number of households in different

types of houses according to the 1989 and 1999 population censuses. Rental values are either obtained from price collection or imputed. Output is calculated by multiplying the rental values with the number of households in each category. Constant prices are calculated by projection with the number of households. Intermediate consumption is estimated at 10% of output for modern houses and 5% for other houses. No intermediate consumption is calculated for traditional houses. Renting and Business services: The estimate based on benchmark is projected at constant prices with a volume index calculated as changes in employment (LES) with an addition for an annual increase in productivity with 2%. Intermediate consumption is estimated at 28% of output and Compensation of employees at 60% of value added.

Government account: Output is calculated as sum of costs. Constant prices estimates as the sum of costs: Intermediate consumption is derived by deflation with CPI, non-food excluding VAT. Compensation of employees is extrapolated with employment in the public sector according to LES. Public administration and defense: Three sub-sectors of government public administration and defense services: central government, local government, and social security institutions and output is based on sum of cost approach. Output at constant prices as the sum of costs: Intermediate consumption is derived by deflation with CPI, non-food excluding VAT. Compensation of employees is extrapolated with employment in the public sector according to LES (Government services; Law and order; Defense; and Other public administration).

Education: Private sector (Primary and secondary education): The estimates at current prices are based on the number of private schools. Output at current prices is calculated as the sum of intermediate consumption and compensation of employees. Consumption of fixed capital and surplus are ignored. Compensation of employees is calculated as the percentage of private and secondary schools, of the government schools, is multiplied with the compensation of employees in government schools. Intermediate consumption is assumed at 30% of compensation of employees. Output at constant prices is calculated by extrapolation with enrolment numbers with a higher weight for a secondary school student. Intermediate consumption is deflated with CPI, non-food excluding VAT. Tertiary education (Private): The estimates at current prices are based on enrolment numbers in private teacher training colleges, technical schools and universities. The average cost per student is assumed to be 10% higher than in the public counterparts. Output at current prices is then calculated as the sum of intermediate consumption and compensation of employees. Consumption of fixed capital and operating surplus is ignored. Output at constant prices is calculated by extrapolation with enrolment numbers. Intermediate consumption is deflated with CPI, non-food excluding VAT. Government (some of cost approach is used): The major part of government schools are sponsored by the Teachers' Salary Commission. This is a statutory body, which pays the salaries. Local authorities also operate some schools. Central government operates teachers' training colleges and some technical schools. The universities are statutory bodies that are controlled and mainly financed by central government

Health and social work: Private sector: Based on 1996 output, the constant price output is brought forward with employment numbers according to the annual Labour Enumeration Survey (LES). CPI, medical services is used for reflation. Intermediate consumption is assumed at 30% of output at constant prices and reflatd with of CPI, non-food excluding VAT and CPI, medical services. Compensation of employees (a benchmark based on 1998 LFS) is brought forward with employment numbers and the CPI, non-food. Government: Public health facilities are operated mainly by central government but some health activities are also carried out by local government. Output at constant prices is calculated as the sum of costs: Intermediate consumption is derived by deflation with CPI, non-food excluding VAT. Compensation of employees is extrapolated with employment in the public sector according to LES.

Other services: Private: Estimates based on 2001 benchmark for output. At constant prices, this is projected with a volume index calculated as changes in employment according the annual Labour Enumeration Survey (LES) with an addition of an annual increase of 2% in order to take changes in productivity and the informal sector into account Intermediate consumption is estimated at 34% of output and Compensation of employees at 60% of value added. Government (sum of cost approach): Minor activities are carried out by central government in field of culture. The major part includes the activities of local government in the fields of sewage and refuses collection. Output at constant prices is calculated as the sum of costs: Intermediate consumption is derived by deflation with

CPI, non-food excluding VAT. Compensation of employees is deflated with a salary index.

Domestic services: A benchmark has been calculated for 1998. Number of persons employed in domestic work is available from the 1998 Labour Force Survey and has been multiplied with the gazetted minimum wage for a general labourer, other municipalities. Employment is assumed to have increased with 2% per year since 1990 and the average salary to change with the gazetted minimum wage. Meals during work are assumed at 40% of the wages at constant prices; this is reflatd with CPI, food.

Reply to the United Nations national accounts questionnaire from the Planning Office, Ministry of Finance, Tarawa.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts (SNA) so far as the existing data would permit. It should be noted that the estimates for 1972-1974 include data for Tuvalu (former Ellice Islands).

Korea, Republic of

Source

The preparation of annual national accounts statistics in the Republic of Korea is undertaken by the Economic Statistics Department at the Bank of Korea (BOK), the central bank located in Seoul. The official estimates are published annually on the internet (<http://ecos.bok.or.kr>), as well as in "National Accounts". The data provided to UNSD was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The official estimates and methodological notes on sources and methods are published annually by the Bank of Korea (BOK) in "National Accounts". Input-Output tables have been compiled and published by BOK as well. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Original estimates at constant prices are currently based on the year 2000.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled. Input-Output tables are currently not compiled annually but at a lower frequency.

Expenditure Approach

For final consumption expenditure by household, the estimates are mostly obtained by means of the commodity flow method using Input-Output tables. The estimation of some items such as grains, meat, tobacco and motor cars, however, are compiled directly. The sources of data include industrial output data by commodities, data on foreign trade by commodities, statistics on agricultural produce, motor cars sales statistics and others. The estimates of final consumption expenditure by general government are derived from government fiscal data.

For gross fixed capital formation in construction, the values are derived from data on construction and agriculture output. The estimates of facilities and intangible fixed assets are based on commodity flow method and converted to current price estimates using producer price index and output deflator by commodities.

For change in inventories, commodity flow method is largely used for inventories of distribution, agricultural goods and ships. On the other hand, increase in inventories of mineral and manufactured goods, livestock products, crude oil and buildings are compiled directly using various data from relating industry.

The estimates of imports and exports of goods and services are based on balance of payments. For the constant price estimates, price deflation is used for final consumption expenditure by general government, imports and exports of goods and services. The values of final consumption expenditure by household and gross fixed capital formation are based on constant value of production, imports and exports and change in inventories.

Income Approach

The estimates of compensation of employees and consumption of fixed capital are compiled on the basis of the accounting records of the various entities by industry. For taxes and subsidies on production are broadly derived from tax statistics. Operating surplus is basically derived as a residual item.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate the value added of most industries.

The value added of agriculture is obtained by deducting the cost of all inputs from the output value which are estimated by multiplying the quantities of production by the corresponding prices. The source data are supplied by the Ministry of Agriculture & Forestry. The financial data contained in the "Yearbook of Agriculture and Forestry Statistics" are used to obtain the value added of agricultural services. The value added of forestry and that of fisheries are obtained by multiplying the value of production by the value added ratio calculated from the Input-Output tables.

Value added data of the mining and manufacturing are estimated by applying the value added ratio to current value of output. Value added ratios are calculated from the Input-Output tables and the financial statement analysis of enterprises. For mining, the values of output are estimated by multiplying quantity data of production which are obtained from statistics on mining products by unit prices collected from mineral products sales statistics.

Value added of electricity, gas and water supply is derived from the financial records of concerned enterprises.

Value added of the construction is obtained by multiplying the construction output of each sector by a corresponding value added ratio. The construction output is estimated by multiplying total floor area by construction unit cost for the private and public sector, derived from fiscal data. The construction unit cost and value added ratio are calculated from the Input-Output tables.

Value added of the trade is estimated by multiplying total mark-up by the value added ratio calculated from the Input-Output tables. For restaurants and hotels, value added is extrapolated from the base year value added by volume indicators and revalued at current prices.

Value added of railway and air transportation and communication is derived directly from the respective financial data while for other transportation and storage, the estimates are extrapolated using the rate of increase in the service activity index.

The value added of financial intermediation and real-estate is obtained from financial data and taxation data, respectively. For business services, value added is estimated by multiplying output data which are based on the service activity index by the value added ratios. For the private services, estimates are calculated in a similar way to business services. The sources of data include Statistical Yearbook of Education and Yearbook of Public Health and Social Statistics.

For the constant price estimates, double deflation method is largely used. Current price output and intermediate consumption data are deflated by appropriate price indexes such as the consumer price index, the producer price index and the import deflator.

Source

Reply to the United Nations national accounts questionnaire from the Central Office of Statistics, Ministry of Planning, Kuwait City. Official estimates are published by the same Office in "National Accounts Statistics". This is the twenty-second issue of the annual publication entitled "National Accounts Statistics" which presents time-series estimates of principal national accounting aggregates and their components. This publication presents the estimates for the years 1995 to 2002.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Estimates refer to calendar year. For the purpose of deriving estimates on a calendar year basis, government accounts were readjusted from fiscal to calendar year using closed accounts for fiscal years and periodic (monthly) statements of actual expenditure. For establishments in the petroleum sector which follow the fiscal year for their accounting, estimates were made for calendar year on the basis of data available for production, sales, exports, salaries and wages, materials purchased, capital formation etc. Basic data for most of the other enterprises and foreign trade statistics were available for calendar years.

Imputed bank and insurance service charges have been derived on the basis of actual data made available by the survey that carried out and special questionnaires that sent to these banks and insurance companies.

Methodology:

Overview of GDP Compilation

Basic data for the compilation of national accounts were drawn from the following sources: a) Annual Survey of Establishments, conducted by the Central Statistical Office (CSO) for the years 1995 to 2002; b) Annual Survey of Holdings, 1994-95 to 2001-2002; c) Closed Accounts of the Government, Ministry of Finance, 1994-95 to 2002-2003; d) Periodic (monthly) Statements to Actual Expenditure, 1994-95 to 2002-2003; e) Annual Foreign Trade Statistics, 1995 to 2002; f) Balance of Payments Estimates, Central Bank of Kuwait, 2000 to 2004; g) Annual Reports of the Central Bank of Kuwait, 1995 to 2002; h) Survey Results Income, expenditure and consumption, 1999-2000; i) Annual Statistical Abstract, CSO, 1995 to 2002; j) Consumer Price Index Numbers, Revised Series, (1995=100) 1995-2002; k) Wholesale Price Index Numbers, Revised Series, (1995=100) 1995-2002; l) Annual Reports of Ministries/Departments of the Government, 1995 to 2002; m) Annual Reports of various share-holding companies, 1995 to 2002. Estimates of GDP at constant prices are available by kind of activity and by type of expenditure.

The year 1995 has been taken as base for constant price estimates. The constant price estimates have been derived from current price series by deflation or by extrapolation on the basis of physical indicators

Expenditure Approach

Government final consumption expenditure 'Government' excludes the industrial activities such as generation and distribution of electricity, production and supply of water, communications, ports and crude petroleum production, marketing etc., which are undertaken directly by the various departments/ministries of the government, government enterprises and public corporations. Government final consumption expenditure is obtained as the sum of compensation of employees, intermediate consumption of goods and services and consumption of fixed capital less sales of 'other goods and services'.

Private final consumption expenditure estimates presented here are obtained as residuals from total GDP after allowing for all other components.

Exports of goods and services include in addition to exports as recorded in foreign trade statistics, various services rendered by resident producers to agencies outside in the form of freight, insurance, travel, transportation etc. It also includes purchases in the country by extra-territorial organisations such as embassies and non-resident persons. Imports of goods and services include in addition to the value of goods imported or recorded in the foreign trade statistics, travel, transportation and direct purchases abroad by government and residents of the country. The relevant estimates for the services components for exports and imports are taken from balance of payments statistics compiled by the Central Bank of Kuwait with a downward adjustment for the item – government services (debit). This item which refers to the payment of consultancy services, expenditure of Kuwaiti embassies abroad etc. was to be overestimated in the Balance of Payments statistics. The figures of imports of goods and services presented in this publication are therefore lower than those in the previous issues of this publication.

Regarding GDP by type of expenditure at current prices, estimates concerning government final consumption expenditure, exports and imports of goods and services are obtained from firm data and hence are more reliable than other components. For gross fixed capital formation, the portion concerning government services and government enterprises can be considered accurate as they are based on closed accounts but for private gross fixed capital formation assumptions had to be made. Estimates for changes in stocks are based on the results of the years 1995 to 2002. Gross capital formation has been obtained as a residual and is bound to be affected by the lack of reliability in the estimates of other components.

Production Approach

GDP at producers' values is obtained as the difference between gross output valued at producers prices (that is, at prices prevailing at the units) and value of goods and services consumed in the process of production at purchasers' prices (that is, at prices paid by the purchaser).

Estimates of GDP at current prices reflect changes in quantities as well as prices of outputs and inputs. In studies on economic growth, interest mainly centers around the changes that take place in the volume of goods and services produced, that is, in real product measures. In constant price estimates, price effects are isolated so that the figures represent only changes in the physical volume of goods and services produced. The year 1995 has been taken as base for constant price estimates. The constant price estimates have been derived from current price series by deflation or by extrapolation on the basis of physical indicators

Estimates of GDP originating from activities such as electricity and gas, water, communications, public administration and defence, governmental education, health, social, community, recreational and cultural services are based on data from the closed account of government besides of changing the methodology of estimating of GDP of electricity and water depending on the actual cost of production not on the revenue as in the previous method. With respect to data of real estate depends on services publication also the results of the survey of income, expenditure and consumption of households that carried out 1999-2000.

The base year for the compilation of constant prices estimates has been shifted from 1984 to 1995, 2000. Timeseries data on GDP at constant (1995, 2000) prices show the changes in value added due to change in volume of production. Public sector include producers of government services and producing units completely owned by the government such as electricity generation and distribution, water production and distribution (except water tankers), communication (post, telephone and telegraph), port public authority, Shuaiba Board, Civil Aviation Department, Kuwait Petroleum Corporation, and its subsidiaries, Kuwait Airways etc.

Indirect taxes are defined as taxes chargeable to the cost of production sale of goods and services. The include (a) import and export duties, (b) excise, sales, entertainment and turnover taxes, (c) real estate and land taxes, (d) motor vehicle, driving test, license, airport and passport fees when paid by the producers and (e) the operating

surplus of government fiscal monopolies on such items as tobacco. Import duties are levied on the output of foreign producers, hence they are not shown by kind of activity but as a separate item in the tables. Other indirect taxes are distributed by kind of activity.

Imputed bank and insurance service charges have been derived on the basis of actual data made available by the survey that carried out and special questionnaires that sent to these banks and insurance companies.
