

**Department of Economic and Social Affairs
Statistics Division**

**NATIONAL ACCOUNTS
STATISTICS: MAIN AGGREGATES
AND DETAILED TABLES, 2008**

PART IV

**UNITED NATIONS
NEW YORK, 2009**

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which Members States of the United Nations draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and helps build national capacities through technical assistance.

NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas.

INTRODUCTION

1. This is the fiftieth issue of *National Accounts Statistics: Main Aggregates and Detailed Tables*^{1,2} showing detailed national accounts estimates for 193 countries and areas for the reporting years 1997 to 2008. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical offices. It is issued in accordance with the recommendation of the Statistical Commission at its first session³ that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

THE NATIONAL ACCOUNTS QUESTIONNAIRE

2. This publication is the tenth issue based on the United Nations National Accounts Questionnaire (NAQ) introduced in October 1999, which in turn is based on *the System of National Accounts 1993 (1993 SNA)*⁴.

3. The 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts (1968 SNA)*⁵, the Council in its resolution 1993/5 of 12 July 1993 recommends that Member States use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that Member States consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool. In 2003 the United Nations Statistical Commission (UNSC) called for an update of the 1993 SNA. The first 17 Chapters of the 2008 SNA, comprising the accounting rules, the accounts and tables, and their integration was approved by the UNSC in 2008; Chapters 18 to 29, comprising the interpretations and extensions of the accounts and tables of the System, was approved by the UNSC in 2009. The updated SNA, called *The System of National Accounts 2008*⁶, or in short the 2008 SNA, was finalised in September 2009. It is expected that countries would start compiling national accounts data according to the 2008 SNA by 2010.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the United Nations Regional Commissions, has designed the United Nations National

Accounts Questionnaire (NAQ) based with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the United Nations Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UNSC has agreed that the scope and pace of the implementation of the 1993 SNA must be decided by each country according to its analytical and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

SCOPE OF THE QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditure in current and constant prices and on the relations among product, income, saving and net lending aggregates.

6. Part II (Tables 2.1 to 2.3) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities, Rev. 3 (ISIC Rev. 3)⁷ either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O) or as single tabulation categories (A to P) (one-digit level of ISIC). Only in the case of categories A and I information at the two-digit level is requested for divisions 01, 02, 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according to the Classifications of Expenditure According to Purpose⁸. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10

divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure by households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC)⁹. For the individual consumption expenditure by non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure by general government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.9) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e. the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Table 5.1) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 as indicated in Part II above.

10. Countries are requested to update the data tables and complete them as comprehensively as possible. The tables are listed below :

Part I: Main aggregates

Table 1.1 Gross domestic product by expenditures at current prices

Table 1.2 Gross domestic product by expenditures at constant prices

Table 1.3 Relations among product, income, saving and net lending aggregates at current prices

Part II: Domestic production by industries

Table 2.1 Value added by industries at current prices

Table 2.2 Value added by industries at constant prices

Table 2.3 Output, gross value added and fixed assets by industries at current prices

Part III: Classifications of expenditure according to purpose

Table 3.1 General government final consumption expenditure by function at current prices

Table 3.2 Individual consumption expenditures at current prices

Part IV: Integrated economic accounts

Table 4.1 Total economy (S.1)

Table 4.2 Rest of the world (S.2)

Table 4.3 Non-financial corporations (S.11)

Table 4.4 Financial corporations (S.12)

Table 4.5 General government (S.13)

Table 4.6 Households (S.14)

Table 4.7 Non-profit institutions serving households (S.15)

Table 4.8 Combined Sectors: Non-Financial and Financial Corporations (S.11 + S.12)

Table 4.9 Combined Sectors: Households and NPISH (S.14 + S.15)

Part V: Cross classification of gross value added by industries and institutional sectors

Table 5.1 Cross classification of gross value added by industries and institutional sectors

11. It should be noted that the NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it is mainly serves to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly the one-digit level of ISIC instead of the two-digit level of ISIC.

COLLECTION OF DATA

12. To collect the large volume of national accounts data, the Statistics Division annually sends a pre-filled NAQ to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical offices and from national source publications. Countries are also requested to provide a brief overview of the sources and methods to compile their national accounts.

13. In order to lighten the reporting burden of countries to different international and regional organizations the UNSD receives data from the Statistical Office of the European Commission (EUROSTAT), the Organisation for Economic Co-operation and Development (OECD), the United Nations Economic Commission for Europe (ECE) and the Caribbean Community (CARICOM) on behalf of their constituents. The UNSD, EUROSTAT and the OECD have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), all OECD countries submit data either to EUROSTAT or OECD but need not provide duplicate submissions. Member States of OECD which are not members of the European Community complete a sub-set of the ESA 1995 questionnaire. The ECE provides data for transition economies. CARICOM uses the NAQ to collect data from its Member States and provided it to UNSD. As a result, the United Nations questionnaire based on the 1993 SNA is sent to less than 160 countries, areas, and territories out of the 235 (of which only 193 have provided sufficient data to be published) included in the UNSD National Accounts database.

14. In order to create a comprehensive database based on the 1993 SNA, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database.

CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

15. The form and concepts of the statistical tables in the present publication generally conform to the recommendations by the 1993 SNA. A summary of the conceptual framework and definitions of transactions is provided in chapter I of the present publication.

16. Although the NAQ collects data in the 1993 SNA format, countries may still use the 1968 SNA (or in some rare cases the 1953 SNA) guidelines to compile their national accounts. The UNSD evaluates the status of the conceptual adherence to the 1993 SNA from time to time.

17. The Series note at the top of each table indicates which SNA version is used by the given country to compile their national accounts. Series numbers below 100 relates to data according to the 1968 SNA data and series numbers 100 and above relates to data according to the 1993 SNA. Whenever 1968 SNA data are not replaced backwards for all years by a series of 1993 SNA data, the 1993 SNA data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or

statistical reasons from the definitions and classifications recommended by the 1993 SNA, a footnote is attached to the relevant tables.

18. In the tables with constant price data (Table 1.2 and Table 2.2), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is chain linked volume series. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use chain linked volume series but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e. the total is not equivalent to the sum of its components. Also, constant price data, which are scaled up or down to a certain reference year in order to allow international comparison, are not additive.

19. In the present publication, the data for each country or area are presented in separate chapters, in alphabetical order, under uniform table headings and classifications of the 1993 SNA. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series note at the top of each table indicates the type of fiscal year used for any given series.

COMPARABILITY OF THE NATIONAL ESTIMATES

21. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted that the country notes not only refer to the latest data covered in this publication but to the country in general.

REVISIONS

22. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

NOMENCLATURE

23. The information for the countries and areas shown in this publication reflect what is available to the UNSD as of August 2009. Updated national accounts data are usually provided by countries to the UNSD between January and July. Data for the year 2008 is currently available for 66 countries and areas.

24. Designations, which have changed in years represented in this yearbook (1997 to 2008), are as follows:

Hong Kong - Pursuant to a Joint Declaration signed on 19 December 1994, the United Kingdom restored Hong Kong to the People's Republic of China with effect from 1 July 1997; the People's Republic of China resumed the exercise of sovereignty over the territory with effect from that date. However, China is published in this yearbook in three sections: China; China, Hong Kong; and China, Macao. The data for China excludes the special administrative regions of Hong Kong and Macao.

Zaire - All data for the former Zaire are shown under the country name of Democratic Republic of the Congo.

Serbia and Montenegro – The state union of Serbia and Montenegro dissolved in June 2006. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. Available data are shown for the individual republics.

Tanzania – The data for Tanzania is published in two parts in this yearbook: mainland Tanzania and Zanzibar. Note that the data listed under Tanzania does not include Zanzibar.

SYMBOLS AND DATA DISPLAY

25. The following symbols have been employed:

Data not available..... [...]
Magnitude nil or less than five percent of the unit employed..... [0.0]
Decimal figures are always preceded by a point [.]

26. Each series version is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series version is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series note at the top of each table informs about the SNA version applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

27. Decimals in tables do not necessarily add to totals shown because of rounding.

GENERAL DISCLAIMER

28. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

29. Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation “country” appears in the headings of tables, it covers countries, territories, cities or areas

I. SYSTEM OF NATIONAL ACCOUNTS

1. The origins of the System of National Accounts (SNA) trace back to the 1947 Report of the Sub-Committee on National Income Statistics of the League of Nations Committee of Statistical Experts under the leadership of Richard Stone¹. At its first session in 1947, the United Nations Statistical Commission emphasized the need for international statistical standards for the compilation and updating of comparable statistics in support of a large array of policy needs. Specifically, the Commission recommended that the United Nations Statistical Office, in consultation with the interested specialized agencies, should work on guidelines for national accounts statistics (national income and expenditure), taking into consideration best practises and international comparability². In view of the emphasis on international statistical standards, the first national accounts standard was produced and published in 1953. The SNA was subsequently revised and updated in 1960, 1964, 1968 and 1993. In 2003 the United UNSC called for an update of the 1993 SNA. The System of National Accounts 2008³, (in short the 2008 SNA) was finalised in September 2009. This chapter describes the concepts and definitions of the SNA as recommended by the 1993 SNA.

A. THE SNA AS A SYSTEM

2. The System of National Accounts (SNA) consists of a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA includes an external account

that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyse the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic product (GDP), that are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to

describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to chapter II of the 1993 SNA for a comprehensive overview of the System.

1. The sequence of accounts

Current accounts

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

Production account

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

Distribution and use of income accounts

8. These consist of a set of articulated accounts showing how incomes are:

Generated by production

Distributed to institutional units with claims on the value added created by production

Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes

Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from

production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward into the capital account, the first in the System's sequence of accumulation accounts.

Accumulation accounts

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).

The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.

A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

Balance sheets

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever

any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

2. *Activities and transactions*

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly the main sectors of the economy for which it is possible to compile the full sequence of accounts summarized in the previous section. Two main kinds of institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analysed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V of the 1993 SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the

economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the 1993 SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

1. Supply and use tables

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

2. Price and volume measures

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modelling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as targets for the formulation of economic policy-making. They are an essential part of the System, especially given the emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

1. The production boundary

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

Household production

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

- (a) The production of agricultural goods by household enterprises for own final consumption;

(b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc;

(c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the production of personal and domestic services by members

of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

Other production boundary problems

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

2. The consumption boundary

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the estimated values of the agricultural products consumed by

households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

3. The asset boundary

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

4. National boundaries

29. The accounts of the System are compiled for resident institutional units grouped into institutional

sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high-inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total

economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

1. Specific uses

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

Monitoring the behaviour of the economy

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

Macroeconomic analysis

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different economic variables by applying econometric methods to time series of data at both current and constant prices compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

Economic policy-making and decision-taking

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data. The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees.

Such agencies typically require very detailed national accounts data.

International comparisons

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by

most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

2. Flexibility of implementation and use

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the 1993 SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the 1993 SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the 1993 SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

3. The SNA as a coordinating framework for statistics

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind revisions of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the 1993 SNA, the harmonization process has been particularly effective in respect of balance of

payments statistics, government finance statistics and money and banking statistics, for which the IMF has responsibility. Revisions of each of these three systems are being undertaken by the IMF in order not only to update these systems but also to make them consistent with the 1993 SNA to the fullest extent possible. Revised manuals on these systems are being published at about the same time as, or in the years immediately following, the 1993 SNA.

48. Various other revised international guidelines are being issued at about the same time as the 1993 SNA. These include the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the 1993 SNA. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the 1993 SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

1. Final consumption, intermediate consumption and gross fixed capital formation

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption, whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

Training, research and development

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

Education

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practising - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

Repairs, maintenance and gross fixed capital formation

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or

prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

2. Interpretation of the distinction between consumption and gross fixed capital formation

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain

expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

Acquisitions

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

Actual final consumption of general government

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.

Actual final consumption of households

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

Actual final consumption of NPISHs

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

Additivity

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

Base period

The period that provides the weights for an index is described as the base period.

Basic price

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

C.i.f. price

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

Capital transfers

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred.

Chain indices

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

Changes in inventories (including work-in-progress)

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

Compensation of employees

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

Constant prices

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in “constant price terms”).

Consumption good or service

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

Consumption of fixed capital

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

Current transfers

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.

Deductible VAT

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

Disposals

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

Export subsidies

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

Export taxes

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

Exports of goods

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

Exports of services

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

F.o.b. price

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

Factor cost

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

Final consumption

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

Final consumption expenditure of government

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

Final consumption expenditure of households

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by

resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

Final consumption expenditure of NPISHs

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

Financial intermediation services indirectly measured (FISIM)

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

Fixed assets

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

Goods

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

Gross

The term “gross” is a common means of referring to values before deducting consumption of fixed capital (generally used as in “gross capital stock” or “gross domestic product”).

Gross capital formation

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

Gross domestic product - expenditure based

Expenditure-based gross domestic product is total final expenditures at purchasers’ prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

Gross domestic product - income based

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

Gross domestic product - output based

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross domestic product at market prices

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

Gross fixed capital formation

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.

Gross national disposable income

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Gross national income (GNI)

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

Gross saving

Gross saving is gross disposable income less final consumption expenditure.

Gross value added

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Gross value added at basic prices

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

Gross value added at producers' prices

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

Import duties

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

Import subsidies

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

Imports of goods

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

Imports of services

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

Indirect taxes

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term “indirect taxes” is not used in 1993 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

Intermediate consumption

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

Inventories

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

Invoiced VAT

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

Market prices

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

Mixed income

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

Net

The term “net” is a common means of referring to values after deducting consumption of fixed capital (generally used as in “net capital stock” or “net domestic product”); it should be noted, however, that the term “net” can be

used in different contexts in the national accounts, such as “net income from abroad” which is the difference between two income flows.

Net income from abroad

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

Net lending

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as “net borrowing”.

Net national disposable income

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Net national income

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

Net saving

Net saving is net disposable income less final consumption expenditure.

Net value added

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Non-deductible VAT

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

Non-financial assets

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

Non-produced assets

Non-produced assets are non-financial assets that come into existence other than through processes of production.

Non-profit institutions serving households (NPISHs)

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

Non-resident

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

Operating surplus

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called “mixed income”).

Other subsidies on production

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (eg, subsidies on payroll or workforce or subsidies to reduce pollution).

Other subsidies on products

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1)

subsidies on products used domestically, (2) losses of government trading organisations, and (3) subsidies to public corporations and quasi-corporations.

Output

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

Producer's price

The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

Property income

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

Purchaser's price

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Resident

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

Services

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realised by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

Stocks

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as “inventories” in the System).

Subsidies

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

Taxes and duties on imports

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

Taxes on production and imports

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

Taxes on products

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a

result of their use for own consumption or own capital formation.

Transfer

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

Valuables

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

Value added - gross

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Value added - net

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Value added tax (VAT)

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

II. COUNTRY TABLES

Republic of Moldova

Source

The national accounts of the Republic of Moldova are produced by the Division for Macroeconomic Statistics of the National Bureau of Statistics of the Republic of Moldova. The latest data was received through the United Nations Economic Commission for Europe (UN/ECE).

The statistical data are distributed to users of statistical information through the Bureau's monthly press releases, a quarterly report on the social and economic development of the Republic of Moldova, various monthly and quarterly bulletins and a statistical yearbook, all published by the National Bureau of Statistics, and through the placement of statistical data on the Bureau's website: www.statistica.md.

General

The United Nations 1993 System of National Accounts (1993SNA) provides the methodological basis for calculating the gross domestic product (GDP).

A schedule for the dissemination of the preliminary and revised national accounts data is published by the National Bureau of Statistics at the beginning of the calendar year as part of the Statistical Development Programme. The calculations of annual GDP indices are revised over a two-year period: the first semi-final version is published 11 months after the end of the base period; the second semi-final version is published one year after the end of the base period. The revision cycle is established in advance and is known to the users. The revised data are published with accompanying short notes. Any significant changes in methodology, base data and statistical methods are announced in a timely fashion through the annual statistical programme. A technical description of the changes (when applicable) accompanies the data disseminated.

Annual and quarterly GDP are calculated at current market prices and at the previous year's prices and are then recalculated at constant prices. The base year is currently 2000.

Methodology:

Overview of GDP Compilation

GDP is calculated annually (by the production, expenditure and income approaches) and quarterly (by the production and expenditure approaches). GDP is calculated at current market prices and at the previous year's prices. A supply and use table for 46 types of economic activity in current market prices and previous year's prices is also compiled on an annual basis. It should be noted that the quarterly GDP calculations are performed on a discrete basis and subsequently used to establish annual figures, recalculated at constant prices and with seasonal adjustments. The base year is currently 2000. The National Bureau of Statistics has already distributed the time series of quarterly national account data for the period 1995-2006. As the quarterly and annual GDP estimates are adjusted for the estimated volume of the non-observed economy (formal sector, informal sector and household production of goods for own final consumption, excluding illegal activity).

The Classification of Economic Activities of the Republic of Moldova (first edition), harmonized with the International Standard Industrial Classification of All Economic Activities (ISIC, Rev. 3) was used from 1995 through 2000 in drawing up the GDP indices according to the production-based method. Beginning in 2001, the classification of economic activities, harmonized with the Statistical Classification of Economic Activities in the European Community (NACE), was used (and since 2004, the revised version NACE Rev. 1.1).

The quarterly GDP indices are disaggregated by type of economic activity and by final use components (final consumption of households, final consumption of government agencies and final consumption of non-profit institutions serving households, gross fixed capital formation, changes in stocks and net exports). The GDP index does not include the Transnistrian region.

The annual GDP indices are disaggregated by type of economic activity, final use components and type of primary income (compensation of employees, taxes (less subsidies) on production and imports, gross operating surplus and mixed income).

Non-financial accounts are also compiled for the economy as a whole, by type of economic activity and institutional sector (financial and non-financial corporations, financial institutions, general government, non-profit institutions serving households, households) and also for the “rest of the world” sector (goods and services account, primary income and current transfer account, capital transactions account). The information source consists of quarterly and annual statistical accounts, financial and banking accounts, administrative accounts (implementation of the national public budget and data from the State tax inspectorate), sampling surveys for the agricultural sector, households and employment, and the structural enterprise survey.

The monetary unit for the period 1990-1992 was the ruble, but since 1993 it has been the Moldovan leu.

Metadata — including information on concepts, definitions, classifications —are made available in printed publications only. Methodological notes are issued in special publications and in the statistical yearbook.

The metadata contained in national accounts publications reflect the levels of detail and degree of data aggregation distributed through these media outlets.

The annual national accounts are internally coordinated. GDP estimates according to the types of activity and expenditure components are coordinated in the course of a process of precise balancing on the basis of the supply and use tables. Estimates at current prices are brought into line with the corresponding data series in constant prices and with deflators. Estimates at current prices, volume indices and implicit deflators are coordinated within the “value = volume x price” relationship. The quarterly GDP estimates are added together to obtain annual estimates. The concepts, definitions and classifications used to compile the quarterly GDP estimates are similar to those used to draw up the annual estimates.

Coordinated annual data series are available starting from 1989 to recent year. Coordinated quarterly data series are available from 1995. The data series are reviewed in accordance with changes in the methodology. There is a comprehensive document which explains the basic changes in methodology made with the introduction of 1993 SNA.

The national accounts statistics are, in general, consistent with balance of payments and government finance statistics. Currently, the balance of payments is the main statistical data source for transactions with the rest of the world, while the current account is used as a “mirror” account in the national accounts. The national accounts statistics and the data on general government are consistent.

The main methodological revisions are documented, and the reasons for the revisions are explained. The magnitude of the revisions is measured, and the results are made available to the general public.

Expenditure Approach

Household final consumption expenditure includes:

- Expenditures on consumer goods and services;
- Consumption of goods and services received in kind as payment for labour, gifts and so on;
- Consumption of goods and services produced by households for their own final consumption; in terms of services this refers only to housing services for own consumption and domestic services produced by paid domestic staff.

Household final consumption expenditures include purchases by residents of goods and services abroad (for example, when travelling on business or on tourist trips) and excludes similar purchases by non-residents within the country.

Household final consumption expenditures are determined as the actual payment for consumer goods and services made from household income.

The benchmark information for calculating household final consumption expenditures are data on purchases by the population of goods and services. To bring these data in line with the index of household final consumption expenditures in SNA the following adjustments are made:

The following are excluded from the total volume of purchases of goods and services by the population (statistical data on trade and services):

- Expenditures relating to other SNA categories (payment for goods by social protection agencies, goods for intermediate consumption, and jewellery and other valuables, and payment of work-related travel and hotel expenses within the country, and for services for intermediate consumption and capital services).

The following are added:

- Services provided to households but paid by enterprises (housing and communal services, educational, tourist and excursion services and so on);
- Expenditures of households on the purchase of services not considered in the accounts of paid services (lottery services and so on);
- Changes in debt in relation to housing rent and payment of communal services;
- Consumption by households of goods and services in kind;
- Balance of purchases of goods and services by residents abroad and non-residents.

The final consumption expenditures of the general government sector includes expenditures by the sector's institutional units on goods and services provided by the units of other sectors free of charge or at prices that are not economically significant. They include:

- The cost of non-market goods and services provided to the institutional units of other sectors free of charge or at prices that are not economically significant;
- The cost of consumer goods and services purchased by the units of the government sector from market producers for transfer to households without any modification;
- Compensation to households for expenditures on goods and services from budgetary funds and government extra-budgetary social funds.

The main source of information is the national public budget performance report.

Gross fixed capital formation is computed on the basis of capital investments calculated from statistics on capital construction.

The following are excluded:

- Expenditures that do not increase the value of fixed assets (expenditures on training and building conservation, expenditures related to compensation provided to citizens when buildings belonging to them are demolished on land sited for construction and so on);
- The cost of low-cost, quickly expendable tools and equipment included in construction estimates.

The following are added:

- Changes in inventories of equipment requiring installation;
- Increases in fixed assets in livestock;
- Expenditures on major maintenance of fixed assets;
- Acquisition of equipment and inventory by State-financed organizations;
- Acquisition of books for libraries;
- Expenditures on the creation and acquisition of software and databases;
- Acquisition of the originals of literary or artistic works.

The sources of information used to assess gross fixed capital formation are investment data and the national

public budget performance report.

Inventories of tangible current assets include all goods owned at a given time by residential units that are not included in gross fixed capital formation.

Changes in tangible current assets take place as a result of the acquisition and disposal of assets, and in accordance with SNA principles they are defined as the difference between goods included in inventories and those removed there from. The change in inventories is calculated from the data on the bookkeeping balance sheet dividing them into three groups: producer inventories, consumer inventories and trade inventories.

In order to exclude the influence of price changes on the calculation of changes in tangible current assets, a special computation method is used, which consists in assessing stocks at the beginning and end of the accounting period at mean prices over that period.

It should be noted that all indices are calculated on the same basis.

The main source of statistical data on imports and exports of goods and services is the balance of payments, while the balance-of-payments current account is used as a "mirror" account in the national accounts.

Conversion to constant price data (previous year's prices).

Final Household consumption

- Acquisition of goods/services: Consumer price index for goods/services.
- Personal consumption: Consumer price indices and producer price indices for industrial and agricultural products.

Government final consumption and Final consumption of non-profit organizations serving households: Deflator index for the delivery of the relevant type of service and the consumer price index for the relevant goods and services.

Gross fixed capital formation: Capital formation index; price index for the printing industry; price index for construction and installation work; price index for machinery and equipment and so on.

Change in inventories: Consumer price indices for goods; producer price indices for industry and agriculture.

Exports and imports of goods: Unit value indices for goods.

Exports and imports of services: Exchange rate of Moldavian leu to the United States dollar.

Income Approach

The main source for determining the wage fund for the economy as a whole and according to type of economic activity is the publication "The Labour Force and Wages".

The information source for determining taxes and subsidies is the public national budget performance report.

Production Approach

The specially designed and introduced 5-C statistical accounting form on enterprise expenditures is used to determine the volume of production and intermediate consumption by type of economic activity. Each accounting unit uses this form to indicate the volume of work carried out and the expenditures made (with quite a detailed breakdown) for production of a given volume. The volume of agricultural and industrial production is equated with the volume cited by the sectoral management units.

The non-market production volume and intermediate consumption are determined from the national public budget performance report.

Conversion to constant price data (previous year's prices).

- A. Agriculture, hunting and forestry: Direct conversion of natural indicators for the current period at the previous period's prices (producers' prices).
- B. Fishing: Deflation of the data by producers' price indices.
- C. Quarrying: Extrapolation using the quantum index of production.
- D. Manufacturing: Extrapolation using the quantum index of production.
- E. Electricity, gas and water supply: Extrapolation using the quantum index of production.
- F. Construction: Deflation of data using an index of changes in the estimated cost of construction and installation work.
- G. Wholesale and retail trade: Extrapolation of data on the expenditure made in the previous year at current prices, using the quantum indices for trade.
- H. Hotels and restaurants:
- Catering: Deflation of data on the turnover of catering services at current prices for the reporting year using the catering price index.
 - Hotels: Deflation using the price index for hotel services.
- I. Transport and communications:
- Cargo transport: Extrapolation of data (by type of transport) using the indices for cargo turnover.
 - Passenger transport services: Extrapolation of data using the index for passenger turnover.
 - Communications services: Deflation using the index for communication service tariffs.
- J. Financial intermediation: Extrapolation of data using the employment index.
- K. Real estate, renting and business activities: Market services — by deflation of data by the relevant price indices; non-market services — by estimate according to items of expenditure.
- L. General government: Estimate by items of expenditure and extrapolation of data using the employment index.
- M. Education: Market services — by deflation of data through the consumer price index; non-market services — by estimate according to items of expenditure.
- N. Health and social work: Market services — by deflating data using the consumer price index; non-market services — by estimate according to items of expenditure.
- O. Other communal, social and personal services: Market services — deflation of data using the relevant price indices; non-market items — by estimate according to items of expenditure.
- P. Private households with employed persons: Deflation using the consumer price index for services.

Table 1.1 Gross domestic product by expenditures at current prices

Series 200: 1993 SNA, Moldovan leu, Western calendar year												Data in hundreds of thousands

Romania

Source

In Romania, annual non-financial national accounts are elaborated by Direction of National Accounts and Macroeconomic Synthesis from General Direction of National Accounts and Macroeconomic Synthesis, National Institute of Statistics (NIS) located in Bucharest.

The financial national accounts are separately elaborated by National Bank of Romania, Statistics Division, Monetary and Financial Statistics Department.

The official estimates together with the main concepts of non-financial national accounts are annually published in Romanian Statistical Yearbook, National Accounts chapter. This publication can be found on the internet NIS web-site (www.insse.ro) under the label "Anuarul statistic", "Conturi naționale" chapter.

Also, the final version of annual national accounts in current and constant prices is published into "National Accounts" brochure yearly issued both in Romanian and English versions. The brochure contains information on evolution of the Romanian macroeconomic figures, the explanations of the ESA95 concepts.

Romania was involved into a multi-country programme PHARE 2002 and 2003 on macroeconomic statistics, resulting the standard "GNI Inventory" submitted to Eurostat and approved in 2005. This working was the basis for issuing the national accounts methodology applied in Romania posted on the NIS web-site.

General

The latest estimates of Romanian national accounts are made according to European System of Accounts 1995 (ESA95), and are perfectly compatible with System of National Accounts 1993 (SNA93). SNA93/ESA95 has been applied since 1998 compilation year, the series 1989-1997 are available according to ESA79/SNA68. Anyway, certain improvements already existed before 1998 according to SNA93, for example:

- valuation of output and value added at base prices;
- including expenditures with geological explorations into Gross fixed capital formation;
- elaboration of resources-uses tables and input-output tables in current and constant prices;
- using prices of the previous year for the constant prices evaluation.

The main tables published in the National Accounts brochure each year are: Supply-Use/Input-Output Tables and the Table of Integrated Economic Accounts (the sequence of accounts). The symmetric Input-output table in current and constant prices according to the required classification (by A60) was performed for the year 2003.

The revision policy follows the following timetable: A revision is currently performed according to ESA95/SNA93 on the data series of national accounts for 1989-1997. On the 1st of July 2005 the Romanian currency (Lei-ROL) suffered the denomination, meaning dividing by 10 000 the amounts in ROL, transforming them into RON. Data from brochures were published in ROL, but the data from the Statistical Yearbook and other information to media were issued in RON. Since 1st of January 2007 only the new currency can be used.

The fiscal year is the calendar year.

The constant prices estimation is based on the previous year prices. The main indicators used for the deflation and extrapolation are:

- Consumer price indices (CPI);
- Industrial producer price indices (IPPI);
- Turnover indices;
- Turnover volume indices;

- Price index of agricultural production, calculated by products;
- Volume index of industrial production;
- Cost index of construction;
- Unit value indices for imports and exports of goods;
- Volume index of investments.

Some of these series are compiled and provided by other departments of the NIS while others are estimated within the national accounts department.

Romania receives each year from UNSD the Questionnaire_Romania to be filled in with data of GDP (in current and constant prices) and aggregates from institutional sectors accounts.

Methodology:

Overview of GDP Compilation

Gross Domestic Product is estimated based on the three methods: production approach, expenditure approach and income approach. While the production and expenditure approaches are compiled using preliminary (semi-final) data, the income approach is compiled using final GDP. The GDP aggregates are compiled both by industries and by institutional sectors. For constant prices estimates of GDP, only the output and expenditure approaches are applied. The GDP methods are reconciled within the Supply and Uses Tables, both in current and constant prices.

Expenditure Approach

The expenditure approach represents, for Romanian NA, a base approach, together with the production approach for GDP. It represents the uses side of the economy, shown in the supply and use tables, in current and constant prices.

The main data sources used to compile GDP by expenditure approach are:

- Statistical data sources: Structural Business Survey (SBS), Households Budget Survey (HBS), balance of agricultural products, retail trade data/ commodity flow, Census on population and dwellings (2002), other statistical sources;
- Accounting and financial data sources: accounting statements submitted to the Ministry of Public Finance (MoPF);
- Administrative data sources: Budgetary execution (covering central government, social security, local and special funds), plus autonomous public institutions' budgets (financed by extra budgetary funds); Balance of payments (BoP) from the National Bank of Romania; Global income declarations from the MoPF submitted by the self-employed and family associations (referred to also as unincorporated enterprises).

The majority of the expenditure is accounted for by households spending on goods and services. The calculation of expenditure is essentially linked to the HBS and SBS.

HBS offers information regarding:

- The food products and alcoholic drinks;
- Purchases of non-food goods;
- Expenditures for rendering services: rents, health services, transport services, postal services;
- Incomes from: paid activities; agriculture; social benefits; property; in kind.
- Expenditures on investments, on production, taxes, contributions;
- Living conditions, including number and type of dwellings;
- Endowment of goods;
- The state of health including types of affections;
- The satisfaction level of household necessities according to incomes.

- Structural business survey comprises detailed information about retail trade and services.

The following products are included into consumption expenditure of households: Food and non-alcoholic beverages (separated by consumption of own-account production and purchases of the household on the peasant market), alcoholic beverages, tobacco, non-food goods, housing services, water, electricity, gas and other fuels, health, transport, communication, recreation and culture, education, restaurants and hotels, miscellaneous goods and services.

The consumption expenditure of NPISHs is valued as the sum of costs involved by the production of these services. It is computed as the difference between the total output of NPISHs and the value of the market output of this sector. Consumption expenditures incurred by government units may be for the benefit of individual households or of the community as a whole. A distinction is therefore made in the ESA95 between:

- expenditures for individual consumption
- expenditures for collective consumption.

The consumption expenditure of general government is valued as the sum of costs incurred to produce these services. It is computed as the difference between the total output of government and the value of the market output of this sector.

Gross fixed capital formation for a unit includes all the expenses for acquiring new fixed assets to the unit, less sales, or for improving existing assets, including major renovations. Gross fixed capital formation for tangible fixed assets is estimated both by product and by institutional sectors. GFCF by product and for the economy in total therefore refers to acquisition of new assets only. GFCF by institutional sectors covers acquisitions less disposals of existing assets. These two different totals, in the input-output table and in the Integrated Economic Accounts Table for sectors, are reconciled. The project on entertainment, literary or artistic originals was in process during the year 2004 and a first estimation was made on data for the year 2003. The first estimations on small tools were made for the year 2003 under the Phase 2001 project regarding Gross capital formation were also made. The ESA requires that all expenditures on such items which do not exceed 500 Euro (at 1995 prices) per item (or, when bought in quantities, for the total amount bought), should be recorded not as GFCF, but as intermediate consumption. In addition, to qualify as GFCF, such items need to be used in the production process for more than one year.

Changes in inventories are measured by the value of entries into inventories less the value of withdrawals. For the national accounts and also in business accounts, firms recorded the levels of inventories at the beginning and the end of the accounting periods, based on 'historic cost'. The Romanian National Accounts chose to deal with this problem taking into account the "middle of the year" method, so-call "French approach".

The estimates of exports and imports of goods and services are based on foreign trade statistics and the Balance of Payments. In the supply and use tables, data on exports and imports are broken down by 105 products, according to the classification adopted linked to NACE Rev.1.1. Imports covered by customs declarations are included in trade figures when they cross the frontier. For imports not covered by customs statistics, such as electricity and gas mentioned above, the change of ownership principle is used. The import data are available at CIF prices and exports at FOB prices. The CIF-FOB adjustment is performed by inserting an adjustment line and column within the resources and uses framework, according to SNA93 methodology. Starting with 2003, the ESA 95 definition was applied for CIF-FOB correction.

Regarding data on constant prices, the above enumerated indices are used. The final consumption expenditure is estimated by each component, as following: for households final consumption consumer price indices, price indices of agricultural products, price indices of market rent; the government final consumption estimates are tightly linked to the output data, price indices of non-market output and consumer price indices for market output are used. For the Gross Fixed Capital Formation, aggregated indices of output and import of goods entering within this category are used, specifically basic price IPPI are adjusted to the purchase price valuation basis of GFCF.

The constant prices estimate of changes in inventories is undertaken by deflating values of the changes in inventories adjusted for holding gains and losses in current prices with the same type of synthetic indices which are calculated and used to deflate intermediate consumption and to estimate holding gains and losses.

The deflation of import-export components is made in special using unit value indices, producer price indices and exchange rate changes.

Income Approach

The generation of income account, which is the base for income approach of GDP, is compiled both by homogenous branches (formed by Local Kind of Activity Units(LKAU)) and by institutional sectors in parallel with the production account. It is an integral part of supply and use tables and Integrated Economic Accounts Table, constituting the table of primary inputs.

In Romania, the GDP by income approach is estimated using independent sources by institutional sectors. By homogenous branches the Gross operating surplus is not allocated using directly the data sources, thus is compiled as residual

The main data sources used to compile the generation of income accounts are:

- by homogenous branches: SBS, Labour Force Survey (LFS), HBS, Labour cost survey (S3), balance of agricultural products; Budgetary execution
- by institutional sectors: Accounting statements submitted by financial enterprises, non-financial enterprises and non profit institutions serving households to the Ministry of Public Finance, Declarations on global income of self-employed and family associations submitted to Ministry of Public Finance, Budgetary execution.

Compensation of employees is directly compiled using the statistics on wages (SBS, S3), accounting statements, budgetary execution and Declarations on global income of self-employed and family associations. The employees social contributions are compiled based on information regarding the quantum legally established to be paid to: state funds for social security, for unemployment, for health. In Romania, starting this year the private social security funds/schemes are introduced.

Other taxes and subsidies on production are valued on accrual basis, being identified/classified and adjusted from the budgetary execution.

Aggregates of the Income approach are not estimated in constant prices.

Production Approach

This approach is for Romania the base one, due to various data sources available and enhanced by the compilation process.

The output approach to GDP is compiled both by institutional sector and by kind of activity, covering the goods and services and production accounts. Final estimates by kind of activity and by institutional sectors are simultaneously elaborated in the framework of the resources-uses tables.

All exhaustiveness adjustments are specified by institutional sector and also at the level of LKAU/homogenous branches

The data sources used for the estimations for the final version of GDP are: Structural business survey, Households budget survey, Economic Agricultural Accounts, accounting statements of financial, insurance and non-financial corporations and non-profit institutions, budgetary execution, Balance of Payment, income declaration for self employed and family associations etc.

Output is valued at basic prices, this valuation being directly identified or assuming the basic prices of the similar

products from the market. The products/services used for intermediate consumption are valued at the purchasers prices. Beginning with 2002, all taxes and subsidies on products and production, social contributions and interests are evaluated on accrual basis in national accounts

Gross value added is mostly compiled as difference between output and intermediate consumption. Measurement of output for General government and NPISHs is based on costs by economic classification, adding up the items of both intermediate consumption and gross value added (obtained directly, not as a balancing item).

The output and intermediate consumption for agriculture are supplied by the specialised department of the NIS, based on balance of agricultural products and Economic Agricultural Accounts, including also the estimations for output produced for own-consumption.

Data for most manufacturing industries are based on direct methods, that is, sample surveys and financial statements for producers and administrative records for government. The SBS covers all businesses and collects detailed data on production and intermediate consumption (e.g. distribution of expenditures from intermediate consumption over consuming activities of enterprise (CANE classes) and by provenience products and services). Separate special surveys, administrated by special departments of NIS, give more information on industries as: trade (for turnover), transport (also volume indicators), construction, hotels and restaurants, telecommunications etc. The statistical surveys held by NIS are mostly adapted to the SNA93/ ESA95 concepts in order to supply direct information for national accounts estimations.

For the estimation of imputed rent, the "Stratification method" is applied, together with consumer price indices. The real estate estimates are based on the benchmark data from Census of population and dwellings held in 2002 and other statistical reports.

For the financial institutions, value added is derived from accounting statements of these institutions and also from the financial records of the supervisory board for insurance.

The value added of government services is estimated by adding the cost items obtained from budgetary reports. The method is also applied for public health services. The estimation of other services is based on annual turnover statistics.

Regarding the non-observed economy in Romania, the estimations are made for:

- under-reported value added by registered institutional units in the formal sector (non-financial corporations) because of the underground utilisation of labour;
- under-reported value added by registered institutional units in the formal sector (non-financial corporations) because of value added taxes evasion/fraud
- for informal sector, for activities performed by family associations and self-employed not elsewhere registered.

For the constant prices estimations, double deflation is mostly applied, using the price and volume indices as for expenditure approach. Some indices are resultant indices from the balancing process between resources and uses within the synthesis table. Also, it is used the intermediate consumption matrix in current and constant prices, by applying the appropriate price indices and technical coefficients. For the general government and financial intermediation the value added is directly deflated by using the average wages indices and indices of number of employees.

Russian Federation

Source

Data on national accounts are compiled by the Federal State Statistics Service (Rosstat) and published in the annual "National Accounts of Russia" (an electronic version is posted on the Rosstat website). Furthermore, quarterly and annual gross domestic product (GDP) estimates are regularly posted on the Rosstat website.

General

The Russian System of National Accounts includes the following accounts and tables:

- (a) Value added by type of economic activity and GDP in current and constant prices;
- (b) GDP components by expenditure in current and constant prices;
- (c) Production account;
- (d) Generation of income account;
- (e) Allocation of primary income account;
- (f) Secondary distribution of income account;
- (g) Use of income account;
- (h) Capital account;
- (i) Rest of the world account.

Accounts are classified according to institutional sector. However, separate tables contain units in financial and non-financial sectors, which have been consolidated into one institutional sector.

The following additional accounts and tables are regularly compiled:

- (a) Quarterly value added and GDP in current and constant prices by type of activity;
- (b) Quarterly GDP components by expenditure in current and constant prices;
- (c) Quarterly generation of income account;
- (d) Annual input-output tables.

No financial account is compiled.

Rosstat also compiles regional indicators on an annual basis: gross regional product by type of activity, actual final consumption of households, and gross fixed capital formation for 89 constituent entities of the Russian Federation. Furthermore, components of the generation of income account are compiled for constituent entities of the Russian Federation.

Classification systems:

- Operations, flows and institutional sectors: in accordance with the 1993 SNA;
- Final consumption of households: according to the national classification;
- Final consumption of government: following the Classification of Individual Consumption According to Purpose (COICOP) and the Classification of the Functions of Government (COFOG);
- Foreign trade: according to the commodity nomenclature of foreign economic activity, developed on the basis of the international Harmonized Commodity Description and Coding System;
- Types of activity by industry: until 2003, following the Russian Classification of Branches of the National Economy; data after 2003, in accordance with the Russian Classification of Types of Economic Activity, which is fully compatible with the first version of the Statistical Classification of Economic Activities in the European Community (NACE Rev.2);
- Goods and services: based on the national classification.

Relationship with international methodological instruments:

- Classification of products: the national classification of products is currently not harmonized with the Classification of Economic Activities;
- Final consumption of households: consumption of households is based on the national classification and not on COICOP.

Methodology:

Overview of GDP Compilation

The conceptual framework for Russian national accounts is the “1993 System of National Accounts”, developed under the auspices of the Inter-Secretariat Working Group on National Accounts, which was established by the Statistical Office of the European Communities (EUROSTAT), the International Monetary Fund, the Organization for Economic Cooperation and Development, the United Nations and the World Bank.

GDP is calculated by three methods: the output method, the income use method and the sources of income method. GDP obtained using the sources of income method is not independent since, with the methodology used, not all income indicators are obtained by direct calculation and some of them are calculated by the balance method.

Because the main method for calculating GDP is the output method, a breakdown of GDP by category of expenditure includes a statistical discrepancy: the difference between GDP calculated by the output method and by the income use method. The statistical discrepancy between closing estimates of GDP by type of activity and component of income use is, on average, less than two per cent of GDP.

Expenditure Approach

The information database for calculating GDP aggregates uses the following data:

- Final consumption expenditure of households: data on the volume of retail turnover, data on the volume of paid services to the public, household budget surveys, and balance of payments data;
- Final consumption expenditure of government: data on the execution of the State budget, and data from the statistical observation of activity of State extrabudgetary funds;
- Final consumption expenditure of non-profit institutions serving households: a sample statistical survey of non-profit institutions serving households;
- Gross fixed capital formation: a statistical survey of investments in fixed capital, and data on livestock population and on prices for the sale of animals from the main herd;
- Changes in inventories: data from the balance sheet and from a statistical survey of inventory availability by type;
- Export and import of goods and services: balance of payments data.

Estimation procedure: All components of GDP calculated by the income use method are obtained independently.

- Final consumption expenditure of households is estimated for aggregated groups of goods and services in the national classification. Final consumption expenditure of households is estimated using data on the volume of retail turnover. Expenditure by residents abroad is included in final consumption expenditure of households, but expenditure by non-residents in the domestic economy is excluded;
- Agricultural production for own final consumption is included in the estimate. It is obtained by the balance method based on data on household economic output and trends for its use;
- Data on in kind goods and services received by households are obtained from company surveys, and Federal Customs Service data on humanitarian assistance;
- Final consumption expenditure of government is compiled in the context of COICOP and COFOG;
- Gross fixed capital formation is calculated on the basis of company survey data on investments (in the construction of buildings and installations, acquisition of machinery and equipment, etc.);
- Data on changes in inventories are obtained from surveys of inventories by type. Estimates are adjusted for holding gains.

Each of the three methods for calculating GDP contains adjustments for the unobserved economy, i.e. hidden and informal economic activity.

Annual GDP growth series estimates have been available since 1990, and quarterly ones since 1995. However, estimates prior to 1995 have not been reviewed and the individual components of GDP are not compatible with the data for later periods. Furthermore, following the transition to the Russian Classification of Types of Economic Activity, starting with data for 2003, estimates of components of GDP produced are not compatible with similar data for earlier periods.

Growth series / Base year

1995-2000 / 1995

2000-2002 / 2000

2002-2005 / 2003

GDP growth series and components of GDP in constant prices are obtained by multiplying data on GDP and its components in the base period (for annual calculations: the year 2003; for quarterly calculations: the notional average for one quarter of 2003 (the value for 2003 divided by four)) for the corresponding chain volume indices. Volume indices of GDP and its components for the corresponding period of the preceding year are calculated as the quotient from the division of the reporting period indicator (in annual average prices for the previous year) by a similar indicator for the corresponding period of the preceding year (in annual average prices).

This approach results in discrepancies between GDP as a whole and the sum of its components, calculated in constant prices, as a result of the change in the weighting pattern.

Rosstat conducts regular reviews of GDP:

- A preliminary set of annual estimates is disseminated on the last working day of the month following the end of the period, and a definitive set of data is disseminated 24 months following the end of the period;
- A first set of preliminary quarterly estimates is disseminated 50 working days following the end of the period. A second set is disseminated 80 working days following the end of the period. A set of quarterly calendar year estimates is finalized 27 months following the end of a given calendar year.

Production Approach

Basic data are compiled from a combination of annual and quarterly company surveys, data from administrative sources, and annual household budget surveys. Administrative data include budget execution data, tax data and so forth.

Estimates of output, intermediate consumption and value added are published at the one-digit level of the Russian Classification of Types of Economic Activity.

- Private homes: the output of private homes is estimated as the cost of repairs and maintenance and consumption of fixed capital. The market value of rental housing actually rented is also estimated;
- Adjustment for changes in inventories: changes in inventories are estimated using data from the balance sheet and from a statistical survey of inventory availability by type. Estimates of changes in inventories are adjusted for income arising from appreciation in the value of assets as a result of price increases;
- Consumption of fixed capital: the perpetual inventory method is used to assess consumption of fixed capital.

^b Includes Mixed Income, Gross.

^c Refers to current transfer from the rest of the world

^d Refers to current transfer to the rest of the world

^e Discrepancy with equivalent item in Table 1.1. GDP by Expenditures. Data needs to be revised/updated.

^f Includes Consumption of fixed capital.

^g Excludes the statistical discrepancy between expenditure-based and production-based GDP amounts.

Source

Reply to the United Nations national accounts questionnaire from the Ministry of Finance and Economic Planning, Kigali. Some official estimates and information on concepts, definitions and methods of estimation are published in "Comptes Economiques du Rwanda, 1969 et 1970". Data from 1990 onwards of the latest series were obtained through the National Bank of Rwanda. These figures are published by the Ministry of Finance and Economic Planning, Direction de la Statistique, and in "Indicateurs de Développement du Rwanda", No. 4, Juillet 2001.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Source

The estimates were published in "Economic Survey and Projections", by the British Development Division in the Caribbean. Reply to the United Nations national accounts questionnaire by the British Development Division.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Saint Vincent and the Grenadines

Source

The preparation of national accounts statistics in St. Vincent and the Grenadines is undertaken by the Statistical Office, Ministry of Finance, Planning and Development, Kingstown. The official estimates and a description of the sources and methods used for the national accounts estimation are published in "National Accounts of St. Vincent and the Grenadines". Reply to the United Nations national accounts questionnaire by the Statistical Office.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Samoa

Source

Data was received from the Finance Statistics Division, Samoa Bureau of Statistics.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), using the industry approach. The Bureau is currently undergoing a development to compile GDP Expenditure, and also other aggregated accounts. It is expected that we published this information in the very near future.

San Marino

Source

The following tables have been prepared from reply to the UN National Accounts Questionnaire by the Statistical Office of San Marino.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) as far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Saudi Arabia

Source

The Department of General Statistics and Information of the Ministry of Economy and Planning, in Riyadh, is the authority responsible for preparing the national accounts statistics in the Kingdom of Saudi Arabia. The Department officially publishes national accounts data in a yearly bulletin entitled "National accounts of the Kingdom of Saudi Arabia". The accounts are compiled on the basis of the detailed results of the various statistical studies carried out periodically by the Department, primarily the annual economic studies and social studies, as well as the data of the Saudi Arabian Monetary Institute, the State's final accounts data provided by the Ministry of Finance, and other economic indicators.

General

Generally speaking, the methods and procedures employed in the preparation and calculation of national accounts data and the compilation of the related accounts are based on statistical sources available through the country's statistics development programmes in accordance with international specifications and definitions. The Department follows the 1968 System of National Accounts for the issuance of its yearly bulletin. In addition, the Department has begun a trial application of the 1993 System of National Accounts (1993 SNA), issuing a new bulletin in accordance with the 1993 SNA side by side with the previous bulletin. The base year for calculations of the gross domestic product (GDP) at constant prices is 1999. The development of such statistics unquestionably requires coordination and cooperation on the part of the State authorities concerned, such as the Saudi Arabian Monetary Institute, the Ministry of Finance, etc.

Methodology:

Overview of GDP Compilation

From the accounts compiled, GDP can be calculated using the output method or the expenditure method.

Expenditure Approach

The calculation of GDP using the expenditure method is based on a number of sources. With regard to the household sector, it is calculated by means of a survey of household expenditure and income carried out by the Department of General Statistics and Information, in 1999, which up to the present time has been the principal source for calculating the final consumption expenditure of the household (family) sector, taking into account population growth rates and price change rates (the Department is currently carrying out a new survey of household expenditure and income).

Final consumption expenditure of general government comprises total government expenditure (inputs + wages and salaries + depreciation) less market and non-market sales. The final accounts of government units issued by the Ministry of Finance are the principal source of these data.

Gross fixed capital formation is calculated by means of the economic studies carried out by the Department of General Statistics and Information, which cover all economic activities; the surveys provide data on gross fixed capital formation by type of fixed asset. In addition, the final accounts of the State provide information on expenditure on government gross fixed capital formation. The surveys also provide, by means of questionnaires, the item on depreciation (depreciation of fixed capital) other than governmental, depreciation being calculated indirectly.

With regard to exports and imports, reliance is placed on the data issued by the Directorate of Foreign Trade Statistics, within the Department, covering exports and imports of goods, and on balance of payments data provided by the Saudi Arabian Monetary Institute which includes exports and imports of services and their various subcategories.

Lastly, changes in inventory are measured by means of economic studies carried out by the Department of General Statistics and Information using questionnaires to obtain data on changes in inventory in the government sector.

Production Approach

GDP tables are prepared by type of economic activity classified by economic sector, as specified below.

(a) Non-financial sector

This covers all economic activities in accordance with the registry of economic activities (ISIC Rev.3) apart from banking and insurance activities, and ancillary financial services. In general, it can be said that the production approach has been used to calculate value added (output less inputs being equal to value added) for all activities comprising this sector. These activities can be classified as follows:

1. Agriculture, hunting and fishing

This activity includes plant production, animal production, fishing, the production of honey, etc. The Ministry of Agriculture is the primary source of data on this activity and provides data on the various kinds of agricultural output based on the results of computations and agricultural studies made by the Ministry. It provides data on output and intermediate consumption from which value added is calculated. The Ministry also provides data on wages and salaries paid and on capital formation, from which the surplus in the income-generation account is calculated. To compile the other accounts, a sample of farms and agricultural enterprises is taken and, in the light of the data provided by their final accounts, indicators are prepared for use in compiling the remaining accounts for this activity.

2. Extraction of crude petroleum and natural gas

(a) Crude petroleum

The Ministry of Oil and Mineral Resources is the principal source of data, whether monthly or annual, on crude petroleum extracted by oil companies working in the Kingdom. The Ministry provides data on the quantities and value of annual output, the source of the crude petroleum, as well as on the refineries and banks involved in production in connection with the activity of extraction in the Kingdom of Saudi Arabia only; value added is calculated for the oil extraction activity and use is made of the annual reports provided by these companies to calculate capital formation by type of capital asset, together with other information pertaining to wages and salaries, taxes, royal revenue, current and capital transfers in order to compile the current and capital accounts.

(b) Exploitation of other mines and quarries

Use is made of the results of economic studies carried out annually by the Department using questionnaires specially designed for the purpose which provide full information on outputs, inputs, wages and salaries, taxes, subsidies, current and capital transfers and royal revenue. From these data a calculation is made of value added, and of current account and capital formation.

3. Manufacturing

Studies carried out annually by the Department of General Statistics and Information using questionnaires specially designed for the purpose are the principal source of data on all manufacturing industries. By means of a comprehensive listing of all establishments with 50 employees or more and a sampling of establishments with fewer than 50 employees, by administrative district and economic activity, the questionnaire provides all necessary data for compiling the accounts, ranging from the output account to the capital account.

4. Electricity, gas and water

The annual economic surveys made by the Department of General Statistics and Information, together with the final accounts of the Consolidated Saudi Electricity Company and the National Gas and Industrialization Company

are the principal source of data on electricity; the State budget provides data on water through the budget of the water authorities in various regions of the Kingdom. On the basis of these data, the value added is calculated and the remaining current accounts and the capital account are compiled.

5. Construction and building

Construction and building activity includes all operations for the construction of residential and non-residential buildings, the construction and surfacing of roads, the building of bridges and tunnels, railways, drainage, water, sewerage, electricity and telephone projects, the drilling of wells, land reclamation, etc. The results of the annual economic surveys provide data and indicators that are used to measure the necessary changes in such activities.

6. Wholesale and retail trade

The measurements and accounts for this activity are based on the data provided by the annual economic surveys of trade and distribution statistics made by the Department of General Statistics and Information using a comprehensive listing of establishments with 50 employees or more, and a sampling of establishments with fewer than 50 employees. The annual surveys provide data on sales and purchases, wages and salaries, inputs, new fixed assets purchased and all types of expenditures and other income necessary for compiling the accounts.

7. Hotels and restaurants

The activities of hotels and restaurants are separated from wholesale and resale trade and the calculations and compilation of the accounts for this activity are based on the results of the economic surveys made by the Department of General Statistics and Information. The questionnaires provide data on the income and expenditures of the units engaged in this activity.

8. Transport, storage and communications

This activity includes transport by land, sea and air, together with communications activities, whether in the public, private or mixed sector. Use is made of economic studies and of the data provided on communications activities and on companies engaged in that field. Value added is measured and accounts compiled using the output method.

9. Real estate and business services

This includes housing rentals together with business services, such as advisory services, accountants, auditors, etc. Housing rentals are measured using data from surveys of household expenditure and income after taking into account population growth rates and rental cost indices. Figures for business services are based on the results of the annual economic survey.

10. Social, recreational and personal services

This includes educational services, health services, entertainment and recreation together with laundry, cleaning services, barbershops, etc. among personal services. The economic survey is the principal source of such data.

(b) Financial sector

This sector covers financial intermediation projects and the final accounts of units engaged in banking, and insurance companies. The annual survey made by the Department is the principal source of data on this sector. As regards the actual provision of financial intermediation services, the methodology applied is that recommended in the System of National Accounts for measuring financial intermediation services, namely measuring the services indirectly and globally as they have not yet been delivered to the entities using them.

(c) General government sector

As we have indicated, the general government sector offers goods and services either free of charge or at nominal prices. It follows that the output of government services has no market value and output in the government sector is therefore measured by means of expenditures, in other words, total output is equal to production inputs plus the remuneration of employees and depreciation. By subtracting production inputs from the value of output one

obtains the overall value added which is equal to the remuneration of employees plus depreciation; subtracting marketed and unmarketed sales from total expenditures, we obtain the final consumption costs of the Government. The total current and capital accounts are compiled from the data provided in the final accounts of the State.

(d) Household sector (family sector) (covers informal enterprises)

Output for this sector is measured using a survey of family expenditures and income by measuring remuneration for household services, together with units in which fewer than five persons are employed, engaged in various unregulated economic activities. That being so, such units are excluded from the scope of the annual economic surveys; the overall current accounts, and the capital account are compiled together with such enterprises.

(e) Non-profit institutions serving households

Such institutions provide services and goods without charge or at nominal prices and their output therefore has no market value. It is therefore measured, as in the case of the general government sector, by the expenditure method (inputs + remuneration of employees + depreciation = output). By subtracting production inputs we obtain the value added. The annual economic survey is the principal source of data on this sector and provides all that is needed for compiling the current accounts and the capital account, as well as for measuring the final consumption costs, after deduction of marketed and unmarketed sales.

(f) The rest of the world

The balance of payments prepared by the Saudi Arabian Monetary Institute is the principal source of data for compiling the accounts for this sector, together with a number of other financial reports.

Senegal

Source

The National Accounts of Senegal that were published in September 2008 were compiled by the Division for National Accounting, Syntheses and Analytical Studies of the National Agency for Statistics and Demography (NASD) of Senegal. They represent the final accounts for 2005, semi-final accounts for 2006 and the provisional accounts for 2007.

In 2002, the former Directorate of Forecasts and Statistics (DFS) published the revised provisional national accounts for 1996-2001 with the aim of both clearing the significant backlog and applying the new methodology using a different base year, in accordance with 1993 SNA. With that publication, it was possible to clear the backlog built up by national accounts in the past and, at the same time, to adapt to the new rules for national accounts that are being progressively adopted in most of the States members of the West African Economic and Monetary Union. A CD was prepared in order to disseminate those accounts.

Subsequently, DFS, in collaboration with a certain number of technical directorates and international institutions and, in particular, the Economic and Statistical Observatory for Sub-Saharan Africa (AFRISTAT) and the French Cooperation Agency, undertook a revision and retroactive compilation of national accounts for 1980-2003, using 1999 as the base year. Those accounts were published in March 2005.

National accounts publications are divided into three main sections. The first analyses changes in the principal aggregates and ratios of national accounts; the second presents the various tables of the revised national accounts; and the third provides a concise summary of the methodology. The main tables (macroeconomic indicators, gross domestic product (GDP) and its uses, and aggregates by branch) are disseminated in printed form, accompanied by an analytical note on the outcomes.

The data are also available on the NASD website at www.ansd.sn. More detailed results may be obtained from the NASD Division for National Accounting, Syntheses and Analytical Studies.

General

1993 SNA was adopted in Senegal at the time of the compilation of the revised interim national accounts for 1996-2001 that were published in December 2002. A retroactive compilation of national accounts since 1980 has also been formulated on the basis of 1993 SNA.

The process of compiling those accounts involves seven major stages, as follows:

- (a) Review of sources of information and classification. An inventory is made of all available statistics and common classifications are defined. That stage was conducted at the time of the compilation of the revised national accounts for 1980-2003;
- (b) Adoption of common classifications. That stage made it possible to reconcile all sources of data through the formulation of conversion tables for the changeover to the Classifications of Activities of AFRISTAT Member States as adapted for use by Senegal, and operations classifications;
- (c) Fine-tuning of production. Once the common classifications had been adopted, production was possible using several sources. An initial series of adjustments is conducted in order to set a production value;
- (d) Establishment of preliminary resource-use balances;
- (e) Compilation of production accounts by branch of activity;
- (f) Compilation of preliminary input-output table;
- (g) Compilation of final input-output table. After the preliminary table has been compiled, production is fine-tuned by being adjusted to use by branch of activity. Detailed components of production accounts are also processed.

Activities are classified on two levels (42 branches and 93 sub-branches). The classification of products, taken together with the classification of activities, consists of three levels which include 232 products at the most detailed level.

Methodological notes on the compilation of national accounts that described those stages in detail were prepared in 2005 and updated in 2006. The most significant corrections related to the evaluation of agricultural production (rural production $n/n+1$ is currently applied to year n) and of Government agencies (consumption of fixed capital and all foreign aid is incorporated). The new classifications that are used are adapted from the classifications of activities and products recommended by AFRISTAT member States.

The synoptic tables that are normally published are the following:

- macroeconomic indicators;
- Gross Domestic Product and its uses;
- aggregates by product at current prices and constant prices for 1999.

It should be noted that the fiscal year used is the calendar year.

Methodology:

Overview of GDP Compilation

GDP is calculated using three approaches: production, expenditure and income. The two first are obtained from the supply and use table.

Firstly, supply and use balances and branch accounts for each of the 41 branches of the Classifications of Activities of AFRISTAT Member States, as adapted for use by Senegal, are compiled. Indirectly Measured Financial Mediation services have been assigned to a forty-second, fictitious branch.

Expenditure Approach

GDP equals the sum of net final use (final consumer expenditure by households, general government and non-profit institutions serving households plus gross fixed capital formation plus exports minus imports plus changes in inventories).

The final consumption expenditure of general government and non-profit institutions serving households is derived from production estimates calculated using data obtained from various sources. Non-market general government Final consumption expenditure is obtained by calculating the difference between total production and market production. Final consumption expenditure is divided into individual and collective non-market categories.

Household final consumption expenditure is of two types, namely, market and non-market. The sources of data that have been used heretofore vary. Final merchandise consumer expenditure is estimated for the majority of products on the basis of budget consumer surveys, in particular: (i) Priority survey, 1991; (ii) Survey on household expenditure in the capital, 1996; (iii) the Senegalese household surveys No. 1 and 2, carried out in 1995 and 2002 respectively; and (iv) follow-up survey on poverty in Senegal, 2005-2006. Annual population growth rates and the harmonized consumer price index are used in order to determine final consumption at constant and current prices for a given year.

Non-market final consumption is estimated on the basis of own-consumption rates provided by household surveys.

Private sector gross fixed capital formation (GFCF) reflects the value of acquisitions, less the disposal of fixed assets. It covers the following specific capital assets: livestock products; timber sector products; mining and hydraulic equipment, building and public works equipment, machinery and appliances, and transport and handling equipment and vehicles.

Information on GFCF of imports is obtained by applying a structure that breaks down the use of each imported product.

Public sector GFCF is derived by using data on the performance of State capital and operation budgets, the State

financial transaction table, the financial statements of various central Government agencies, the operating accounts of local administrative bodies (regions, communes and rural communities), and the financial statements of social security funds.

Figures for the imports and exports of goods and services are derived from customs and balance of payment statistics. A conversion table has been prepared in order to convert the foreign trade data, which are presented under with the Harmonized Commodity Description and Coding System, to national accounts product classifications. Separate analysis of the price and volume indices by subsample and year has made it possible to calculate a volume index. Balance of payments statistics have been used in order to determine price trends. The balance of payments is worked out by the Central Bank of West African States, and a conversion table has been established in order to reconcile its classifications with those of national accounts.

Income Approach

Information on the compensation of employees and tax less subsidies on the production of financial and non-financial corporations is derived from company statistical and tax declarations.

With respect to general government, the same data are obtained from monthly payrolls, the table of State financial operations and the accounting records of local communities and public establishments.

As regards households, the information is derived from survey data on the informal sector.

Gross operating surplus and mixed income is estimated from the balance between the value added from the production account of each institutional sector.

Production Approach

GDP is equal to the sum of total value added and net taxes on products.

With respect to total value added, data on merchandise and non-merchandise production are derived from several sources, while those on intermediate consumption are determined using a technical coefficient matrix based on the 2001 input-output table.

Data on the production of subsistence and industrial export crops is derived from the statistics of the Directorate of Analysis, Forecasting and Statistics. They are calculated using prices supplied by the Food Security Commissariat through the market information system.

Data on livestock and fish are provided by the Directorate of Animal Husbandry and the Directorate of Marine Fisheries, respectively.

Forestry production data are provided by the Directorate of Water, Forests, Hunting and Soil Conservation.

Data on mining and manufacturing industry production are obtained from the statistical and tax declarations of companies in that sector.

Data on the production of banks are obtained by using questionnaire data provided by the Central Bank of West African States. Such data include the various services rendered to customers; income from fixed assets; and bank service charges, which in 1993 SNA are called financial intermediation services indirectly measured (FISIM). The value added of the sector to which FISIM has been allocated has the opposite sign to intermediate consumption. Microfinance institution production is determined by using their financial statements.

Data on insurance company production are obtained from the annual report prepared by the Directorate of Insurance. Production equals the difference between gross premiums and net premiums.

General government production is calculated by costs, namely, employee compensation, intermediate

consumption, and consumption of fixed capital. Such data is derived from various public institution records.

Informal sector production is determined by using Senegalese household survey No. 1 of 1995 and the survey of the informal sector that was conducted for the 2006 input-output table.

Estimated production for 1996 is projected using price indices for each branch of activity and trends in the economically active population by branch.

Information on net taxes on products is provided by the General Directorate of Public Accounts and Treasury through the State financial transaction table.

Overview of the Compilation of the Integrated Economic Accounts

Following Senegal's undertaking to adhere to the Special Data Dissemination Standard, NASD has formulated the accounts of the institutional sectors and the table of integrated economic accounts. In that regard, it has benefited from technical assistance provided by the Africa Technical Assistance Centre (AFRITAC) for West Africa and financial assistance provided by the African Development Bank, which made it possible to produce the integrated economic accounts for 2001-2005. However, NASD intends to share the results of its work with partners, including the Central Bank and the General Directorate of Public Accounts and Treasury, before they are finally approved and published. Therefore, those data are not presented in this questionnaire.

Serbia

Source

The compilation of annual national accounts and main macroeconomic aggregates is within the competency of Statistical Office of the Republic of Serbia located in Belgrade – Department for compilation of NA. The official estimates are usually published annually, after finishing preliminary results of calculation in regular publications: Communications (NA 30), Statistical Yearbook (Chapter 6), Working documents related to HFCE, GDP at constant prices and Studies and analyses – System of national accounts of the Republic of Serbia, with main methodological notes and explanations. The data are available on website (www.statserb.sr.gov.yu). The latest data was received through the United Nations Economic Commission for Europe (UN/ECE). Starting from year 2006, Serbia and Montenegro are two separated states.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA) and the European System of Accounts 1995 (ESA95) as methodological framework. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The state union of Serbia and Montenegro dissolved in June 2006. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. Data for the Republic of Serbia was first provided in 2006. The Republican Statistical Office of Serbia has, so far, performed only one general revision in the area of National Accounts that took place in 2006 for the complete time series of data available. The results of the revision have appeared in the publication "System of National Accounts of the Republic of Serbia, 1997 – 2004".

GDP calculations and compilations of National Accounts for the Republic of Serbia, in line with the internationally recognized standards, have been performed since 1997, the year from which published data are available. However from 1999 the data for Kosovo and Metohia have not been included. To ensure consistent and comparable figures, Statistical Office of the Republic of Serbia has, so far, performed more than one general revision in the area of National Accounts for the complete time series of data available. The results of the previous revision have appeared in the publication "System of National Accounts of the Republic of Serbia, 1997 – 2006" (October 2008), and the new one (presented here) in the Communication NA30 No. 080 (31/03/2009) as well as on the website in the same time.

The revision in the System of National Accounts is growing into more and more customized procedure in the framework of international standards and recommendations. In the previous audit when FISIM was computed for the first time displaying the services of financial intermediation - indirectly measured it was given on the level of the entire economy, now the correction is made in the Financial sector and by the Convention FISIM does not account for the central bank. In our case this means that the output (value of production) for the National Bank of Serbia is computed by the cost method (as the sum of its costs) and is shown as part of intermediate consumption of other financial institutions that led to the reduction of GDP. This has also affected calculation of GDP at constant prices, as current values changed together with weights in base year of 2002.

Basic methodological explanations can be found in Federal Statistical Office's edition Methodological papers No. 32 "Basic System of National Accounts" (Belgrade, 1997) and more detailed calculations in the publications of Republic Statistical Office of Serbia: "System of National Accounts of the Republic of Serbia 1997- 2006" (Belgrade, 2008), "Gross Domestic Product of the Republic of Serbia (at 2002 constant prices) 1999 - 2005" (Belgrade, 2007) and "Households Final Consumption Expenditure in the Republic of Serbia in 2003" (Belgrade, 2005).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach at current and constant prices by activities at the division level (two- digit level of NACE.Rev.1.). There is a set of non-financial accounts until capital account for economy in total and institutional sectors and output, intermediate consumption and value added data aggregated by sections (for 1997-1999) and divisions (for 2000 - 2007). At constant prices results for the whole period 1997 - 2007 were released. Those calculations were based on production method, applying indirect single indicator method and the method of extrapolation to the fixed base year (2002). Expenditure approach is also compiled only at current prices. For the time being Input-Output tables are not compiled.

Expenditure Approach

The estimates of government final consumption expenditure are derived from annual financial statements of budget users combined with administrative data sources, Ministry of Finance and Treasury reports about revenues and expenditures. Household final consumption expenditure has been estimated in a detailed and direct way from 2003 according to the COICOP unlike previous years (obtained as residual item). For the categories of food and alcoholic beverages the method of commodity flows for around 20 items was used in accordance with the "Food Balance Sheet method" by the UN, FAO. The sources of data relied upon are agricultural statistics, retail trade, HBS, industrial output data by commodities, data on foreign trade by commodities, motor vehicle registration, labor force, public transportation enterprises, communication, insurance, as well as data obtained from Ministry of Finance, Customs, Tax administration, Ministry of Interior, Electrical power company, Chamber of Commerce, etc.

The data on increase in stocks are based on data from annual financial statements of institutional units. Statistical discrepancy, previously included in the item "Changes in inventories", from 2004 is presented separately. For gross fixed capital formation data are derived from regular statistical surveys carried out and physical entities' investments are estimated using data from agricultural, construction and foreign trade statistics. The estimates of exports and imports of goods and services are based on foreign trade statistics, Republic Customs Administration and the Balance of payments from the National Bank.

Income Approach

Income approach is currently not applied independently.

Production Approach

Gross domestic product at market prices is calculated on the total economy level and the production approach is used to estimate value added by industries at the division level. For public administration and defense, total production costs are used for calculation of output as sum of compensation of employees, intermediate consumption, taxes on production and consumption of fixed capital.

Main data sources from production approach are annual financial statements of concerned enterprises (legal entities) and unincorporated enterprises (entrepreneurs that have double entrance book- keeping), and the regular statistical surveys within Agriculture statistics based on quantities of agricultural products and corresponding prices as well as various administrative data sources (such as Central bank, body agencies, Tax Authorities, etc.). Gross domestic product of the Republic of Serbia at constant prices has been estimated according to the method of extrapolation on the fixed base year (2002), generally using a single indicator approach. Direct estimation of GVA is based on the presumption that ratios between output, intermediate consumption and value added are fixed. Indices of volume changes of production, turnover, price indices, working hours and number of employees has been used as indicators.

As regards the activities for which output indicators are available (agriculture, forestry, industry, transport), current values of the base year are extrapolated by the corresponding volume indices. The most frequently used

indicators in calculating services (public administration, education, health and social work, other community, social and personal services and households with employed persons) are input indicators (number of employees indices).

Serbia and Montenegro

Source

Reply to the United Nations national accounts questionnaire from the Federal Statistical Office. The latest data for Serbia and Montenegro (formerly Yugoslavia) was received through the United Nations Economic Commission for Europe (UN/ECE). Effective January 1999, data does not include Kosovo and Metohia. It should also be noted that the change in name from Yugoslavia to Serbia and Montenegro was made official only on 4 February 2003.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA) (ESA95 respectively) as methodological framework. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Effective January 1999, data does not include Kosovo and Metohia. It should also be noted that the change in name from Yugoslavia to Serbia and Montenegro was made official only on 4 February 2003. Series 20 which excludes Kosovo and Metohia was first provided in 2003.

In June 2006 the state union of Serbia and Montenegro dissolved. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. When available, data are shown for the individual republics.

Seychelles

Source

The national accounts of Seychelles is prepared and released by the National Statistics Bureau (NSB) of Seychelles.

NSB maintains a working document "Detailed notes on Production Account compilation" This outlines details of data sources, estimation methodology, plus coverage and classifications issue for each Sector and Industry. The Statistical Bulletin "National Accounts Estimates 2004-2008 is the latest publication on the national accounts statistics for the country. This document is available from NSB on request. The data is also available on the NSB website www.nsb.gov.sc.

General

The National Accounts redevelopment is working towards meeting the UN System of National Accounts, SNA93. The implementation of the SNA93 only started in early 2007 and the data series runs from 2004 to 2007. Some back casting exercise will have to be done to bring the earlier published series in line with the new based on the new concepts, methodology and coverage.

The publication, "National Accounts Estimates 2004-2008", is the second issue in the series of annual national accounts figures released following the launch of the project in early 2007. The objective of the project was to substantially update and improve the compilation of the Seychelles National Accounts statistics. This bulletin presents revised estimates for the period 2004-2007 and new estimates for 2008. The classification of industry used is based on the UN International Standard Industrial Classification (ISIC) Rev4 customised to meet Seychelles requirements.

GDP estimates for 2004, 2005 and 2006 have been labelled final, whereas for 2007 the estimate is still provisional and for 2008 the figures are labelled indicative as the compilation has been based on partial data.

The base year used to calculate the constant price data is 2006. Seychelles uses fiscal year which is similar to Calendar year.

Methodology:

Overview of GDP Compilation

GDP at current prices are presented in the recommended UN System of National Accounts (SNA) format for Production Accounts (showing Gross Output, Intermediate Consumption and Value Added). Value added has been compiled by both Industrial Activity (SIC-Seychelles Industrial Classifications) and by a customised version of the SNA Institutional Sector (ISIC Rev IV).

Gross Domestic Product is measured as the sum of the Value Added generated by the productive activities in the Seychelles economy.

GDP in constant 2006 prices are shown as the sum of value added by industry only. Constant Price GDP is measured as changes in production volumes. It excludes impact of price changes.

Production Approach

GDP have been compiled so far only by the production accounts and will be compiling the income and other accounts of the System in the future.

GDP is obtained as the difference between output and intermediate consumption where output is measured at

basic prices (i.e., the amount received by the producer excluding taxes and including subsidies on products) and intermediate consumption is measured at purchaser's prices.

Private Sector Financial Statements is provided by companies to the Revenue Commission (ex-Tax office). Copies are received by the NSB under the data supply and confidentiality provisions of the National Statistics Bureau Act (2005), Section 12 "Access to public and other records".

Data on GST tax collected has also been computerised and classified, and used to produce estimates of output where possible. This is a valuable data source, but has coverage limits because Seychelles GST is levied on specified activities and not on all economic activity. Also, Output cannot be estimated from GST levied on a volume basis for some manufacturing activities.

Government expenditure data by COFOG is provided by the Ministry of Finance. NSB has gained access to and made use of direct financial data as follows:

- a. Government (Budgetary) from Ministry of Finance
- b. Commercial Banks from the Central Bank of Seychelles (CBS) records
- c. Market parastatals, and selected large private companies

More intensive use of existing data such as the NSB employment database, trade statistics, production surveys, tourism statistics and results from household surveys. This also included work on harmonising classifications and other developments to meet national accounts data needs.

Other data includes access to various other administrative data including information held by Seychelles International Business Authority (SIBA) on the operations of companies operating in the SITZ.

FISIM is obtained as the difference between interest received and interest paid by banks excluding those received on its own funds. As it is difficult to allocate FISIM to the intermediate consumption of different industries, the total value of FISIM is imputed to a nominal industry with negative value added.

Tourism is an essential economic activity to monitor in the Seychelles. Tourism direct contributions are estimated as the sum of shares of value added for the main tourism related activities.

Fishing is also an important economic activity in the Seychelles and this is the first time that the NSB has estimated its "direct" contribution to total GDP.

This has been derived from an analysis of the production accounts and should be considered as a prototype. The NSB remains open to comments / discussions / inputs on the methodology, with a view to making improvements in the future.

Fisheries direct contributions are estimated as the sum of shares of value added for the main fisheries related activities.

For the first time, a GDP by production table has also been compiled to show the contribution of fisheries related activities to total GDP.

Sierra Leone

Source

The preparation of national accounts statistics in Sierra Leone is undertaken by Statistics Sierra Leone. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Expenditure Approach

Private Final Consumption is now compiled by using the Household Survey Data conducted in 2003. Population index is used to extrapolate constant figures for other years, while the CPI is used to inflate the figures for current price figures. Consumption estimates for the NPISH sector is computed from the returns received from the questionnaires; they are computed similarly to government. Capital Formation is also computed using the Bank of Sierra Leone (BSL) Publications. The total value of machinery and equipment is used; this however is not classified into different types of machinery and equipment. The Change in Stock, which is added to the fixed Capital, is computed as residual. Government Final Consumption is computed by summing all expenditures on goods and services and deducting the fees, receipt income and sales of used assets, services etc. However, Capital Consumption Allowance is included to have the Final Government Expenditure. The foreign Trade statistics are obtained from the BSL and are adjusted to account for smuggling using the World Bank Direction of Trade.

Income Approach

Data have not been presented strictly according to the SNA93 sequence and therefore do not include some of the estimates. However, certain items in these accounts are regularly presented and they include the following: Compensation of Employees; Operating Surplus; Net Factor Income from the Rest of the World; National Income; Other Current Transfer from the ROW; National Disposable income; Private Final Consumption; Government Final Consumption and Savings.

Production Approach

The Production Account follows the International Standard of Industrial Classification (ISIC) and compilation is done at sub-sector levels.

The sources of data for agricultural crops include the following: Planning, Evaluation, Monitoring and Statistics Division (PEMSD) of the Ministry of Agriculture, Forestry and Food Security (MAFFS), Sierra Leone Integrated Household Survey, 2003/4 - (SLIHS 2003/4) - Statistics Sierra Leone (SSL), CPI Section - Statistics Sierra Leone (SSL). A recent survey on Crops and Livestock (Integrated Survey on Farm Production, Food Security and Vulnerability and Nutrition) was conducted in March/April 2005 by MAFFS and FAO but analysis by MAFFS of the results of this survey is yet to be done. The results will be used to evaluate the current estimates and incorporated into the national accounts compilation where applicable. The estimates for Crop production obtained from the Planning, Evaluation, Monitoring and Statistics Division (PEMSD) in the Ministry of Agriculture and Food Security are based on the results from the round of crop surveys conducted by MAFFS. Only the activities of timber, the gathering of firewood and charcoal are covered in the output of forestry. Estimates are currently constructed by using the timber data provided by MAFFS along with the Household Survey data for charcoal and firewood. Prices for Timber are obtained from the market. Prices for other items are obtained from the CPI. In the current estimates, hunting and trapping is assumed to move with total forestry production and these were estimated in the 2003

SLIHS and are extrapolated for other years using population and price figures.

Fishing includes fishing in coastal water belonging to the domestic territory of the country or in areas where the country has exclusive right of exploitation, and fish catch of resident establishment fishing in international waters. Sources of data: Ministry of Marine Resources. For estimation purposes the industry is divided into three major segments: industrial fishing, artisan fishing and subsistence fishing. Estimates of production for industrial and artisan fishing are based on the quantity (ton) of the total catch provided by the ministry of Marine Resources and Fisheries. The estimates of the industrial and artisan catch are supplemented with an estimate of the catch for subsistence fishing which is assumed to be 20% of artisan fishing. There is no information on the respective quantities or prices of the various species of fish and seafood which make up the three segments of fishing. Therefore, the total quantity of the undifferentiated catch represents production or gross output of each segment, valued at the average price of fish obtained from the CPI basket in the Price Statistics Section (the base year price for constant price estimates and the average price of each year for the current price gross output estimates). Ratios from earlier year's estimates are then applied to these values to estimate intermediate consumption. A constant intermediate consumption to gross output ratio of 28% is used for industrial fishing. The ratio for artisan and subsistence fishing is held constant at 8%. Gross value added is derived by deducting intermediate consumption from gross output for constant and current prices, respectively.

In Sierra Leone mining and quarrying comprises; Diamond, Gold, Bauxite, Rutile, and Quarrying of sand and gravel. Estimates are also made for smuggled diamond. Source of data: The Government Gold and Diamond Office (GDDO), Bank of Sierra Leone – Balance of Payments Section, Sample survey of major mining companies – SSL, Sample of construction firms – SSL. Quarrying is estimated as a constant (1.5) percentage of the gross output of total mining derived as indicated above. For the 2001-2005 period, only diamond mining is estimated directly, with quarrying estimated as a constant percentage of the gross output of diamond mining. Estimates of diamond exports (quantities in carats) and their values are obtained from the Government Gold and Diamond Office (GGDO). In estimating, it is assumed that diamond exports (official exports and unrecorded exports of diamonds) equal total production since all of the diamond production is destined for export. Additional figures are obtained from the Balance of Payments section in the Bank of Sierra Leone to account for the value of unrecorded diamond exports. The volume index of carats of diamond exports is used as the indicator for the constant price estimates and these are inflated by the average price index to estimate the current price production figures. A mark-up of about 15% is used to account for current price estimates of quarrying while the constant GDP growth rate of Construction is used to estimate the constant Quarrying. Data on intermediate consumption ratios are provided by the Ministry of Mines and the GDDO. Value added at current and constant prices is derived residually.

Generally, the activities covered under Building and Construction are construction and maintenance of all buildings, construction and maintenance of all waterways, water reservoirs such as dams, and other irrigation systems, construction and maintenance of roads, bridges, tunnels, etc. Source of data: Annual Survey of Building and Construction, Bank of Sierra Leone, Sierra Leone Integrated Household Survey. Estimates are made from the survey questionnaires sent out and the index of the sum of cement manufactured and imported is used as an indicator of constant price production. Since all construction companies have their head offices in the City, estimates are assumed to reflect national figure. These estimates have now become more solid since the master sample frame is now available after the Establishment Census. At the moment a commodity flow approach is used to estimate output for the Trading sector. The trade margin is then applied for each commodity group in order to derive an estimate of the gross output of trade (the gross margin) and then adding the gross margin to estimate the value of gross sales for wholesale and retail trade for analytical and reconciliation purposes. Various sources are used to estimate the percentage margin, including data from the annual sample survey of wholesale and retail trade establishments conducted by SSL for national accounts. The results from the sample survey of wholesale and retail trade establishments conducted by SSL for national accounts was used to estimate the ratio of intermediate consumption to gross output of trade. These ratios are reviewed after every two years by means of survey. The current price estimate of value added is deflated with the CPI for goods to derive the constant price series.

The total value of FISIM is measured as the total interest income receivable by financial intermediaries minus their

total interest payable, excluding the value of any property income receivable from the investment of their own funds. The amount of FISIM is allocated as an intermediate consumption of a nominal sector called FISIM. Most important is the Banking Supervision Department which now provides to SSL an annual bulletin which contains a consolidated account of all banking activities in the Republic. Similar approach is being put in place for the Insurance; but at the moment estimates for Insurance are made from Annual surveys conducted by the National Accounts. In calculating the contribution of the sector to GDP, a service charge equal to the excess of interest received over interest paid is calculated. The procedure for estimating the gross national output is not akin to the one used estimating the output of most other sectors. If the transaction of financial institutions were conceptually treated like the transactions of other activity sectors, the gross output would be underestimated.

Sources of data for Public Administration: Budget Bureau and Accountant General's Department of the Ministry of Finance and the Bank of Sierra Leone. Data on government final consumption expenditure and contribution of government to GDP are extracted from the budget documents. Final figures are also obtained from the Accountant General's Office one year after budget period and this is revised regularly. The local government is newly established institution in Sierra Leone; their figures are included in the Central Government estimates. As per SNA, the contribution of government services to GDP is equal to the value of government COE and CCA. General government, non-profits institutions and private sectors are all engaged in provision of education service in Sierra Leone. The source of data for public education is the Ministry of Finance. In this report, the component of public education is deducted from general government data while the general administration of education component is added to Public Services. For private sector education, the estimate is made by multiplying public estimate by certain multiplier made available by past survey. However, a recent Private Education survey carried out under ICP Africa is being analysed by staff in order to revise the multipliers.

The source of data for public health is the Ministry of Finance. In this report the component of public health is deducted from general government data excluding the administration component of health. For private sector health, like the education, a multiplier/SLIHs indicating the relationship between the private and the public health is used. These multipliers have been in use and are based on previous survey conducted. The output of NPISHs is produced on a non-profit basis and that the net operating surplus for these non-market establishments is zero. The value of NPISHs output, like government, is accordingly derived solely from the market cost of the factors used to generate its intermediate consumption, compensation of employees, taxes (less subsidies) on production and fixed capital consumption.

Reply to the United Nations national accounts questionnaire from the Department of Statistics, Ministry of Trade and Industry, Singapore.

General

The latest data shown in the following tables are prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The "Singapore System of National Accounts 1995", published by the Singapore Department of Statistics, contains the detailed methodology used to compile Singapore's national accounts. Information on the adoption of basic price is available in the information paper "Rebasing of the Singapore System of National Accounts to Reference Year 1995". Information on the capitalisation of software expenditure and other recent methodological/classification changes can be found in the information paper "Rebasing of Singapore's National Accounts to Reference Year 2000". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated using the production, expenditure and income approaches.

Expenditure Approach

Private Consumption Expenditure (PCE) is obtained as the sum of domestic consumption expenditure and residents' expenditure abroad less non-residents' expenditure locally. Domestic consumption expenditure on goods and services is derived using the commodity flow approach where the supply of goods from local production and imports, derived from the Census of Manufacturing Activities and external trade statistics respectively, are examined to determine the proportion meant for household consumption. The value of these consumer goods is then marked up by trade and transport margins and taxes on products to derive consumption expenditure on goods at purchasers' prices. Consumption expenditure on services is derived mainly from the Survey of Services. Estimates on residents' expenditure abroad and non-residents' expenditure locally are compiled from the balance of payment statistics on travel services. Constant price estimates on private consumption expenditure are mainly obtained by deflating the corresponding current price estimates by relevant sub-components of the Consumer Price Index (CPI).

Government Consumption Expenditure (GCE) is estimated based on the cost of production approach, that is, the sum of compensation of employees, other costs and taxes on production less receipts from sales of goods and services. The data sources for GCE include detailed income and expenditure statements of government ministries, departments and non-profit-non-market statutory boards.

GCE at constant market prices is largely obtained by deflating the corresponding current price estimates using appropriate price indices, for example, the implicit government wage index and sub-indices of the CPI.

Gross Fixed Capital Formation (GFCF) comprises construction and works, transport equipment and machinery, equipment and software. GFCF on construction and works refers to the value of construction work put in place with respect to residential buildings, non-residential buildings and civil engineering and the cost of ownership transfer of existing buildings. The value of construction work put in place comprises certified payments to contractors, real estate developers' margin and other costs incurred on the property development. Data on real estate developers' margin and other construction-related costs are obtained from the Survey of Real Estate Developers.

The commodity flow approach is used extensively to measure capital formation on machinery and equipment (including transport equipment). The supply of goods from local production and imports are first measured and examined to determine the proportion meant for capital formation. Trade and transport margins are then added to derive the market value of these capital goods.

Data on the production and imports of machinery & equipment are mainly from the Census of Manufacturing Activity, external trade statistics and other administrative data.

Capital expenditure on purchased software is largely compiled, through demand approach, using business surveys and government financial statements while in-house software development expenditure is estimated using the cost of production approach that is the sum of compensation of software professionals engaged in in-house software development and its associated non-labour cost.

Constant price estimates on GFCF are mainly derived by deflating the corresponding current price estimates using relevant price indices.

The main data sources for changes in inventories are the Census of Manufacturing Activities, Wholesale Trade Survey and Retail Trade Survey.

Data on exports and imports of goods and services are based on the Balance of Payment.

Exports and imports at constant prices are computed by deflation using relevant price indices of the various items exports or

Income Approach

The estimates of the cost/income structure of the gross domestic product are compiled at current market prices. Compensation of employees includes wages and salaries, employers' contribution to Central Provident Fund (CPF) and pension funds, and benefits in kind. In line with the SNA, compensation of employees exclude incomes received by self-employed or own account workers (which are classified as operating surplus). It excludes any taxes (such as foreign worker's levy) payable by the employer. In addition, wages and salaries are recorded before the deduction of employee's contribution to CPF. Estimates of compensation of employees are compiled based on administrative data on average monthly earnings by industry obtained from the CPF Board and employment statistics obtained from the Ministry of Manpower. These estimates are reviewed when the results from the annual surveys such as the Census of Industrial Production, Survey of Commerce, Survey of Services, and Survey of Financial Institutions become available. Estimates of gross operating surplus are mainly based on annual surveys that provide data on corporate profits for most industries. Annual estimates for the current year are computed based on the data on operating receipts and expenses collected from the Survey of Monthly Industrial Production for the manufacturing sector and the quarterly business expectation surveys for commerce and services industries as well as quarterly surveys on financial institutions and insurance activities. Taxes on production and on imports such as import and excise duties, foreign workers' levy, business registration fees, stamp duties and property tax, are obtained from government administrative records.

Production Approach

The table on gross domestic product by kind of economic activity is prepared at basic prices. The classification of GDP by industry follows the Singapore Standard Industrial Classification 2005, adapted from the International Standard Industrial Classification (Rev 4). Value-added estimates for past years have been benchmarked to comprehensive survey data. Estimates for recent years are obtained through the use of short-term indicators, as elaborated below:

- Manufacturing constant price estimates are derived through extrapolation with the index of industrial production. Current price estimates are then obtained through inflation with appropriate price indicators.
- Construction value added at current prices is estimated based on certified progress payments data collected by

the Building and Construction Authority of Singapore. Additional estimates are made for alterations, maintenance and repair works which may not be reflected in the certified progress payments. Value added at constant prices is obtained by deflation with appropriate price indices.

- For utilities, current price estimates are derived directly from utilities companies' income and expenditure statements. Constant price estimates are derived by extrapolation with volume indicators on the consumption of electricity, gas and water.
- For agriculture and fishing, current price value added estimates are obtained by inflating constant price data with the price indices of local farm products. Constant price estimates are derived by extrapolation with volume indicators such as quantity of farm production.
- Value added estimates of the wholesale and retail trade industry are obtained by extrapolation with the Wholesale Trade Index, Retail Sales Index and external trade statistics.
- For the transport and storage industry, current price estimates are derived directly from statements of income and expenditure, and inflating constant price estimates with appropriate price indicators. Constant price estimates are derived by extrapolating with volume indicators, such as volume of cargo, passenger-kilometres and number of postal articles.
- Data on hotel revenue and restaurant turnover are used to derive current price estimates. Constant price estimates are obtained by extrapolation with indicators such as room days occupied, visitor arrivals and the Catering Trade Index.
- For the information and communications industry, current price estimates are derived directly from statements of income and expenditure from telecommunications companies and through inflating constant price estimates by appropriate price indicators. The constant price estimates are obtained using volume indicators such as international call usage, mobile phone and broadband subscriptions.
- Current price estimates for the financial services sector are derived from the quarterly survey of financial institutions. Administrative data such as loans and advances, and volume of stocks transactions are used as supplementary indicators.
- Current price estimates of the business services industry are mainly derived from income and expenditure statements and inflating constant price estimates. Constant price estimates are largely derived through extrapolation with volume indicators such as number of property transactions and employment.
- For the other services industries, current price estimates are derived from government administrative data on wages, income and expenditure statements of statutory boards, and inflating constant price estimates with appropriate price indicators. Constant price estimates are mainly derived from extrapolation with volume indicators such as employment, number of students, number of outpatient visits and admission tickets to performances.
- The estimates of ownership of dwellings are imputed based on the annual value of properties as assessed for property tax, as well as movements in housing stock.

Slovakia

Source

The preparation of annual national accounts statistics in Slovakia is undertaken by the Section of National Accounts and Prices of the Statistical Office of the Slovak Republic located in Bratislava.

The official estimates are annually published in the annual Statistical Yearbook and since May 2007, they are also available on the website of the Statistical Office (www.statistics.sk).

General

The estimates have been prepared in accordance with the concepts and definitions of the European System of Accounts (ESA95), introduced in 2000.

When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

The selected data of annual national accounts were until 1993 compiled by a transformation of Material Product System data into SNA, according to the recommended methodology released by the United Nations Statistics Division. After the compilation of the first annual accounts under ESA79 methodology for 1993 (in 1996) the first big revision of quarterly accounts was made.

Preparation for the implementation of the revised transmission programme ESA 95 and the accession of the Slovak Republic to the EU had resulted in measures which changed the strategy of revisions in the System of National Accounts in Slovakia. The annual accounts compiled for 1994-2003 included the gradual implementation of further principles of ESA95 in relation to the building-up of the required data sources. The big revision covered implementation of the significant revision of ESA95 methodology in the time series from 1995 until the reference year (revision of historical data for the time periods before the existence of the independent Slovak Republic or for the years 1993 and 1994 is not carried out in accounts). Big revision of annual national accounts was done in 2005-2006 for the time series from 1995 up to 2003 (data for 2004 and 2005 were consistent already within their compilation).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and expenditure approach. The calculation of GDP by income approach is not to be considered as an independent method.

Gross domestic product at constant prices is estimated mainly through the production and expenditure approach not through the income approach. For constant price estimates 2000 is currently used as the base year.

Expenditure Approach

When calculating particular components of the expenditure approach, the statistical surveys, administrative data sources and other alternative sources are used as the basis. Alternative sources are represented by other data sources, which are available from web sites (annual economic reports) or by specific sources based on the direct agreement between the SOSR and data suppliers.

For the final household consumption statistical Household Budget Survey is the main source for the calculation as well as data on retail trade sales. Additional data sources are data on market services, administrative data, mainly from the Ministry of Finance, Tax Authorities, National Bank of Slovakia, Ministry of Defence (Interior, Education) and from the Police Headquarters. Apart from the direct statistical and administrative data sources, alternative sources are used, e.g. annual reports, press, consultations with experts, which serve for the purposes of indirect

estimation methods intended for the verification of estimates.

For the final consumption expenditure by general government the administrative data reported in questionnaires on revenues and expenditures as well as on the fulfilment of budget and on the fulfilment of selected financial indicators related to particular organisations of general government are used.

For calculations of gross fixed capital formation and changes in inventories, the annual structural statistical survey is the main data source. Additional data sources are the balance sheets data as well as alternative data sources like annual reports, data provided by stakeholders according to special agreements.

For the exports and imports estimates, statistical surveys for data on trade of goods and balance of payments for data on services are used as the main data sources.

Data for the calculation of expenditures on final consumption are recorded at purchaser's prices. Goods and services for own final uses are valued at basic prices. According to the accounting rules, the fixed assets are valued at acquisition prices, including expenditures related to their acquisition. Assets acquired during the time period under reporting are valued at current replacement prices. Similarly, the donated tangible and intangible fixed assets or leased assets are valued at current replacement prices. Own account produced assets used for own final consumption are valued at factor costs and marked-up for profit margin. Stocks of stored material and goods are valued at acquisition price, which consists of the purchaser's price and costs related to the acquisition of inventories (transportation, commissions, customs duties, insurance etc.) Data on inventories are adjusted by holding gains and losses. Both, import and export of goods are valued at FOB prices.

All estimates of particular expenditure components of GDP, except final consumption of household, are figured out by using a direct method, which is based on direct data available from statistical surveys, administrative and alternative sources. Only some items are estimated indirectly, i.e. imputed rent and gross fixed capital formation in relation to literary, entertainment and artistic originals as well as to non-observed economy. When compiling the final consumption of households, both, the direct and indirect estimation methods, are used.

Expenditure approach of the calculation of GDP at constant prices:

The estimation of particular expenditure components of GDP at constant prices is being done by using the SUT framework.

Final consumption of households:

The standard deflation method is used for the estimates of FCH at constant prices by applying the CPIs. In line with Eurostat requirements, the development of CPIs is traced according to the COICOP classification. However, for the recalculation of SUTs into constant prices, it is necessary to allocate the given CPI, or groups of CPIs, to the corresponding CPA category. This is done by using a transformation bridge between these two classifications. Within this transformation, the weighted arithmetic mean of CPIs related to those COICOP groups, which according to their nature mostly correspond to the content of the relevant CPA category, is applied. As far as weights are concerned, the weighting structure available from the price statistics is used. For the final consumption of households, the deflation of 60 commodities by CPIs is used.

Final consumption of government:

The CPIs obtained as described were used also for the deflation of final consumption of government in connection to relevant commodities.

Final consumption of NISH:

The CPIs, obtained as described, are used also for the deflation of final consumption of NISH in connection to relevant commodities.

Gross capital formation:

The gross capital formation, which is the main factor of changes in non-financial assets, covers:

- a) gross fixed capital formation
- b) changes in inventories
- c) acquisition less disposal of valuables

The recalculation of the aforementioned items into constant prices is done within the framework of SUTs as follows:

As far as the GFCF is concerned, the PPIs are used for the deflation of relevant commodities. Concretely, the vector of PPIs, compiled from the diagonal elements of the matrix of prices indices used for the recalculation of output, is applied.

As for inventories, they are deflated broken down into material, work in progress, finished goods and tradable goods by using the appropriate PPIs and the wholesale trade turnover indices. The particular components of inventories are recalculated as follows: for material the vector of PPIs, compiled from the diagonal elements of the matrix of price indices used for the recalculation of intermediate consumption, is used; for the work-in-progress and finished goods the vector of PPIs compiled from the diagonal elements of the matrix of price indices used for the recalculation of output is applied; and for goods for resale the PPIs for wholesale trade are used.

Import/ export of goods and services:

In terms of import and export, one of the problems within the compilation of SUTs at current prices and their consequent recalculation into constant prices is the indiscrimination of purchases of residents abroad and non-residents at domestic market. Another problem is that the import and export merchandise are deflated by using UVIs derived from custom data. In addition, the data sources are not available for the entire foreign trade of Slovakia but rather only for Europe. Nevertheless, the share of foreign trade of Slovakia with European countries is dominant in the total import and export of the SR. The values of import and export are compiled as FOB, i.e. they cover the transaction value of goods and the value of services, e.g. transport, insurance, reloading and storage of goods etc., provided for the delivery of goods to the border of the exporting country.

Data collection and processing of information on goods, assigned by the specification approved by Customs Office based on documents imposed for customs procedure, is performed by customs bodies. From the data provided by the Customs Headquarters of the SR, the SOSR prepares the information on the foreign trade of the Slovak Republic and publishes the indices of prices of foreign trade according to the items of Harmonised System (HS).

Whereas the foreign trade indices are processed according to the items of HS, their transformation to CPA, which is used in the SUT framework, is being done in line with the Eurostat's recommendations, following the customs nomenclatures HS/CN, taking into account the official transformation bridge.

The indices for the above mentioned CPA categories are calculated by using the weighted arithmetic mean of UVIs for export/import corresponding to the relevant HS codes by applying the relevant weights. In case where no foreign trade indices are available, or when it has not been possible to transform them in relation to the given CPA category, the PPIs and CPIs are used for export and import respectively.

For imports and exports of services, no direct price indices are available. Export of services is deflated by using corresponding PPIs and import by the deflators of the corresponding CPIs.

Income Approach

The calculation of GDP by income approach is not to be considered as an independent method. The net operating surplus and mixed income, as the balancing items, are the result of compilation of annual sectoral accounts, therefore their values are influenced by value added, which is enumerated by production approach. Within the calculation of GDP by income approach, mainly the direct estimation methods are used. The expert estimates are used in case of incomplete, insufficient and non-existing data sources for particular transactions, e.g. in the area of wages and salaries.

Data sources for the income approach for particular institutional sectors are taken from the annual statistical surveys and administrative data sources.

Other taxes on production and import consist of all taxes, which are paid by enterprises due to their own production activity, regardless of the amount or value of produced and/or sold goods and services. Other subsidies on production represent subsidies, i.e. current transfers to the national institutions, intended for the compensation of their financial damage. Administrative data as well as statistical data are to be considered as the main data source.

The calculation of consumption of fixed capital is based in all sectors and sub-sectors on the value of durable tangible and intangible assets expressed at replacement prices. The CFC is estimated only linearly, the geometric model of depreciation is currently not used. The original method for calculation of consumption of fixed capital was replaced in 2005 by the permanent inventory method (PIM) and the data were recalculated for the whole time series.

Production Approach

The main independent approach within the compilation of national accounts, and thus within the calculation of Gross Domestic Product (GDP), is the production approach. The structure of the system of national accounts is formed by complex accounts, sectoral accounts and system of both, SUTs and IOTs. The basic components of the structure of sectoral accounts are institutional sectors, transaction types and the sequence of accounts.

The output and intermediate consumption of the sector of non-financial corporations is calculated on the basis of data obtained from annual statistical structural survey. By the means of this survey, the information on indicators characterising the activity of the enterprise and its establishment units in terms of generation and distribution of resources, financial management, employment and the activity specification is obtained. The particular items in questionnaires for intermediate consumption and output are compiled in line with the ESA 95 methodology, except for the following items, by which the output and intermediate consumption are adjusted:

- in terms of output, the holding gains and losses, underestimated output, subsidies on products, tips in services, increase of the standing timber and the output of dwelling services and consumption of fixed capital are in question;
- the intermediate consumption is adjusted by the holding gains and losses, payments for financial services, capitalisation of costs on research and development, costs on the overestimated intermediate consumption and on the borderline data between the tangible fixed assets, intangible fixed assets and intermediate consumption, which stems from the different borderline for accounting of fixed assets in the national accounting system and in the ESA95 rules.

Sector of non-financial corporations includes all business entities, which carry out their business activities based on the registration in the Business Register, i.e. national legal entities, foreign persons and national physical persons performing activities for profit-making purposes in all activity areas (agriculture, forestry, manufacturing, construction, trade, hotels and restaurants, transport, post and telecommunication, selected markets services, research and development) and profit-oriented subsidised organisations, in case of which the costs are covered by sales at the level of 50% and more.

For estimates of output and intermediate consumption for the sector of financial corporations, a combination of statistical and administrative sources is used. The sector of financial corporations covers units engaged in financial intermediation and/or activities auxiliary to financial activities, delimited and allocated into the sub-sectors in line with the criteria of ESA 1995.

The main data sources for the calculation of output and intermediate consumption in the sector of general government are the administrative data sources obtained from the statements on revenues and expenditures based on the Regulation of the Ministry of Finance of the SR (MFSR). The sector of general government covers all institutional units, which are other non-market producers, whose output is intended for individual and collective

consumption and is mainly financed by the means of compulsory payments pursued by units belonging into other sectors and/or all institutional units dealing mainly with redistribution of national income and property.

For the calculation of output and intermediate consumption in the sector of households, the accounting statement being submitted by the business-making households is used and also the results from the sample statistical survey, which are afterwards grossed up to the total population of active units, are used for comparison purposes. Sector of households covers physical persons, who carry out their business activities based on the licence for sole traders and persons who are making business based on specific rules other than the licence for sole traders. This category involves free-lancers, physical persons performing agricultural activities, who are not registered according to a specific rule – the self-employed farmers registered in the municipality registers are in question.

Data for output and intermediate consumption estimates for non-profit institutions are taken from statistical or administrative sources. Sector of non-profit institutions serving households covers institutional units, mainly social and other non-profit institutions, which provide non-market services to households, associations of persons, and comply also with interests of other supportive and auxiliary organisations belonging to other sectors. These units belong to other non-market producers, whose main part of production is provided to their members free of charge or for economically insignificant prices.

All flows and stocks recorded in annual sectoral accounts are expressed in monetary units at current prices. Flows are recorded according to the accrual principle. Data used for the compilation of output are surveyed at basic prices. Data for the calculation of intermediate consumption are surveyed at purchaser's prices.

Components of production approach are calculated for each sector in breakdown according to NACE 2 digit level.

GDP by production approach at constant prices

For output, as in the case of expenditure approach, the supply/use approach is used with the estimation at the level of the 60 (ESA two-digit) branches, deflating value estimates for each of 60 (ESA two-digit) commodity groups. The price information for the various commodity groups is based on the range of available PPIs, CPIs, construction, agriculture and special or estimated prices, including those based on wage rates. All the price information used is based on the fixed base Laspeyres formula.

For intermediate consumption, as for output, estimation is done again at the level of the 60 branches, deflating value estimates for each of the 60 commodity groups analysed. Again PPIs, CPIs, together with special price information, is used; all price information is based on the Laspeyres formula.

For both, output and intermediate consumption, the working level for estimates at constant prices is being done at 502 commodity groups.

The value added at constant prices is obtained as a difference between the output and intermediate consumption both at constant prices.

For construction, an index of construction works is applied.

For trade, relevant indices according to CPA and COICOP categories are used. The CPIs according to COICOP categories are transformed into CPA categories and subcategories. In cases when the COICOP's CPIs are directly identifiable, they are simply taken over and used for deflation of relevant retail trade subcategories.

For transport, output is derived by using special deflators obtained as implicit prices from particular value and volume data. Separate deflators are used for passenger and freight activities. For communication the CPI is used.

For market and non-market services, output is mostly obtained by deflating value figures, for various industries, by movements in wages and salaries.

For the estimation of taxes and subsidies on products at constant prices the volume projection approach for VAT and for subsidies is used. For VAT, estimates are being made for those parts of the variables attracting final VAT - household final consumption, intermediate consumption and relevant part of gross fixed capital formation - by extrapolating base year tax rates, by commodity, by appropriate constant price data. For subsidies, the projection is based on data for commodity output. For excise taxes and taxes on imports, the constant price figures are obtained by deflating the tax values by relevant indices. For the trade and transport margins the volume projection approach is used as well.

Slovenia

Source

The Statistical Office of the Republic of Slovenia (SURS), National accounts division, is responsible for the compilation and publishing of national accounts statistics. The official estimates are published annually and quarterly on the website of SURS (www.stat.si), as well as in the annual Statistical Yearbook and Rapid reports. The concepts, definitions, sources of basic statistics and methods of estimation are described in these publications.

General

The estimates shown in the following tables have been prepared in line with the concepts and definitions of the European System of National and Regional Accounts 1995 (ESA95). Regular estimates of GDP by the production, the income and the expenditure approach were introduced in national accounts at the beginning of the 1990s covering the period since 1990. Symmetric input-output tables have been published for the years 1990, 1992, 1993. Supply and use tables in line with ESA95 were published for the year 1996 and from 2000 on they are published annually.

For the years 1996, 2000 and 2001 also symmetric input-output tables were published. The latest supply and use table was published for the year 2005. All the data are available through the publications and website stated above. National accounts figures for a year are first published 70 days after the end of the year as the sum of four quarters estimated within quarterly accounts.

Annual accounts estimates for the year are first published 9 months after the end of the year.

Routinely revised annual accounts estimates are published 21 and 33 months after the end of the year. The last methodological revision was completed in 2008, covering the series from 1995.

The main purpose was further alignment of GDP estimates with the European System of Accounts (ESA 95). This revision therefore improved exhaustiveness of estimates and the quality of previous estimates due to new data sources and methods used. The data are published in the national currency - Slovenian Tolar (SIT). On 1.1.2007 Slovenia joined the European Monetary Union (EMU). Fixed exchange rate for the former currency was set at 1€ = 239.64 SIT. The fiscal year is equal to the calendar year. Constant price data are calculated and published at previous year prices (t-1).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated independently by the production and by the expenditure approach. GDP by the income approach is estimated at the same time and with the same data sources as GDP by the production approach and with gross operating surplus/mixed income as balancing item. GDP by the production approach is the main approach.

Expenditure Approach

Government final consumption expenditure consists of two components. The first component, other non-market output, is equal to output by the non-market producers' concept described in the production approach, less market output less output for own final use less other non-market output. For this component the data sources are annual accounting statements.

The second component is transfers in kind of goods and services purchased by the government and by the health social security fund and directly transferred to households. For this component, data sources are government

budget statistics and annual report of the health social security fund.

Household final consumption expenditure is estimated on the basis of various source data of which the household budget survey and the retail trade survey are the principal sources. Other sources are commodity flow estimates, VAT reports, accounting data of economic accounts for agriculture, passenger car registration data and other administrative data. Annual statistical surveys with good coverage of corporations and government units are the principal data source for the calculation of gross fixed capital formation. For the government sector and aggregating purposes accounting and employment data are used. For cross-checking and for estimation of gross fixed capital formation of household production units additional data sources are VAT reports.

Changes in inventories are estimated as the difference between values at the end and at the beginning of the period at the average prices of the period. Annual accounting statements are used as the main data source, facilitating the estimation of four different types of inventories: finished goods; work-in-progress; trade goods and raw materials; and supplies. For agriculture production of households, changes in inventories are estimated within the economic accounts for agriculture. Principle data sources for exports and imports of goods are external trade statistics according to the customs declarations together with the coverage adjustments in the balance of payments data prepared by the central bank. Exports and imports of services are estimated by the central bank and the estimates are mainly based on the International Transactions' Recording System. For the estimation of the GDP by the expenditure approach at constant prices various price and volume indicators are used. Household consumption expenditure is mainly deflated with consumer price indices but also extrapolation with volume indicators is used. Government and NPISG expenditure is deflated with implicit deflators calculated within compilation of GDP by the production approach. Changes in inventories are deflated with producer price indices, price indices for agricultural products and suitable consumer price indices; in several cases unit value indices for imports are also used. For deflating exports and imports of goods the unit value indices (Paasche indices) are used. For deflating exports and imports of services consumer price indices are used.

Income Approach

GDP by the income approach is estimated at the same time as GDP by the production approach. To a large extent the data sources for primary income categories calculation are the same as for GDP by the production approach.

Basic data for the calculation of compensation of employees are taken from annual accounting statements and are arranged into three main components: gross wages, other labour costs and actual employers' social contributions. After the necessary adjustments for coverage, concepts and definitions the data are rearranged to ESA95 components using the results of the labour costs survey from the year 2000 as benchmark.

The main data source for the calculation of taxes on production is government budget data which shows by type all public revenues and their distribution to the central government, local government level and to social security funds. Subsidies on production are also based on government budget data and annual budget reports by individual ministries. The data sources for subsidies in agriculture are economic accounts for agriculture.

For non financial and financial corporations and market housing activities of households, gross operating surplus is a residual category of value added. In non market activities of general government and non profit institutions serving households, gross operating surplus equals the consumption of fixed capital (for the general government sector, consumption of fixed capital is estimated by the perpetual inventory method including public roads, bridges and similar infrastructure).

For own-account production of housing services of owner-occupiers, gross operating surplus is the sum of net operating surplus and consumption of fixed capital. Gross mixed income is a residual category of value added in un-incorporated enterprises of the households sector.

Production Approach

GDP by the production approach is obtained as an independent estimate and is covered by exhaustive data sources for all sectors of the economy. Gross value added at the level of 140 industries is calculated as the difference between output at basic prices and intermediate consumption at purchasers' prices. Taxes on products are added and subsidies on products subtracted to calculate GDP at market prices by the production approach. The main sources of data are annual accounting statements, and their filing is required by law. Other important data sources are administrative data such as annual income tax declarations in the case of production activities of households, government budget data for the calculation of taxes and subsidies, central bank statistics for monetary intermediaries, and other data sources such as surveys in the case of economic accounts for agriculture and surveys for supply and use tables which are also used for balancing purposes in the compilation of GDP by the production approach. With these data sources distinction between market and non-market producers is made at unit level. Those below the 50% criterion of financing their production costs through sales on the market are classified as non-market producers and their output is valued as the sum of intermediate consumption, compensation of employees, other taxes on production and consumption of fixed capital. In accordance with the accounting principles, data in accounting statements and administrative sources which are used for the estimation of output and intermediate consumption components are reported on accrual basis, except for a part of general government units, which report data on cash basis and need adjusting to the accrual concept.

Other data adjustments include (but are not limited to) exclusion of holding gains from changes in inventories; allocation of financial intermediary services indirectly measured to user sectors and activities; and correction of certain categories from intermediate consumption to the income approach categories. For the constant price estimates of output, intermediate consumption and value added various methods on the basis of numerous price and volume indicators are used. For some government services also the input method is used.

Solomon Islands

Source

Data was obtained from the internet website (<http://www.spc.int/prism/country/sb/stats/Economic/economic.htm>) as reported by the Solomon Islands National Statistics Office (SINSO), Department of Finance.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

South Africa

Source

The preparation of national accounts statistics in South Africa is undertaken by the National Accounts Division at the South African Reserve Bank (the Bank) and Statistics South Africa (Stats SA), both located in Pretoria. The Bank and Stats SA share responsibility for the compilation of national accounts. Stats SA is responsible for compiling the production side of the national accounts, while the Bank is responsible for compiling the expenditure side of the national accounts, as well as a comprehensive set of production, distribution and accumulation accounts in an integrated manner for the institutional sectors and the balance of payments. The official estimates of the production side of the national accounts are published in the quarterly statistically release P0441 (gross domestic product (GDP)) by Stats SA and is available at www.statssa.gov.za. The total set of official national accounts estimates are published quarterly in the Bank's Quarterly Bulletin and can be accessed on www.reservebank.co.za. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the 1993 System of National Accounts (1993 SNA). A detailed description of the sources and methods used for the national accounts estimation is contained in a supplement to the Quarterly Bulletin published in June 2005 titled "South Africa's National Accounts, 1946 to 2004" and is available at the following website address: [www.reservebank.co.za/internet/Publication.nsf/LADV/B4B9F44FE87A4DFD42257027004AD266/\\$File/SupplJun2005.pdf](http://www.reservebank.co.za/internet/Publication.nsf/LADV/B4B9F44FE87A4DFD42257027004AD266/$File/SupplJun2005.pdf). GDP and supply-and-use tables have been published by Stats SA according to the 1993 SNA in statistical release P0441. A description of the methodology for the GDP compilation is contained in the quarterly newsletter published in November 2007 and is available at the following website address: www.statssa.gov.za/Publications/P0441/P04413rdQuarter2007. Data are disseminated in millions of rand, the local currency. The data for the most recent quarters are preliminary and subject to revisions, revised data are published in the December issue of the Quarterly Bulletin and the November quarterly statistical release P0441 of each year. Minor changes in methodology are explained in notes to tables in the relevant Quarterly Bulletin. Comprehensive changes in the methodology are normally described in the issue of the Quarterly Bulletin and statistical release P0441 in which the five-yearly base year changes are first introduced. When the scope and coverage of the estimated aggregates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, an explanation is attached to the relevant table as a footnote. The current base year is 2000.

Methodology:

Overview of GDP Compilation

GDP is estimated mainly through the production approach for the benchmark years and annual estimates. For the quarterly estimates a combination of the production approach and the income method is used. The estimates for GDP by kind of economic activity at constant prices, using the extrapolation method of base-year estimates (by appropriated volume indices) have been supplemented, since 1993, by deflating output and intermediate input for the relevant sectors

Expenditure Approach

Estimates of final consumption expenditure by households are based on a variety of sources such as the five-yearly survey of income and expenditure of households conducted by Stats SA, quarterly data on the agricultural products marketed for food, monthly excise figures for beverages and tobacco, monthly retail trade sales data, number of motor vehicles and motorcycles sold for transport equipment, number of dwelling units, capital stock of residential buildings, and annual average rental values. Price deflation is used for some of the constant price estimates of final consumption expenditure by households while the base-year values of other components such as transport equipment are extrapolated by appropriate volume indices. The estimates of final

consumption expenditure by general government are derived through the use of published annual accounts and monthly issues from the exchequer account for the national and provincial government, quarterly returns submitted directly to the Bank for the extra-budgetary units, and annual and quarterly data collected by Stats SA for the local government. For constant price estimates, price deflation is used for final consumption expenditure on intermediate goods and services by general government. The base-year value of government compensation of employees is extrapolated by employment indices for general government sourced from Stats SA. Data on capital formation in the public sector are obtained from published accounts updated by quarterly returns submitted to the Bank through Government Financial Statistics (GFS) analysis. For the private sector, data on capital formation by the different industries are obtained from sources such as the annual Economic Activity Survey (EAS), and periodic large sample surveys, while quarterly results are obtained from the quarterly financial statistic surveys conducted by Stats SA and the Bank. For constant price estimates, price deflation is used. The estimates of change in inventories are based on annual EAS and results, and quarterly financial statistic surveys by Stats SA and the Bank. For constant price estimates the book value of inventories is deflated by appropriate production price indices. In the case of agricultural stocks-in-trade base-year values are extrapolated using the quarterly change in physical quantities. All relevant information for exports and imports of goods and services is based on balance-of-payments data. For constant price estimates price deflation is used for exports and imports of goods and services. The net value of gold exports at constant prices is obtained by extrapolating the value of the base year by the kilograms of gold produced.

Income Approach

Estimates of compensation of employees are based on annual EASs, census results and the quarterly survey of employment and earnings conducted by Stats SA. Annual operating surpluses are derived as residual items. The quarterly operating surpluses for the different industries are obtained from quarterly surveys of financial statistics conducted by Stats SA and the Bank. Consumption of fixed capital is calculated according to the straight-line method and valued at replacement cost. Taxes on production and imports are estimated on the basis of an analysis of government accounts by the Bank.

Production Approach

Value added by kind of economic activity is prepared at basic price values. For the period before 1993 the income approach is used to estimate the annual and quarterly value added of industries, except agriculture for which the production approach is used. From 1993 the annual value-added estimates are compiled according to the production method, whereby complete production accounts are compiled for the various industries. For quarterly estimates a combination of the production approach and the income method is used. The estimates of agricultural production are obtained by valuing physical output at net producers' prices. The value added of agriculture is obtained from periodic censuses of agriculture conducted by Stats SA, as well as quarterly value added estimates compiled by the National Department of Agriculture. For forestry and fishing, estimates are obtained from the Department of Water and Forestry Affairs and from the Marine Development Branch of the Department of Environmental Affairs, respectively. Value added of mining and quarrying are obtained from periodic large sample surveys and annual EASs, as well as quarterly sample surveys of financial statistics of mining and information from the Department of Minerals and Energy, supplemented by quarterly working results of the Chamber of Mines. Value added of manufacturing is based on periodic large sample surveys and annual EASs, as well as monthly data on production and sales, and quarterly surveys of financial statistics conducted by Stats SA, supplemented by sample surveys on financial statistics conducted by the Bank. For value added of electricity, gas and water, estimates are based on annual EASs and supplemented by annual financial statements for Eskom, a number of water boards and annual censuses of local government institutions. The value-added estimates of construction are based on periodic large sample surveys and annual EASs of construction conducted by Stats SA. Base-year estimates are extrapolated according to the trend in gross fixed capital formation for residential and non-residential buildings and construction works. Information for value added in the trade sector is obtained from the periodic large sample surveys of wholesale trade, retail trade, motor trade, and catering and accommodation, as well as EASs, conducted by Stats SA. This is supplemented by monthly surveys of turnover statistics of wholesale, the retail and motor trade, and quarterly accommodation statistics conducted by Stats SA. Estimates for the value added of the transport, storage and communication sector are obtained from large sample surveys and annual EASs as well as published financial reports of major role players such as Transnet, Telkom and the South African

Post Office. Value-added estimates for financial institutions is based on annual and quarterly surveys conducted by the Bank among banks and other financial institutions in the private sector and information reported by public corporations. Value added for real-estate and business services are based on the results from periodic large sample surveys, annual EASs and the quarterly financial statistics of Stats SA. The value-added estimates of general government services are derived from cost using the information obtained from GFS. For the value added of other community, social and personal services, estimates are based on annual EASs of social services conducted by Stats SA, supplemented by information obtained from the population censuses, the General Household Survey and annual reports of relevant non-profit institutions available from Stats SA. Annual constant value-added estimates are mainly derived from the nominal estimates using double deflation with appropriate price indices. On a quarterly basis, the constant value added of most industries is extrapolated by appropriate volume indices while in the case of agriculture the double deflation method is used.

Spain

Source

The preparation of national accounts statistics in Spain is undertaken by the Instituto Nacional de Estadística (INE), Madrid. The official estimates are published annually in "Contabilidad Nacional", INE. In this publication traditional accounts and tables of institutional sectors and industry are included, as well as the annual input-output table related to the year in which calculations are definite. The following tables have been prepared from successive replies to the United Nations national accounts questionnaires. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. The publication: "Contabilidad Nacional de España. Base 1985. Cuentas Nacionales y Tabla Input-Output" includes detailed description of utilized sources and methodology for calculation of the national accounts. Likewise, annual consecutive publications include improvements made to the procedures and sources of data of the Spanish System of National Accounts. Furthermore, a linkage of all national accounts series in Spain has been elaborated. In doing so, many complicated methodological problems have been solved such as the standardization of value for some transactions before and after including VAT in the Spanish tax system. Methodology and calculations of this linkage are published in: Contabilidad Nacional de España. Serie Enlazada 1964-1991. Base 1986". When the scope and coverage of the estimates differ from conceptual or statistical reasons, from definitions and classifications recommended by the SNA, a footnote is indicated to the relevant tables. On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Spain the currency name for the data before 1999 is "1999 ESP euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 166.386 peseta. - The name of the currency of the newly submitted data is "1999 ESP euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Spain, like for example all old data following the 1968 SNA is still in "peseta", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used for calculation of collective consumption expenditure of government, changes in stocks and imports and exports of goods and services. This approach combined with equilibrium of resources/employment is used to estimate private consumption and gross fixed capital formation. Calculations of collective consumption of government are based on data from budgetary data from central government, territorial and social security administrations. Calculation of private consumption is made with data from income and expenditure survey, using the commodity flow method. In calculating value of stocks several sources are used,

among them: data from Fondo de Regulacion y Ordenacion de Producciones y Productos Agrarios; Servicio Nacional de Productos Agrarios for agricultural sector and annual industrial survey, which has large coverage of energy and industrial units (exhaustive for establishments with more than 20 employees and by sampling for establishment with less than 20 employees). Data on supply (production from industrial survey data and external trade from customs data) and demand (data from the Ministry of Agriculture for agricultural production units, Construction Survey of the Ministerio de Obras Publicas y Medio Ambiente for construction units and data from government) are used for fixed capital formation calculations. Balance of payments is the source of information for calculation of imports and exports of goods and services. Balance of Payments calculation is based on external trade statistics, data on external monetary flows and other complementary information, from insurance company surveys and government. Regarding constant price calculations, all GDP aggregates made with expenditure approach, are deflated with appropriate price indexes.

Income Approach

Calculations on compensation of employees are made with data from statistical sources of each sector or industry, as well as research on employment costs. As in the case of wages and salaries, information is used from: agricultural survey on wages and salaries of the "Ministerio de Agricultura"; survey on salaries on industry and services (quarterly short-term statistics) and labor costs survey (quarterly) and from statistics on collective agreements of the Labor Ministry and Social Security. Calculation of social security contributions is made with data from government accounts which are elaborated by "Intervencion General de la Administracion del Estado". The same source is used for taxes and subsidies on production and imports. In the case of institutional sectors, the operating surplus is calculated with data from specific sources: households, credit institutions, insurance companies and government. In the case of enterprises and non-financial quasi-enterprises, operating surplus is calculated by the difference with respect to the total national economy which in turn has been calculated by industry with the functional analysis approach.

Production Approach

Initially, Gross domestic product by industry is calculated at market prices in accordance with the criteria on definition and valuation of transactions adopted by the Spanish National Accounting, in accordance with the European System of Integrated Economic Accounts on actual production valued at producers' prices, intermediate consumption at purchasers' prices. Calculations for agricultural sector are made with data from the Ministry of Agriculture (agriculture accounts, statistics on production) and by INE (sectors of agricultural inputs) which are integrated and adapted to the SNA. For mining and energy activities, economic data is used from EI, as well as other set of information from the Ministry of Industry and Energy in conjunction with INE. The industrial survey is the basic data source for calculations of manufacturing industry. Data from the survey of structure and construction are used for construction activities, as well as building and dwelling statistics. Internal trade survey is used for trade calculations. The survey is carried out quarterly and it has a large coverage. Up to now, 1984, 1988 and 1992 surveys have been carried out. Specific studies on trade are also carried out by the Direccion General de Comercio Interior. In the case of hotels and restaurants, there are many sources on the short-term evolution of these activities (rooms, rate of occupancy, etc.) as well as two exhaustive structural researches carried out by INE: hotel's survey (1987) and Encuesta de Restauracion (1989). Calculations on transport are based on data from RENFE (public enterprise) and other public and private railroad enterprises; airline enterprises; survey on transport of travellers and transport of goods that is used for road transport, and data from maritime enterprises are used for maritime transportation. Calculations of value added for communications are made directly from state monopolies data. Data for financial and insurance activities are from the directly implicated institutions. Institutional sector credit accounts are elaborated by the Banco de Espana. Calculation for imputed rents is based on income and expenditure survey results; rents are imputed at total cost base, hence net rent is considered as property income. Production of government services is obtained from Ministerio de Economia y Hacienda data. Data on public and private health sector is from government accounts, complemented with income and expenditure survey and health establishments survey. Accounting of other services is based on accounting data, specific surveys and on the number of employed persons reported by population censuses and labour surveys, comparing such data within the framework of the input-output table elaboration. Value added of domestic services and other services rendered to households is obtained from the income and expenditure survey. Calculation at constant prices is made by

using double deflation in the case of agriculture, energy industry, construction and certain services. Other services are deflated or extrapolated in accordance to the availability of appropriate price or quantity index.

^a Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.

^b Mixed income, net. Excludes consumption of fixed capital.

Sri Lanka

Source

Reply to the United Nations national accounts questionnaire from the Sri Lankan Department of Census and Statistics, Colombo. The official estimates are published by the Department in "National Accounts in Sri Lanka".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following presentation on sources and methods is based mainly on a report by the U.N. Regional Adviser of National Accounts entitled "Assessment of sources, methods and reliability of estimates of gross domestic product by kind of economic activity in Sri Lanka (1975)" and on a detailed and comprehensive information received from the Department of Census and Statistics in 1978.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, gross fixed capital formation in the public sector and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used to estimate private final consumption expenditure. The commodity-flow approach is used for gross fixed capital formation in the private sector. Changes in stocks are estimated as a residual. General government expenditure consists of actual expenditure made by central government and current expenditure by the local government on goods and services which are obtained from the Treasury Votes Ledgers and the Ministry of Local Government, respectively. Private consumption expenditure is estimated by using the commodity-flow method on the basis of imports as well as domestic goods available for consumption. Benchmark estimates for selected consumer items are available in value terms through the use of household survey data. These estimates are extrapolated by using the increase in population and price levels. For gross fixed capital formation in the public sector, direct estimates are prepared on the basis of information available in the budgetary accounts. For building and other construction, the supply of locally produced building materials are first compiled, adding 45 per cent to the production values for trade and transport margins while data on imported materials are obtained from customs returns adding import duties and 45 per cent for trade and transport margins. It has been found that building materials constitute 45 per cent of the construction cost with wages and profits at 55 per cent. For machinery and equipment, import statistics are analyzed in detail. Estimates for exports and imports of goods and services are based on foreign trade statistics and balance of payments data. For the constant price estimates, all items of Gross domestic product by expenditure type are deflated by appropriate price indices or extrapolated by using quantum indices.

Income Approach

Data on wages and salaries in the government sector are obtained from Treasury records. In order to estimate compensation of employees in the private sector, the percentages of wage component for the key sectors, obtained from the socio-economic survey data for 1980/1981, are applied to the respective activity. Based on special inquiries made, depreciation is assumed to be 33.3 per cent of the value of fixed assets up to 1978 and 20 per cent for the years 1979, 1980 and 1981. Indirect taxes are obtained from government revenue records and subsidies from treasury records.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in producers values. The production approach is used to estimate value added of most industries. For livestock and forestry, the expenditure approach is used and for some of the service sectors like banking and transport, the income approach is used. Estimates of value added for tea and rubber have been revised by using the production approach. The estimation of coconut production is based on domestic and industrial consumption and exports. The annual cost of production returns are used for estimating inputs. The volume of paddy production is estimated on the basis of acreage statistics obtained from a multistage sample survey of crop-cutting. Own-account consumption is estimated as 10 per cent of production. Benchmark estimates for fruits and vegetables are based on the 1973 consumer finance survey. These are extrapolated for current years by increase in population and price levels. For livestock products, the per capita consumption obtained from the 1973 consumer finance survey is multiplied by each year's mid-year population. Production data for the mining and quarrying sector are obtained from the Department of Geological Survey. The value of input is assumed to be 15 per cent of the value of gross output.

For large-scale manufacturing, quantities and values of gross output and values of inputs are submitted in annual returns furnished by the registered industrial establishments. Benchmark estimates for small-scale industries are obtained from the 1971 survey on the unorganized sector conducted by the Industrial Development Board. Extrapolation is done by using the growth in the labour force and the wage index. Data on electricity, gas and water are obtained from the Ceylon Electricity Board and the Ministry of Industries. The value added of construction activity in the private sector is based on locally produced and imported building materials obtained from the annual returns of manufacturing establishments and the customs returns, respectively. For the government sector, value of materials used in building and other construction accounts for 45 per cent of the gross value. This estimate is deducted from the value of the total supply of materials to obtain the value of material used in the private sector. Value added for the distributive trade is measured by net trade margins earned by traders on various types of products. Gross trade margin estimates are made separately for exports, local market production, government and private imports, etc. From these estimates 15 per cent is deducted for input. Benchmark estimates for hotels and restaurants have been obtained from the 1969/70 socio-economic survey. These estimates are extrapolated by population growth and a specially constructed index for meals consumed outside homes.

For transport in the government sector, the expenditure on personal employment is taken as value added. The gross value of goods, transport and trade is obtained by applying specified distribution margins to the c.i.f. value in the case of imports and to the producer value in the case of locally produced goods. Wherever retail and producer prices are available the difference between them is taken as the distribution margin. For the financial sector, value added is based on data obtained from the Central Bank and concerned institutions. Benchmark data for gross rental values have been obtained from the 1980/81 socio-economic survey. These estimates are applied to the housing stock, with an allowance made for rental increases. The value added of government services is obtained from the treasury accounts. For the private sector, value added is based on expenditure data obtained from the 1980/81 consumer finance survey, extrapolated by the growth in the labour force adjusted for changes in wages. For the constant price estimates, price deflation is used for most of the industries. For some agricultural products, electricity, gas and water, transport and government services, value added is extrapolated by a quantity index.

Source

Reply to the United Nations national accounts questionnaire from the Algemeen Bureau Voor de Statistiek, Paramaribo. The official estimates are published by the Bureau in "Nationale Rekeningen van Suriname".

General

The estimates shown in the following table have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Swaziland

Source

National Accounts are compiled by the National Accounts Unit in the Central Statistical Office, Mbabane, Swaziland. Official estimates are published annually by the Central Statistical Office in "National Accounts Report" and in other official publications.

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The CSO has incorporated the guidelines given in the 1993 SNA in the concepts underlying the GDP estimates, where resources have permitted. As a result the structure has changed considerably. The CSO reviewed the changes needed to bring the scope of the national accounts into line with the 1993 SNA. The transition to the 1993SNA was facilitated with technical assistance from the International Monetary Fund (IMF) through the General Data Dissemination System (GDDS) project, in which Swaziland has been participating since 2003. These technical assistance missions helped the national accounts unit to refine the methodology used to prepare the accounts and improve the quality of the data. Following these missions, the methodology used is now in conformity with 1993 SNA.

This series differs from previous ones because of rebasing. A general issue of concern relating to previously published volume estimates is that they have an old base year of 1985. The international standard is to rebase at least every 5 years. The CSO was under the impression that it is only possible to rebase when a comprehensive set of source data become available. It is true that, ideally, rebasing should take place for a year when comprehensive source data are collected. However, it is possible to rebase on any year, which results in the volume estimates being based on the pattern of production for that year. So, the IMF mission assisted the CSO to rebase their GDP estimates to the year 2000.

Methodology:

Overview of GDP Compilation

GDP is calculated using the production and expenditure approaches.

Expenditure Approach

The final consumption expenditure is derived as a residual using the GDP from the production approach.

The gross fixed private capital formation is derived largely imports of capital goods. The imports considered are those that are used for construction of industrial buildings, residential buildings, other types of construction, transportation equipment, farming equipment, and plant and equipment under construction. Gross fixed public capital formation is obtained from central government expenditures. Figures for imports and exports of goods and services are obtained from customs and balance of payments statistics. The balance of payments is prepared by the Central Bank of Swaziland in accordance to the Balance of Payments Manual 5 which is in line with the SNA1993 classifications and those used in the national accounts.

Production Approach

Data on production in the different economic sectors are obtained from various sources. Data on production are at

base prices. Data on the crop production, livestock and forestry are obtained from the Agriculture Statistics Unit and the Ministry of Agriculture. The Agriculture Statistics Unit conducts surveys on subsistence and commercial farmers every year.

Data on the production of manufacturing, electricity, wholesale and retail and the other industries are obtained statistical surveys conducted yearly as well as administrative data. The value of the non-merchandise production of public administrations is calculated from the wage bill. Taxes less any subsidies on production and fixed capital consumption are from the Ministry of Finance government accounts. An estimate is done for informal sector activities in the sector where there is such activity based on the 2007 Labour Force survey.

^a Includes Financial intermediation services indirectly measured (FISIM).

Sweden

Source

The preparation of national accounts statistics in Sweden is undertaken by Statistics Sweden. The annual estimates of certain standard tables are published on the internet (www.scb.se), in the statistical databases and in a series of Statistical Reports entitled "Nationalräkenskaper - National Accounts" 23 months after the year in question. Some tables are also published in the annual Statistical Yearbook. The concepts, definitions, sources of basic statistics and methods of estimation in current and in constant prices are described in the GNI Inventory and the Description of price and volume measures respectively, which are also available on the website. The data in the following tables was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of The System of National Accounts 1993 (1993 SNA). Time series on the most detailed level are available from 1993 onwards. On a more aggregated level series are drawn back to 1980. Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Separate input-output tables have been published for the years 1964, 1968, 1969, 1975, 1980 and 1985 in "Input-Output tabeller for Sverige". Input-output tables for 1995 and 2000 are available on the website. Chain indices are used to measure volume growth and the resulting chained constant prices data are not additive.

Methodology:

Overview of GDP Compilation

Complete calculations of the Swedish national accounts are currently only undertaken for the expenditure and the production approaches, respectively. Independent industry-by-industry calculations of GDP from the income side were undertaken partly as an experiment for the period 1980-1993. Since the changeover to SNA93, however, complete income calculations have not been carried out although it is the intention to resume them.

The main approach in the calculations is geared to the use side. The statistical basis is well developed, with possibilities for comparison between different independent sources. The annual calculations are balanced both in current and constant prices in a system of supply and use tables for 400 product groups. These form the basic tables, which can be further developed to input/output tables. The system also includes employment calculations, with average numbers of employees and hours worked.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure is calculated from the cost side. However, in November 2007 will be published compilations of individual non-market production for the latest years based on output methods. The calculations for the central government are based on information collected by The Swedish National Financial Management Authority. For local government the calculations are based on statistics collected by Statistics Sweden and The Swedish Association of Local Authorities and Regions. Private consumption expenditure consists of approximately 145 items, for which a number of estimation methods are used. Information from cash registers and VAT-registration is the source for the estimate of food consumption, and for most of the remaining goods, the estimates are based on a combination of the Household Budget Survey, Structural Business Statistics, vehicle registers, energy balances and currency exchange. Gross capital formation estimates are derived from Structural Business Statistics and investment and changes in stocks surveys from the different sectors of economic activity and from government accounts data. Exports and imports of goods and services are mainly estimated from foreign trade statistics and balance of payment statistics of the Swedish Central Bank. For the constant price estimates, price deflation is used for most of the expenditure items, the current values being deflated by various price indexes such as weighted consumer price indexes, adjusted export and import price indexes, price indexes for different

capital goods, etc. Components of government consumption expenditure are deflated by relevant price indexes, except wages and salaries which are extrapolated by employment indexes.

Income Approach

Estimates of the cost components of the gross domestic product are for compensation of employees based on statistics on income verifications from employers with addition for employers' contribution to social security schemes etc. Consumption of fixed capital is calculated from capital stock values. Data on indirect taxes and subsidies are based on government finance statistics. Operating surplus is a residual item.

Production Approach

The table on gross domestic product by kind of economic activity is calculated in basic values. Value added is derived from the supply and use tables. The supply and use tables are calculated annually in current and constant prices starting from 1980. Statistics from the Board of Agriculture (Economic Accounts of Agriculture) is the main source of information for the estimation of the agriculture sector. Estimates of output and intermediate consumption of most industries, both production and services, are based on annual censuses (SBS). Special calculations are made to include establishments not included in the census. Output of construction is calculated mainly from the demand side. Production of the trade sector (trade margins) is calculated within the supply and use tables. The source for central government services is statistics from the Swedish National Financial Management Authority, estimates on local government are based on the same material as for the expenditure side. The general approach for the constant price estimates is double deflation. Different kinds of price indexes are used, such as producer's price indexes, consumer price indexes, implicit price indexes, etc. For producers of government services compensation of employees is extrapolated by employment statistics (hours worked).

Switzerland

Source

The annual national accounts statistics are produced by the National accounts division of the Swiss Federal Statistical Office located in Neuchâtel. The official data are published yearly on the internet site www.bfs.admin.ch under "national economy topics". The data are also presented yearly in the publication "Le système de comptabilité nationale", as well as in the annual Statistical Yearbook.

General

Since 2003 the national accounts estimates are produced in accordance with the concepts and definitions of the European System of Account 1995 (ESA 95). The series have been retropolated until 1980. Previously the estimates were prepared in accordance with the European System of Accounts 1979 (ESA 79). Constant prices are calculated at prices of the preceding year. The concepts, definitions, sources of basic statistics and methods of estimation are described in the publication "Une introduction à la théorie et à la pratique des Comptes nationaux: Méthodes et concepts du SEC" which was edited in 2003.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated through the production and expenditure approach, without giving more weight to one of these two approaches. Income approach is also compiled, although no specific sources are used. Input-Output tables are compiled on an irregular frequency, and benchmark values are derived from GDP data.

Expenditure Approach

Final consumption expenditure by general government is compiled on the basis of the accounting records of the various authorities. Final consumption expenditure by households is mainly derived from survey to households. Data on increase in stocks are based on regular survey to nonfinancial corporations. Gross fixed capital formation in machinery and equipment is estimated by using the commodity flow method. For construction, the gross value is derived from an annual survey. The estimates of exports and imports of goods and services are based on foreign trade statistics and the balance of payments. Consumer price index is largely referred to for the expenditure approach at constant price. Construction price index is used for investment in construction.

Income Approach

No specific sources are used to compile the GDP through the income approach. For example, estimates of compensation of employees are based on contribution paid by employers to the social security funds. Indirect taxes and subsidies are obtained directly from the records in the accounting of the various authorities.

Production Approach

Gross domestic product is prepared at market prices. The production approach is used to estimates value added of all industries. For nonfinancial corporations the value added is derived from the result of an annual survey to the enterprises of this sector. For financial institutions, excluding the insurances, the value added is estimated from data compiled by the central bank, and made available in the publication "Banks in Switzerland". Estimates for insurance companies are derived from administrative data and exploitation of data collected by the Federal Office of Private Insurance. For general government (including social security funds) the estimates are calculated on the basis of the accounting records of the various authorities. GDP at constant price is estimated by using appropriated price indexes for each component of the value-added by kind of economic activity.

Table 1.1 Gross domestic product by expenditures at current prices

Syrian Arab Republic

Source

The preparation of national accounts statistics in Syrian Arab Republic is undertaken by the Directorate of National Accounts, Central Bureau of Statistics, Damascus. The official estimates are published annually in the "Statistical Abstract", issued by the Central Bureau of Statistics. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The following presentation of sources and methods is based on a report entitled: "National Accounts of the Syrian Arab Republic and Syria's First Effort at Implementing Stages of the New United Nations System of National Accounts 1968 (1968 SNA)". The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, exports and imports of goods and services, and part of changes in stocks. This approach, in combination with the commodity-flow approach, is used to estimate gross fixed capital formation. Private final consumption expenditure is obtained as a residual. The basic data for government final consumption expenditure estimates are available from the budgets of the state, the municipalities and religious endowment administrations. Stock fluctuations are not estimated. For gross fixed capital formation, detailed classification of import statistics are utilized for machinery and equipment. Added to the c.i.f. values are import duties, other indirect taxes and estimated trade margins. For construction in the private sector, estimates are obtained by multiplying the area of floor space indicated in the annual census by the average price per square metre and by adding thereto the value of repairs carried out. The estimates of exports and imports of goods and services are based on foreign trade statistics and balance-of-payments data. For the constant price estimates, price deflation is used for government final consumption expenditure and gross fixed capital formation. Price deflation and extrapolation by volume index are used for exports and imports of merchandise. Private consumption expenditure is obtained as a residual and no estimates for increase in stocks are made.

Income Approach

The cost-structure table of the gross domestic product is not being estimated.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most industries. The income approach is used for some private services and for producers of government services. The commodity-flow approach is used to estimate the gross output of the trade sector. The data on field and animal agricultural production are collected by the Ministry of Agriculture. Gross output and intermediate input are compiled per individual commodity group, estimated from figures gathered separately on quantities and prices. The agricultural prices were obtained through a census for the year 1971. For other years, only wholesale prices are known while producers' prices are derived on the basis of varying assumptions. Own-account consumption of agricultural production is mainly based on the sample survey conducted in 1970 and the 1968 family budget survey.

Data for extractive industries, such as crude oil and phosphates, owned by the state are obtained from reports that include the size and value of production and intermediate consumption. Extractive industries in the private sector are based on industrial surveys. Data concerning industrial public enterprises are available from the Union of Industries. For the private sector, the Central Bureau of Statistics has undertaken a general economic survey for 1971, which covers all establishments employing more than nine persons and includes a sample of the smaller establishments. The frame for the survey was based on the 1970 population census. Other data sources has been used to cover establishments created after 1970. In the manufacture of food, the value of flour is multiplied by the ratio between the value of bread and the value of flour derived from the economic survey. Similar ratios between gross output and intermediate consumption and compensation of employees are used for the estimation of intermediate consumption and compensation of employees.

The sources of data on the electricity and water industries are the accounts of the concerned enterprises. For construction, estimates of production values and intermediate consumption in the private sector are made by determining the value of construction projects completed during the year and adding to it the value of the completed portions of unfinished buildings and construction projects. The progress reports issued by the State Planning Commission are the prime source of data for construction in the public sector. For trade, gross margins are estimated as percentage mark-ups on commodity-flow values. The value of intermediate consumption is estimated as 8 percent of the production value. Information on railway and air transport and communication activities is supplied entirely by public enterprises. Gross output of road transport are based on the registration of licenses issued, and on gross revenue and cost data by type of unit, based on ad-hoc transport sample surveys. Estimates of pipeline and sea transport are obtained from concerned enterprises.

For banks, the production value is calculated by adding to actual expenditure imputed service charges. Estimates of insurance and real estate activities are derived from the concerned companies. The production value of the housing sector is estimated as rents paid to others for house leases plus the estimated rental value of owner-occupied houses. For community services, the basic data are available from the accounting records of public enterprises and the budgets of public authorities. The results of the 1971 general economic survey are used for some private services while proxy output indicators derived from the results of the 1970 population census and administrative records are used for other services.

For the constant price estimates, double deflation is used for agriculture. Value added of all other economic activity sectors of GDP, except trade, is extrapolated by a quantity index. To obtain wholesale and retail trade margin at constant prices, the same percentages as those used for current prices are applied to the production values of the agricultural, mining and quarrying and manufacturing sectors.

Tajikistan

Source

The institution responsible for compiling national accounts statistics is the System of National Accounts and Financial Statistics Directorate of the State Statistical Committee of the Republic of Tajikistan.

National accounts data, such as the gross domestic product (GDP) structure on a cumulative basis, are published in a monthly report entitled The Socio-economic Situation in Tajikistan, for each quarter. GDP (production account by industries and GDP use) by expenditures is published in the statistical compendium Statistical Yearbook of the Republic of Tajikistan. The statistical compendium Main Indicators of the System of National Accounts is also issued as a separate publication. The information published is material which may be used by a broad target audience (including government bodies, scholarly research organizations and institutions of higher learning) and individual researchers working on and interested in issues of macroeconomic analysis and forecasting.

General

Development of the calculations for the system of national accounts (SNA) indicators is based primarily on the methodology adopted as the international SNA 93 standard as well as recommendations and methodology developed by the Statistical Committee of the Commonwealth of Independent States in accordance with SNA-93 concepts. All the accounts used in constructing national accounts are developed on the basis of official statistics on various industries, individual studies and sampling surveys, and budget and banking statistical data.

It should be noted that preliminary assessments and adjusted calculations are produced. Preliminary assessments are made cumulatively after each month's reporting period, based on a simplified scheme, while the adjusted ones are produced according to an expanded scheme in September and October of the year following the reporting year. At the same time, in March and April of each year, tables are developed for calculation of output, intermediate consumption and value added, by industries, with industries statistics then used to gather adjusted annual data.

In accordance with SNA-93, the preferred method for converting gross value added (GVA) into previous year's prices is double deflation or use of the gross output price index (for nominal output deflation) and the intermediate consumption price index (for nominal intermediate consumption deflation). But in the absence of intermediate consumption indices, the direct deflation method is used with GVA converted into the previous year's prices. At the present time, the State Statistical Committee is making provisions to carry out calculations on national account aggregates in constant prices using chain indicators for fixed base years.

Methodology:

Overview of GDP Compilation

In accordance with SNA methodology now in effect, GDP calculations are carried out in three ways: using the production approach, the expenditure approach the income (distribution) approach.

Given that production information is the most reliable and complete, the production approach is the main method for calculating GDP.

Expenditure Approach

Household final consumption expenditure includes household expenditures for the procurement of consumer goods and services in all commercial enterprises and markets, in domestic, housing and public utilities enterprises, passenger transport and communications enterprises and cultural, health-care and educational institutions, as well as the cost of goods and services consumed in their natural form, produced for private consumption. The information sources are administrative reports of the commercial-1 and services-1 type and family household

budget surveys, which carry out statistical price surveys by industry and gather other statistical information on a monthly basis.

General government consumption expenditure is compiled on the basis of State budget operating expenses. General government final consumption expenditure is made equivalent to the gross output of the State institutional sector, which comes from the production account (i.e., is transferred from the production account), and includes individual and collective consumption expenditure.

Final consumption expenditure of non-profit institutions serving households consists of the expenditure of those organizations for consumer goods and services provided to households free of charge or at prices that have no economic significance. Membership dues, contributions and other transfers are the main source of funding for their expenditures.

Primary data on gross fixed capital formation consist of capital investments attributed to clients, geological prospecting work, increase in the value of primary herd cattle, forestation, expenditures for procurement of equipment, tools and items of long-term use and books for libraries, made by budget organizations against budgetary funds. It also includes fixed capital coming in at no cost; retired assets and so forth are deducted. Information sources include administrative statistical reports, which come in on a quarterly and annual basis, construction industry statistics, as well as State budget use reports and fixed asset financial statements.

Calculation of changes in inventories is based on existing forms of financial statements of ministry and agency enterprises.

Imports and exports of goods and services in current prices are determined according to existing National Bank information. The Republic balance-of-payments indicators are used for calculations.

Income Approach

The GDP through the income approach reflects the payment of primary income by institutional units directly involved in the production of goods and services.

When arrived at using the income formation method, the GDP consists of compensation of employees, the gross operating surplus by type of economic activity and net taxes on production and import.

Compensation of employees is calculated on the basis of amounts paid out and includes income tax and other payments to be made by hired workers. Compensation of employees is comprised of two basic components: wages, and deductions by employers for state social insurance. Administrative statistical reporting on labour statistics is the source of this information.

Taxes on production and imports less subsidies: information sources are the section on income and expenditure indicators of the State budget.

Production Approach

Calculating the gross domestic product using the production method involves adding up gross value added by industry in primary prices (as the difference between gross output and intermediate consumption) plus net taxes on products (with subsidies deducted).

Output of goods and services means the value of goods and services which are the outcome of production activity of the branches of the economy during the reporting period. All economic branch information is included in the GDP calculation based on actual market value.

Intermediate consumption consists of the value of goods and services which are fully consumed in the production process during the reporting period. Consumption of fixed capital is not included in intermediate consumption.

Intermediate consumption includes, as a separate entry, financial intermediation services indirectly measured. Theoretically, the use of these services should be distributed between the intermediate consumption of all industries, but due to a lack of information, a notional sector is the consumer of these services, and its output is established as equal to zero. This approach shows that the sum of gross value added for the economy as a whole is reduced by the volume of financial intermediation services indirectly measured.

Gross value added is calculated at the branch and sector level as the difference between output of goods and services and intermediate consumption (prior to deduction of consumption of fixed capital).

Overview of the Compilation of the Integrated Economic Accounts

The system of accounts consists of sequential, reciprocally linked accounts, with each account reflecting a specific type of activity such as production, generation, allocation or use of income. Each account is balanced by introducing a balancing item, which is defined as the difference between total resources and uses indicators. The balancing item from one account is carried over as the first item of the next account in the resource column, which guarantees the consistency of the accounts.

At the present time, the system of national accounts includes the following accounts:

- goods and services account;
- production account;
- generation of income account;
- allocation of primary income account;
- secondary distribution of income account;
- use of disposable income account;
- capital account.

Thailand

Source

Reply to the United Nations national accounts questionnaire from the Office of the National Economic Development Board, Bangkok. The official estimates are published annually by the same office in "National Income of Thailand".

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), as far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. The commodity-flow approach, supplemented by the expenditure approach, is used for the estimation of private final consumption expenditure and gross fixed capital formation. Estimates of government consumption expenditure are compiled from government accounts. Expenditure financed by foreign aid is added. For the main items of private consumption expenditure, the commodity-flow method is used. The per capita consumption of other items such as flour and chicken is based on family expenditure inquiries extrapolated by population and price changes. Stock changes in the private sector are estimated on the basis of commodity balance accounts. The estimate of private building activity is based on building permits issued for the urban areas and on municipal building construction costs. Additions are made for the input profit of builders based on sample surveys, for permanent fixtures and fittings and for construction for own use. For the public sector questionnaires are sent to various government departments and enterprises. Estimates of other capital formation are based on foreign trade statistics. Import duties, mark-ups and installation costs are added to the import values. Exports and imports of goods and services are derived directly from the balance of payments. For the constant prices estimates, current values of most of the expenditure items are deflated by appropriate price indexes. For private consumption expenditure, direct revaluation at base year prices is used when information is available on quantities of commodities consumed.

Income Approach

Estimates of compensation of employees are derived from the cost of production estimated through surveys for the agricultural sector, from data on the average wage per worker multiplied by the construction sector, and for the public and financial sectors, the estimates are obtained from their records. Depreciation is estimated as 12 per cent and 15 per cent of gross domestic product for building construction and equipment, respectively. Indirect taxes net of subsidies are estimated by the Comptroller-General's Department. Operating surplus is obtained as a residual.

To follow the new concept of balance of payment version (BOP5), the reinvested earning is included into the national income statistics started from 2001 to be consistent with the BOP that compiled by the Bank of Thailand.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate value added of most industries. However, the expenditure

approach is used to estimate part of the agricultural sector, the income approach for public administration and defence and part of the private services and the commodity-flow approach for gross output of the trade sector.

For the agricultural sector, annual production figures of paddy and 19 other principal crops are reported by the Department of Agriculture while vegetables and fruit production is based on consumption estimates. The production figure of each crop is multiplied by the average ex-farm prices. Annual livestock production estimates are based on inventory changes and the number of animals that are exported or slaughtered while cost estimates are based on information from the Department of Livestock Development. Own-account consumption of rice and fish, vegetables and fruits is based on the quantity consumed multiplied by local prices and on the 1962 household expenditure survey, respectively. The value of forestry production is estimated by multiplying the average price per unit by the total quantity produced.

For mining and quarrying, the total production quantity of each mineral is multiplied by its average price to obtain the production value. Data on the gross value of production, intermediate consumption and value added in manufacturing by both private and public enterprises and registered partnerships are obtained from reports submitted to the Comptroller-General's Department, the Ministry of Industry, the Department of Revenue and the Budget Bureau. For other manufacturing, value added is estimated by applying approximate value added ratios to the gross value of production derived from financial statements and tax returns.

The estimates of electricity, gas and water are computed directly from the financial statements of the various agencies.

Construction expenditure in the public sector is reported directly to the National Statistical Office. Adjustments are made for non-reported construction.

For the private sector, it is based on reported data such as building permits of municipalities or on average price of new houses. Intermediate cost for each type of construction is derived from questionnaires sent to contractors and information received from architects and engineers.

The income originating in the trade sector is estimated by the commodity-flow method which traces the flows of consumer and producer goods of both domestic and foreign origin through the distribution channel. Gross margins are derived from the differences between retail prices and producers' prices.

For the public transport and communications sectors, information is obtained directly from the financial statements of the agencies concerned. In the private sector, information is obtained from various sources such as the operating accounts of enterprises, registration and licence data and information on the earnings of companies that supply data. Value added of travel agencies is calculated from a tourist expenditure survey.

For the financial sector, estimates are based on profit and loss statements for banking and insurance and on income tax returns for real-estate brokers and warehouse operators. Value added of ownership of dwelling represents the estimated rental value after expenses. Net rent is estimated by multiplying the estimated average net rent per dwelling by the estimated number of dwellings.

For business services, value added of legal services for the base year is estimated from the number of lawyers practicing while average income is based on the labour survey and extrapolated by the growth rate of total criminal and civil cases. Other services such as auditing and engineering are estimated from auditing fees paid and the value of dwellings construction in the municipal area, respectively.

Value added of public administration and defence is supplied by the Comptroller-General's Department.

For other private services, including restaurants and hotels, data from the Department of Revenue licensing statistics and other data collected by the National Statistical Office are used.

Both public and private education estimates are based on wages and salaries data of teachers.

For the constant price estimates, price deflation is used to estimate the value added for most industries.

For agriculture, when quantity figures of agricultural products are available, the base year of mining and quarrying are extrapolated by quantity indicators.

For public administration and defence, the number of employees by civil classification is used as an indicator of value added in real terms.

The former Yugoslav Republic of Macedonia

Source

The State Statistical Office of the Republic of Macedonia undertakes the compilation of annual national accounts statistics in Republic of Macedonia. Annual GDP data are published in the annual report as preliminary data (www.stat.gov.mk), in annual Statistical Review as final data and as well as in Statistical Yearbook.

General

The compilation of all National Accounts categories are in accordance with SNA 93 and ESA 95.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated through the three approaches: production approach, expenditure and income approach.

Expenditure Approach

The GDP according to the expenditure method presents the final consumption, i.e. consumption of final goods and services produced in the domestic economy, gross investments and net export and import of goods and services.

Final consumption expenditure consists of expenditure incurred by resident institutional units on goods or services that are used for the direct satisfaction of individual needs or wants or the collective needs of members of the community. Final consumption expenditure may take place on the domestic territory or abroad.

Final consumption expenditure of households includes the procurement or acquisition of goods and services by a household, intended for satisfying the needs of the members of the relevant household. Household final consumption is calculated for resident households and represents the final consumption of households according to the national concept adjusted to direct procurements of residential households abroad and direct procurements of nonresidential households on the domestic market.

The calculation of the Household final consumption expenditure is made using the COICOP international classification of goods and services (Classification of Individual consumption by purpose).

The sources of data used for the calculations are: household budget survey, final annual statements of educational, health care and social welfare services providers, data from foreign trade statistics, other statistical surveys that are conducted by the State Statistical Office and internal documents from a large number of enterprises.

Government final consumption expenditure consists of the expenditures, including imputed expenditure, incurred by the government both for individual consumption of goods and services and collective consumption of services.

These expenditures may be divided into:

Government expenditures for individual consumption of goods and services; government expenditures for collective consumption of services; government expenditures for individual consumption of goods and services include the payments for nonmarket public services (education, health care, social welfare, culture, sports etc.) and market goods and services (pharmaceutical and therapeutic products etc.)

Government expenditures for collective consumption of services consist of expenditures for administrative, defense, R&D and other non-market public services.

Final consumption expenditure of Non-profit institutions serving households (NPISHs) consists of the expenditure, including imputed expenditure, incurred by resident NPISHs for individual consumption of goods and services.

Gross investments

Gross fixed capital formation is measured by the total value of producer acquisitions, less disposals of fixed assets during the accounting period, plus certain additions to the value of non produced assets realized by the productive activity of the institutional unit.

The calculations of the investments in machinery and equipment use the commodity flow method. This method uses data from foreign trade statistics (import and export of machinery and equipment) and domestic industrial production. The data on construction investments, as well as data on other investments were taken from the statistical survey conducted by the State Statistical Office.

Change in inventories

Change in inventories shall be the value of total inventory inputted, reduced by the value of discharged inventories and the value of all periodical losses of goods that are held in stock. Products that enter or leave inventories are implicitly treated as sold or procured from stocks and are valued according to the prices of actual sales or purchases that take place at the same time.

Export of goods and services means a sale, barter or awarding of goods and services, by residents to non-residents.

Non-resident purchases in the country cover the purchases made by international organizations, embassies and diplomatic missions, and by tourists. Non-resident consumption is computed on the basis of data from the Non-resident consumption surveys which are conducted by the State Statistical Office.

Imports of goods and services shall mean sale, barter or awarding of goods and services, to residents by non-residents.

Calculations of expenditure GDP aggregates (Final Consumption Expenditure, Gross Capital Formation, Export-Import of goods and services) at constant prices are calculated by the deflation method using appropriate deflators (prices indices), for each of the GDP expenditure aggregates.

The deflated values of the GDP expenditure aggregates, calculated according to the expenditure method, are used for calculation of the volume indices.

Income Approach

The basic data source for production and income estimates of GDP are the Income statements and Balance sheets of legal units obtained from the Central Register.

Central Register is a legal unit founded as a central informative database of legal and other relevant data, and this data entry is in accordance with a law or agreement.

In line with the Trade Company Law, all legal entities and sole traders (natural persons engaged in market activities), except small unincorporated units with very low levels of turnover (less than 400 Euros) and with less than two employees are obliged to submit annual financial reports to the Central register. This information provides the bulk of data for GDP estimates of value-added in the market sector.

The annual financial reports contain balance sheet and income statements that allow for coherent estimates of gross and net value-added to be compiled for each legal unit.

The estimates of the value-added provided by the balance sheet data are systematically checked/confronted against other data sources within the national accounts data warehouse established by SSRM, that stores

standardized and harmonized data from the various sources of business statistics data, namely the Central register, Ministry of Finance, Pension fund, Tax Office, Health insurance fund, Employment bureau, and the National bank. Moreover, indicators of activity at the NKD activity level are also checked to ensure that growth rates are plausible.

Data on those unincorporated units not required to provide annual reports to the Central Register come from a number of sources. Data on small-scale unincorporated traders (natural persons paying annually fixed amount of tax income and contribution), for example, is provided by the Public Revenue Office whose data, in turn, is sourced from local authorities where registration occurs.

Compensations of employees are defined as funds given to employees and workers for the work done during the year and paid out in cash or in kind.

This category of funds includes wages and salaries, allowances added to salaries, social contributions, personal taxes as well as all compensations for food, transport, accommodation, vacation, etc.

Operating surplus is the residual component of the value added. It represents value added reduced for the amount of depreciation, compensations of employees and taxes on production. Operating surplus can be calculated in gross value if it includes depreciation or as net value if the depreciation is excluded.

Operating surplus for the household sector (mixed income) is obtained by subtracting net indirect taxes and compensations of the value added. Because it is difficult to separate salaries of self-employed persons, individual agricultural producers and members of their family from the surplus achieved, this category contains the owner's salaries.

Consumption of fixed capital during the accounting period is defined as a decrease of current value of producer's fixed assets due to the physical use, obsolescence and accidental damages. Calculating GDP, the depreciation value is calculated based on the data from annual reports of legal entities. For the calculation of gross rents and value added of unincorporated enterprises, the value of depreciation is estimated.

Production Approach

Gross domestic product (GDP) at market prices is the final result of the production activity of the resident producer units and is the sum of gross value added of the various institutional sectors or the various industries at basic prices plus value added, import duties less subsidies on products (which are not allocated to sectors and industries).

Gross Value added at basic prices is the basic category of the GDP. It represents the balance between gross output and intermediate consumption.

Gross output is a value of goods and services produced in the course of one year, regardless whether or not the whole quantity is sold or partially added to stocks. It consists of three kinds of output: market output, output for own final use and non-market output. Due to the specifics of some activities, various definitions of gross output exist.

For example, in trade, gross output is defined as a difference between sales value and purchase value of merchandise sold i.e. the gross output value is equal to trade gross margin.

Concerning banks and other financial institutions, gross output is the sum of banking income earned by performing banking services and calculated value of imputed banking services, computed on the other hand as a difference between interest receivable and payable.

Insurance companies calculate gross output as a difference between income of insurance premiums and other damage compensations i.e. it is equal to the value of calculated insurance services.

For the Government and other non-market and non-profit institutions, gross output is calculated as a sum of intermediate consumption, depreciation, compensations to employees and taxes on production. Because these organizations and institutions do not make profit, their net operating surplus is always zero.

Intermediate consumption is a value of products and market services, which the producer uses as inputs in the production process, excluding fixed capital consumption i.e. depreciation, in order to produce other products and services. This category includes consumption of current purchases, stock consumption as well as consumption of own products and services in the production process. For non-market service producers, by definition, the value of intermediate consumption is equal to the value of current purchases. Therefore, intermediate consumption includes the use of raw materials, materials, energy, office supplies, spare parts, transport costs of employees, daily allowances, separate life, contract payments and other benefits received by the employees, and which are connected with the performing of a regular economic activity.

The calculations of GDP data at constant prices are made by applying a movable base year. It means that each previous year is taken as the base year.

In GDP calculations at constant prices two methods are used: the method of single extrapolation and the method of single deflation.

Regarding the method of single extrapolation the part of volume indices used are calculated from the Business statistics, while a part of them is calculated in the appropriate department of the National Accounts Sector.

The producer price indices are used for single deflation for calculation of Value added at constant prices for C, D, E section from the NACE classification.

The calculations for some industry branches are made by using a deflator, which is completely overtaken from the export unit value indices. The reason behind using of such a deflator is that those activities are exclusively export oriented. In some economic activities employee's chain single indices are used as indicators for those activities.

Timor-Leste

Source

Reply to the United Nations national accounts questionnaire from the UN Transitional Administration in East Timor (UNTAET) on behalf of the East Timor Central Fiscal Authority, with the assistance of the Boston Institute for Developing Economies, Massachusetts.

General

The estimates in the tables below have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. Prior to independence in September 2002, the gross domestic product of East Timor was estimated by the Indonesian Central Statistics Agency (Badan Pusat Statistik, BPS). The only account estimated by BPS annually was the production account, as shown in tables 2.1 and 2.2, which present the 1993-1998 series in current and constant 1993 rupiah respectively. In attempting to build a system of national accounts for an emerging country such as East Timor with its limited human and financial resources, the tables below should be interpreted as "order-of-magnitude" estimates, subject to much greater error than those of other more developed countries. As the first set of accounts for the nation, it was important to produce aggregates with a tolerable level of accuracy, since these will form the basis for policy in the coming year. When the coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Trinidad and Tobago

Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Office, Port-of-Spain. The official estimates are published by the Central Statistical Office in the "National Income of Trinidad and Tobago" and in the "Annual Statistical Digest".

The Central Statistical Office derives most of the data from an annual sample survey of establishments, which incorporates the major players in all sectors of the economy. The large establishments are selected with certainty. Most industries are usually dominated by at least one significant establishment. In some industries where many establishments exist (Bakeries, Printing, Furniture Manufacturers, Distribution) simple random sampling is most often used. Data are collected annually via an establishment survey that captures data on, inter alia, employment (male/female), ownership, expenses/intermediate costs, receipts, inventories, consumption of fixed capital, capital formation, cash flow statement, and assets and liabilities.

The national accounts, in principle, cover all the resident institutional units operating in Trinidad and Tobago whether locally or foreign owned. Both units in the formal sector and units engaged in informal activities (taxi drivers, small farmers, own account construction workers and self employed professionals) are included in the data. Transactions in goods and services and distributive transactions and other accumulation entries are covered. The accounts published cover both Trinidad and The sister isle Tobago. Attempts are currently being made by a Tobago based research organization to derive separate GDP estimates for Tobago. Illegal activities are covered in principle, as are all informal activities.

General

The concepts and definitions utilized are broadly consistent with those included in SNA 1993. Where there are exceptions due to unavailability of data, these are clearly stated. For example, imports are still valued c.i.f, while consumption of fixed capital is compiled as derived from business accounts. No estimates are made for consumption of fixed capital as it applies to Government, as estimates of the value of the stock of capital owned by government do not exist. No adjustments are as yet made for holding gains/losses on inventories, which would primarily affect the following industries: Petroleum Exploration, Natural Gas Processing and Refining, Oil Refining and Petrochemicals.

Two industrial classification systems are used for the national accounts: ISIC Rev 3, and the Trinidad and Tobago Industrial Classification System used for National Accounts (TTSNA). In the latter, Petroleum Industries includes the following activities: Exploration and Production, Refineries, Petrochemicals, LNG, Service Contractors, Marketing and Distribution of Petroleum Products, Asphalt. Since the economy is still largely petroleum based, this modification was implemented to ensure that all Petroleum based industries were together under category. In addition, Sugar Refineries and Distilleries (Rum Manufacturers) are included in Sugar, which in turn forms part of the Agriculture Industry.

The time of recording is generally on an accrual basis, except for government accounts, which are derived from administrative records, which are kept on a cash basis. Inventories are valued at producers prices for own output and at purchasers prices when acquired from other institutional units. Exports are valued free on board (f.o.b.), and imports as stated earlier are still valued at c.i.f values.

Deflation is used to derive data at constant prices for most services, while extrapolation is used calculate data at constant prices in Agriculture, Manufacturing and Oil industries. In the TT SNA, output is valued at producers' prices -Taxes on production and imports are included in the data, but not subsidies- (e.g. raw materials imported by manufacturers and the finished goods imported for resale in the same condition as purchased by distributors contain taxes and duties, but they can not be easily distinguished at the firm or industry level). GDP is valued at market prices. Adjustments are made to convert reported data from a fiscal to a calendar year basis.

Methodology:

Overview of GDP Compilation

The basic accounts which reflect GDP on an industry basis at both current and constant prices are published on an annual basis, as are the other aggregates and components- Expenditure on the GDP, Cost structure of the GDP, National Disposable Account, Capital Finance Account, External Transactions, and Relations among National Accounting Aggregates.

The Board of Internal Revenue (BIR) provides an alternative source of data where missing data are involved. Ratio estimates are used to estimate for non- responding firms, especially those in the informal sector. GDP is not estimated from the Income side; neither there is an independent estimate of Private Final Consumption Expenditure that would provide for a more reliable estimate in the Expenditure side. This is treated as a residual after the other components. However, at the industry level rigorous checks are made to ensure the integrity and the consistency of the data. Direct deflation of value added is still widely used to derive constant price estimates by industry.

Estimates for the Agriculture industry are based on quantity and price data obtained from the Agriculture Statistics Division of the CSO and other Administrative sources. Administrative sources are also used to supplement information for Construction and Distribution. Because of the many small businesses in these industries and their informal nature, annual survey data are supplemented with information derived from the Board of Internal Revenue (BIR). For some industries in transport, notably taxis and own account truckers, the estimates are based on data derived from the Motor Vehicle Licensing Department. As stated earlier, government data are derived from administrative sources. Information on Business Services is obtained from the BIR.

In the Personal Services Industry most of the estimates are arrived at from the expenditure side and as a result Household Budget Survey data for 1997/98 are used. For the later years, the estimates are derived using changes in the price indices for these selected services (e.g., private doctors, auto mechanics, tailors hairdressers, gardeners) The change in the number of households which is obtained from the Population Division is used with these price changes to derive current price estimates for the respective years 1999, 2000, 2001, 2002 etc.

Education includes both the education services provided by Government, which is obtained from administrative sources, as well as the private educational institutions, the data for which are derived via the annual establishment survey. FISIM is derived from data submitted by banks and other financial intermediaries.

The estimates for the Health industry include only Private Medical Practitioners and Private Hospitals. Health Services provided by Government are included in with Public Administration and Defense, as separate data for government hospitals and clinics are not available. Estimates for own account housing (Dwelling Services) are Benchmarked Estimates which uses a combination of estimates of the housing stock (Approved building Plans) and the RPI index for rents. Plans exist to re examine this benchmark by using the data captured in the 2000 Population and Housing Census in which all Owners /occupiers were required to report the rent they would charge if they were to rent their dwelling.

Tunisia

Source

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique, Ministère du Développement Economique, Tunis. As part of its national accounts activities, the National Statistics Institute of Tunisia publishes major national accounts data series annually. This volume covers the years 2002-2006

General

The national accounts presented in this volume use the concepts and definitions of the United Nations System of National Accounts 1968 (1968 SNA). The national accounts are compiled by applying a series of procedures to the data from the primary sources, making use of specific classifications and concepts that define the integrated nature of the SNA68. The data consistency required by the SNA68 is ensured by arbitrages and adjustments between the various accounts compiled.

Methodology:

Overview of GDP Compilation

National accounts describe the national economy, which is made up of all units residing in national economic territory. That territory consists of Tunisian geographic territory excluding extraterritorial enclaves such as foreign embassies and international organizations, but including Tunisian territorial enclaves such as Tunisian embassies abroad. Resident units are those that have conducted economic transactions for more than a year on national economic territory. It is residence rather than nationality that is the consideration here.

The national accounts compiled in this document deal primarily with flows, that is to say economic movements over a particular period, although inventory and work-in-progress accounts might appear in some balance sheets. While the period used is the calendar year, national accounts are often supplemented by quarterly accounts in order to reflect the business cycle more closely.

In addition to the accounts of economic agents (such as companies, government agencies and households) arranged by institutional sector and transaction, central framework accounts are compiled and presented in three large summary tables: an input-output table arranged by activity and product, an overall economic table, and a financial transactions table.

As in previous volumes, accounts are calculated in both current prices and constant 1990 prices. Successive version of accounts being compiled for a given year. Each version is characterized by the nature of the information used (provisional, partial or final data, sub-sample or full sample for surveys, data from yearly or less than yearly statements, etc.). Each version improves the previous one by setting out more precisely and in greater detail the information used and the accounts compiled. Accordingly, three versions are compiled for a given year:

- a provisional account six months after the end of the year considered;
- a semi-final account 18 months after the end of the year considered;
- a final account 30 months after the end of the year in question.

An accounting campaign, which runs from October in a given year (n-1) until the following June (n), involves the compilation of accounts for three successive years (final account for year n-3, semi-final account for year n-2 and provisional account for year n-1).

The various overall aggregates, balances and other macroeconomic data are also available on the Institute website.

In parallel to the valuation at current prices, the goods and services accounts are valued at constant 1990 prices. The prices for year n-1, which provide a volume assessment, are used as an intermediary stage between the evaluation methods mentioned. The volume-price split is calculated for each product, using current quantities (when available) and prices from the previous year or the reference year.

For most goods and services, the values are deflated by a wide variety of available indices (family consumer price index, industrial production price index, foreign trade unit value index and so on). Balancing techniques are then used to estimate the deflators of other measures of the supply and use balance according to the specific nature of each product.

The statistical sources used in the context of compiling national accounts are numerous and specific to each area studied. For non-financial and non-agricultural enterprises, the main source is the annual survey of economic activities that covers a sample of enterprises with more than 6 employees. This survey is essential as it provides a body of information on the production, purchases, stocks, investments and accounting data of enterprises. It can also be used to extrapolate data for the entire field of enterprises with more than 6 employees. In order to supplement that field, a five-year survey (1997, 2002 and so on) of enterprises with fewer than 6 employees (informal sector) is conducted, or else the survey results are updated and data are included from sectors that are beyond the scope of the survey (agriculture, fishing and others).

A number of sources provide statistical coverage for credit institutions:

Financial statistics are published by the Central Bank of Tunisia. Accounting data are available from annual reports (report of the Tunisian Professional Association of Banks) and the responses to a survey of those bodies. The main source of data on insurance companies is the report of the Directorate of Insurance (Ministry of Finance) and the report of the Tunisian Federation of Insurance Companies (FTUSA) which produces annual accounting aggregates for the sector. There are also the companies' annual reports and the associated accounting documents.

There are many sources for basic information on public administration, including various public finance reports on allocations and expenditure, the general State budget, special funds and statements from government agencies. There are a number of sources for local finances, in particular annual accounting statements. There are also the accounting reports and documents of social security agencies and non-administrative public institutions, which are included with government units in view of their non-market activity.

Other information is collected for accounting needs: fiscal data on imported products, trade margin rates and a set of short-term indicators such as producer price indices, consumer price indices and industrial production indices. In 2002, a survey of associations was carried out in conjunction with the Centre for Information, Training, Studies and Documentation on Associations (IFEDA). That survey was used to estimate the activity of non-profit institutions, which are included in the institutional sector of households.

Expenditure Approach

Evaluations for each item in the balance are made both at current year prices and at 1990 prices. GDP is calculated at market prices, imports are evaluated cost, insurance and freight (CIF), while exports are established carriage paid (CPT). As for other final uses (final consumption, gross fixed capital formation, changes in inventories), they are established at acquisition cost (including taxes net of subsidies and commercial margins). The two main sources for exchanges with the rest of the world are foreign trade statistics for goods, and balance of payments data for services, transfers and financial transactions. As for households, the only consumption data initially available are from the various five-year surveys of household budgets and consumption, which can be used to produce a first estimate of final consumption. The final aggregate is achieved by summarizing the supply and use balances for goods and services. Gross fixed capital formation, consisting essentially of housing and

capital transfers [droits de mutation] is evaluated as an estimate of housing production that is obtained by applying an implementation matrix to building permits.

Production Approach

Gross Domestic Product according to the production approach is the sum of value added deriving from the productive activity of resident units, after deduction of imputed bank service charges (FISIM). The production of credit institutions resulting from their role as financial intermediaries is calculated conventionally as the balance of received interest and paid interest, but it is not broken down among the various users as intermediate consumption. A further global adjustment to the total of value added also allows import taxes and duties to be incorporated (in addition), as imports are evaluated CIF and final use includes all taxes.

Turkey

Source

Reply to the United Nations national accounts questionnaire from the State Institute of Statistics, Ankara. Methods of estimation, explanatory notes and primary sources are described annually in "National Income of Turkey". The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The official estimates have been prepared by the State Institute of Statistics in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Turkmenistan

Source

Reply to the United Nations national accounts questionnaire from the Statistics Department, Nuku'alofa. The latest data for Turkmenistan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). The official currency of Turkmenistan changed in 1992 from the Russian ruble to Turkmen manat. Data for 90-91, originally compiled in Russian rubles, have been converted to manats applying a conversion rate of 500:1.

Turks and Caicos Islands

Source

The preparation of annual national accounts statistics in Turks and Caicos is undertaken by the Statistical Office of the Department of Economic Planning & Statistics. The latest data was published in the "National Accounts Statistics 2000-2005".

The data used in the compilation of the national accounts were obtained from different sources such as surveys and administrative records from the government, private establishments and individuals. The primary source of data used in majority of the sectors was the Survey of Business Establishments (SoBE). This survey provided information on employment and financial operations of businesses and organizations operating in TCI. The SoBE data was collected from a sample of establishments selected from the Central Business Register maintained and updated by the Statistics. Other major sources included: Employment and wages data from the National Insurance Board (NIB); Trade Statistics provided by the Customs Department and the Department of Economic Planning and Statistics (DEPS); Fish Landings from the Department of Environment and Coastal Resources (DECR); Accommodation Tax and Stamp Duties from the Revenue Control Unit; Financial Intermediation information from the Financial Services Commission (FSC), Fiscal Accounts of the Government obtained from the Treasury; and financial statements of establishments. Other sources of data were ad-hoc surveys designed for selected sectors and distributed to selected establishments. These included prices of basic construction materials and mark-up price of selected wholesale and retail traders. Other administrative records were sourced from Tourist Board, Road Safety, Planning Department, Civil Aviation, Electricity Commissions Office and Labour Department.

Data received from sources were validated and cross-checked for consistency of information. The SoBE questionnaires were designed for a two-year reporting period (current and previous year) to validate previous years' reported data. In cases where there are low response rate from the SoBE, additional information were gathered from a combination of ad-hoc survey of establishments and administrative records from related government and private offices, and individuals.

Imputations on non-responses and missing data were also employed to generate the information for the whole sector. Preliminary results of the national accounts statistics, 2000-2005 was presented before the staff of the Statistical Office and Economics Unit of the DEPS and representatives from the data sources. Inputs from this forum were incorporated in the final estimation of the national accounts.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts (SNA) so far as the existing data would permit. The Turks and Caicos Islands System of National Accounts (TCI SNA) is fundamentally based on the recommended requirements of the 1993 United Nations System of National Accounts (UN SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) and were published in "Economic Survey and Projections", by the British Development Division in the Caribbean. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and expenditure approaches. The income approach is partially compiled.

Expenditure Approach

The expenditure approach is used to estimate the GDP according to categories of final use. Final uses of the country's output consist of estimating private consumption, gross capital formation, government consumption expenditure, and net exports of goods and non-factor services. The commodity flow analysis is a methodology employed in TCI to estimate the components of final expenditures on GDP. This approach aims at determining the final values paid by consumers at the retail level by tracing through various stages of production and distribution. This method requires the classification of trade data by end use categories. Indirect estimates of capital formation are usually made through the commodity flow method. The commodity flow method can be used for estimation of gross fixed capital formation in machinery and equipment and construction. A classification of capital formation according to classes of commodities is automatically compiled when this method is used. Combination of the relevant kinds of commodities yields a classification of capital formation by type. Estimates of capital formation by the commodity flow method do not however, lend themselves to classification according to the kinds of economic activity of the purchasers. For the commodity flow analysis, it is necessary to have: a) comprehensive data on the total supply of all the kinds of commodities which are disposed of partially or entirely to gross fixed capital formation; b) information on the disposition to various uses of such commodities and; c) supplementary information on the costs of installation, transportation costs and trade mark-ups.

The commodity flow analysis was also used in the construction and wholesale and retail trade economic activities in computing gross output then the production approach was utilized in estimating Gross Value Added and GDP for these economic activities.

Income Approach

This approach looks at the costs incurred by the producer within his own operation and is used to estimate the value added by aggregating these costs: the incomes paid out to employees, taxes and subsidies on products, consumption of fixed capital, and the operating surplus. However, for non-market producers, e.g., government units, services are valued by the sum of the cost incurred in the production, namely: intermediate consumption, compensation of employees, consumption of fixed capital and other taxes, less subsidies on production. Even though a non-market establishment may have sales receipts, its total output (covering both its market and non-market output) is still valued by the production cost. Thus, the value added is the sum of compensation of employees, consumption of fixed capital and other taxes, less subsidies on production.

Production Approach

The production approach considers the way output is produced. It measures the contribution to output made by each producer by deducting from the total value of its output the value of the goods and services it has purchased from other producers and used up in producing its own output. This contribution to output is known as the value added by the producer.

Those used up in production is intermediate consumption. The gross value added in basic prices is obtained by deducting FISIM from the sum of all value added of producers. With adjustments on taxes and subsidies on products, the gross domestic product in market prices is derived. The production approach is useful for estimation of value added for commodity producing sectors such as agriculture, mining and quarrying, and manufacturing. This approach is most commonly used in the case of services sectors, since data on the gross output and intermediate consumption in these sectors may not be readily available.

Data was obtained from the internet website (<http://www.spc.int/prism/country/tv/stats/Economic/NA2003Revision.pdf>), as reported by the Central Statistics Division, Ministry of Finance & Economic Planning, Tuvalu.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Uganda

Source

The preparation of national accounts statistics in Uganda is undertaken by the Uganda Bureau of Statistics, Entebbe. The official estimates are published by the Bureau in "Statistical Abstract" and "Statistical Bulletin".

General

The basic data sources utilized in the estimation of GDP by industrial origin and by expenditure categories are: the Uganda Business Inquiry (UBI); the Uganda National Household Survey (UNHS); financial accounts of the major public sector enterprises; government accounting records (budget data and final audited accounts); and other administrative data such as, external trade statistics based on customs returns and data furnished by the Ministry of Agriculture, Animal Industry and Fisheries (MAAIF). The UBI was a sample survey of about 160,000 establishments, contained in the business register, conducted for the reference year 2000/01, and covered enterprises/establishments as long as they were in operation in the year 2000/01 and had a fixed location. All establishments having more than 20 employees were fully enumerated; while, for the rest, a sample was taken. In all, about 4300 establishments were covered. The UBI was a successor to the Census of Business Establishments (COBE) conducted for reference year 1989. The primary objectives of the survey was to aid in the measurement of GDP by economic activity and to that end incorporated an extensive range of information on gross output, intermediate consumption [broken down by major categories and components of value added – i.e., employee compensation, consumption of fixed capital, and elements of operating surplus (e.g., interest dividends and profits)]. In addition, information was sought on the value of fixed assets outstanding, broken down by broad categories.

The UNHS is conducted, on average, every three years. The latest survey covered the period 2002/2003, while its predecessor covered the period 1999/2000. In addition to the usual item coverage in typical household income and expenditure surveys, the UNHS also had a module on economic activity undertaken by households, covering both output and intermediate costs. The 2000/2001 survey excluded economic activity relating to food crop while the 1999/2000 included such activity. An attempt is made to reconcile results from these sources, as well as from other sources so as to establish the levels of gross output for benchmark period, which are then extrapolated or interpolated for intervening years through the use of quantity and price data. In most cases, a fixed output-input coefficient (from the benchmark period) is utilized to construct estimates of value added the period between benchmark years. It has to be stressed that, currently, the UBOS has not fully integrated results of the UBI in establishing benchmark estimates of value added. The methodology is being updated in the context of the construction of the supply/use table which will utilize the results obtained from the UBI. The following paragraphs provide short summaries of the estimation procedure in respect to each branch of economic activity.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. The Government compiles national accounts using two period types, fiscal year ending 30th June and Western calendar year. The data stored in the UN national accounts database are based on Western calendar year. Since the constant price data with base 1998 are compiled on the basis of the fiscal (as opposed to calendar) reference year, current price data and constant price data are not identical in the base year. Data at constant prices with base year 2002 are compiled on the basis of calendar year.

Expenditure Approach

Household consumption expenditure in the benchmark period is estimated, to a preponderant extent, utilizing results obtained from the household budget inquiries. The survey results are used to reconcile with production and import data pertaining to consumer goods. As noted previously, production estimates for food crops and livestock are adjusted downwards in the benchmark years to reconcile with household consumption estimates, estimates of

these products utilized as intermediate goods in restaurants and other eating establishments, and relevant export data. In other cases, such as beer, soft drinks, and cigarettes, reliance is placed on production data originating in manufacturing activity. It should be noted that, in the benchmark years, adjustments to the household consumption estimates are made for expenditure by non-Ugandan households. For the services items, a combination of production data and household consumption estimates are used to establish levels of consumption for these items.

To estimate household consumption expenditure for periods between survey periods, the benchmark estimates of household consumption are grouped into four main groups – viz., food crops, other goods, services, and excluded items (outside the scope of the survey, e.g., non-Ugandan households and districts not covered in the survey due to security concerns. During the inter-survey period, the NAS interpolates that data. For periods subsequent to the benchmark years, estimation of food crops could be made with an acceptable degree of accuracy, because production and survey data were so well reconciled that trends of value added in the food crops sector could be used to directly estimate trends in consumption expenditure. However, interpolation for other goods and services is less reliably based. A constant growth rate in real terms over the inter-survey period has been assumed and then inflated with standard CPI components to estimate expenditure in current prices. The same approach is adopted for period subsequent to the survey period. As shown in Table 1, private consumption expenditure accounts for about 75 percent of expenditure on GDP.

In principle, the coverage of the general government sector in Uganda consists of the central government, local governments and donor funded projects. The central government encompasses the budgetary central government (comprising 19 government agencies and commissions, embassies, and missions abroad, judiciary, 15 ministries, parliament, president's office, prime minister's office, and state house), extra-budgetary units/entities (primarily the national agricultural research organization, referral hospitals, and universities), and the national social security fund. The local governments sub-sector consists of the Kampala city council, 55 districts, 13 municipalities, and 60 town councils. In practice, the social security fund is excluded from the scope of government activity.

Beginning with data for the fiscal year 1997/98, the Public Finance section of the UBOS has undertaken a detailed functional and economic classification of government expenditure. This covers both recurrent and capital expenditure. The analysis for central government is made for all expenditure, initially using data from the Approved Budget and subsequently revising these using the final audited accounts of actual expenditure when they become available. For district administrations and urban authorities, initial estimates are based on the budgeted release of central government funds to the district administrations. Subsequently, detailed financial statements of actual expenditure are obtained and analyzed for a representative sample of over 50 percent of the total number of authorities, and these have a very good geographic spread to ensure that they are as representative of overall district/urban authority expenditure as possible. Expansion to totals is made in proportion to the subventions from central government to districts, as recorded in the central government accounts. The data from the economic and functional classification permit estimates of value added (and also intermediate consumption) of government to be made. The total, out of the government sector consisting of employee compensation (value added) and intermediate consumption, is equated to find consumption expenditure of general government. No deductions are made for any sales of goods and services to other sectors by the government.

One or two major problems remain. The most serious relates to domestic arrears and covers both salaries/wages (value added) and goods and services (intermediate consumption). Every effort is made in the national accounts to classify all arrears from 2000/01 to date to the year of accrual, although only the verified arrears are taken into accounts. The second problem relates to the timing of release of accurate data. It has been found that employee compensation tends to be underestimated (mainly because of failure to account for any salary increases that are announced in the budget), and budgeted outlays on goods and services tend to be overstated. Therefore, reliable functional and economic classification can only be made when the final detailed audited accounts of actual expenditure are released. For central government, the final detailed audited accounts seem to be available about nine months after the end of the fiscal year, while the lag is over a year for district governments.

Gross fixed capital formation: The estimate of gross output of the construction sector less a small allowance for

output of a non-capital nature (viz., minor maintenance and repairs) is treated as fixed capital formation. Separate estimates of public and private capital formation are prepared.

As domestic production of machinery and vehicles is negligible, estimates of investment are built on an analysis of import data based on SITC classification of imports. The classification and the codes assigned permit an identification of private importers, diplomatic imports, and project imports. This breakdown is used to determine the separation between public and private investment and also as a guide in determining the proportion of this trade that should be allowed to capital formation. An allowance is made for vehicles used for consumption as opposed to capital purposes, based on statistics of vehicle registrations specifying categories of different vehicles and their use. Taxes and installation costs are applied to the import data to approximate purchasers' value of fixed investment in machinery and transport equipment. In the published data, a separation is made between transport equipment and other machinery and equipment, as well as between private and public investment.

Estimates of public investment by type of asset – e.g. building and construction, vehicles, and other machinery and equipment – is built up from government accounts and from the budgeted amounts recorded in the Public Investment Plan (PIP). This document provides a detailed breakdown of expenditure by major economic categories. It is assumed that a fixed percentage (90 percent) of budgeted amounts is disbursed each year.

Net increase in inventories: There are no available data of changes in stocks at the distributor level. Accordingly, it is implicitly assumed for most economic sectors that domestic production and imports are consumed (or formed into capital formation or exported) immediately. Net increase in stocks covers stock changes at the producer levels, e.g. coffee production held in stocks and changes in livestock.

Data on exports and imports of goods and services in the national accounts are reconciled with those contained in the balance of payments accounts compiled by the Bank of Uganda (BOU).

There exists in Uganda a committee on international trade statistics comprising representatives of the BOU, the UBOS, the Uganda Revenue Authority (URA) and the Ministry of Finance, Planning, and Economic Development. Given the deterioration in the timeliness and coverage of customs data on exports and imports, it had been necessary to resort to the use of alternative data sources to augment the customs data and to reach agreement on the level of trade to be used both in the national accounts and the balance of payments. In this regard, the UBOS has worked very closely with the BOU in identifying alternative data sources and making adjustments to the data.

Regarding exports of traditional cash crops, e.g. coffee, cotton, tea, and tobacco, data on quantity and value of exports are obtained from the UCDA, CDO, the Tea Association, and the two enterprises engaged in tobacco manufacture and export. For vanilla and flowers, data obtained from the Civil Aviation Authority is used. Adjustments are also made for exports of maize and beans, utilizing data from a variety of sources such as, the Uganda Grain Traders Association. An arbitrary estimate is also made for unrecorded border trade. The UBOS, BOU and URA are undertaking a joint informal cross-border trade survey and the results will replace the ad hoc adjustment made previously.

Concerning import data, an adjustment is also made for undervaluation and coverage. The procedure is to compare data on foreign exchange import payments effected through the BOU and to make apportionments concerning payments for imports of services, income payments, debt repayment, and imports of commodities. The level of commodity imports are compared with the recorded data as reflected in the customs returns and adjustments are made accordingly.

Data on transportation services (credit) are based on data derived from surveys of the major transport enterprises, while imports of freight services are obtained via adjustments from the c.i.f. valuation of imports to f.o.b. valuation. Regarding travel credits, the estimates are based on number of travellers (UBOS) and average per capita expenditure (obtained from a survey conducted in 2001 by the Ministry of Trade Tourism and Industry). With respect to other services, a variety of sources are used, e.g. providers of communication services and foreign exchange transactions (with respect to services) effected through the commercial banks and foreign exchange bureau.

Income Approach

For the government sector, wages and salaries are derived from the government accounts, for large-scale manufacturing they are obtained from the surveys of industrial production, for trade they are based on the 1966 census of distribution, with a constant ratio to total value added for other years and for services, they are taken from accounts of the services establishments or from the enumeration of employees. The estimates of consumption of fixed capital are built-up by branch from various sources such as the annual surveys of industrial production and the accounts of enterprises in mining, electricity and water supply. Estimates of indirect taxes and subsidies are obtained from government accounts. Operating surplus is in most cases derived as a residual.

Production Approach

Agriculture, hunting, and forestry:

Estimation is undertaken separately for cash crops (comprising mainly coffee, tea, cotton, and sugar cane). Estimates of production, prices, values of output and inputs (including utilization of output for seed) are developed from a variety of sources such as the Ugandan Coffee Development Authority (UCDA), the Cotton Development Organization (CDO), the sugar refineries, and export values of flowers, cacao, and vanilla. Regarding food crops, estimates of both production and consumption of individual crops are available from a variety of sources. Official estimates of area and production are provided by the MAAIF, while estimates of consumption are obtained from the household expenditure survey. From a comparison of the results, the NAS has decided to use, as benchmark production, the consumption data adjusted for food crops used as intermediate goods in restaurants and cafes, as well as exports/imports. Value added is compiled in the benchmark year using data on costs of production supplied by MAAIF. For subsequent period, the value added is extrapolated on the basis of the growth implied in the MAAIF data and the movements in consumer prices for each crop collected for computing the consumer price index (CPI). The benchmark estimate of the farmgate price is gathered from the household budget surveys, which ascertain data on the quantity and value of monetary and non-monetary consumption.

For livestock, the consumption data is favored over the production estimates. For subsequent period, a similar approach as for food crops is adopted.

For estimating value added in forestry activity, the Forestry Department provides the relevant information on the value of production of logs and charcoal and the benchmark prices for these products as well as input/output coefficients relating to logs and charcoal. The benchmark value added figure is then extrapolated for other years on the basis of the trend in volume of production (supplied by the Forestry Department) and the movements in the consumer price of charcoal and poles (as a proxy for logs).

In the case of fisheries, total output is estimated on the basis of results obtained from the UNHS and the amount of raw fish delivered as intermediate input in fish processing and fish exports. Estimates of output and value added are then prepared.

The agriculture, forestry and fishing industry accounts for about 40-percent of GDP and absorbs about 80 percent of the work force.

Mining and quarrying:

There is very little mining activity in Uganda. The value of gold exports is distributed between smuggled imports and domestic production and trade margin of gold dealers. Data on quarrying (especially limestone) is built up on the basis of inputs use in cement manufacturing. Value added is estimated by applying an assumed input-output coefficient.

Manufacturing:

A distinction is drawn between formal and informal manufacturing activity. Formal manufacturing refers to activity for which trends can be measured in the index of industrial production (IIP) with an acceptable degree of accuracy, while informal relates to activity for which trends can only be estimated. The benchmark data (gross output and value added) for manufacturing are obtained from the UBI and UNHS enterprise module. Value added for formal

manufacturing is extrapolated for subsequent period, reflecting movements in the IIP and relevant price developments. For informal manufacturing, the benchmark data are extrapolated on the basis of population growth and other subjective indicators. At this juncture, the UBOS has yet to integrate the results of the UBI in the IIP methodology which is based on the COBE for weights.

Electricity, gas, and water supply:

Data on output and associated intermediate inputs are extracted from the accounts of the suppliers of electricity and water. The Uganda National Water and Sewage Corporation (NWSC) supplies water in a few urban areas. Water supply to other urban and few rural areas is provided by local governments. Such activity is treated as general government activity rather than as an enterprise activity. The value added in this regard is included indistinguishably under community service in the government sector.

Construction:

The estimation of construction output and value added in the construction industry has remained problematic in Uganda. In estimating gross output in the benchmark year, using the COBE, a distinction is drawn between private building construction activity undertaken in urban areas and private building construction activity undertaken in the rural areas. For the government sector, estimates of outlays on building and civil works are derived from an analysis of Donor Government funded project reports. An estimate of private building construction is prepared in consultation with industry experts, on the relationship between selected building materials – e.g., cement and bricks and construction output. For subsequent years, the output is estimated on the basis of the trends in the availability of building materials, i.e., cement and roofing materials. An estimate of rural building activity is also derived for benchmark year, based on the census of population and COBE. For subsequent years, rural construction activity is extrapolated on the basis of population growth. To compute value added, fixed input/output coefficients have been established for each category of building and construction in the benchmark period, and applied in subsequent years.

Wholesale and retail trade and repair of motor vehicles:

For the benchmark year, data on gross output, intermediate expenses, and value added are derived from results of UBI and the UNHS (covering informal activity). For subsequent years, the value added is estimated from statistics of monetary domestic production and imports, after making allowance for produce that does not pass through the distributive channels. To this end, the estimated trade margin less intermediate consumption is applied in order to derive value added.

Hotels and restaurants:

Survey results obtained from the UBI and the UNHS are the primary source of data for benchmarks. Interpolation is made between surveys, and for subsequent periods, the information is extrapolated on the basis of tourist arrivals.

Transport, storage, and communication:

Data for computing value added in rail and air transports, as well as communications, are obtained on a regular basis from the suppliers of such services (e.g. Uganda Airlines, Uganda Railways, Posta Uganda and Uganda Telecommunications Ltd.). In addition, data are incorporated in respect of travel agencies. Measurement of the contribution of road transport operators – taxis and boda boda (motor cyclists), with the exception of buses – remains an informal type of activity and is difficult to measure. Estimation is done on the basis of number of operators obtained from the Uganda Taxi operators and Drivers Association (UTODA) and operational data from a sample of operators.

Financial intermediation:

Value added for the central bank is estimated as the sum of employee compensation and consumption of fixed capital. In the case of commercial banks, financial intermediation services indirectly measured (FISIM, as suggested in 1993 SNA) is estimated in addition to the value of services for which explicit charges are made. The total of FISIM is treated as an intermediate cost and effectively deducted from the total measure of GDP. Data are also captured with respect to insurance activity and services auxiliary to financial intermediation.

Real estate, renting, and business activities:

Benchmark estimates of value of rental income are obtained from the household budget surveys. This covers both actual rental and imputed rentals of owner-occupied dwellings. Gross output data are converted to value added by applying an input/output coefficient.

Public administration and defense:

Source data is the analysis of government accounts as described in section 3.2 and donor funded projects. Currently, as usable data are lacking on the consumption of fixed capital, the value added is effectively equivalent to employee compensation.

Education, health and social services:

The source data for estimating government's contribution to GDP in this industry is as described in 2.11. For the private sector component (market output), the starting point is the reported outlays by households on education and health, which are adjusted for any apparent under-reporting. Estimated ratios of value added to gross output are then applied to each item of expenditure. For other years, overall inter-survey growth rates and inflation, measured in the appropriate subsections of the CPI, are utilized to measure value added in current prices.

Other community, social and personal service activities:

The government component of this industry is measured as described in section 3.2. For the private component, data obtained from the UNHS are utilized to build the relevant measures.

Domestic services:

Expenditure on domestic services, as collected from the household budget inquiries, are used to estimate value added in the production of domestic services.

Ukraine

Source

Reply to the United Nations national accounts questionnaire from the Ministry of Statistics of the Ukraine. Official estimates are published in "Statistical Bulletin in National Accounts". The latest data for Ukraine was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). In the reporting year 1996, the official currency has changed from karbovantsy to hryvnia (1 hryvnia equals 100,000 karbovantsy).

Methodology:

Overview of GDP Compilation

Gross Domestic Product is estimated using the production method, methods of income and end-use.

Expenditure Approach

The GDP by the end-use method is estimated as the sum of final consumer expenditures, gross accumulation, balance of exports/imports of goods and services.

The final consumption expenditures consists of households' expenditures for own final consumption, final consumption expenditures of the state administration bodies to satisfy individual and collective society's needs and final consumption expenditures of non-profit organizations servicing households and associated with the supply of non-market goods and individual services.

The final consumption expenditures of households include the following components: money expenditures for purchasing the consumer goods and services; products produced by households for own consumption; value of goods and services obtained in kind as labor remuneration.

The final consumer expenditures of the state administration bodies include the following: expenditures for purchasing goods and services that are rendered to households for free or at price which is economically insignificant; expenditures associated with production and supply of non-market products.

The expenditures of the state administration bodies are split into individual and collective ones. The individual services of the state administration bodies are consumed directly by households. The collective services are rendered to the whole society (maintenance of security and defense, support of law and order, implementation of the government policy, scientific researches, etc.).

The final consumer expenditures of non-profit organizations servicing households include the expenditures of public organizations (political parties, trade unions, religious and youth organizations, etc.) and units of non-financial corporations that provide the social and cultural services to households.

The gross formation incorporates the following components: gross fixed capital formation; changes in inventories, acquisition less disposal of valuables.

Gross fixed capital formation includes the following: acquisition less disposal of the new or current tangible and non-tangible fixed assets; expenditures for improvements to non-produced tangible assets; expenditures

associated with the transmission of the property rights for non-produced assets. Changes in inventories are defined as the sum of increase/decrease in the following elements: productive supplies, construction-in-progress, finished products and goods for resale. According to the 1993 SNA recommendations and for the purpose of eliminating the price changes effects when keeping the products in stocks, the residue stocks are being revaluated into the average prices of the reference period depending either on their turnover period or the average time for their keeping.

The valuables are assets that are not used for consumption or production and whose attributes are not getting worse with the passage of time provided they are kept in good environment. The valuables include the precious stones and metals, paintings, sculptures, jewellery made of precious stones and metals, collections, etc.

Data on exports/imports of goods and services are taken from the balance of payments compiled by the National Bank of Ukraine.

The final consumption expenditures of households are estimated at comparable prices in line with the classification of individual consumption by purpose through deflating the indicators at current prices mainly with the help of indices for consumer prices.

The expenditures for final consumption of the state administration sector and non-profit organizations servicing households are estimated at comparable prices by deflating each type of expenditure using producers' price indices, consumer prices, indices for average wages of employees in the state-financed establishments and deflator-indices for output by selected type of economic activity.

The estimate of gross fixed capital formation at comparable prices is made by type of tangible and non-tangible assets by deflating their values with the help of indices for producers' prices, construction and assembly operations, deflator-indices for output by relevant type of economic activity and an aggregated price index for capital investment.

Changes in manufacturing inventories, construction-in-progress, finished products and goods for resale are estimated by deflating their value at current prices and using producers' price indices and deflator-indices of output by type of economic activity.

To reevaluate the value of valuables purchased during the reference period, CPI for jewellery is used.

The estimate for exports/imports of goods and services at comparable prices is made separately by goods and services. The estimate of exports/imports of goods is made by commodity groups using their volume indices and applying the relevant price indices. To reevaluate exports/imports of services, deflator-indices of output by relevant type of economic activity, consumer price indices and an index for dollar rate changes are employed.

Income Approach

The GDP through the income method is defined as the sum of primary incomes: compensations to employees, taxes excluding subsidies for production and imports, gross (net) income and mixed surplus by type of economic activity and all institutional sectors of the economy. This method is not the main one since not all indicators for income are compiled on the basis of the reported data, a part of them is estimated through the balance method. Thus, the gross (net) income and mixed surplus are defined as difference between the GDP (GVA) estimated for the whole economy and by type of economic activity using the production method on the one hand, and compensations to employees, net taxes on production and imports on the other hand. The mentioned method is mainly employed to analyze the GDP cost structure.

Production Approach

GDP measured through the production method is defined as the difference between the output and the intermediate consumption. Output is the value of goods and services that are the result of resident units' production activity during the reference period.

Within the production scope, the output comprises the following components:

1. all goods regardless of their usage (both goods supplied to other units and goods for own final consumption or accumulation);
2. services to other institutional units, non-market services of the state administration bodies and public organizations;
3. services of households.

The intermediate consumption includes the value of goods and non-material services consumed during a certain period to produce other goods and services. The intermediate consumption incorporates the following components:

1. material inputs;
2. payment for services;
3. payment for business trips including the cost of travel and accommodation without per diems.

Within the SNA production account, the intermediate consumption of financial intermediaries' services are not distributed by a specific type of economic activity but presented as a separate item for the whole economy.

The GDP estimates on the production side at comparable and constant prices are made using volume indices for production by type of economic activity (operations, services) and the relevant indices for producers' prices and consumer prices.

United Kingdom

Source

The preparation of national accounts statistics in United Kingdom is undertaken by the Office for National Statistics(ONS), London. The official estimates are published in "United Kingdom National Accounts", ONS. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Not all of the tables were updated and only contain data following the 1968 SNA which usually show small differences to the new data compiled in accordance to the 1993 SNA. A comprehensive description of the sources and methods used in the preparation of the estimates is given in "National Accounts Statistics, Sources and Methods", H.M.S.O., London, 1968. A new source of reference is "The National Accounts - A Short Guide", H.M.S.O. London, 1981. Input-output tables for selected years are produced and published by the Central Statistical Office. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is calculated as average estimate of the three component measures of income, expenditure and output. Geographical coverage of the statistics comprises the United Kingdom of Great Britain and Northern Ireland only. i.e. territories such as Bermuda, British Virgin Islands, Cayman Islands, Anguilla, Turks and Caicos, Falkland Islands, Gibraltar, Pitcairn, St. Helena, Channel Islands, Ile of Man are excluded.

Expenditure Approach

The expenditure approach is used to estimate all types of expenditure. Government final consumption expenditure is based on accounting data and departmental returns. Estimates for the central government are derived from the various exchequer and departmental accounts. Both the central government and the local government data are extensively rearranged to fit the concepts used in the national accounts. The estimates of private final consumption expenditure are built up commodity by commodity from a variety of independent sources. The sources available are statistics of supplies, sample surveys of consumers' expenditure, and statistics of sales by retail shops and other outlets. The major sources for estimating gross fixed capital formation in private industries are the annual censuses of production and annual inquiries into the distributive and service trades. Base year estimates of dwellings are, however, based on the number of houses under construction and average prices. Changes are estimated from building output data obtained from contractors. The estimates of capital formation for the public sector are based on accounts. The statistics of exports and imports of goods and services are taken from the balance of payments accounts. Government final consumption expenditures referring to wages and salaries are estimated at constant prices partly by deflating by indexes of changes in rates of pay, but mostly by the use of volume indicators based on numbers employed. Goods and services are mainly deflated by composite base-weighted price indexes. No single-approach is used for all components of private final consumption expenditure. Most food, beverages and tobacco are revalued item by item at average base-year prices. Deflators constructed from components of the General Index of Retail Prices are used for other items. Price deflation is used for gross fixed capital formation. For buildings and other construction out-turn price indexes of successful tenders are used. For exports and imports of goods and services base-year figures on a balance of payments basis are extrapolated by means of volume changes for many goods. For other goods and services, however, mainly price deflation is used.

Income Approach

Information about wages and salaries paid in cash is obtained from the PAYE (Pay-As-You-Earn) system. The estimates of employers' contributions to national insurance and health are taken from the central government accounts. Estimates of operating surplus are provided through tax assessment data for profit incomes. Since they, however, are not available for the latest periods, the quarterly sample inquiry on company trading profits undertaken by the Inland Revenue is also used. Statistics of the trading surplus of public corporations, central government and local authority trading enterprises are taken from their accounts. The method used for estimating capital consumption is mainly the perpetual inventory method. Estimates of total taxes on expenditure and subsidies are available from government accounts.

Production Approach

The income approach is used to estimate value added of most of the various economic activities. The production approach is applied in connexion with the estimates of agricultural income. The production figures of agriculture are based on estimates prepared by the departments concerned. Agricultural earnings, including payments in kind, are estimated by these departments from regular sample surveys. The estimate of income from farming is built up from very detailed estimates of output and expenditure. Information about crop areas and livestock numbers is collected from farmers by means of questionnaires, and estimates on the quantity harvested are based on the production acreage and the yield per acre. The estimates of mining and quarrying, manufacturing, electricity, gas and water and construction are built up from tax assessment data and production censuses. The censuses of production which are conducted annually, provide information on sales, employment, wages and salaries, purchases, expenditure, etc. For electricity, gas and water annual accounts data are also used, while for construction government accounts are among the sources. The estimates for the distributive trade are calculated from tax assessment data, number in employment and changes in average earnings. In the transport, storage and communication group, income data for the nationalized industries and public corporations are obtained from their annual reports, whereas for the remainder tax assessment data, annual censuses of employment and earnings inquiries are used. Tax assessment data and PAYE (Pay-As-You-Earn) statistics are mainly used as sources for financial institutions. Rents are based on the estimated rent income from various groups of property. Business services are mainly estimated from Inland Revenue data. The figures of central government wages and salaries are obtained from departments, while for local authorities they are derived from official publications. Tax assessment data are utilized to estimate the wage and salary bill for most services. Estimates at constant prices for the agricultural sector are obtained through double deflation. Output is valued at base year prices, while input is valued at pre-subsidy base year prices. Value added of all other sectors is obtained through extrapolation by indexes of production, volume or output.

United Republic of Tanzania

Source

The preparation of National Accounts Statistics in the United Republic of Tanzania is undertaken by the Bureau of Statistics, President's Office, Planning Commission, Dar-es-Salaam. Official estimates are published in a series of reports entitled "National Accounts of Tanzania". Reply to the United Nations national accounts questionnaire by the Bureau of Statistics.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The estimates presented relate to Tanzania (mainland) only, i.e., the former territory of Tanganyika, excluding Zanzibar. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

I. Introduction:

The publication entitled "National Accounts of Tanzania Mainland 1988-1999" gives consolidated estimates of Gross Domestic Product (GDP) and other allied aggregates of Tanzania Mainland. It is the third in the series of the publication with GDP at 1992 prices. Estimates of GDP with 1992 as the base year are also available in the Economic Survey 1999, published by the Planning Commission. The national accounts methodology was essentially based on the 1991/92 Household Budget Survey (HBS), the 1991 Informal Sector Survey, the Agriculture Surveys. Also data from the 1996 economic survey of three industries - Construction, Trade, and Transport - was incorporated in the national accounts.

II. Concepts and Definitions:

The concepts and definitions followed to a large extent conform to the latest United Nations Recommendations on the subject contained in the United Nations publication a System of National Accounts (SNA 1993). A few points of divergence, however, do exist and these have already been outlined in the sources and methods. Short definitions of the main aggregates are given here for the convenience of readers and users.

Gross Domestic Product:

GDP is the sum of the values added of all resident producers in the economy. GDP factor cost is measured exclusive of taxes on products and GDP at market prices includes all taxes on products including import taxes.

National Income at market prices:

Is the sum of compensation of resident employees, the excess of the property and entrepreneurial income receivable by resident economic agents over the property and entrepreneurial income payable by them and indirect taxes net of subsidies. It differs from the domestic product at market prices by inclusion of net factor income (i.e. net incomes other than transfer incomes received through participation in productive activity) received from abroad. Gross Domestic Product at factor cost differs from GDP at market prices by the exclusion of the excess of indirect taxes over subsidies. It is the value of all goods and services produced by the resident producers of Tanzania, counted without duplication and is the same as the aggregate of wages, salaries, interest, rent dividends and profits attributable to resident producers of Tanzania before making provision for consumption of fixed capital.

Gross fixed capital formation:

This consists of the sum of all producers' acquisitions, less disposals, of new or existing fixed assets. Disposals do not include consumption of fixed capital, hence the term "gross".

Household Final Consumption:

This consists of the expenditure of resident households on goods and services. It includes goods produced for

own consumption and imputed expenditures made by Government and Non-profit Institutions serving Households (NPISHs) on behalf of households.

Government Final Consumption:

This consists of expenditures incurred by both Central and Local Governments on goods and services other than those distinguishes between individual consumption of goods and services and collective consumption of services. Individual services are those provided to particular households that could be bought and sold on the market. Examples are health and education services, which as mentioned above, are treated as Household rather than Government. Collective services are those that are provided simultaneously to all members of the community, such as public administration and defence. These are the "public goods" of economic theory.

Net taxes on products:

These are taxes on goods and services that become payable as a result of production, sale or transfer of these goods and services. Subsidies are treated as negative taxes.

III. Geographical Coverage:

The estimates presented in the report relate to Tanzania Mainland only.

IV. Estimates of GDP by Region:

Estimates of Gross Domestic Product by region for years 1988-2002 at current prices have been presented in this publication. With the exception of Agriculture, Mining and Manufacturing, estimates of the rest of sectors are based on the basis of number of registered business establishments in the region.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income and production approaches.

Expenditure Approach

Government final consumption expenditure and exports and imports of goods and services are estimated through the expenditure approach, while private final consumption expenditure and gross capital formation are compiled by using a combination of the commodity-flow and expenditure approaches. For government expenditure, actual central government revenue and expenditure, classified by purpose, are available from government documents. Revenue and expenditure details of local authorities are obtained from the Prime Minister's Office and from the local authorities themselves. For private consumption expenditure, estimates of domestic production of all commodities are compiled and allowances made for various intermediate uses and government and business purposes. The estimates are then marked up for distribution costs and adjusted for imports and exports. Data from the 1991/92 Household Budget Survey are used with regard to most expenditures on services. The estimate of change in stocks covers parastatal enterprises, livestock and national grain reserve, export crops, livestock and those factories which were included in the survey of manufacturing industries. Estimates of gross fixed capital formation for the public sector are derived from detailed analysis of the accounts of the agencies concerned and from detailed statistics on imports of capital equipment. Own-account rural residential construction has been estimated on the basis of building costs data, rental values and data on population growth. Exports and imports of goods and services are obtained from the balance of payment statements of the Bank of Tanzania. Gross domestic product by expenditure at constant prices is not regularly estimated.

Income Approach

In estimating the cost structure components of gross domestic product, estimates of compensation of employees are obtained from each industry group separately. In addition, information obtained from employment and earnings survey is used for the non-primary and mining industries groups. For agriculture, animal husbandry, forestry and fishing, the wage component of value added is fixed at 4.3 per cent of its value added based on the results of various farm surveys. Operating surplus estimates for each industrial sector is obtained from the companies

concerned. Estimates of depreciation for fixed assets of the parastatal enterprises are provided by the establishments themselves and for other sectors, estimates are based on percentages obtained from previous surveys. Data on indirect taxes and subsidies are obtained by analyzing government recurrent revenue and expenditure.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at factor costs. The value added of agriculture, mining and manufacturing is estimated through the production approach while for the remaining industries, the income approach is used. For agriculture, the data on production, prices and cost of production of each export crop, available with the respective commodity boards, are utilized to derive estimates of their value added. For the non-export crops, similar data available from the Ministry of Agriculture and Livestock Development, Marketing Development Bureau, Bureau of Statistics and data collected through Economic and Household Budget Surveys and the 1992 Input-Output Table have been used.

United States

Source

The Bureau of Economic Analysis (BEA), an agency of the Department of Commerce, is responsible for the preparation of national economic accounts of the United States. The official estimates are published in the "Survey of Current Business". Reply to the United Nations national accounts questionnaire was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). For the new 1993 SNA data, original chain constant prices are based on the year 1996 and have been scaled down to the price levels of 1995 in order to allow international comparisons. In the latest submission of data at constant prices the base year is 2000. The resulting chain constant prices are not additive. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA), although the official estimates were not totally consistent with the classifications and definitions used in the 1968 SNA. See "The United Nations System of National Accounts: An Introduction" which was published in the June 1990 Survey. A summary explanation of the accounting framework appears in BEA's 1985 publication, Methodology Paper No.1, "An Introduction to National Economic Accounting". Subsequent modifications are described in the September and October 1991 Surveys. Information on sources and methods used to estimate the national accounts appears in BEA's 1987 publication, Methodology Paper No. 4, "GNP: An Overview of Source Data and Estimating Methods". The July 1992, August 1993, and July 1994 Surveys update this publication. Information on United States' capital finance accounts and balance sheets is found in "Guide to Flow of Funds, 1993", a publication of the Boards of Governors of the Federal Reserve System. The most recent benchmark input-output accounts were published in 1994 in "The Benchmark Input-Output Accounts of the United States". The following tables have been prepared to complete the national accounts questionnaire provided by the United Nations. The United States converts its official estimates as closely as possible to SNA definitions. When differences in scope and coverage from definitions and classifications recommended in the SNA remain, footnotes are attached to the appropriate tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated using both the income and expenditure approaches. The economic area covered by the US national accounts consists of the 50 states and the District of Columbia. Outlying territories, such as the Commonwealth of Puerto Rico, Guam, American Samoa, Northern Mariana Islands, US Virgin Islands are excluded.

Expenditure Approach

The estimates of general government final consumption expenditures are based largely on budgetary and administrative information. Estimates of federal government expenditures are based on the federal budget, published by the Office of Management and Budget, on financial reports published by the Department of Treasury, and on reports of other federal government agencies. Estimates of State and local government expenditures are based largely on Census Bureau quinquennial and annual surveys of these governments. Benchmark estimates of private final consumption expenditures are taken from the detailed input-output tables prepared every five years to coincide with comprehensive Census Bureau economic censuses. In addition, major statistical sources include the Census Bureau decennial census of housing and survey of residential finance for housing services; Department of Energy and private trade sources for household utilities; various federal regulatory agencies for imputed financial service charges; and private trade sources for various insurance expenses. Estimates for non-benchmark years are extrapolations and interpolations of the benchmark data, using Census Bureau surveys of retail trade sales, service receipts, rental payments, and other public and private data sources. Benchmark estimates of gross fixed capital formation are summations of residential buildings (estimates are based on Census Bureau construction

surveys and sources), non-residential buildings and other construction (estimates are from the census of construction industries and other Census Bureau surveys, other government agencies statistics, and private trade data), and producers' durable goods (estimates are mainly from the Census Bureau census of manufactures shipments data, Census Bureau on U.S. international trade in goods, and private trade sources). Estimates for non-benchmark years are extrapolations and interpolations of the benchmark data using Census Bureau annual and monthly survey data, Census Bureau and BEA data on U.S. international trade in goods and services, and various trade sources. Estimates of exports and imports of goods, taken from U.S. balance of payment accounts, are based on customs documents tabulated by the Census Bureau. Service transactions, taken from U.S. balance of payments accounts, are based on BEA surveys and other government sources. Constant-dollar government final consumption expenditures are calculated in three parts. Employee compensation is obtained by extrapolating base-year compensation with full-time equivalent employment measures, with detail by level of pay or experience. Purchases of many defense goods are derived by developing base-year prices for specific items and applying those prices to actual deliveries of goods. Purchases of most other goods and services are obtained by deflation. The price indexes used include components of the Consumer Price Index (CPI) and the Producer Price Index (PPI), selected construction price indexes, and other indexes. Constant-dollar private final consumption expenditures are deflated mainly by components of the CPI. To deflate several service components, BEA composite indexes of input prices are used. Constant-dollar gross fixed capital formation are deflated by various price indexes. For residential buildings, hedonic price indexes from the Census Bureau and from BEA are the major sources. For non-residential buildings and other construction, cost indexes from government agencies and trade sources are used. For most of producers' durable goods, components of the PPI are used; for computers and peripheral equipment, a BEA hedonic price index is used. For purchases of imports, components of the Bureau of Labor Statistics (BLS) import price index are used. Constant-dollar exports and imports of goods and services are deflated mainly by components of the BLS export and import price indexes. Other indexes used include the PPI, CPI, BEA computer price indexes, indexes from other government agencies, and other sources.

Income Approach

Indirect taxes for the federal government include excise taxes and customs duties; estimates are based on administrative records. Indirect taxes for state and local government include sales taxes and property taxes; estimates are derived from Census Bureau sources. Subsidies paid by the federal government are mainly payments to farmers and housing subsidies. Subsidies are estimated using the same sources that are used for government final consumption. Consumption of fixed capital is derived from perpetual inventory calculations used in BEA's capital stock estimates. The annual estimates of compensation of employees are taken mainly from administrative records of government agencies. The operating surplus is estimated in four separate parts: Income of unincorporated enterprises (farm and nonfarm proprietors' income), corporate profits, net interest, and rental income of persons. Tabulations of tax returns are the primary source for nonfarm proprietors' income, corporate profits and net interest. Farm income is based on data from by the Department of Agriculture. Rental income of persons - which covers only rental income of persons not primarily engaged in the real estate business - is based primarily on the decennial census and a biennial survey of housing; royalty payments are also included and are based on tax information. Imputed rental receipts of owner-occupants of nonfarm dwellings are estimated using the rental-equivalency method. Rental receipts for both tenant and owner-occupied housing are adjusted to exclude expenses.

Production Approach

Except for establishments of government enterprises which are shown as a single industry, the industrial distributions are based on the U.S. standard industrial classification (SIC) system. Some differences between the SIC and the ISIC are the following: establishments that manufacture and sell commodities including food and apparel, at retail are classified in retail trade in the SIC and in manufacturing in the ISIC; establishments that publish and reproduce video recordings and computer media, retread and repair machinery and equipment are classified in services in the SIC and in manufacturing in the ISIC; and establishments that repair motor vehicles are classified in services in the SIC and in retail trade in the ISIC.

^a Includes Fishing.

^b From 1998 data, "Repairs and maintenance" is included in "Other community, social and personal service activities".

^c At factor cost. Discrepancy between components and total as data for individual industries include all taxes less all subsidies.

^d Starting 1998 a new classification - NAICS98 - is used to compile data for Value Added.

^e Chained-linked volume measures are presented in this table, thus discrepancies between components and total may exist.

^a At producer's prices.

^b Value Added refers to GDP.

^c The individual industries do not add to the total because the statistical discrepancy between GDP by expenditure approach and the GDP by production approach is included in the total, but not allocated among the individual industries. Also Output and the components of Value Added do not include said statistical discrepancy.

^d Includes Taxes less Subsidies on products.

^e Data have not been revised. Discrepancy with data in Table 4.1.

^f Includes Mixed Income, Gross. Discrepancy with equivalent item in Table 4.1. For private industries, operating surplus is presented without the capital consumption adjustment, which is not available by industry.

^g Discrepancy with equivalent item in Tables 1.3 and 4.1. For private industries, consumption of fixed capital is presented without the capital consumption adjustment, which is not available by industry. Consumption of fixed capital for general government and government enterprises includes the adjustment.

^h Includes Net mixed income.

ⁱ Discrepancy between Total Economy and breakdown by industry.

^a At producer's prices.

^b Includes all taxes less all subsidies.

^c Differences with data in table 2.3 due to different methodology.

^d Discrepancy with equivalent item in Table 2.3. Includes capital consumption adjustment. For private industries, operating surplus is presented without the capital consumption adjustment, which is not available by industry.

^e Includes Social benefits other than social transfers in kind.

^f Net lending in the financial account and Net lending in the capital account have not been reconciled.

Uruguay

Source

The preparation of national accounts statistics in Uruguay is undertaken by the Banco Central del Uruguay, Montevideo. The official estimates and some methodological notes are published annually and quarterly by the Banco Central in: <http://www.bcu.gub.uy/a31831.html>. The following presentation of sources and methods can be found also at its website in: <http://www.bcu.gub.uy/a31837.html>.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA).

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated annually and quarterly using the production approach and expenditure approach. GDP annual estimates using the income approach have been made for the years 1997-2005 (tables 203). On March 1, 1993, the Uruguayan peso, equal to 1,000 new Uruguayan pesos, was introduced.

Expenditure Approach

All components of gross domestic product by expenditure are estimated using the expenditure approach except private final consumption expenditure and gross investment in machinery and equipments which are estimated by the commodity-flow approach. The estimates of government final consumption expenditure are based on the budgetary programmes of the different institutional sub-sectors. The items are analyzed in accordance with the government disbursements which are classified into ten different items. The commodity-flow approach is used to estimate private final consumption expenditure by separating the current products according to their origin and source and estimates are periodically checked by surveys of homes and of family budgets. The estimates of increase in stocks refer to stock variations for some main products such as meat, wool and oil products.

The estimates of imported machinery and equipment are based on c.i.f. import values classified by industry of origin, principal groups of goods and sectors of destination. Customs duties, indirect taxes, trade margins, etc. are then added. Domestically produced capital goods are estimated in the same manner. The estimates of exports and imports of goods and services are based on the foreign trade statistics which are adjusted for unregistered transactions. The balance of payments data are also used. For the constant price estimates, price deflation is used for government purchases of goods and services, public construction and exports and imports of services. For government compensation of employees, increase in stocks, private construction, investment in machinery and equipment and exports and imports of goods, the base year estimates are extrapolated by quantity indexes. Private consumption expenditure is obtained through a supply-use consistency approach.

Income Approach

The estimates of wages and salaries in the agricultural sector, manufacturing activities and trade sector are estimated by using employment data and average wages obtained from censuses (1996 population, 1997 economic) and other socio-demographic household surveys, extrapolated and interpolated by using indices of physical volumes. For private construction, the ratio of wages and salaries to the value of building is determined for the different types of construction work. For the public sectors, compensation of employees is obtained directly from the government enterprises. In general, consumption of fixed capital is valued at original cost. Information of indirect taxes and subsidies is available directly for registered tax classifications by economic branch. Profits of government monopoly enterprises are treated as indirect taxes while deficits are treated as subsidies. Operating surplus is obtained as a residual.

Production Approach

The production approach is used to estimate the value added of most industries. However, the income approach is used for producers of government services, part of the construction sector and part of the services sector. The Ministerio de Ganadería y Agricultura conducts censuses and surveys every four years, covering agricultural establishments of over one hectare. The censuses include various type of information such as ownership, locations, land tenure conditions, production, stocks, etc. The Ministerio also conducts annual sample surveys on principal crops, wool production, etc. The gross value of livestock production is based on the number of livestock, adjusted for imports and exports and changes in stocks. Data on mining production and prices are provided by the Instituto Geológico del Uruguay and the Cámara de la Construcción, respectively. The estimates of intermediate consumption are based on the 1997 SUT.

For manufacturing, quarterly and annual surveys are conducted. They provide data on labour force, salaries and wages, raw materials, manufactured products, costs, etc. The value of electricity and water production is obtained directly from the concerned enterprises which are government monopolies. The data of gas production are furnished by the concerned companies. Basic information used to estimate the gross value of production in the building sector is obtained from the administrative records of the public sector. For private building, the municipal records provide data on approved licenses, quantity, size and type of construction. This information is adjusted on the basis of surveys on time extension of buildings and areas. The accounting records of the central government and public enterprises supply the information used to estimate the gross production value of public buildings. The estimates of the trade sector are based on the gross value of commercialized production while intermediate consumption is obtained from an analysis of the accounts of certain enterprises. The Banco Central del Uruguay conducts surveys of trade channels and trade margins. For restaurants and hotels, the estimates are based on specific studies carried out for 1997 SUT and for base year 2005, extrapolated by price and volume indexes.

The production values of railways, air transport and ports are estimated from the data supplied by the respective government enterprises. For other transport, data are obtained directly from concerned enterprises and from license permits issued. Information on water transport, storage and communication is obtained directly from a special maritime commission, from the Mercado de Frutos, and from the accounts of government enterprises, respectively. The estimates of banking services are obtained from administrative records. For real estate, the value of production is determined as the amount of gross rents paid or imputed for housing services. Owner-occupied dwellings are imputed in accordance with the average rents for rented houses. The estimates of business services are based on the number of persons employed and average wages. For producers of government services, the estimates are based on budgetary programmes of the institutional subsectors. For other private services, bench-mark studies referring to 1997-2005 SUTs are extrapolated by the most suitable indicators. For the constant price estimates, value added of most industries is extrapolated by a quantity index.

Uzbekistan

Source

Reply to the United Nations national accounts questionnaire from the State Committee of the Republic of Uzbekistan on Forecasting and Statistics. The latest data for Uzbekistan was received through the United Nations Economic Commission for Europe (UN/ECE).

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Uzbekistan has changed in 1994 from the Russian rouble to Uzbek sum. One sum equals 1,000 Russian rubles (see World Bank "Statistical Handbook for the States of the FSU, 1996").

Vanuatu

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Office of Vanuatu, Vila. The estimates are published in "National Income Accounts of Vanuatu, 2007". The report presents the national accounts of Vanuatu for the period 2002-2007.

General

The conceptual framework used to compile the system of national accounts for Vanuatu is essentially that of System of National Accounts, 1993 (SNA93), with some adaptations to reflect the situation in an island economy like Vanuatu.

Methodology:

Overview of GDP Compilation

The national accounts for Vanuatu comprise four main summary accounts - gross domestic product account, national income account, national capital account, and external transactions account – together with supporting tables. At this stage, other elements of full SNA93 system, such as financial accounts and balance sheets, have not been compiled.

The external transaction is compiled from the balance of payments statistics published by the Reserve Bank of Vanuatu. From 1995, the balance of payments have been prepared using recommendations contained in the 5th edition of the IMF Balance of Payments Manual (BPMS).

Current price estimates for GDP in Vanuatu are compiled using both the production and expenditure approaches. The data source available for the production approach is more robust than those available for expenditure approach. Consequently, the official measure of GDP is obtained from the production approach, with the statistical discrepancy being shown on the expenditure side to align the expenditure measure with the production measure.

Expenditure Approach

Household final consumption expenditure is estimates using the commodity flow method. Available supply is estimated by adding together subsistence production, local market production, imports and trade make-up. The value of intermediate consumption is deducted from this total to derive the household final consumption expenditure.

Government final expenditure: Vanuatu government financial statistics provided detailed information on the receipts and recurrent expenditure of the central government. The corresponding data for provincial government were made available from the provincial government administrative office.

Gross fixed Capital Formation: Estimates for annual expenditure on fixed assets are derived from imports and production statistics by the use of the commodity flow approach. The aggregate for construction and land improvements is estimated as the value of output of the construction industry. Estimation for annual expenditure on durable equipment are derived from imports statistics.

Changes in inventories are compiled by industry and are derived mainly from data collected in the annual business survey. For construction, a proportion of the imports of building materials each year are assumed to remain in inventories at the end of the year and to be used in construction work the following year.

Exports and imports of goods and services: Data on merchandise trade are obtained from the detailed overseas trade statistics maintained by the National Statistics Office. Time series data on non merchandise exports and imports are available from the balance of payments statistics compiled by the Reserve Bank of Vanuatu.

Production Approach

The value added for Agriculture includes crops such as copra, cocoa, kasava, coffee as well as livestock, fishing and forestry. Data is obtained from exporters, the Department of Forestry, the department of Agriculture, and the Department of Fisheries. These data are supplemented by external trade data compiled by the National Statistics Office.

Estimates of commercial production such as copra, cocoa and coffee are based on the volume of these commodities received by exporter authorities for export and local sales, valued at prices paid to the farmers. Including transport costs.

The main data source for the manufacturing estimates is the annual business survey. However, for year 2002 to 2007, the current price estimates for manufacturing production are extrapolated using movements derived from VAT sales data collected by Department of Customs and Inland Revenue.

Value added data for Electricity, gas and water are obtained from detailed income and expenditure statements included in the annual reports of UNELCO and the Ministry of Infrastructure and public Utilities.

The value of construction output is calculated using the value of imported building materials used in construction activities. An imputation is included for own account construction of dwelling in the subsistence sector.

The value added for the rest of the industries and services are estimated using data obtained from the 2001 annual business survey. The current estimates for the year 2002 to 2007 are extrapolated using movements derived from VAT sales data collected by the Department of Customs and Inland Revenue.

Venezuela

Source

The preparation of national accounts statistics in Venezuela is undertaken by the Banco Central de Venezuela. The official estimates are published annually by the Banco Central in "Memorias o Informes Economicas". A detailed description of the sources and methods used for the national accounts estimation is found in "Metodologia de las Cuentas Nacionales de Venezuela" and in "Practicas en materia de cuentas" also published by the Banco Central.

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previous estimates were prepared in accordance with the concepts and definitions of the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used for private consumption expenditure and gross fixed capital formation. Increase in stocks is obtained as a residual. The estimates of government final consumption expenditures are based on information obtained from government budgets and financial statements of the government entities. For private consumption expenditure on imported goods, estimates are based on the value of imports f.o.b. Values of locally produced goods are based on the production account of agriculture, manufacturing and the services. Trade margins based on surveys are used to estimate purchasers' values. The information used to estimate gross fixed capital formation include data on construction, manufacturing production, sales of vehicles and livestock and imported capital goods. The data on petroleum and iron-ore exports are obtained from the Ministerio de Energia y Minas while exports of other merchandise are obtained from the Oficina Central de Estadisticas e Informatica. The Corporacion de turismo, the embassies as well as companies engaged in transports, communication and insurance also provide export data. Import data are mainly provided by the Oficina Central de Estadisticas e Informatica. For the constant price estimates, only information for gross fixed capital formation is available. The item is deflated by price indexes constructed separately for construction, machinery and equipment and transport equipment. For other aggregates of this item, the estimates are obtained directly at constant prices.

Income Approach

In estimating the cost structure components of gross domestic product, estimates of compensation of employees, operating surplus and depreciation are obtained for each industry group separately. For agriculture, forestry and fishing, they are estimated as a percentage of the gross value of production based on factor and coefficients from a 1968 study. For the mining sector, information from the Ministerio de Energia e Minas are used for petroleum activity and iron-ore mining. For manufacturing, estimates are based on cost structure data by the Ministerio de Hacienda supplemented by information from public enterprises and petroleum refineries. A survey conducted by the Banco in 1968-70 provides coefficients for the trade sector. Financial statements are used for public enterprises railway transport, communication, financial institutions and insurance. Input coefficients obtained from surveys are used for road transport and private services. Data on indirect taxes and subsidies are obtained from government sources.

Production Approach

The table of gross domestic product by kind of economic activity at market prices, i.e., producers' values. The production approach is used to estimate the value added of most industries. The income approach is used to estimate producers of government services, domestic services and part of other private services. The information on gross output in the agricultural sector is furnished annually by the Ministerio de Agricultura y Cria on the basis of field survey conducted during the summer (January-April) and the winter (May-December). These surveys give information on cultivated areas and physical production of the principal crops. The value of production is first calculated in constant prices by multiplying the physical production of each item by the respective producers' prices in 1968 and then converting it to current values by using the producers' price index estimated by the Banco. Value added is obtained by applying the cost structure estimated for 1968.

For crude petroleum and refinery products, a production account covering all enterprises in the petroleum sector is constructed on the basis of information provided by the Ministerio de Energia y Minas. Crude petroleum is separated from refinery production on the basis of annual survey data. During the period 1968-1975, exports were calculated at official fiscal prices for export as declared by foreign concessionaires while from 1976 onwards, the prices reported by the nationalized enterprises have been used. Value added for the manufacturing industries is estimated by applying to the gross value of production by kind of economic activity the cost structure information on companies. Benchmark estimates on gross value of manufacturing production have been prepared based on the third industrial survey conducted in 1971. These estimates are extrapolated by the annual changes in the index of industrial production through annual surveys. The Instituto Nacional de Obras Sanitarias provides information on production and cost structure of water supply.

For public construction, information is obtained from censuses conducted by the Banco. For private construction requiring permits, estimates are based on construction coefficients per capita which are available for 14 urban centers through a survey. The estimates for the federal district are calculated independently through a survey and through using information on construction permits. Non-permit construction estimates are agriculture. Benchmark estimates for each of the activities in the trade sector have been prepared for 1968-1970 by using the results of a national survey conducted by the Banco. Since 1970, overall estimates are made by extrapolating the total value of production by an index of market sales. Adjustments are made to account for the public enterprises by using their respective financial statements. Value added in the private transport sector is estimated by applying the sample coefficient, obtained through surveys, to the receipts for each type of services. For the public sector, information is obtained directly from concerned enterprises.

The value added of the financial institutions is obtained as the difference between the value of production and intermediate consumption. For ownership of dwellings, the value of production is estimated from the total number of occupied dwellings and the annual average rent, adjusted by the rent item in the cost-of-living index. For real estate and business services, the production value is estimated by projecting the annual changes of incomes obtained from surveys. The value added of government services constitutes the remuneration of employees of the various government agencies and the consumption of fixed capital of the administrative organizations. For private services, coefficients of value added obtained from surveys are used. For the constant price estimates, value added of agriculture and mining is extrapolated by quantum indexes. For other industries, current values are deflated by various price indexes.

Viet Nam

Source

Reply to the United Nations national accounts questionnaire from the Secretariat and International Cooperation, General Statistics Office of Vietnam. The official estimates are published in "System of National Accounts of Viet Nam". The most recent data was obtained from the internet website (www.gso.gov.vn), as reported by the General Statistics Office in Hanoi, Vietnam.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA).

Yemen

Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Organization, Sana'a.

General

The latest data shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. In May 1990, Yemen and Democratic Yemen united to form a single State. Since that date it has been represented as one country with the name "Yemen".

Zambia

Source

The preparation of national accounts statistics in Zambia is undertaken by the Central Statistical Office (CSO), Lusaka. The official estimates are published in the Monthly Statistical Bulletin. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

A description of the sources and methods used for the National Accounts estimation is found in "National Income Statistics-Sources and Methods, 1994 Benchmark Year" Volumes 1 and 2. The national accounts estimates are compiled according to the guidelines of the 1968 SNA. However, some parts of the 1993 SNA were used to compile the GDP estimates for 1994-2001. The accounts cover, in principle, all resident institutional units and economic activities within the geographical boundaries of Zambia. However, informal activities are not well covered. In the case of the general government sector, imputations are made for local government because of lack of data. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

The annual Gross Domestic Product is estimated using both the production and expenditure approach. On the production side, GDP estimates are compiled for 11 major industry groups and 23 sub-groups, grouped into primary, secondary and tertiary sectors, including FISIM. The classification used under this approach is the second revision of the International Standard Industrial Classification all Economic Activities (ISIC Rev. 2). For external trade statistics, the classifications used are the Standard International Trade Classification (SITC) and the Harmonized System (HS). Gross Domestic Product estimates using the expenditure approach at current and constant 1994 prices are compiled but not disseminated. The expenditure estimates are compiled for 6 main components. In addition, Gross National Income (GNI), and the National Disposable Income (NDI) and its appropriation, down to saving, are also compiled and disseminated.

The benchmark year for GDP estimates is 1994. Output is recorded at producer prices, while exports and imports are valued f.o.b. The recording period for most economic activities is the calendar year, except for agriculture where the crop year runs from October to September of the following year. Production is recorded in the year in which harvest takes place. The benchmark data at constant prices are extrapolated with output indicators. Gross Value Added (GVA) at basic prices is then computed as the sum of the individual industry value added estimates, less the Financial Intermediation Services Indirectly Measured (FISIM). After adding net taxes on products to this total, constant price GDP is obtained. To derive GDP at current prices, the individual industry value added estimates at constant prices are deflated with an appropriate deflator (CPI). The estimates of value added so obtained are then summed to obtain GDP at market prices, taking into account FISIM and net taxes on products. The single deflation of output is used.

Expenditure Approach

This approach covers six (6) main components: Government final consumption expenditure, private/ household final consumption expenditure, gross fixed capital formation, changes in stocks, exports and imports of goods and services. All components of gross domestic product by expenditure type are estimated through the expenditure approach except for the total estimate of private consumption expenditure which is obtained as a residual due to lack of data that could be used as extrapolators. Data for government final consumption expenditure are derived from Central Government expenditure. Local government expenditure is not covered directly. It is imputed as a fixed percentage of Central Government expenditure.

The total CPI is used to deflate to current prices. Estimates for Gross Fixed Capital Formation (GFCF) are based

on the output of the construction industry and the imports of capital equipment. The two indicators are used to extrapolate the 1994 benchmark estimates. Estimates for changes in stocks are based on the 1994 PHS and the CIP for the same year. Changes in the volume of copper electrolytic bars were used to extrapolate the benchmark figures. The External Trade branch of the CSO tabulates data on foreign merchandise trade, obtained from the Zambia Revenue Authority (ZRA) customs documents. No unit value indices are compiled. Foreign Trade in services data are obtained from the Balance of Payments, compiled by the Central Bank. For the expenditure side, current price estimates are compiled directly from existing sources since data is available in the form of current prices. To obtain constant price estimates, current price values are deflated by components of the CPI.

Income Approach

The estimates of compensation of employees are based on information obtained through the annual income inquiries, the annual censuses of production and construction and other sources. Grossing-up factors to account for non-responding units are worked out on the basis of employment data collected through the quarterly employment surveys. Compensation of employees includes an estimated figure for domestic servant based on the 1969 population census data projected by an assumed 5 per cent annual growth rate. Consumption of fixed capital figures are obtained from the balance sheets of enterprises. Depreciation is imputed for some government enterprises and government administration and for owner-occupied buildings in urban and rural areas. Indirect taxes estimates are derived from the annual national income inquiries, the annual censuses of industrial production and construction data. Operating surplus is obtained as a residual.

Production Approach

The production approach is used to estimate the value added for 11 major industries. These include Agriculture, Forestry and Fishing; Mining and Quarrying; Manufacturing; Electricity Gas and Water; Construction; Wholesale and Retail Trade; Restaurants, Bars and Hotels; Financial institutions and Insurance; Transport, storage and Communications; Real Estate and Business Services; and Community, Social and Personal services.

Agriculture has two components, crops and livestock. For crops, volumes of production of food and cash crops are compiled using data from the Crop Forecasting and Post-Harvest Surveys conducted by the CSO in collaboration with the Ministry of Agriculture and Co-operatives (MACO). Benchmark data are based on the 1994 Post-harvest survey. Current price values are obtained by multiplying the benchmark figures with the CPI for agriculture. Benchmark estimates for livestock are also based on the 1994 PHS. Data are extrapolated on the livestock population growth numbers, obtained from the Department of Veterinary in the MACO. Estimates for the forestry sector are derived indirectly by using the output from a selected sample of enterprises in the manufacture of forestry products. Fishing data are based on fish landings/catch data from the major lake and rivers obtained from the Department of Fisheries.

The Industrial Production Branch of the CSO conducts a quarterly survey of industrial production, which covers all the major mining and quarrying establishments. Benchmark is based on the 1994 Census of Industrial Production (CIP). The price weights for the Index of Industrial Production (IIP) are based on 1980 CIP re-referenced to 2000 using turnover/sales as weights. The export price index of copper and Cobalt is used to deflate the constant price estimates to obtain current price data. For manufacturing, benchmark estimates are based on the 1980 CIP re-referenced to 2000 using turnover/sales as weights. The quarterly survey of IP is used to extrapolate the benchmark estimates. The statistical section of the Zambia Electricity Supply Corporation (ZESCO) collects data on the production of electricity which is used to extrapolate value added for the sector. Population growth is used to extrapolate VA for the water sector. Estimates for the Construction sector are based on building materials with the main indicators being domestic (figures obtained from the sole domestic producer and imported cement (import data obtained from customs documents).

Wholesale and Retail Trade estimates are based on the 1994 National Income Inquiry (NII). Those for subsequent years are based on weighted output of agriculture, manufacturing and imports of consumption goods. For Restaurants and Bars, the change in the IIP for food is used to extrapolate VA at constant prices. For current prices, the Wholesale Price Index for food is used to inflate the estimates at constant prices. For Hotels, data on

bed occupancy rates is used to extrapolate the 1994 benchmark estimates from the NII. For road transport, estimates are extrapolated with indicators of passengers carried and cargo hauled by the major transport companies. Those for rail transport are based on data on cargo hauled and carried by from the two major rail transport companies. The same applies to air transport. The communications sector includes postal and telecom services. Postal services estimates are based on the number of domestic and international letter mail and parcels, with the benchmark being the 1994 NII.

Constant price estimates for the Telecom industry are based on the number of telephone calls, as reported by the major telecom companies. Constant price estimates for financial institutions are based on employment in the financial institutions and insurance sector as an indicator of constant price output and value added. The number of policies issued by major insurance companies is used as an indicator in the insurance sector. For Real Estate, data from the Household Based Survey (HBS) of 1994 are used to derive the estimates with the extrapolator being the population growth rate. The change in the VA in trade is used to extrapolate estimates for Business Services, computed using the 1994 NII.

Zanzibar

Source

The computation of National Accounts Statistics for Zanzibar is conducted by the Economic Statistics Section of the Office of the Chief Government Statistician of Zanzibar, which provided the reply to the United Nations national accounts questionnaire.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA).

Methodology:

Overview of GDP Compilation

National accounts are compiled using a combination of production and income approaches. Definitions and concepts followed in the estimates are broadly in conformity with the recommendations of the SNA.

Expenditure Approach

Since there is no direct information on household expenditure except when there is a recurrent household budget survey (HBS), it is not possible to compile regular independent estimates by the expenditure method. The latest available HBS was conducted in 1991.

Production Approach

The primary method of estimating the GDP of Zanzibar is to assess the gross value added (GVA) by each branch of activity in the economy, in both current and constant prices. The economy is classified into economic activities according to Revision 3 of the International Standard Industrial Classification (ISIC Rev3). Value added is measured "at basic prices", that is excluding taxes on products (such as import duties and VAT) and including subsidies.

Although agriculture is an important sector in the economy no reliable statistics are available as the larger part of this activity is carried out by individual farmers who do not keep records. Crop husbandry is split into export crops and all other crops. For most export crops the source of information is the Zanzibar State Trading Corporation (ZSTC) who keeps monthly records of the quantity and value of purchases. For other crops (mainly food) the source is the Ministry of Agriculture, who make rough estimates of the output based on the acreage cultivated in each District. Producer prices are no longer regularly available for food crops, so the prices are projected using information from the CPI or staff estimates. Total output is calculated at both current and constant prices by multiplying the quantities by the prices. (In the case of export crops prices are obtained by dividing values by quantities. Sometimes adjustments are necessary to eliminate data errors.) Value added is obtained by subtracting estimates of intermediate consumption from total output of all types of crops. The value of intermediate consumption is estimated at 6 percent of total output. This ratio was based on studies done in the Ministry of Agriculture in the 1970s. Estimates of marketed and non-marketed output are made using fixed proportions of the output of each crop. These proportions were derived from the HBS (1991).

Livestock estimates are made for the following categories: cattle, goats and sheep, chickens, milk, eggs, and hides and skins. Total output is calculated at both current and constant prices by multiplying the quantities by the prices. The estimates of quantity were based originally on a Livestock Census carried out by the Veterinary Department of the Ministry of Agriculture. They have been projected using 3 per cent per year for cattle, goats and sheep, and milk; 5 per cent per year for chickens and eggs; and 4 per cent for hides and skins. In the absence of regular information, the prices used in 1991 are projected using the CPI for meat. Value added is obtained by subtracting intermediate consumption. The originally estimate proportion of 15% has been used in every year. Estimates of marketed and non-marketed output are made using fixed proportion assumed to be 80 per cent.

Forestry estimates are made for the following forestry products: beams, big poles, poles, medium poles, witches, saw wood, logs, firewood and charcoal. Total output is calculated at both current and constant prices by multiplying the quantities by the prices. Originally, data on the quantity of forest products (from the government-administered forests) were obtained from the Department of Commercial Crops, Fruits and Forestry. Figures continue to be obtained from the Department, except for firewood, which is based on the 1991 Household Budget Survey and projected using population growth. Value added is obtained by deducting a fixed proportion of 10 per cent for intermediate costs. The 10 per cent intermediate costs were considered to be appropriate in the absence of reliable data. Estimates of marketed and non-marketed output are made using fixed proportion assumed to be 60 per cent.

The source of data on fishing is the Department of Fisheries and Sea Products. The Department collects data on the value and quantity of different types of fish caught at various landing points. Total quantities are multiplied by average prices to obtain total output. The price data may be adjusted to eliminate large fluctuations. Value added is obtained by deducting 15 per cent for intermediate costs. This proportion was reviewed with the Department of Fisheries and Sea Products in 2003, and was considered to be appropriate in the absence of more reliable data. Estimates of marketed and non-marketed output are made using fixed proportion assumed to be 84 per cent.

Mining and Quarrying covers quarrying activity only. No other minerals are being exploited. For 2001, total output, intermediate consumption and value added were all taken from the 2001 Industrial Census conducted by the OCGS, which covered businesses with 10 or more employees the quarrying sector. Estimates of informal activity were derived from the total number of people working in the sector according to the Population Census 2002. This was multiplied by an estimated wage rate, to give an informal value added about twice that of the formal sector. The estimates from year to year are based on the quantities of quarry products, as recorded by the Department of Commercial Crops, Fruits and Forestry. Quantity indicators are calculated and these indicators are weighted together to form a quantity index. Until 2001, the estimates were based on four types of products. However since 2001, because the data on limestone was no longer available, the index was based on three products, as shown in the following table. Estimates at constant prices are derived by projecting the base year values by the quantity index. Estimates at current prices are derived by projecting the base year values by a value index, obtained by multiplying the quantity index by the all items CPI.

Manufacturing activity is sub-divided into three groups. The first group consists of establishments employing 10 and more persons, the second group covers establishments employing 5-9 persons and the third group consists of activity involving less than 5 persons either in establishments or in households. The Office of Chief Government Statistician conducted an Industrial Census with a reference period 2001. Data for all three groups are available, except that, for the third group, only establishments on the Central Register of Establishments were covered. The results of the Census were used to establish a new benchmark for 2001. Annually, the source of data is the quarterly survey of industrial production. This survey collects data on the quantities of production of goods manufactured by large establishments employing 50 or more people. An index of manufacturing production is compiled by multiplying the quantities by the corresponding prices (estimated where necessary) in the base year (now 2001). The producer prices are first adjusted by the ratio of gross value added (GVA) to total output, which is equivalent to using value added weights. For the time being, value added at constant prices for all the sub-sectors is obtained each year by applying the index to the total benchmark value added in 2001. For current prices, a value index is obtained by inflating the index described above by the all items CPI. This value index is used to extrapolate the benchmark to give estimates of value added for other years.

For electricity the main source of information is the State Fuel Power Corporation, which is responsible for the importation, generation and distribution of electricity in Zanzibar. There are a number of electricity generators belonging to industrial establishments, hospitals and some private people but this output is not included as no information is available. Annual turnover is taken as being equal to total revenue collected. According to the accounts of the Corporation, in 2001 value added amounted to 24% of this turnover after subtracting the amounts paid to TANESCO for electricity imported from the mainland. This ratio is therefore used to estimate value added at current prices. (In fact, total billings are substantially higher than total revenue collected; on the other hand,

amounts payable to TANESCO are substantially higher than the amounts actually paid. In 2001 these differences were roughly the same.) For constant prices, a combined index of power (KWH) and load (KVA) is used to extrapolate the base year value added. Estimates of per capita consumption of water in urban and in rural areas for 1991 were supplied by the Department of Water. These quantities are multiplied by estimates of the urban and rural populations. An allowance of 30 per cent is added for the non-domestic use of water. The average values per litre of urban and rural water in 1991 have been projected using the all items CPI. The quantities are multiplied by current and base year prices to give estimates of total output at current and constant prices respectively. To get value added, 75% is deducted from the output to account for intermediate consumption.

The estimates for the construction sector are obtained from estimated values of inputs. These inputs are quarry products (from the mining sector), and building materials imported from mainland and from the rest of the world (rough indicators from TRA). There is little information on the cost structure of construction sector. The estimates are based on historic ratios of value added to material inputs of 1.27 to 1. Estimates at constant prices are made by deflating the current price figures by the all items CPI. An allowance of 9 per cent is added to take account of rural construction.

The trade and repairs sector covers wholesale and retail trade, and the repair of motor vehicles and motorcycles and of personal and household goods. In Zanzibar, apart from ZSTC and a few other wholesalers, the sector is dominated by small businesses that do not keep records. The total output of the trade sector is equal to their gross trade margins, and these are estimated indirectly. The sources of information are the figures for imports from the mainland and from the rest of the world, and estimates of locally produced goods. Assumptions have been made about the proportions of imports and of locally produced goods that pass through the sector, rather than being purchased directly by the consumers. For imports from the rest of the world, these proportions are shown in Annex B. Of imports from mainland, 100% are assumed to be traded goods. For local production the proportions for crops are at Annex A; for livestock 80% of total output; for forestry 60%, for fishing 84% and for industrial products 100%. In order to estimate the percentage trade mark-ups, survey of distribution was conducted in the early 1980s. The survey was repeated in 2002, but results were considered implausible, so the earlier figures were retained for consistency. The overall mark-ups for locally produced goods were taken as 30%, while those for imported goods were 20%. Intermediate consumption, at 20 per cent of total output, is deducted to give gross value added at current prices. For constant price estimates, the current price figures are deflated using the CPI. For repairs, figures from an employment survey for the year 1999 were extrapolated using the growth rate of the urban population (4.3%). Wage rates were used to obtain estimates of value added at current prices. For constant prices, base year (2001) figures are extrapolated using employment.

For the years 2001 and 2002, a survey of hotels was undertaken. The 2001 results have used as a basis for estimating total output and intermediate consumption (close to 50 per cent of total output). Also, in 2001 a survey of departing visitors was conducted in Tanzania as a whole. Evidence from both these surveys suggested that some hotels understated their turnover. Where this was suspected, total output estimates were based on their expenditures on intermediate consumption and on labor. An allowance was added for the value added in restaurants. For other years, the number of visitor arrivals is considered to be the best available indicator of activity in this sector. The number has been used as a quantity indicator to project the value added in 2001 to give constant price estimates. For the current prices, the quantity indicator is multiplied by the CPI to derive a value indicator.

The sector on transport and communication consists of land transport, water transport, air transport, other transport (travel agents and tour operators, and clearing and forwarding agents) and communication. The main source of information on transport and communication is the annual survey of the main companies involved in the sector, conducted by the OCGS. For the year 1991, calculations were made to determine the value added by different types of land transport, based on the numbers of vehicles, assumed numbers of trips per vehicle, passengers per trip and fares. For subsequent years, an index of the quantity of land transport services is based on the numbers of vehicles licensed. (Up to 2001, this was assumed to grow by just under 4 per cent per year, in the absence of reliable statistics.) A value index is calculated as the quantity index multiplied by the CPI for transportation. Value added at current and constant prices are then derived in the usual way. Regarding water

transport, current prices estimates of total output, intermediate consumption and value added are taken from the returns of the operating companies. An allowance is added for the value added of informal sector transport based on figures of employment and average earnings.

For constant prices, estimates are based on a combined quantity index of cargo and passengers. Air companies based in Zanzibar provide annual returns of their income and expenditure. For companies based outside Zanzibar, only wages and salaries paid in Zanzibar are included. For estimates at constant prices, a combined quantity index of cargo and passengers is used. The "other transport" sub-sector covers travel agents and tour operators; and clearing and forwarding agents. A special survey of these businesses was conducted for the year 2001, from which benchmark levels of total output, intermediate consumption and value added were obtained. For other years, the number of visitor arrivals and the quantities of freight handled are used as quantity indicators, inflated by the CPI for transportation to obtain value indices. These value and quantity indices are used to project the base year value added to give current and constant price estimates respectively. Communications sector: current prices estimates of total output, intermediate consumption and value added are taken from the returns of the operating companies. In the absence of a satisfactory quantity indicator or a specific price index for telecommunications, the all items CPI is used as a deflator.

The Financial Institutions sector consists of three sub-sectors: banking, insurance and bureaux de changes. The main sources of information are the accounts of the major banks and insurance companies. FISIM: The output of the financial sector usually includes "Financial Intermediation Services Indirectly Measured", or FISIM for short. FISIM used to be known as "Imputed bank service charges". Essentially, FISIM is the difference between interest received by financial institutions from borrowers and interest paid to depositors. While FISIM is included in output (and hence the value added of the financial sector), according to SNA conventions it is subtracted again from the gross value added of all sectors to obtain GDP. Because of this treatment, the size of FISIM does not affect the size of GDP. In Zanzibar, it is difficult to measure FISIM properly, especially in the case of branches of institutions whose headquarters are on the mainland. Interest received does not necessarily exceed interest paid by the branch. As it makes no difference to GDP, it was therefore decided to omit FISIM from total output, and not to subtract it at the end. (The treatment implies that the operating surplus of the banks is less than it would be, if satisfactory estimates of FISIM were included.) Banking: as described above, only non-interest operating income (charges, commissions, etc) is included in total output.

Value added at current prices is obtained by deducting intermediate inputs. In the case of the Bank of Tanzania, only wages and salaries paid to staff in Zanzibar are included in value added. For constant prices, the current price figures are deflated using the all items CPI. Insurance: Total output is measured as total premiums minus claims. In theory, additions made to technical reserves should also be deducted, but no information is available on this item. Value added is derived by subtracting intermediate inputs. The all items CPI is used to derive estimates at constant prices. Bureaux de Changes: A benchmark survey for 2001 was conducted to provide estimates for that year. For other years, the number of visitor arrivals is used to derive a quantity indicator. A value index is constructed by multiplying the quantity index by the all items CPI.

Real Estate and Business Services is divided into dwellings, other real estate, and business services such as accountants, auditors, architects and consultants. Estimates for the value added in dwellings depend on estimates of the number of households in urban and rural areas, projected by assumed growth rates. These growth rates have been revised following the incorporation of new figures from the 2002 Population Census. Compared with the figures for 1991, growth in the number of urban households has been 5.9 per cent per year while rural households have grown by 2.1 per cent. Prices, based on 1991 estimates of rents, are extrapolated using the CPI. These are multiplied by current and base year prices to give estimates at current and constant prices respectively.

The value added generated through other real estate is based on historic estimates. Since 1991, a growth rate of 5.9 per cent has been assumed, based on the newly estimated urban growth rate. The resulting quantity index is inflated by a composite index of wages and prices to give a value index. The value index is used to extrapolate the 1991 estimate of value added at current prices. Base year value added is extrapolated by the quantity estimates to give value added at constant prices. The composite wages and prices index is based on two indices, which are

each given a weight of 50 per cent. The indicators are: an index of the annual minimum wage (calculated as a total of the minimum wages each month), and the all items CPI. The value added generated through other real estate and business services is based on 1999 estimates of employment and value added per person employed. For other years a growth rate of 5.9 per cent has been assumed, based on the newly estimated urban growth rate. The resulting quantity index is used to project the employment figures. The wages and prices index is used to extrapolate the value added per person. Employment is multiplied by value added per person (in the current and the base year) to give estimates of value added (at current and constant prices respectively).

Public administration consists of the following entities: Ministries of Central Zanzibar Government (SMZ), but excluding the Water Department, and education and health services, the Zanzibar part of the Union Ministries, namely defence, police, foreign affairs and Vice President's Office, Local Government: which consists of Zanzibar Municipal Council, and Wete, Chake Chake and Mkoani Town Councils, Extra Budgetary Units. The main source of data is the government accounts. Only wages and salaries (i.e. personal emoluments, leave payments, allowances, pensions and social security contributions) are included in the value added. (In theory, the consumption of fixed capital should be added, but no estimates exist for this.) Wages and salaries of the Water Department and of the public sector education and health services (see below) are deducted. The earnings of employees of Union Ministries, local authorities and extra budgetary units are obtained through a survey. For constant prices, value added is deflated using a composite index of wages and prices. This composite index is based on two indices, which are each given a weight of 50 per cent. The indicators are: an index of the annual minimum wage (calculated as a total of the minimum wages each month), and the all items CPI.

Estimates of value added in the education sector are made separately for the public and the private sectors. For the public sector, data on the total wage bill (and other charges) is taken from the government accounts for each financial year, for the following parts of the Ministry: Department of Education, Department of Curriculum, Examination and Teachers training, Department of Adult Education, Department of Higher Education, Science and Technology. The data are converted to calendar years by averaging two financial years. For constant prices, the current price figures are divided by the combined wages and prices index (described under public administration). Private sector estimates are based on 1999 estimates of employment and value added per person employed. For other years a growth rate of 4.3 per cent has been assumed, and the resulting quantity index is used to project the employment figures. In a similar way, the wages and prices index is used to extrapolate the value added per person. Employment is multiplied by value added per person (in the current and the base year) to give estimates of value added (at current and constant prices respectively).

The public and private sector contributions to health services are estimated separately. A survey of the government hospitals and other units is conducted to provide public sector estimates of the total wage bill. As with education, private sector estimates are based on 1999 estimates of employment and value added per person employed. For other years a growth rate of 4.3 per cent has been assumed, and the resulting quantity index is used to project the employment figures. In a similar way, the wages and prices index is used to extrapolate the value added per person. Employment is multiplied by value added per person (in the current and the base year) to give estimates of value added (at current and constant prices respectively).

Other Community and Personal Services covers sports activities, religious organizations, social clubs, the arts, hairdressing and beauty saloons and laundries, among others. As with private education, estimates are based on 1999 estimates of employment and value added per person employed. For other years a growth rate of 4.3 per cent has been assumed, and the resulting quantity index is used to project the employment figures. In a similar way, the wages and prices index is used to extrapolate the value added per person. Employment is multiplied by value added per person (in the current and the base year) to give estimates of value added (at current and constant prices respectively).

Zimbabwe

Source

The preparation of national accounts statistics in Zimbabwe is undertaken by the Central Statistical Office, Harare. The official estimates and methodological notes are published by the Central Statistical Office annually in "National Accounts of Zimbabwe" and quarterly in the "Quarterly Digest of Statistics".

General

The most recent data shown in series 100 have been prepared following the United Nations System of National Accounts 1993 (1993 SNA). The estimates shown in series 20 have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the use of the expenditure approach combined with the commodity-flow approach except private consumption expenditure which is derived as a residual. In general, the commodity-flow approach determines to which consuming sector or group the commodities would be allocated. For government expenditure, detailed accounts are available from each department of the central government while the local authorities and certain controlled organizations and funds provide copies of their annual financial statement. Total private consumption expenditure is to a large extent derived as a residual. However, supplementary information is obtained from returns of major suppliers of consumer products and from family budget surveys. The estimates are checked by turnover statistics of retailers. Data on changes in stocks are available from the annual censuses of production, agriculture and livestock, census of road transport and for the trade sector, from turnover indexes. Expenditure on capital goods are available in the annual censuses of agriculture and production, the annual analysis of public sector accounts and the annual surveys of financial institutions. The data from these sources are classified by industry, sector and type of asset. The value of new buildings construction is estimated from monthly surveys of private contractors and public sector producers. The estimates include own-account construction of dwellings and service charges of capital nature. Tabulations of exports and imports classified by industry of origin and commodity are used to determine the proportion of each group's output sold abroad and the value of imports at the border. Valuation adjustments are made to bring all trade to a uniform f.o.b. or free-on-rail valuation at the border of the exporting country. For the constant price estimates of all expenditure items deflation is done with the use of appropriate price indexes.

Income Approach

Wages and salaries paid in the industrial activity sectors are obtained from the annual censuses of industrial production. The estimates are adjusted from fiscal to calendar year and projected using ratios derived from the quarterly employment inquiries. This latter source also provides wage data for the financial, trade and service sectors. Wages and salaries paid in the agricultural sector are taken from the results of quarterly censuses of farmers. Estimates of indirect taxes and subsidies are obtained from government accounts. Gross operating surplus, including depreciation, is estimated as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. For the service sector, the income approach is used

while for the trade sector, the estimates are made by projecting the results of the latest census of distribution. Information on the gross output of agriculture is available either from regular annual censuses or from records of sales to official marketing authorities. Value of own-account consumption for some items is estimated on the basis of forecasts of total production less recorded sales and for other items, on the basis of assumed average consumption rates. The gross output of forestry and logging is estimated to include the cost of plantation development, sales and increase in stocks of cut timber, etc.

For the industrial activity sector and construction, complete output and input accounts are available from the annual censuses of production. The results are converted from fiscal to calendar-year basis and extrapolated by indicators such as turnover, mineral output, construction work done and prices. The gross output of establishments classified to manufacturing which also engage in distribution activity includes the sales margin only on goods purchased for resale without further processing. Estimates of output and input of the trade sector are made by extrapolating the results of the latest census of distribution, using turnover indicators.

For transport, the production account is based on the results of the census of road transport supplemented by the accounts of concerned companies. Estimates of financial institutions are based on the results of annual surveys taken together with statutory statistical returns rendered by registered institutions. The 2002 census of population provided information on the number of dwellings by type of dwelling, as well as the average gross rents paid for rented dwellings and these are updated using the consumer price rent index. Costs of input into dwellings are estimated on a unit basis from annual surveys.

Value added of private domestic services is estimated as wages in cash and in kind paid. Value added of education, health and other services are based on income tax statistics and wage data collected through the quarterly employment inquiries. Gross domestic product by kind of economic activity is estimated at constant prices mainly by the use of volume indices at commodity group levels for goods producing industries, trade (volume of goods handled), transport (volume of traffic by types) and services like education (combined index of students and teachers). In the case of the rest of the services, the total employment in each year is used as the indicator for constant price estimates.

^a Excludes gas.^b Includes Business activities.^c Discrepancy between components and total as one or more components have not been revised.^d Refer to other taxes on production, less subsidies.^e Excludes Financial intermediation services indirectly measured (FISIM).^f At factor cost.^g Derived from available industry breakdown.

Table 2.3 Output, gross value added, and fixed assets by industries at current prices
Total Economy

Series 20: 1968 SNA, Zimbabwe dollar, Western calendar year

Data in tens of billions

	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008
Series	20											
Output, at basic prices									
Less: Intermediate consumption, at purchaser's prices									
Equals: VALUE ADDED, GROSS, at basic prices ^a	9.1	12.6	18.6									
Compensation of employees									
Taxes on production and imports, less Subsidies									
Taxes on products									
Other taxes on production	0.1	0.1	0.1									
OPERATING SURPLUS, GROSS	4.2	6.2	...									
MIXED INCOME, GROSS									
Total Economy only:												
Adjustment for FISIM (if FISIM is not distributed to uses)	0.3	0.6	1.0									
Gross capital formation ^b	2.0	3.1	3.4									
Gross fixed capital formation ^b	1.8	3.1	3.1									
Changes in inventories ^b	0.1	0.0	0.3									
Acquisitions less disposals of valuables									

^a At factor cost. Discrepancy with equivalent item in Table 2.1 Value added by industries, as data have not been revised.

^b Discrepancy with equivalent item in Table 1.1 GDP by Expenditure since data have not been revised.
